This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201: Don't understand why the standard references the Planning Authority and "entity responsible. Isn't the Reliability Authority the function ultimately responsible for determining IROLs? Also believe that section 1.2.1 should be revised to read: "The reliability authority shall identify a maximum response time (Tv) for all interconnection reliability operating limits within its reliability area." Regarding the levels of non-compliance, believe there should be a level (level 3?) for a partial list of IROLs.

### Requirement 202 - Monitoring

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202: Regarding compliance monitoring, suggest that section 4.3.2 be added to allow compliance monitor inspection of RA audited limit data. With respect to levels of non-compliance, seems that items 5.4.2 an 5.4.3 should have some sort of time boundaries associated

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

with them before sanctions can be assessed. For example, is the sanction the same regardless of whether real-time data is unavailable for 5 minutes or 5 days?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?  
 Yes                       No
22. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 205: A little concerned that the entities required to provide data not have to submit the same data to multiple authorities. For example, some of the data that the RA will want from a generator operator for its models, should be the same data required by the PA for its models. The generator operator should only have to submit this data one time (to some central data

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

collecting point), to be utilized by all functions that have a need for it. This should make the data collection processes more efficient for all and decrease the possibility of data errors.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206: In the requirements and measures section, would like to see language added that will be more specific as to where entities can obtain RA specifications for data provision. For example, section 1.1 could be modified to read as follows: " Each entity performing one of the following functions shall provide data, as specified *in the RA's business practice manual*, to the reliability authority(ies) with which is has a reliability relationship."

Regarding the compliance monitoring process, section 4.3.1 may be inconsistent since the method of transmitting data is not specified.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207: Suggest adding a requirement that the RA notify those entities impacted by the action plan, of their responsibilities within the action plan. This will enable them to incorporate the required actions into their own operating plans.

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

34. Do you agree with the levels of non-compliance?

Yes

No

Comments about Requirement 208: Suggest that the generator operator function be added to section 1.1. Regarding the levels of non-compliance, agree that an entity should be penalized for not following a RA's directive, but question whether it is appropriate to take every violation to level four.

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments** If information critical to the reliability of the power system is not being provided to the RA, notifying the compliance monitor of this fact as soon as possible, rather than waiting for annual self-certification under section 206 of the standard, seems to be a reasonable response.

**37. Any other comments on this standard?**

None

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

Comments about Requirement 208:

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

**Note** – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.  
We do not understand the total reason for changing Operations Security Limit to Interconnection Reliability Operating Limit, given its implications.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments We agree with removing redundancy, but not coordination.

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201:

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?  
 Yes                       No
22. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 205:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:  
We believe the reliability of the real-time bulk transmission system is a coordinated effort between the Reliability Authority and Transmission Operator and the data should be provided to both functions.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207: We believe that for an action plan to mitigate events it must be coordinated between involved parties, i.e. Reliability Authorities and Transmission Operators.

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**37. Any other comments on this standard?**

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
 The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
 E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

**Major Changes to this Standard:**

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

- 1) All of the definitions should be cross-referenced against the Functional Model and other standards to ensure the same term has a consistent definition. For example "Reliability Authority Area" and "Transmission Operator" within this standard is different than in the Functional Model.
- 2) "Bulk Electric System" definition within this standard is a bit ambiguous. The TS knows that "Bulk Electric System" is a controversial term that has different meanings to different individuals, but a more in-depth definition is recommended (no suggestion).
- 3) "Documentable Interconnection Reliability Operating Limit Violation" and "Interconnection Reliability Operating Limit Event" have identical definitions.
- 4) Suggestion: "Real-time Monitoring" – Personnel are available to see and hear various real-time data sources as conditions dictate.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201:

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments about Requirement 202:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?  
 Yes                       No
22. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 205: 1) Requirement 205, 1.1, The TS recommends enhancing the last sentence to read "This includes specifying and collecting data from entities such as:"  
2) The TS recommends adding "1.1.6. Planning Authority."  
3) The TS recommends enhancing 1.3. to read "The reliability authority shall notify its compliance monitor when an entity does not provide data as specified."

 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

The TS recommends identifying the terms used in the standards that are found in the new Standards Process “Glossary of Terms” repository. The TS suggests small capital letters, highlighted letters, bold letters, italicized letters or other method of making the defined words, terms and acronyms stand out.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                      X No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

All the definitions should be cross-referenced against the Functional Model and other Standards to ensure the same term has a consistent definition. In particular, Reliability Authority Area and Transmission Operator have different wording than the Functional Model.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                      X No

Comments: It would be appropriate to leave the requirements for the Transmission Operator in the Standard as long as it is better clarified that the Transmission Operator is responsible for the local network system and not duplicating the Reliability Authority's responsibility for the overall Bulk electric system.

Furthermore, the comment on page 3, third paragraph in the Comment Form, "Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages" may need to be reworded or possibly removed in light of the recent Blackout. Does Local Network Integrity need to be addressed in a Standard itself?

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?

Yes                      X No

4. Do you agree with the measures?

X Yes                       No

5. Do you agree with the compliance monitoring process?

X Yes                       No

6. Do you agree with the levels of non-compliance?

X Yes                       No

Comments about Requirement 201: The Transmission Owner should be added to 201 1.1.1 and 201 1.2.1.

### Requirement 202 - Monitoring

7. Do you agree with the requirement?

Yes                      X No

8. Do you agree with the measures?

X Yes                       No

9. Do you agree with the compliance monitoring process?

X Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

10. Do you agree with the levels of non-compliance?

X Yes       No

Comments about Requirement 202: Transmission Operator should be added to 202 1.1.1

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?

Yes      X No

12. Do you agree with the measures?

X Yes       No

13. Do you agree with the compliance monitoring process?

X Yes       No

14. Do you agree with the levels of non-compliance?

X Yes       No

Comments about Requirement 203: The Transmission Operator should be added to 203 1.1.1, 203 1.1.2, 203 2.2.1.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Yes

No

Comments about Requirement 208: If the RA makes an unreasonable request for data, whether it be the type of data needed or the timing of the data, the Transmission Operator, Balancing Authority, and the Interchange Authority will be considered totally (level 4) out of compliance if they do not fully comply. Therefore, a graduated scale is recommended.

### 35. List any Regional or Interconnection Differences for this standard:

### 36. Notifying the Compliance Monitor

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

Include in this standard

Include in a Compliance Enforcement Program Document

**Comments**

### 37. Any other comments on this standard?

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

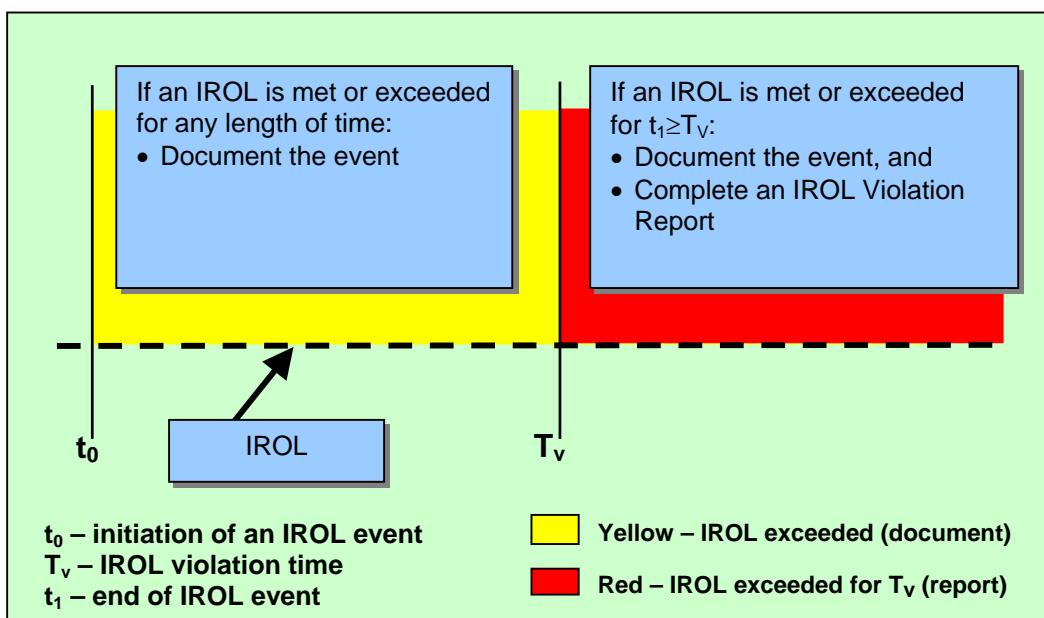

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

Based on the following definitions, we do not believe that the definition of “*Documentable Interconnection Reliability Operating Limit Violation*” is necessary (is it truly a violation?). It appears that it is identical to the definition of “*Interconnection Reliability Operating Limit Event*” and the fact that an “*event*” must be documented is contained in the definition of “*Interconnection Reliability Operating Limit*”.

- **Documentable Interconnection Reliability Operating Limit Violation:** An instance of exceeding an interconnection reliability operating limit for any length of time.
- **Interconnection Reliability Operating Limit Event:** An instance of exceeding an interconnection reliability operating limit for any length of time.
- **Interconnection Reliability Operating Limit Violation:** An instance of exceeding an interconnection reliability operating limit for time greater than or equal to  $T_v$ .
- **Interconnection Reliability Operating Limit:** A system operating limit that, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system. The reliability authority must log each case of exceeding an interconnection reliability operating limit, and must report (to its compliance monitor) each case of exceeding an interconnection reliability operating limit for a time greater than or equal to  $T_v$ . Note that  $T_v$  may be zero.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments: This should not preclude the Transmission Operator from conducting independent analysis.

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

Yes                       No

5. Do you agree with the compliance monitoring process?

Yes                       No

6. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 201:

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

- What happens if you identify another (unexpected) limit during real-time that is not on the list? Are you not responsible for this case as well? We all know that planning studies cannot predict all the challenges that are faced in real-time.
- Who determines  $T_v$  and what restrictions are placed on the entity establishing it?

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. This Standard could be improved by formatting (where possible) Measurement 2.1 to relate to Requirement 1.1 and Measurement 2.2 to relate to Requirement 1.2, etc. rather than listing the measures and requirements arbitrarily and independently.

In order to tie the OEC's to the Measures, Section 4 should be clarified to read:

4.3. The entity responsible shall have the following Objective Evidence for Compliance available upon the request of its compliance monitor:

- 4.3.1. List of interconnection reliability operating limits for the reliability authority's reliability area **as described in Measure 2.1 above**
- 4.3.2. List of facilities (or groups of facilities) in the reliability authority's reliability area that are subject to interconnection reliability operating limits **as described in Measure 2.2 above**

### **Requirement 202 - Monitoring**

- 7. Do you agree with the requirement?  
 Yes                       No
- 8. Do you agree with the measures?  
 Yes                       No
- 9. Do you agree with the compliance monitoring process?  
 Yes                       No
- 10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3.1 is too specific for the measures it supports. It may be a practical solution that the real-time data and interconnection reliability operating limits be made available to operators in the form of a "display", however this solution is not prescribed in the measures and should not be listed exclusively.

We suggest that section 4.3.1 be rewritten to read:

- 4.3.1. Process used for monitoring and comparing real time data associated with interconnection reliability operating limits in accordance with Measure 2.3 above.**

This may be accomplished through the use of an operator display and should demonstrate compliance with Measures 2.1 and 2.2.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be rewritten to read:

**4.3. The reliability authority shall demonstrate in accordance with Measure 2.1, the following upon the request of the compliance monitor:**

- 4.3.1. Ability to perform an operational planning analysis**
- 4.3.2. Ability to perform a real time assessment**

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

We have a general concern that the Reliability Authority is the only function held responsible for instances where the IROL is exceeded. Currently, not all RAs have operating responsibility over their systems. Some functions are delegated. With this in mind, the levels of non-compliance would pertain only to RAs, while they may not have direct control. For instance, the operating entities could choose not to follow the RA's direction. It seems that there should be a complimentary standard that would penalize operating entities for not adhering to the direction of the RA. The penalties should be ranked according to the severity of the situation. In other words, the entities who actually have the operating responsibility must be held accountable.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Has the Interconnection Reliability Operating Limit Violation Report been developed yet? Is this the existing NERC Operating Policy 5, Appendix 5F as modified with the results of the Reliability Coordinator IRLV Field Test?

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

In section 2, the measures do not capture the requirement to PREVENT instances where IROLs may be exceeded. The following re-wording is suggested. Section 4, below is also slightly modified to align with change in the measurement.

2.1. **The reliability authority shall document each instance where actions are taken to prevent exceeding or to mitigate the magnitude and duration of interconnection reliability operating limit:**

2.1.1. The reliability authority shall document, via an operations log or other data source, the actions taken or directives issued, the magnitude of the event, and the duration of the event. (This data may be from an operating log, may be from the entity's energy management system, or may be from some other source.)

2.2. The reliability authority shall report each instance of exceeding an interconnection reliability operating limit for time greater than or equal to  $T_v$ :

2.2.1. The reliability authority shall complete an Interconnection Reliability Operating Limit Violation Report and shall file the report with its compliance monitor within five business days of the initiation of the event. (The report includes the date and time of the event, identification of which interconnection reliability operating limit was violated and the  $T_v$  for that limit, magnitude and duration of exceeding the interconnection reliability operating limit, actions taken or directives issued, and explanation of results of actions or directives.)

4.3. The reliability authority shall have the following available upon the request of its compliance monitor:

4.3.1. Operations logs or other documentation **in accordance with Measure 2.1 indicating the magnitude and duration of each interconnection reliability operating limit event** and the actions or directives issued for each of these instances

4.3.2. Interconnection Reliability Operating Limit Violation Reports **completed in accordance with Measure 2.2**

### **Requirement 205 - Data Specification**

19. Do you agree with the requirement?

Yes

No

20. Do you agree with the measures?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No

21. Do you agree with the compliance monitoring process?

Yes                       No

22. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 205:

The requirement for data collection should be tied to its impact on reliability. Requirement 1.3 should be modified to read:

- 1.3. The reliability authority shall notify its compliance monitor when an entity that has facilities monitored by the reliability authority does not provide data as specified **and this lack of data has an impact on reliability.**

Measurement 2.3.1 should be rewritten to read:

- 2.3.1. The notification shall take place within five business days of discovering that the data **having an impact on reliability** is missing.

In order to prevent a shotgun approach to data collection we propose Section 2.1.1 be modified to read:

- 2.1.1. Specification shall include a list of **minimum** required data, a mutually agreeable format, and timeframe and periodicity for providing data.

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be rewritten to read:

- 4.3. The reliability authority shall have the following available upon the request of the compliance monitor:

- 4.3.1. Data specification(s) **in accordance with Measure 2.1**

- 4.3.2. Proof of distribution of the data specification(s) **in accordance with Measure 2.2**

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?

Yes                       No

24. Do you agree with the measures?

Yes                       No

25. Do you agree with the compliance monitoring process?

Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

26. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 206:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3.1 is too specific for the measure it supports. A possible solution might be:

4.3.1. **Documentation** indicating data was sent to the reliability authority **in accordance with Measure 2.1**

Non-compliance in data submission could take several forms and levels of impact to reliability. Section 5 should be modified as follows:

5. Levels of Non-compliance:

5.1. Level one: **Data was provided, but not in the mutually agreed format**

5.2. Level two: **Data was provided, but not within the time-frame specified**

5.3. Level three: **Incomplete data was provided**

5.4. Level four: Data **was** not provided to the reliability authority as specified.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?

Yes  No

28. Do you agree with the measures?

Yes  No

29. Do you agree with the compliance monitoring process?

Yes  No

30. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 207:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. The Levels of non-compliance should be objectively determined based on the evidence.

Measure 2.1 should be modified to include:

2.1. The reliability authority shall have a documented action plan that addresses preventing and mitigating instances of exceeding interconnection reliability operating limits. The plan shall **identify and** be coordinated with those entities responsible for acting and with those entities impacted by such actions.

Section 4.3 should be modified to include:

4.3. The reliability authority shall make the following available for inspection by the compliance monitor upon request:

4.3.1 Action plan **developed in accordance with Measure 2.1**

Section 5 should be modified to include:

5. Levels of Non-compliance

- 5.1. Level one: Action plan exists but wasn't coordinated with all involved and impacted entities
- 5.2. Level two: Action plan exists but wasn't coordinated with any involved or any impacted entities
- 5.3. Level three: **Action plan is incomplete**
- 5.4. Level four: No action plan

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?

Yes                       No

32. Do you agree with the measures?

Yes                       No

33. Do you agree with the compliance monitoring process?

Yes                       No

34. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 208:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. Non-compliance could take several forms and levels of impact to reliability. The Levels of non-compliance should be objectively determined based on the evidence.

Section 4.3.1 should be modified to read:

4.3.1. Operations log or other data source(s) to show the following for each instance of being issued a reliability authority directive relative to an interconnection reliability operating limit:

4.3.1.1. Date and time of each of directive received

4.3.1.2. Directive issued

4.3.1.3. Actions taken in response to directive **in accordance with Measure 2.1**

Section 5 should be modified as follows:

5. Levels of Non-compliance

5.1 Level one: Operations log or other data source(s) do not show one of the following:

5.1.1 Date and time of each of directive received

5.1.2 Directive issued

5.1.3 Actions taken in response to directive

5.2 Level two: Operations log or other data source(s) do not show any of the following:

5.1.4 Date and time of each of directive received

5.1.5 Directive issued

5.1.6 Actions taken in response to directive

5.3 Level three: Not applicable.

5.4 Level four: Did not follow directives.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**35. List any Regional or Interconnection Differences for this standard:**

None

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments** We believe that it is appropriate to include this in the standard with the comments noted in Section 205.

**37. Any other comments on this standard?**

Please note that throughout the standard the Tv term is used but is not formatted the same (Tv vs. T<sub>v</sub>). This is a minor, formatting issue, but should be consistent throughout to reduce confusion.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

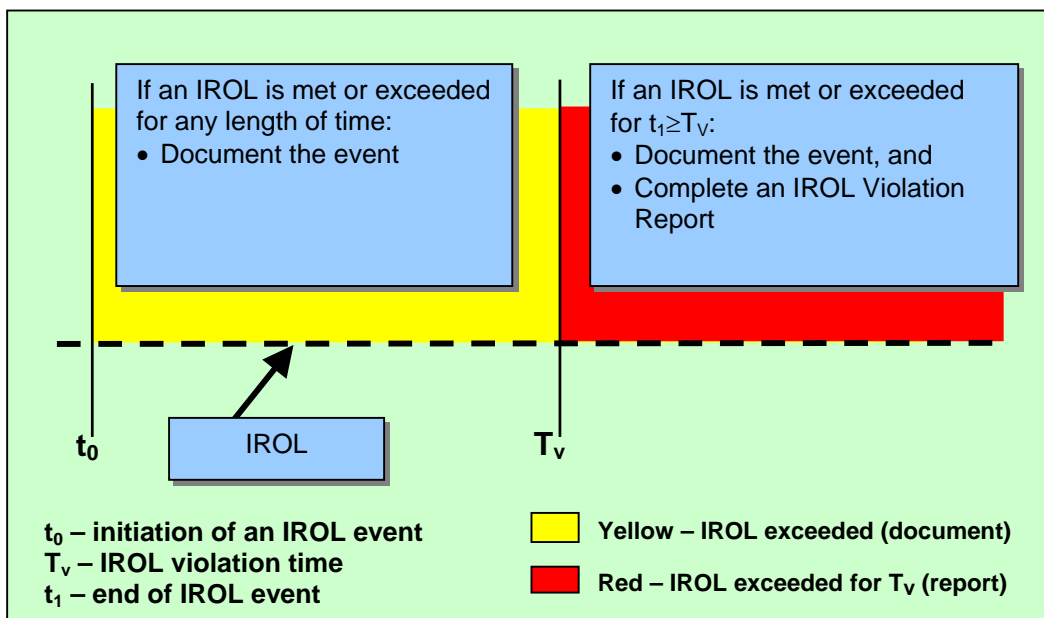

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.  
**I would suggest that the terms Documentable IROL Violation and IROL Event be combined in a single definition. Offer the following:**

**IROL Event: An instance.....for any length of time. These events are documentable IROL violations.**

**Similarly for IROL Violation and Reportable IROL Violation.**

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHIN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

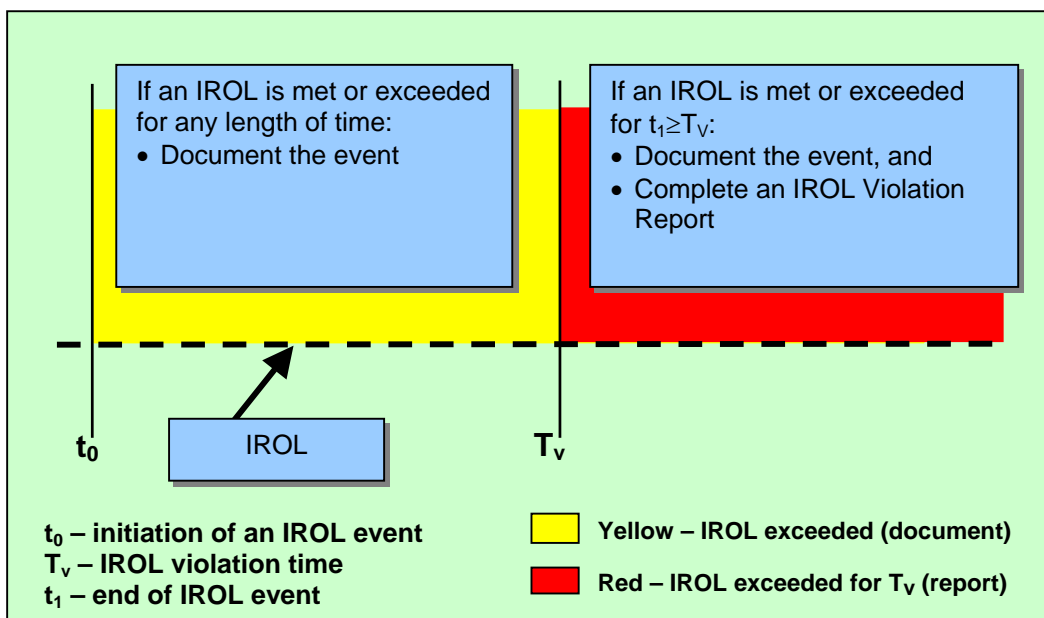

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the 'yellow' area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the 'yellow area') and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the 'red area'), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

**I would recommend the definition Tv and section 1.2.1 be made consistent.**

**As the standard now reads, the definition of Tv is the violation time associated with a limit. Section 1.2.1 refers to the identification of Tv as a response time.**

**Those are two very different things.**

**The response limit must be the total time from when a flow/voltage/stability limit is first violated to when operator action is initiated and finally the system (transaction curtailments/generation redispatch/switching/load control action...) responds to bring the violated operating limit back to below the limit.**

**The definition should be changed to bring it in line with the usage in the standard.**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

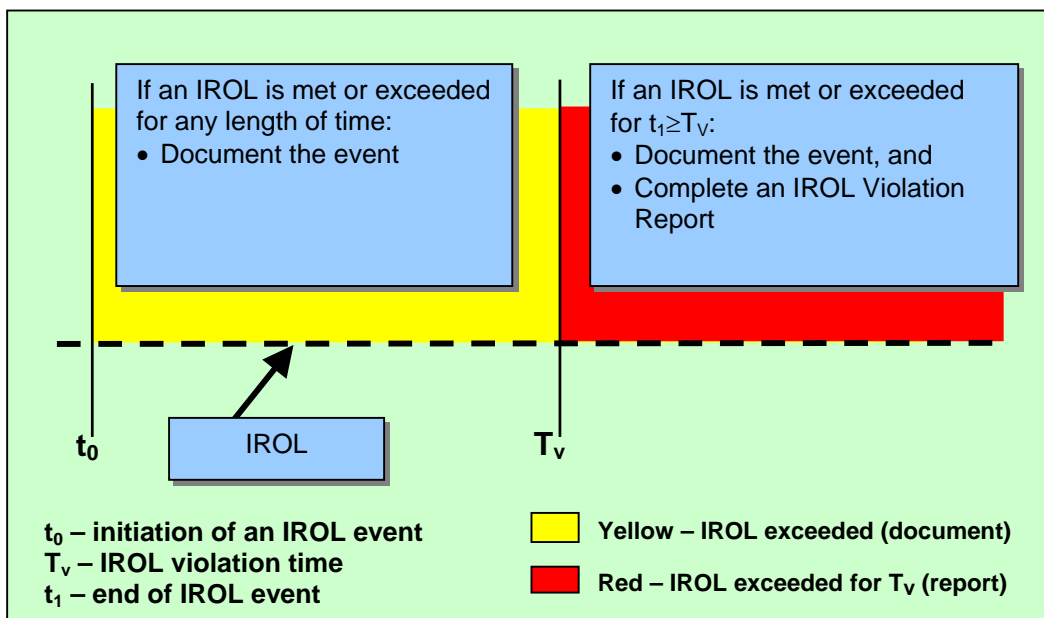

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

**The definitions involving Interconnection Reliability Operating Limit need to be cleaned up to increase clarity and to eliminate duplication.**

- a) Remove the definition for “Documentable Interconnection Reliability Operating Limit Violation”**
- b) Remove the definition for “Reportable Interconnection Reliability Operating Limit Violation”**
- c) Change, as follows, the definition for “Interconnection Reliability Operating Limit Event: An instance of exceeding an Interconnection Reliability Operating Limit for any length of time. The event must be documented (logged).”**
- d) Change, as follows, the definition for “Interconnection Reliability Operating Limit Violation: An instance of exceeding an Interconnection Reliability Operating Limit for a time greater than or equal to Tv. This is an event that has progressed to also become a violation. The event must be documented and the violation must be reported (to the compliance monitor).”**

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

- 3. Do you agree with the requirement?

33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### **Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

The term "Documentable Interconnection Reliability Operating Violation" is never used in the standard and has the same definition as "Interconnection Reliability Operating Event". Likewise, the term "Reportable Interconnection Reliability Operating Violation" is never used in the standard and has the same definition as "Interconnection Reliability Operating Violation". We suggest that the terms "Documentable Interconnection Reliability Operating Violation" and "Reportable Interconnection Reliability Operating Violation" be deleted from the list of definitions.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No

Comments It is not clear to us that the Transmission Operator would never be responsible for performing the requirements included in this standard. Similar to Standard 600, this requirement could apply to "the areas for which they are responsible".

### **Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201: The Transmission Owner should be added to this requirement if they can be held liable for violating IROL's.

### **Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202: The Transmission Operator should also be included in this requirement for "the areas for which they are responsible".

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203: The Transmission Operator should also be included in this requirement for "the areas for which they are responsible".

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?  
 Yes                       No
22. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 205: The Transmission Operator should also be included in this requirement for "the areas for which they are responsible".

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### 35. List any Regional or Interconnection Differences for this standard:

We do not currently know of any Regional or Interconnection Differences at this time. However, during the initial phasing in of standards each region may find adopting or developing a different approach provides increased reliability. Therefore, we believe that differences should be considered as they are identified in the future.

### 36. Notifying the Compliance Monitor

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

### 37. Any other comments on this standard?

This standard should not be brought to ballot until the Planning Authority is defined in the Functional Model since the Planning Authority is assigned requirements in this standard.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.  
Operational Planning Analysis - There should be no time component to this definition. As long as it has been completed prior to when it is needed. Tv - Should include maximum response time.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201: Should remove planning authority to obtain a single point of responsibility. Also, Remove maximum response time and use just Tv, this will apply to the entire definition associated with Tv.

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203: 2.1.1 There should be no time frame, as long as the analysis is done prior to the need it shouldn't matter.

5.1 Remove - to indicate actions taken or directives issued to mitigate the instance. This additional verbage is not needed, the discription of the documentation is already covered in the requirements.

5.4 Remove at least once each day.

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204: 5.4 Remove minutes, TV may be seconds and TV is already a time period by definition.

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?  
 Yes                       No
22. Do you agree with the levels of non-compliance?  
 Yes                       No

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

In the Northwest, where there isn't a RTO in place, there seems to be some confusion on what current entity would be the RA? Who makes the decision or assigns who is the RA? We have also heard that a RA can direct TOP or others to do operational planning analysis, but we have not been able to find it in the Functional Model or this document. If that is the intent then it should be included in the Functional Model or this document. If you could direct us in these matters it would greatly improve our understanding of the document. Thank you for your help.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHIN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

**I would suggest that the terms Documentable IROL Violation and IROL Event be combined in a single definition. Offer the following:**

**IROL Event: An instance.....for any length of time. These events are documentable IROL violations.**

**Similarly for IROL Violation and Reportable IROL Violation.**

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
X Yes  No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
X Yes  No  
Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
X Yes  No
4. Do you agree with the measures?  
X Yes  No
5. Do you agree with the compliance monitoring process?  
X Yes  No
6. Do you agree with the levels of non-compliance?  
X Yes  No

Comments about Requirement 201: We agree with the current list but wonder if their should be a category for an "incomplete list".

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
X Yes  No
8. Do you agree with the measures?  
X Yes  No
9. Do you agree with the compliance monitoring process?  
X Yes  No
10. Do you agree with the levels of non-compliance?  
X Yes  No

Comments about Requirement 202:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

- 11. Do you agree with the requirement?  
X Yes             No
  
- 12. Do you agree with the measures?  
X Yes             No
  
- 13. Do you agree with the compliance monitoring process?  
X Yes             No
  
- 14. Do you agree with the levels of non-compliance?  
X Yes             No

Comments about Requirement 203: We agree with this but think there should possibly be some room for "extenuating circumstances" (i.e., computer problems, in middle of restoration, etc.).

**Requirement 204 - Actions**

- 15. Do you agree with the requirement?  
X Yes             No
  
- 16. Do you agree with the measures?  
X Yes             No
  
- 17. Do you agree with the compliance monitoring process?  
X Yes             No
  
- 18. Do you agree with the levels of non-compliance?  
X Yes             No

Comments about Requirement 204:

**Requirement 205 - Data Specification**

- 19. Do you agree with the requirement?  
X Yes             No
  
- 20. Do you agree with the measures?  
X Yes             No
  
- 21. Do you agree with the compliance monitoring process?  
X Yes             No
  
- 22. Do you agree with the levels of non-compliance?  
X Yes             No

Comments about Requirement 205:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

- 23. Do you agree with the requirement?  
X Yes             No
  
- 24. Do you agree with the measures?  
X Yes             No
  
- 25. Do you agree with the compliance monitoring process?  
X Yes             No
  
- 26. Do you agree with the levels of non-compliance?  
X Yes             No

Comments about Requirement 206:

**Requirement 207 - Action Plan**

- 27. Do you agree with the requirement?  
X Yes             No
  
- 28. Do you agree with the measures?  
X Yes             No
  
- 29. Do you agree with the compliance monitoring process?  
X Yes             No
  
- 30. Do you agree with the levels of non-compliance?  
X Yes             No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

- 31. Do you agree with the requirement?  
X Yes             No
  
- 32. Do you agree with the measures?  
X Yes             No
  
- 33. Do you agree with the compliance monitoring process?  
X Yes             No
  
- 34. Do you agree with the levels of non-compliance?  
X Yes             No

Comments about Requirement 208: This does not allow for a directive to be challenged. It is either comply with the directive or don't and suffer the results. It would seem that you should have the right to request additional or further discussion surrounding the directive.

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
 The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
 E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

**Major Changes to this Standard:**

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

- Operational Planning analyses are conducted for time periods up to 13-months into the future. Please revise the definition as follows:

Operational Planning Analysis: “ .... An operational planning analysis is done for the next day’s operation and up to 13-months ahead of the expected conditions.”

- The Transmission Owner has fiduciary responsibility for his owned facilities. Therefore he has ultimate responsibility and liability for owning, maintaining and operating his facilities to protect his stockholders’ and lending institutions’ investments. The Transmission Owner then is ultimately responsible for establishing system operating limits, including Tv, for his facilities. Therefore, the definition of Tv should be revised to:

“Tv: The violation time associated with a limit that is determined by the Transmission Owner for equipment-based limits, and by the Reliability Authority and Planning Authority for system-based limits.”

- The responsibilities of the RA are to “monitor” the system, not “control” the system. Therefore, we suggest the following change:

Reliability Authority Area: A defined electrical system bounded by interconnection (tie-line) metering and telemetry monitored by a single reliability authority.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments: Given the significant changes to this draft standard, the RA is now monitoring the facilities with identified and documented IROLs. We do not agree with this blanket statement until we are able to review all the requirements of all the functional entities. For instance, this draft standard does not recognize that the TO has fiduciary responsibility to his stockholders’ and lending institutions’ investments and that neither NERC standards, nor the Functional Model, can take that responsibility and liability away. This fiduciary responsibility requires the TO establish thermal ratings, and associated Tv, for its equipment and then monitor that equipment. If those thermal ratings are the lesser of the thermal, stability or voltage limits, then the TO has established the IROL limit. Therefore, we suggest the requirements identified in this standard are not redundant requirements but are requirements met by several entities (functions), not met by one entity (function).

Also, the requirements should be changed to the TO, from the TOP. The TO may delegate some parts of that function to another entity, at the TO’s option. However, for the purposes of this standard, the Transmission Owner must be added to all parts of this standard.

In addition, what functional entity is monitoring all the transmission facilities with system operating limits not included in the IROLs? What functional entity is monitoring all the other transmission

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

facilities? The answer is that the TO, and maybe the TOP, must be added to the list of entities (functions) monitoring the real-time system to ensure all the transmission facilities are being operated within limits.

If the TO is not added to this standard, then there is a major piece missing to the monitoring of the power system and the reliability of the system. That missing piece is the monitoring of the system operating limits.

Therefore, another standard needs to be written with a title something like – “Operate Within Limits – All Transmission and System Operating Limits Other Than Interconnection Reliability Operating Limits”.

### **Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO, RA, PA, TSP, and TOP, and recommend all functional entities be identified in Standard 201 part 1.1 and 1.2.

Standard 201 part 1.2.1 should have the “RA or PA” replaced with the “Transmission Owner or Transmission Operator” as the functional entities responsible for establishing the maximum response time (Tv) for any IROL that does not already have one.

In the measures sections 2.1 and 2.2, replace the “entity responsible” with the “TO, RA, PA, TSP, and TOP” as the entities establishing a list of IROLs.

Measures section 2.1.1 should have the “entity responsible” replaced with the “TO” being responsible for establishing the maximum value of Tv.

In the Compliance Monitoring Process section, the “entity responsible” should be replaced with the “Transmission Owner” in each occurrence of that term.

### **Requirement 202 - Monitoring**

7. Do you agree with the requirement?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No

8. Do you agree with the measures?

Yes                       No

9. Do you agree with the compliance monitoring process?

Yes                       No

10. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 202:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 202 be replaced with "reliability authority and transmission owner".

In addition, it appears from the wording of this draft standard Section 202 Monitoring, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded:

1.1. The reliability authority shall monitor real-time system operating parameters to determine if the reliability area is operating within its interconnection reliability operating limits.

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?

Yes                       No

12. Do you agree with the measures?

Yes                       No

13. Do you agree with the compliance monitoring process?

Yes                       No

14. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 203:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO and RA. Therefore, we suggest that every

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

occurrence of the term “reliability authority” in all of this section 203 be replaced with “reliability authority and transmission owner”.

In addition, it appears from the wording of this draft standard Section 203 Analysis and Assessments, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded:

- 1.1. The reliability authority shall perform operational planning analyses to verify that the planned bulk electric system operations will not exceed any of its interconnection reliability operating limits.

The wording of Item 1.2 should also be revised to make it clear the RA and TO verify the power system operation is not exceeding IROL limits:

- 1.2. The reliability authority shall perform real-time assessments to verify that the power system is not exceeding any interconnection reliability operating limits. The transmission owner shall perform real-time assessments to verify its equipment is not exceeding any interconnection reliability operating limits.

**Requirement 204 - Actions**

- 15. Do you agree with the requirement?  
 Yes                       No
- 16. Do you agree with the measures?  
 Yes                       No
- 17. Do you agree with the compliance monitoring process?  
 Yes                       No
- 18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

**Requirement 205 - Data Specification**

- 19. Do you agree with the requirement?  
 Yes                       No
- 20. Do you agree with the measures?  
 Yes                       No
- 21. Do you agree with the compliance monitoring process?  
 Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

22. Do you agree with the levels of non-compliance?

Yes

No

Comments about Requirement 205:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 205 be replaced with "reliability authority and transmission owner".

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 206 be replaced with "reliability authority and transmission owner".

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 207 be replaced with "reliability authority and transmission owner".

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

We believe the wording of this draft standard Section 208 Reliability Authority Directives, 1. Requirements, Item 1.1 is restricted to too few entities, needs to be expanded to encompass all functions and users of the power system, should recognize the RA is required to issue directives consistent with applicable tariffs and contract, and the RA is required to use Good Utility Practices. This requirement must be reworded:

1.1. The reliability authority shall use applicable tariffs, contracts, and Good Utility Practice when directing use of the power system, and all users of the power system shall follow the reliability authority's directives to:

1.1.1.1. Prevent instances where interconnection reliability operating limits may be exceeded

1.1.1.2. Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded

**35. List any Regional or Interconnection Differences for this standard:**

None

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

- Two definitions should be changed based on our comments:

**Reliability Authority Area:** A defined electrical system bounded by interconnection (tie -line) metering and telemetry monitored by a single reliability authority.

**T<sub>v</sub>:** The violation time associated with a limit that is determined by the Transmission Owner for equipment-based limits and by the Reliability Authority and the Planning Authority for system-based limits.

- We are becoming increasingly concerned about this standard development process. This and other standards are being developed based on certain definitions and assumptions contained in the Function Model. These “standards” will become fixed such that the industry will be held accountable to and measured by these standards. However, the Functional Model and the definitions contained in that revised model are changing and will not necessarily be the same as those used to develop the standards, like this Operate Within Limits. What is the process for reviewing, revising and implementing changes to the Functional Model, and the impact of those changes on all these standards that have been developed based on the old Functional Model? Are the changes to the Functional Model being vetted by all industry participants before implementation? What is the process to revise these standards prior to implementing changes to the Functional Model?

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

Operational Planning Analysis – Omit the word “peak” in the first sentence as a qualifier for load. There may be instances where reliability is compromised during non-peak load conditions. The analysis should be done over a range of loads based on forecasts.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments This issue is addressed well in this version.

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201: The requirement to produce a list of IROLs must include the notion that if the failure to identify an existing IROL results in the system experiencing cascading outages, instability, or uncontrolled separation - a consequence occurs. The requirement, as written, provides no monitoring or non-compliance provisions for the failure to properly identify an IROL – an entity is compliant if they have a list of one IROL – even if in the last year they caused multiple bulk reliability catastrophes due to not identifying other IROLs on their system.

The order of 2.1 and 2.2 should be swapped to agree with 1.1 and 1.2 order.

### Requirement 202 - Monitoring

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No

Comments about Requirement 202:

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?

Yes                       No

12. Do you agree with the measures?

Yes                       No

13. Do you agree with the compliance monitoring process?

Yes                       No

14. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 203:

**Requirement 204 - Actions**

15. Do you agree with the requirement?

Yes                       No

16. Do you agree with the measures?

Yes                       No

17. Do you agree with the compliance monitoring process?

Yes                       No

18. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 204:

The Measure 2.1.1 should include the explicit provision that this log is a publicly available document. The actions so logged by the RA should be independent and consistent, and the log is one way of enhancing visibility to assure this is the case.

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?

Yes                       No

20. Do you agree with the measures?

Yes                       No

21. Do you agree with the compliance monitoring process?

Yes                       No

22. Do you agree with the levels of non-compliance?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No

Comments about Requirement 205:

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?

Yes                       No

24. Do you agree with the measures?

Yes                       No

25. Do you agree with the compliance monitoring process?

Yes                       No

26. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 206: Provisions should be made to excuse the temporary loss of real-time data due to technical difficulties, such as telecommunications interruptions.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?

Yes                       No

28. Do you agree with the measures?

Yes                       No

29. Do you agree with the compliance monitoring process?

Yes                       No

30. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?

Yes                       No

32. Do you agree with the measures?

Yes                       No

33. Do you agree with the compliance monitoring process?

Yes                       No

34. Do you agree with the levels of non-compliance?

Yes                       No

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Comments about Requirement 208: Please clarify if the intention here is for entities to comply with the RAs directives in cases that those directives are proscribed by an existing operating guide – or in **all** cases? If a Reliability Authority is issuing an order that conflicts with a standing operating guide, then the RA must first explicitly/formally invalidate the guide prior to issuing the directive. Please provide information regarding how liability will be assigned for actions that are found to be improper that result in harm.

### 35. List any Regional or Interconnection Differences for this standard:

### 36. Notifying the Compliance Monitor

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

#### Comments

**Relaying on a centralized compliance document would result in a compliance document that could never be stabilized due to too many changes being required.**

### 37. Any other comments on this standard?

The Sanctions Subsection (number 6) for each heading should define the MW value to be used when determining monetary penalties if an entity is found to be non-compliant, or clarify that the fixed level sanctions should be used and not the per-MW sanctions.

Is there a reason why NERC defined terms are not capitalized throughout the standard?

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?

Yes                      X  No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

1. "Documentable Interconnection Reliability Operating Limit Violation" and "Interconnection Reliability Operating Limit Event" have identical definitions. Two terms having the same definition leads to confusion. Eliminate one of the terms and modify Standard accordingly.
2. "Interconnection Reliability Operating Limit" definition
  - a. Second sentence contains a reporting requirement for the Reliability Authority. A definition should simply define the term. Required actions are to be contained in the standard itself. Delete sentence two.
  - b. First sentence is confusing it that it appears to imply that there just may be certain situations where "instability, uncontrolled separation, or cascading outages" may NOT "adversely impact the reliability of the bulk transmission system". Assuming this is not the intent, consider rewording as:
    - i. Interconnection Reliability Operating Limit: A System Operating Limit on the Bulk Electric System that if exceeded, could lead to instability, uncontrolled separation, or cascading outages.
3. Real-time Monitoring: Standard 202 implies that "Real-time Monitoring" is an activity to be performed as opposed to equipment in place that simply facilitates that function. Consider rewording as:
  - i. Real-time Monitoring: Draw conclusions from various Real-time Data sources.
4. Operational Planning Analysis: The last sentence specifies that such an analysis is performed up to seven days ahead of expected conditions. Sentence is unnecessary and confusing. Neither 203.1 or 203.2 does not specify a time horizon for the Operational Planning Analysis beyond the 'next day'.
5. Real-time: definition not necessary, consider deleting.
6. Real-time Data: Consider rewording as " Readily available measured values of existing system parameters, state estimator values....."
7. Tv: Definition confusion. Consider: Minimum time of a system parameter that exceeds an Interconnection Reliability Operating Limit that requires a report to the Compliance Monitor.
8. Real-time Assessment: The second sentence is not needed. Required actions are to be contained in the standard itself. Additionally, real-time assessments can be performed others, not just the RA.
9. "Interconnection Reliability Operating Limit Violation" and "Reportable Interconnection Reliability Operating Limit Violation" have the same definition. Two terms having the same definition leads to confusion. Eliminate one of the terms and modify Standard accordingly.
10. Self-certification: Remove the second and third sentences. They are editorial comments that do not belong in a definition. If the comments are relevant to a particular standard, then they belong in the Compliance Monitoring Process section of the Standard.
11. Transmission Operator: The definition given sounds more like the definition of a Transmission Service Provider. The Functional Model Review Task Force in their January 1, 2003 Group Report defined Transmission Operator as: "The entity that operates the transmission facilities and executes switching orders."

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

- 3. Do you agree with the requirement?  
 Yes                      X  No
- 4. Do you agree with the measures?  
X  Yes                       No
- 5. Do you agree with the compliance monitoring process?  
 Yes                      X  No
- 6. Do you agree with the levels of non-compliance?  
 Yes                      X  No

Comments about Requirement 201:

- 1. In 201.1.2.1 Consider: The Reliability Authority or Planning Authority shall establish a maximum response time (Tv) for all Interconnected Reliability Operating Limits.
- 2. In 201.5.4 "States NO list of Interconnected Reliability Operating Limits or NO list of facilities .....". Should it be "Incomplete" lists?
- 3. Defined terms should be capitalized, such as "Reliability Authority", "Interconnected Reliability Operating Limits", etc.
- 4. Who is the ultimate arbiter of what is the "complete list" of facilities and limits? Should the RA and PA be required to have studies available that support their IROLs or is just having a list of facilities with associated limits enough? If having studies is to be required, then what is the penalty if studies show other facilities should have had an IROL but the RA or PA did not specify a limit for that facility? Is the real concern identifying what facilities have an IROL or is it that we want to ensure that the RA does not operate in violation of identified IROLs? This version of the Standard has requirements for both, but leaves a lot of unanswered questions.
- 5. 201.1.1: How will the Reliability Authority and Planning Authority identify and document the facilities subject to operating limits jointly? What is the course of action if there is disagreement? Which functional entity has the final say? We believe the Standard should specify only one entity to be ultimately responsible. For this requirement we suggest it should be the RA. Suggested rewording: "The Reliability Authority in coordination with the Planning Authority shall identify and document . . ."
- 6. 201.1.2: Suggested rewording: "The Reliability Authority in coordination with the Planning Authority shall identify . . ."
- 7. 201.1.2.1: Suggested rewording: "The Reliability Authority in coordination with the Planning Authority shall identify a maximum . . ."
- 8. 201.4.2: We believe the performance-reset period should be 12 months from the date of the infraction not one calendar year.
- 9. 201.5 Levels of Non-compliance: We disagree with the SDT's perspective that there is no gray area where partial credit is appropriate. Requirement 201 is a documentation and communication requirement. The RA needs to have documented IROLs and have such documentation of limits available to the RA system operators. As such this requirement is similar to the communication requirements 602, 604, and 606 in the "Determine Facility Ratings, System Operating Limits, and Transfer Capabilities Standard." In those requirements, it is proposed that there be multiple levels of non-compliance. We believe that is prudent and should be the case with this requirement too. As presently stated, if an RA has an incomplete list of IROLs or incomplete list of facilities requiring IROLs, he is still compliant. The RA is only non-compliant if they have "no list." We believe this is too lenient. We suggest that the levels of non-compliance should address both completeness (all identified facilities have associated IROL and Tv value) and quality (all appropriate facilities have been identified and the limits and Tv values are reasonable).

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 202 - Monitoring**

- 7. Do you agree with the requirement?  
X  Yes                       No
- 8. Do you agree with the measures?  
X  Yes                       No
- 9. Do you agree with the compliance monitoring process?  
 Yes                              X  No
- 10. Do you agree with the levels of non-compliance?  
X  Yes                             No

Comments about Requirement 202:

- 1. For clarity consider rewording 202.1.1 as “The Reliability Authority shall perform Real-time Monitoring of applicable operating parameters to determine if.....”
- 2. Defined terms should be capitalized, such as “Reliability Authority”, “Interconnected Reliability Operating Limits”, etc.
- 3. 202.4.2: The performance reset period should be 12 months from the time of the infraction not one calendar year.
- 4. Suggest combining 202.4.3 and 202.4.3.1 and rewording as: “The Reliability Authority shall have display(s) with real time data associated with interconnection reliability operating limits.

**Requirement 203 - Analyses and Assessments**

- 11. Do you agree with the requirement?  
 Yes                              X  No
- 12. Do you agree with the measures?  
 Yes                              X  No
- 13. Do you agree with the compliance monitoring process?  
X  Yes                             No
- 14. Do you agree with the levels of non-compliance?  
X  Yes                             No

Comments about Requirement 203:

- 1. Wording of 203.1 implies that a specific favorable outcome of Operational Planning Analyses and Real-time Assessments is required. Consider reword as:
  - a. 203.1.1 The Reliability Authority shall perform Operational Planning Analyses to assess if the planned Bulk Electric System operations will result in any of its Interconnection Reliability Operating Limits being exceeded. The Reliability Authority will modify planned operations if analyses indicate such a violation.
  - b. 203.1.2 The Reliability Authority shall perform Real-time assessments to assess if any Interconnection Reliability Operating Limits are being exceeded. Any identified violated will be addressed immediately.
- 2. Defined terms should be capitalized, such as “Reliability Authority”, “Operational Planning Analyses”, “Interconnected Reliability Operating Limits”, etc
- 3. 203.4 Compliance Monitoring Process: Today we require the Reliability Coordinators to have available for review and investigation study case results and related documentation for a rolling three month period (refer to compliance template P9 T1). Maintaining this compliance

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

requirement may prove beneficial during investigations due to complaints and would not add any additional reporting burden beyond today's process.

### **Requirement 204 - Actions**

15. Do you agree with the requirement?  
X  Yes                       No
16. Do you agree with the measures?  
X  Yes                       No
17. Do you agree with the compliance monitoring process?  
X  Yes                       No
18. Do you agree with the levels of non-compliance?  
X  Yes                       No

Comments about Requirement 204:

1. Defined terms should be capitalized, such as "Reliability Authority", "Operational Planning Analyses", "Interconnected Reliability Operating Limits", etc

### **Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                      X  No
20. Do you agree with the measures?  
 Yes                      X  No
21. Do you agree with the compliance monitoring process?  
X  Yes                       No
22. Do you agree with the levels of non-compliance?  
X  Yes                       No

Comments about Requirement 205:

1. Defined terms should be capitalized, such as "Reliability Authority", "Operational Planning Analyses", "Interconnected Reliability Operating Limits", etc
2. This section should only deal with the data specification. The data collection portion should either be its own section or be combined with section 206 at a minimum. Items 1.3 and 2.3 of this section should be a part of that new section or merged into section 206.
3. The standard as it is written assumes that 100 percent of the data that is required for real-time monitoring, operational planning analyses and real-time assessments can be collected 100 percent of the time. The availability of real-time data is subject to many controllable and uncontrollable factors of both the Reliability Authority and the entity providing the data.
4. The Reliability Authority and the entity providing the data should have documented protocols for the acceptable level of data quality and availability specific to the data type, need, and other factors. This information is outside the scope of this standard, but this standard should ensure that the documentation does exist and the requirements established in the protocols are enforced. This will enable the requirement of the entity to provide the data sufficient for the

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Reliability Authority to perform its functions and require the Reliability Authority to report any non-compliance without the ambiguity of what is an acceptable failure or not.

5. What is the dispute resolution process for disagreements with requirements established by the Reliability Authority? Can the entity say they cannot provide the data requested and justify why not to some group or entity? We suggest that there should be a provision that the data requested by the RA is reasonable and needed and that the NERC Regional Reliability Councils will be the arbiter for disputes.
6. We continue to maintain that there needs to be an industry minimum specification for the type of data required, similar to Appendix 4B "Electric System Security Data."
7. There should be a requirement that the data specification, including scan rates, data transmission rates, and data quality, is mutually agreed upon between the RA and their data supplier.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
X  Yes                       No
24. Do you agree with the measures?  
X  Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                              X  No
26. Do you agree with the levels of non-compliance?  
 Yes                              X  No

Comments about Requirement 206:

1. Defined terms should be capitalized, such as "Reliability Authority", "Operational Planning Analyses", "Interconnected Reliability Operating Limits", etc
2. The compliance sections of Requirements 205 and 206 are not complimentary. If the RA doesn't have a data specification for an entities data, even if the RA really needs and should have that data, the maximum level of non-compliance for the RA is a level two. However, if an entity does not provide the data as specified, that entity is level 4 non-compliant, even if the data requested is not critical. Depending on how the RA writes his specification, an entity could be in violation of Requirement 206 if only a few pieces of individual data are missing, regardless of the criticality of that data.
3. Need to refer to non-compliance of meeting the data quality and availability protocols (see comments for section 205) established by the Reliability Authority.
4. Additionally, Section 205 1.3 and 2.3 should either be placed in a new section regarding data collection by the Reliability Authority or they should be contained within this section.
5. 206.4.3.1: "Copies of transmittal cover letters indicating data was sent to the reliability authority." This is too vague. A lot of the data covered by this requirement is real-time or near real-time data that is sent via an ICCP connection. Is the required transmittal letter the letter that initially set up the link between the two parties? As worded one could even take the position that the entity responsible is required to send a transmittal cover letter every time they send data via the ICCP link. The SDT should rewrite this requirement to better reflect their desired intent.
6. An example to consider: A RA has in his data specification the requirement that a certain piece or pieces of data be provided to the RA every 5 seconds. However, the entity with the data has systems in place that only report/refresh the desired data on an exception basis, such as breaker status is provided only when the breaker changes states. Per requirement 206, the data providing entity would be level 4 non-compliant. However, the RA would have the data they need in order to perform their required assessments and monitor the system. So why would the data providing entity still be able to be found non-compliant? This also goes to the heart of the issue of the RA having to justify the reasonableness of his data specification before a data providing entity would be required to spend significant dollars in order to meet the RA's arbitrary specification.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
X  Yes                       No
28. Do you agree with the measures?  
X  Yes                       No
29. Do you agree with the compliance monitoring process?  
X  Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

30. Do you agree with the levels of non-compliance?

X  Yes

No

Comments about Requirement 207:

1. Defined terms should be capitalized, such as "Reliability Authority", "Operational Planning Analyses", "Interconnected Reliability Operating Limits", etc

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?

Yes

X  No

32. Do you agree with the measures?

Yes

X  No

33. Do you agree with the compliance monitoring process?

X  Yes

No

34. Do you agree with the levels of non-compliance?

X  Yes

No

Comments about Requirement 208:

1. Defined terms should be capitalized, such as "Reliability Authority", "Operational Planning Analyses", "Interconnected Reliability Operating Limits", etc
2. 208.1.1: Add generator operator.
3. 208.2.1: The requirement for the entity responsible to follow the Reliability Authority's directives is already stated in the requirements section and does not need to be restated in the measures section. Suggest rewording as follows: "The entity responsible shall document the directives of the Reliability Authority and the actions taken to meet those directives."

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments** We would encourage the Reliability Authority to work with the entities not providing the specified data and try to resolve the dispute prior to reporting the issue to the Compliance Monitor. Additionally, we believe the requirement for the Reliability Authority to notify the Compliance Monitor does not need to be contained within this standard.

**37. Any other comments on this standard?**

1. In each of these Standards the ‘tie-in’ to the Sanctions Matrix is insufficient and unclear. For example if an entity is first occurrence, level 4 non compliant to Standard 206. The penalty is a Letter (B) and \$2000 OR \$2 per MW. Which penalty is being applied the fix or variable? If it is variable, what MW is the penalty based on? The RA’s load, generator rating, something else?
2. We request the SDT review the levels of non-compliance and take into account the timeliness of actions or data submitted, the completeness of actions or data submitted and the quality of actions or data submitted. We believe that some of the requirements, when properly measured will lend themselves to having additional levels of non-compliance, for the ramifications of non-compliance for some of the requirements is not so severe to actually have an adverse impact on the bulk transmission system.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

The SDT should utilize the NERC functional model and thoroughly review and correct all definitions associated with this standard. Some definitions included in this standard are not needed and others don't appear to belong in the standard. Others are simply the wrong definition. Noting the comment box on page 3 of the standard, we wonder why a definitions section was even included in the standard.

Here are some specific problem definitions:

Real-time Monitoring and the use of vision and hearing to define this term.

Real-time – Shouldn't historical time also be included?

Self-certification – Why is this term included in this standard? It probably belongs in the Compliance Enforcement Document. The second sentence doesn't appear to be a part of the definition.

Transmission Operator has the wrong definition. The definition given is the definition for Transmission Service Provider.

Documentable Interconnection Reliability Operating Limit Violation and Interconnection Reliability Operating Limit Event have the exact same definition.

Reportable Interconnection Reliability Operating Limit Violation and Interconnection Reliability Operating Limit Violation are basically the same definition.

T<sub>v</sub> should be listed as T<sub>v</sub>.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

Yes                       No

5. Do you agree with the compliance monitoring process?

Yes                       No

6. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 201:

It is very cumbersome and can often times be very confusing when two entities are given responsibility for the same task. The requirements outlined in 1.1, 1.2 and 1.1.2 call for both the reliability authority and the planning authority to identify the facilities that have IROLs and also to identify the IROL. We suggest that the reliability authority should be ultimately responsible for identifying and quantifying the IROLs since these are operating limits. However, the reliability

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

authority should thoroughly coordinate this effort with the planning authority. Wording such as “The reliability authority shall coordinate with the planning authority to identify...” would be better.

Following this line of thought with the measures in 2.1, 2.1.1 and 2.2, wording should be changed to reflect the reliability authority’s ultimate responsibility. “The reliability authority entity shall establish...” makes a better fit.

The performance reset period should be changed to 12 months rather than one calendar year.

The SDT needs to revisit the levels of non-compliance associated with this standard. If compliance is truly a black/white issue with no shades of gray as the proposed levels indicate, why not have just a level one with no financial penalty? The proposed non-compliance level implies that it may be more important to have a list of IROLs rather than a correct list of IROLs. Also, if no IROLs exist, there will be no list which would cause the reliability authority to be in non-compliant. There needs to be consistency throughout all the standards on documentation-type non-compliance.

### **Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

Combine 4.3 and 4.3.1 into a revised 4.3 as follows:

“The reliability authority shall have displays with real-time data associated with interconnection reliability operating limits.”

The performance reset period should be changed to 12 months rather than one calendar year.

Again the issue of degrees of non-compliance surfaces. Are there shades of gray with non-compliance for this standard or is it strictly a black and white issue? Why jump directly to level four non-compliance? Is progressive non-compliance not an option? For example, if a reliability authority had identified 25 IROLs, he is level four non-compliant if only one of the IROLs is not available for real-time use. Shouldn’t there be allowances for such situations? Also, perhaps a letter that lists critical displays and identifies discrepancies would be more beneficial to maintaining interconnection reliability than a monetary penalty.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

The proposed measures may be too weak. For example, it appears that a reliability authority could satisfy the operational planning analysis by evaluating an invalid case for a given day. While it meets the letter of the measure, it doesn't meet the intent of the measure. Also, does 2.1.2 apply to IROLs that are associated with stability limits? If so, this measure would require a reliability authority to run real-time stability analyses every 30 minutes.

Again the issue of degrees of non-compliance surfaces. Are there shades of gray with non-compliance for this standard or is it strictly a black and white issue? Why jump directly to level four non-compliance? Is progressive non-compliance not an option? Is missing an operational planning assessment one day in a month as detrimental as missing it 10-15 days per month? Similarly, is missing one real-time assessment as bad for reliability as missing these assessments for hours, on a regular basis?

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

The performance reset period should be changed to 12 months rather than one calendar year.

Non-compliance items should match the standard's definitions. Section 5.1 should be referred to as a Documentable Interconnection Reliability Operating Limit Violation. Section 5.2 should be referred to as an Interconnection Reliability Operating Limit Violation or a Reportable Interconnection Operating Limit Violation, whichever is correct (see response to Question 1).

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?  
 Yes                       No
22. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 205:

Requirements 1.1, 1.2 and 1.3 are too open-ended on the part of the reliability authority. Justification should be required for all requested data to prevent unreasonable and burdensome requests on the part of the reliability authority. The data requested and the timing of the delivery of the data should be mutually agreeable to the reliability authority and the responding entity.

The SDT should define a minimum, default set of data, such as that spelled out in Appendix 4B, and provide that as a guide for what type of data may be requested.

Requirement 1.3 appears to be repeated again as a measure in Measure 2.3. Shouldn't Requirement 1.3 be moved to Standard 206 since it deals with provision of the data? In fact, there is a great deal of material in 205 that is related data provision. Shouldn't all of this be moved to 206? Perhaps additional clarification between 205 and 206 is all that is needed.

The performance reset period should be changed to 12 months rather than one calendar year.

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

The cover letter requirement in 4.3.1 is confusing and needs clarification. While such a letter can provide evidence that data has been sent, such a requirement could also prove to be excessive and impractical. Infrequent data transmittals such as impedance changes, ratings, etc, could easily be transmitted under cover letter. However, does this requirement also apply to each bit of real-time data transmitted via ICCP?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Only one data point out of potentially thousands of points could cause non-compliance as specified in Section 5. This implies that nothing less than 100% of the data, 100% of the time is sufficient. Is this the intent of the SDT? Is a transducer failure in a remote substation as damaging to reliability of the interconnection as the loss of an entire ICCP link between a responding entity and its reliability authority? Is a failure for one scan cycle as critical as that point not being available for days or weeks? It would appear that non-compliance associated with this standard needs revisiting.

There appears to be inconsistency between non-compliance in 205 and 206. If a reliability authority makes an unreasonable data request in 205 and doesn't get the requested data within the specified timeframe, then the reliability authority is only penalized at a level one. But if a responding entity loses one data point for one four-second data scan, that responding entity is blasted with a level four penalty. There does not appear to be equity here.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?

Yes                       No

28. Do you agree with the measures?

Yes                       No

29. Do you agree with the compliance monitoring process?

Yes                       No

30. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?

Yes                       No

32. Do you agree with the measures?

Yes                       No

33. Do you agree with the compliance monitoring process?

Yes                       No

34. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 208:

Generator operators need to be added to the entities listed in Requirement 1.1.

Requirement 1.2 is repeated again in Measure 2.1.

The levels of non-compliance need to be reviewed to ensure that they accurately reflect how well the directives were followed. Timing of actions taken with regards to when the directives were issued should also be considered.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**35. List any Regional or Interconnection Differences for this standard:**

None

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents to not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

This standard does not require the reliability authority to notify those entities not providing data to remind those entities that they should be providing data. The reliability authority should be trying to obtain the missing data and working to resolve differences that prevent delivery of the data. If the reliability authority and the responding entity cannot reach agreement on data delivery, then the reliability authority should notify the compliance monitor.

**37. Any other comments on this standard?**

The performance reset period of one calendar year in 201, 202, 204 and 205 should be changed to 12 months. 206, 270 and 208 should remain 12 months.

Areas where non-compliance is the result of a lack of proper documentation should be consistent throughout each individual standard and across all standards, especially between this standard and Standard 600, Determine Facility Ratings, System Operating Limits and Transfer Capabilities.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

**Note** – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

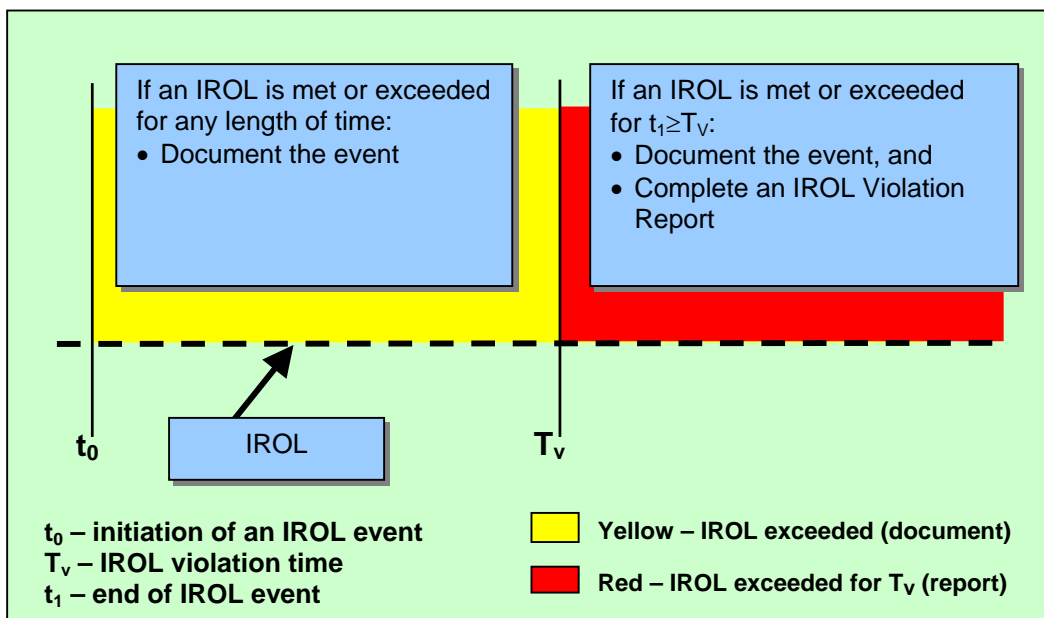

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Exelon recommends the following definition changes to eliminate terminology from the definitions that is vague and therefore can lead to different interpretations and uncertainty as to whether there is a violation of the standard.

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread service interruption, which cannot be restrained from sequentially spreading. ~~beyond an area predetermined by appropriate studies.~~

**Interconnection Reliability Operating Limit:** A system operating limit that, if exceeded, could lead to instability, uncontrolled separation, or cascading outages. ~~that adversely impact the reliability of the bulk transmission system.~~ The reliability authority must log each case of exceeding an interconnection reliability operating limit, and must report (to its compliance monitor) each case of exceeding an interconnection reliability operating limit for a time greater than or equal to  $T_v$ . Note that  $T_v$  may be zero.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments                      Based on recent events of August 14, 2003 Exelon Corporation is not as confident as the SAR authors in stating, "Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages". We ask that this Standard be put on "hold" until investigations are completed and root cause has been established.

Exelon Corporation feels that ultimately the reliability of the interconnection lies with the Reliability Authority, but Transmission Operators should not be eliminated from contributing/participating in actions that enhance reliability.

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

Yes                       No

5. Do you agree with the compliance monitoring process?

Yes                       No

6. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

Based on the following definitions, we do not believe that the definition of “*Documentable Interconnection Reliability Operating Limit Violation*” is necessary (is it truly a violation?). It appears that it is identical to the definition of “*Interconnection Reliability Operating Limit Event*” and the fact that an “*event*” must be documented is contained in the definition of “*Interconnection Reliability Operating Limit*”.

- **Documentable Interconnection Reliability Operating Limit Violation:** An instance of exceeding an interconnection reliability operating limit for any length of time.
- **Interconnection Reliability Operating Limit Event:** An instance of exceeding an interconnection reliability operating limit for any length of time.
- **Interconnection Reliability Operating Limit Violation:** An instance of exceeding an interconnection reliability operating limit for time greater than or equal to  $T_v$ .
- **Interconnection Reliability Operating Limit:** A system operating limit that, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system. The reliability authority must log each case of exceeding an interconnection reliability operating limit, and must report (to its compliance monitor) each case of exceeding an interconnection reliability operating limit for a time greater than or equal to  $T_v$ . Note that  $T_v$  may be zero.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

Yes                       No

5. Do you agree with the compliance monitoring process?

Yes                       No

6. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 201:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. This Standard could be improved by formatting (where possible)

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Measurement 2.1 to relate to Requirement 1.1 and Measurement 2.2 to relate to Requirement 1.2, etc. rather than listing the measures and requirements arbitrarily and independently.

In order to tie the OEC's to the Measures, Section 4 should be clarified to read:

4.3. The entity responsible shall have the following Objective Evidence for Compliance available upon the request of its compliance monitor:

- 4.3.1. List of interconnection reliability operating limits for the reliability authority's reliability area **as described in Measure 2.1 above**
- 4.3.2. List of facilities (or groups of facilities) in the reliability authority's reliability area that are subject to interconnection reliability operating limits **as described in Measure 2.2 above**

**Requirement 202 - Monitoring**

- 7. Do you agree with the requirement?  
 Yes                       No
- 8. Do you agree with the measures?  
 Yes                       No
- 9. Do you agree with the compliance monitoring process?  
 Yes                       No
- 10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3.1 is too specific for the measures it supports. It may be a practical solution that the real-time data and interconnection reliability operating limits be made available to operators in the form of a "display", however this solution is not prescribed in the measures and should not be listed exclusively.

We suggest that section 4.3.1 be rewritten to read:

- 4.3.1. Process used for monitoring and comparing real time data associated with interconnection reliability operating limits in accordance with Measure 2.3 above. This may be accomplished through the use of an operator display and should demonstrate compliance with Measures 2.1 and 2.2.**

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be rewritten to read:

**4.3. The reliability authority shall demonstrate in accordance with Measure 2.1, the following upon the request of the compliance monitor:**

**4.3.1. Ability to perform an operational planning analysis**

**4.3.2. Ability to perform a real time assessment**

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

Has the Interconnection Reliability Operating Limit Violation Report been developed yet? Is this the existing NERC Operating Policy 5, Appendix 5F as modified with the results of the Reliability Coordinator IRLV Field Test?

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

- 4.3. The reliability authority shall have the following available upon the request of its compliance monitor:
  - 4.3.1. Operations logs or other documentation **in accordance with Measure 2.1** indicating the magnitude and duration of each instance of exceeding an interconnection reliability operating limit and the actions or directives issued for each of these instances
  - 4.3.2. Interconnection Reliability Operating Limit Violation Reports **completed in accordance with Measure 2.2**

Level four: non-compliance is not supported by either the Measures or the Compliance Monitoring Process. We understand there is a desire by some in the industry to hold the Reliability Authority accountable for Interconnection Reliability Operating Limit Violations, however, as written, this standard does not support it. Section 5.4 should be rewritten to read:

- 5.4. Level four: Interconnection reliability operating limit exceeded for time greater than or equal to  $T_v$  minutes and either:
  - 5.4.1 no documentation to indicate actions taken or directives issued to mitigate the instance, or
  - 5.4.2 no Interconnection Reliability Operating Limit Violation Report completed and filed with its compliance monitor

### **Requirement 205 - Data Specification**

- 19. Do you agree with the requirement?  
 Yes                       No
- 20. Do you agree with the measures?  
 Yes                          No
- 21. Do you agree with the compliance monitoring process?  
 Yes                          No
- 22. Do you agree with the levels of non-compliance?  
 Yes                          No

Comments about Requirement 205:

The requirement for data collection should be tied to its impact on reliability. Requirement 1.3 should be modified to read:

- 1.3. The reliability authority shall notify its compliance monitor when an entity that has facilities monitored by the reliability authority does not provide data as specified **and this lack of data has an impact on reliability.**

Measurement 2.3.1 should be rewritten to read:

- 2.3.1. The notification shall take place within five business days of discovering that the data **having an impact on reliability** is missing.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

In order to prevent a shotgun approach to data collection we propose Section 2.1.1 be modified to read:

- 2.1.1. Specification shall include a list of **minimum** required data, a mutually agreeable format, and timeframe and periodicity for providing data.

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be rewritten to read:

- 4.3. The reliability authority shall have the following available upon the request of the compliance monitor:

4.3.1. Data specification(s) **in accordance with Measure 2.1**

4.3.2. Proof of distribution of the data specification(s) **in accordance with Measure 2.2**

### **Requirement 206 - Data Provision**

23. Do you agree with the requirement?

Yes  No

24. Do you agree with the measures?

Yes  No

25. Do you agree with the compliance monitoring process?

Yes  No

26. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 206:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3.1 is too specific for the measure it supports. A possible solution might be:

- 4.3.1. **Documentation** indicating data was sent to the reliability authority **in accordance with Measure 2.1**

Non-compliance in data submission could take several forms and levels of impact to reliability. Section 5 should be modified as follows:

5. Levels of Non-compliance:

5.1. Level one: **Data was provided, but not in the mutually agreed format**

5.2. Level two: **Data was provided, but not within the time-frame specified**

5.3. Level three: **Incomplete data was provided**

5.4. Level four: Data not provided to the reliability authority as specified.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?

Yes  No

28. Do you agree with the measures?

Yes  No

29. Do you agree with the compliance monitoring process?

Yes  No

30. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 207:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. The Levels of non-compliance should be objectively determined based on the evidence.

Measure 2.1 should be modified to include:

- 2.1. The reliability authority shall have a documented action plan that addresses preventing and mitigating instances of exceeding interconnection reliability operating limits. The plan shall **identify and** be coordinated with those entities responsible for acting and with those entities impacted by such actions.

Section 4.3 should be modified to include:

- 4.3. The reliability authority shall make the following available for inspection by the compliance monitor upon request:

- 4.3.1 Action plan **developed in accordance with Measure 2.1**

Section 5 should be modified to include:

5. Levels of Non-compliance

- 5.1. Level one: Action plan exists but wasn't coordinated with all involved and impacted entities
- 5.2. Level two: Action plan exists but wasn't coordinated with any involved or any impacted entities
- 5.3. Level three: **Action plan is incomplete**
- 5.4. Level four: No action plan

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. Non-compliance could take several forms and levels of impact to reliability. The Levels of non-compliance should be objectively determined based on the evidence.

Section 4.3.1 should be modified to read:

- 4.3.1. Operations log or other data source(s) to show the following for each instance of being issued a reliability authority directive relative to an interconnection reliability operating limit:
- 4.3.1.1. Date and time of each of directive received
  - 4.3.1.2. Directive issued
  - 4.3.1.3. Actions taken in response to directive **in accordance with Measure 2.1**

Section 5 should be modified as follows:

5. Levels of Non-compliance
- 5.1 Level one: **Operations log or other data source(s) do not show one of the following:**
    - 5.1.1 **Date and time of each of directive received**
    - 5.1.2 **Directive issued**
    - 5.1.3 **Actions taken in response to directive**
  - 5.2 Level two: **Operations log or other data source(s) do not show any of the following:**
    - 5.1.4 **Date and time of each of directive received**
    - 5.1.5 **Directive issued**
    - 5.1.6 **Actions taken in response to directive**
  - 5.3 Level three: Not applicable.
  - 5.4 Level four: Did not follow directives.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**35. List any Regional or Interconnection Differences for this standard:**

None

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments** We believe that it is appropriate to include this in the standard with the comments noted in Section 205.

**37. Any other comments on this standard?**

None

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.  
A definition for Minimum Return Time should be included (the minimum period in seconds that a value must remain below an IROL limit after an excursion has occurred. If the value again exceeds IROL before this time limit, the event continues.).

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201: Reword measures to state what is measured and to refer to the associated requirements. Section 201.5.3 should read "List exists, but is not complete or lacks technical merit (is not good utility practice)."

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203: Modify section 203.1.1 to read "The reliability authority shall perform, **or direct performance of**, operational planning analyses . . . ". Modify 203.4.2 to read "The performance-reset period shall be one **year**. The . . . "

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?  
 Yes                       No
22. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 205:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206: For consistency with previous sections, replace the first sentence in section 206.4.2 with "The performance-reset period shall be one calendar year."

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207: For consistency with previous sections, replace the first sentence in section 207.4.2 with "The performance-reset period shall be one calendar year."

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208: Modify section 208.5.1 to read "Level one: Did not properly document an issued directive and/or the subsequent action taken."

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.  
The definition for Transmission Operator is incorrect. The definition is word for word the definition of the Transmission Service Provider in the Functional Model. It appears the wrong definition was used. The right definition is in the functional model.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201:

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202: Step 4.3.1 appears to assume that the RA will use computer displays for real time data. What if some other method that works equally as well is used. As written this is a "how" statement. I would suggest that the statement be "Provide evidence of tools used to monitor real time data".

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203: Why was 30 minutes used for a real time assessment? Is one day a good target to be performing planning Analysis? If a generator or transmission operator is planning an outage will the RA tell the generator or transmission operator the day before the outage that is OK to proceed with the outage? Is that process covered in some other standard?

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204: The level four non-compliance does not match the measure. The measure only requires a report and does not hold the RA responsible for exceeding the operating limit.

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?  
 Yes                       No
22. Do you agree with the levels of non-compliance?  
 Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments about Requirement 205:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

- Step 4.3.1 is not necessarily going to be required. Real time data will not have a cover letter. I would suggest that it should be re-worded to say: "Provide evidence that data was sent to the reliability authority."
- The measure and level of non-compliance does not address failure to provide data because of broken equipment. If an entity temporarily fails to provide real time data because of a failure of a RTU would it be considered a level four non-compliance?

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Comments about Requirement 208:

- 31. Documentation is not a reliability issue
- 32. Documentation is not a reliability issue
- 33. The entity should only document the actions taken. The RA should document the directive.
- 34. The level of non-compliance only deals with following the directives. Why are there measurements (documentation) that are not compliance issues? Either they should not be measurements (my choice because failure to document is not a reliability issue), or the should have a compliance measure.

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

Not all System operating limits are being addressed in this standard. System operating limits in one area can be caused by the failure of another BA to balance generation and load. The RA will be getting the ACE values and should be responsible for assuring that imbalance situation does not cause a problem on the system. This situation is not addressed in the Balance Resource and Demand Standard because it allows unlimited imbalance if it is the opposite direction of frequency error. This situation needs to be addressed in a standard.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

**Note** – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?

- Yes                       No    Real time monitoring: Vision and hearing does not comply with the Americans with Disabilities Act. "To use human or automated means"  
Reliability Authority Area: "interconnection (tie-line) metering". This provision is for a Balancing Authority and Energy Management, not the RA. The Reliability Authority area consists of all assets under the control and responsibility of the RA.

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.  
See Standard document

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

- Yes                       No  
Comments: The Transmission Operator should have operating performance requirements developed in another Standard.

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?

- Yes                       No    Standard and requirements shall apply to only one function!  
There should be only one responsible function.

4. Do you agree with the measures?

- Yes                       No    Where does the Buck stop?

5. Do you agree with the compliance monitoring process?

- Yes                       No    Only the RA should be listed.

6. Do you agree with the levels of non-compliance?

- Yes                       No

Comments about Requirement 201:

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?

- Yes                       No

8. Do you agree with the measures?

- Yes                       No    2.3 Add in Real Time

9. Do you agree with the compliance monitoring process?

- Yes                       No

10. Do you agree with the levels of non-compliance?

- Yes                       No

**35. List any Regional or Interconnection Differences for this standard:**

None

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

Please provide assessment of how this Standard will work with abnormal operations and emergency restoration. How is the line drawn. Use the August 14, 2003 event as an example for determining compliance and sanctions.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
 The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
 E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

**Major Changes to this Standard:**

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the 'yellow' area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the 'yellow area') and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the 'red area'), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

**Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?

- Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision. Most of the definitions are very helpful. However, we do have some questions on a few of them.

- There is a definition for Real-time Monitoring and one for Real-time Assessment. The monitoring definition states "To use vision and hearing.." while the assessment definition states to collect and review immediately available data. It seems to us that the monitoring definition is really unnecessary, as we believe the intent is really covered in the assessment definition.
- The definition for Operational Planning Analysis states, "The analysis should ensure that no IROLs will be exceeded." Is that really true for the analysis? Doesn't the analysis identify potential problems that need to be acted upon, so that it is really the actions of entities, not the analysis itself, that ensures no limit will be exceeded?
- The definition of transmission operator in this document does not agree with the definition of transmission operator in the Functional Model. This definition actually is the same as the transmission service provider function. It appears there is still confusion over the functions defined in the functional model which is alarming since we are developing the reliability standards based on those functions.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

- Yes                       No

Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?

- Yes                       No

4. Do you agree with the measures?

- Yes                       No

5. Do you agree with the compliance monitoring process?

- Yes                       No

6. Do you agree with the levels of non-compliance?

- Yes                       No

Comments about Requirement 201: In 1.2.1 of the requirement, Tv is called a "response time", but on the definition page it is called a "violation time". Consistency is needed. We did not agree with the measures because the measures state "the entity responsible" which is not specific enough. Who is the entity responsible? We do not have any problems with the steps of the compliance monitoring process, but again, the phrase "the entity responsible" is used throughout and this should be more specific. We do agree with the intent of the non-compliance level listed in 5.4; however do have a concern that it presumes that all transmission systems will have an IROL. This may not be true for radial systems. Perhaps 5.4 could be reworded as follows, "No documented analysis of possible IROLs or list of facilities subject to IROLs for the RA's reliability area was provided. Finally, Section 6, Sanctions should be removed completely. The compliance monitoring process and non-compliance levels are appropriate parts of the reliability standard. However, the sanctions and penalties are part of the compliance program and are separate. The enforcement matrix should not be attached to this document, even for information only, as that gives the appearance of being part of the standard. The

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

sanctions and penalties, along with the enforcement matrix are the responsibility of the new Compliance and Certification Committee (CCC). If the matrix is attached to the standard, every time the CCC changes it, the standard will need to be revised which is not something we should set ourselves up to do.

**Requirement 202 - Monitoring**

- 7. Do you agree with the requirement?  
 Yes                       No
  
- 8. Do you agree with the measures?  
 Yes                       No
  
- 9. Do you agree with the compliance monitoring process?  
 Yes                       No
  
- 10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202: Measure 2.3 needs to be clarified to state "The RA shall monitor real-time system operating parameters.." rather than just system operating parameters. We have the same concern that we identified in the comments to Requirement 201 regarding 5.4, the level of non-compliance. Section 6, Sanctions should be removed completely. The compliance monitoring process and non-compliance levels are appropriate parts of the reliability standard. However, the sanctions and penalties are part of the compliance program and are separate. The enforcement matrix should not be attached to this document, even for information only, as that gives the appearance of being part of the standard. The sanctions and penalties, along with the enforcement matrix are the responsibility of the new Compliance and Certification Committee (CCC). If the matrix is attached to the standard, every time the CCC changes it, the standard will need to be revised which is not something we should set ourselves up to do.

Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement 203 - Analyses and Assessments**

- 11. Do you agree with the requirement?  
 Yes                       No
  
- 12. Do you agree with the measures?  
 Yes                       No
  
- 13. Do you agree with the compliance monitoring process?  
 Yes                       No
  
- 14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203: In 1.1 it states that the RA is performing operational planning analyses to "verify that its planned bulk electric system operations will not exceed.." Is that really what they are doing? It would seem to us that this operation planning is being done to determine if there is a potential problem so that actions can be directed to alleviate or mitigate the problem so that IROL violations will not occur. The SDT may want to consider rewording this for clarification. Also, 1.2 states that real time assessments are to verify that it is not exceeding IROLs. Again, verify does not seem to be the correct word. The reason we have stated that we do not agree with the compliance monitoring process is that the performance reset period of one day seems much too frequent. Even though the measures are to be done daily, the performance monitoring period should not be more often than monthly. If one day is kept, it would be a great burden on both the RA and the compliance monitor and we are not sure that would really improve reliability. Since we believe the reset period should be monthly, the non-compliance levels should be adjusted to reflect level one for a small number of days, and level 4 being every day of the month. We also have a question about 5.4 level of non-compliance for operational planning. Does the SDT assume these analyses are load flow studies? If so, we agree with the daily measure. However; if the intent was to also include daily stability studies, we do not agree. Stability studies should only be required to be performed annual and prior to scheduled maintenance outages that create potential for IROLs. Please see our earlier comments about section 6 - Sanctions.

**Requirement 204 - Actions**

- 15. Do you agree with the requirement?  
 Yes                       No
  
- 16. Do you agree with the measures?  
 Yes                       No
  
- 17. Do you agree with the compliance monitoring process?  
 Yes                       No
  
- 18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204: Both requirement 1.2 and measure 2.2 are about reporting IROL violations when the time is greater than or equal to Tv. We do not agree with the equal to portion of this. To us, Tv is analogous to a speed limit. You would not report if you were equal, but only if in excess. We do not understand the reasoning for equal to being included. We do not agree with the levels of non-compliance because level 4 is based on an IROL being exceeded for a time greater or

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

equal to Tv. This does not agree with the measures listed. The measures are to document actions taken or report violations that occurred. The levels of non-compliance should be based on what we are measuring. Please see our earlier comments on Section 6 - sanctions.

This requirement in particular brought a question to mind about what the RA really is. Does this requirement assume the RA is the Reliability Coordinator of today who looks at "the big picture", or does it mean today's control area operator? It is still unclear to us what the RA really is. Is there a hole in the functional model that needs to be filled? We do not think we are the only participants in the industry still confused, so work needs to be done to clarify exactly who or what the RA is.

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?

Yes                       No

20. Do you agree with the measures?

Yes                       No

21. Do you agree with the compliance monitoring process?

Yes                       No

22. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 205: Is requirement 1.1.3 really meant to be RA's other than themselves? Again, confusion about who/what the RA really is. Depending on who/what is the RA, we may have concern over what data is being requested. There needs to be a reliability justification for the data requested. What happens if there is a disagreement over what data should be supplied? In regards to the levels of non-compliance, why only levels 1 and 2 in this requirement and level 4 in all the others? Does this imply that this standard is not as important?

Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207: We are not convinced that this requirement is needed. The requirements in 204 (Actions) seem to already cover this area. There could be many actions to take to prevent or mitigate instances of exceeding IROLs, so it could be extremely burdensome to document every conceivable action. Truly the proof is in the 204 requirement so we would suggest deleting this one.

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments about Requirement 208: Clarification of who is the entity responsible needs to be made throughout this requirement 208. Step 4.1 of the compliance monitoring process is not complete. It would seem that this 208 is a complement to 204. In 204 the RA is already documenting the actions directed, along with information if a violation occurred. This states that a level 4 is obtained if they did not follow directives. It would seem to make sense to only have this if they did not follow directives and a violation occurred. Perhaps consideration needs to be given to a lower non-compliance level for not documenting their actions, or lack of actions taken when given a directive.

Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments** We agree with including it in the standard because there needs to be some place for recognition of not getting the data that is needed. We are not entirely sure what steps the compliance monitor would then take, but are assuming the compliance monitor would follow up with the entity not supplying the needed information. In FRCC, if our Security Coordinator does not get the requested information, our Operating Reliability Subcommittee is informed so that follow up can take place. Ultimately, our Security Process (Reliability Plan) requires the operating entities to supply required reliability data and our ORS and OC are the back stop to ensure it is supplied.

**37. Any other comments on this standard?**

On the first page, the SDT has identified an "Effective Period". By using the term period, it implies that there will be an end time when the standard will no longer apply. Would it be more appropriate to just state an effective date?

In the applicability paragraph, the SDT has referenced the functional model approved by the BOT in June 2001. This reference causes concern. We understand that including this reference and date identifies the version of the functional model so that the understanding of the functions are based on this particular document. But, what happens when the BOT approves a change to the model at a later date? Do we now have standards based on one set of functions or understanding of functions that are different than what is in the latest functional model? This will certainly cause confusion in the industry. But, on the other hand, if you remove the date reference, then anytime the BOT changes the model, they are effectively changing the standard without going through the SAR process. We do not want the BOT to be able to change who the standards apply to without going through due process either. How do we deal with this situation?

In the comment box on this first page, the SDT has stated that the terms BA, RA etc really apply to the entities performing the functions identified in the functional model. We understand and

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

appreciate why the team did this, however, there is still a lot of confusion about functions vs entities in the functional model. We would suggest that the standard include the extra words to make this distinction. For example, in 1.1 of standard 201, it should read "The entities performing the reliability authority and planning authority functions shall.." This seems trivial, but we believe it is very important in helping the industry understand the functional model and how the standards apply to the entities performing the functions.

Just a note for future comment forms, please provide a comment box after every question, not just at the end of the section on a particular standard. That way the comments and yes/no answers could be kept together.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

The definitions which need modifications are the following:

- Interconnection Reliability Operating Limit The first sentence is the complete definition. The rest is a description of activities related to this definition and should not be included here.

- Real-time Monitoring. This should be modified to "The act of using human vision and hearing or computer software to scan various real-time data sources and draw conclusions about what the data indicates.

- Real-time The word present time should be used instead of immediate.

The words present or presently should be used instead of immediate or immediately in context to real-time in any definition contained in this Standard.

- Self-certification should be changed to " A process by which an entity does a self evaluation to determine if it is compliant with the specific requirements for a reliability standard". The rest can remain the same.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments The responsibility for monitoring IROLs, addressed in this Standard, rests with the Reliability Authority as defined in the Functional Model. However Manitoba Hydro believes there is also a reliability requirement to monitor real-time operations for all other system operating limits (SOL) which are not identified as IROLs. If it is not appropriate to include these monitoring requirements in this Standard, then another Standard should be created to address this requirement.

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

Yes                       No

5. Do you agree with the compliance monitoring process?

Yes                       No

6. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 201: Manitoba Hydro believes that it will be very difficult to identify the IROL subset from the SOLs determined for operation of the transmission facilities in the geographical footprint for which the RA has operational responsibility. .

Any SOL provides protection for the worst contingency, so if the limit is respected, events such as system collapse, cascading loss of lines and other major events are extremely unlikely, unless there are multiple near-simultaneous contingencies. However, most system operating limits (SOL) could lead to significant system disturbances if they are exceeded by a large amount or exceeded for a significant period of time, or both. While any SOL will have been established such that the next contingency should not have any impacts if operation is within the SOL, operation outside of the SOL, accompanied by even one contingency, could lead to cascading loss of lines (thermal limits) or system instability (voltage or angular stability limits). It is Manitoba Hydro's

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

belief that it is very difficult to identify such situations without exhaustive studies on very detailed models.

The normal approach for developing system operating limits will likely incorporate some reliability margins for dealing with some of the lack of detail (for example, overcurrent protection is often not modelled, phase shifter action is assumed to occur without being studied at all possible positions) but, if system operation is to be investigated beyond such limits, small details become very important.

It is important that NERC instil a culture of respect for limits of all types and values. There is a risk that a focus on the nebulous concept of an IROL will diffuse the respect for all other limits and the frustration of identifying such IROL's will further reduce the number classified as IROL's. NERC should clearly state how IROL's are to be identified and how NERC or the regions can address the other limits which may be important (among other things, the regional standards must either be developed through a separate standards process or flow from a NERC standard – the current proposal does not let the other limits flow from this standard).

In item 201.2.1.1 the words at the end of this sentence (that does not already have a  $T_v$ ) should be removed.

### **Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202: In 202.4.3.1, what is meant by a display ? How does one make a display available.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203: In item 203.1.1 the words “will not exceed” are used. The correct phrase should be “should not exceed” since the ability to predict is only valid for events studied, not for unanticipated system conditions.

In item 203.2.1.1, there should be a statement indicating the range of studies required. Should the contingencies applicable to SOL’s be used or should the range of studies be broader?

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?  
 Yes                       No
22. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 205:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208: the documentation in 4.1 is incomplete. For purpose of determining the acceptability of this item it was assumed that the intent was for the documentation to be similar to the wording for 207 item 4.1

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**35. List any Regional or Interconnection Differences for this standard:**

There should be no Regional or Interconnection Differences

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

A NERC standard is a form of legal document – it spells out the standards, the measurements, the levels of compliance and the penalties for non-compliance. As such, there should be no ambiguity, so any term defined by NERC should be clearly identified in the standard (capitalized, bold, etc.) where it is used as a defined term, or NERC must certify that all uses of a defined word are a reference to the defined term.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

- **Operational Planning analyses are conducted for time periods up to 13-months into the future. Please revise the definition as follows:**

Operational Planning Analysis: “ .... An operational planning analysis is done for the next day’s operation and up to 13-months ahead of the expected conditions.”

- **The Transmission Owner has fiduciary responsibility for its owned facilities. Therefore he has ultimate responsibility and liability for owning, maintaining and operating his facilities. The Transmission Owner then is ultimately responsible for establishing system operating limits, including Tv, for his facilities. Therefore, the definition of Tv should be revised to:**

“Tv: The violation time associated with a limit that is determined by the Transmission Owner(s) for equipment-based limits, and by the Reliability Authority and Planning Authority(ies) for system-based limits.”

- **The responsibilities of the RA are to “monitor” the system, not “control” the system. Therefore, we suggest the following change:**

Reliability Authority Area: A defined electrical system bounded by interconnection (tie-line) metering and telemetry monitored by a single reliability authority.

- **Based on the following definitions, we do not believe that the definition of “Documentable Interconnection Reliability Operating Limit Violation” is necessary (is it truly a violation?). It appears that it is identical to the definition of “Interconnection Reliability Operating Limit Event” and the fact that an “event” must be documented is contained in the definition of “Interconnection Reliability Operating Limit”.**

- **Documentable Interconnection Reliability Operating Limit Violation:** An instance of exceeding an interconnection reliability operating limit for any length of time.
- **Interconnection Reliability Operating Limit Event:** An instance of exceeding an interconnection reliability operating limit for any length of time.
- **Interconnection Reliability Operating Limit Violation:** An instance of exceeding an interconnection reliability operating limit for time greater than or equal to Tv.
- **Interconnection Reliability Operating Limit:** A system operating limit that, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system. The reliability authority must log each case of exceeding an interconnection reliability operating limit, and must report (to its compliance monitor) each case of exceeding an interconnection reliability operating limit for a time greater than or equal to Tv. Note that Tv may be zero.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments:

This should not preclude the Transmission Operator(s) from conducting independent analysis.

This draft standard does not recognize that the TO has fiduciary responsibility for its owned facilities and neither NERC standards, nor the Functional Model, can take that responsibility and liability away. This fiduciary responsibility requires the TO to establish thermal ratings, and associated Tv, for its equipment and then monitor that equipment. If those thermal ratings are the lesser of the thermal, stability or voltage limits, then the TO has established the IROL limit. Therefore, we suggest the requirements identified in this standard are not redundant requirements but are requirements met by several entities (functions), not met by one entity (function).

It should also be acknowledged that entities such as the RA and the TO(s) may delegate their respective monitoring responsibilities to the TOP.

The following is an excerpt from page three of this document: *“This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority.”* For TOs/TOPs, system operating limits should not include only those limits which have been identified as leading to cascading outages, instability, or uncontrolled separation. This is a major issue in terms of the scope. As conceived, this standard does not result in any entity assuring that bulk power system is operating within limits. It only results in operating within those limits for which violations result in instability/cascading outage risk. Any defined operating limit, which has been identified as potentially threatening bulk reliability and thereby requiring consistent monitoring and adherence, should be covered by a standard.

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

Yes                       No

5. Do you agree with the compliance monitoring process?

Yes                       No

6. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 201:

The statements in sections 1.1.1 and 1.1.2 imply that the Planning Authority Area is the same size as the Reliability Authority Area. Entities that currently perform planning authority functions do not cover the same geographical area as their respective reliability authorities. The statements should be changed as follows: “The reliability authority and planning authority(ies) shall...”

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

as a shared activity between the TO(s), RA, PA(s), TSP, and TOP(s), and recommend all functional entities be identified in Standard 201 part 1.1 and 1.2.

What happens if you identify another (unexpected) limit during real-time that is not on the list? Are you not responsible for this case as well? We all know that planning studies cannot predict all the challenges that are faced in real-time.

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. This Standard could be improved by formatting (where possible) Measurement 2.1 to relate to Requirement 1.1 and Measurement 2.2 to relate to Requirement 1.2, etc. rather than listing the measures and requirements arbitrarily and independently.

In order to tie the OEC's to the Measures, Section 4 should be clarified to read:

4.3. The entity responsible shall have the following Objective Evidence for Compliance available upon the request of its compliance monitor:

- 4.3.1. List of interconnection reliability operating limits for the reliability authority's reliability area **as described in Measure 2.1 above**
- 4.3.2. List of facilities (or groups of facilities) in the reliability authority's reliability area that are subject to interconnection reliability operating limits **as described in Measure 2.2 above**

### **Requirement 202 - Monitoring**

- 7. Do you agree with the requirement?  
 Yes                       No
- 8. Do you agree with the measures?  
 Yes                       No
- 9. Do you agree with the compliance monitoring process?  
 Yes                       No
- 10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s) and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 202 be replaced with "reliability authority and transmission owner(s)".

It should also be acknowledged that entities such as the RA and the TO(s) may delegate their respective monitoring responsibilities to the TOP(s).

In addition, it appears from the wording of this draft standard Section 202 Monitoring, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded:

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

- 1.1. The reliability authority shall monitor real-time system operating parameters to determine if the reliability area is operating within its interconnection reliability operating limits.

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3.1 is too specific for the measures it supports. It may be a practical solution that the real-time data and interconnection reliability operating limits be made available to operators in the form of a "display", however this solution is not prescribed in the measures and should not be listed exclusively.

We suggest that section 4.3.1 be rewritten to read:

- 4.3.1. Process used for monitoring and comparing real time data associated with interconnection reliability operating limits in accordance with Measure 2.3 above. This may be accomplished through the use of an operator display and should demonstrate compliance with Measures 2.1 and 2.2.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Requirement 203 - Analyses and Assessments

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s) and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 203 be replaced with "reliability authority and transmission owner(s)".

In addition, it appears from the wording of this draft standard Section 203 Analysis and Assessments, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded:

- 1.1. The reliability authority shall perform operational planning analyses to verify that the planned bulk electric system operations will not exceed any of its interconnection reliability operating limits.

The wording of Item 1.2 should also be revised to make it clear the RA and TO(s) verify the power system operation is not exceeding IROL limits:

- 1.2. The reliability authority shall perform real-time assessments to verify that **the power system** it is not exceeding any interconnection reliability operating limits. **The transmission owner(s) shall perform real-time assessments to verify its equipment is not exceeding any interconnection reliability operating limits.**

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be rewritten to read:

- 4.3. **The reliability authority shall demonstrate in accordance with Measure 2.1, the following upon the request of the compliance monitor:**
- 4.3.1. **Ability to perform an operational planning analysis**  
4.3.2. **Ability to perform a real time assessment**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Requirement 204 - Actions

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

We have a general concern that the Reliability Authority is the only function held responsible for instances where the IROL is exceeded. Currently, not all RAs have operating responsibility over their systems. Some functions are delegated. With this in mind, the levels of non-compliance would pertain only to RAs, while they may not have direct control. For instance, the operating entities could choose not to follow the RA's direction. It seems that there should be a complementary standard that would penalize operating entities for not adhering to the direction of the RA. The penalties should be ranked according to the severity of the situation. In other words, the entities that actually have the operating responsibility must be held accountable.

Has the Interconnection Reliability Operating Limit Violation Report been developed yet? Is this the existing NERC Operating Policy 5, Appendix 5F as modified with the results of the Reliability Coordinator IRLV Field Test? Will this report become part of this standard?

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

In section 2, the measures do not capture the requirement to PREVENT instances where IROLs may be exceeded. The following re-wording is suggested. Section 4, below is also slightly modified to align with change in the measurement.

**2.1. The reliability authority shall document each instance where actions are taken to prevent exceeding or to mitigate the magnitude and duration of interconnection reliability operating limit:**

2.1.1. The reliability authority shall document, via an operations log or other data source, the actions taken or directives issued, the magnitude of the event, and the duration of the event. (This data may be from an operating log, may be from the entity's energy management system, or may be from some other source.)

2.2. The reliability authority shall report each instance of exceeding an interconnection reliability operating limit for time greater than or equal to  $T_v$ :

2.2.1. The reliability authority shall complete an Interconnection Reliability Operating Limit Violation Report and shall file the report with its compliance monitor within five business days of the initiation of the event. (The report includes the date and time of the event, identification of which interconnection reliability operating limit was violated and the  $T_v$  for that limit, magnitude

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

and duration of exceeding the interconnection reliability operating limit, actions taken or directives issued, and explanation of results of actions or directives.)

4.3. The reliability authority shall have the following available upon the request of its compliance monitor:

4.3.1. Operations logs or other documentation **in accordance with Measure 2.1 indicating the magnitude and duration of each interconnection reliability operating limit event** and the actions or directives issued for each of these instances

4.3.2. Interconnection Reliability Operating Limit Violation Reports **completed in accordance with Measure 2.2**

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?

Yes  No

20. Do you agree with the measures?

Yes  No

21. Do you agree with the compliance monitoring process?

Yes  No

22. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 205:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s) and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 205 be replaced with "reliability authority and transmission owner(s)".

The requirement for data collection should be tied to its impact on reliability. Requirement 1.3 should be modified to read:

1.3. The reliability authority shall notify its compliance monitor when an entity that has facilities monitored by the reliability authority does not provide data as specified **and this lack of data has an impact on reliability.**

Measurement 2.3.1 should be rewritten to read:

2.3.1. The notification shall take place within five business days of discovering that the data **having an impact on reliability** is missing.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

In order to prevent a shotgun approach to data collection we propose Section 2.1.1 be modified to read:

- 2.1.1. Specification shall include a list of **minimum** required data, a mutually agreeable format, and timeframe and periodicity for providing data.

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be rewritten to read:

- 4.3. The reliability authority shall have the following available upon the request of the compliance monitor:
  - 4.3.1. Data specification(s) **in accordance with Measure 2.1**
  - 4.3.2. Proof of distribution of the data specification(s) **in accordance with Measure 2.2**

**Requirement 206 - Data Provision**

- 23. Do you agree with the requirement?  
 Yes                       No
- 24. Do you agree with the measures?  
 Yes                       No
- 25. Do you agree with the compliance monitoring process?  
 Yes                       No
- 26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s) and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 206 be replaced with "reliability authority and transmission owner(s)".

Add planning authority(ies) to the list of functions in section 1.1.1 that have a reliability relationship and shall provide data (particularly results of dynamic analysis) to the reliability authority and transmission owner(s).

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3.1 is too specific for the measure it supports. A possible solution might be:

- 4.3.1. **Documentation** indicating data was sent to the reliability authority **in accordance with Measure 2.1**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Non-compliance in data submission could take several forms and levels of impact to reliability. Section 5 should be modified as follows:

5. Levels of Non-compliance:

- 5.1. Level one: **Data was provided, but not in the mutually agreed format**
- 5.2. Level two: **Data was provided, but not within the time-frame specified**
- 5.3. Level three: **Incomplete data was provided**
- 5.4. Level four: Data **was** not provided to the reliability authority as specified.

### Requirement 207 - Action Plan

27. Do you agree with the requirement?

- Yes                       No

28. Do you agree with the measures?

- Yes                       No

29. Do you agree with the compliance monitoring process?

- Yes                       No

30. Do you agree with the levels of non-compliance?

- Yes                       No

Comments about Requirement 207:

Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s) and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 207 be replaced with "reliability authority and transmission owner(s)".

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. The Levels of non-compliance should be objectively determined based on the evidence.

Measure 2.1 should be modified to include:

- 2.1. The reliability authority shall have a documented action plan that addresses preventing and mitigating instances of exceeding interconnection reliability operating limits. The plan shall **identify and** be coordinated with those entities responsible for acting and with those entities impacted by such actions.

Section 4.3 should be modified to include:

- 4.3. The reliability authority shall make the following available for inspection by the compliance monitor upon request:
  - 4.3.1 Action plan **developed in accordance with Measure 2.1**

Section 5 should be modified to include:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

5. Levels of Non-compliance

- 5.1. Level one: Action plan exists but wasn't coordinated with all involved and impacted entities
- 5.2. Level two: Action plan exists but wasn't coordinated with any involved or any impacted entities
- 5.3. Level three: **Action plan is incomplete**
- 5.4. Level four: No action plan

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?

- Yes                       No

32. Do you agree with the measures?

- Yes                       No

33. Do you agree with the compliance monitoring process?

- Yes                       No

34. Do you agree with the levels of non-compliance?

- Yes                       No

Comments about Requirement 208:

We believe the wording of this draft standard Section 208 Reliability Authority Directives, 1. Requirements, Item 1.1 is restricted to too few entities, needs to be expanded to encompass all functions and users of the power system, should recognize the RA is required to issue directives consistent with applicable tariffs and contract, and the RA is required to use Good Utility Practices. This requirement must be reworded:

**1.1. The reliability authority shall use applicable tariffs, contracts, and Good Utility Practice when directing use of the power system and all users of the power system shall follow the reliability authority's directives to:**

1.1.1.1. Prevent instances where interconnection reliability operating limits may be exceeded

1.1.1.2. Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. Non-compliance could take several forms and levels of impact to reliability. The Levels of non-compliance should be objectively determined based on the evidence.

Section 4.3.1 should be modified to read:

4.3.1. Operations log or other data source(s) to show the following for each instance of being issued a reliability authority directive relative to an interconnection reliability operating limit:

4.3.1.1. Date and time of each of directive received

4.3.1.2. Directive issued

4.3.1.3. Actions taken in response to directive **in accordance with Measure 2.1**

Section 5 should be modified as follows:

5. Levels of Non-compliance

5.1 Level one: **Operations log or other data source(s) do not show one of the following:**

5.1.1 **Date and time of each of directive received**

5.1.2 **Directive issued**

5.1.3 **Actions taken in response to directive**

5.2 Level two: **Operations log or other data source(s) do not show any of the following:**

5.1.4 **Date and time of each of directive received**

5.1.5 **Directive issued**

5.1.6 **Actions taken in response to directive**

5.3 Level three: Not applicable.

5.4 Level four: Did not follow directives.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### 35. List any Regional or Interconnection Differences for this standard:

None

### 36. Notifying the Compliance Monitor

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments:** We believe that it is appropriate to include this in the standard with the comments noted in Section 205.

### 37. Any other comments on this standard?

- Please note that throughout the standard the Tv term is used but is not formatted the same (Tv vs. T<sub>v</sub>). This is a minor, formatting issue, but should be consistent throughout to reduce confusion.
- Two definitions should be changed based on our comments:

**Reliability Authority Area:** A defined electrical system bounded by interconnection (tie -line) metering and telemetry **monitored by** a single reliability authority.

**Tv:** The violation time associated with a limit **that is determined by the Transmission Owner(s) for equipment-based limits and by the Reliability Authority and the Planning Authority(ies) for system-based limits.**

- We are becoming increasingly concerned about this standard development process. This and other standards are being developed based on certain definitions and assumptions contained in the Functional Model. These “standards” will become fixed such that the industry will be held accountable to and measured by these standards. However, the Functional Model and the definitions contained in that revised model are changing and will not necessarily be the same as those used to develop the standards. What is the process for reviewing, revising and implementing changes to the Functional Model, and the impact of those changes on all these standards that have been developed based on the old Functional Model? Are the changes to the Functional Model being vetted by all industry

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

participants before implementation? What is the process to revise these standards prior to implementing changes to the Functional Model?

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
X Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
X Yes                       No
4. Do you agree with the measures?  
 Yes                      X No
5. Do you agree with the compliance monitoring process?  
 Yes                      X No
6. Do you agree with the levels of non-compliance?  
 Yes                      No

Comments about Requirement 201: It is unclear what a “responsible entity” is. Why are the functional model “functions” not specifically referenced in the “Measures” and “Compliance Monitoring Process” sections? Specific functions should be identified to eliminate conflict and dispute.

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
X Yes                       No
8. Do you agree with the measures?  
X Yes                       No
9. Do you agree with the compliance monitoring process?  
X Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                      X No

Comments about Requirement 202: Please consider having compliance levels 1 thru 3 for this Requirement. It may be beneficial for reliability to progressively measure adherence to the Requirements for situations where a RA is implementing a phased in start up of operations or transition from existing systems to new systems.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
X Yes             No
12. Do you agree with the measures?  
X Yes             No
13. Do you agree with the compliance monitoring process?  
X Yes             No
14. Do you agree with the levels of non-compliance?  
X Yes             No

Comments about Requirement 203:

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
X Yes            No
16. Do you agree with the measures?  
X Yes            No
17. Do you agree with the compliance monitoring process?  
X Yes            No
18. Do you agree with the levels of non-compliance?  
X Yes            No

Comments about Requirement 204:

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes            X No
20. Do you agree with the measures?  
 Yes            X No
21. Do you agree with the compliance monitoring process?  
 Yes            X No
22. Do you agree with the levels of non-compliance?  
 Yes            X No

Comments about Requirement 205: The data obtained through this reliability requirement have significant commercial significance. NERC must ensure that the entities who receive such information have their employees maintain confidentiality of the data from market participants including their affiliated generators, transmission providers, load serving entities, marketers or other relevant market participants. Although a confidentiality agreement or confidentiality requirement is

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

not a specific reliability need, NERC must be cognizant of and sympathetic to these commercial concerns in its reliability requirements. The confidentiality agreement itself may be developed and administered through some other standard setting organization.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207: The requirement is silent on whether the Action Plan must comply with any tariff or market requirements. As written, it is allowable for an RA to submit a "command and control" schedule reduction or load-shedding procedure as its Action Plan to meet this Requirement. Reliant understands that NERC believes such Action Plans have significant commercial consequences and should be developed by other standard setting organizations. However, without the RA and control area operators' agreement that such Action Plans are effective, the industry effort to develop such plans will be slow and cumbersome. Reliant recommends that this SDT coordinate with the appropriate standards setting organization(s) to ensure the Action Plans are effective. Further, this Requirement should include a requirement that these Action Plans are the primary means of mitigating Reliability Operating Limit violations and not a "command and control" or "Emergency" procedure.

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                      X No
32. Do you agree with the measures?  
 Yes                      X No
33. Do you agree with the compliance monitoring process?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                      X No

34. Do you agree with the levels of non-compliance?

Yes                      X No

Comments about Requirement 208: The RA should have contractual arrangements in place with generators, transmission providers, control area operators and any entity that is required to respond to the "Actions" and "Action Plan" that expressly provides the RA the authority to execute this Requirement.

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208: **Opinion within ATC was divided over requirement 208. One side could agree with the requirement, its measures, and its monitoring process. The other side could not agree and specifically cited 208.1.2, 208.2.1, and 208.2.2, and those requirements to document directives and actions taken, as onerous.**

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

None.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

**Note** – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

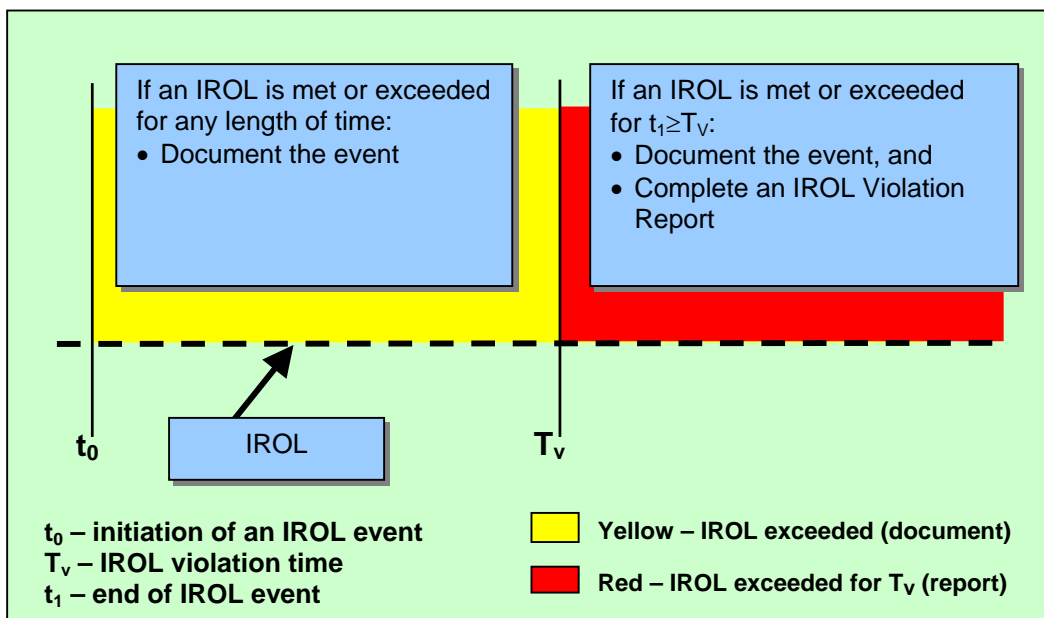

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.  
The term "Documentable Interconnection Reliability Operating Violation" is never used in the standard and has the same definition as "Interconnection Reliability Operating Event". Likewise, the term "Reportable Interconnection Reliability Operating Violation" is never used in the standard and has the same definition as "Interconnection Reliability Operating Violation". We suggest that the terms "Documentable Interconnection Reliability Operating Violation" and "Reportable Interconnection Reliability Operating Violation" be deleted from the list of definitions.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No

Comments It is not clear to us that the Transmission Operator would never be responsible for performing the requirements included in this standard. Similar to Standard 600, this requirement could apply to "the areas for which they are responsible".

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201: Should Transmission Owner be added to this??

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?  
 Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments about Requirement 202: The Transmission Operator should also be included in this requirement for "the areas for which they are responsible".

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### 35. List any Regional or Interconnection Differences for this standard:

We do not currently know of any Regional or Interconnection Differences at this time. However, during the initial phasing in of standards each region may find adopting or developing a different approach provides increased reliability. Therefore, we believe that differences should be considered as they are identified in the future.

### 36. Notifying the Compliance Monitor

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

### 37. Any other comments on this standard?

This standard should not be brought to ballot until the Planning Authority is defined in the Functional Model since the Planning Authority is assigned requirements in this standard.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

**Note** – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

In the definition of **cascading outages** the term “**beyond an area predetermined by appropriate studies**” should be specifically defined. Suggestion: “**beyond the control area of the initial disturbance**”.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments:

Page 3, paragraph 3 says: “**Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages**”. Considering the events leading to the recent blackout, this section may have to be revised. Suggestion: allow a system to exceed local operating limits only if a controlled islanding scheme is in place, which can be shown to prevent cascading for the operating condition in question.

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

Yes                       No

5. Do you agree with the compliance monitoring process?

Yes                       No

6. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 201:

### Requirement 202 - Monitoring

7. Do you agree with the requirement?

Yes                       No

8. Do you agree with the measures?

Yes                       No

9. Do you agree with the compliance monitoring process?

Yes                       No

10. Do you agree with the levels of non-compliance?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No

Comments about Requirement 202:

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?

Yes                       No

12. Do you agree with the measures?

Yes                       No

13. Do you agree with the compliance monitoring process?

Yes                       No

14. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 203:

**Requirement 204 - Actions**

15. Do you agree with the requirement?

Yes                       No

16. Do you agree with the measures?

Yes                       No

17. Do you agree with the compliance monitoring process?

Yes                       No

18. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 204:

 Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208: [Suggestion: Include generator operator in section 1.1](#)

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

None

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

- **Reliability Authority does not have “control” of the system, but provides direction to the asset owners/operators. Therefore, suggest the following change:**

Reliability Authority Area: A defined electrical system bounded by interconnection (tie-line) metering and telemetry under the direction of a single reliability authority.

- **The definition of “Documentable Interconnection Reliability Operating Limit Violation” appears to be redundant to the definition of “Interconnection Reliability Operating Limit Event.” Suggest deletion of “Documentable Interconnection Reliability Limit Violation.”**
2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments:

This standard should be modified to specify non-redundant requirements for the TO responsibilities for operating within system operating limits or a separate standard created for this issue.

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201:

The statements in sections 1.1.1 and 1.1.2 imply that the Planning Authority Area is the same size as the Reliability Authority Area. Entities that perform planning authority functions may not cover the same geographical area as their respective reliability authorities. The statements should be changed as follows: “The reliability authority and planning authority(ies) shall...”

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. This Standard could be improved by formatting (where possible) Measurement 2.1 to relate to Requirement 1.1 and Measurement 2.2 to relate to Requirement 1.2, etc. rather than listing the measures and requirements arbitrarily and independently.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

In order to tie the OEC's to the Measures, Section 4 should be clarified to read:

4.3. The entity responsible shall have the following Objective Evidence for Compliance available upon the request of its compliance monitor:

- 4.3.1. List of interconnection reliability operating limits for the reliability authority's reliability area **as described in Measure 2.1 above**
- 4.3.2. List of facilities (or groups of facilities) in the reliability authority's reliability area that are subject to interconnection reliability operating limits **as described in Measure 2.2 above**

**Requirement 202 - Monitoring**

- 7. Do you agree with the requirement?  
 Yes                       No
- 8. Do you agree with the measures?  
 Yes                       No
- 9. Do you agree with the compliance monitoring process?  
 Yes                       No
- 10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

It appears from the wording of this draft standard Section 202 Monitoring, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded:

- 1.1. The reliability authority shall monitor real-time system operating parameters to determine if the reliability area is operating within its interconnection reliability operating limits.

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3.1 is too specific for the measures it supports. It may be a practical solution that the real-time data and interconnection reliability operating limits be made available to operators in the form of a "display", however this solution is not prescribed in the measures and should not be listed exclusively.

Suggest that section 4.3.1 be rewritten to read:

- 4.3.1. **Process used for monitoring and comparing real time data associated with interconnection reliability operating limits in accordance with Measure 2.3 above. This may be accomplished through the use of an operator display and should demonstrate compliance with Measures 2.1 and 2.2.**

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

It appears from the wording of this draft standard Section 203 Analysis and Assessments, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded:

- 1.1. The reliability authority shall perform operational planning analyses to verify that the planned bulk electric system operations will not exceed any of its interconnection reliability operating limits.

The wording of Item 1.2 should also be revised:

- 1.2. The reliability authority shall perform real-time assessments to verify that **the power system** it is not exceeding any interconnection reliability operating limits.

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be rewritten to read:

- 4.3. **The reliability authority shall demonstrate in accordance with Measure 2.1, the following upon the request of the compliance monitor:**
- 4.3.1. **Ability to perform an operational planning analysis**  
4.3.2. **Ability to perform a real time assessment**

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

18. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 204:

RA should only be penalized if the RA failed to direct action. If an operating entity fails to implement the directed action then the RA should not be penalized (if the RA does not have direct operational control.)

Section 5.4 should be amended to include "and RA failed to direct action."

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be re-written to read:

- 4.3. The reliability authority shall have the following available upon the request of its compliance monitor:
  - 4.3.1. Operations logs or other documentation **in accordance with Measure 2.1** and the actions or directives issued for each of these instances
  - 4.3.2. Interconnection Reliability Operating Limit Violation Reports **completed in accordance with Measure 2.2**

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?

Yes  No

20. Do you agree with the measures?

Yes  No

21. Do you agree with the compliance monitoring process?

Yes  No

22. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 205:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be rewritten to read:

- 4.3. The reliability authority shall have the following available upon the request of the compliance monitor:
  - 4.3.1. Data specification(s) **in accordance with Measure 2.1**

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4.3.2. Proof of distribution of the data specification(s) **in accordance with Measure 2.2**

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?

Yes  No

24. Do you agree with the measures?

Yes  No

25. Do you agree with the compliance monitoring process?

Yes  No

26. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 206:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3.1 is too specific for the measure it supports. A possible solution might be:

4.3.1. **Documentation** indicating data was sent to the reliability authority **in accordance with Measure 2.1**

Non-compliance in data submission could take several forms and levels of impact to reliability.

Section 5 should be modified as follows:

5. Levels of Non-compliance:

5.1. Level one: **Data was provided, but not in the mutually agreed format**

5.2. Level two: **Data was provided, but not within the time-frame specified**

5.3. Level three: **Incomplete data was provided**

5.4. Level four: Data **was** not provided to the reliability authority as specified.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?

Yes  No

28. Do you agree with the measures?

Yes  No

29. Do you agree with the compliance monitoring process?

Yes  No

30. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 207:

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. The Levels of non-compliance should be objectively determined based on the evidence.

Measure 2.1 should be modified to include:

- 2.1. The reliability authority shall have a documented action plan that addresses preventing and mitigating instances of exceeding interconnection reliability operating limits. The plan shall **identify and** be coordinated with those entities responsible for acting and with those entities impacted by such actions.

Section 4.3 should be modified to include:

- 4.3. The reliability authority shall make the following available for inspection by the compliance monitor upon request:

- 4.3.1 Action plan **developed in accordance with Measure 2.1**

Section 5 should be modified to include:

5. Levels of Non-compliance
  - 5.1. Level one: Action plan exists but wasn't coordinated with all involved and impacted entities
  - 5.2. Level two: Action plan exists but wasn't coordinated with any involved or any impacted entities
  - 5.3. Level three: **Action plan is incomplete**
  - 5.4. Level four: No action plan

### **Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. Non-compliance could take several forms and levels of impact to reliability. The Levels of non-compliance should be objectively determined based on the evidence.

Section 4.3.1 should be modified to read:

- 4.3.1. Operations log or other data source(s) to show the following for each

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

instance of being issued a reliability authority directive relative to an interconnection reliability operating limit:

- 4.3.1.1. Date and time of each of directive received
- 4.3.1.2. Directive issued
- 4.3.1.3. Actions taken in response to directive **in accordance with Measure 2.1**

Section 5 should be modified as follows:

### 5. Levels of Non-compliance

5.1 Level one: **Operations log or other data source(s) do not show one of the following:**

- 5.1.1 **Date and time of each of directive received**
- 5.1.2 **Directive issued**
- 5.1.3 **Actions taken in response to directive**

5.2 Level two: **Operations log or other data source(s) do not show any of the following:**

- 5.1.4 **Date and time of each of directive received**
- 5.1.5 **Directive issued**
- 5.1.6 **Actions taken in response to directive**

5.3 Level three: Not applicable.

5.4 Level four: Did not follow directives.

### 35. List any Regional or Interconnection Differences for this standard:

None

### 36. Notifying the Compliance Monitor

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments:**

### 37. Any other comments on this standard?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- Please note that throughout the standard the  $T_v$  term is used but is not formatted the same ( $T_v$  vs.  $T_v$ ). This is a minor, formatting issue, but should be consistent throughout to reduce confusion.

Mr. Timothy R. Gallagher  
Director-Standards  
North American Electric Reliability Council  
116-390 Village Boulevard  
Princeton, New Jersey 08540

Re: Comments by the Independent Electricity Market Operator (IMO) to Posted NERC Standards:

Dear Mr. Gallagher,

The Independent Electricity Market Operator (IMO) respectfully submits the following comments, to the following posted Standards.

1. **NERC Standard 200, “Monitor and Assess Short Term Transmission Reliability-Operate Within Limits”**
2. **NERC Standard 300, “Balance Resources and Demand”**
3. **NERC Standard 600, “Determine Facility Ratings, System Operating Limits and Transfer Capabilities”**

**General comments to all standards posted to date:**

The first concerns the repeated insertion of the monetary “Sanctions Table.” Sanctions in whatever form have no direct relevance to the reliability standard being developed. They belong in a stand-alone document, endorsed by NERC and the Regions, that specifically address the enforcement process of the standards. Furthermore monetary sanctions have not been broadly endorsed, and this continues to be an outstanding issue with all posted standards to date. It is the IMO's opinion that these references must be removed

The second deals with the need for supporting documentation, such as provided for the Balancing Resources and Demand standard, that clearly articulates the "principles" and/or "objective" that each drafting team used in developing each specific standard and measure. This would greatly aid, particularly during the standard development stages, in understanding the "intent" of the DRAFT standard, which tends to be written in generic terms.

Other comments to specific language in the Standards follow:

**1. NERC Standard 200, “Monitor and Assess Short Term Transmission Reliability-Operate Within Limits”**

Definitions:

$T_v$ : The violation time associated with a limit.

This definition seems to reflect the compliance violation time frame, but the usage of the  $T_v$  term in the draft standard is the "maximum acceptable response time" as determined by the RA/PA.

BPS (Bulk Power System) - Definition for BPS is required.

Sections 201 IROL Identification, requirements and measures read as follows:

**1. Requirements**

- 1.1. The reliability authority and planning authority shall identify and document which facilities (or groups of facilities) in the reliability authority's reliability area are subject to interconnection reliability operating limits.
- 1.2. The reliability authority and planning authority shall identify each interconnection reliability operating limit within the reliability authority's reliability area.
  - 1.2.1. The reliability authority or planning authority shall identify a maximum response time (Tv) for any interconnection reliability operating limit that does not already have a Tv.

**2. Measures**

- 2.1. The entity responsible shall establish a list of interconnection reliability operating limits for the reliability authority's reliability area.
  - 2.1.1. The entity responsible shall establish a maximum response time (Tv) for any interconnection reliability operating limit that does not already have a Tv.
- 2.2. The entity responsible shall establish a list of facilities (or groups of facilities) in the reliability authority's reliability area that are subject to interconnection reliability operating limits

IMO believes that the present definition of Tv, which is "self-defined, as so broad that the re-preparation time of thirty minutes has been lost. It is unclear if this was indeed the intent based on Section 203 requirements 1.1 and 1.2 and measure 2.1.2.

In Section 201 (1.2.1):

- the reliability authority or planning authority identifying Tv must establish and present the process through which Tv is derived, or the re-preparation time of thirty minutes should become the standard default absent such a process.
- the reliability authority or planning authority identifying Tv in one region/area must have a peer review and dispute resolution process with its' neighboring region(s)/area(s) to ensure a mutually acceptable Tv. Additionally, Section 1.1 suggests the need for a demonstrated process to "... identify and document which facilities (or groups of facilities) in the reliability authority's reliability area are subject to interconnection reliability operating limits." The mechanism to determine this critical element of the definition cannot be left open-ended. Without a recognized and accepted process, significant inconsistencies will result throughout the Interconnections.

A further concern with the draft is the continuing difficulty of defining wide area impact versus local impact. As the Standard defines "Cascading Outages":

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread service interruption, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies.

There is no guidance on how the parameters are to be defined which would permit the identification of the local area and the widespread area. It also fails to recognize that a local area problem may evolve into a wider area problem depending on the load, time of day, recent contingencies and other factors. A well defined process for determining what is (and what is not) a reportable event is essential.

## Section 202 Monitoring read as follows

### 1. Requirements

- 1.1. The reliability authority shall monitor real-time system operating parameters to
- 1.2. Determine if it is operating its reliability area within its interconnection reliability operating limits.

### 2. Measures

- 2.1. The reliability authority shall have interconnection reliability operating limits available for its operations personnel's real-time use.
- 2.2. The reliability authority shall have real-time data available in a form that system operators can compare to the interconnection reliability operating limits.
- 2.3. The reliability authority shall monitor system operating parameters and compare these against its interconnection reliability operating limits.

The term "real-time" as used in the above lacks clarity in defining how well the RA monitors data ( ie how often - every 2 sec; 10 seconds, etc). As an example a RA may sample data instantly (real time), but only monitor once every 30 minutes. It is IMO's view, such sampling frequency satisfies the above measures, however, its adequacy for maintaining system reliability must be questioned.

## Section 203 Analysis and Assessment

### 1. Requirements

- 1.1. The reliability authority shall perform operational planning analyses to verify that its planned bulk electric system operations will not exceed any of its interconnection reliability operating limits.
- 1.2. The reliability authority shall perform real-time assessments to verify that it is not exceeding any interconnection reliability operating limits.

### 2. Measures

- 2.1. The reliability authority shall identify operating situations or events that impact its ability to operate its reliability area without exceeding any identified interconnection reliability operating limits.
  - 2.1.1. The reliability authority shall conduct an operational planning analysis at least once each day, evaluating the next day's projected system operating conditions
  - 2.1.2. The reliability authority shall conduct a real-time assessment periodically, but at least once every 30 minutes.

The standard must provide a clear distinction between i) how often IROL's, are assessed, whether in real time or for operational planning analyses and ii) how quickly an IROL violation must be resolved. Requirement 1.2 "..... **to verify** that it is not exceeding any interconnection reliability operating limits" can be, in IMO's opinion, interrupted as to how quickly an IROL violation must be resolved...ie: each time it is detected in real-time, which shall be within 30 minutes or less in accordance with measure 2.1.2. This requirement belongs in section 201.

## Section 204 Actions

### 1. Requirements

- 1.3. The reliability authority shall act1 or direct others to act to:
  - 1.3.1. Prevent instances where interconnection reliability operating limits may be exceeded
  - 1.3.2. 1.1.2. Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded

- 1.4. The reliability authority shall document instances of exceeding interconnection reliability operating limits and shall document and complete an Interconnection Reliability Operating Limit Violation Report for instances of exceeding interconnection reliability operating limits for time 2 greater than or equal to Tv.

A further concern with the draft is the continuing difficulty of defining wide area impact versus local impact and the actions that are to be taken in such situations. As the Standard defines “Cascading Outages”:

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread service interruption, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies.

In Section 201 there is no guidance on how the parameters are to be defined which would permit the identification of the local area and the widespread area. Further, fails to recognize that a local area problem or an "out of scope coverage" may evolve into a wider area problem depending on the load, time of day, recent contingencies and other factors. A well-defined process for determining what is (and what is not) a reportable event is essential. While, Section 204 fails to identify what actions are to be taken in such "out of scope coverage" situations.

## **2. NERC Standard 300, “Balance Resources and Demand”**

The IMO fully supports the comments put forth by NPCC - entitled “NPCC Comments On The NERC Balancing Standard,” which details numerous concerns with the methodology of the proposed new standard for frequency control.

## **3. NERC Standard 600, “Determine Facility Ratings, System Operating Limits and Transfer Capabilities”**

## Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard

---

each of these pairs, the draft standard requires the development and availability of a “methodology” to determine the required quantities and secondly the application of this methodology in the establishment and communication of these values to the users of the values. These standards were developed assuming that the Facility Ratings, System Operating Limits and Transfer Capability values are to be provided to the user (e.g. those entities performing the reliability authority, planning authority, and transmission operator functions) on a schedule established by the *user*. The SDT endeavored to ensure that this draft standard would not require the determination of various values that had no identified user. For this reason, the user of the various values must request the specific values from the value provider (e.g. those entities performing the facility owner and planning authority functions) through the establishment of a schedule to supply the data.

### **Levels of Noncompliance:**

In the three ‘methodologies’ sections (601, 603, 605), the levels of noncompliance are based upon the availability and completeness of the documented procedures. In the three ‘communication’ sections (602, 603, 605), the levels of noncompliance are based on the availability of the values *requested by the users* of the information and the consistency of these values with the documented methodologies.

### **Sanctions:**

The SDT believes that failure to comply with the three ‘methodologies’ sections (601, 603, 605) does not warrant monetary sanctions, since the methodologies themselves would not *directly* impact the reliable operation of the transmission system.

The unavailability of Facility Rating *values*, System Operating Limit *values* and to a lesser extent, Transfer Capability *values* will have a real and detrimental impact on the real time reliability of the transmission system as well as the validity of transmission plans for future transmission system additions. Therefore, the three ‘communication’ sections (602, 604, 606) include monetary sanctions for repeated and/or significant noncompliance as per the sanction table. The SDT believes that nominal, fixed dollar sanctions are appropriate in these cases. The application of ‘per MW’ variable sanctions would be inappropriate for these infractions compared to the consequences of violating the requirements of the standard. While the SDT realizes that a minor omission of a requested value could result in sanction, the SDT also believes that graduated sanctions based upon the level of ‘completeness’ of the data received by the users are impractical. The SDT is of the opinion that not all values have equal importance to the reliability of the transmission system, and therefore, sanctions based upon ‘percentage of requested data received’ (perhaps omitting values of specific critical limitations) would be arbitrary.

### **Relationship with “Operate Within Limits” Standard:**

The SDT suggests that this draft standard be reviewed in concert with the “Operate Within Limits” draft standard. The Facility Ratings, System Operating Limits, and Transfer Capabilities draft standard requires the availability and usability of these data. The Operate Within Limits standard addresses the use of a subset of these values in real time operation. The SDT believes that the definitions developed in conjunction with this standard do not prohibit the stratification, or sub-classification, of the requested data (Facility Ratings, System Operating Limits, Transfer Capabilities) for specific uses or users. The intent and purpose of this standard, however, is to identify *all* system operating limits and not to differentiate them based upon the impacts of violating them.

**Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard**

---

**1. This standard assumes that the reliability authority has the ultimate responsibility to establish system operating limits and relies upon the transmission operator for input. Have the roles and responsibilities of transmission operators versus reliability authorities in determining system operating limits been properly characterized in this standard?**

Yes

No

Comments

**2. Do you agree that identifying and communicating all system operating limits is within the scope of this standard and is necessary for reliability?**

Yes

No

Comments

**3. NERC Regions have the right to ask for Regional differences for inclusion in NERC standards. Such differences would apply only to the listed Region and would become an enforceable part of the NERC standard only if approved by the industry. NPCC has requested a Regional difference in section 603. Do you think NPCC’s Regional difference should be included in this standard?**

Yes

No

Comments The NPCC criteria is more stringent than the NERC standard.

**4. Are you aware of any other Regional differences that should be included in this standard?**

Yes

No

Comments Possibly ERCOT and WSCC will have differences.

**Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard**

---

**5. Do you agree with the sanction philosophy in this standard? (No financial penalties for methodology violations, nominal fixed monetary penalties for failure to communicate values).**

Yes

No

Comments Financial penalties should not be applied. This would open the gate to financial penalties for the many, much more severe violations addressed in other standards. The IMO feels that non-monetary sanctions are sufficient.

**6. Do you agree with the proposed requirements and measurements in section 601?**

Yes

No

Comments

**7. Do you agree with the proposed compliance monitoring process in section 601?**

Yes

No

Comments

**8. Do you agree with the proposed levels of non-compliance in section 601?**

Yes

No

Comments See general comment below

**Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard**

---

**9. Do you agree with the proposed requirements and measurements in section 602?**

Yes

No

Comments

**10. Do you agree with the proposed compliance monitoring process in section 602?**

Yes

No

Comments

**11. Do you agree with the proposed levels of non-compliance in section 602?**

Yes

No

Comments The levels do not seem to follow any progression which would suggest increasing severity. Why is failure to have all ratings for existing facilities any different than not having all ratings for new facilities: level 1 as opposed to level 2? Either you have ratings or not.

**12. Do you agree with the proposed requirements and measurements in section 603?**

Yes

No

Comments

**23. Do you agree with the proposed levels of non-compliance in section 606?**

Yes

No

Comments See general comment below

**24. What additional clarification, details, or modifications to this standard are necessary before it can be brought to ballot?**

Comments All the sanctions text should be removed, as they are dealt with elsewhere.

**25. Please enter any other comments you have regarding this standard in the space below.**

Comments

The proposed non-compliance levels for all these standards do not follow a natural progression. They seem to be somewhat contrived and slotted into the 4 levels.

601.4.2.2 - 10 years seems rather infrequent. Should provide opportunity for some verification when ratings change.

601.4.3, 602.4.4, 604.4.4, 606.4.4 - 3 years may not be long enough, given the typical timelines required to resolve differences.

603 Table I Note a) – reference is made to NERC Planning Standards – Will these still exist after the new family of standards are in place.

603 Table IA

– The NERC standard permits this table to be included here, but is it really necessary to have it here, other than for information purposes. At the NERC level, would it be sufficient to just note

**Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard**

---

that NPCC has more stringent criteria and refer the reader to the NPCC standards.

- In the 2<sup>nd</sup> row, for “Cascading outages”, superscript “f” should be “c”. Under category C, for “Double Circuit Tower” (item #3) superscript “e” should be “f”
- Note “e” text requires reformatting to remove blank line.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

 Yes                       No

Comments about Requirement 208:

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
 The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
 E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

**Major Changes to this Standard:**

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

NPCC feels that with respect to  $T_v$  there must be an established process through which this is derived or the re-preparation time of thirty minutes should become the standard default absent such a process.

Regarding Cascading Outages; There is no guidance on how the parameters are to be defined which would permit the identification of the local area and the widespread area. It also fails to recognize that a local area problem may evolve into a wider area problem depending on the load, time of day, recent contingencies and other factors. A well-defined process for determining what is (and what is not) a reportable event is essential.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201:

IROL will not always be known ahead of time. An unusual combination of events could create an IROL type event that was unplanned for. Some of the IROL may be time variant so the Compliance Monitoring Process section needs to address this.

Regarding levels of compliance it is suggested that less severe levels of non-compliance be associated with incompleteness or inaccuracy of the list. NPCC suggests that compliance with only IROLs for planned system conditions be the requirement.

### Requirement 202 - Monitoring

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No

9. Do you agree with the compliance monitoring process?

Yes                       No

10. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 202:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

NPCC requests the drafting team to provide their thoughts and incorporate allowances in the compliance area for EMS "down time" for maintenance or to switch over to backup system should problems arise.

Although we agree with the measures stated, we would suggest that more frequent in-day analyses based on changed system conditions to predict system performance in the coming hours be required.

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

NPCC also suggests adding "footnote 1" that appears on page 10 to the Level one non-compliance measure to capture the thought that no overt action is sometimes an acceptable action.

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?  
 Yes                       No
20. Do you agree with the measures?  
 Yes                       No
21. Do you agree with the compliance monitoring process?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes

No

22. Do you agree with the levels of non-compliance?

Yes

No

Comments about Requirement 205:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

Regarding the level of non-compliance for not providing data to the reliability authority, NPCC feels that there should be some differentiation between not submitting any data and submitting partial data or new/additional data and perhaps there needs to be some more granularity in the description of what constitutes non-compliance.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

NPCC suggests that there be timeframe requirement added instead of "upon request" to providing the Action plan and suggests 20 business days.

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments about Requirement 208:

Although we agree with the level four instance of non-compliance it would be beneficial for the compliance monitor to require data and other information surrounding the inaction.

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

NPCC is adamantly opposed to monetary sanctions and feels letters of increasing severity are a more effective compliance tool for ensuring adherence to standards.

NPCC also feels there is a lack of coordination between the standard drafting teams and has noted instances where one team felt an issue was addressed in a separate standard to later learn it was not. As an example, with respect to the Balancing Resources standard, transmission overloads that are caused by poor control are not covered by this standard unless they reach a high level IROL. It later was identified that where this was thought to have been covered, the Operate Within Limits Standard, it was not. We would suggest that there be technical oversight as we go forward with these processes to ensure there are no “gaps” or critical reliability issues that are not addressed in the resultant standards.

Establishment of the IROL should be done in the Facility Rating Standard because that is the standard that establishes Operating Limits otherwise the wording of the title should be changed to Establish IROL and Operate within Limits.

From a global perspective it might be a prudent action to place the NERC RS development in a moratorium until the investigation into the blackout cause is completed and determinations have been made. There could be new Reliability issues that need to be captured in the developing RS that need to be incorporated into the upcoming draft RS.

NPCC seeks explanation for drawing the line at addressing only instability, cascading outages and separation. For example, what standard, if any, will address the scenario where an entity operates their system to cause a sizable thermal overload on a

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

transmission line in another entity's system. (e.g. a transmission line burns down if the affected entity does not take corrective action)

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
 The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
 E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

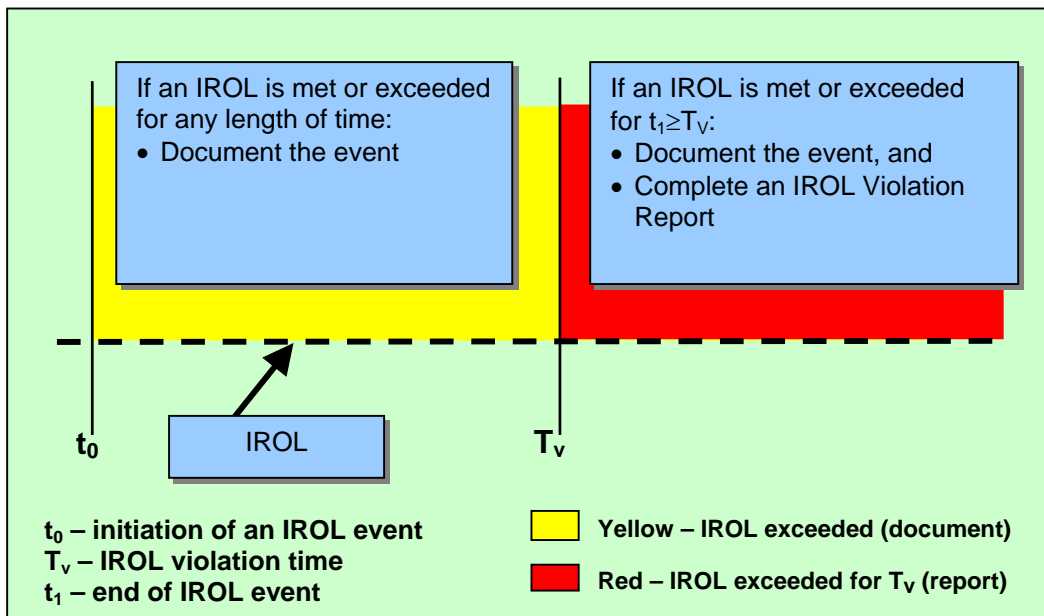

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

**Major Changes to this Standard:**

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

The “Transmission Operator” definition appears to be a definition for transmission provider. The functional model defines Transmission Operator as: “Operates and maintains the transmission facilities, and executes switching orders”.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No  
Comments

There should be some responsibilities for both RA (present day Reliability Coordinator) and the Transmission Operator. They aren’t necessarily the same requirements.

The TO-RA relationship is akin to the pilot-air traffic controller relationship. Both monitor some common items. In genera, one view is local, the other is broader and at a higher level. Both have a responsibility for air safety.

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201:

Who is “the entity responsible”?

It would be preferable to have limits populated in a common database available to all reliability entities so that there’s no miscommunication of limits between PA, TO and RA or misunderstandings of one RA’s impact on another. Also, the RA wouldn’t be hit with a level 4 compliance violation for failing to produce a piece of paper during a site visit.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

The Planning Authority is to provide limits used by the RA. The posted functional model has no details on the planning authority. Perhaps the standard should say, the planning authority and/or Transmission Operator

**Requirement 202 - Monitoring**

- 7. Do you agree with the requirement?  
 Yes                       No
  
- 8. Do you agree with the measures?  
 Yes                       No
  
- 9. Do you agree with the compliance monitoring process?  
 Yes                       No
  
- 10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

TOs should also be monitoring this.

What if other authorities refuse to provide data or provide corrupt data to the RA? It appears the RA is accountable, which doesn't seem appropriate.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

There can be up to 365 of both “real time assessment” and “planning analysis” violations in a year. Although it’s not likely many will occur, probably every RA will have occurrences of data transmission problems or EMS outages of 30 minutes in a year. Keep in mind the RA relies on data provided by others.

Since this is self-reported, it’s akin to a person sending an annual letter to their state patrol telling them how many times they were speeding during the year so that they can receive back the proper number of tickets in the mail.

To accrue a level 4 violation for each data hiccup or EMS outage doesn’t seem appropriate.

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

In this section, the RA gets a level 4 compliance violation if a limit is exceeded, the RA takes action and the limit is exceeded for  $T_v$ . It appears the RA is accountable if they take timely action (direct corrective measures) and the other authorities (IA, BA, TO) fail to respond.

Also, it appears that the same penalty is assessed whether the RA failed to act for one event or 100 events for the year.

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?

Yes

No

20. Do you agree with the measures?

Yes

No

21. Do you agree with the compliance monitoring process?

Yes

No

22. Do you agree with the levels of non-compliance?

Yes

No

Comments about Requirement 205:

Why does the RA have to notify the Compliance Monitor within 5 days if an entity doesn't provide data to the RA if "data provision" is monitored via annual self-certification?

The standard requires the RA to be responsible for collecting data from all participants in a "mutually agreeable" format. This seems to be saying that each generator owner, BA, TP can ask for a different format. If the RA doesn't agree to this, the RA becomes non-compliant because it is failing to collect data.

The RA should have the authority to require consistent data formats from each participant group (the participant group as a whole should have a say in the data format, not each individual participant).

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

This section appears to have an “all or nothing” format. The RA needs a great deal of information to fulfill its obligations. The “level 4” violation should only be for failure to provide data on IROL elements. There should perhaps be some scaled compliance level for failure to provide other data, such as:

Level 1: failure to provide 10% of the RA’s required data or data transmission failures greater than X% of the year.

Level 2: failure to provide 10% of the RA’s required data or data transmission failures greater than X% of the year.

Level 3: failure to provide 10% of the RA’s required data or data transmission failures greater than X% of the year.

Level 4: Failure to provide data for any IORL or pre-contingent element.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

How do you demonstrate coordination of an action plan?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?

Yes

No

32. Do you agree with the measures?

Yes

No

33. Do you agree with the compliance monitoring process?

Yes

No

34. Do you agree with the levels of non-compliance?

Yes

No

Comments about Requirement 208:

The “measures” section only say that the various authorities only have to document the directive and the actions they took (not that they actually followed the directive).

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments** There does not appear to be a need to make submissions within 5 business days. It may take a while to sort out a problem.

**37. Any other comments on this standard?**

In general, the level of compliance violation should be proportional to its impact on reliability (not the size of the entity).

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

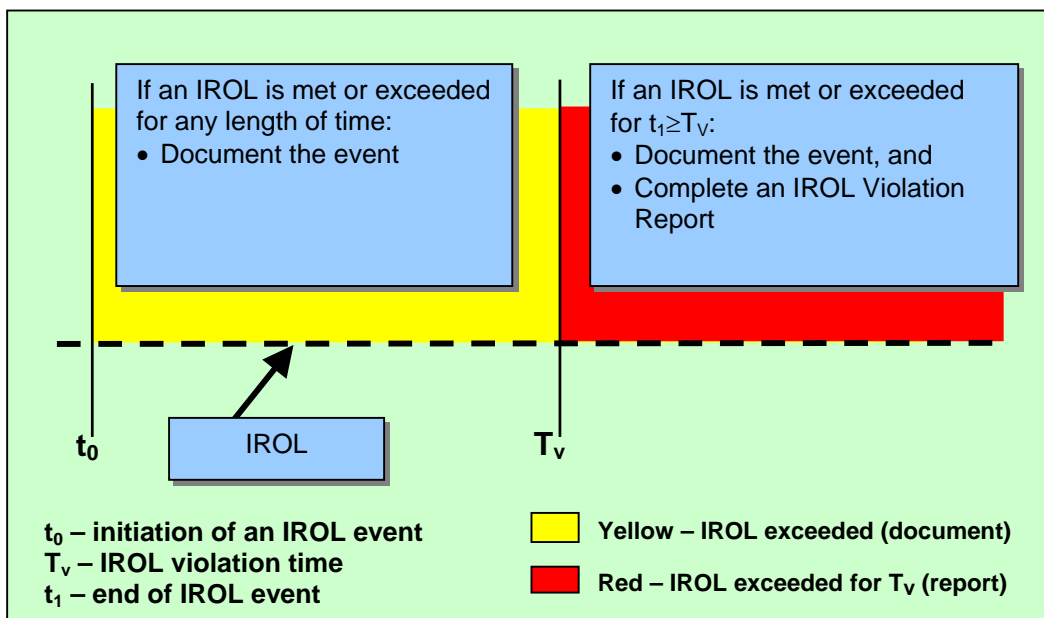

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments AE agrees that two organizations controlling the same limit is not productive.

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

Yes                       No

5. Do you agree with the compliance monitoring process?

Yes                       No

6. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 201:

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?

Yes                       No

8. Do you agree with the measures?

Yes                       No

9. Do you agree with the compliance monitoring process?

Yes                       No

10. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 202:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206: However, refer to comment under question 37.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 208:

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

**RA data collection and communication is required under Std. 200 and 600 with financial sanction for noncompliance under both. An organization should not be hit with financial sanctions under both standards for not communicating the data. Only one standard should apply.**

August 29, 2003

Comments

200- Operate within Interconnection Reliability Operating Limits

CS Review Team Comments:

- The definitions are well thought out.
- The document has been written in a manner that meets many of the concerns we had with the first draft.
- The key compliance issues that should be measures are captured in 202, 203 and 204. (The other measures, identifying the elements, data collection, data provision, action plan, and RA Directives are important as supporting requirements but do not require a compliance structure. Suggest that the certification process should spell out the policies, procedures and processes, reporting relationships and data collection requirements.)
- There are some concerns with the Compliance levels, and the CS and CRS will discuss that in Charleston, September 8 and 9.
- The added comments below deal mostly with the Compliance Monitoring Process.

201

1. Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion.
2. 4.2 Subsequent to the initial compliance review, the entity responsible shall demonstrate compliance through self-certification submitted to its compliance monitor annually.
3. 4.3 Compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation) method, or review of information submitted as requested, at the discretion of the compliance monitor.
4. Change 4.2 and 4.3 to 4.4 and 4.5

202

1. Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion.
2. Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation of complaint) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor.
5. Re-number 4.2 and 4.3 to 4.3 and 4.4

203

1. Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or

- the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion.
2. Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation of complaint) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor.
  3. Re-number 4.2 and 4.3 to 4.3 and 4.4

204

1. Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion.
2. Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor.
3. Re-number 4.2 and 4.3 to 4.3 and 4.4

205

1. Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion.
2. Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor.
3. Re-number 4.2 and 4.3 to 4.3 and 4.4

206 OK

207

1. Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion.
2. Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor.
3. Re-number 4.2 and 4.3 to 4.3 and 4.4

Background Information:

**Notes to Industry Commenters:**

The standard drafting team (SDT) considered the SAR for this proposed standard as well as the SAR comments previously supplied by the industry community while developing the standard. The SDT believes that it is helpful for the industry to understand the perspective of the SDT while reviewing this draft standard. The SDT also believes that it would be helpful to explain the linkages with other standards currently under development. The explanations below are offered to provide context and facilitate industry comments.

**General Philosophy:**

The SDT addressed the three components of this draft standard in three sets of pairs: Facility Ratings (601, 602), System Operating Limits (603, 604), and Transfer Capabilities (605,606). In

## Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard

---

each of these pairs, the draft standard requires the development and availability of a “methodology” to determine the required quantities and secondly the application of this methodology in the establishment and communication of these values to the users of the values. These standards were developed assuming that the Facility Ratings, System Operating Limits and Transfer Capability values are to be provided to the user (e.g. those entities performing the reliability authority, planning authority, and transmission operator functions) on a schedule established by the *user*. The SDT endeavored to ensure that this draft standard would not require the determination of various values that had no identified user. For this reason, the user of the various values must request the specific values from the value provider (e.g. those entities performing the facility owner and planning authority functions) through the establishment of a schedule to supply the data.

### **Levels of Noncompliance:**

In the three ‘methodologies’ sections (601, 603, 605), the levels of noncompliance are based upon the availability and completeness of the documented procedures. In the three ‘communication’ sections (602, 603, 605), the levels of noncompliance are based on the availability of the values requested by the users of the information and the consistency of these values with the documented methodologies.

### **Sanctions:**

The SDT believes that failure to comply with the three ‘methodologies’ sections (601, 603, 605) does not warrant monetary sanctions, since the methodologies themselves would not directly impact the reliable operation of the transmission system.

The unavailability of Facility Rating *values*, System Operating Limit *values* and to a lesser extent, Transfer Capability *values* will have a real and detrimental impact on the real time reliability of the transmission system as well as the validity of transmission plans for future transmission system additions. Therefore, the three ‘communication’ sections (602, 604, 606) include monetary sanctions for repeated and/or significant noncompliance as per the sanction table. The SDT believes that nominal, fixed dollar sanctions are appropriate in these cases. The application of ‘per MW’ variable sanctions would be inappropriate for these infractions compared to the consequences of violating the requirements of the standard. While the SDT realizes that a minor omission of a requested value could result in sanction, the SDT also believes that graduated sanctions based upon the level of ‘completeness’ of the data received by the users are impractical. The SDT is of the opinion that not all values have equal importance to the reliability of the transmission system, and therefore, sanctions based upon ‘percentage of requested data received’ (perhaps omitting values of specific critical limitations) would be arbitrary.

### **Relationship with “Operate Within Limits” Standard:**

The SDT suggests that this draft standard be reviewed in concert with the “Operate Within Limits” draft standard. The Facility Ratings, System Operating Limits, and Transfer Capabilities draft standard requires the availability and usability of these data. The Operate Within Limits standard addresses the use of a subset of these values in real time operation. The SDT believes that the definitions developed in conjunction with this standard do not prohibit the stratification, or sub-classification, of the requested data (Facility Ratings, System Operating Limits, Transfer Capabilities) for specific uses or users. The intent and purpose of this standard, however, is to identify *all* system operating limits and not to differentiate them based upon the impacts of violating them.

**Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard**

---

**1. This standard assumes that the reliability authority has the ultimate responsibility to establish system operating limits and relies upon the transmission operator for input. Have the roles and responsibilities of transmission operators versus reliability authorities in determining system operating limits been properly characterized in this standard?**

Yes

No

Comments

**2. Do you agree that identifying and communicating all system operating limits is within the scope of this standard and is necessary for reliability?**

Yes

No

Comments

**3. NERC Regions have the right to ask for Regional differences for inclusion in NERC standards. Such differences would apply only to the listed Region and would become an enforceable part of the NERC standard only if approved by the industry. NPCC has requested a Regional difference in section 603. Do you think NPCC’s Regional difference should be included in this standard?**

Yes

No

Comments The NPCC criteria is more stringent than the NERC standard.

**4. Are you aware of any other Regional differences that should be included in this standard?**

Yes

No

Comments Possibly ERCOT and WSCC will have differences.

**Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard**

---

**5. Do you agree with the sanction philosophy in this standard? (No financial penalties for methodology violations, nominal fixed monetary penalties for failure to communicate values).**

Yes

No

Comments Financial penalties should not be applied. This would open the gate to financial penalties for the many, much more severe violations addressed in other standards. The IMO feels that non-monetary sanctions are sufficient.

**6. Do you agree with the proposed requirements and measurements in section 601?**

Yes

No

Comments

**7. Do you agree with the proposed compliance monitoring process in section 601?**

Yes

No

Comments

**8. Do you agree with the proposed levels of non-compliance in section 601?**

Yes

No

Comments See general comment below

**Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard**

---

**9. Do you agree with the proposed requirements and measurements in section 602?**

Yes

No

Comments

**10. Do you agree with the proposed compliance monitoring process in section 602?**

Yes

No

Comments

**11. Do you agree with the proposed levels of non-compliance in section 602?**

Yes

No

Comments The levels do not seem to follow any progression which would suggest increasing severity. Why is failure to have all ratings for existing facilities any different than not having all ratings for new facilities: level 1 as opposed to level 2? Either you have ratings or not.

**12. Do you agree with the proposed requirements and measurements in section 603?**

Yes

No

Comments

Yes

No

Comments

**23. Do you agree with the proposed levels of non-compliance in section 606?**

Yes

No

Comments See general comment below

**24. What additional clarification, details, or modifications to this standard are necessary before it can be brought to ballot?**

Comments All the sanctions text should be removed, as they are dealt with elsewhere.

**Comment Form – 1st Posting of the draft ‘Determine Facility Ratings, System Operating Limits, and Transfer Capabilities’ Standard**

---

**25. Please enter any other comments you have regarding this standard in the space below.**

Comments

The proposed non-compliance levels for all these standards do not follow a natural progression. They seem to be somewhat contrived and slotted into the 4 levels.

601.4.2.2 - 10 years seems rather infrequent. Should provide opportunity for some verification when ratings change.

601.4.3, 602.4.4, 604.4.4, 606.4.4 - 3 years may not be long enough, given the typical timelines required to resolve differences.

603 Table I Note a) – reference is made to NERC Planning Standards – Will these still exist after the new family of standards are in place.

603 Table IA

- The NERC standard permits this table to be included here, but is it really necessary to have it here, other than for information purposes. At the NERC level, would it be sufficient to just note that NPCC has more stringent criteria and refer the reader to the NPCC standards.
- In the 2<sup>nd</sup> row, for “Cascading outages”, superscript “f” should be “c”. Under category C, for “Double Circuit Tower” (item #3) superscript “e” should be “f”
- Note “e” text requires reformatting to remove blank line.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Background

1. Do you agree with the definitions provided in the front of this standard?

Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision.

ISO-NE believes that, with respect to  $T_v$ , there must be an established process through which this is derived or the re-preparation time of thirty minutes should become the standard default absent such a process.

Regarding Cascading Outages, There is no guidance on how the parameters are to be defined which would permit the identification of the local area and the widespread area. It also fails to recognize that a local area problem may evolve into a wider area problem depending on the load, time of day, recent contingencies and other factors. A well-defined process for determining what is (and what is not) a reportable event is essential.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?

Yes                       No

Comments

### Requirement 201 - Interconnection Reliability Operating Limit Identification

3. Do you agree with the requirement?

Yes                       No

4. Do you agree with the measures?

Yes                       No

5. Do you agree with the compliance monitoring process?

Yes                       No

6. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 201:

ISO New England does not believe that we should identify specific limits which must be reported on. Rather, we advocate internally reporting on every violation which does not clear within 30 minutes (as defined in NERC policy). Subsequently, each reported violation will be studied/examined to see if it would have caused instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk power transmission system (have an Inter-Area impact outside of the New England Area following next contingency). If so, ISO New England would report this "OSL violation" to NPCC and NERC within 72 hours. If there would not have been an Inter-Area impact (i.e. the impact would have been localized within the offending Control Area's boundary), no external reporting will occur. We suggest this approach be adopted.

By restricting reporting to pre-identified limits, NERC may not be getting the information they seek through this Standard. Only through a post-operational assessment, can a true analysis (with the correct system configuration) be performed and an adequate judgement be made on the potential impact to the bulk power system.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

We also believe that data should not be archived unless the limit is not cleared within 30 minutes. We do not advocate archiving data for every limit violation if it cleared in less than 30 minutes.

**Requirement 202 - Monitoring**

- 7. Do you agree with the requirement?  
 Yes                       No
  
- 8. Do you agree with the measures?  
 Yes                       No
  
- 9. Do you agree with the compliance monitoring process?  
 Yes                       No
  
- 10. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 202:

ISO-NE believes that, as stated above, data should not be archived unless the limit is not cleared within 30 minutes. Additionally, we suggest the data retention requirement of three years be modified to a 12-month rolling retention.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?  
 Yes                       No
12. Do you agree with the measures?  
 Yes                       No
13. Do you agree with the compliance monitoring process?  
 Yes                       No
14. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 203:

ISO-NE requests the drafting team to provide their thoughts and incorporate allowances in the compliance area for EMS “down time” for maintenance or to switch over to backup system should problems arise.

ISO-NE suggests that more frequent in-day analyses, based on changed system conditions to predict system performance in the coming hours, be required. Again, we believe this relates directly to “hardening up” the  $T_v$  value (i.e. if  $T_v$  is fifteen minutes, how does the ‘at least every 30 minutes’ requirement support reliable operation regarding that specific limit?).

**Requirement 204 - Actions**

15. Do you agree with the requirement?  
 Yes                       No
16. Do you agree with the measures?  
 Yes                       No
17. Do you agree with the compliance monitoring process?  
 Yes                       No
18. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 204:

ISO-NE also suggests adding “footnote 1” that appears on page 10 to the Level one non-compliance measure to capture the thought that no overt action is sometimes an acceptable action.

ISO New England does not believe that we should identify specific limits which must be reported on. Rather, we advocate internally reporting on every violation which does not clear within 30 minutes (as defined in NERC policy). Subsequently, each reported violation will be studied/examined to see if it would have caused instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk power transmission system (have an Inter-Area impact outside of the New England Area following next contingency). If so, ISO New England would report this "OSL violation" to NPCC and NERC within 72 hours. If there would not have been an Inter-Area impact (i.e. the impact would have been localized within the offending Control Area's boundary), no external reporting will occur. We suggest this approach be adopted.

## **Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

By restricting reporting to pre-identified limits, NERC may not be getting the information they seek through this Standard. Only through a post-operational assessment, can a true analysis (with the correct system configuration) be performed and an adequate judgement be made on the potential impact to the bulk power system.

We also believe that data should not be archived unless the limit is not cleared within 30 minutes. We do not advocate archiving data for every limit violation if it cleared in less than 30 minutes.

### **Requirement 205 - Data Specification**

19. Do you agree with the requirement?

Yes

No

20. Do you agree with the measures?

Yes

No

21. Do you agree with the compliance monitoring process?

Yes

No

22. Do you agree with the levels of non-compliance?

Yes

No

Comments about Requirement 205:

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206:

Under the Section 4.3.1 “Copies of transmittal cover letters...” may not be an appropriate measure for instances of notification of missing data. For example, most of the data required is transmitted electronically from field equipment, through ICCP/SCADA, and into the EMS. Where would such “cover letters” fall in this process?

Regarding the level of non-compliance for not providing data to the reliability authority, ISO-NE believes that there should be some differentiation between not submitting any data and submitting partial data or new/additional data and perhaps there needs to be some more granularity in the description of what constitutes non-compliance.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207:

ISO-NE again suggests that provisions be made for mitigating actions which were not previously identified by study, but cleared the limit violation. If these provisions are not included, it may restrict the actions that may be taken and, ultimately, adversely impact reliability (i.e. there may be actions that can be taken in real-time, given an existing network configuration which was not envisioned at the time the operational analysis was done; however, if NERC Standards mandate that an action plan be followed, these actions may not be taken or seriously considered).

All data retention requirements of three years should be modified to a 12-month rolling retention.

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes

No

33. Do you agree with the compliance monitoring process?

Yes

No

34. Do you agree with the levels of non-compliance?

Yes

No

Comments about Requirement 208:

Although we agree with the level four instance of non-compliance, it would be beneficial for the compliance monitor to require data and other information surrounding the inaction.

**35. List any Regional or Interconnection Differences for this standard:**

**36. Notifying the Compliance Monitor**

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

**37. Any other comments on this standard?**

ISO-NE is adamantly opposed to monetary sanctions and believes that letters of increasing severity are a much more effective compliance tool for ensuring adherence to standards.

ISO-NE also believes there is a lack of coordination between the standard drafting teams and has noted instances where one team felt an issue was addressed in a separate standard to later learn it was not. As an example, with respect to the Balancing Resources standard, transmission overloads that are caused by poor control are not covered by this standard unless they reach a high level IROL. It later was identified that where this was thought to have been covered, the Operate Within Limits Standard, it was not. We would suggest that there be technical oversight as we go forward with these processes to ensure there are no “gaps” or critical reliability issues that are not addressed in the resultant standards.

ISO New England does not believe that we should identify specific limits which must be reported on. Rather, we advocate internally reporting on every violation which does not clear within 30 minutes (as defined in NERC policy). Subsequently, each reported violation will be studied/examined to see if it would have caused instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk power transmission system (have an Inter-Area impact outside of the New England Area following next contingency). If so, ISO New England would report this "OSL violation" to NPCC and NERC within 72 hours. If there would not have been an Inter-Area impact (i.e. the impact would have been localized within the offending Control Area's boundary), no external reporting will occur. We suggest this approach be adopted.

By restricting reporting to pre-identified limits, NERC may not be getting the information they seek through this Standard. Only through a post-operational assessment, can a true analysis (with the correct system configuration) be performed and an adequate judgement be made on the potential impact to the bulk power system.

## **Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

We also believe that data should not be archived unless the limit is not cleared within 30 minutes. We do not advocate archiving data for every limit violation if it cleared in less than 30 minutes.

From a global perspective, it would be a prudent action to place the NERC RS development in a moratorium until the investigation into the August 14<sup>th</sup> blackout cause is completed and determinations have been made. There could be new reliability issues that need to be captured in the developing RS that need to be incorporated into the upcoming draft RS.

ISO-NE also seeks explanation for drawing the line at addressing only instability, cascading outages and separation. For example, what standard, if any, will address the scenario where an entity operates their system to cause a sizable thermal overload on a transmission line in another entity's system. (e.g. a transmission line burns down if the affected entity does not take corrective action).

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 2 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)  
The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_02) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>  
E-mail this form between July 1–August 29, 2003, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards Draft Comment Form, please contact the Director of Standards – Tim Gallagher at 609-452-8060.

### Major Changes to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first posting of this standard. You can see the Standards Drafting Team’s consideration of those comments at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

**Definition of System Operating Limits Addressed by this Standard.** The system operating limits being addressed by this standard are called, ‘interconnection reliability operating limits’ or ‘IROLs.’ Each IROL is a system operating limit established by the Reliability Authority following the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes.

When an IROL is exceeded (operating in the ‘yellow’ area in the following figure), then the RA must act or direct others to act. The clock starts ticking once the value is equal to or greater than the IROL. (This is  $t_0$ .) The clock continues to tick until the value is returned to a magnitude that is less than the IROL. Note that the value must remain below the IROL for a minimum of 30 seconds for the clock to stop. (The end of the event is marked by  $t_1$ .) If the duration of the event is less than  $T_v$ , then the event must be documented. If the duration of the event is equal to or greater than  $T_v$  (enters the red area in the following figure), then the event must be documented and reported to the Compliance Monitor.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (when the value enters the ‘yellow’ area) and continues to the end of the event  $t_1$ , when the value returns to a magnitude that is less than the IROL and remains under the IROL for at least 30 seconds. In this example,  $t_1$  is less than  $T_v$ , and the event must be documented, but the event does not need to be reported to the Compliance Monitor with an IROL Violation Report.

The following figure provides an example of an event where some value exceeds its IROL. The clock starts ticking at  $t_0$  (enters the ‘yellow area’) and continues to the end of the event, when the value returns to a magnitude that is less than the IROL and remains below the IROL for at least 30 seconds. In this example,  $t_1$  is greater than  $T_v$  (enters the ‘red area’), and the event must be documented and reported to the Compliance Monitor.

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

**Requirement to Establish a List of IROLs.** When this standard was first drafted, the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Team (Facility Ratings Team) was still working on its SAR. The Facility Ratings Team developed a definition of a system operating limit, but did not develop a term to identify the subset of system operating limits addressed by this standard. This version of this standard includes a new requirement that the RA or PA identify the facilities in the reliability area that are subject to IROLs, and that the RA or TOP identify the IROLs within that reliability area. The list of facilities subject to IROLs is expected to remain relatively constant, with a change or two in a year – but the list of IROLs is dynamic and could change daily.

**TOP Requirements.** The first version of this standard included several requirements for Transmission Operators that were identical, or nearly identical, to requirements for the Reliability Authority. Several commenters indicated that these redundant requirements were inappropriate. Some commenters indicated the TOP requirements were inappropriate because they could lead to operating confusion by having multiple entities trying to control the same limit. Other commenters indicated that having the same requirement assigned to both the RA and the TOP wasn't supported in the Functional Model. (Under the Functional Model, each responsibility is assigned to a single function, and no responsibility is assigned to more than one function.) Other commenters indicated that under the Functional Model, the Transmission Operator has the following responsibility:

- “Provides local network integrity by defining operating limits, developing contingency plans, and monitoring operations.”

This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority. Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages.

For these reasons, this second version of the standard does not contain the following requirements for the TOP:

- 202 - The Transmission Operator (TOP) shall monitor (in real time) the system operating limits (identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system) and the actual real time data associated with those limits.
- 204 - The Transmission Operator (TOP) shall specify and collect the data it needs (from its associated Balancing Authorities (BAs), Interchange Authorities (IAs), Generators and Reliability Authority (RA) and other associated TOPs] to maintain the models needed to support real time monitoring and reliability analyses.
- 211 - The Transmission Operator (TOP) shall perform reliability analyses to identify where on its system the TOP may encounter problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 213 - The Transmission Operator (TOP) shall use the results of real time monitoring and/or reliability analyses to take actions necessary to prevent/mitigate identified problems that could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.
- 215 - The Transmission Operator (TOP) shall have a documented mitigation plan that identifies actions to be taken to prevent exceeding an identified system operating limit.
- 217 - The Transmission Operator (TOP) shall document instances of exceeding identified system operating limits

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Because several commenters indicated a desire to have requirements that address the TOP's control of its system operating limits, the SDT has sent a letter to the Director of Standards to apprise him of the situation and request appropriate follow-up.

### **Requirement to Follow RA Directives**

Several commenters indicated there should be a requirement for TOPs to follow the RA's directives. The functional model includes the following under the functional relationships of the RA:

- Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities

In preventing or relieving IROLs, the RA may direct not only the TOP, but also the BA, and IA and these functions were added to this new requirement to follow RA directives.

The SDT could not identify any actions the TSP would take to prevent or relieve instances of exceeding IROLs, and did not include the TSP in the list of functions that must comply with the RA's directives.

**RA to RA Coordination.** Several commenters indicated a need to add a requirement for the Reliability Authority to coordinate its actions with other Reliability Authorities. There is another standard called, "Coordinate Operations" that addresses the coordination between Reliability Authorities.

**Levels of Non-compliance.** There were many comments submitted, asking that the SDT include more than one level of non-compliance for each requirement. The SDT considered this, and added more levels in some cases, but not in all cases. These new standards are very different from the existing Operating Policies and Planning Standards. The new standards provide much less specificity on 'how' to achieve the performance requirement – and attempt to describe more objective performance goals. From the SDT's perspective, either the performance goal is met or it isn't met – there isn't a gray area where partial credit is appropriate. In this standard, the focus is on a subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. Implementing a system that 'forgives' RAs for missing this performance goal seems inappropriate to the SDT. As you review the revised standard, the SDT asks that you consider the ramifications of not meeting the requirement. If the ramifications are severe enough, then consider whether multiple levels of non-compliance are appropriate.

**RA Responsibility for Effort or Achievement.** This standard includes a requirement that the RA act or direct others to act to return to an operating state where no IROL has been exceeded before the time of the event exceeds the IROL's  $T_v$ . Several commenters suggested that the RA should not be penalized if the RA directed others to act, but they failed to act in time to prevent exceeding an IROL for its  $T_v$ . The SDT understands that there is division in the industry on this issue, and asks that you pay special attention to the levels of non-compliance in this standard. The SDT believes that the RA must be held accountable for achieving results – not just for trying to achieve those results.

**Compliance Monitoring Process.** There were several comments submitted with questions about the compliance monitoring process and the terminology used to define how compliance will be administered. The Reliability Standards Process Manual includes the following table that identifies what compliance elements must be addressed within each standard. Standards Drafting Teams are responsible for drafting the Compliance Monitoring Process for each standard, and for identifying Levels of Non-compliance. The Sanctions table is referenced in each standard, but is updated each year as part of the Compliance Program.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Compliance Monitoring Process	Defines for each measure: <ul style="list-style-type: none"> <li>– The specific data or information that is required to measure performance or outcomes.</li> <li>– The entity that is responsible to provide the data or information for measuring performance or outcomes.</li> <li>– The process that will be used to evaluate data or information for the purpose of assessing performance or outcomes.</li> <li>– The entity that is responsible for evaluating data or information to assess performance or outcomes.</li> <li>– The time period in which performance or outcomes is measured, evaluated, then reset.</li> <li>– Measurement data retention requirements and assignment of responsibility for data archiving.</li> </ul>
Levels of Non-Compliance	Defines the levels of non-compliance for each measure, typically based on the actual or potential severity of the consequences of non-compliance.
Sanctions	Defines all penalties or sanctions associated with non-compliance, typically based on level of non-compliance and number of offenses.

The following information was provided by the Director of Compliance to help teams identify the compliance monitoring process for each requirement in the standard.

- **Self-Certification** – A process whereby an entity submits a form to its Compliance Monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard. Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed each year.
- **Periodic Reporting** – An established monitoring and reporting process (to measure compliance with one or more requirements for a standard) with a defined frequency such as monthly reports, or quarterly reports. Each entity submits a form to its Compliance Monitor per the announced frequency.
- **Spot Reporting or Spot Reviews** – A monitoring and reporting process (to measure compliance with one or more requirements for a standard) without an announced schedule. Each entity submits a form to its Compliance Monitor when requested by that Compliance Monitor.
- **Exception Reporting** - A reporting process where, when an entity’s performance meets certain criteria, such as exceeding certain operating limits, that entity is responsible for reporting its performance to its Compliance Monitor.
- **Triggered Investigation** – An investigation initiated when the Compliance Monitor becomes aware of operational performance that has jeopardized reliability of the bulk electric system. The intent of the investigation is to verify that the entity responsible is aware of the seriousness of any infractions and to determine if the unreliable performance was an aberration or part of a pattern of unreliable operational performance.

**Definitions.** The last comment form asked if there were any terms that should be defined as part of the development of this standard. Each term that is in the revised standard has been defined. None of the terms was in the NERC Terms Used in the Policies, but several of the terms were in the NERC Glossary. If the term was previously defined as part of the NERC Glossary, we’ve adopted that definition. Several of the terms related to the Functional Model, and we’ve included the definitions provided in the Functional Model.

The SDT thanks all who contributed comments on the first posting of this standard. Your feedback provided the guidance needed to revise this standard!

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Background**

1. Do you agree with the definitions provided in the front of this standard?  
 Yes                       No

Identify any definitions that you feel need to be revised, and if possible provide a suggested revision. Assuming that the intent of including the definitions is a placeholder until a new Glossary is developed, then it is appropriate that the definitions be provided with the standard. There is a risk of a conflicting definition if more than one document. The only definitions that should appear in the Standard should be those specific to THIS standard and NOT defined in a higher level or more authoritative document. There is/was a NERC Glossary of Terms that contains consensus definitions of terms (including BES, instability, etc.). There is a clear risk of writing a new or conflicting definition.

2. Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?  
 Yes                       No

Comments:

Conditionally that it cannot be interpreted to absolve or insulate the TOP from responsibility for following the directive(s) of the RA.

**Requirement 201 - Interconnection Reliability Operating Limit Identification**

3. Do you agree with the requirement?  
 Yes                       No
4. Do you agree with the measures?  
 Yes                       No
5. Do you agree with the compliance monitoring process?  
 Yes                       No
6. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 201: While 201.4.1 states "self-certification" who is the ultimate arbiter of what is the "complete list" of facilities and limits? The levels of non-compliance do not allow for degrees of compliance (e.g., list is not complete). We disagree with the imposition of monetary sanctions as it has not been demonstrated to be an effective means of achieving compliance.

**Requirement 202 - Monitoring**

7. Do you agree with the requirement?  
 Yes                       No
8. Do you agree with the measures?  
 Yes                       No
9. Do you agree with the compliance monitoring process?  
 Yes                       No
10. Do you agree with the levels of non-compliance?

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No

Comments about Requirement 202: The levels of non-compliance do not allow for degrees of compliance (e.g., list is not complete). We disagree with the imposition of monetary sanctions as it has not been demonstrated to be an effective means of achieving compliance.

**Requirement 203 - Analyses and Assessments**

11. Do you agree with the requirement?

Yes                       No

12. Do you agree with the measures?

Yes                       No

13. Do you agree with the compliance monitoring process?

Yes                       No

14. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 203: the general nature of this requirement seems “open-ended” and does not reflect the reality of system analysis capabilities. R203.2.1.1 appears to require day-ahead assessment of voltage and stability, and R203.2.1.2 requires that assessment be performed every 30-minutes. Analysis of voltage or transient stability is not possible in a (near) real-time environment, and may not be practical even in a day-ahead context. Data to perform such analysis may also be required from planning, balancing and scheduling authorities and market operations. Should the Planning Authority be required to evaluate the “maintainability” of the “as designed” system to insure that system security can be preserved during equipment maintenance outages?

We disagree with the imposition of monetary sanctions as it has not been demonstrated to be an effective means of achieving compliance.

**Requirement 204 - Actions**

15. Do you agree with the requirement?

Yes                       No

16. Do you agree with the measures?

Yes                       No

17. Do you agree with the compliance monitoring process?

Yes                       No

18. Do you agree with the levels of non-compliance?

Yes                       No

Comments about Requirement 204: The level of compliance does not recognize that there could be frequent occurrences where a limit is exceeded and then clears with no action being required or taken – that no action was taken could be (incorrectly) interpreted as a compliance violation for which there was no IROL violation. There are also examples of system limits that can be violated by external cause for which the RA has no control over – is the RA expected to take all actions (including shed

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

firm load) to correct for a condition which it neither caused, nor has the means to correct through other means?

We disagree with the imposition of monetary sanctions as it has not been demonstrated to be an effective means of achieving compliance.

**Requirement 205 - Data Specification**

19. Do you agree with the requirement?

Yes  No

20. Do you agree with the measures?

Yes  No

21. Do you agree with the compliance monitoring process?

Yes  No

22. Do you agree with the levels of non-compliance?

Yes  No

Comments about Requirement 205: Entities providing data should be expanded to include the Planning authority, loads (and other PSE, etc.). Measures does not recognize that certain aspects of data communication/collection can take weeks/months to implement, and the process of getting data for new facilities needs to be started with the Planning authority – hardly a matter of 5 days. The EMS systems being used by RAs are at a point that manual process is ineffective (if even possible) – the standard should encourage increased functionality of automated back-up systems or redundant EMS capabilities to insure continuity of data and functionality.

205.1.3 remove phrase “that has facilities monitored by the reliability authority”

We disagree with the imposition of monetary sanctions as it has not been demonstrated to be an effective means of achieving compliance.

**Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

**Requirement 206 - Data Provision**

23. Do you agree with the requirement?  
 Yes                       No
24. Do you agree with the measures?  
 Yes                       No
25. Do you agree with the compliance monitoring process?  
 Yes                       No
26. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 206: Entities providing data should be expanded to include the Planning authority, loads (and other PSE, etc.).  
We disagree with the imposition of monetary sanctions as it has not been demonstrated to be an effective means of achieving compliance.

**Requirement 207 - Action Plan**

27. Do you agree with the requirement?  
 Yes                       No
28. Do you agree with the measures?  
 Yes                       No
29. Do you agree with the compliance monitoring process?  
 Yes                       No
30. Do you agree with the levels of non-compliance?  
 Yes                       No

Comments about Requirement 207: Requirement is too vague; what is an "action plan" – please define. The 207.2.1.1 measure is a conditional definition of "action plan" and, as such, should be in the glossary of terms. We disagree with the imposition of monetary sanctions as it has not been demonstrated to be an effective means of achieving compliance.

**Requirement 208 – Reliability Authority Directives**

31. Do you agree with the requirement?  
 Yes                       No
32. Do you agree with the measures?  
 Yes                       No
33. Do you agree with the compliance monitoring process?  
 Yes                       No
34. Do you agree with the levels of non-compliance?  
 Yes                       No

## Comment Form for 2<sup>nd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Comments about Requirement 208: RAs using real-time security constrained dispatch may automatically correct for limit violations by adjusting output of one or more generators. The process is automatic and may only generate logs entries on an exception basis – when a generator fails to follow dispatch signals. It should also be noted that these systems typically have performance penalties as part of the energy accounting process and therefore the imposition of monetary sanctions would not be necessary to achieve compliance.

### 35. List any Regional or Interconnection Differences for this standard:

### 36. Notifying the Compliance Monitor

One of the elements in Requirement 205 - Data Specification & Collection is:

- *The reliability authority shall notify its compliance monitor when an entity does not provide data as specified.*

In response to the first posting of this draft standard, several commenters indicated that requirement should not be included in the standard. The reason provided was:

- *The reference to notification of Compliance Monitor should not be specific to this or another standard and should be centralized in a compliance document.*

The SDT originally included this to ensure that the compliance monitor would know if some entity had failed to provide the RA with critical data – the intent was to give the Compliance Monitor information to start a ‘triggered investigation’. The existing compliance program documents do not contain any documentation to address the need to notify the compliance monitor. The SDT is undecided about whether the requirement to notify the compliance monitor should be included in this standard.

Do you think this standard should include language that requires the RA to notify its compliance monitor – or do you think notification of the compliance monitor should be addressed more globally in a Compliance Enforcement Program document?

**Include in this standard**

**Include in a Compliance Enforcement Program Document**

**Comments**

### 37. Any other comments on this standard?

These definitions will be posted and balloted along with the standard, but will not be restated in the standard. Instead, they will be included in a separate “Definitions” section containing definitions relevant to all standards that NERC develops.

### Definitions

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and bulk transmission system.

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location.

**Generator Owner:** The entity that owns the generator.

**Instability:** The inability of the transmission system to maintain a state of equilibrium during normal and abnormal system conditions or disturbances.

**Interconnection Reliability Operating Limit:** A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system.

**Interconnection Reliability Operating Limit Event:** An instance of exceeding an Interconnection Reliability Operating Limit for any length of time.

**Interconnection Reliability Operating Limit Event Duration:** The length of time an Interconnection Reliability Operating Limit is exceeded. The duration is measured from the point where the limit is first exceeded and ends when the value drops below the limit and remains below the limit for at least 30 seconds.

**Occurrence Period (Performance-reset Period):** The time period in which performance is measured, evaluated, and then reset.

**Operational Planning Analysis:** An analysis of the expected system conditions, given the load forecast(s), and known system constraints, some examples being transmission facility outages, generator outages, and equipment limitations.

**Real-time:** Present time as opposed to future time.

**Real-time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

**Real-time Data:** Real-time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

**Reliability Authority Area:** The collection of generation, transmission, and loads within the boundaries of the organization performing the Reliability Authority function. Its boundary coincides with one or more Balancing Authority areas.

**Self-certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

**T<sub>v</sub>:** The maximum time that an Interconnection Reliability Operating Limit can be exceeded without compliance sanctions being applied.

**Transmission Operator:** The entity that operates the transmission Facilities and executes switching orders.

**Uncontrolled Separation:** The unplanned break-up of an interconnection, or portion of an interconnection, that is not the result of automatic action by a special protection system or remedial action scheme operating correctly.

**Wide Area Impact:** The impact of an event that, if left untended, could lead to voltage instability, cascading outages or uncontrolled separation that jeopardizes the reliability of an interconnection. The geographic size of the area affected by such an event is always larger than the local area monitored by a single transmission operator and may also be larger than a single Reliability Authority's area.

## 200 — OPERATE WITHIN INTERCONNECTION RELIABILITY OPERATING LIMITS

201	Interconnection Reliability Operating Limit Identification
202	Monitoring
203	Analyses and Assessments
204	Actions
205	Data Specification and Collection
206	Data Provision
207	Action Plan
208	Reliability Authority Directives

1. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system.
2. **Effective Date:** This standard will become effective on the first day of the month following the month that the NERC Board of Trustees adopts the standard.
3. **Applicability:** These requirements apply to entities performing various electric system functions, as defined in the functional model approved by the NERC Board of Trustees in June 2001. NERC is now developing standards and procedures for the identification and certification of such entities. Until that identification and certification is complete, this standard applies to the existing entities (such as control areas, transmission owners and operators, and generator owners) that are currently performing the defined functions.

In this standard, the terms *Balancing Authority*, *Generator Operator*, *Generator Owner*, *Interchange Authority*, *Load-serving Entity*, *Reliability Authority*, *Transmission Operator*, and *Transmission Owner* refer to the entities performing these functions as defined in the functional model.

**201 IROL Identification**

**(a) Requirements**

- (1) The Reliability Authority shall identify and document which Facilities (or groups of Facilities) in the Reliability Authority's Reliability Authority Area are subject to Interconnection Reliability Operating Limits.
- (2) The Reliability Authority shall identify each Interconnection Reliability Operating Limit within the Reliability Authority's Reliability Authority Area.
  - (i) The Reliability Authority shall identify a  $T_v$  for each Interconnection Reliability Operating Limit.

**(b) Measures**

- (1) The Reliability Authority shall have a list of Facilities (or groups of Facilities) in the Reliability Authority's Reliability Authority Area that are subject to Interconnection Reliability Operating Limits.
  - (i) The Reliability Authority shall have evidence it reviews and updates the list of Facilities to reflect changes in system topology.
- (2) The Reliability Authority shall have a list of Interconnection Reliability Operating Limits for the Reliability Authority's Reliability Authority Area.
  - (i) The Reliability Authority shall have a  $T_v$  for each Interconnection Reliability Operating Limit.
- (3) The Reliability Authority shall have evidence that it updates the list of Interconnection Reliability Operating Limit values to reflect current system conditions.

**(c) Regional Differences**

None identified.

**(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Reliability Authority shall keep data on facilities and limits for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall have the following available upon the request of its Compliance Monitor:
  - (i) List of Facilities (or groups of Facilities) in the Reliability Authority's Reliability Authority Area that are subject to Interconnection Reliability Operating Limits.

- (ii) List of Interconnection Reliability Operating Limits for the Reliability Authority's Reliability Authority Area.
- (iii) Evidence that the list of Facilities subject to Interconnection Reliability Operating Limits and the list of Interconnection Reliability Operating Limits were updated.

**(e) Levels of Noncompliance**

- (1) Level one: Not applicable
- (2) Level two: Not applicable
- (3) Level three: Either the list of Interconnection Reliability Operating Limits or the list of Facilities subject to Interconnection Reliability Operating Limits was not updated.
- (4) Level four: No list of Interconnection Reliability Operating Limits or no list of Facilities subject to Interconnection Reliability Operating Limits exists for the Reliability Authority's Reliability Authority Area.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where financial sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## **202 Monitoring**

### **(a) Requirements**

- (1) The Reliability Authority shall perform Real-time Monitoring of system operating parameters to determine if the Reliability Authority Area is operating within its Interconnection Reliability Operating Limits.

### **(b) Measures**

- (1) The Reliability Authority shall have Interconnection Reliability Operating Limits available for its operations personnel's Real-time use.
- (2) The Reliability Authority shall have Real-time Data available in a form that system operators can compare to the Interconnection Reliability Operating Limits.
- (3) The Reliability Authority shall monitor system operating parameters and compare these against its Interconnection Reliability Operating Limits.

### **(c) Regional Differences**

None identified.

### **(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Reliability Authority shall keep data on limits for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall demonstrate the following upon the request of the Compliance Monitor:
  - (i) System operators actively monitoring and comparing Real-time system operating parameters associated with Interconnection Reliability Operating Limits.

### **(e) Levels of Noncompliance**

- (1) Level one: Not applicable
- (2) Level two: Not applicable
- (3) Level three: Not applicable
- (4) Level four: A level four noncompliance occurs if any of the following conditions are present:
  - (i) Interconnection Reliability Operating Limits not available to operations personnel for Real-time use; or
  - (ii) Real-time Data not available in a form that can be compared to the Interconnection Reliability Operating Limits; or

- (iii) System operating parameters not monitored and compared against Interconnection Reliability Operating Limits.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where financial sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

**203 Analyses and Assessments**

**(a) Requirements**

- (1) The Reliability Authority shall perform Operational Planning Analyses to assess whether the planned Bulk Electric System operations within the Reliability Authority's Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits.
- (2) The Reliability Authority shall perform Real-time Assessments to determine if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits.

**(b) Measures**

- (1) The Reliability Authority shall identify operating situations or events that impact its Reliability Authority Area's ability to operate without exceeding any identified Interconnection Reliability Operating Limits.
  - (i) The Reliability Authority shall conduct an Operational Planning Analysis at least once each day, evaluating the next day's projected system operating conditions.
  - (ii) The Reliability Authority shall conduct a Real-time Assessment periodically, but at least once every 30 minutes.

**(c) Regional Differences**

None identified.

**(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall identify the following upon the request of the Compliance Monitor:
  - (i) The time the most recent Operational Planning Analysis was conducted.
  - (ii) Whether the planned Bulk Electric System operations within the Reliability Authority's Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits.
  - (iii) The time the most recent Real-time Assessment was conducted.
  - (iv) Whether the Real-time Assessment identified if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits.

**(e) Levels of Noncompliance**

- (1) Level one: Not applicable
- (2) Level two: Not applicable
- (3) Level three: A level three noncompliance exists if any of the following conditions are present:
  - (i) No indication that an Operational Planning Analysis was conducted at least once each day.
  - (ii) No indication that a Real-time Assessment was conducted at least once each 30 minutes.
- (4) Level four: A level four noncompliance exists if either of the following conditions are present:
  - (i) The Reliability Authority could not identify whether the planned Bulk Electric System operations within the Reliability Authority's Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits, based on the results of the most recent Operational Planning Analysis.
  - (ii) The Reliability Authority could not identify whether the most recent Real-time Assessment identified if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where financial sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

**204 Actions**

**(a) Requirements**

- (1) The Reliability Authority shall act<sup>1</sup> or direct others to act to:
  - (i) Prevent instances where Interconnection Reliability Operating Limits may be exceeded.
  - (ii) Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded.
- (2) The Reliability Authority shall document instances of exceeding Interconnection Reliability Operating Limits and shall document and complete an Interconnection Reliability Operating Limit Violation Report for instances of exceeding Interconnection Reliability Operating Limits for time greater than  $T_v$ .
  - (i) The RA shall measure the duration of the event from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

**(b) Measures**

- (1) The Reliability Authority shall document each instance where actions are taken or directives are issued to mitigate the magnitude and duration of exceeding an Interconnection Reliability Operating Limit.
  - (i) The Reliability Authority shall document, via an operations log or other data source, the actions taken or directives issued, the magnitude of the event, and the duration of the event. (This data may be from an operating log, may be from the entity's energy management system, or may be from some other source.)
- (2) The Reliability Authority shall report each instance of exceeding an Interconnection Reliability Operating Limit for time greater than  $T_v$ .
  - (i) The Reliability Authority shall complete an Interconnection Reliability Operating Limit Violation Report and shall file the report with its Compliance Monitor within five business days of the initiation of the event. (The report shall include the date and time of the event, identification of which Interconnection Reliability Operating Limit was violated and the  $T_v$  for that limit, magnitude and duration of exceeding the Interconnection Reliability Operating Limit, actions taken or directives issued and the time these were initiated or issued, and explanation of results of actions or directives.)

**(c) Regional Differences**

None identified.

---

<sup>1</sup> Note that the Reliability Authority may choose to take 'no overt action' and this may be an acceptable action as long as it is documented. Taking 'no overt action' is not the same as ignoring the problem.

**(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Reliability Authority shall keep Interconnection Reliability Operating Limit Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall have the following available upon the request of its Compliance Monitor:
  - (i) Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an Interconnection Reliability Operating Limit and the actions or directives issued for each of these instances.
  - (ii) Interconnection Reliability Operating Limit Violation Reports.

**(e) Levels of Noncompliance <sup>2</sup>**

- (1) Level one: Interconnection Reliability Operating Limit exceeded for a time less than or equal to  $T_v$  and no documentation to indicate actions taken or directives issued to mitigate the instance.
- (2) Level two: Not applicable
- (3) Level three: Not applicable
- (4) Level four: Interconnection Reliability Operating Limit exceeded for time greater than  $T_v$ .

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. Level one noncompliance sanctions shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions. Level four noncompliance sanctions shall be the greater of the fixed dollar sanctions listed in the matrix, or the number of megawatts above the Interconnection Reliability Operating Limit multiplied by the dollar value for the number of times of noncompliance.

---

<sup>2</sup> Note that the Reliability Authority may choose to take 'no overt action' and this may be an acceptable action as long as it is documented. Taking 'no overt action' is not the same as ignoring the problem.

**205 Data Specification and Collection**

**(a) Requirements**

- (1) The Reliability Authority shall specify and collect the data it needs to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments conducted relative to operating within its Reliability Authority Area's Interconnection Reliability Operating Limits. The Reliability Authority shall collect this data from the entities performing functions that have Facilities monitored by the Reliability Authority, and from entities that provide Facility status to the Reliability Authority. This includes specifying and collecting data from the following:
  - (i) Balancing Authorities
  - (ii) Generator Owners
  - (iii) Generator Operators
  - (iv) Load-serving Entities
  - (v) Reliability Authorities
  - (vi) Transmission Operators
  - (vii) Transmission Owners
- (2) The Reliability Authority shall specify when to supply data (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).
- (3) The Reliability Authority shall notify its Compliance Monitor when both of the following conditions are present:
  - (i) An entity that has data needed to support Real-time Monitoring, Operational Planning, or Real-time Assessments relative to operating within the Reliability Authority's Reliability Authority Area has not provided data as specified, and
  - (ii) The Reliability Authority was unable to resolve the issue with the entity responsible for providing the data.

**(b) Measures**

- (1) The Reliability Authority shall have a documented specification for data needed to build and maintain models needed to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments relative to Interconnection Reliability Operating Limits.
  - (i) Specification shall include a list of required data, a mutually agreeable format, and timeframe and periodicity for providing data.
  - (ii) Specification shall address the data provision process to use when automated Real-time system operating data is unavailable.

- (2) The Reliability Authority shall have evidence that it has distributed its data specification to entities that have Facilities monitored by the Reliability Authority and to entities that provide Facility status to the Reliability Authority.
- (3) The Reliability Authority shall notify its Compliance Monitor when an entity that has Facilities monitored by the Reliability Authority, or an entity that provides Facility status to the Reliability Authority, does not provide data as specified and the Reliability Authority was unable to resolve the issue with the entity responsible for providing the data.
  - (i) If the Reliability Authority does not receive data as specified, and is unable to resolve the situation, then the Reliability Authority shall notify its Compliance Monitor within five business days of discovering that the data is missing.

**(c) Regional Differences**

None identified.

**(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Reliability Authority shall keep its data specification(s) for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall have the following available upon the request of the Compliance Monitor:
  - (i) Data specification(s)
  - (ii) Proof of distribution of the data specification(s)

**(e) Levels of Noncompliance**

- (1) Level one: Data specification incomplete (missing either the list of required data, a mutually agreeable format, a timeframe for providing data, or a data provision process to use when automated real-time system operating data is unavailable).
- (2) Level two: No data specification or the specification not distributed to the entities that have Facilities monitored by the Reliability Authority and the entities that provide the Reliability Authority with Facility status.
- (3) Level three: Not applicable
- (4) Level four: Not applicable

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

**206 Data Provision**

**(a) Requirements**

- (1) Each entity performing one of the following functions shall provide data, as specified, to the Reliability Authority(ies) with which it has a reliability relationship. The data is limited to data needed by the Reliability Authority to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments conducted relative to operating within its Reliability Authority Area's Interconnection Reliability Operating Limits.
  - (i) Balancing Authorities
  - (ii) Generator Owners
  - (iii) Generator Operators
  - (iv) Load-serving Entities
  - (v) Reliability Authorities
  - (vi) Transmission Operators
  - (vii) Transmission Owners

**(b) Measures**

- (1) The responsible entity shall have evidence that it has provided data, as specified, to the requesting Reliability Authority, within the timeframe specified, in the mutually agreed upon format.

**(c) Regional Differences**

None identified.

**(d) Compliance Monitoring Process**

- (1) The responsible entity shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period is 12 months from the last violation. The responsible entity shall keep data transmittal documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The responsible entity shall have the following available upon the request of the Compliance Monitor:
  - (i) Evidence indicating data was sent to the Reliability Authority or evidence that the entity responsible committed to providing the data identified in the specification.

**(e) Levels of Noncompliance**

- (1) Level one: Not applicable
- (2) Level two: Not applicable
- (3) Level three: Not applicable
- (4) Level four: Data was not provided to the Reliability Authority as specified and the situation was not resolved with the Reliability Authority.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

**207 Action Plan**

**(a) Requirements**

- (1) The Reliability Authority shall have an action plan that identifies actions it shall take or actions it shall direct others to take, to prevent or mitigate instances of exceeding its Interconnection Reliability Operating Limits.

**(b) Measures**

- (1) The Reliability Authority shall have a documented action plan that addresses preventing and mitigating instances of exceeding Interconnection Reliability Operating Limits. The plan shall identify and be coordinated with those entities responsible for acting and with those entities impacted by such actions.
  - (i) The action plan may be a process or procedure for preventing or mitigating instances of exceeding Interconnected Reliability Operating Limits. (Note: an emergency operations plan satisfies this requirement if the emergency operations plan addresses actions to prevent and mitigate instances of exceeding Interconnected Operating Reliability Limits.)

**(c) Regional Differences**

None identified.

**(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period is 12 months from the last violation. The Reliability Authority shall keep its action plan for three calendar years. The Compliance Monitor shall keep audit records for three calendar years.
- (3) The Reliability Authority shall make the following available for inspection by the Compliance Monitor upon request:
  - (i) Action plan

**(e) Levels of Noncompliance**

- (1) Level one: Action plan exists but wasn't coordinated with all involved and impacted entities.
- (2) Level two: Action plan exists but wasn't coordinated with any involved or any impacted entities.
- (3) Level three: Not applicable
- (4) Level four: No action plan

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where sanctions are applied

for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

**208 Reliability Authority Directives**

**(a) Requirements**

- (1) The Transmission Operator, Balancing Authority, and Interchange Authority shall follow the Reliability Authority's directives to:
  - (i) Prevent instances where Interconnection Reliability Operating Limits may be exceeded.
  - (ii) Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded.
- (2) The responsible entity shall document the Reliability Authority's directives and the actions taken.

**(b) Measures**

- (1) The responsible entity shall follow the Reliability Authority's directives and shall document the directives and actions taken to meet the directives.
- (2) The responsible entity shall document via an operations log or other data source, the following for each directive it receives relative to an Interconnection Reliability Operating Limit:
  - (i) Date and time of directive received
  - (ii) Directive issued
  - (iii) Actions taken in response to directive

**(c) Regional Differences**

None identified.

**(d) Compliance Monitoring Process**

- (1) The responsible entity shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint to assess performance.
- (2) The Performance-reset Period is 12 months from the last violation. The responsible entity shall keep its documentation for three calendar years. The Compliance Monitor shall keep audit records for three calendar years.
- (3) The responsible entity shall make the following available for inspection by the Compliance Monitor upon request:
  - (i) Operations log or other data source(s) to show the following for each instance of being issued a Reliability Authority directive relative to an Interconnection Reliability Operating Limit:
    - 1) Date and time of each directive received
    - 2) Directive issued
    - 3) Actions taken in response to directive

**(e) Levels of Noncompliance**

- (1) Level one: The responsible entity followed Reliability Authority's directives relative to preventing or mitigating instances of exceeding Interconnection Reliability Operating Limits but did not document the date and time of each directive received, the directive received, and the actions taken in response to the directive.
- (2) Level two: Not applicable
- (3) Level three: Not applicable
- (4) Level four: The responsible entity did not follow the Reliability Authority's directives.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

### **Sanctions Table**

The following table is an approved table of Compliance Sanctions. This table of sanctions was developed by the Compliance Subcommittee as part of the NERC Compliance Enforcement Program and was approved by the NERC Board of Trustees. The enforcement matrix is divided into four levels of increasing noncompliance vertically and the number of violations in a defined period at a given level horizontally. In the enforcement matrix, note that there are three sanctions that can be used: a letter, a fixed fine, and a \$\$ per MW fine.

#### **Letter**

The letter is a sanction used to notify company executives, Regional officers, and regulators when an entity is noncompliant. The distribution of the letter varies depending on the severity of the noncompliance. It is used first to bring noncompliance the attention of those who can take action to bring the entity into compliance.

- Letter (A) — Letter to the entity's vice president level or equivalent informing the entity of noncompliance, with copies to the data reporting contact, and the entity's highest ranking Regional Council representative.
- Letter (B) — Letter to the entity's chief executive officer or equivalent, with copies to the data reporting contact, the entity's highest ranking Regional Council representative, and the vice president over the area in which noncompliance occurred.
- Letter (C) — Letter to the entity's chief executive officer and chairman of the board, with copies to the NERC president, regulatory authorities having jurisdiction over the noncompliant entity if requested by such regulatory authorities, the data reporting contact, the entity's highest ranking Regional Council representative, and the vice president over the area in which noncompliance occurred.

#### **Fixed Dollars**

This sanction is used when a letter is not enough and a stronger message is desired. Fixed dollars are typically assigned as a one-time fine that is ideal for measures involving planning-related standards. Many planning actions use forward-looking assumptions. If those assumptions prove wrong in the future, yet they are made in good faith using good practices, entities should not be harshly penalized for the outcome.

#### **Dollars per MW**

Dollars per MW sanctions are oriented toward operationally based standards. The MW can be load, generation, or flow on a line. Reasonableness of a sanction needs to be figured into assessing \$/MW penalties. Assessing large financial penalties is not the goal, but sending a message with proper emphasis on \$\$\$ can be controlled with the multiplier.

**Operate Within Interconnection Reliability Operating Limits Standard**

<b>Occurrence Period Category</b>	<b>Number of Violations in Occurrence Period at a Given Level</b>			
1 <sup>st</sup> Period of Violations (Fully Compliant Last Period)	1	2	3	4 or more
2 <sup>nd</sup> Consecutive Period of Violations		1	2	3 or more
		\$ Sanction from Table; Letter (C) only if Letter (B) previously sent		
3 <sup>rd</sup> Consecutive Period of Violations			1	2 or more
			\$ Sanction from Table; Letter (C) only if Letter (B) previously sent	
4 <sup>th</sup> or greater Consecutive Period of Violations				1
				\$ Sanction from Table; Letter (C)

<b>Level of Noncompliance</b>	<b>Sanctions Associated With Noncompliance</b>			
Level 1	Letter (A)	Letter (A)	Letter (B) and \$1,000 or \$1 Per MW	Letter (B) and \$2,000 or \$2 Per MW
Level 2	Letter (A)	Letter (B) and \$1,000 or \$1 Per MW	Letter (B) and \$2,000 or \$2 Per MW	Letter (B) and \$4,000 or \$4 Per MW
Level 3	Letter (B) and \$1,000 or \$1 Per MW	Letter (B) and \$2,000 or \$2 Per MW	Letter (B) and \$4,000 or \$4 Per MW	Letter (B) and \$6,000 or \$6 Per MW
Level 4	Letter (B) and \$2,000 or \$2 Per MW	Letter (B) and \$4,000 or \$4 Per MW	Letter (B) and \$6,000 or \$6 Per MW	Letter (B) and \$10,000 or \$10 Per MW

**Interpreting the Tables:**

- These tables address penalties for violations of the same measure occurring in consecutive compliance reporting periods.
- If a participant has noncompliant performance in consecutive compliance reporting periods, the sanctions applied are more punitive.

# Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits

---

## Implementation Plan Contents:

Prerequisite Approvals .....	2
Applicability During Transition to Functional Model.....	2
Retirement of Sections of Operating Policies .....	3
Policy Retirements or Revisions .....	5
Compliance With Standard .....	14
Functions That Must Comply With the Requirements .....	14
Phased-in Compliance .....	15

## **Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

---

### **Prerequisite Approvals**

The Determine Facility Ratings, System Operating Limits, and Transfer Capabilities Standard must be implemented before this standard can be implemented.

### **Applicability During Transition to Functional Model**

The requirements in Standard 200 apply to entities performing various electric system functions, as defined in the functional model approved by the NERC Board of Trustees in June 2001. NERC is now developing standards and procedures for the identification and certification of such entities. Until that identification and certification is complete, these standards apply to the existing entities (such as control areas, transmission owners and operators, and generation owners and operators) that are currently performing the defined functions.

## Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits

---

### Retirement of Sections of Operating Policies

Many elements contained in Standard 200 address the same or similar performance objectives as sections of Operating Policy 2, Operating Policy 4, Operating Policy 5, and Operating Policy 9. To eliminate duplication and minimize confusion, the following sections of existing Operating Policies should be retired when this standard is implemented. Justification for these retirements is provided in the tables on the following pages.

#### Operating Policy 2:

- Standard A.1. (just last 2 bullets)
- Standard A.1.2.
- Standard A.2.
- Standard A.2.1.
- Requirement A.1.
- Requirement A.1.1.
- Requirement A.1.2.
- Requirement B.5.

#### Operating Policy 4:

- Requirement A.1.
- Requirement B.3.
- Requirement B.3.1.
- Requirement B.4.
- Requirement B.4.1.
- Appendix 4BA

#### Operating Policy 5:

- Requirement 5.C.1.
- Requirement 5.C.2.

#### Operating Policy 9:

- Requirement A.1.
- Requirement A.1.1.
- Requirement A.1.2.

#### Other Changes:

- Operating Policy 4, Requirement A.2. should be 'tagged' to note that the requirement is no longer applicable to system operators working for entities performing the reliability authority function, but is still applicable to system operators working for entities performing the transmission operator function.

## Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits

### Policy Retirements or Revisions

The following tables identify the sections of existing Operating Policies that shall be retired when this standard is implemented.

Policy 2 — Transmission Language in Policy	Standard 200 Replacement Requirement
<p><b>Standard A.1.</b>  <b>Basic reliability requirement regarding single contingencies.</b>                      All CONTROL AREAS shall operate so that instability, uncontrolled separation, or cascading outages will not occur as a result of the most severe single contingency.</p>	<p>204. 1.1. The reliability authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul>
<p><b>Standard A.1.2.</b>  <b>Operating Security Limits.</b> Operating Security Limits define the acceptable operating boundaries.</p>	<p>201.1. The reliability authority shall identify and document which facilities (or groups of facilities) in the reliability authority’s reliability area are subject to interconnection reliability operating limits.</p> <p>201.2. The reliability authority shall identify each interconnection reliability operating limit within the reliability authority’s reliability area.</p> <ul style="list-style-type: none"> <li>▪ The reliability authority shall identify a <math>T_v</math> for each interconnection reliability operating limit.</li> </ul>
<p><b>Standard A.2.</b>  <b>Return from OPERATING SECURITY LIMIT Violation.</b>                      Following a contingency or other event that results in an OPERATING SECURITY LIMIT violation, the CONTROL AREA shall return its transmission system to within OPERATING SECURITY LIMITS soon as possible, but no longer than 30 minutes.</p>	<p>204.1.1. The reliability authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul>
<p><b>Standard A.2.1.</b>  <b>Reporting Non-compliance.</b> Each violation of this Standard shall be reported to the Regional Council and NERC Compliance Subcommittee within 72 hours.</p>	<p>204.1.2. The reliability authority shall document instances of exceeding interconnection reliability operating limits and shall document and complete an Interconnection Reliability Operating Limit Violation Report for instances of exceeding interconnection reliability operating limits for time greater than <math>T_v</math>.</p>

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

Policy 2 — Transmission Language in Policy	Standard 200 Replacement
<p><b>Requirement A.1.</b> Policies for dealing with transmission security. CONTROL AREAS, individually and jointly, shall develop, maintain, and implement formal policies and procedures to provide for transmission security. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional security, including:</p> <ul style="list-style-type: none"> <li>▪ Equipment ratings</li> <li>▪ Monitoring and controlling voltage levels and real and reactive power flows</li> <li>▪ Switching transmission elements</li> <li>▪ Planned outages of transmission elements</li> <li>▪ Development of Operating Security Limits</li> <li>▪ Responding to OPERATING SECURITY LIMIT violations.</li> </ul>	<p><i>(Only highlighted items on the left should be retired.)</i></p> <p>201.2. The reliability authority shall identify each interconnection reliability operating limit within the reliability authority’s reliability area.</p> <p>The reliability authority shall identify a T<sub>v</sub> for each interconnection reliability operating limit.</p> <p>207.1.1. The reliability authority shall have an action plan that identifies actions it shall take or actions it shall direct others to take, to prevent or mitigate instances of exceeding its interconnection reliability operating limits.</p> <p><i>(Operating Security Limits that, when exceeded may cause instability and cascading outages on the bulk electric system have now been defined as Interconnection Reliability Operating Limits (IROL) within this standard.)</i></p>
<p><b>Requirement A.1.1.</b> Responsibility for transmission security. When OPERATING SECURITY LIMIT violations occur, or are expected to occur, the CONTROL AREAS affected by and the CONTROL AREAS contributing to these violations shall implement established joint actions to restore transmission security.</p>	<p>204.1.1. The reliability authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul>

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

Policy 2 — Transmission Language in Policy	Standard 200 Replacement
<p><b>Requirement A.1.2.</b> Action to keep transmission within limits. CONTROL AREAS shall take all appropriate action up to and including shedding of firm load in order to comply with Standard 2.A.2.</p>	<p>204.1.1. The reliability authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul> <p>208.1.1. The transmission operator, balancing authority, and interchange authority shall follow the reliability authority’s directives to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul>
<p><b>Requirement B.5.</b> <b>Preventing Voltage Collapse.</b> The SYSTEM OPERATOR shall take corrective action, including load reduction, necessary to prevent voltage collapse when reactive resources are insufficient.</p>	<p>204.1.1. The reliability authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul>

<p align="center"><b>Policy 4 — System Coordination</b></p> <p align="center"><b>Language in Policy</b></p>	<p align="center"><b>Standard 200 Replacement</b></p>
<p><b>Section A — Monitoring System Conditions</b>  <b>Requirement A.1 Resources.</b> The system operator shall be kept informed of all generation and transmission resources available for use.</p>	<p><i>Keep for transmission operator’s system operators</i></p> <p>205.1.1. The reliability authority shall specify and collect the data it needs to support real-time monitoring, operational planning analyses, and real-time assessments conducted relative to operating within its reliability area’s interconnection reliability operating limits. The reliability authority shall collect this data from the entities performing functions that have facilities monitored by the reliability authority, and from entities that provide facility status to the reliability authority. This includes specifying and collecting data from the following:</p> <ul style="list-style-type: none"> <li>▪ Balancing authorities</li> <li>▪ Generator owners</li> <li>▪ Generator operators</li> <li>▪ Load-serving entities</li> <li>▪ Reliability authorities</li> <li>▪ Transmission operators</li> <li>▪ Transmission owners</li> </ul>
<p><b>Requirement A.2.</b>  <b>Transmission status and data.</b> System operators shall monitor transmission line status, MW and MVAR flows, voltage, LTC settings and status of rotating and static reactive resources.</p>	<p><i>Keep for transmission operator’s system operators</i></p> <p>202.1.1. The reliability authority shall perform real-time monitoring of system operating parameters to determine if the reliability area is operating within its interconnection reliability operating limits.</p>

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

<p align="center"><b>Policy 4 — System Coordination</b> <b>Language in Policy</b></p>	<p align="center"><b>Standard 200 Replacement</b></p>
<p><b>B3 — Data required from control areas</b></p> <p><b>3. Data required from Control Areas.</b> Each CONTROL AREA shall provide its SECURITY COORDINATOR(S) with the Electric System Security Data that is necessary to allow THE SECURITY COORDINATOR(S) to perform its operational security assessments and coordinate reliable operations.</p> <p><b>3.1 Data.</b> CONTROL AREAS shall provide the types of data as listed in Appendix 4B, “Electric System Security Data, Section A, Electric System Security Data”, unless otherwise agreed to by the CONTROL AREAS and their SECURITY COORDINATOR(S).</p>	<p>206.1.1. Each entity performing one of the following functions shall provide data, as specified, to the reliability authority(ies) with which it has a reliability relationship.</p> <ul style="list-style-type: none"> <li>▪ Balancing authorities</li> <li>▪ Generator owners</li> <li>▪ Generator operators</li> <li>▪ Load-serving entities</li> <li>▪ Reliability authorities</li> <li>▪ Transmission operators</li> <li>▪ Transmission owners</li> </ul>
<p><b>4. Data exchange among SECURITY COORDINATORS.</b> Upon request, SECURITY COORDINATORS shall, via the ISN, exchange with each other Electric Security Data that is necessary to allow the SECURITY COORDINATORS to perform their operational security assessments and coordinate their reliable operations.</p>	<p>206.1.1. Each entity performing one of the following functions shall provide data, as specified, to the reliability authority(ies) with which it has a reliability relationship.</p> <ul style="list-style-type: none"> <li>▪ Balancing authorities</li> <li>▪ Generator owners</li> <li>▪ Generator operators</li> <li>▪ Load-serving entities</li> <li>▪ Reliability authorities</li> <li>▪ Transmission operators</li> <li>▪ Transmission owners</li> </ul>

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

<p align="center"><b>Policy 4 — System Coordination</b></p> <p align="center"><b>Language in Policy</b></p>	<p align="center"><b>Standard 200 Replacement</b></p>
<p><b>4.1. Data.</b> SECURITY COORDINATORS shall share with each other the types of data as listed in Appendix 4B, “Electric System Security Data, Section A, Electric System Security Data”, unless otherwise agreed to.</p>	<p>206.1.1. Each entity performing one of the following functions shall provide data, as specified, to the reliability authority(ies) with which it has a reliability relationship.</p> <ul style="list-style-type: none"> <li>▪ Balancing authorities</li> <li>▪ Generator owners</li> <li>▪ Generator operators</li> <li>▪ Load-serving entities</li> <li>▪ Reliability authorities</li> <li>▪ Transmission operators</li> <li>▪ Transmission owners</li> </ul>
<p><b>Appendix 4BA</b></p>	<p>205.1.1 The reliability authority shall specify and collect the data it needs to support real-time monitoring, operational planning analyses, and real-time assessments conducted relative to operating within its reliability area’s interconnection reliability operating limits. The reliability authority shall collect this data from the entities performing functions that have facilities monitored by the reliability authority, and from entities that provide facility status to the reliability authority. This includes specifying and collecting data from the following:</p> <ul style="list-style-type: none"> <li>▪ Balancing authorities</li> <li>▪ Generator owners</li> <li>▪ Generator operators</li> <li>▪ Load-serving entities</li> <li>▪ Reliability authorities</li> <li>▪ Transmission operators</li> <li>▪ Transmission owners</li> </ul>

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

<p align="center"><b>Policy 5 — Emergency Operations Language in Policy</b></p>	<p align="center"><b>Standard 200 Replacement</b></p>
<p><b>Requirement 5.C.1. Relieving security limit violations.</b> Each CONTROL AREA experiencing or materially contributing to an OPERATING SECURITY LIMIT violation shall take immediate steps to relieve the condition.</p>	<p>204.1.1. The reliability authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul> <p>208.1.1. The transmission operator, balancing authority, and interchange authority shall follow the reliability authority’s directives to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul>
<p><b>Requirement 5.C.2. Operator authority and responsibility.</b> SYSTEM OPERATORS having responsibility for the reliability of the transmission system within a CONTROL AREA, pool, etc., shall be given and shall exercise specific authority to alleviate OPERATING SECURITY LIMIT violations. The authority shall enable the SYSTEM OPERATOR to take timely and appropriate actions including curtailing transmission service or energy schedules, operating equipment (e.g., generators, phase shifters, breakers), shedding load, etc.</p>	<p>204.1.1. The reliability authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul> <p>208.1.1. The transmission operator, balancing authority, and interchange authority shall follow the reliability authority’s directives to:</p> <ul style="list-style-type: none"> <li>▪ Prevent instances where interconnection reliability operating limits may be exceeded.</li> <li>▪ Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded.</li> </ul>

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

<p align="center"><b>Policy 9 — Security Coordinator</b> <b>Language in Policy</b></p>	<p align="center"><b>Standard 200 Replacement</b></p>
<p><b>Requirement A.1.</b> <b>Perform security analysis.</b> The RELIABILITY COORDINATORS shall ensure that next-day reliability analyses are performed simultaneously for all CONTROL AREAS and TRANSMISSION PROVIDERS in its RELIABILITY AREA to ensure that the bulk power system can be operated in anticipated normal and contingency conditions.</p>	<p>203.1.1. The reliability authority shall perform operational planning analyses to assess whether the planned bulk electric system operations within the RA’s reliability area will exceed any of its interconnection reliability operating limits.</p> <p>203.1.2. The reliability authority shall perform real-time assessments to determine if its reliability area is exceeding any interconnection reliability operating limits or is expected to exceed any interconnection reliability operating limits.</p>
<p>1.1. <b>Information sharing.</b> Each CONTROL AREA in the SECURITY AREA shall provide information required for system studies, such as critical facility status, load, generation, operating reserve projections, and known INTERCHANGE TRANSACTIONS. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection, and 1200 Pacific Standard Time for the Western Interconnection.</p>	<p>206.1.1. Each entity performing one of the following functions shall provide data, as specified, to the reliability authority(ies) with which it has a reliability relationship.</p> <ul style="list-style-type: none"> <li>▪ Balancing authority</li> <li>▪ Generator owners</li> <li>▪ Generator operators</li> <li>▪ Load-serving entities</li> <li>▪ Reliability authorities</li> <li>▪ Transmission operators</li> <li>▪ Transmission owners</li> </ul> <p><i>(Note that this data is only a subset of the data addressed in Policy 9 Requirement A.1.1.1)</i></p>

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

---

<p><b>Requirement A.1.2.</b> <b>System Studies.</b> The RELIABILITY COORDINATORS shall conduct studies to identify potential interface and other OPERATING RELIABILITY LIMIT violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p>	<p>203.1.1. The reliability authority shall perform operational planning analyses to assess whether the planned bulk electric system operations within the RA’s reliability area will exceed any of its interconnection reliability operating limits.</p> <p>203.1.2. The reliability authority shall perform real-time assessments to determine if its reliability area is exceeding any interconnection reliability operating limits or is expected to exceed any interconnection reliability operating limits.</p>
---	---

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

**Compliance With Standard**

Requirement	Functions That Must Comply With the Requirements*							
	Reliability Authority	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator	Load-Serving Entity

\* Please note that this standard will apply to the existing entities (such as control areas, transmission owners, etc.) performing the functions listed above until functional certification of the RA, BA, IA, etc has been completed.

## Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits

---

### *Phased-in Compliance*

The following table identifies the implementation date and the earliest compliance date for each requirement.

The implementation date is the date entities are expected to begin meeting the performance identified in this standard. Because this standard depends upon the communication of system operating limits as defined in Standard 600, “*Determine Facility Ratings, System Operating Limits and Transfer Capabilities*”, compliance to this standard will not be required until Standard 600 has been balloted and implemented. Additional time (preparation time) has been added to give entities time needed to fully comply with the requirements. Although compliance reviews will begin no sooner than six months after the implementation of Standard 600, the NERC Compliance and Certification Committee and NERC’s Director of Compliance will determine the exact timing of compliance reviews for this standard. The justification for the staggered effective dates is in the tables on the following pages:

<b>Requirement</b>	<b>Implementation Date</b>	<b>Compliance Date</b>
201 — IROL Identification	3 months from Board adoption	6 months from implementation of Standard 600
202 — Monitoring	3 months from Board adoption	6 months from implementation of Standard 60
203 — Analyses and Assessments	3 months from Board adoption	6 months from implementation of Standard 600
204 — Actions	3 months from Board adoption	6 months from implementation of Standard 600
205 — Data Specification and Collection	3 months from Board adoption	9 months from implementation of Standard 600
206 — Data Provision	3 months from Board adoption	12 months from implementation of Standard 600
207 — Action Plan	3 months from Board adoption	6 months from implementation of Standard 600
208 — Reliability Authority Directives	3 months from Board adoption	9 months from implementation of Standard 600

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 201 — IROL Identification</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
201.2.1	The reliability authority shall establish a list of facilities (or groups of facilities) in the reliability authority’s reliability area that are subject to interconnection reliability operating limits.	This should already be done in some format to comply with current field testing of IRLs and to comply with existing Operating Policy — only additional time needed would be to produce some evidence that list has been updated.
201.2.1.1	The reliability authority shall review and update the list of facilities to reflect changes in system topology.	This should already be done in some format to comply with current field testing of IRLs and to comply with existing Operating Policy — only additional time needed would be to produce some evidence that list has been updated and this could be done in less than one week if needed.
201.2.2	The reliability authority shall establish a list of interconnection reliability operating limits for the reliability authority’s reliability area.	This should already be done in some format to comply with current field testing of IRLs and to comply with existing Operating Policy.
201.2.2.1	The reliability authority shall identify a $T_v$ for each interconnection reliability operating limit.	Current policy has a 30-minute response time for all limits. Entities may need additional time to establish variable $T_v$ s for IROLs. This should be done within six months.
201.2.2.2	The reliability authority shall update the list of interconnection reliability operating limit values to reflect current system conditions.	This should already be done in some format to comply with existing Operating Policy — only additional time needed would be to produce some evidence that the list has been updated — and this could be done in less than one week if needed.

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 202 — Monitoring</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
202.2.1	The reliability authority shall have interconnection reliability operating limits available for its operations personnel’s real-time use.	This should already be done in some format to comply with existing Operating Policy — only additional time needed would be to re-title the limits as IROLs.
202.2.2	The reliability authority shall have real-time data available in a form that system operators can compare to the interconnection reliability operating limits.	This should already be done in some format to comply with existing Operating Policy — only additional time needed would be to let system operators know that the limits are called IROLs and may have unique T <sub>v</sub> s.
202.2.3	The reliability authority shall monitor real-time system operating parameters and compare these against its interconnection reliability operating limits.	This should already be done in some format to comply with existing Operating Policy — only additional time needed would be to let system operators know that the limits are called IROLs and may have unique T <sub>v</sub> s.

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 203 — Analyses and Assessments</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
203.2.1	The reliability authority shall identify operating situations or events that impact its reliability area’s ability to operate without exceeding any identified interconnection reliability operating limits.	This should already be done in some format to comply with existing Operating Policy — only additional time needed would be to let system operations personnel know that the limits are called IROLs and may have unique T <sub>v</sub> s.
203.2.1.1	The reliability authority shall conduct an operational planning analysis at least once each day, evaluating the next day’s projected system operating conditions.	This should already be done to comply with existing Operating Policy — current operating practice in many locations is to do the analysis each day for the day ahead only on weekdays, and to do the ‘weekend ahead’ on Friday. Many entities do not conduct an operational planning analysis on Saturday or Sunday for Sunday and Monday. Entities may need some time to train additional personnel so that the analysis could be conducted every day of the week.
203.2.1.2	The reliability authority shall conduct a real-time assessment periodically, but at least once every 30 minutes.	This should already be done to comply with existing Operating Policy — only additional time needed would be to let system operators know that the limits are called IROLs and may have unique T <sub>v</sub> s and to identify that the assessment must be conducted at least once every 30 minutes.

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 204 — Actions</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
204.2.1	The reliability authority shall document each instance where actions are taken or directives are issued to mitigate the magnitude and duration of exceeding an interconnection reliability operating limit.	This requires that the system operators know which of their limits are IROLs. The actions are done today to comply with Operating Policy.
204.2.1.1	The reliability authority shall document, via an operations log or other data source, the actions taken or directives issued, the magnitude of the event, and the duration of the event. (This data may be from an operating log, may be from the entity’s energy management system, or may be from some other source.)	This requires that the system operators know which of their limits are IROLs. The actions are done today to comply with Operating Policy.
204.2.2	The reliability authority shall report each instance of exceeding an interconnection reliability operating limit for time greater than $T_v$ .	This requires that the system operators know which of their limits are IROLs. The actions are done today to comply with Operating Policy.
204.2.2.1	The reliability authority shall complete an Interconnection Reliability Operating Limit Violation Report and shall file the report with its compliance monitor within five business days of the initiation of the event. (The report includes the date and time of the event; identification of which interconnection reliability operating limit was violated and the $T_v$ for that limit; magnitude and duration of exceeding the interconnection reliability operating limit after exceeding $T_v$ ; actions taken or directives issued and the time these were initiated or issued; explanation of results of actions or directives.)	<p>This requires that the Compliance Enforcement Program accept the IROL Violation Report developed by the IROL Standard Drafting Team. The report collects only the information identified in the measure.</p> <p>This also requires that the RA know which entity is acting as its compliance monitor.</p> <p>This also requires that the IROL Violation Report be made available to the RAs.</p>

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 205 — Data Specification &amp; Collection</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
204.2.1	The reliability authority shall have a documented specification for data needed to build and maintain models needed to support real-time monitoring, operational planning analyses, and real-time assessments relative to interconnection reliability operating limits.	Many entities may not have a data specification in place. The data specification may be distributed in several other documents, and entities may need time to assemble this. Since the data needed is known, even if it is not formally documented, it should be possible to accomplish this documentation within nine months — this includes time to come to ‘mutual agreement’ with other entities.
205.2.1.1	Specification shall include a list of required data, a mutually agreeable format, and timeframe and periodicity for providing data.	
205.2.1.2	Specification shall address the data provision process to use when automated real-time system operating data is unavailable.	This may not exist and may need to be developed. It should be possible to develop this within the nine-month period identified for developing the complete data specification.
205.2.2	The reliability authority shall distribute its data specification to the entities that have facilities monitored by the reliability authority and to entities that provide facility status to the reliability authority.	This requires documentation that wouldn’t be available until after the data specification were completed. This should be done no later than ten months after the standard is approved — this allows nine months to develop the specification, and then a month to deliver it.
205.2.3	The reliability authority shall notify its compliance monitor when an entity that has facilities monitored by the reliability authority, or an entity that provides facility status to the reliability authority, does not provide data as specified.	This requires that the data specification be developed and distributed. This should come into effect a year after the standard is approved. This allows entities some time to ‘field test’ their data specification before compliance is a factor.
205.2.3.1	The notification shall take place within five business days of discovering that the data is missing.	

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

---

<b>Requirement 206 — Data Provision</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
206.2.1	The entity responsible shall provide data, as specified, to the requesting reliability authority, within the timeframe specified, in the mutually agreed upon format.	The data specification in requirement 205 needs to be in place before this can be implemented. There should be a 12-month delay in implementing compliance with this measure. This allows entities time to work with their RA to come to agreement with a ‘mutually acceptable format’ and gives the entities that must provide the RA with data a three month trial and error period for providing data before there is any compliance measurement.

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

---

<b>Requirement 207 — Action Plan</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
207.2.1	The reliability authority shall have a documented action plan that addresses preventing and mitigating instances of exceeding interconnection reliability operating limits. The plan shall identify and be coordinated with those entities responsible for acting and with those entities impacted by such actions.	Entities should have this plan in place now. A six-month delay in compliance should allow everyone time to develop a plan if it doesn't already exist.
207.2.1.1	The action plan may be a process or procedure for preventing or mitigating instances of exceeding interconnected reliability operating limits. (Note: An emergency operations plan may be used to satisfy this requirement if the emergency operations plan addresses actions to prevent and mitigate instances of exceeding interconnected reliability operating limits.)	

**Implementation Plan for Standard 200 — Operate Within Interconnection Reliability Operating Limits**

---

<b>Requirement 208 — Reliability Authority Directives</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
208.2.1	The entity responsible shall document the following: <ul style="list-style-type: none"><li>▪ Date and time of directive received</li><li>▪ Directive issued</li><li>▪ Actions taken in response to directive</li></ul>	This should already be done and no additional time for preparation should be needed.

### Introduction to Standard

This standard requires adherence to the subset of system operating limits<sup>1</sup> identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. These limits are called interconnection reliability operating limits and are under the authority of the entity performing the reliability authority function. (Note that there are many other system operating limits that are used by system operators working for entities performing the Reliability Authority function and for entities performing the Transmission Operator function. This standard only addresses Interconnection Reliability Operating Limits.)

This standard is subdivided into eight requirements. Each of the requirements addresses some aspect of monitoring or controlling the transmission system to operate within IROLs. Some of these requirements address underlying responsibilities that must be accomplished as a prerequisite to monitoring and controlling the transmission system relative to IROLs.

201 Interconnection Reliability Operating Limit Identification — requires identification of the facilities that are subject to IROLs and requires identification of IROLs. Each IROL must have a  $T_v$ . The lists must be updated to reflect changes in topology and system conditions. (The entity performing the Reliability Authority Function is responsible for this requirement.)

202 Monitoring — requires monitoring real time data and comparing the data to IROLs to determine if the RA Area is operating within its IROLs (The entity performing the Reliability Authority Function is responsible for this requirement.)

203 Analyses and Assessments — requires that an operational planning analyses be conducted at least once each day to look at the ‘day ahead’ and requires that real-time assessments be conducted at least once every 30 minutes. These analyses and assessments are done to see if the transmission system is expected to be operated within its IROLs and to see if the transmission system is operating within its IROLs. (The entity performing the Reliability Authority Function is responsible for this requirement.)

204 Actions — requires that actions be taken or directives issued to prevent or mitigate instances of exceeding IROLs. These actions and directives must be documented when an IROL is exceeded, and when an IROL is exceeded for a time greater than the IROL’s  $T_v$  this event must be reported to the Compliance Monitor. (The entity performing the Reliability Authority Function is responsible for this requirement.)

205 Data Specification and Collection — requires that a data specification be developed that identifies the data needed for monitoring real-time parameters against IROLs, and for conducting operational planning analyses and real-time assessments relative to operating within its reliability area’s IROLs. The Data Specification must be distributed to entities that are expected to provide data and needs to address what data to provide, a mutually agreeable format for the data, a timeframe and periodicity for providing data, and must address the data provision process to use when automated real-time system operating data is unavailable. The Reliability Authority must notify its Compliance Monitor if data is not provided as specified. (The entity performing the Reliability Authority Function is responsible for this requirement.)

206 Data Provision — requires that entities provide the Reliability Authority with data needed to monitor real-time parameters against IROLs, and to conduct operational planning analyses and real-time

<sup>1</sup> System Operating Limits are established through the standard, “Determine Facility Ratings, Operating Limits and Transfer Capabilities”

## Questions & Answers About the Operate within IROLs Standard

---

assessments relative to operating within its reliability area's IROLs. (The entities performing the following Functions are responsible for this requirement: Balancing Authorities, Generator Operators, Generator Owners, Load-serving Entities, Reliability Authorities, Transmission Operators, and Transmission Owners)

207 Action Plan — requires that there be a plan to address actions to take or directions to issue to prevent and mitigate instances of exceeding IROLs. The plan must identify and be coordinated with all entities that have to take actions as part of the plan, and with entities that would be impacted by the actions taken in the plan. (The entity performing the Reliability Authority Function is responsible for this requirement.)

208 Reliability Authority Directives — requires that entities follow the Reliability Authority's directives issued to prevent or mitigate instances of exceeding IROLs. The directives issued and the actions taken in response to those directives must be documented. (The entities performing the following functions are responsible for this requirement: Balancing Authority, Interchange Authority, and Transmission Operator.)

### Expansion on Definitions

**Balancing Authority:** Integrates resource plans ahead of time, and maintains load-interchange-generation balance within its metered boundary and supports system frequency in real time.

*Note: This term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.*

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and bulk transmission system.

*Note: This term was included in the NERC Glossary of Terms approved by the Engineering Committee and the Operating Committee in August 1996. The Glossary of Terms was prepared by the NERC Glossary of Terms Task Force.*

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread service interruption, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies.

*Note: The word, 'cascading' was included in the NERC Glossary of Terms approved by the Engineering Committee and the Operating Committee in August 1996. The Glossary of Terms was prepared by the NERC Glossary of Terms Task Force.*

**Generator Operator:** Operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.

*Note: This is the definition proposed by the Functional Model Review Task Group for inclusion in the second version of the Functional Model.*

**Generator Owner:** The entity that owns the generator.

*Note: This is the definition proposed by the Functional Model Review Task Group for inclusion in the second version of the Functional Model.*

**Instability:** The inability of the transmission system to maintain a state of equilibrium during normal and abnormal system conditions or disturbances.

**Interconnection Reliability Operating Limit:** A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system.

*Note: This term was adapted from the term, Interconnection Reliability Limit, drafted by the Operating Limit Definition Task Force.*

**Interconnection Reliability Operating Limit Event:** An instance of exceeding an interconnection reliability operating limit for any length of time.

*Note: All IROL Events must be documented.*

**Interconnection Reliability Operating Limit Event Duration:** The length of time an interconnection reliability operating limit is exceeded. The duration is measured from the point where the limit is first exceeded and ends when the value drops below the limit and remains below the limit for at least 30 seconds.

*Note: Graphics in next section of this Technical Reference shows the application of this 30-second rule.*

## Questions & Answers About the Operate within IROLs Standard

---

**Load-serving Entity:** Secures energy and transmission (and related generation services) to serve the end user.

*Note: This term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.*

**Occurrence period (Performance-reset Period):** The time period in which performance is measured, evaluated, and then reset.

*Note: This is a term used by the Compliance Monitors. When you look at the Sanctions Tables, note that the first table's column headings reference the number of infractions within the Performance-reset period. As the number of infractions within a performance reset period increases, so does the severity of the sanctions.*

**Operational Planning Analysis:** An analysis of the expected system conditions, given the load forecast(s) and known system constraints, such as transmission facility outages, generator outages and equipment limitations.

*Note: This standard requires that an operational planning analysis be conducted at least once each day, looking at the day ahead. This does not mean that operational planning analyses are limited to being conducted on a day-ahead basis. For example, an operational planning analysis should be conducted as part of approving a transmission line outage — and this operational planning analysis may be conducted several months ahead of the day being reviewed.*

**Real-time:** Present time as opposed to future time.

**Real-time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

**Real-time Data:** Real-time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

*Note: This definition supports the concept that monitoring is an 'active' task. The system operator assigned to monitor system conditions should be prepared to answer questions about what he/she has been monitoring without any preparation time. Simple questions can be used to determine whether or not monitoring has taken place. For example, a system operator who has been monitoring real time data to see if the area under the operator's direction is approaching or exceeding any IROLs should be able to answer the question, "Are there any IROLs on your system that have been exceeded? If any have been exceeded, are you approaching or exceeding the IROL's  $T_v$ ?"*

**Reliability Authority:** Ensures the reliability of the bulk power transmission system within its Reliability Authority Area.

*Note: This term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.*

**Reliability Authority Area:** The collection of generation, transmission, and loads within the boundaries of the Reliability Authority. Its boundary coincides with one or more Balancing Areas.

## Questions & Answers About the Operate within IROLs Standard

---

*Note: This is the definition proposed by the Functional Model Review Task Group for inclusion in the second version of the Functional Model.*

**Self-certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

*Note: This is a term used by the Compliance Monitors.*

**T<sub>v</sub>:** The maximum time that an interconnection reliability operating limit can be exceeded without compliance sanctions being applied.

*Note: Operating Policy 2 — Standard A.2. included the following requirement:*

*Following a contingency or other event that results in an OPERATING SECURITY LIMIT violation, the CONTROL AREA shall return its transmission system to within OPERATING SECURITY LIMITS AS soon as possible, but no longer than 30 minutes.*

*This new standard does not require a response within 30 minutes — rather each limit has its own 'T<sub>v</sub>'. Some IROLs are so critical that exceeding them for 30 minutes may be too long — and for other IROLs, a T<sub>v</sub> greater than 30 minutes may represent an acceptable risk. While a default of 30 minutes may be easier to remember, this default may have the undesirable result of limiting the application of Market Solutions that could be used to resolve instances of exceeding IROLs.*

*See the charts in the next section for examples of how T<sub>v</sub> is used to determine whether an instance of exceeding an IROL must be reported to the Compliance Monitor.*

**Transmission Operator:** The entity that operates the transmission facilities and executes switching orders.

*Note: This term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.*

**Transmission Owner:** Owns transmission facilities.

*Note: This term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.*

**Uncontrolled Separation:** The unplanned break-up of an interconnection, or portion of an interconnection, that is not the result of automatic action by a special protection system or remedial action scheme operating correctly.

**Wide Area Impact:** The impact of an event that, if left untended, could lead to voltage instability, cascading outages or uncontrolled separation that jeopardizes the reliability of an interconnection. The geographic size of the area affected by such an event is always larger than the local area monitored by a single transmission operator and may be larger than the portion of the transmission system under the authority of a single reliability authority.

## Questions & Answers About the Operate within IROLs Standard

### Questions and Answers

#### *Who needs to comply with this standard?*

Each of the requirements in the standard assigns responsibility for that requirement to one or more 'functions.' The entities performing the listed functions are the entities that must comply with that requirement. Most of the requirements are applicable to entities that perform the Reliability Authority Function — but several functions are assigned responsibility for the Data Provision and RA Directives requirements.

Requirement	Entities that Perform these Functions Must Comply With the Requirements							
	Reliability Authority	Balancing Authority	Interchange Authority	Trans. Operator	Trans. Owner	Gen. Owner	Gen. Operator	Load-Serving Entity
201 IROL Identification	X							
202 Monitoring	X							
203 Analyses & Assessments	X							
204 Actions	X							
205 Data Specification & Collection	X							
206 Data Provision	X	X		X	X	X	X	X
207 Action Plan	X							
208 RA Directives		X	X	X				

### ***When does compliance with this standard start?***

Several things must be in place before entities are expected to come into full compliance with all of the requirements in this standard. Most importantly, the Operate Within IROLs Standard can't be implemented until after the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard has been implemented. The methodology for developing system operating limits must be in place and the RA must identify system operating limits before the RA can be held accountable for identifying which of its system operating limits are IROLs. There are other parts of the standard that will take some time to put into place if they aren't already in place. Some entities performing the RA function may have a detailed data specification that could be used to meet the Data Specification requirement in this standard — but other entities may have handled this requirement on a more casual basis and may need some time to formalize their data specifications.

### ***For a System Operator — how does this new standard differ from Operating Policy 2 — Transmission?***

There are three significant differences between what is expected of system operators under Policy 2, and what is expected of system operators under Standard 200.

#### **Major Difference #1 — Term, 'OSLs' replaced with term, 'IROLs'**

The first difference is a terminology change. The NERC Director-Compliance reports on compliance violations at each NERC Board of Trustees Meeting. He noted an increase in the number of OSL violations and was directed by the BOT to investigate the cause. The investigation results showed a widespread misunderstanding on what was/was not an OSL. The task force that worked on this problem, called the Operating Limits Definitions Task Force (OLDTF) recommended that the term, "Operating Security Limit" not be used in the future because of the widespread misunderstanding associated with this term. The new standard uses the term, 'Interconnection Reliability Operating Limit — IROL'.

From the Terms Used in the Operating Policies, here is the definition of an Operating Security Limit (OSL):

- The value of a system operating parameter (e.g. total power transfer across an interface) that satisfies the most limiting of prescribed pre- and post-contingency operating criteria as determined by equipment loading capability and acceptable stability and voltage conditions.

From the Operate within IROLs Standard, here is the definition of an Interconnection Reliability Operating Limit (IROL):

- A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system.

## Questions & Answers About the Operate within IROLs Standard

### Major Difference #2 — Resolution time changed from a uniform ‘30-minutes’ for all OSLs to a ‘unique’ $T_v$ for each IROL

Policy 2 has a standard ‘30 minute’ response time for resolving any instance of exceeding an operating security limit. The 30 minutes was established to give system operators enough time to recognize the problem and take corrective actions. The new Operate Within IROLs standard is designed from a perspective of system risk, and doesn’t have a standard ‘30 minute’ response time.

$T_v$  is the maximum amount of time the system operator has to return to a state that is at or below the limit before being subjected to compliance sanctions.  $T_v$  is based on system risk — and recognizes that some IROLs shouldn’t be exceeded for longer than 10 minutes without causing an unacceptable risk to the interconnection. Each IROL may have its own  $T_v$ .

*From Policy 2 — All OSLs addressed with the same 30-minute maximum resolution time*

← *Operate within IROLs Standard — each IROL may have its own  $T_v$ .*

*For IROLs that should never be exceeded,  $T_v$  may be zero minutes.*

### Major Difference #3 — New Report for IROL Violations

Policy 2 requires that a NERC Preliminary Disturbance Report be completed for OSL violations that exceed 30 minutes. The Preliminary Disturbance Report asks for a preliminary analysis to be conducted regarding the cause of the event — and is still needed. The new report is a compliance document and doesn’t require the same data that is required of the Preliminary Disturbance Report.

The data that is collected in the IROL Violations Report is data that should be readily available to the system operator shortly after an instance of exceeding an IROL. The report doesn’t ask for an analysis, just for a collection of the facts such as what limit was exceeded, how long was it exceeded, etc. The new report must be filed with the compliance monitor within five days of the event.

### ***What is an IROL?***

An IROL is a special type of system operating limit. While operating so that system operating limits aren't exceeded is always important, if an IROL is exceeded, there is an increased risk of voltage instability, cascading outages or uncontrolled separation that adversely impacts the interconnection.

System Operating Limits are monitored by system operators working for entities performing the Transmission Operator function and may also be monitored by system operators working for entities performing the Reliability Authority function.

The Reliability Authority monitors IROLs. The Reliability Authority may delegate this responsibility to system operators working for entities performing the Transmission Operator function, but it is the Reliability Authority that is held accountable for ensuring that IROLs aren't exceeded.

### ***What is the IROL's $T_v$ ?***

$T_v$  is the maximum amount of time the system operator has to return to a state that is at or below the limit before being subjected to compliance sanctions.

The  $T_v$  associated with each IROL is a time value used to assess how quickly the interconnection may deteriorate if an IROL isn't mitigated. IROLs should never be exceeded — but if one is exceeded, the  $T_v$  represents the maximum amount of time the limit can be exceeded before the risk to the interconnection becomes unacceptable. Under this standard, if a  $T_v$  is exceeded, there are financial penalties and additional reporting requirements.

### ***Why don't all IROL's have the same $T_v$ ?***

The IROL's  $T_v$  is based on system risk — and recognizes that exceeding some IROLs is unacceptable for any length of time; while exceeding other IROLs can probably be tolerated for a longer period of time before there is an unacceptable risk to the interconnection. By establishing a  $T_v$  for each IROL, the RA has information needed to anticipate the negative results of exceeding an IROL. If an IROL can't be exceeded for any length of time, then the RA may choose to install a special protection scheme to control the risk of exceeding the limit in real time.

### ***If an RA installs a special protection scheme to reduce the probability of exceeding an IROL for time greater than the limit's $T_v$ , does this eliminate the IROL?***

No. The facility being protected by the special protection scheme would still need to be included in the list of facilities subject to IROLs, and the IROL would need to be listed with its  $T_v$ . Since special protection schemes don't always work as planned, it is important that system operators know where they have IROLs, know which facilities are subject to IROLs and know what the  $T_v$  is for each IROL. The system operator needs access to this data to make appropriate system operating decisions when special protection schemes don't work as planned.

### ***How do you develop a list of IROL's?***

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard includes a requirement that entities responsible for developing system operating limits document their methodology for developing these limits. The RA is responsible for developing the subset of system operating limits that are called IROLs. The RA must follow its methodology for developing system operating limits and then must identify whether or not exceeding that limit could cause voltage instability, cascading outages,

## Questions & Answers About the Operate within IROLs Standard

or uncontrolled separation from the interconnected transmission system. If the system operating limit could lead to one or more of these dire consequences, then the limit is an IROL.

### **How do you establish a $T_v$ for an IROL?**

Each RA may use whatever system it wants for establishing a  $T_v$  for its IROLs. This gives each RA the latitude to be as conservative as it desires. Some RAs may choose to use a default  $T_v$  of 30 minutes — currently some entities have a default of 20 minutes for all limits that would be categorized as IROLs. One of the benefits of this variable  $T_v$  is that it gives an RA that operates in a market environment greater flexibility before implementing remedial actions that have the effect of negatively impacting that market.

### **Which instances of exceeding an IROL need to be documented?**

All. Every instance of exceeding an IROL for any length of time must be documented. Most entities are expected to document the instance on a system operating log, but the standard does not require that the documentation be on an operating log, just that it be documented somewhere.

### **When you exceed an IROL, what do you have to document?**

When you exceed an IROL for any length of time, you need to document the following three things:

- Actions taken or directives issued
- Magnitude of the event
- Duration of the event

### **Does the standard require that exceeding an IROL be documented on the system operator's daily log?**

No. Each entity can document IROL events using whatever documentation system works best for them. While each entity may use whatever system(s) it chooses to document instances of exceeding IROLs, the documentation must be retrievable so it can be shown to the compliance monitor. The data can be retrievable through computer screen displays, through paper or electronic logs, or other sources.

### ***Which instances of exceeding an IROL need to be reported?***

Every instance of exceeding an IROL for time greater than the IROL's  $T_v$  is reported to the compliance monitor within five business days.

*The value being monitored exceeded its IROL for a time greater than the IROL's  $T_v$  and the event must be documented and reported.*

### ***When you exceed an IROL for a time greater than the IROL's $T_v$ , what do you have to report?***

When you exceed an IROL for a time greater than the IROL's  $T_v$ , you have to report the following information to the compliance monitor:

- Date and time of the event
- Identification of which interconnection reliability operating limit was violated
- $T_v$  for that limit
- Magnitude and duration of exceeding the interconnection reliability operating limit
- Actions taken or directives issued
- Time actions or directives were initiated or issued
- Explanation of results of actions or directives

There is a report called the IROL Violation Report that captures this information. This report is available from the NERC website and is provided at the end of this document.

**How do you calculate the duration of an IROL event?**

The duration of an IROL event is measured from the point in time when the IROL is first exceeded to the point in time where the parameter being monitored has returned to a value that is at or below the IROL. The event concludes when the actual value is below the IROL for 30 seconds.

The monitored parameter must remain at or below the IROL for 30 seconds or more.

The line for  $t_1$  shows the end of the IROL event, which is the point in time when the monitored value returns to a value that is at or below the IROL as long as the monitored value remains at or below the limit for at least 30 seconds. (From pt. A to pt. B is 30 seconds.)

The following example is shown in the chart below. The IROL that has been exceeded has a  $T_v$  of 10 minutes. The IROL is exceeded for 15 minutes, then the monitored value returns to a value that is below that IROL for just 20 seconds, then exceed the IROL for another 10 minutes — then returns to a value that is below the IROL for 2 hours, the duration of the event that must be reported is:

- 25 minutes, 20 seconds

**Responses to comments submitted during the balloting of the Monitor and Assess short-term Transmission Reliability, Operate within Interconnection Reliability Operating Limits standard**

The Operate within Limits Standard Drafting Team thanks all those who submitted comments with their ballots on the recent posting of this standard. After careful review and consideration of all comments received, the drafting team has modified the standard and is re-posting the standard for another 45-day comment period.

**The SDT's most significant changes include the following:**

- Clarified the definitions of 'widespread impact,' 'cascading outages' and 'bulk electric system' so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can't exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act 'without delay' to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

**Changes outside the Scope of the SDT:**

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT. These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits – not just those that could cause instability, cascading outages or uncontrolled separation

**Consideration of Comments:**

The SDT provided a response to each comment that was submitted with a ballot. These comments can be reviewed at the following site:

<http://www.nerc.com/~filez/standards/IROL.html>

## Definitions

### **T<sub>v</sub>**

T<sub>v</sub>: The maximum time that an Interconnection Reliability Operating Limit can be exceeded ~~without compliance sanctions being applied~~ before the risk to the interconnection becomes greater than acceptable. T<sub>v</sub> may not be greater than 30 minutes.

#### **Summary Consideration:**

Several balloters indicated a preference for a definition that references risk to the interconnection rather than compliance sanctions. In other comments, many balloters indicated a preference for setting a maximum value for T<sub>v</sub> of 30 minutes. The definition has been revised as follows:

#### **Entergy EES (Transmission Owners)**

DEFINITION OF T<sub>v</sub> - The Transmission Owner has fiduciary responsibility for his owned facilities. Therefore he has ultimate responsibility and liability for owning, maintaining and operating his facilities to protect his stockholders' and lending institutions' investments. The Transmission Owner then is ultimately responsible for establishing system operating limits, including T<sub>v</sub>, for his facilities.

By definition, a system violating an IROL, and in the T<sub>v</sub> period, is operating in a critical operating state and is probably violating equipment limits set by the Transmission Owner.

Also, the value of T<sub>v</sub> could be specified in terms of hours instead of minutes because this standard does not specify a maximum value for T<sub>v</sub>. The system violating an IROL should be brought out of that critical operating state as soon as possible. We therefore suggest T<sub>v</sub> be capped at 30 minutes to avoid operating in a critical state for long periods of time.

Therefore, the definition of T<sub>v</sub> should be revised to:

"T<sub>v</sub>: The maximum time that an Interconnection Reliability Operating Limit, as determined by the Transmission Owner for equipment-based limits and by the Reliability Authority and Planning Authority for system-based limits, can be exceeded without compliance sanctions being applied. The maximum time any IROL may be exceeded is 30 minutes unless an alternative value can be shown to be more appropriate."

The Transmission Owner is responsible for establishing facility ratings for its equipment. The Transmission Owner's facility ratings must be respected by the entities that develop associated system operating limits and Interconnection Reliability Operating Limits. The new standards being developed by NERC are being developed in support of the terminology and concepts in the Functional Model. The Functional Model assigns the Reliability Authority the responsibility for identifying IROLs. To clarify that the Transmission Owner's facility ratings must be respected, this standard has been revised to include a statement indicating that the IROLs are developed from SOLs that are developed according to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard.

There were many industry balloters who indicated a desire to set T<sub>v</sub> at a maximum of 30 minutes, and this change has been implemented.

**Tampa Electric Company TEC (Brokers)**

It is unclear if an IROL event would be pre-contingency or post-contingency. This question was raised on the web cast, and it sounded like the answer was that the IROL events were all “real-time”. Should  $T_v$  be 0 for a real-time event and something greater than 0 for a pre-contingency event? The definition of  $T_v$  states that it is the maximum time the system operator has to return to a state that is at or below the limit before being subjected to compliance sanctions. This is an inadequate definition.  $T_v$  should not be based on when compliance sanctions begin, but rather on the time the RA is willing to risk the system. This also depends whether it is pre or post contingency. It is clear that more work needs to be done in clarifying this definition.

The definition of  $T_v$  has been revised. IROL's are based on system operating limits that are developed based on study criteria identified in the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard. IROLs are expected to be updated to match changing system conditions. IROLs are developed based on studies of pre-contingency situations and are updated in real time to address changes in system topology such as a loss of a line or a unit trip

**Gainesville Regional Utilities GVL (LSEs)**

**City of Tallahassee TAL (Transmission Owners)**

The IROL  $T_v$  continues to be an area of confusion.  $T_v$  is the maximum amount of time the system operator has to return to a state that is at or below the limit before being subjected to compliance sanctions. This does not help anyone figure out how to determine  $T_v$ . It should be based on how much time before the risk is too great.

- How is the IROL  $T_v$  calculated? If it is pre-contingency, it is really how long the RA is willing to take the risk of the contingency.
- Does the calculation of  $T_v$  depend on the tool used to determine the IROL?
- Would  $T_v$  be 0 for a real-time event and  $T_v$  be something greater for a pre-contingency event?
- Should  $T_v$  have a maximum, for example 30 minutes?

Each RA needs to determine  $T_v$  using methodology that is reasonable for that system.  $T_v$  is intended to be risk-based and the definition of  $T_v$  has been revised to make this clarification.

**T<sub>v</sub> doesn't depend on the tool used to determine the IROL.**

**T<sub>v</sub> can be between 0 and 30 minutes for any IROL.**

**The balloters overwhelmingly asked for a maximum T<sub>v</sub> of 30 minutes, and this change has been implemented.**

**Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

**Manitoba Hydro MHEB (LSEs)**

**Manitoba Hydro (Transmission Owners)**

Standard 200 requires criteria to be defined for the determination of T<sub>v</sub> as a reporting benchmark – inviting misuse of the quantity. As defined in the Standard definition section, T<sub>v</sub> does not appear to relate to the risk in the system, the responsiveness of the operators, the complexity of restoration procedures except in a vague sense that T<sub>v</sub> is likely too long to wait before a return below the limit. This simplistic definition is very different than the one provided in page 9 of the question and answers document issued with the Standard which states “T<sub>v</sub> is based on system risk.” Therefore this definition should be revised to reflect that T<sub>v</sub> should be based on the potential risk to the system of not taking corrective action in a time frame less than defined by T<sub>v</sub>. This wording should also be included in section 201a.2.i of the Standard. This definition would be similar to the rationale for the 30 minute limit defined for OSL.

**Several balloters indicated a preference for a definition that references risk to the interconnection rather than compliance sanctions. The definition has been revised to reflect this preference.**

**Gainsville Regional Utilities GVL (LSEs)**

**City of Tallahassee TAL (Transmission Owners)**

T<sub>v</sub>: The maximum time that an Interconnection Reliability Operating Limit can be exceeded without compliance sanctions being applied. Shouldn't the time be based upon the time before the system is in jeopardy rather than when a sanction is applied for non-compliance? This definition would not help the RA determine what T<sub>v</sub> should be.

**Several balloters indicated a preference for a definition that references risk to the interconnection rather than compliance sanctions. The definition has been revised to reflect this preference.**

**City of Tallahassee TAL (Generators)**

The definition of T<sub>v</sub> in the standard does not match the intent explained in the Q&A document. By the Q&A document it includes “unacceptable” risk, shouldn't that be in the definition? “The maximum amount of time that an IROL can be exceeded without the risk to the interconnection becoming unacceptable”? IROL violations that persist for longer than T<sub>v</sub> will result in a sanction.

**Several balloters indicated a preference for a definition that references risk to the interconnection rather than compliance sanctions. The definition has been revised to reflect this preference.**

## Operational Planning Analysis

### Summary Consideration:

Several commenters provided suggestions for improvements to the definition of Operational Planning Analysis. The definition was revised as follows:

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as; given the load forecast(s), generation output levels and known system constraints, some examples being (transmission facility outages, generator outages, and equipment limitations,

### American Transmission Company LLC ATC

#### MAIN

The definition of "Operational Planning Analysis" refers to "expected system conditions." The use of the word "expected" leaves too much room for interpretation about which contingencies, if any, must be included in the planning analysis.

Because each RA's system is different, there may be different considerations for each RA's expected system conditions.

### Entergy EES (Transmission Owners)

DEFINITION OF OPERATIONAL PLANNING ANALYSIS - Operational Planning Analysis does not address the time frame of the analysis, which as contained in the draft could inappropriately be extended to years. Operational Planning Analyses are typically conducted for the next day's operation and up to 13 months. Therefore, this definition needs to be changed to "An analysis of the expected system conditions for the next day's operation and up to 13 months ahead of expected conditions, given the load forecast(s), ..."

The definition has been revised to support the concept of your recommendation but because the Functional Model uses 12 months as the suggested dividing line between operational planning and long-range planning, the revised definition of operational planning uses the phrase, 'up to 12 months ahead.'

### Action Plan

Bonneville Power Administration Transmission BPAT

- 1) "Action Plan" should be defined in the "Definition" section of the Standard.

The standard has been revised to replace the phrase, 'action plan' with the terms, 'procedures, processes or plans'. These new terms have been used to conform with the terminology used in the Coordinate Operations standard. These terms are defined in the Coordinate Operations standard.

## IROL

### Summary Consideration:

The definition was revised to replace the phrase, 'bulk transmission system' with the phrase, 'bulk electric system.' This change was made because 'bulk electric system is already a defined term.

**Interconnection Reliability Operating Limit:** A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk ~~transmission~~ electric system.

### Gainesville Regional Utilities GVL (LSEs)

#### City of Tallahassee TAL (Transmission Owners)

Interconnection Reliability Operating Limit: A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system. Is the definition for cascading outages provided above good enough to determine an IROL?

The definition of cascading outages has been revised as follows:

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location- which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

The revised definition should help RAs determine which SOLs are IROLs. The definition of wide area impact has also been revised to try and assist in clarifying which SOLs are IROLs. However the term, 'wide area impact' is not included in this standard and the SDT is removing it from the list of terms to be approved with this standard.

### Dairyland Power Cooperative DPC

The definition of "Interconnection Reliability Operating Limit" implies that it is acceptable to operate over established limits if it would not cause cascading. Concern that this could result in a degradation of reliability.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

**Manitoba Hydro MHEB (LSEs)**

**Manitoba Hydro (Transmission Owners)**

There is a fundamental disconnect between standard 600 regarding the development of limits (such as System operating Limits) and the limits (IROL's) required to implement this standard. Until this disconnect is resolved or this standard is revised to deal explicitly with the development of IROL's, it is not appropriate for standard 200 to be in place. Standard 600 specifies that SOLs are to be developed as first contingency limits that ensure that all underlying limits (such as voltage, flow or stability) are not violated. IROLs are defined as SOLs which if exceeded could lead to instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk electric system. Based on standard 600, violation of most SOLs will not lead to instability, uncontrolled separation or cascading outages. For most regions only a small subset of SOLs are likely to be IROLs. Many tightly interconnected regions will not have IROLs at all for first contingency. The only time that most SOLs could conceivably be classified as IROLs would be for deliberate disregard of the limits, multiple simultaneous contingencies or a system condition which is not consistent with the study assumptions used to define the limits (as might happen if other system operating limit violations are ignored). Therefore it is unlikely that monitoring only IROLs will be an effective way to prevent instability, uncontrolled separation, or cascading outages of the bulk electric system.

The scope of this standard was limited to the subset of SOLs that are IROLs. As envisioned, there are relatively few IROLs, and many, many SOLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Midwest Independent Transmission System Operator, Inc.**

There is still is not a common understanding of an Interconnected Reliability Limit (IRL).

This standard addresses IROLs, which are a bit different from the IRLs being field-tested by the NERC Operating Limits Definition Task Force. The definitions of cascading outages and wide area impact have been revised, and these revisions should help in the understanding of what is/is not an IROL.

**WECC**

**Minnesota Power MP**

**Public Works Commission Fayetteville PWCF**

**Southern California Edison SCET**

**Salt River Project SRP**

**Tucson Electric Power Company TEPC**

**Platte River Power Authority TP PRPA**

The definition of Interconnection Reliability Operating Limit includes the following statement --- "A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system." This seems to imply that it is OK to operate over the established limit if it would not cause cascading, even

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Definitions**

---

though it could result in damaging equipment, loss of load, or overloads on another entity’s facilities. We believe that implying that limits are only exceeded if the violation could lead to “instability, uncontrolled separation, or cascading outages” will lead to a degradation of system reliability. For example, a system operator may conclude that it is acceptable to violate an operating limit as long as the consequences are not a cascading outage. This philosophy is not acceptable.

The scope of this standard was limited to the subset of SOLs that are IROLs. As envisioned, there are relatively few IROLs, and many, many SOLs. The SDT recognizes that exceeding any SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Power Pool of Alberta PPOA**

Standard 200 needs enhanced definitions of IROL and wide area impact, in order to more precisely define the portions of power systems that IROLs are meant to protect. At a minimum there should be recognition of the need for adjacent Reliability Authorities to reach a common understanding of wide area impact.

The definitions of IROL and Wide Area Impact have both been revised to improve their understanding. Note that the term, “wide area impact” was not used in this standard. Although the SDT continues to try and help the industry reach consensus on a definition of this term, the term will be removed from the list of terms associated with this standard.

**Cascading Outages**

**Summary Consideration:** There were several comments indicating that the definition of cascading outages be refined to match the definition that had been contained within the NERC Glossary. The definition contained within the NERC Glossary reads as follows:

**Cascading**

The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread service interruption, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies

Because the industry hasn’t been able to agree on a definition of ‘widespread’ and the suggested addition uses the phrase, ‘widespread’, the SDT declined to revise the definition of cascading to exactly match the definition in the NERC Glossary. The SDT replaced the phrase, ‘widespread’ with the Department of Energy’s threshold for reporting system outages through Report 417. The revised definition reads as follows:

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location, which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

**Bonneville Power Administration Transmission BPAT**

Definition of Cascading outages does not match existing definition that was laboriously reviewed within NERC (the last sentence of the old definition was not included here). The widespread component of cascading in the original definition is important – some local cascading could be acceptable and must be preserved.

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Definitions**

---

Because the industry hasn't been able to agree on a definition of 'widespread' and the suggested addition uses the phrase, 'widespread', the SDT declined to revise the definition of cascading to exactly match the definition in the NERC Glossary. The SDT replaced the phrase, 'widespread' with the Department of Energy's threshold for reporting system outages through Report 417. The revised definition reads as follows:

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location- which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

**WECC**

**Minnesota Power MP**

**Public Works Commission Fayetteville PWCF**

**Southern California Edison SCET**

**Salt River Project SRP**

**Tucson Electric Power Company TEPC**

**Platte River Power Authority TP PRPA**

**California Energy Commission**

The definition of "cascading" is inconsistent with NERC definitions found elsewhere. The definition of "wide area impact" is overly broad, stating the area affected is "always larger than the local area monitored by a single transmission operator." By this definition, the affected area could be large (such as a major metropolitan area or multi-state RTO) and still not be considered a "wide area impact."

Because the industry hasn't been able to agree on a definition of 'widespread' and the suggested addition uses the phrase, 'widespread', the SDT declined to revise the definition of cascading to exactly match the definition in the NERC Glossary. The SDT replaced the phrase, 'widespread' with the Department of Energy's threshold for reporting system outages through Report 417. The revised definition reads as follows:

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location- which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

**Gainesville Regional Utilities GVL (LSEs)**

**City of Tallahassee TAL (Transmission Owners)**

Cascading Outages: The uncontrolled successive loss of system elements triggered by an incident at any location. There are more words in the definition provided in the Q&A documents. Is this definition good enough? Does it need to impact more than one system?

Because the industry hasn't been able to agree on a definition of 'widespread' and the suggested addition uses the phrase, 'widespread', the SDT declined to revise the definition of cascading to

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location- which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

**Responses to Operate within IROLS Standard Ballot**  
**Comments on Definitions**

---

exactly match the definition in the NERC Glossary. The SDT replaced the phrase, ‘widespread’ with the Department of Energy’s threshold for reporting system outages through Report 417. The revised definition reads as follows:

**Occurrence Period**

**Summary Consideration:**

The definition of Occurrence Period has been separated from the definition of Performance-reset Period.

~~Occurrence Period (Performance-reset Period):~~ The time period that the entity being assessed must operate without any violations to reset the level of non-compliance to zero.

**Occurrence Period:** The time period in which performance is measured and evaluated.

**Bonneville Power Administration Transmission BPAT**

The “Definitions” Section defines the “Occurrence Period (Performance-reset Period)” as “the time period in which performance is measured, evaluated, and then reset”. The “Performance-reset Period” for each of the requirements in this Standard is 12 months and the maximum “Number of Violations in Occurrence Period at a Given Level” is “4 or more”.

We recommend that the definition of “Occurrence Period” not be included in the definition of the “Performance-reset Period” but be defined on its own so that the Standard and the Compliance Sanction Table are understandable.

We recommend that the compliance processes be defined in a Compliance Standard instead of each separate standard.

The terms defined in this standard were included at the request of industry commenters. While the occurrence period is sometimes the same as the ‘Performance-reset period, they do not always have to be the same. The definitions have been revised as follows:

**System Operating Parameters**

**Bonneville Power Administration Transmission BPAT**

In Section 202(b)(3), the standard indicates that the RA shall monitor “system operating parameters” which is an undefined term. It is unclear why the RA would need any information not included in the IROL to monitor the system. More explanation of what system operating parameters include is needed and how this information is different from the information in the IROL. It is recommended that “System Operating Parameters” be defined in the “Definition” section of the Standard and that it include something similar to “variables that impact the IROL”.

If the SDT defines system operating parameters, then readers may interpret the requirement to mean that IROLS should be limited to the listed parameters, and this isn’t the intent. The standard only addresses the system operating parameters associated with the IROLS.

## **Bulk Electric System**

### **Summary Consideration:**

The definition of Bulk Electric System that was posted with the standard for ballot, was the same definition that was included in the NERC Glossary of Terms, approved by the Engineering and Operating Committees in 1996. At the request of several balloters, the definition has been refined as follows:

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and bulk high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC.).

### **City of Lakeland PLKT**

Better definition of Bulk Electric System is needed.

At the request of several balloters, the definition has been refined to indicate that it is limited to voltages higher than 35 kV or as approved in a tariff filed with FERC.

### **City of Lakeland PLKT**

Some definitions are vague and somewhat circular. Wide Area Impact seems to be same as IROL, lack of clarity on scope of area for cascading outages, ie; single control area or RA's area or beyond ? Possible confusion with Wide Area Impact. Bulk Electric System definition ?

The definition of Bulk Electric System that was posted with the standard for ballot, was the same definition that was included in the NERC Glossary of Terms, approved by the Engineering and Operating Committees in 1996. At the request of several balloters, the definition has been refined to indicate that it is limited to voltages higher than 35 kV or as approved in a tariff filed with FERC.

### **Carolina Power & Light Company CPL (Transmission Owners)**

#### **Carolina Power & Light Company CPL (LSEs)**

#### **Carolina Power & Light Company CPL (Generators)**

The definition of Bulk Electric System is circular and does not help anyone understand what is the Bulk Electric System. In fact, the interim blackout report has a definition that is more specific, but we are not even sure if that is the definition that has been used in other NERC policies and standards. The definition of Wide Area Impact is really the same as the definition of IROL. This definition does not help anyone understand what a wide area really is either.

The definition of Bulk Electric System that was posted with the standard for ballot, was the same definition that was included in the NERC Glossary of Terms, approved by the Engineering and Operating Committees in 1996. At the request of several balloters, the definition has been refined to indicate that it is limited to voltages higher than 35 kV or as approved in a tariff filed with FERC.

The SDT searched the Interim Blackout Report (page 117) and found that the Report used exactly the same definition for Bulk Electric System that was used with the version of this standard posted for ballot.

### **Florida Power & Light FPL**

#### **FRCC**

The definition of Bulk Electric System is circular and does not help anyone understand what is the Bulk Electric System. In fact, the interim blackout report has a definition that is more specific, but we are not even sure if that is the definition that has been used in other NERC policies and standards.

The definition of Bulk Electric System that was posted with the standard for ballot, was the same definition that was included in the NERC Glossary of Terms, approved by the Engineering and Operating Committees in 1996. At the request of several balloters, the definition has been refined to indicate that it is limited to voltages higher than 35 kV or as approved in a tariff filed with FERC.

The SDT searched the Interim Blackout Report (page 117) and found that the Report used exactly the same definition for Bulk Electric System that was used with the version of this standard posted for ballot.

### **Wide Area Impact**

The impact of ~~an event~~ a single incident resulting in uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes. ~~that, if left untended, could lead to voltage instability, cascading outages or uncontrolled separation that jeopardizes the reliability of an interconnection. The geographic size of the area affected by such an event is always larger than the local area monitored by a single transmission operator and may also be larger than a single Reliability Authority's area.~~

#### **Summary Consideration:**

The SDT did not use the term, 'wide area impact' in this standard. There is no industry consensus on the definition of this term. The Functional Model Review Task Group has declined to develop a definition, and the Operate in Limits Definition Task Force has not been successful in reaching a concise definition. The SDT will request that this term continue to be refined, but recommends that this refinement take place outside the scope of this standard. The SDT revised the definition to conform to the Department of Energy threshold for reporting disturbances as defined in DOE Form EIA-417. The DOE Form EIA-417 uses the following criteria for reporting disturbances:

"Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident"

**City of Lakeland PLKT**

Better definition of Wide Area Impact is needed.

The SDT did not use the term, 'wide area impact' in this standard. There is no industry consensus on the definition of this term. The SDT will request that this term continue to be refined, but recommends that this refinement take place outside the scope of this standard.

**City of Lakeland PLKT**

Some definitions are vague and somewhat circular. Wide Area Impact seems to be same as IROL, lack of clarity on scope of area for cascading outages, ie; single control area or RA's area or beyond ? Possible confusion with Wide Area Impact . Bulk Electric System definition?

The SDT did not use the term, 'wide area impact' in this standard. There is no industry consensus on the definition of this term. The SDT will request that this term continue to be refined, but recommends that this refinement take place outside the scope of this standard.

**Duke Power DUKE (Electric Generators)**

**Duke Power DUKE (LSEs)**

**Duke Power DUKE (Transmission Owners)**

The definition of "wide area" is still being developed. Industry needs to reach consensus definition of this term prior to its being utilized in a Standard.

Recommend that this definition be completed prior to being used in a Standard.

The SDT did not use the term, 'wide area impact' in this standard. There is no industry consensus on the definition of this term. The SDT will request that this term continue to be refined, but recommends that this refinement take place outside the scope of this standard.

**Carolina Power & Light Company CPL (Transmission Owners)**

**Carolina Power & Light Company CPL (LSEs)**

**Carolina Power & Light Company CPL (Generators)**

The definition of Bulk Electric System is circular and does not help anyone understand what is the Bulk Electric System. In fact, the interim blackout report has a definition that is more specific, but we are not even sure if that is the definition that has been used in other NERC policies and standards. The definition of Wide Area Impact is really the same as the definition of IROL. This definition does not help anyone understand what a wide area really is either.

The SDT did not use the term, 'wide area impact' in this standard. There is no industry consensus on the definition of this term. The SDT will request that this term continue to be refined, but recommends that this refinement take place outside the scope of this standard.

**ISO New England Inc ISNE**

The Standard does not include clear definitions or criteria on how "local" and "Wide Area Impact" are determined. Therefore, it is difficult to assess what electrical boundaries an IROL is meant to protect. This definition of Wide Area Impact points out that the electrical area to be included in the limit may be larger than the portion of the transmission system under the authority of a single Reliability Authority (RA). This indicates the need for studies and associated limits that transcend the boundaries of a single RA's purview, yet there is no formal statement identifying this need in standard, 200, 600 or the Co-ordinate Operations Standard (currently under development).

The SDT did not use the terms, 'wide area impact' or 'local area' in this standard. There is no industry consensus on the definition of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

### **Electricity Consumers Resource Council**

We are concerned that the definition or criteria regarding the differentiation between "Local" and "Wide Area Impact" is unclear. The proposed standard does not appear to provide adequate responses if the electric area to be included in the limit is larger than the portion of the transmission system under the authority of a single Reliability Authority (RA). The standard should clearly explain how an RA can order all TO's, BA's, IA's and other RA's to take necessary actions if they are not within the controlling RA's reliability area.

The SDT did not use the terms, 'wide area impact' or 'local area' in this standard. There is no industry consensus on the definition of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

The Coordinate Operations standard addresses the coordination of actions between two RAs. There is a requirement in this standard that requires the entities that work under the direction of an RA to follow that RA's directives. RA Certification is expected to include requirements that the RA have written agreements with all entities that operate within its physical and/or electrical boundaries. These agreements are expected to address the authority of the RA to direct entities to take actions under normal and abnormal conditions.

### **Exelon Energy Delivery EED - PECO & ComEd (LSEs)**

#### **Exelon Generation Company LLC EXGN**

Exelon believes that the definition of "Wide Area Impact" is incorrect. The second sentence of the definition states, "The geographic size of the area affected by such an event is always larger than a single Reliability Authority's area". This implies that a blackout confined to a major city monitored by a single transmission operator is not a violation of this Standard. Such an event not being a violation of this standard could lead to the conclusion that this Standard is not accomplishing its objective. Exelon suggests that the second sentence be removed.

The SDT did not use the term, 'wide area impact' in this standard. There is no industry consensus on the definition of this term. The SDT will request that this term continue to be refined, but recommends that this refinement take place outside the scope of this standard.

### **MAIN**

We believe that the definition of "Wide Area Impact" is incorrect. The second sentence of the definition states, "The geographic size of the area affected by such an event is always larger than the local area monitored by a single transmission operator and may also be larger than a single Reliability Authority's area". This implies that a blackout confined to a major city monitored by a single transmission operator is not a violation of this standard. Such an event not being a violation of this standard could lead to the conclusion that this standard is not accomplishing its objective. We suggest the second sentence be removed.

The SDT did not use the term, 'wide area impact' in this standard. There is no industry consensus on the definition of this term. The SDT will request that this term continue to be refined, but recommends that this refinement take place outside the scope of this standard.

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Definitions**

---

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**FirstEnergy Corp**

It is difficult to establish what areas, or electrical boundaries, are to be protected. The standard does not give clear definition on how local or wide area impacts are determined.

IROL's are based on system operating limits that are developed based on study criteria identified in the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard. IROLs are expected to be updated to match changing system conditions. . Each RA is expected to study its SOLs to determine which ones could lead to voltage instability, cascading outages or uncontrolled separation. IROLs are developed based on studies of pre- contingency situations and are updated in real time to address changes in system topology such as a loss of a line or a unit trip

Note that the SDT did not use the terms, 'wide area impact' and 'local impact' in this standard. There is no industry consensus on the definitions of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

of a single Reliability Authority (RA). This indicates the need for studies and associated limits that transcend the boundaries of a single RA's purview, yet there is no formal statement identifying this need in standard, 200, 600 or the Co-ordinate Operations Standard (currently under development).

Note that the SDT did not use the terms, 'wide area impact' and 'local impact' in this standard. There is no industry consensus on the definitions of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

The SDT does expect that studies will need to be conducted in advance and will need to look beyond a single RA's Reliability Area. There were several suggestions that the standard be revised to include a requirement that the identification of IROLs be coordinated between adjacent RAs within an Interconnection. The standard has been revised to include this requirement.

**WECC**

**Minnesota Power MP**

**Public Works Commission Fayetteville PWCF**

**Southern California Edison SCET**

**Salt River Project SRP**

**Tucson Electric Power Company TEPC**

**Platte River Power Authority TP PRPA**

The definition of "cascading" is inconsistent with NERC definitions found elsewhere. The definition of "wide area impact" is overly broad, stating the area affected is "always larger than the local area monitored by a single transmission operator." By this definition, the affected area could be large (such as a major metropolitan area or multi-state RTO) and still not be considered a "wide area impact."

Note that the SDT did not use the terms, 'wide area impact' and 'local impact' in this standard. There is no industry consensus on the definitions of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

The SDT did update its definition of 'cascading' to clarify what was intended. The new definition of 'cascading outages' is as follows:

The uncontrolled successive loss of system elements triggered by an incident at any location which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

The new definition of cascading outages conforms with the threshold criteria used for reporting outage-related disturbances to the Department of Energy.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding any SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Gainesville Regional Utilities GVL (LSEs)**

**City of Tallahassee TAL (Transmission Owners)**

Wide Area Impact: The impact of an event that, if left untended, could lead to voltage instability, cascading outages or uncontrolled separation that jeopardizes the reliability of an interconnection. (This is really the same as the definition for the IROL. Are they really trying to define “wide area”? This does not seem to be correct. What does it add?) The geographic size of the area affected by such an event is always larger than the local area monitored by a single transmission operator and may also be larger than a single Reliability Authority’s area.

Note that the SDT did not use the terms, ‘wide area impact’ and ‘local impact’ in this standard. There is no industry consensus on the definitions of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

The SDT did update its definition of ‘cascading’ to clarify what was intended. The new definition of ‘cascading outages’ is as follows:

The uncontrolled successive loss of system elements triggered by an incident at any location which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

The new definition of cascading outages conforms with the threshold criteria used for reporting outage-related disturbances to the Department of Energy.

**Power Pool of Alberta PPOA**

Standard 200 needs enhanced definitions of IROL and wide area impact, in order to more precisely define the portions of power systems that IROLs are meant to protect. At a minimum there should be recognition of the need for adjacent Reliability Authorities to reach a common understanding of wide area impact.

The SDT does expect that studies will need to be conducted in advance and will need to look beyond a single RA’s Reliability Area. There were several suggestions that the standard be revised to include a requirement that the identification of IROLs be coordinated between adjacent RAs within an Interconnection. The standard has been revised to include this requirement.

**Sacramento Municipal Utility District SMUD**

The definition of "Wide Area Impact" is overly broad.

Note that the SDT did not use the terms, ‘wide area impact’ and ‘local impact’ in this standard. There is no industry consensus on the definitions of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

The SDT did update its definition of ‘cascading’ to clarify one of the probable impacts of exceeding an IROL for a time greater than  $T_v$ . The new definition of ‘cascading outages’ is as follows:

The uncontrolled successive loss of system elements triggered by an incident at any location which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

The new definition of cascading outages conforms with the threshold criteria used for reporting outage-related disturbances to the Department of Energy.

**Southern Company Services SOCO (Generators)**  
**Southern Company Services SOCO (Transmission Owners)**  
**Georgia Power Company (LSEs)**

Wide Area/Local Area

The following definition is included in the standard. Although this is a start in the right direction, the NERC OC indicated a need for better defining wide and local areas. It seems that it would be prudent to wait and include any clarifications to the definitions from the OLDTF and/or RCWG. This is an example of two different, but related objectives working on incongruous timetables. Southern Company Services SOCO (Generators)

As interpreted from the note pertaining to definitions on page 1 of the standard, a vote for approving this standard also approves the definitions within even though the definitions will be pulled out into a separate definitions document. If the separate definitions document can then be easily modified according to subsequent recommendations from the OLDTF and RCWG, this would help alleviate this issue.

The SDT did not use the terms, 'wide area impact' or 'local area' in this standard. There is no industry consensus on the definition of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

Note that the FMRTG could not agree on a definition of Wide Area, and the SDT did not find that the definition produced by the OLDTF is useful in determining the scope of the 'wide area'. The OLDTF's definitions for Local Area and Widespread Area are

Local Area: The portion of a Widespread Area, predetermined by appropriate analyses, where the impact of a Contingency or other event will not cause instability, uncontrolled separations or cascading outages to propagate beyond the local boundaries (i.e., will not impact the overall reliability of a major portion of the Interconnection.) Impact to a Widespread Area indicates significant impact to the Interconnection.

Widespread Area: Any area that extends beyond any predefined Local Area.

The SDT did refine the definition of cascading outages to help clarify one of the probable impacts of exceeding an IROL. The refined definition of cascading outages ties to the threshold criteria used for reporting outage-related disturbances to the Department of Energy. The new definition of cascading outages is:

"The uncontrolled successive loss of system elements triggered by an incident at any location which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes."

**Western Area Power Administration - CM WACM**

There needs to be further development in the definitions of "wide- spread" and "local" impact. The SDT did not use the terms, 'wide area impact' or 'local area' in this standard. There is no industry consensus on the definition of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

**Wisconsin Energy Corporation - PM WEC**

Do not agree that the area must be larger than a single transmission operator.

The SDT did not use the terms, 'wide area impact' or 'local area' in this standard. There is no industry consensus on the definition of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Local Area**

**Electricity Consumers Resource Council**

We are concerned that the definition or criteria regarding the differentiation between "Local" and "Wide Area Impact" is unclear. The proposed standard does not appear to provide adequate responses if the electric area to be included in the limit is larger than the portion of the transmission system under the authority of a single Reliability Authority (RA). The standard should clearly explain how an RA can order all TO's, BA's, IA's and other RA's to take necessary actions if they are not within the controlling RA's reliability area.

The SDT did not use the terms, 'wide area impact' or 'local area' in this standard. There is no industry consensus on the definition of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

## 201 IROL Identification

### **Requirements**

#### (a) Requirements

- (1) The Reliability Authority shall identify and document which Facilities (or groups of Facilities) in ~~the its Reliability Authority's~~ Reliability Authority Area are subject to Interconnection Reliability Operating Limits<sup>1</sup>. (footnote: <sup>1</sup> Each IROL is developed by following the requirements in the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard.)
  - (ii) All Reliability Authorities that share a Facility (or group of Facilities) shall agree on whether that Facility (or group of Facilities) is (are) subject to Interconnection Reliability Operating Limits.
- (2) The Reliability Authority shall identify ~~each~~ Interconnection Reliability Operating Limits for its ~~within the Reliability Authority's~~ Reliability Authority Area. Each Interconnection Reliability Operating Limit shall have a  $T_v$  that is smaller than or equal to 30 minutes.
  - (i) ~~The Reliability Authority shall identify a  $T_v$  for each Interconnection Reliability Operating Limit.~~
- (3) All Reliability Authorities that share a Facility (or group of Facilities) subject to an Interconnection Reliability Operating Limit, shall agree upon the process used to determine that Interconnection Reliability Operating Limit and its associated  $T_v$ .

### **Summary Consideration:**

Several balloters indicated a need to have coordination between RAs in setting IROLs that involve more than one RA. The SDT added a requirement that RAs sharing a Facility must have a process for determining whether that Facility is subject to IROLs and for setting the IROL and its  $T_v$ .

Several balloters indicated that there needs to be a formal link between this standard and Standard 600. The link was added to the first requirement, and indicates that each IROL is developed following the requirements in the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard.

Many balloters requested that  $T_v$  be set at a maximum of 30 minutes, and this upper limit was added to the definition of  $T_v$  as well as to this requirement.

- **Add other Functions**

**Georgia Power Company (LSEs)**

**Southern Company Services SOCO (Generators)**

**Southern Company Services SOCO (Transmission Owners)**

The standard has been changed so that the RA is the responsible party for managing IROLs. Although the supporting documentation for this standard indicates that responsibilities CAN be delegated (see excerpt below), it is important to note that the ultimate responsibility lies with the RA and the standard itself does not speak to a delegation of responsibilities.

The technical discussion of the Functional Model includes a discussion on delegating tasks, and clearly states that a task may be delegated, but not its associated responsibilities for compliance. The SDT doesn't believe it is necessary to add language to each of the standards indicating that a requirement may be delegated. Note that if this task is delegated, the RA is still responsible for compliance.

**MAIN**

The standard as drafted appears to place a sole responsibility with the Reliability Authority for determining which "facilities," Interconnection Reliability Operating Limits, and  $T_v$  are appropriate. It was stated on the informational call held by NERC that the RA is assumed to be the local system operator not the Reliability Coordinator. At least some members are of the opinion that the RA should work jointly, and in cooperation, with the Reliability Coordinator, Control Area Operator, Transmission Owner, Transmission Operator and Transmission Provider to accomplish the identification called for in section 201. This is a reasonable approach that will ensure complete identification of the facilities and limits, and further ensure a common understanding of any directives from the RA. The measurements could remain as stated.

New reliability standards are being developed using the terminology defined in the Functional Model. Only functions identified in the Functional Model are assigned responsibility for requirements in these new standards. The Reliability Coordinator and Control Area Operator are not 'functions' defined in the Functional Model and will not be identified as being responsible for any requirements in the new standards.

- **Set  $T_v$  at a Max of 30 min**

**AEP Service Corp -- Transmission System AEP (Transmission Owners)**

$T_v$ , which is defined as the maximum time that an Interconnection Reliability Operating Limit (IROL) can be exceeded without compliance sanctions being applied, has no maximum limit. Currently policy requires OSL violations to be corrected within 30 minutes. The proposed standard would allow a Reliability Coordinator to choose what he believes to be an appropriate  $T_v$  for each IROL. With no maximum  $T_v$  required, there is potential for Reliability Coordinators to choose something much longer than 30 minutes in order to minimize their exposure to a compliance sanction. Placing no restrictions on how long an IROL can be exceeded is not in the best interest of reliability.

The standard has been changed to indicate that  $T_v$  cannot be set higher than 30 minutes. The RA should establish a  $T_v$  that is appropriate to each IROL. IROLs should **never** be exceeded for any length of time, but because operations can't always be predicted, there are events that occur that

can cause an IROL to be exceeded. The  $T_v$  is a recognition that system operators can't re-dispatch or reconfigure their system instantaneously and  $T_v$  allows the system operators some time to take corrective actions before the risk to the interconnection becomes unacceptable.

### **Allegheny Power AP**

$T_v$  should have a default value of 30 minutes. Variations should be permitted with reason.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **Bonneville Power Administration Transmission BPAT**

We recommend a NERC maximum  $T_v$  of 30 minutes with the option for the NERC Region and/or the Reliability Authority to set a shorter  $T_v$  as appropriate.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **Boston Edison Company BECO (Transmission Owners)**

NSTAR shares the general concern that the standard is not specific relative to the time in which the system should be placed back to a secure state. This leaves the requirement as an open ended one and we feel it should have a maximum duration established, preferably 30 minutes.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **City Water Light & Power CWLP**

There is no upper limit to  $T_v$ . I believe it should have an upper limit of 30 minutes.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **Con Edison Company of New York CEPD (LSEs)**

### **Con Edison Company of New York CEPD (Brokers)**

### **Consolidated Edison Co. of New York NYCE (Generators)**

The existing NERC Policy 2 limits the time an IROL shall be exceeded to 30 minutes. Permitting a Reliability Authority to establish a  $T_v$  in excess of 30 minutes for certain IROLs, as permitted by the proposed Standard 200, implies that not restricting the maximum value of  $T_v$  poses no threat to reliability. However, we know of no method for calculating the reliability risk of increasing  $T_v$  above 30 minutes. Moreover, if Reliability Authorities were permitted the option of expanding  $T_v$  beyond 30 minutes according to what they perceive as acceptable risk, the reliability of neighboring systems will be impacted by decisions they have no control over.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

In addition, some balloters indicated a concern about the need for more specific coordination of IROLs on 'shared' facilities. The standard was revised to include a requirement that RAs develop a single IROL with a single  $T_v$  for each shared Facility (or group of Facilities) subject to IROLs.

### **Consumers Energy CETR (LSEs)**

Tv should not be left without a default value that represents a generally recognized value used by much of the industry.

Tv should have a default value assigned of 30 minutes. If explicitly justified and coordinated with other RA's or entities whose areas may be affected by by the IROL, the Reliability Authority should then have the ability to override the default value.

There were many balloters who indicated a need to set an upper limit on Tv and the standard has been changed to include this restriction. Requiring a default of 30 minutes defeats the purpose of allowing RAs the flexibility of developing a Tv that is best for each IROL.

Some balloters indicated a concern about the need for more specific coordination of IROLs on 'shared' facilities. The standard was revised to include a requirement that RAs develop a single IROL with a single Tv for each shared Facility (or group of Facilities) subject to IROLs.

### **Consumers Energy CETR (TDUs)**

Consumers Energy votes against this proposed standard because it fails to establish specific Interconnection Reliability Operating Limit measures and specific Tv values for those measures. Further it leaves the development of such measures to each Reliability Authority, thus potentially causing significant differences in compliance requirements between control areas without a workable mechanism to come to consensus on the appropriate measures and Tv values.

There were many balloters who indicated a need to set an upper limit on Tv and the standard has been changed to include this restriction.

Some balloters indicated a concern about the need for more specific coordination of IROLs on 'shared' facilities. The standard was revised to include a requirement that RAs develop a single IROL with a single Tv for each shared Facility (or group of Facilities) subject to IROLs.

### **Duke Power DUKE (Electric Generators)**

#### **Duke Power DUKE (LSEs)**

#### **Duke Power DUKE (Transmission Owners)**

This standard has "lost" the recognition of current Policy that recovery from an OSL violation should be capped at some maximum amount of time. Recommend that a maximum time for recovery be developed which will limit the exposure of the Interconnection to the OSL risk while recognizing the various time duration assumptions used in the development of the associated equipment rating(s).

This standard was intended to change the focus of system operators from 'recovery' to 'prevention'. This standard includes several requirements that are more explicit and more stringent than the language in Policy 2. Collectively, these new requirements aim to help the system operator be more focused in monitoring limits and taking actions to PREVENT instances of exceeding any IROLs. The standard does recognize that there may be instances where an IROL is exceeded, and the standard requires that system operators have a plan to follow so that if faced with the situation, the system operator will know what to do to mitigate the incident.

There were many balloters who indicated a need to set an upper limit on Tv and the standard has been changed to include this restriction.

### **Electricity Consumers Resource Council**

NERC's current Operating Policy 2 limits the time an IROL (TV) can be exceeded without compliance sanctions to a maximum of 30 minutes. The proposed standard implies that TV's may be greater than 30 minutes. This change must be more fully explained.

NERC's Policy 2 focuses on 'recovery' when a limit has been exceeded. The SDT drafted this standard to change the focus from 'recovery' to 'prevention'. This standard includes new requirements that go beyond what is required in Policy 2. The new standard puts most of its emphasis on preventing instances of exceeding an IROL. The new standard requires that system operations:

- Have a list of their facilities subject to IROLs
- Be able to identify current IROLs with a  $T_v$  for each
- Have procedures, processes or plans for preventing as well as mitigating instances of exceeding IROLs
- Conduct operational planning analyses and real time assessments with a focus on IROLs
- Take action or direct others to take action to prevent instances of exceeding IROLs

Because exceeding an IROL for any length of time is a risk to the interconnection, the SDT initially did not think that it was necessary to set an 'upper limit' on the duration of  $T_v$ . However, the balloters have clearly indicated a desire to have an 'upper limit' and the standard has been changed to add an upper limit for  $T_v$  of 30 minutes.

### **Exelon Energy Delivery EED - PECO & ComEd (LSEs)**

#### **Exelon Generation Company LLC EXGN**

Exelon believes that a maximum  $T_v$  should be established, and a requirement should be put in place for the coordination of  $T_v$  for tie-lines and for limiting elements in different RAs that are results of a common contingency

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

Some balloters indicated a concern about the need for more specific coordination of IROLs on 'shared' facilities. The standard was revised to include a requirement that RAs develop a single IROL with a single  $T_v$  for each shared Facility (or group of Facilities) subject to IROLs.

### **FirstEnergy Corp**

FirstEnergy does not agree that there should be an open ended position on the  $T_v$ . The development of  $T_v$ , as stated in the standard, is open to determination by the Reliability Authority. There needs to be a maximum time limit established, such as the current 30 minute as stated in NERC policy

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **FirstEnergy Solutions FESC (LSEs)**

FES does not agree that the  $T_v$  should be open ended to determination by the Reliability Authority.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **FirstEnergy Solutions FESC (Brokers, Aggregators, and Marketers)**

My main concern is that standards should not left up to determination by the individual RAs. Since the individual RAs have a different risk tolerance, the standards may vary over the different RAs and may impact the market.

Some balloters indicated a concern about the need for more specific coordination of IROLs on 'shared' facilities. The standard was revised to include a requirement that RAs develop a single IROL with a single  $T_v$  for each shared Facility (or group of Facilities) subject to IROLs.

### **Gainesville Regional Utilities GVL (Generators)**

I also believe that IROL  $T_v$  should be defined(30 Minutes).

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **Great River Energy GRE**

I have concerns about having an undefined upper limit on  $T_v$ . I would suggest thirty minutes if anything greater than thirty minutes being adopted as an exception to the standard needing approval by the appropriate committee.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **Hydro One Networks Inc. (Transmission Owners)**

We are very much concerned that the a diluted version of the existing standard is posted for approval post August 14 outage.

Core Reliability Standards such as this one should be extremely stringent and prescribed for all entities. Entities such as RC or CA should not have inconsistent practices to determine their own  $T_v$ . As a minimum maximum value of  $T_v$  should be prescribed.

NERC's Policy 2 focuses on 'recovery' when a limit has been exceeded. The SDT drafted this standard to change the focus from 'recovery' to 'prevention'. This standard includes new requirements that go beyond what is required in Policy 2. The new standard puts most of its emphasis on preventing instances of exceeding an IROL. The new standard requires that system operations:

- Have a list of their facilities subject to IROLs
- Be able to identify current IROLs with a  $T_v$  for each
- Have procedures, processes or plans for preventing as well as mitigating instances of exceeding IROLs
- Conduct operational planning analyses and real time assessments with a focus on IROLs
- Take action or direct others to take action to prevent instances of exceeding IROLs

Because exceeding an IROL for any length of time is a risk to the interconnection, the SDT initially did not think that it was necessary to set an 'upper limit' on the duration of  $T_v$ . However,

the balloters have clearly indicated a desire to have an ‘upper limit’ and the standard has been changed to add an upper limit for  $T_v$  of 30 minutes.

Some balloters indicated a concern about the need for more specific coordination of IROLs on ‘shared’ facilities. The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

### **Hydro One Networks Inc (LSEs)**

The value  $T_v$  defined in the standard at the time an Interconnection Reliability Operating Limit (IROL) can be exceeded within compliance is not given a maximum limit as presently stated in NERC’s Operating Policy 2. The proposed draft does not limit the values and implies that violations of over 30 minutes are acceptable to the North American Bulk Power System. The lack of method to determine acceptable risks is of special concern after the experience of the August 14th, 2003 events. Hydro One Networks does not support the concept that response times greater than 30 minutes are acceptable.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **Hydro-Quebec HQT**

The proposed Standard implies that  $T_v$ ’s may be greater than 30 minutes and may represent an acceptable risk to the North American bulk power system. There is no method or criteria established for determining acceptable risk or impact on reliability identified in the Standard or the associated Q&A. Therefore, it is difficult to support the statement that a response time greater than 30 minutes is acceptable.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **New York Power Authority MED**

### **Northeast Utilities NU**

### **Nova Scotia Power NSPI**

### **Ontario - Independent Electricity Market Operator IMO**

### **United Illuminating UICO**

### **New York Power Authority NYPA**

### **ISO New England Inc ISNE**

It is National Grid’s (NPCC’s) (UI’s) (ISO-NE’s) position that  $T_v$ , the time an IROL can be exceeded without compliance sanctions, be limited to a maximum of 30 minutes as presently stated in NERC Operating Policy 2. The proposed Standard implies that  $T_v$ ’s may be greater than 30 minutes and may represent an acceptable risk to the North American bulk power system. There is no method or criteria established for determining acceptable risk or impact on reliability

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 201 – IROL Identification**

---

identified in the Standard or the associated Q&A. Therefore, it is difficult to support the statement that a response time greater than 30 minutes is acceptable.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**Kansas City Power & Light KCPL**

The standard must state the maximum time allowed for  $T_v$

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**MAAC**

I agree with commenters who suggest that there should be a 30 minute maximum limit to  $T_v$ , the "at risk" interval, and with the obligation that action should be initiated as soon as possible after recognition that a limit has been exceeded. I don't think that these are reasons enough to vote no, but would support them as additions to the standard.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**MAIN**

A maximum  $T_v$  should be established, and further a requirement should be put in place for the coordination of  $T_v$  for tie-lines and for limiting elements in different RAs that are results of a common contingency. This is the time that the Reliability Authority has to bring the violation back within limits. The current time maximum value for SOL's is 30 minutes. The proposed standard for this new subset of SOL's that effect interconnections doesn't have a cap and should if this standard will have any teeth, plus the standard should exemplify to the public that the industry is concerned about reliability Retaining 30 minutes as the cap is reasonable.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

Some balloters indicated a concern about the need for more specific coordination of IROLs on 'shared' facilities. The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

**Midwest Independent Transmission System Operator, Inc.**

There should be some maximum cap on  $T_v$ .

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**Mirant Americas Energy Marketing LP MAEM**

Under Section 201, concerned that a maximum  $T_v$  is not defined for the interconnect. Can appreciate the drafting teams intent here (allow flexibility), but we're supposed to be talking about the reliability of the interconnection here, and I have a tough time understanding how there isn't a maximum  $T_v$  for the interconnection.

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 201 – IROL Identification**

---

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**New York State Reliability Council**  
**LIPA LIPA (Transmission Owners)**

Allowing  $T_v$  to exceed 30 minutes as permitted by proposed Standard 200 would degrade NERC criteria and therefore would threaten reliability by increasing the risk of voltage instability, cascading outages, and uncontrolled system separation.

The existing NERC Policy 2 limits the time an IROL shall be exceeded to 30 minutes. Permitting a Reliability Authority to establish a  $T_v$  in excess of 30 minutes for certain IROLs, as permitted by the proposed Standard 200, implies that not restricting the maximum value of  $T_v$  poses no threat to reliability. However, we know of no method for calculating the reliability risk of increasing  $T_v$  above 30 minutes. Moreover, if Reliability Authorities were permitted the option of expanding  $T_v$  beyond 30 minutes according to what they perceive as acceptable risk, the reliability of neighboring systems will be impacted by decisions they have no control over.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

Some balloters indicated a concern about the need for more specific coordination of IROLs on 'shared' facilities. The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

**NPCC**  
**LIPA LIPA (Transmission Owners)**

$T_v$ , the time an IROL can be exceeded without compliance sanctions, should be limited to a **maximum** of 30 minutes as presently stated in NERC Operating Policy 2.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**Northeast Utilities NU**

The Standard must, as a minimum, clearly define the acceptable time of violation for each IROL. The Standard is developed to address contingencies that could result in instability, voltage collapse, uncontrolled separation and/or cascading outages that could impact the integrated bulk power system.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**Transmission Agency of Northern California – TANC**

The other reason we are voting "No" is that in the standard, the time allowed for the system to return to safe operating limits following a disturbance ( $T_v$ ) is a variable whose value is based on the particular limit being violated. This concept is fine. However, there is no upper limit to  $T_v$ . The Reliability Authority is responsible for setting  $T_v$ , but without a limit on the maximum

amount of time allowed to return the system to within its operating limits, some areas could end up setting values of  $T_v$  that could put other areas at risk.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

## **NYISO**

### **Ontario - Independent Electricity Market Operator IMO** **New England ISO**

The Standard 200 does not set a maximum limit to the “at risk” interval (“ $T_v$ ” in Standard 200 - the time a Reliability Operating Limit can be exceeded without compliance sanctions). Current NERC policy effectively establishes a maximum “at risk” interval of 30 minutes, and we believe this must be carried forward in Standard 200 to ensure a timely and implementation of the standard and for the standard to meet reliability objectives. Providing future flexibility for the Reliability Authority, or some other authority, to establish an acceptable longer “at risk” interval may be possible, but we recommend an evolutionary approach to this development of the standard.

Recommendation: the parameter  $T_v$ , be limited to a maximum value of 30 minutes.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

## **Public Service Company of New Hampshire PSNH**

The primary objection is that this standard would now allow a Reliability Authority (RA) to define the acceptable time of violation of each IROL. We now operate with the expectation that the transmission system will be returned to within Operating Security Limits as soon as possible, but no longer than 30 minutes. Given the August 14 Blackout, how can we as an industry allow an RA to lesson this expectation?

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

## **Southern Company Services SOCO (Generators)**

### **Southern Company Services SOCO (Transmission Owners)**

Please note in the excerpt below that each RA may use whatever system it wants for choosing  $T_v$ . This will certainly be an important issue along seams, especially if there is no limit for  $T_v$ . “How do you establish a  $T_v$  for an IROL?”

Each RA may use whatever system it wants for establishing a  $T_v$  for its IROLs. This gives each RA the latitude to be as conservative as it desires. Some RAs may choose to use a default  $T_v$  of 30 minutes — currently some entities have a default of 20 minutes for all limits that would be categorized as IROLs. One of the benefits of this variable  $T_v$  is that it gives an RA that operates in a market environment greater flexibility before implementing remedial actions that have the effect of negatively impacting that market.”

Southern recommends a cap (maximum) for  $T_v$  of 30 minutes. The 30-minute limit is the best benchmark we have as a maximum value and should be considered as the cap unless an alternative value can be shown to be more appropriate.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

Some balloters indicated a concern about the need for more specific coordination of IROLs on 'shared' facilities. The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

**Carolina Power & Light Company CPL (Transmission Owners)**

**Carolina Power & Light Company CPL (LSEs)**

**Carolina Power & Light Company CPL (Generators)**

**Southern Company Services SOCO (Generators)**

**Southern Company Services SOCO (Transmission Owners)**

By definition, all IROLs are significant and impact the reliability of the Interconnection. Therefore, the reasoning for allowing an RA the full range to determine  $T_v$  is especially bothersome. The best compromise is for the standard to set a maximum  $T_v$  and allow the RAs to set it up to that cap. In addition, although various market solutions can/should be used to manage the system in an attempt to avoid IROLs, it should not dictate or drive what  $T_v$  should be set at.  $T_v$  should be set according to the severity of the situation, not according to the least cost/least impact to the market. Once you are dealing with IROLs and into the  $T_v$  period, you are at a critical operating state. In a response to comments the SDT stated, "Including specific language that references tariffs and market issues is outside the scope of NERC's reliability standards."

Not only should specific language that references markets be absent, but those markets should not drive aspects of reliability standards to the detriment of reliability. The 30-minute limit contained in Policy 2 is the best benchmark we have as a maximum value and should be used as the cap.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**Southern Company Services SWE**

For  $T_v$  related to an Interconnected Operating Reliability Limit, IROL: The Standard allows the Reliability Authority to identify the  $T_v$  for each IROL. It is recommended that the  $T_v$  time limit not be open ended but require the RA to establish a maximum time limit of 30 minutes (as current policy requires) to return to normal operating conditions. It could be less if the RA deems it necessary.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**Wisconsin Public Service Corporation WPS**

The  $T_v$  should have a maximum time limit that coincides with the max value for SOL's.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

**Westar Energy WR**

The unlimited  $T_v$  allows an entity to set a  $T_v$  value "accepting risk" for some period of time, while neighboring entities are also exposed to the risk but are unable to limit the  $T_v$  that is defined. A variable  $T_v$  with a maximum of 30 minutes or 1 hour would be more acceptable. If more time is needed to resolve loading problems, actions should be started prior to reaching the IROL.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **American Transmission Company LLC ATC (Transmission Owners)**

#### **MAIN**

The treatment of  $T_v$  is incomplete in a number of ways. For example, the compliance monitoring process requires a list of facilities and associated operating limits subject to IROL's but without mention of the associated  $T_v$  for each of that list's facilities (Section 201 (d) (3)). Conformance to the NERC Functional Model could be improved since the current version of the Functional Model makes the Reliability Authority responsible for determining IROL's but not specifically the time limits associated with those IROL's. Finally, the standard allows for some radical values of  $T_v$ . If  $T_v$  is set to zero, for instance, it creates the possibly unintended requirement to operate some facilities to an N-2 criterion.

The requirement and the measures already include a requirement that there be a  $T_v$  for each IROL.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **Western Area Power Administration - CM WACM**

$T_{sub v}$  needs to be developed with a maximum time limit. All IROLs are significant, by definition, and should not have the latitude of an open ended requirement.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

### **Westar Energy WR (LSEs)**

We feel that there should be a specific length of time to correct any violation. If that time is exceeded, then penalties should occur. The way the rule is currently written, an entity could be violating a reliability limit for an indefinite length of time with no penalty.

There were many balloters who indicated a need to set an upper limit on  $T_v$  and the standard has been changed to include this restriction.

#### **MAIN**

Having identified the IROLs in advance there needs to be allowance for reacting to a system circumstance that has similarity to what was predefined but has some operationally significant differences in real time. e.g. there could be instances where an operator is directed to follow a predefined solution to an operating limit that may be invalid due to different circumstances that exist on the transmission system. While we are not trying to suggest that the process be burdened with debates, we believe that there should be a provision for discussions of conditions and effective actions, where time allows.

This standard doesn't require the RAs to follow their action plans, they may adjust these plans to meet real time conditions. For IROLs that can't be exceeded for more than a few cycles, special protection systems or remedial action schemes may be installed.

- **Tv – Seams issues & 2<sup>nd</sup> Party Review**

**Western Area Power Administration - CM WACM**

One of the on-going problems that has existed from region to region, and in some cases, within sub-regions, is the development of a consistent operating limit. While the purpose of this standard is to enforce the observance of those limits, we feel that there needs to be more proscriptive wording within the standard for the creation to those limits.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

**Bonneville Power Administration - Power Business BPAP**

201.a.2.i states that the Reliability Authority (RA) shall identify the maximum time that an Interconnected Reliability Operating Limit (IROL) can be exceeded without compliance sanctions being applied for each IROL. Presently WECC states the time limit as 20 minutes for stability and 30 minutes for thermal limitations. It should not be the responsibility of each individual RA to set the time limit, but rather the responsibility of the NERC Region (or sub region at the very least). There are paths on which energy flows between different RA's areas of responsibility. There is, under the proposed wording, the possibility that two different time limits be set, one by each RA? This could lead to much confusion.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

If a Region wants to establish limits that are more stringent than the NERC standard, that is acceptable without the need to revise the language in the standard. If a Region wants to establish a standard that is less restrictive than the NERC standard, then the Region must request a Regional Difference.

**Allegheny Power AP**

Adjoining Reliability Authorities should be allowed to review Tvs.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs. With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

**Allegheny Power AP**

Regional Councils should monitor Tvs.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

If a Region wants to monitor and/or approve the Tvs of its Region, the Region may request this outside of the NERC standard. If a Region wants to require that the Tvs be submitted to the Region as part of this standard, then the Region should request a Regional Difference as part of this standard.

## **Ontario Power Generation Inc OPG**

### SECTION 201:

Tv needs to be specified and should be consistent, at least across each interconnection.

A maximum for Tv has been established.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs. With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

## **PSEG Energy Resources & Trade LLC PS**

### **PSEG Power LLC**

### **Public Service Electric and Gas Company (LSEs)**

The RAs should be required to ensure that the facilities monitored and the physical and time limits are consistently determined within their footprint and coordinated with interconnected RAs to ensure consistency. (Section 201)

Standard 600 requires that there be a methodology used to develop SOLs that are a basis for IROLs.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs. With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

## **Reliant Resources Inc RRI**

Sec 201 - There is no consistency required between Reliability Authorities as far as which flowgates are monitored, what physical limit they will be not allowed to exceed, and what time frame operating limits may be exceeded. A lack of consistency will lead to operating reliability problems as well as hinder market transactions that impact flowgates across multiple RAs.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs. With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

## **Wisconsin Energy Corporation - PM WEC**

The ability of the RA to both identify and set the Tv for IROL's lends itself to a natural conflict with the compliance sanctions. The longer the Tv the more time the RA has to act to mitigate the limit violation and avoid a stronger penalty in requirement 204. Suggest that the list of IROL's and their Tv may be developed by the RA but must be confirmed by the Planning Authority if not the same entity, or the RA's Regional Reliability Council. For RA's with dynamic or automated

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 201 – IROL Identification**

---

determination of IROL's and their Tv conformation of the criteria and methodology by the PA if not the same entity or the RA's RRC. Confirmation by a third party may ensure that the RA will not put the interconnection in undue risk.

T<sub>v</sub> has been revised so that it can't exceed 30 minutes.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

### **Electricity Consumers Resource Council**

Section 201 does not require consistency between RA's regarding the monitoring of flow gates. A lack of consistency will lead to reliability problems and must be resolved.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs. With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

### **City of Lakeland PLKT**

STD does not address seams issues and how the RA interacts with other RA's when seams problems arise

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs. With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

### **Consumers Energy CETR (TDUs)**

Consumers Energy votes against this proposed standard because it fails to establish specific Interconnection Reliability Operating Limit measures and specific Tv values for those measures. Further it leaves the development of such measures to each Reliability Authority, thus potentially causing significant differences in compliance requirements between control areas without a workable mechanism to come to consensus on the appropriate measures and Tv values.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs. With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

### **Minnesota Power MP**

In the MAPP region, the North Dakota and Manitoba to USA flowgates can be constrained by either thermal limits or stability limits. How could proposed standard 200 be approved for the stability attributes of these flowgates, without consideration of how the thermal attributes of these flowgates will be administered?

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

Thermal limits and stability limits can be IROLs if operating outside of these limits could lead to instability, cascading outages or uncontrolled separation that adversely impacts the interconnection. If operating outside of these limits does not lead to instability, cascading outages or uncontrolled separation, then these limits are not IROLs.

- **Add a link to the DFR Standard**

### **Carolina Power & Light Company CPL (Transmission Owners)**

#### **Carolina Power & Light Company CPL (LSEs)**

#### **Carolina Power & Light Company CPL (Generators)**

There needs to be additional verbiage in Standard 200 linking it to the Determine Facility Ratings Standard's methodology for establishing limits.

The following footnote has been added to the standard.

Each IROL is a system operating limit established by following the methodology established in the "Determine Facility Ratings, System Operating Limits and Transfer Capabilities" standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as '0' minutes or as long as 30 minutes.

### **Bonneville Power Administration Transmission BPAT**

The term "system operating limit" is used in the definition of the Interconnection Reliability Operating Limit (IROL) but it is not defined in this standard nor is there a reference that it is as defined in the proposed Standard 600, "Determine Facility Ratings, System operating Limits, and Transfer Capabilities". In Standard 200 there should be a clear understanding that the IROL is a subset of a "System Operating Limit" as defined in the proposed Standard 600.

The definitions developed by drafting teams are not intended to be unique to each standard. Each definition that is accepted by the industry will be entered into a common database and used by all drafting teams.

The following footnote has been added to the standard.

Each IROL is a system operating limit established by following the methodology established in the "Determine Facility Ratings, System Operating Limits and Transfer Capabilities" standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as '0' minutes or as long as 30 minutes.

**Entergy EES (Transmission Owners)**

At this time it appears the Determine Facility Ratings standard may provide for some coordination by stating that RAs, PAs, and TOPs will establish system operating limits for the areas for which they are responsible. However, this Operate Within IROL standard requires the RA to determine SOLs and then decide which of those will be used as IROLs, completely independent of, and not coordinated with the Determine Facility Rating standard requirements. These two standards must be coordinated. The IROLs used by the RAs in this standard must be a subset of the SOLs developed jointly under the Determine Facility Rating standard.

The following footnote has been added to this standard.

Each IROL is a system operating limit established by following the methodology established in the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes or as long as 30 minutes.

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard does not require that System Operating Limits be developed jointly. The Determine Facility Ratings Standard requires that the RA develop System Operating Limits for its Reliability Area.

**Southern Company Services SOCO (Generators)**

**Southern Company Services SOCO (Transmission Owners)**

**Georgia Power Company (LSEs)**

The concept of operating to first contingency seems lost except where it is covered in the Determine Facility Ratings Standard. The idea that you are trying to protect for these circumstances should at least be mentioned in Standard 200. Southern thinks there should be additional verbiage in Standard 200 linking to the Determine Facility Ratings Standard’s methodology for establishing limits.

The following footnote has been added to this standard.

Each IROL is a system operating limit established by following the methodology established in the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes or as long as 30 minutes.

**Carolina Power & Light Company CPL (Transmission Owners)**

**Carolina Power & Light Company CPL (LSEs)**

**Carolina Power & Light Company CPL (Generators)**

The concept of operating to first contingency seems to have been lost in the development of this standard. It is a core precept of reliable operations and should be included in this standard.

The concept of operating to first contingency is addressed in the Determine Facility Ratings Standard’s requirement for developing a methodology for System Operating Limits.

The following footnote has been added to the IROL Identification Requirement of this standard to clarify that IROLs are a subset of the System Operating Limits developed under the Determine Facility Ratings standard.

Each IROL is a system operating limit established by following the methodology established in the “Determine Facility Ratings, System Operating Limits and Transfer Capabilities” standard. IROLs are the subset of system operating limits that, if exceeded, may cause instability, uncontrolled separation or cascading outages. Each IROL has both a magnitude and a duration component. The duration component may be different for each IROL and may be as short as ‘0’ minutes or as long as 30 minutes.

## **PSEG Energy Resources & Trade LLC PS**

### **PSEG Power LLC**

#### **Public Service Electric and Gas Company (LSEs)**

Whatever emergency ratings are implemented by the RA, e.g., 24-hour, 4-hour, 30-minute, etc., the RA must possess the ability to relieve actual post-contingency overloads to acceptable levels within the time limit allowed by the particular rating invoked. (Section 201)

This standard has been revised so that  $T_v$  cannot exceed 30 minutes.

- **Add a requirement to share or post limits**

#### **Reliant Resources Inc RRI**

Sec 201 - There is no requirement to make the operating limits and time limits available to transmission users. Such information provides transparency to the market.

This standard is limited to addressing reliability issues. With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

#### **Public Service Electric and Gas Company (Trans owners)**

The present language of the Standard proposed for Ballot must be modified to include the following issue

The RA must publically post the Operating Limits and time limits for all facilities under their jurisdiction.

The SDT is unaware of any reliability – related reason for posting operating limits. Some of these IROLs may be very dynamic and may change multiple times over the course of a day. Asking all RAs to post these without a reliability-related reason is beyond the scope of the SDT. If you are aware of a reliability reason for posting these limits, please submit the reason on the next posting. Keep in mind that an RA may request data from another RA if the data is needed to support reliability. Not all RAs are TSPs and some RAs will not have access to OASIS.

With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

**PSEG Energy Resources & Trade LLC PS**

**PSEG Power LLC**

**Public Service Electric and Gas Company (LSEs)**

In the interest of transparency of operating requirements, a provision requiring that the RA publicly and timely post the operating limits and time limits for every facility for which they have established such must be added. Such posting should be made on each OASIS covering any portion of the RA's footprint. (Section 201)

The SDT is unaware of any reliability – related reason for posting operating limits. Some of these IROLs may be very dynamic and may change multiple times over the course of a day. Asking all RAs to post these without a reliability-related reason is beyond the scope of the SDT. If you are aware of a reliability reason for posting these limits, please submit the reason on the next posting. Keep in mind that an RA may request data from another RA if the data is needed to support reliability. Not all RAs are TSPs and some RAs will not have access to OASIS.

With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

**Mirant Americas Energy Marketing LP MAEM**

Under Section 201, would like to see a requirement that the RA reveal the list of IROLs and facilities impacted by said IROLs, at a minimum to all RAs (possibly publicly available, but I'm not sure that's the right thing to do) in the relevant interconnection. This would enable necessary coordination of action plans.

The Coordinate Operations standard requires that each RA provide requested data to another RA if there is a reliability-related reason for the request. Publicly posting the data seems to be asking the RA to expend resources that may not be needed to support reliability. With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

**Ontario Power Generation Inc OPG**

**SECTION 201:**

Reliability Authorities should be obligated to publish, for market participant use, the list of facilities which they are monitoring and the limits on those facilities. In part, this will insure appropriate coordination between adjacent RAs.

This standard is limited to addressing reliability issues.

The standard was revised to include a requirement that RAs have an agreed upon process for developing IROLs for each shared Facility (or group of Facilities) subject to IROLs.

With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- **Add language indicating IROLs can be dynamic**

**Power Pool of Alberta PPOA**

Standard 200 should be changed to clearly reflect the fact that IROLs can be dynamic in nature.

One of the measures for requirement 201 was revised so that the RA must be able to demonstrate that it can identify its current Interconnection Reliability Operating Limits. This switch from having a 'list' should clarify that the IROLs may be dynamic.

**Carolina Power & Light Company CPL (Transmission Owners)**

**Carolina Power & Light Company CPL (LSEs)**

**Carolina Power & Light Company CPL (Generators)**

The list of IROLs is a dynamic list. Standard 200 needs clear verbiage noting the dynamic nature of this list. In addition, the standard should not imply that if the limit is not on the list that you don't have to operate to it. The not-previously-identified events that would place you in an IROL should have the same requirements as those already on the list.

One of the measures for requirement 201 was revised so that the RA must be able to demonstrate that it can identify its current Interconnection Reliability Operating Limits. This switch from having a 'list' should clarify that the IROLs may be dynamic.

**National Grid USA**

**New Brunswick Power Corporation NBPC**

**New York Power Authority NYPA**

**Niagara Mohawk NMPC**

**New York Power Authority MED**

**Northeast Utilities NU**

**Nova Scotia Power NSPI**

**Ontario - Independent Electricity Market Operator IMO**

**Hydro One Networks Inc (LSEs)**

**Hydro-Quebec HQT**

It is National Grid's (NPCC's) (ISO New England) (Hydro Quebec HQT) position that Standard 200 should clearly reflect the fact that IROL's can be dynamic in nature. While it may be possible that every possible configuration can be identified in advance to deal with this dynamics, the reality is that this list would be extremely large and difficult to maintain. To improve on the situation, this section should require that the RA operators have a base set of limits that include N-1 configurations, along with identifying the following:

- The boundary conditions for which the published limits are applicable;
- The critical contingency that drive the applicable limit; and
- An understanding of what the associated limit is designed to protect the system against (i.e. transient stability, voltage decline, etc.)

One of the measures for requirement 201 was revised so that the RA must be able to demonstrate that it can identify its current Interconnection Reliability Operating Limits. This switch from having a 'list' should clarify that the IROLs may be dynamic.

With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

## **NPCC**

### **New York Power Authority MED**

### **Northeast Utilities NU**

### **LIPA LIPA (Transmission Owners)**

Standard 200 should reflect the fact that IROLs can be dynamic in nature. RAs should have a base set of limits that include N-1 configurations, along with identifying the following:

- The boundary conditions for which the published limits are applicable;
- The critical contingency that drives the applicable limit; and
- An understanding of what the associated limit is designed to protect the system against (i.e. transient stability, voltage decline, etc.)

One of the measures for requirement 201 was revised so that the RA must be able to demonstrate that it can identify its current Interconnection Reliability Operating Limits. This switch from having a 'list' should clarify that the IROLs may be dynamic.

With the next posting of this standard, the SDT will ask the industry the following question:

Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

- **Add requirement to study area beyond RA's perimeter**

## **Hydro One Networks Inc (LSEs)**

The Standard does not include clear definitions or criteria on how "local" and "Wide Area Impact" events are determined. Therefore, it is difficult to assess what electrical boundaries an IROL is meant to protect. The definition of Wide Area Impact points out that the electrical area to be included in the limit may be larger than the portion of the transmission system under the authority of a single Reliability Authority (RA). This indicates the need for studies and associated limits that transcend the boundaries of a single RA's purview, yet there is no formal

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 201 – IROL Identification**

---

statement identifying this need in standard, 200, 600 or the Co-ordinate Operations Standard (currently under development).

The definitions provided with this standard have been revised to improve the industry's understanding of the applicability of these terms to this standard. Note that the terms, 'local area' and 'wide area impact' are not used in this standard.

**Wide Area Impact:** ~~The impact of an event that, if left untended, could lead to voltage instability, cascading outages or uncontrolled separation that jeopardizes the reliability of an interconnection. The geographic size of the area affected by such an event is always larger than the local area monitored by a single transmission operator and may also be larger than a single Reliability Authority's area.~~

The impact of a single incident resulting in uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and ~~bulk~~ high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Operating within IROLs should prevent instability, cascading outages and uncontrolled separation.

### **South Carolina Electric & Gas Company SCEG**

This standard places a lot of emphasis on IROLs, however, no guidelines on how to determine an operating limit have yet been determined. It goes further by allowing an arbitrary 30 minute time limit – why not 15, 5, or 0 minutes? Some limits cannot be surpassed by 15 minutes, yet the standard allows for it. In another respect, some limits can be exceeded for far more than 30 minutes depending on the situation, but the standard ignores that. I know this standard is not meant to define limits, but how can one be expected to agree to its requirements until the definition of limits is better defined?

The definitions provided with the standard have been revised to assist in interpreting the applicability of this standard. The standard was revised, based on the numerous comments submitted by balloters, to indicate that  $T_v$  may not exceed 30 minutes.

### **NPCC**

#### **New York Power Authority MED**

#### **Northeast Utilities NU**

#### **LIPA LIPA (Transmission Owners)**

The Standard should establish criteria on how "local" and "Wide Area Impact" are determined. The definition of Wide Area Impact in the standard cites that the electrical area to be included may be larger than a single RA. This indicates the need for studies

and associated IROLs that transcend the boundaries of a single RA's purview, yet there is no statement identifying this need in the standard.

The definitions provided with the standard have been revised to assist in interpreting the applicability of this standard.

**National Grid USA**

**New Brunswick Power Corporation NBPC**

**New York Power Authority NYPA**

**Niagara Mohawk NMPC**

**New York Power Authority MED**

**Northeast Utilities NU**

**Nova Scotia Power NSPI**

**Ontario - Independent Electricity Market Operator IMO**

**United Illuminating UICO**

**Hydro-Quebec HQT**

The Standard does not include clear definitions or criteria on how “local” and “Wide Area Impact” are determined. Therefore, it is difficult to assess what electrical boundaries an IROL is meant to protect. This definition of Wide Area Impact points out that the electrical area to be included in the limit may be larger than the portion of the transmission system under the authority of a single Reliability Authority (RA). This indicates the need for studies and associated limits that transcend the boundaries of a single RA's purview, yet there is no formal statement identifying this need in standard, 200, 600 or the Co-ordinate Operations Standard (currently under development).

The definitions provided with the standard have been revised to assist in interpreting the applicability of this standard. The standard was revised, based on the numerous comments submitted by balloters, to indicate that  $T_v$  may not exceed 30 minutes.

**FirstEnergy Corp**

A fundamental problem is that it is difficult to determine what facility could be a potential IROL before the fact. The proposed document gives little guidance. In section 201, IROL Identification, the requirements simply state the Reliability Authority shall identify what facilities are subject to IROL, with no real guidance on how to do it. This leaves it up to the Reliability Authority to document how they will determine their IROLs, and then if anything goes wrong they will be second guessed that they did not do it right. If the Reliability Authority takes the extreme position and 'over' specify facilities as potential IROLs, they will cover themselves for any second guessing, but operate the system in a potentially overly conservative manner.

The definitions provided with the standard have been revised to assist in interpreting the applicability of this standard.

**MAIN**

The standard is not precise enough in defining where it should be applied. More specifically, the standard asks Reliability Authorities to designate facilities to be subject to IROL's, as distinct from SOL's, presumably on the basis of potential "Wide Area Impact," but the meaning of "Wide Area" remains an open question. For example, it remains undetermined whether the largest city or

**Responses to Operate within IROLs Standard Ballot**  
***Comments on Requirement 201 – IROL Identification***

---

even some multi-state regions would meet the definition of "Wide Area."

The definitions provided with the standard have been revised to assist in interpreting the applicability of this standard.

## Measures

### (b) Measures

- (1) The Reliability Authority shall have a list of Facilities (or groups of Facilities) in its ~~the Reliability Authority's~~ Reliability Authority Area that are subject to Interconnection Reliability Operating Limits.
  - (i) The Reliability Authority shall have evidence it ~~has reviewed~~s and ~~updated~~s ~~the~~ its-list of Facilities (or groups of Facilities) to reflect changes in its Reliability Authority Area's system topology.
- (2) The Reliability Authority shall be able to identify the current values of the Interconnection Reliability Operating Limits for its Reliability Authority Area. Each of these Interconnection Reliability Operating Limits shall have a  $T_v$  that is smaller than or equal to 30 minutes.
  - (iii) The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$ .
- (3) The Reliability Authority shall ~~have evidence that it updates the list of~~ be able to demonstrate that its Interconnection Reliability Operating Limit values and their  $T_v$  ~~to~~ reflect current system conditions.

### Summary Consideration:

The measures were revised to conform to the changes requested in the associated requirements, specifically to add a requirement that addresses shared facilities and to modify the requirement so that the dynamic nature of IROLs is recognized.

### Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)

#### Manitoba Hydro MHEB (LSEs)

#### Manitoba Hydro (Transmission Owners)

The need for all system conditions to be studied as they occur should be emphasized. Statement 201 b.3 should be expanded to state that the limits and the mitigation steps must BOTH be reviewed and revised, if required, to reflect all changes in current conditions. This need could also be identified in 203 b.1.ii (i.e., an assessment must be followed by revision of limits and guides if conditions warrant)

The measures were revised to indicate that the RA must be able to demonstrate that the IROLs reflect current system conditions. This supports your suggestion.

## Compliance Monitoring

### Bonneville Power Administration Transmission BPAT

Section 201.d.2 states that the “Performance reset period shall be 12 months from the last violation”. I assume that this is per each IROL (or rated path), but there is no further information. Are the facilities/IROLs grouped into one for the reset period or is there a separate reset period for each facility/IROL?

The levels of non-compliance are based on not meeting the individual measures within a requirement. A violation occurs whenever a measure in the requirement has not been met. Each violation is considered a separate occurrence – and each successive violation would result in an increasingly more severe penalty. To reset the accumulation of occurrences, (end of the performance reset period) the RA needs to go 12 months without any violations.

The way the performance reset period works, performance is measured over the course of a 12 month period of time. If there is any violation during this time, then the performance reset period would not reset.

### Levels of Non-compliance

(e) Levels of Noncompliance

- (1) Level one: ~~Not applicable~~ No process for determining if shared Facilities (or groups of Facilities) are subject to Interconnection Reliability Operating Limits and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$ .
- (2) Level two: ~~Not applicable~~ No evidence that a shared Facility (or group of Facilities) has an Interconnection Reliability Operating Limit with a  $T_v$  that has been agreed to by all Reliability Authorities that share the Facility (or group of Facilities).
- (3) Level three: A level three noncompliance occurs if either of the following conditions are present:
  - (i) One or more Interconnection Reliability Operating Limits had a  $T_v$  that was greater than 30 minutes.
  - (ii) ~~No evidence that Either the list of Interconnection Reliability Operating Limits or the list of Facilities subject to Interconnection Reliability Operating Limits was not updated.~~
- (4) Level four: A level four noncompliance occurs if either of the following conditions are present:
  - (i) Could not identify the current values of the IROLs for its Reliability Area
  - (ii) No list of ~~Interconnection Reliability Operating Limits or no list of~~ Facilities subject to Interconnection Reliability Operating Limits exists for the ~~Reliability Authority's~~

#### AEP Service Corp -- Transmission System AEP Oklahoma Gas and Electric OKGE

The SDT needs to revisit the levels of non-compliance associated with this standard. If compliance is truly a black/white issue with no shades of gray as the proposed levels indicate, why not have just a level one with no financial penalty? The proposed non-compliance level implies that it may be more important to have a list of IROLs rather than a correct list of IROLs. Also, if no IROLs exist, there will be no list which would cause the reliability authority to be in non-compliant. There needs to be consistency throughout all the standards on documentation-type non-compliance.

This requirement was revised and its levels of non-compliance were also revised to address the elements that were added to the standard based on balloters comments.

## 202 Monitoring

### Requirements

#### Public Service Electric and Gas Company

The present language of the Standard proposed for Ballot must be modified to include the following issue

The RA is required to ensure that all facilities monitored within their area of responsibility are consistently determined and shared with adjacent RAs.

There is another requirement in this standard that requires each RA to develop a specification for data needed to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments. The data specification should address this concern.

The Coordinate Operations Standard addresses sharing data and information between RAs.

### Measures

#### (b) Measures

- (1) The Reliability Authority shall have a list of Facilities (or groups of Facilities) subject to Interconnection Reliability Operating Limits and shall have Interconnection Reliability Operating Limits available for its operations personnel's Real-time use.
- (2) The Reliability Authority shall have Real-time Data available in a form that system operators can compare to the Interconnection Reliability Operating Limits.
- (3) The Reliability Authority shall monitor system operating parameters and compare these against its Interconnection Reliability Operating Limits.

#### Southern Company Services SOCO (Generators)

#### Southern Company Services SOCO (Transmission Owners)

#### Georgia Power Company (LSEs)

The standard still seems to indicate a somewhat static list of IROLs. The SDT added a few words about the list having to be updated, but did not adequately address some other issues:

“What happens if you identify another (unexpected) limit during real-time that is not on the list? Are you not responsible for this case as well? We all know that planning studies cannot predict all the challenges that are faced in real-time.”

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 202 – Monitoring**

---

The list of IROLs is a dynamic list. Standard 200 needs clear verbiage noting the dynamic nature of this list. In addition, the standard should not imply that if the limit is not on the list that you don't have to operate to it. The not-previously-identified events that would place you in an IROL should have the same requirements as those already on the list. In section 203, part b, "identified" should be removed from the last part of the sentence:

"The Reliability Authority shall identify operating situations or events that impact its Reliability Authority Area's ability to operate without exceeding any ~~identified~~ Interconnection Reliability Operating Limits."

One of the measures for requirement 201 was revised so that the RA must be able to demonstrate that it can identify its current Interconnection Reliability Operating Limits. This switch from having a 'list' should clarify that the IROLs may be dynamic. Your suggestion to remove the word, 'identified' was adopted and is reflected in the revised standard.

**Bonneville Power Administration Transmission BPAT**

In Section 202(b)(3), the standard indicates that the RA shall monitor "system operating parameters" which is an undefined term. It is unclear why the RA would need any information not included in the IROL to monitor the system. More explanation of what system operating parameters include is needed and how this information is different from the information in the IROL. It is recommended that "System Operating Parameters" be defined in the "Definition" section of the Standard and that it include something similar to "variables that impact the IROL".

Most industry commenters agreed with the original language in this requirement.

If the SDT defines system operating parameters, then readers may interpret the requirement to mean that IROLS should be limited to the listed parameters, and this isn't the intent. The standard only addresses the system operating parameters associated with the IROLS.

### **Levels of Non-compliance**

#### **AEP Service Corp -- Transmission System AEP Oklahoma Gas and Electric OKGE**

Again the issue of degrees of non-compliance surfaces. Are there shades of gray with non-compliance for this standard or is it strictly a black and white issue? Why jump directly to level four non-compliance? Is progressive non-compliance not an option? For example, if a reliability authority had identified 25 IROLs, he is level four non-compliant if only one of the IROLs is not available for real-time use. Shouldn't there be allowances for such situations? Also, perhaps a letter that lists critical displays and identifies discrepancies would be more beneficial to maintaining interconnection reliability than a monetary penalty.

Due to the severity of IROL violations, not being aware of one IROL is unacceptable.

#### **Kansas City Power & Light KCPL**

Question if compliance differentiates between telemetered and not telemetered but should

The definition of Real-time data allows for data to be collected manually – so there isn't a need to differentiate between telemetered and non-telemetered data.

## **203 Analyses and Assessments**

### **Requirements**

#### **Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

##### **Manitoba Hydro (Transmission Owners)**

The requirement to perform Operational Planning Analysis or the Real-time Assessment in standard 203 a should be more clearly defined. A methodology including any restrictions on or recommendations for how to perform these activities should be included in this standard.

The RA Certification Standard is expected to include a requirement that the RA have a process or procedure in place that identifies how it will perform its Operational Planning analyses and Real-time assessments. Each RA may have different tools and different operating constraints, and establishing a methodology that would be applicable to all RAs is more restrictive than necessary to support reliability.

#### **City of Tallahassee TAL**

How far out is the Real-time Assessment supposed to look? Only 30 minutes since it is run at least every 30 minutes, or up to the day ahead since a day ahead look is done at least every day. What is meant by "expected"? First contingency?

Real-time assessments look at real time information as well as future information. The RA needs to make a judgment about how far ahead the real-time assessment should look, based on its specific operating conditions.

The Operational Planning Analysis is conducted each day to look at the day ahead. The definition of Operational Planning Analysis has been modified to clarify that an operational planning analysis may look for the next day's operation up to 12 month's ahead. This standard only addresses the Operational Planning Analysis that is done to look at the day ahead with respect to operation without violating any IROLs.

## Measures

### (b) Measures

- (1) The Reliability Authority shall identify operating situations or events that impact its Reliability Authority Area's ability to operate without exceeding any identified Interconnection Reliability Operating Limits.
  - (i) The Reliability Authority shall conduct an Operational Planning Analysis at least once each day, evaluating the next day's projected system operating conditions.
  - (ii) The Reliability Authority shall conduct a Real-time Assessment periodically, but at least once every 30 minutes.

### Gainesville Regional Utilities GVL (Generators)

The second point as to when Contingency analysis needs to be run. The requirement says a requirement of 30 minutes. I believe this should be executed as needed without the requirement of 30 minutes.

The analysis should be conducted whenever needed, but must be conducted at least every 30 minutes.

### AEP Service Corp -- Transmission System AEP Oklahoma Gas and Electric OKGE

The proposed measures may be too weak. For example, it appears that a reliability authority could satisfy the operational planning analysis by evaluating an invalid case for a given day. While it meets the letter of the measure, it doesn't meet the intent of the measure. Also, does (b)(1)(ii) apply to IROLs that are associated with stability limits? If so, this measure would require a reliability authority to run real-time stability analyses every 30 minutes.

An RA that deliberately uses an invalid case is jeopardizing the reliability of its system as well as the interconnection and faces lawsuits and other public sanctions that are greater than any sanction associated with non-compliance with this standard.

The real-time assessment doesn't have to be a 'study'. The definition is: An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

The levels of non-compliance don't link sanctions to value judgments about the quality of assessments.

### Power Pool of Alberta PPOA

we see a requirement to enhance Section 203 (b), Measures, Analyses and Assessments. Measures (1)(i) as stated require "... an operating planning analysis [be conducted] at least once each day, evaluating the next day's projected system operating conditions". We propose that a review of the next day's projected system operating conditions, against a pre-described set of

operating conditions that governs IROLs, conducted at least once each day, should be considered an alternative to the above measure.

The suggested addition seems to be more of a definition of what is already understood to be done as part of the operational planning analysis and doesn't really add to the clarity of the standard.

### **Southern Company Services SOCO (Generators)**

#### **Southern Company Services SOCO (Transmission Owners)**

The list of IROLs is a dynamic list. Standard 200 needs clear verbiage noting the dynamic nature of this list. In addition, the standard should not imply that if the limit is not on the list that you don't have to operate to it. The not-previously-identified events that would place you in an IROL should have the same requirements as those already on the list. In section 203, part b, "identified" should be removed from the last part of the sentence: "The Reliability Authority shall identify operating situations or events that impact its Reliability Authority Area's ability to operate without exceeding any Interconnection Reliability Operating Limits."

The standard has been modified to clarify that system operators must be provided a current list of facilities subject to IROLs must be able to show its current Interconnection Reliability Operating Limits and must have IROLs available for its operations personnel's Real-time use.

While the list of facilities subject to IROLs is expected to be static, IROLs are expected to be dynamic. As soon as an IROL is identified, the system operators must begin monitoring parameters against those IROLs. This supports the industry's concern that the standard be changed to recognize that IROLs can be dynamic.

### **Levels of Non-compliance**

#### **AEP Service Corp -- Transmission System AEP**

##### **Oklahoma Gas and Electric OKGE**

Again the issue of degrees of non-compliance surfaces. Are there shades of gray with non-compliance for this standard or is it strictly a black and white issue? Why jump directly to level three non-compliance? Is progressive non-compliance not an option? Is missing an operational planning assessment one day in a month as detrimental as missing it 10-15 days per month? Similarly, is missing one real-time assessment as bad for reliability as missing these assessments for hours, on a regular basis?

For this requirement, missing one assessment may be as bad as missing many assessments.

#### **Kansas City Power & Light KCPL**

Is missing one assessment as bad as missing assessments for a period of time?

For this requirement, missing one assessment may be as bad as missing many assessments.

**204 Actions**

## Requirements

### (a) Requirements

(1) The Reliability Authority shall, **without delay**, act<sup>1</sup> or direct others to act to:

- (i) Prevent instances where Interconnection Reliability Operating Limits may be exceeded.
- (ii) Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded.

The Reliability Authority shall document instances of exceeding Interconnection Reliability Operating Limits and shall document and complete an Interconnection Reliability Operating Limit Violation Report for instances of exceeding Interconnection Reliability Operating Limits for time greater than  $T_v$ .

- **Add the phrase, 'Act Immediately' – or 'Prudently'**

### ISO New England Inc ISNE

Standard 200 should clearly reflect requirements and measures that require all Reliability Authorities to initiate immediate corrective actions as soon as an Interconnection Reliability Operating Limit (IROL) is exceeded or the system is in an unanalyzed state. It is NPCC's position that NERC Standards should ensure mitigating actions are implemented when instability, uncontrolled separation, or cascading outages would occur as a result of a change in one or more operating parameter(s) as soon as the condition exists.

The standard has been revised to add the phrase, 'without delay' to indicate that actions should be taken ASAP.

### NPCC

#### New York Power Authority MED

#### Northeast Utilities NU

#### LIPA LIPA (Transmission Owners)

Standard 200 should require all Reliability Authorities (RAs) to initiate *immediate* corrective actions *as soon as* the system is in an unanalyzed state or an IROL is exceeded ( $T=0^+$ ).

The standard has been revised to add the phrase, 'without delay' to indicate that actions should be taken ASAP.

Requiring that system operators take actions when their system is in an unanalyzed state is beyond the scope of this standard.

### **Power Pool of Alberta PPOA**

Standard 200 should be changed to require that: corrective actions be taken immediately once an Interconnection Reliability Operating Limit (IROL) is exceeded, and the parameter  $T_v$ , the time an Interconnection Reliability Operating Limit can be exceeded without compliance sanctions being applied, be limited to a maximum value of 30 minutes

The standard has been revised to add the phrase, 'without delay' to indicate that actions should be taken ASAP. The standard has also been revised to indicate that  $T_v$  may not be greater than 30 minutes.

### **Hydro-Quebec HQT**

Standard 200 should clearly reflect requirements and measures that require all Reliability Authorities to initiate immediate corrective actions as soon as an Interconnection Reliability Operating Limit (IROL) is exceeded or the system is in an unanalyzed state.

The standard has been revised to add the phrase, 'without delay' to indicate that actions should be taken ASAP.

Requiring that system operators take actions when their system is in an unanalyzed state is beyond the scope of this standard.

### **United States Bureau of Reclamation**

It also appears that more focus is needed on assuring that operators take timely and appropriate actions to correct any violations of operating limits.

The standard has been revised to add the phrase, 'without delay' to indicate that actions should be taken ASAP.

### **MAIN**

There is no specific language stating operators should begin to take action immediately to rectify the limit violation.

The standard has been revised to add the phrase, 'without delay' to indicate that actions should be taken ASAP.

### **MAAC**

I agree with commenters who suggest that there should be a 30 minute maximum limit to  $T_v$ , the "at risk" interval, and with the obligation that action should be initiated as soon as possible after recognition that a limit has been exceeded. I don't think that these are reasons enough to vote no, but would support them as additions to the standard.

The standard has been revised to add the phrase, 'without delay' to indicate that actions should be taken ASAP.

The standard has also been revised to indicate that  $T_v$  may not be greater than 30 minutes.

### **Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

**Manitoba Hydro MHEB (LSEs)**

**Manitoba Hydro (Transmission Owners)**

Standard 200 must be revised with a clearer statement that action is required in a timely manner. This requirement should be included in standard 204 a.1.

The standard has been revised to add the phrase, ‘without delay’ to indicate that actions should be taken ASAP.

**Hydro One Networks Inc (LSEs)**

The Standard should contain clear requirements and measures to call for immediate action on the part of Reliability Authorities to initiate corrective actions as soon as an IROL is exceeded or the system enters into an unanalyzed operating state. Hydro One Networks’ position is that mitigating corrective actions must be initiated as soon as the condition exists.

The standard has been revised to add the phrase, ‘without delay’ to indicate that actions should be taken ASAP.

Requiring that system operators take actions when their system is in an unanalyzed state is beyond the scope of this standard.

**NYISO**

**Ontario - Independent Electricity Market Operator IMO**

**ISO New England**

The Standard 200 does not carry forward the current NERC Policy obligation to initiate action “as soon as possible” to restore system operation to a secure state. Our concern is that the introduction of compliance to standards must not diminish what has become accepted practice among large and sophisticated system operators to initiate actions as soon as possible to reduce the ‘at risk’ interval. The possible difficulties in implementing such a measure are understood, but we believe this change to the standard is necessary and achievable.

Recommendation: corrective action to be taken as soon as possible once an Interconnection Reliability Operating Limit (IROL) is exceeded.

The focus of this standard is on preventing an incident of exceeding an IROL, not just to take action after an IROL has been exceeded, which is the focus of Policy 2. The standard has been revised to add the phrase, ‘without delay’ to indicate that actions should be taken ASAP.

**National Association of Regulatory Utility Commissioners**

**New York State Public Service Commission**

The proposed standard lacks a definitive statement indicating that it is unacceptable to operate the bulk system beyond established limits and that the system must be returned to a reliable state of operation within a reasonable time frame.

The standard has been revised to add the phrase, ‘without delay’ to indicate that actions should be taken ASAP. The standard has also been revised to indicate that  $T_v$  may not be greater than 30 minutes.

**New York State Reliability Council**  
**LIPA LIPA (Transmission Owners)**

In addition, proposed Standard 200 fails to clearly require the Reliability Authority to initiate corrective actions as soon as a limit is exceeded.

We believe it is an unwarranted risk for Standard 200 to degrade present NERC criteria, particularly in the aftermath of the August 14, 2003 Blackout.

The focus of this standard is on preventing an incident of exceeding an IROL, not just to take action after an IROL has been exceeded, which is the focus of Policy 2. The standard has been revised to add the phrase, ‘without delay’ to indicate that actions should be taken ASAP.

**National Grid USA**  
**New Brunswick Power Corporation NBPC**  
**Niagara Mohawk NMPC**  
**New York Power Authority MED**  
**Northeast Utilities NU**  
**Nova Scotia Power NSPI**  
**Ontario - Independent Electricity Market Operator IMO**  
**United Illuminating UICO**

Standard 200 should clearly reflect requirements and measures that require all Reliability Authorities to initiate *immediate* corrective actions *as soon as* an Interconnection Reliability Operating Limit (IROL) is exceeded or the system is in an unanalyzed state. It is NPCC’s position that NERC Standards should ensure mitigating actions are implemented when instability, uncontrolled separation, or cascading outages would occur as a result of a change in one or more operating parameter(s) *as soon as the condition exists*.

The focus of this standard is on preventing an incident of exceeding an IROL, not just to take action after an IROL has been exceeded, which is the focus of Policy 2. The standard has been revised to add the phrase, ‘without delay’ to indicate that actions should be taken ASAP.

**Wisconsin Public Service Corporation WPS**

Language is not specific enough to operators about when to begin taking immediate action to rectify the limit violation.

The standard has been revised to add the phrase, ‘without delay’ to indicate that actions should be taken ASAP.

**New York Power Authority NYPA**

Standard 200 should clearly reflect requirements and measures that require all Reliability Authorities to initiate corrective actions as soon as an Interconnection Reliability Operating Limit (IROL) is exceeded. It is NPCC’s position that it should be ensured mitigating actions are implemented when instability, uncontrolled separation, or cascading outages would occur as a result of a change in one or more operating parameter(s) as soon as the condition exists.

The focus of this standard is on preventing an incident of exceeding an IROL, not just to take action after an IROL has been exceeded, which is the focus of Policy 2. The standard has been revised to add the phrase, ‘without delay’ to indicate that actions should be taken ASAP.

**Midwest Independent Transmission System Operator, Inc.**

Several people have mentioned that the Standard doesn't require immediate action. While the standard should encourage expeditious response, as the industry found out with the DCS, operators need a few minutes to interpret readings and alarms, select the proper response and then get resources deployed.

The standard has been revised to add the phrase, 'without delay' to indicate that actions should be taken ASAP.

**Entergy Services ENTE (LSEs)**

Section 204(a) needs to be worded so that it is abundantly clear that a Reliability Authority must always act prudently to maintain the reliability of the system given the actual situation that has developed. In certain situations, prudent action may not include taking action to prevent exceeding a predetermined IROL or even mitigating the magnitude or duration of a violation. The definition of IROL is that it is a limit that, if exceeded, "could" lead to instability..... IROLs are no more than measure points to be used in monitoring the system. Any actions taken or directed by a reliability authority must be prudent based on the actual situation and system conditions and with the goal of maintaining reliability not only for the immediate time period but for the entire operational planning time period as well.

The standard has been revised to add the phrase, 'without delay' to indicate that actions should be taken ASAP.

- **Add a requirement to Implement Conservative Operations for Unknown or Unstudied Conditions**  
**Wisconsin Energy Corporation - PM WEC**

Exceeding an IROL is a indicator of a potentially catastrophic event, in addition to the above, the RA should also be required to act by implementing "conservative operations" for conditions that are unknown or not studied and that do not have a defined IROL.

Requiring that system operators take actions when their system is in an unanalyzed state is beyond the scope of this standard.

- **Add a requirement to document RA's Authority**

**Public Service Electric and Gas Company (LSEs)**

There must be an express provision stating that Reliability Authorities have authority over all entities with facilities or operating within the RA's footprint. (Section 204)

There is a requirement in the RA Certification Standard that addresses this. That standard requires the RA to have a written agreement with all of the entities that report to the RA as well as with adjacent RAs that defines the authority of the RA.

**Electricity Consumers Resource Council**

We are concerned that the definition or criteria regarding the differentiation between "Local" and "Wide Area Impact" is unclear. The proposed standard does not appear to provide adequate responses if the electric area to be included in the limit is larger than the portion of the transmission system under the authority of a single Reliability Authority (RA). The standard should clearly explain how an RA can order all TO's, BA's, IA's and other RA's to take necessary actions if they are not within the controlling RA's reliability area.

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 5 – Data Specification and Collection**

---

The SDT did not use the terms, ‘wide area impact’ or ‘local area’ in this standard. There is no industry consensus on the definition of these terms. The SDT will request that these terms continue to be refined, but recommends that this refinement take place outside the scope of this standard.

The Coordinate Operations standard addresses the coordination of actions between two RAs. There is a requirement in this standard that requires the entities that work under the direction of an RA to follow that RA’s directives. RA Certification is expected to include requirements that the RA have written agreements with all entities that operate within its physical and/or electrical boundaries. These agreements are expected to address the authority of the RA to direct entities to take actions under normal and abnormal conditions.

**Wisconsin Energy Corporation - PM WEC**

The RA will have several conditions in which it is required to give operating directives to other functional entities, to require those entities to have specific requirements for documenting RA directives related to IROL is confusing. Suggest all directives issued by the RA shall be documented per these measures.

The standard has been revised to add a requirement that the RA include specific language in its directives to let the recipient know that the directive is related to an IROL.

**Reliant Resources Inc RRI**

Sec 204 - There is no definitive authority given to the Reliability Authorities over each and every entity within their footprint. Lack of authority will jeopardize the effectiveness of the requirements within Standard 200 and ultimately the reliability of the Interconnection(s).

RA Certification is expected to include requirements that the RA have written agreements with all entities that operate within its physical and/or electrical boundaries. These agreements are expected to address the authority of the RA to direct entities to take actions under normal and abnormal conditions.

**WECC**

**Minnesota Power MP**

**Public Works Commission Fayetteville PWCF**

**Southern California Edison SCET**

**Salt River Project SRP**

**Tucson Electric Power Company TEPC**

**Platte River Power Authority TP PRPA**

**California Energy Commission**

The standard focuses too much attention on reporting and documentation rather than focusing on the need for operators to take timely and appropriate actions to correct operating limit violations.

Specific language has been added to clarify that actions be taken, “without delay.” While there are minor sanctions for poor documentation, the standard applies larger sanctions for instances of exceeding an IROL for time greater than  $T_v$ , for ignoring RA directives, and for not monitoring.

**Gainesville Regional Utilities GVL (LSEs)**  
**City of Tallahassee TAL (Transmission Owners)**

Who is responsible for implementing an IROL mitigation plan? Transmission Owners? RA? Does the RA develop the plan or does the Transmission Owner?

IROL mitigation plans are under the control of the RA. The RA may direct other entities to take actions as part of one of these plans.

- **Limit documentation to instances of exceeding Tv**

**FirstEnergy Corp**

FirstEnergy does not support documenting all limit violations. We need to be able to document only those violations that are in excess of Tv. Documenting all limit violations would be an effort with no real reward or substantive information.

There should be very few IROL violations of any duration. The documentation required is that which is typically recorded by system operators in the normal course of duties. There are three reasons for requiring that each instance of exceeding an IROL be documented:

- To ensure that System Operators maintain ‘situational awareness’ of the seriousness of ever exceeding an IROL.
- To ensure that there is sufficient documentation to support an audit of whether actions are being taken to mitigate instances of exceeding an IROL.
- To ensure that the information on exceeding IROLs is available when needed by NERC and/or Regions for reliability analyses.

**FirstEnergy Solutions FESC (LSEs)**

We do not support documenting all limit violations. Only those violations that are in excess of Tv are needed.

There should be very few IROL violations of any duration. The documentation required is that which is typically recorded by system operators in the normal course of duties. There are three reasons for requiring that each instance of exceeding an IROL be documented:

- To ensure that System Operators maintain ‘situational awareness’ of the seriousness of ever exceeding an IROL.
- To ensure that there is sufficient documentation to support an audit of whether actions are being taken to mitigate instances of exceeding an IROL.
- To ensure that the information on exceeding IROLs is available when needed by NERC and/or Regions for reliability analyses.

**FirstEnergy Solutions FESC (Brokers, Aggregators, and Marketers)**

A standard should be a standard for all RAs. Documenting every limit violation may prove to be burdensome with little impact on reliability.

There should be very few IROL violations of any duration. The documentation required is that which is typically recorded by system operators in the normal course of duties. There are three reasons for requiring that each instance of exceeding an IROL be documented:

- To ensure that System Operators maintain ‘situational awareness’ of the seriousness of ever exceeding an IROL.

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 5 – Data Specification and Collection**

---

- To ensure that there is sufficient documentation to support an audit of whether actions are being taken to mitigate instances of exceeding an IROL.
- To ensure that the information on exceeding IROLs is available when needed by NERC and/or Regions for reliability analyses.

**MAIN**

Contrasting operator actions versus documentation, the standard is relatively overly focused on documentation. As a specific example of this, Section 204, which addresses "Actions," permits an IROL shorter than  $T_v$  yet still requires documentation of the event (Section 204 (e) (1)). The documentation required by this standard is so burdensome that it risks system operations could become distracted from its primary role of acting on IROL's.

There should be very few IROL violations of any duration. The documentation required is that which is typically recorded by system operators in the normal course of duties. There are three reasons for requiring that each instance of exceeding an IROL be documented:

- To ensure that System Operators maintain 'situational awareness' of the seriousness of ever exceeding an IROL.
- To ensure that there is sufficient documentation to support an audit of whether actions are being taken to mitigate instances of exceeding an IROL.
- To ensure that the information on exceeding IROLs is available when needed by NERC and/or Regions for reliability analyses.

**NPCC**

**New York Power Authority MED**

**Northeast Utilities NU**

**LIPA LIPA (Transmission Owners)**

Documentation should be required only for those limit violations in excess of the time-duration  $T_v$  value.

There should be very few IROL violations of any duration. The documentation required is that which is typically recorded by system operators in the normal course of duties. There are three reasons for requiring that each instance of exceeding an IROL be documented:

- To ensure that System Operators maintain 'situational awareness' of the seriousness of ever exceeding an IROL.
- To ensure that there is sufficient documentation to support an audit of whether actions are being taken to mitigate instances of exceeding an IROL.
- To ensure that the information on exceeding IROLs is available when needed by NERC and/or Regions for reliability analyses.

**ISO New England Inc ISNE**

ISO-NE does not support documenting all limit violations, but only those in excess of the time-duration  $T_v$  value. This requirement would be a large effort while providing little or no information, as limits are exceeded for very small amounts of time and magnitude just by virtue of normal power system operations.

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 5 – Data Specification and Collection**

---

There should be very few IROL violations of any duration. The documentation required is that which is typically recorded by system operators in the normal course of duties. There are three reasons for requiring that each instance of exceeding an IROL be documented:

- To ensure that System Operators maintain ‘situational awareness’ of the seriousness of ever exceeding an IROL.
- To ensure that there is sufficient documentation to support an audit of whether actions are being taken to mitigate instances of exceeding an IROL.
- To ensure that the information on exceeding IROLs is available when needed by NERC and/or Regions for reliability analyses.

**National Grid USA**

**New Brunswick Power Corporation NBPC**

**New York Power Authority MED**

**Northeast Utilities NU**

**Nova Scotia Power NSPI**

**Ontario - Independent Electricity Market Operator IMO**

National Grid (NPCC) further does not support documenting all limit violations, but only those in excess of the time-duration Tv value. This requirement would be a huge effort while providing little or no information, as limits are exceeded for very small amounts of time on a regular basis just by virtue of power system operations.

There should be very few IROL violations of any duration. The documentation required is that which is typically recorded by system operators in the normal course of duties.

**Hydro One Networks Inc (LSEs)**

We further only support recording limit violations, but documenting and reporting only those in excess of the time-duration TV value. Reporting all limit violations would be a huge effort while providing little or no compliance information, as limits are exceeded for very small amounts of time on a regular basis just by virtue of power system operations.

There should be very few IROL violations of any duration. The documentation required is that which is typically recorded by system operators in the normal course of duties.

There are three reasons for requiring that each instance of exceeding an IROL be documented:

- To ensure that System Operators maintain ‘situational awareness’ of the seriousness of ever exceeding an IROL.
- To ensure that there is sufficient documentation to support an audit of whether actions are being taken to mitigate instances of exceeding an IROL.
- To ensure that the information on exceeding IROLs is available when needed by NERC and/or Regions for reliability analyses.

- **Report 'near misses' to Region**

**Southern Company Services SOCO (Generators)**

**Southern Company Services SOCO (Transmission Owners)**

**Georgia Power Company (LSEs)**

Although the standard states that all instances of exceeding IROLs must be documented (reference excerpt from the definitions below), they are not required to be sent to NERC or the Regions. These “near miss” situations (where the IROL is mitigated in under Tv) contain valuable information and should be reported as well. By tracking these near misses, the compliance monitor can determine how close to the edge the system is being operated. Analysis of this data could indicate that Tv is being used as a grace period, which is in direct conflict with the OLDTF’s recommendations and good utility practice . However, there does not appear to be a compliance “hammer” to prevent entities from using Tv as a grace period. This should somehow be incorporated into the levels of non-compliance and penalties. Southern recommends that near misses be reported to the Region.

There are three reasons for requiring that each instance of exceeding an IROL be documented. Any Region that wants to collect this data is free to do so, and may either handle this with a Regional Difference to this standard, or through a separate Regional requirement.

- To ensure that System Operators maintain ‘situational awareness’ of the seriousness of ever exceeding an IROL.
- To ensure that there is sufficient documentation to support an audit of whether actions are being taken to mitigate instances of exceeding an IROL.
- To ensure that the information on exceeding IROLs is available when needed by NERC and/or Regions for reliability analyses.

- **Question on No Overt Action**

**City of Tallahassee TAL**

footnote- How can we allow 'no overt action' for an expected IROL violation. By 207.a.1 the RA "shall have an action plan to prevent..." If he has to have a plan, how can we allow "no overt action"?

Although this standard requires the RA to have a plan, this standard does not require that the plan be followed because real-time conditions often do not duplicate the conditions that were anticipated when a plan was developed. If a limit is being approached, but the RA knows that it will be relieved before it is exceeded (for example if a unit is coming on line in the next 5 minutes) then the RA may take “no overt action”. Note that if the RA elects to take “no overt action” the RA is required to document this decision so that the decision can be reviewed.

- **Include Time to Respond to Directives**

**Avista Corp. AVA**

**Avista Corp. Washington Water Power Division AVWP**

The standard does not address a time frame in which a response to a directive is required. In order for the standard to be affective there must be a time frame developed to monitor proper response.

**Responses to Operate within IROLs Standard Ballot**  
***Comments on Requirement 5 – Data Specification and Collection***

---

The RA may include a time constraint in its directive, but this is not required. There are many instances where an RA may issue a directive with a time constraint such as, 'as soon as possible' – and this is not measurable. The RA is responsible for achieving the desired results.

**Sanctions**

Summary Consideration: The sanction for exceeding an IROL for time greater than  $T_v$  was modified so that it is proportional to the magnitude and duration of the event and is not tied to the size of any entity.

**(f) Sanctions**  
 Level four noncompliance sanctions shall be the greater of the fixed dollar sanctions listed in the matrix, or the ~~number of megawatts above the Interconnection Reliability Operating Limit multiplied by the dollar value for the number of times of noncompliance.~~ dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table:

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

### **Southeastern Electric Reliability Council**

Once  $T_v$  is violated there needs to be an incentive to get it back within limits soon. As currently written, the standard does not distinguish between short and long  $T_v$  violations.

The emphasis of this standard is different from that of Policy 2. Policy 2 focuses solely on actions after a limit has been exceeded. This standard puts much more emphasis on preventing instances of exceeding IROLs.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident.

### **Georgia Power Company (LSEs)**

Southern believes that the time an IROL is exceeded should be considered in levels of non-compliance or penalties. Once  $T_v$  is violated, there needs to be an incentive to get it back within limits sooner rather than later. As currently written, the standard does not distinguish between violations that last for  $T_v + 5$  minutes vs.  $T_v + 5$  hours.

Because  $T_v$  isn't standard for all IROLs, using the duration of time that a limit is exceeded can't be applied in a 'fair' manner. Changes were made to the standard to set a max for  $T_v$  of 30 minutes. We don't want to encourage RAs to set  $T_v$  at 30 minutes for all limits just to avoid penalties. There were several balloters who suggested that the magnitude of the sanction be proportional to the magnitude and duration of exceeding the limit, and the SDT made this modification.

### **Carolina Power & Light Company CPL (Transmission Owners)**

#### **Carolina Power & Light Company CPL (LSEs)**

#### **Carolina Power & Light Company CPL (Generators)**

The time an IROL is exceeded should be considered in levels of non-compliance or penalties. Once  $T_v$  is violated, there needs to be an incentive to get it back within limits sooner rather than later. As currently written, the standard does not distinguish between violations that last for  $T_v + 5$  minutes vs.  $T_v + 5$  hours.

Because  $T_v$  isn't standard for all IROLs, using the duration of time that a limit is exceeded can't be applied in a 'fair' manner. Changes were made to the standard to set a max for  $T_v$  of 30 minutes. We don't want to encourage RAs to set  $T_v$  at 30 minutes for all limits just to avoid penalties. There were several balloters who suggested that the magnitude of the sanction be proportional to the magnitude and duration of exceeding the limit, and the SDT made this modification.

### **Kansas City Power & Light KCPL**

Is 30 seconds too short of a time for a reset duration for  $T_v$ ?

The thirty seconds was selected because it represented the longest period of time that could be associated with a 'bad scan'. The SDT contacted the balloter to determine what value the balloter suggests would be sufficient, and the balloter suggested one minute. This is what will be proposed to the industry. We will ask the industry for feedback on whether 30 seconds is too short a period of time and will offer 'one minute' as a suggested alternative.

## **MAIN**

Once the violation comes back within limits the standard states the event is over within 30 seconds. This is too soon,- it should be a longer period, perhaps 10 minutes.

The thirty seconds was selected because it represented the longest period of time that could be associated with a 'bad scan'. We will ask the industry for feedback on whether 30 seconds is too short a period of time and will offer 10 minutes as a suggested alternative.

### **Avista Corp. AVA**

#### **Avista Corp. Washington Water Power Division AVWP**

The sanctions need to be set up based on % overload not MW overload. Under the proposed standard a 10 MW overload on a 10,000 MW path will have the same sanction as a 10 MW overload on a 100 MW path.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident.

### **Wisconsin Public Service Corporation WPS**

Penalty matrix should be based upon the % of line capacity violation versus megawatt exceedence.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident.

### **Bonneville Power Administration Transmission BPAT**

In Section 204.f (Actions/Sanctions) there should be a clear definition of the megawatt value used to calculate the sanctions. Is the megawatt value the maximum value the IROL is exceeded, the megawatt value the IROL is exceeded at time  $T_v$ , or an average value of the IROL violation over the  $T_v$  period? We recommend that the MW violation be based on an average MW percentage of the violation of the IROL over the time period that exceeds  $T_v$ .

We would also like to see a time component added in calculating the sanctions. The time component would add motivation to alleviate a violation instead of letting a small violation continue for a long period of time. An example of a time component would the severity of the violation would double if the time of the reportable IROL violation exceeded  $T_v$  such that the IROL has been exceeded for  $2T_v$ .

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident.

The maximum value used for the sanction is the maximum value during the time period after  $T_v$  was exceeded.

### **AEP Service Corp -- Transmission System AEP**

Sanctions are defined on a per MW basis for violations of operating limits but a more realistic approach would be to base them on percentage violations. Ten MWs on a 115 kV facility is probably more critical than 10 MW on a 500 kV facility although the 500 kV facility may be more critical for interconnection reliability.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident.

### **City Water Light & Power CWLP**

Also, in the penalty matrix, the violations should not be based on actual MW, but be based on the percent of the facility rating. For example, being 20 MW over the rating of a 100 MW rated facility is a lot worse than being 20 MW over a 1000 MW rated facility.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident. The dollar amount used as the multiplier is a fixed dollar amount and is not related to the size of any entity or any entity's facility.

### **City of Tallahassee TAL**

If a  $T_v$  is set to zero due to the high risk, and that IROL is exceeded due to "acts of god" or circumstances beyond the entities control, the offending party is subject to sanctions, or having this event count against them, if their Special Protection Scheme fails.

This is correct. However, this standard's primary focus is on preventing any incident of exceeding an IORL. IROLs should not be exceeded.

### **Gainesville Regional Utilities GVL (Generators)**

I also believe that the sanction matrix should be clarified. Is it \$ per mw over IROL Limit, or \$ per Mw for facility. I agree with a % over IROL that exceeds 30 minutes may have sanctions levied. But I must reiterate clarify the Sanction matrix.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident. The dollar amount used as the multiplier is a fixed dollar amount and is not related to the size of any entity or any entity's facility.

### **Kansas City Power & Light KCPL**

The per MW basis for violations is inappropriate, a percentage basis is mor realistic.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident. The dollar amount used as the multiplier is a fixed dollar amount and is not related to the size of any entity or any entity's facility.

### **Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

#### **Manitoba Hydro MHEB (LSEs)**

#### **Manitoba Hydro (Transmission Owners)**

Depending on the final definition of an IROL (in accordance with standard 600, or to avoid cascading, instability and uncontrolled separation), it may be essential to consider the extent of the violation (i.e., was the limit exceeded by 1% or 200 %?). If the IROL definition remains

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 5 – Data Specification and Collection**

---

unchanged then it is very likely that even minimal violations are serious and, as well, that  $T_v$  may have to be very small.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident. The dollar amount used as the multiplier is a fixed dollar amount and is not related to the size of any entity or any entity's facility.

**Allegheny Power AP**

Financial sanctions may be less effective than desired when the structure of the Reliability Authority (RTO) allows for the penalty to be passed on to others.

Addressing this concern is outside the scope of the SDT.

**Southern Company Services SOCO (Generators)**

**Southern Company Services SOCO (Transmission Owners)**

Southern believes that the time an IROL is exceeded should be considered in levels of non-compliance or penalties. Once  $T_v$  is violated, there needs to be an incentive to get it back within limits sooner rather than later. As currently written, the standard does not distinguish between violations that last for  $T_v + 5$  minutes vs.  $T_v + 5$  hours.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident.

**MAIN**

The penalty matrix should be based upon the % of line capacity violation versus the megawatt excess.

The sanctions for this requirement have been revised so that fines for exceeding IROLs for time greater than  $T_v$  are proportional to the magnitude and duration of the incident. The dollar amount used as the multiplier is a fixed dollar amount and is not related to the size of any entity or any entity's facility.

**Southern California Edison SCET**

**Salt River Project SRP**

**Tucson Electric Power Company TEPC**

**Platte River Power Authority TP PRPA**

**California Energy Commission**

The proposed standard will be difficult and impractical to enforce. The standard adds an enforcement burden of proof in that one would have to demonstrate that the violation of the limit "could lead to instability, uncontrolled separation, or cascading outages" for the actual operating conditions which existed. As such there may have to be a technical study conducted almost every time a limit is exceeded to assess each reported potential OWL violation to demonstrate the violation

**Responses to Operate within IROLs Standard Ballot**  
***Comments on Requirement 5 – Data Specification and Collection***

---

would or would not have resulted in cascading for that particular operating point. We do not believe it is practical to expect that a study be run representing the system conditions in effect at the time for each operating limit violation to assess whether the consequences would make the violation reportable.

None of the compliance monitoring processes in this standard include asking that the RA conduct a post-mortem technical study. IROLs are established prior to an event occurring and shall be enforceable in real-time. System Operators must operate so that they don't exceed identified IROLs – its not helpful to identify IROLs after-the-fact.

The SOLs that are identified as IROLs must be developed following Standard 600. Under Standard 600, studies are conducted to identify the SOLs as well as the consequences of violating one of these limits. Studies are not required to be conducted after an IROL has been identified and this standard does not require that any entity demonstrate 'after the fact' that a limit was/was not an IROL.

Whether or not existing system conditions match the conditions studied for the original identification of the IROL, the IROL is still an IROL as far as the system operators are concerned. The IROL remains an IROL until the system operators are informed differently.

## **205 Data Specification and Collection**

### **Requirements**

#### (a) Requirements

(1) The Reliability Authority shall specify and collect the data it needs to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments conducted relative to operating within its Reliability Authority Area's Interconnection Reliability Operating Limits. The Reliability Authority shall collect this data from the entities performing functions that have **real-time** Facilities monitored by the Reliability Authority, and from entities that provide Facility status to the Reliability Authority. This includes specifying and collecting data from the following:

- (i) Balancing Authorities
- (ii) Generator Owners
- (iii) Generator Operators
- (iv) Load-serving Entities
- (v) Reliability Authorities
- (vi) Transmission Operators
- (vii) Transmission Owners

#### **Summary Consideration:**

The requirement was modified to add the adjective, 'real-time' to the term Facilities. This change was requested by a balloter to improve the consistency between Requirements 205 and 206.

#### **Tenaska Inc**

Data requirements in Section 205 need to be more specific to prevent burdensome, discriminatory requests for data. Also, the data request should only be for reliability information and not for competitive cost information. Section 208 should be applicable to anyone who has the ability to impact reliability on the bulk system (transmission owners, transmission operators, generators, load serving entities, etc.). It appears that Section 201 gives tremendous latitude for the reliability authorities to pick and choose what facilities are included which could lead to discriminatory practices. Some more specific language should be added to identify what facilities are in or out.

The requirement is limited to data needed to support reliability. Requiring that all RAs have a common data specification would not be in the best interests of reliability, since some RAs may have a justified need for more data than other RAs.

Regarding Section 208: The entities listed as needing to provide data are those entities that are defined in the Functional Model as needing to provide data to the RA for monitoring and analyses. Other entities may provide data to the RA for other purposes, but that is outside the scope of this standard.

Regarding Section 201: The RA needs the latitude to identify which Facilities it needs to monitor.

### **Bonneville Power Administration Transmission BPAT**

Sections 205 and 206 both deal with “data”. Only in Section 205.b.3 is “status” mentioned. To perform a real time analysis requires both “data” and “status”. We recommend removing “status” from Section 205.b.3 with the understanding that “data” includes “status”.

The standard has been revised to include the phrase “and real-time Facility status” in both Requirements 205 and 206.

### **AEP Service Corp -- Transmission System AEP** **Oklahoma Gas and Electric OKGE**

Requirements (a)(i), (a)(ii) and (a)(iii) are too open-ended on the part of the reliability authority. Justification should be required for all requested data to prevent unreasonable and burdensome requests on the part of the reliability authority. The data requested and the timing of the delivery of the data should be mutually agreeable to the reliability authority and the responding entity.

The standard should include a minimum, default set of data, such as that spelled out in Appendix 4B, and provide that as a guide for types of data that may be requested.

The requirement is limited to data needed to support reliability. Requiring that all RAs have a common data specification would not be in the best interests of reliability, since some RAs may have a justified need for more data than other RAs.

Requirement (a)(iii) appears to be repeated again as a measure in Measure (b)(iii). Shouldn't Requirement (a)(iii) be moved to Standard 206 since it deals with provision of the data?

In fact, there is a great deal of material in 205 that is related data provision. Shouldn't all of this be moved to 206? Perhaps additional clarification between 205 and 206 is all that is needed.

These requirements are closely linked – Requirement 205 requires that the RA develop a data specification to let entities know what data it needs – Requirement 206 requires that those entities provide the data as requested.

206(e) Only one data point out of potentially thousands of points could cause non-compliance as specified in (e). This implies that nothing less than 100% of the data, 100% of the time is sufficient. Is this the intent of the standard? Is a transducer failure in a remote substation as damaging to reliability of the interconnection as the loss of an entire ICCP link between a responding entity and its reliability authority? Is a failure for one scan cycle as critical as that point not being available for days or weeks? It would appear that non-compliance associated with this standard needs revisiting.

When this standard is re-posted for comment, please provide a sample that the industry can review. The standard has been written so that the RA isn't required to ‘turn in’ the names of entities that are non-compliant for a single piece of data. The standard was written so that the RA has an opportunity to resolve any lack of data with the entity responsible and only report instances where there are blatant violations.

### **Kansas City Power & Light KCPL**

Requirements are to open ended. Establish a minimum and let RA justify additional.

**Responses to Operate within IROLs Standard Ballot**  
***Comments on Requirement 5 – Data Specification and Collection***

---

The requirement is limited to data needed to support reliability. Requiring that all RAs have a common data specification would not be in the best interests of reliability, since some RAs may have a justified need for more data than other RAs.

## **Levels of Non-compliance**

### **AEP Service Corp -- Transmission System AEP Oklahoma Gas and Electric OKGE**

There appears to be inconsistency between non-compliance in 205 and 206. If a reliability authority makes an unreasonable data request in 205 and doesn't get the requested data within the specified timeframe, then the reliability authority is only penalized at a level one. But if a responding entity loses one data point for one four-second data scan, that responding entity is blasted with a level four penalty. There does not appear to be equity here.

The SDT suggested different sanctions for not having a data spec and for not providing data as requested. Here is the SDT's reasoning for the different levels of non-compliance:

The data specification does need to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.

The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.

If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.

## **206 Data Provision**

### **Levels of Non-compliance**

#### **Kansas City Power & Light KCPL**

Is missing one data point as severe as an entire ICCP link being down?

As envisioned, the RA would use common sense upon the loss of a single data point for a single scan or even multiple scans, and wouldn't report that to its Compliance Monitor, therefore there would be no associated sanction.

#### **AEP Service Corp -- Transmission System AEP Oklahoma Gas and Electric OKGE**

There appears to be inconsistency between non-compliance in 205 and 206. If a reliability authority makes an unreasonable data request in 205 and doesn't get the requested data within the specified timeframe, then the reliability authority is only penalized at a level one. But if a responding entity loses one data point for one four-second data scan, that responding entity is blasted with a level four penalty. There does not appear to be equity here.

The SDT suggested different sanctions for not having a data spec and for not providing data as requested. Here is the SDT's reasoning for the different levels of non-compliance:

The data specification does need to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.

The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.

If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.

#### **Ontario Power Generation Inc OPG**

SECTION 206:

This section identifies levels of non-compliance and in this case, the only applicable level is level 4, which appears to be unnecessarily harsh.

If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.

**Ontario Power Generation Inc OPG**

SECTION 206:

Entities obliged to provide data to RAs under this section of the Standard should have a means of appealing the decision of the RA on the grounds of relevance.

There is a dispute resolution process that could be used to resolve any difference.

## Sanctions

### City of Tallahassee TAL

Under the Sanctions - Fixed Dollars: In reference to the last line; "If those assumptions prove wrong in the future, yet they are made in good faith using good practices, entities should not be harshly penalized for the outcome." Why is there ANY penalty if a best guess was a little off?

The sentence you've referenced is from the Sanctions Table that is part of the Compliance Enforcement Program approved by the NERC Board. The referenced sentence has been taken out of context – it was written in reference to planning standards, not operations-related standards. The set of paragraphs that explain the rationale for using flat fines and dollars per MW sanctions are as follows:

#### Fixed Dollars

This sanction is used when a letter is not enough and a stronger message is desired. Fixed dollars are typically assigned as a one-time fine that is ideal for measures involving planning-related standards. Many planning actions use forward-looking assumptions. If those assumptions prove wrong in the future, yet they are made in good faith using good practices, entities should not be harshly penalized for the outcome."

#### Dollars per MW

Dollars per MW sanctions are oriented toward operationally based standards. The MW can be load, generation, or flow on a line. Reasonableness of a sanction needs to be figured into assessing \$/MW penalties. Assessing large financial penalties is not the goal, but sending a message with proper emphasis on \$\$\$ can be controlled with the multiplier.

Because the requirement to follow the RA's directives isn't always tied to a certain number of MW, the SDT drafted this standard with "Fixed Dollar" sanctions rather than "Dollars per MW" sanctions.

## **207 Action Plan**

### **Requirements**

#### **207 Action Plan Processes, Procedures or Plans for Preventing and Mitigating IROLs**

##### **(a) Requirements**

- (1) The Reliability Authority shall have ~~an action plan~~ a process, procedure or plan that identifies actions it shall take or actions it shall direct others to take, to prevent ~~or~~ and mitigate instances of exceeding its Interconnection Reliability Operating Limits.

#### **Summary Consideration:**

This requirement was modified to change the word, 'plan' to the phrase, 'process, procedure or plan'. This change aligns the language used in this standard with the language used in the Certification SARs and the Coordinate Operations standard. The word, 'or' was changed to 'and' to clarify that the documents must address Both prevention And mitigation of instances of exceeding IROLs.

- **Add Requirement for an action plan for conservative operations**

#### **Wisconsin Energy Corporation - PM WEC**

Exceeding an IROL is a indicator of a potentially catastrophic event, in addition to the above, the RA should also be required to have an action plan for implementing "conservative operations" for conditions that are unknown or not studied and that do not have a defined IROL.

Requiring that system operators take actions when their system is in an unanalyzed state is beyond the scope of this standard.

- **Require alternatives to curtailments of mkt transactions – comments to reference NAESB practices**

#### **Reliant Resources Inc RRI**

NERC should include in Standard 200, the obligation for operators (RAs) to include as part of its "Action Plan" to mitigate violations to the Interconnected Reliability Operating Limits, procedures that allow transmission customers alternatives to curtailment of market transactions. Such alternative procedures should be referenced in the Action Plans and specific procedures can be provided through another forum, NAESB, that could develop interconnection wide or regional based procedures to enable redispatch or other alternatives to traditional "TLR-type" transaction curtailment.

The Standard does not require nor does it preclude the use of any specific solutions in preventing or mitigating instances of exceeding IROLs.

#### **Reliant Resources Inc RRI**

The problem with NERC Std 200 is that it only requires a "Action Plan" to be in place to mitigate system overloads. Instead, what Standard 200 should do is recognize that RAs have many means to reduce system overloads that can keep as many transactions in place as possible.

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 207 – Processes, Procedures or Plans**

---

The Standard requires processes, procedures or plans to Prevent instances of exceeding IROLs as well as action plans for Mitigating instances of exceeding IROLs. These processes, procedures or plans don't require nor do they preclude the use of any specific solution.

**Reliant Resources Inc RRI**

The way Std 200 is now written; an RA may have as a procedure - e.g. - a load shedding scheme, or bi-lateral transaction curtailment scheme (NERC TLR) to fulfill the NERC Standard 200 requirement for an Action Plan. Neither one of these solutions should be allowed as a first action procedure. By incorporating market procedures through reference in the Action Plan, RAs will be incentivized to utilize other procedures that strive to retain market transactions through the use of financial mechanisms rather than cut them as a first action means to get out of system operating limit violations.

The Standard requires processes, procedures or plans to Prevent instances of exceeding IROLs as well as action plans for Mitigating instances of exceeding IROLs. These processes, procedures or plans don't require nor do they preclude the use of any specific solution.

Adding constraints to the RA's options may limit their ability to protect reliability.

**Ontario Power Generation Inc OPG**

This section identifies the need for RAs to have an action plan for dealing with the exceedances of IROLs. However, such a plan can have substantial commercial implications and the Standard provides no guideline for defining the plan or the mechanism by which a proposed plan can be challenged or modified to mitigate the commercial impacts. OPG believes the most appropriate approach would be to develop plan(s) through NAESB, for adoption by RAs, prior to implementation of this NERC standard.

These processes, procedures or plans are for support of interconnection reliability, they aren't designed to be used to mitigate commercial impacts. NERC is responsible for development of reliability-related standards.

**Reliant Resources Inc RRI**

Sec 207 appears to be the replacement for the current TLR process detailed in NERC Operating Policy Appendix 9C1. References to NAESB or other market based procedures to "unwind" market transactions should be required. NAESB is currently struggling to scope out the needs for a commercial standard to complement the NERC Standard 200. Communication within the appropriate working levels in both the NERC and NAESB forums is required for efficient standards development.

The Standard requires processes, procedures or plans to Prevent instances of exceeding IROLs as well as action plans for Mitigating instances of exceeding IROLs. These processes, procedures or plans don't require nor do they preclude the use of any specific solution.

Adding constraints to the RA's options may limit their ability to protect reliability.

- **Require consistent Action Plans between RAs**

**Reliant Resources Inc RRI**

Sec 207 - There is no requirement for "Action Plans" to be commercially seamless between Regions or RTOs. Although commercial concerns are NOT within NERC's purview, there is no

**Responses to Operate within IROLs Standard Ballot**  
**Comments on Requirement 207 – Processes, Procedures or Plans**

---

acknowledgement that consistent Action Plans between RAs should be implemented where needed, i.e.- within the same interconnection and/or market to ensure seamless operations.

These processes, procedures or plans are for support of interconnection reliability, they aren't designed to be used to mitigate commercial impacts. There is another standard, "Coordinate Operations" that requires RAs to agree to action plans that require cooperation between two or more RAs.

**Electricity Consumers Resource Council**

There is no requirement for commercially seamless Action Plans between Regions or RTOs. The Standard should, at least, recognize that consistent Action Plans may have either reliability or commercial implications.

These processes, procedures or plans are for support of interconnection reliability, they aren't designed to be used to mitigate commercial impacts. There is another standard, "Coordinate Operations" that requires RAs to agree to action plans that require cooperation between two or more RAs. *(Note that the Functional Model doesn't recognize RTOs, so this standard is for RAs.)*

- **Require RAs to implement Action Plans**

**Public Service Electric and Gas Company (LSEs)**

**PSEG Energy Resources & Trade LLC PS**

**PSEG Power LLC**

The RAs should be required to carry out their Action Plan reliability responsibilities in such a manner to ensure seamless operations and markets within their footprints and that of interconnected RAs. (Section 207)

There is no requirement that RAs follow their processes, procedures or plans – this recognizes that the real-time conditions may not match the studied conditions.

These processes, procedures or plans are for support of interconnection reliability, they aren't designed to be used to ensure seamless commercial markets. There is another standard, "Coordinate Operations" that requires RAs to agree to action plans that require cooperation between two or more RAs.

**Measures**

**(b) Measures**

- (1) The Reliability Authority shall have one or more a-documented ~~action plan~~ processes, procedures or plans that addresses- both preventing and mitigating instances of exceeding Interconnection Reliability Operating Limits. The ~~plan~~ processes, procedures or plans shall identify and be coordinated with those entities responsible for taking actions acting and with those entities impacted by such actions.

• **Clarify Action Plan Expectations**

**NPCC**

**New York Power Authority MED**

**Northeast Utilities NU**

**LIPA LIPA (Transmission Owners)**

The Action Plans referred to in Section 207 need to be flexible and allow latitude in operator actions

Agreed. There is no requirement that the RA follow its processes, procedures or plans – this recognizes that the real-time conditions may not match the study conditions.

**Northeast Utilities NU**

The Standards also needs to clarify the expectations of Section 207. Does Section 207 allow for high level guides/guidelines coupled with highly trained operators to make the proper and timely decision(s) or does it require the existence of a step-by-step procedure for each possible contingency.

The standard was modified to indicate that Action Plans could be processes, procedures or plans. These are all 'defined' terms. Each entity may develop a process, procedure or plan, or any combination of these types of documents.

**National Grid USA**

**New Brunswick Power Corporation NBPC**

**New York Power Authority NYPA**

**New York Power Authority MED**

**Northeast Utilities NU**

**Nova Scotia Power NSPI**

**Ontario - Independent Electricity Market Operator IMO**

**ISO New England Inc ISNE**

Section 207, Action Plan. It is National Grid's (NPCC's) (ISO-NE's) position that requiring an Action Plan and its associated steps and procedures for dealing with instances of IROL violations will prove to be restrictive and disallow operators from taking other positive actions than those as outlined in a "plan." National Grid feels that confining operators to a set of steps for an IROL violation may, at face value appear to be laudable, however may not be in the best interest of correcting the IROL violation for the specific set of system conditions that may exist.

Note that although the standard requires RAs to have these documents, the standard does not require RAs to follow these plans. This recognizes that the real-time conditions may not match the study conditions.

**City of Lakeland PLKT**

Action plans referenced in part 207 not sufficiently defined, ie; plan for what, every possible contingency ? subsets ?

The processes, procedures or plans addressed in this requirement need to be developed to suit the individual RA's needs.

**Gainsville Regional Utilities GVL (LSEs)**  
**City of Tallahassee TAL (Transmission Owners)**

The Reliability Authority shall have an action plan that identifies actions it shall take or actions it shall direct others to take, to prevent or mitigate instances of exceeding its Interconnection Reliability Operating Limits. From this it looks like the RA will work with the owner to develop the action plans, but from the non-compliance levels an action plan could be developed without input. What good is this if the RA can't perform the mitigation? Seems very broad and burdensome to the RA. How detailed do the plans have to be? This could be very work intensive if detailed plans have to be documented for every single contingency. Is it alright if the action plan is to work with the facility owner to develop and/or implement mitigating plans? 204 already required that actions be taken. Why is there a need to document every possible action to take? Seems like 204 is the real key to protect reliability, not to keep piles of what it scenarios.

The measures indicate that the documents must identify and be coordinated with those entities responsible for acting and with those entities impacted by such actions.

The documents need to be detailed enough so that the RA knows what actions to take/direct others to take under the studied conditions.

The levels of non-compliance are assigned to the RA because the RA is ultimately responsible for ensuring that these documents are developed and in place so that entities know what actions to take.

Real-time conditions don't always match the studied conditions – for this reason, there is no requirement that the RA follow its plans.

Each RA may make the documents as detailed as necessary to suit its needs. If the RA has new system operators with little operating experience and/or an operating system with known weaknesses, then very detailed documents may be needed. If the RA has a very experienced staff and a very 'robust' operating system, the documents may not need to be as detailed.

## **208 Reliability Authority Directives**

### **Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

#### **Manitoba Hydro MHEB (LSEs)**

#### **Manitoba Hydro (Transmission Owners)**

Standard 208 presumes legal agreements have been put in place to allow the reliability authority to demand actions. We have identified a risk that the presumption of the superiority of the Reliability Authority could have significant safety implications if knowledge of local conditions requires contrary actions to protect equipment or personnel. This risk should be dealt with in these legal documents.

The Reliability Authority Certification Standard includes criteria for the agreements that must be in place defining the Reliability Authority's authority to direct other entities to take actions.

### **Requirements**

#### **City of Tallahassee TAL**

The standard does not specify that another RA has to following the directives of an adjacent RA, such as SERC/FRCC border or interface issues.

This standard does not require one RA to follow the directives of another RA. Under the Functional Model, all RAs are created 'equal' – no RA has more authority than another RA. There is another standard, "Coordinate Operations," that includes requirements for RAs to work together when an operating situation requires the actions of more than one RA.

#### **Gainsville Regional Utilities GVL (LSEs)**

#### **City of Tallahassee TAL (Transmission Owners)**

The standard does not address seams issues. It does not allow the RA to give direction to an entity outside the designated RA area. This is very important regardless if the RA is an entity such as TEC or if the RA is more of the Security (Reliability) Coordinator entity.

Under the Functional Model, issues between Reliability Authority Areas are addressed between the RAs. The Coordination of RA activities is addressed in the Coordinate Operations Standard. The Coordinate Operations standard includes requirements that RAs work together and agree to take certain actions under a range of conditions.

#### **AEP Service Corp -- Transmission System AEP**

Generator operators need to be added to the entities listed.

Under the Functional Model, the RA does not give directions to the Generator Operators. Under the Functional Model, the RA directs the Balancing Authority and the Balancing Authority directs the Generator Operator. The Functional Model (page 12 – under Real-time Relationships that the Reliability Authority has with other 'functions:')

Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities.

The Functional Model (page 18 – under Real-time Relationships that the Balancing Authority has with other ‘functions:’

Directs resources (Generator Operators and Load-Serving Entities) to take action to ensure balance in real time.

## **Measures**

### **(b) Measures**

- (1) The responsible entity shall have evidence that it received and followed the Reliability Authority’s directives. ~~and shall document the directives and actions taken to meet the directives.~~
- (2) The responsible entity shall have document via an operations log or other data source, with the following information recorded for each directive it receives relative to an Interconnection Reliability Operating Limit:
  - (i) Date and time of directive received
  - (ii) Directive ~~issued-received~~
  - (iii) Actions taken in response to directive

### **AEP Service Corp -- Transmission System AEP**

Requirement (a)(ii) is repeated again in Measure (b)(i).

The measures have been revised so they read more like measures and less like requirements.

## **Levels of Non-compliance**

### **Gainsville Regional Utilities GVL (LSEs)**

#### **City of Tallahassee TAL (Transmission Owners)**

Levels of Non-Compliance - Level four: The responsible entity did not follow the Reliability Authority’s directives. If an entity does not follow the RA directive, will the RA have the ability to take action/implement the mitigation plan? If not, other than a financial penalty, it doesn’t look like there is any way to make entities comply and reliability can be jeopardized.

If an entity doesn’t comply with the RA’s directives, then the RA needs to take other actions to preserve the reliability of the Interconnection, up to and including shedding load.

### **AEP Service Corp -- Transmission System AEP**

The levels of non-compliance need to be reviewed to ensure that they accurately reflect how well the directives were followed. Timing of actions taken with regards to when the directives were issued should also be considered.

There is a wide range of possible RA directives – in some scenarios, the RA may direct an entity to take actions within a critical timeframe – in other scenarios, the RA may contact an entity and

**Responses to Operate within IROLs Standard Ballot**  
***Comments on Requirement 208 – RA Directives***

---

ask that entity how long it would take to achieve a specific goal. If you have specific suggestions, please submit them when this standard is re-posted for comment.

## Sanctions

### City of Tallahassee TAL

Under the Sanctions - Fixed Dollars: In reference to the last line; "If those assumptions prove wrong in the future, yet they are made in good faith using good practices, entities should not be harshly penalized for the outcome." Why is there ANY penalty if a best guess was a little off?

The sentence you've referenced is from the Sanctions Table that is part of the Compliance Enforcement Program approved by the NERC Board. The referenced sentence has been taken out of context – it was written in reference to planning standards, not operations-related standards. The set of paragraphs that explain the rationale for using flat fines and dollars per MW sanctions are as follows:

#### Fixed Dollars

This sanction is used when a letter is not enough and a stronger message is desired. Fixed dollars are typically assigned as a one-time fine that is ideal for measures involving planning-related standards. Many planning actions use forward-looking assumptions. If those assumptions prove wrong in the future, yet they are made in good faith using good practices, entities should not be harshly penalized for the outcome."

#### Dollars per MW

Dollars per MW sanctions are oriented toward operationally based standards. The MW can be load, generation, or flow on a line. Reasonableness of a sanction needs to be figured into assessing \$/MW penalties. Assessing large financial penalties is not the goal, but sending a message with proper emphasis on \$\$\$ can be controlled with the multiplier.

Because the requirement to follow the RA's directives isn't always tied to a certain number of MW, the SDT drafted this standard with "Fixed Dollar" sanctions rather than "Dollars per MW" sanctions.

## **Other Comments on Standard**

- **Standard Needs Clarity, General Changes**

### **Alabama Electric Cooperative AEC**

The entire standard is too ambiguous and does little to clear up the OSL- OSLV confusion that has lingered for years.

The definition of Cascading Outages has been refined to try to bring more clarity to this standard.

Under the revised definitions, a cascading outage is the uncontrolled successive loss of system elements triggered by an incident at any location which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

### **American Transmission Company LLC ATC**

The standard is not precise enough in defining where it should be applied. More specifically, the standard asks Reliability Authorities to designate facilities to be subject to IROL's, as distinct from SOL's, presumably on the basis of potential "Wide Area Impact," but the meaning of "Wide Area" remains an open question. For example, it remains undetermined whether the largest city or even some multi-state regions would meet the definition of "Wide Area."

The definitions of Cascading Outages and Bulk Electric System have been refined to try to bring more clarity to this standard. The term, 'wide area impact' is not used in this standard, and has been removed from the terms used in the definition of 'cascading outages'. The new definitions provide specific criteria that should allow entities to determine which of their facilities are subject to IROLs.

Under the revised definitions, a cascading outage is the uncontrolled successive loss of system elements triggered by an incident at any location which results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

### **JEA JEA (LSEs)**

#### **JEA JEA (Generators)**

JEA supports the concepts of this standard, but is voting no because JEA believes the proposed standard in its present form needs more work clarification prior to implementation by the industry.

This comment is not specific enough to provide the SDT with guidance on what needs to be modified.

### **MAIN**

On the surface this standard seems like this is a "no-brainer" except that put into writing it is now too vague and leaves too much room for interpretation.

This comment is not specific enough to provide the SDT with guidance on what needs to be modified.

**New York State Public Service Commission**

The webcast discussion regarding this proposed standard indicated several outstanding issues that should be addressed by the standard drafting committee.

This comment is not specific enough to provide the SDT with guidance on what needs to be modified.

**Aquila, Inc. (Transmission Owners)**

This standard seems to lack industry consensus and needs further development before Aquila could vote yes.

This comment is not specific enough to provide the SDT with guidance on what needs to be modified.

**Carolina Power & Light Company CPL (Transmission Owners)**

**Carolina Power & Light Company CPL (LSEs)**

**Carolina Power & Light Company CPL (Generators)**

The Requirements, Measurements, and Levels of Non-compliance are not well linked throughout the standard. It appears that the majority of comments to place the standard in good, logical format were ignored.

The SDT addressed each comment submitted on each posting of this standard. The format used in this standard is a template that was developed under the guidance of NERC's General Counsel.

**Gainsville Regional Utilities GVL (LSEs)**

**City of Tallahassee TAL (Transmission Owners)**

201 - 208

Compliance Monitoring Process – There are some inconsistencies in this area. It is indicated that the self-certification is submitted to the Compliance Monitor annually and the Performance-reset period is 12 months from the last violation. Do these match? What does it really mean? Do violations “rack-up” for 12 months? What if there is at least one violation each month? In addition to the time constraints, there should be evidence that the list of facilities subject to IROLS and the list of IROLS are supposed were updated. Does this mean keeping revisions for a certain time period?

There is no mis-match between the self-certification and the Performance-reset period. Although self-certification occurs annually, there are other mechanisms for reviewing compliance during the course of a year. The Compliance Monitor could review performance as part of a routine audit, or as part of a triggered investigation. If an entity has non-compliant performance, the reset period won't re-start until that entity has gone 12 months without an incident of non-compliant performance.

**January 2006 – TOP**

**Kansas City Power & Light KCPL**

The levels of compliance sections in these standards should be revised to use all the levels to take into account severity and reasonableness.

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

Some requirements lend themselves to using all levels of non-compliance, and the SDT attempted to put in as many levels of non-compliance as practical. This is a very critical standard, and the requirements are critical to reliability.

**American Transmission Company LLC ATC**

Contrasting operator actions versus documentation, the standard is relatively overly focused on documentation. As a specific example of this, Section 204, which addresses "Actions," permits an IROL shorter than Tv yet still requires documentation of the event (Section 204 (e) (1)). The documentation required by this standard is so burdensome that it risks system operations could become distracted from its primary role of acting on IROL's.

The documentation required in this standard is typically the same documentation made by system operators performing real-time tasks.

- **Wait for Field Testing**

**Western Area Power Administration - CM WACM**

It is suggested that this standard be placed through a field test prior to implementation and enforcement. The Operating Limit Definition Task Force has had a field test in place for the last 6 months which yielded zero violation reports. They are in the process of reviewing the reasons for this extreme drop in reporting, and will discuss those findings at the March NERC Operating Committee meeting. I suggest that this standard would benefit in a similar manner

The determination on whether to conduct field testing is made by the Standards Authorization Committee (SAC). The Director-Compliance makes a recommendation to the SAC and the SAC makes the final determination. The Standards Drafting Team does not have a role in the determination of whether to conduct Field Testing .

**United States Bureau of Reclamation**

Finally the standard has not been tested in a pilot situation to assess how it may operate in practice.

The determination on whether to conduct field testing is made by the Standards Authorization Committee (SAC). The Director-Compliance makes a recommendation to the SAC and the SAC makes the final determination. The Standards Drafting Team does not have a role in the determination of whether to conduct Field Testing .

**Pacific Gas & Electric Company PGEU (Electric Generators)**

Implementation should address:

Field-testing to identify deficiencies due to oversight. Experience with the WECC RMS has shown that technical violations of a deficient standard impose unnecessary sanctions and/or many hours to prepare responses explaining actions. This imposes an undo burden on industry that has no practical benefit for improving reliability.

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

The determination on whether to conduct field testing is made by the Standards Authorization Committee (SAC). The Director-Compliance makes a recommendation to the SAC and the SAC makes the final determination. The Standards Drafting Team does not have a role in the determination of whether to conduct Field Testing .

**American Transmission Company LLC ATC**

This standard should be field tested before implementation, considering the magnitude of the standard's scope, resource requirements, and potentially adverse impact to reliability.

The determination on whether to conduct field testing is made by the Standards Authorization Committee (SAC). The Director-Compliance makes a recommendation to the SAC and the SAC makes the final determination. The Standards Drafting Team does not have a role in the determination of whether to conduct Field Testing .

**California Energy Commission**

The standard has not been field-tested. Experience with the WECC Reliability Management System (RMS) has demonstrated that much can be learned from field tests to verify that the standard requirements are measurable and enforceable. Results from analysis of field tests should be used to refine the standard before it is implemented and enforced.

The determination on whether to conduct field testing is made by the Standards Authorization Committee (SAC). The Director-Compliance makes a recommendation to the SAC and the SAC makes the final determination. The Standards Drafting Team does not have a role in the determination of whether to conduct Field Testing .

**MAIN**

There is substantial agreement with one of the WECC concerns about the application of the standard without first testing the provisions of the standard. The concept of a technical study to determine a fix when a limit is exceeded is good. However, it may be impractical to run such a study representing the system conditions in effect at the time of each operating limit violation to assess the consequences to determine if it is a reportable violation. The operator should be concentrating on fixing the problem.

This standard has not been field-tested. Experience has demonstrated that much can be learned from field tests to verify that the standard requirements are measurable and enforceable. Results from analysis of field tests should be used to refine/verify the standard before it is implemented and enforced.

This standard should be field tested before implementation, considering the magnitude of the standard's scope, resource requirements, and potentially adverse impact to reliability

None of the compliance monitoring processes in this standard include asking that the RA conduct a post-mortem technical study. IROLs are established prior to an event occurring and shall be enforceable in real-time. System Operators must operate so that they don't exceed identified IROLs – its not helpful to identify IROLs after-the-fact.

The SOLs that are identified as IROLs must be developed following Standard 600. Under Standard 600, studies are conducted to identify the SOLs as well as the consequences of violating one of these limits. Studies are not required to be conducted after an IROL has been identified

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

and this standard does not require that any entity demonstrate 'after the fact' that a limit was/was not an IROL.

Whether or not existing system conditions match the conditions studied for the original identification of the IROL, the IROL is still an IROL as far as the system operators are concerned. The IROL remains an IROL until the system operators are informed differently.

The determination on whether to conduct field testing is made by the Standards Authorization Committee (SAC). The Director-Compliance makes a recommendation to the SAC and the SAC makes the final determination. The Standards Drafting Team does not have a role in the determination of whether to conduct Field Testing .

**WECC**

**Minnesota Power MP**

**Public Works Commission Fayetteville PWCF**

**Southern California Edison SCET**

**Salt River Project SRP**

**Tucson Electric Power Company TEPC**

**Platte River Power Authority TP PRPA**

The standard has not been field-tested. Our experience (with the WECC Reliability Management System – RMS) has demonstrated that much can be learned from field tests to verify that the standard requirements are measurable and enforceable. Results from analysis of field tests should be used to refine the standard before it is implemented and enforced.

The determination on whether to conduct field testing is made by the Standards Authorization Committee (SAC). The Director-Compliance makes a recommendation to the SAC and the SAC makes the final determination. The Standards Drafting Team does not have a role in the determination of whether to conduct Field Testing .

**Wisconsin Public Service Corporation WPS**

This standard has not been field-tested. Results from analysis of field tests should be used to refine/verify the standard before it is implemented and enforced.

The determination on whether to conduct field testing is made by the Standards Authorization Committee (SAC). The Director-Compliance makes a recommendation to the SAC and the SAC makes the final determination. The Standards Drafting Team does not have a role in the determination of whether to conduct Field Testing .

- ***Implementation Plan – Fix Date on page 1 of Standard***

**City of Lakeland PLKT**

The Q&A document states the Operate Within IROL standard can't be implemented until after the Determine Facility Ratings System Operating Limits and Transfer Capabilities standard is implemented.

The effective date on the cover page of the standard has been revised to conform with the date in the Implementation Plan. It now states that the standard will become effective three months from

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

the date the NERC BOT votes to adopt the standard, but that compliance with the standard will be delayed until after the Determine Facility Ratings Standard has been implemented.

**Duke Power DUKE (Electric Generators)**

**Duke Power DUKE (LSEs)**

**Duke Power DUKE (Transmission Owners)**

The “Effective Date” as defined by this Standard is inconsistent with the associated Implementation Plan. Further, to predicate the implementation of one Standard on another, yet undeveloped Standard, creates unreasonable uncertainty as to the intended implementation and applicability of this Standard.

The effective date on the cover page of the standard has been revised to conform with the date in the Implementation Plan. It now states that the standard will become effective three months from the date the NERC BOT votes to adopt the standard, but that compliance with the standard will be delayed until after the Determine Facility Ratings Standard has been implemented.

The set of standards currently under development has many inter-relationships. We are attempting to complete the standards in a sequence that makes the adoption and implementation logical to the industry – however because each standard is being developed subject to industry input, the actual completion date of any specific standard is impossible to predict.

**Electricity Consumers Resource Council**

The “Questions and Answers About the Operate Within IROLs Standard” states that the Operate Within Limits Standard cannot be implemented until AFTER the Determine Facility Ratings, System Operating limits and Transfer Capabilities Standard has been implemented. Yet, the Effective Date of this Standard is the first day of the month following NERC Board approval. This conflict must be resolved.

The effective date on the cover page of the standard has been revised to conform with the date in the Implementation Plan. It now states that the standard will become effective three months from the date the NERC BOT votes to adopt the standard, but that compliance with the standard will be delayed until after the Determine Facility Ratings Standard has been implemented.

**Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

**Manitoba Hydro MHEB (LSEs)**

**Manitoba Hydro (Transmission Owners)**

There are a confusing number of dates associated with the standard - these are the “Effective Date”, the “Implementation Date” and the “Compliance Date” – only one of which is defined in the standard (“Effective Date”). These should be better explained and clarified in the preamble of the standard.

The effective date on the cover page of the standard has been revised to conform with the date in the Implementation Plan. It now states that the standard will become effective three months from the date the NERC BOT votes to adopt the standard, but that compliance with the standard will be delayed until after the Determine Facility Ratings Standard has been implemented.

**WECC**

**Minnesota Power MP**  
**Public Works Commission Fayetteville PWCF**  
**Southern California Edison SCET**  
**Salt River Project SRP**  
**Tucson Electric Power Company TEPC**  
**Platte River Power Authority TP PRPA**  
**California Energy Commission**

The document “Questions and Answers About the Operate Within IROLs Standard” states that: “Several things must be in place before entities are expected to come into full compliance with all of the requirements of this standard. Most importantly, the Operate Within IROLs Standard can’t be implemented until after the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard has been implemented.” However, the Effective Date section on page 3 indicates that “This standard will become effective on the first day of the month following the month that the NERC Board of Trustees adopts the standard.” These two statements appear to contradict each other.

The effective date on the cover page of the standard has been revised to conform with the date in the Implementation Plan. It now states that the standard will become effective three months from the date the NERC BOT votes to adopt the standard, but that compliance with the standard will be delayed until after the Determine Facility Ratings Standard has been implemented.

**American Transmission Company LLC ATC**  
**MAIN**

Before this standard can be implemented, the "Determine Facility Ratings, System Operating Limits and Transfer Capabilities" standard must be implemented. However, the effective date of this standard has been set without regard for the effective date of the "Determine Facility Ratings" standard.

The effective date on the cover page of the standard has been revised to conform with the date in the Implementation Plan. It now states that the standard will become effective three months from the date the NERC BOT votes to adopt the standard, but that compliance with the standard will be delayed until after the Determine Facility Ratings Standard has been implemented.

- ***Other Comments on Implementation Plan***

**Consumers Energy CETR (TDUs)**

Consumers Energy is also concerned that the implementation provisions of this standard does not allow for adequate time for development and training of personnel before compliance is mandated.

The implementation plan provided shows that entities would have 9-15 months beyond the date of BOT Adoption to come into compliance with the requirements in this standard. Most of the measures in the standard are only minor modifications to what is currently being done – extensive training should not be required.

**ISO New England Inc ISNE**

While ISO New England generally agrees with a quick implementation of the final approved Standard, there is a large amount of specific data that must be collected and stored to meet the full

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

intent of the Standard. Depending upon what the final approved Standard is, this may require additional software and business processes to fully implement. For this reason we believe that an implementation plan must provide a development period for the responsible entities to fully implement the standard.

The implementation plan, page 15 included the following chart. This chart shows that entities would have several months or more to come into full compliance with this standard. The justification for the delay in compliance with each of the measures is provided in pages 16-23 of the Implementation Plan.

Requirement	Implementation Date	Compliance Date
<b>201 - IROL Identification</b>	3 months from BOT adoption	6 months from implementation of Requirement 604
202 – Monitoring	3 months from BOT adoption	6 months from implementation of Requirement 604
203 - Analyses and Assessments	3 months from BOT adoption	6 months from implementation of Requirement 604
204 - Actions	3 months from BOT adoption	6 months from implementation of Requirement 604
205 – Data Specification & Collection	3 months from BOT adoption	9 months from implementation of Requirement 604
206 – Data Provision	3 months from BOT adoption	12 months from implementation of Requirement 604
207 – Action Plan	3 months from BOT adoption	6 months from implementation of Requirement 604
208 – Reliability Authority Directives	3 months from BOT adoption	9 months from implementation of Requirement 604

**Cinergy Corporation CIN**

Prior to implementation, NERC should not generically assign the responsibilities of the Standard to those currently providing the functions, it should require each Control Area to identify the entity responsible for performing the function of the RA for its Control Area and then require the RA to confirm that responsibility.

Implementing this suggestion is outside the scope of the SDT. Your suggestion was forwarded to the Director-Standards for consideration in the development of the Standards Transition Plan.

**Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

**Manitoba Hydro MHEB (LSEs)**

**Manitoba Hydro (Transmission Owners)**

It is not clear what is the legal standing of the implementation plan; should not this plan be part of the standard itself, so as to be documented, fixed and enforceable?

The members of a standard's Ballot Pool vote to accept the definitions, the standard, the standard's compliance elements and the standard's implementation plan. From ANSI's perspective, the standard is limited to the Requirements and Measures.

If a standard is approved by a Ballot Pool, the Implementation Plan is submitted to the NERC Board of Trustees for its adoption. (Note that the BOT votes to 'adopt' the standard, the definitions, the compliance elements and the implementation plan.) If the implementation plan is adopted and indicates that sections of existing Operating Policies or Planning Standards should be retired, then the Standing Committees will respect the BOT decision and will 'retire' the identified documents as designated in the implementation plan. Similarly, if the approved Implementation Plan indicates that compliance won't be effective until 6 months after the date of the BOT adoption, then those dates would be respected by the Compliance Enforcement Program.

- **Function Responsible & Functional Model Implementation**

**Gainsville Regional Utilities GVL (LSEs)**

**City of Tallahassee TAL (Transmission Owners)**

As previously mentioned, Applicability continues to be an issue. In addition, the inclusion of the Functional Model in the standard implies that the standards will need to be updated every time the functional model changes. This comment also applies to the Implementation Plan.

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC's current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC's vision of control areas is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model's tasks and relationships remain virtually the same as they were in the original version. The addition of separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. But to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

Most of the changes in the Functional Model have been 'format' changes and not content changes. However, as the industry changes, it is possible that the Functional Model will continue to be updated and it is possible that some of the standards will need to be revised to conform with these changes. The alternative is to draft standards without addressing which entities would need to comply with those standards – that's where we are today. Some entities are performing as Control Areas, but many other entities are no longer operating as a Control Area, and there is great confusion as to which entities are responsible for the existing Operating Policies.

**Avista Corp. AVA**

**Avista Corp. Washington Water Power Division AVWP**

The standard puts the responsibility on the RA instead of the path operator. Under the functional model these may be separate entities. The transmission owner and/or path operator should be responsible for maintaining flows within Interconnection Reliability Operating Limits (IROL) not the RA. Combining too much responsibility under the RA will lead to reduced reliability not increased reliability. The transmission owner and/or path operator should not wait for a directive from the RA before taking action. The standard puts another layer between the operation of the path and the reliability of the system.

It is important to keep in mind that a given entity may serve more than one Function.

In its simplest form, a transmission owner may operate only one facility. The Functional Model is designed to address standards at that level. In such an environment, that operator has a very narrow perspective of the transmission system. IROLs can and do go beyond the loading of a single facility. Although the single-facility operator does know how much its *facility* can handle, it may not know how much the *system* can handle – and more to the point the single-facility operator does not have the ability to do anything about such overloads (except to open the facility – which may or may not solve the problem).

A Transmission Operator that is also responsible for the control of its inter-area tie flows would serve two roles: one as the transmission operator and the other as a Balancing Authority – and therefore be subject to both the Balancing Authorities' and the Transmission Operators' standards. A large Transmission owner may serve three or more roles, e.g. it could also serve as Reliability Authority and a Balancing Authority.

The standard does put the responsibility on the RA. Under the Functional Model, only one 'function' is responsible for any one requirement. Thus – either the RA or the TOP must be responsible for ensuring that IROLs aren't exceeded. The Functional Model provides the following explanation on pages 12-13:

The Reliability Authority's purview must be broad enough to enable it to calculate Interconnection Reliability Operating Limits, which may be based on the operating parameters of other transmission systems beyond the Transmission Operator's vision. The Transmission Operator is responsible for the reliability of its "local" transmission system, and may not be aware that its system is violating an Interconnection Reliability Operating Limit. Therefore, the Reliability Authority may direct the Transmission Operators or Balancing Authorities to take action to mitigate Interconnection Reliability Operating Limits.

The Functional Model does allow the RA to 'delegate' some of its tasks, thus it is possible for an RA to delegate the task of monitoring an IROL to one of its TOPs.

Under the Functional Model, the TOP is not responsible for IROLs – under the Functional Model the TOP is responsible for controlling its portion of the transmission system so that system operating limits aren't exceeded. The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Avista Corp. AVA (Transmission Owners)**

**Avista Corp. Washington Water Power Division AVWP (Generators)**

The implementation date is too soon. The standard relies on the role of the Reliability Authority and another standard (Determine Facility Ratings, System Operating Limits and Transfer Capabilities) both of which are still being drafted. The RA functions need to be clearly defined and approved before implementing this standard.

The RA function is defined in the Functional Model - and the Functional Model was approved by the NERC Board of Trustees. Most of the changes to the approved version of the Functional Model are 'format' changes rather than 'content' changes. Waiting for 'final' approval of the revised version of the Functional Model is not practical, since the Functional Model may continue to need to be changed to conform with industry changes that are mandated by entities such as FERC.

**City of Lakeland PLKT**

STD implies the RA has more authority and power to act than what the Functional Model describes

Under the Functional Model, the RA has the authority to direct other entities to take reliability-related actions and other entities are required to act in compliance with those directives. Here are some excerpts from the Functional Model:

Requirement	Quotes from Functional Model (pages 11-13)
Identify IROLs	Calculates Interconnection Reliability Operating Limits based on Transmission Owners' and Generator Owners' specified equipment ratings.
Monitor	Monitor all reliability-related parameters within the Reliability Authority Area, including generation dispatch and transmission maintenance plans
Conduct Analyses	Perform reliability analysis (actual and contingency) for the Reliability Authority Area
Actions	Issues corrective actions (e.g., curtailments or load shedding) to Transmission Operators, Transmission Service Providers, Balancing Authorities, and Interchange Authorities.
Data Specification & Collection	Receives facility and operational data from Generator Operators, Load-Serving Entities, Transmission Owners, Generator Owners, Transmission Operators, Distribution Providers.  Receives real-time operational information from Balancing Authority and Transmission Operator for monitoring.
Data Provision	(Supporting requirement for data specification requirement)
Action Plans	(Supporting requirement for actions requirement)
RA Directives	(Supporting requirement for actions requirement)

**Southern Company Services SOCO (Generators)**  
**Southern Company Services SOCO (Transmission Owners)**  
**Georgia Power Company (LSEs)**

The functional model is used in the standards even before it is finalized. This could be an issue.

The Functional Model was and is designed to be the basis for writing the new Reliability Standards. The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC's current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC's vision of control areas is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model's tasks and relationships remain virtually the same as they were in the original version. The addition of separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. But to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

**Duke Power DUKE (Electric Generators)**  
**Duke Power DUKE (LSEs)**  
**Duke Power DUKE (Transmission Owners)**

The "Applicability" of this Standard to existing entities performing various system functions, as defined in the functional model, prior to the identification and certification of those entities creates unjust confusion and uncertainty as to responsibility and accountability. In this interim period, this creates more uncertainty as to who is responsible and moves the industry to a less defined state.

This is a problem without any single simple solution. The Certification Standards need to ensure that entities applying for certification have the documents and tools in place needed to meet the performance standards – but the performance standards haven't been finalized. The performance Standards need to be developed assuming that entities have met all the criteria in the Certification Standards – but the Certification Standards haven't been finalized. The NERC Board of Trustees has asked the Drafting Teams to move ahead with the development of standards, and that is what we are trying to do. There may need to be some minor changes to both the Certification Standards and these performance standards once all the standards are developed – but having one process wait for the other doesn't seem like a viable solution that will aid the industry in putting into place a set of standards that will support reliability.

**Duke Power DUKE (Electric Generators)**  
**Duke Power DUKE (LSEs)**  
**Duke Power DUKE (Transmission Owners)**

Is this language intended to preclude CAs from having direct ISN and directly sharing operational data? In the current state, this has become an acceptable approach to ISN data exchange.

This standard doesn't reference the ISN, therefore it neither requires nor precludes an entity from having access to and using the ISN for data exchange.

### **Duke Power DUKE (Electric Generators)**

#### **Duke Power DUKE (LSEs)**

#### **Duke Power DUKE (Transmission Owners)**

This Standard appears to be much more prescriptive concerning the responsibility of the RA with respect to the current state of the Reliability Coordinators – specifically with respect to the issues concerning “delegation” of responsibilities and the incumbent utility’s statutory obligations to serve.

The new standards are intended to be more specific than existing Operating Policies in describing required measures of what constitutes good performance. However the new standards are also less ‘prescriptive’ because the new standards provide fewer details on ‘how’ to achieve the required performance.

This standard does give the RA clear authority to direct the actions of entities performing support functions within its Reliability Authority Area. This concept is in support of the Functional Model.

### **East Kentucky Power Cooperative EKPC**

Although the importance of this standard and the excellent work up to this point is recognized, until the relationships and responsibilities of existing Control Areas, Reliability Coordinators, etc. as they will be defined for entities in the new Functional Model are understood, who will need to comply and how they will comply are unclear. Additionally, this standard relies on Facility Ratings and Operating Limits that are yet undefined in another new standard. Approval of this IROL standard at this time is premature. The others need to come first.

The Functional Model contains an explanation of the Reliability Authority and tries to explain the relationship between the RA (a set of tasks to perform) and the Reliability Coordinator (one type of entity that may perform the duties of an RA). Each entity must decide if it wants to be an RA, and any entity that wants to be an RA must then complete the RA Certification process.

### **City of Lakeland PLKT**

The understanding of the functional model needs to be improved. The RA described in the standard is not active today. The functional model needs to have final approval and be implemented.

The RA tasks defined in the Functional Model are being carried out today, and in that sense there are active RAs today. The difficulty is that the entities carrying out those tasks have differing corporate structures – some are control areas, some are ISOs, and some are Reliability Coordinators.

The Functional Model was approved by the NERC Board of Trustees in June, 2001. There are revisions to the Functional Model that are under consideration, but these revisions primarily address ‘format’ and not ‘content’ issues. The Standing Committees approved Version 2 of the Functional Model in November, 2003. The Functional Model may continue to undergo changes to conform to changes in the industry. While this is not ideal, there is nothing the Standards Development Team can do about this reality. Waiting until the Functional Model is ‘finished’ could mean that we may never have a set of reliability standards that is clear enough to support

**Gainesville Regional Utilities GVL (LSEs)**  
**City of Tallahassee TAL (Transmission Owners)**

The question of which entities will be a RA is very critical to considering this standard. If for example, FPL, PEF, TEC or others are all RA's the definition of local area and widespread all have a different view. The standard appears to be written with the RA as a similar entity as the existing Reliability Coordinator. Basically an overseer monitoring a designated area for reliability. The RA as defined in the Functional Model Version 2 does not seem to fit the standard.

To the extent that a Reliability Coordinator does (or is responsible for) all of the tasks defined for an RA, those Reliability Coordinators can be RAs. To the extent that vertically integrated utilities do (or are responsible for) all of those tasks then those utilities may be RAs. The Functional Model defines tasks not corporate structure.

This standard does assume that the entity performing the RA function will have a 'wide area' view and reliability oversight similar to that defined for today's Reliability Coordinators. When the SDT drafted this standard, the SDT did assume that the RA 'function' would replace the RC 'function.' The Functional Model Version 2 supports this assumption. The Functional Model Technical Reference (page 38) includes the following section that addresses the confusion between the RA and the RC:

“When the Control Area Criteria Task Force (the FMRTG's predecessor) began developing the Functional Model in 1999, it assumed that the Reliability Authority would perform the role of the Reliability Coordinator. The Task Force picked a different term because the RC was specifically defined in relation to control areas, and not BAs, Transmission Operators, Generators, and so on. Indeed, the tasks that comprise the Reliability Authority function align closely with those of today's Reliability Coordinator, though the Model does not include the degree of detail found in the Reliability Coordinator criteria in the Operating Manual.”

**Gainesville Regional Utilities GVL (Generators)**

It is not clear as to which individual entities are the reliability authority. Is it each regional Security Coordinator or a Control Area within a security region. This needs clarification.

To the extent that a Reliability Coordinator does (or is responsible for) all of the tasks defined for an RA, those Reliability Coordinators can be RAs. To the extent that vertically integrated utilities do (or are responsible for) all of those tasks then those utilities may be RAs. The Functional Model defines tasks not corporate structure.

While each entity must decide if it wants to become a Reliability Authority, in most cases the Security Coordinator (now called the Reliability Coordinator) can transition to become a Reliability Authority. In some cases, a Control Area may become a Reliability Authority. Each entity must make these decisions for itself, giving consideration to whether it wants to assume the associated responsibilities and giving consideration to the resources required to meet the associated RA Certification standard.

**LG&E Energy Transmission Services LGEE**

We do not believe the concept of a Reliability Authority has been sufficiently defined and needs clarification before we know what we are voting on.

We are concerned about a lack of clarity on exactly who the "Reliability Authority" is that would

**Responses to Operate within IROLs Standard Ballot**

**Carolina Power & Light Company CPL (LSEs)**  
**Carolina Power & Light Company CPL (Generators)**

The understanding of the Reliability Authority is very critical in interpreting this standard. It appears to us that this standard is written with the RA being the entity today that is the Reliability Coordinator. This confusion was discussed on the Web cast conference call, and it was stated by the Chair of the drafting team, that the RA is not the RC of today. The RA in this standard needs “wide area oversight” to perform the requirements of this standard. We have concern, especially with requirement 208, about how a RA (who is not a RC of today) can issue directives to TO’s, BA’s, IA’s and other RA’s if they are not within their reliability area. If the functional model allows an individual CA/TO of today to be a RA tomorrow, it looks like they are giving directives to themselves. So it looks like the RA as defined in version 2 of the functional model does not fit the needs of this standard. That may be more of a problem with interpretation of the functional model than this standard, but until that confusion is cleared up, we have trouble approving this draft.

In the case cited above, the RA is also a BA and a TOP. As such that entity is responsible to effect all of the tasks for the three functions. In that case the RA has the responsibility and would need to ensure that it had the capability to comply with all of those performance requirements.

To the extent that a Reliability Coordinator does (or is responsible for) all of the tasks defined for an RA, those Reliability Coordinators can be RAs. To the extent that vertically integrated utilities do (or are responsible for) all of those tasks then those utilities may be RAs. The Functional Model defines tasks not corporate structure.

As has been shown through the August 14 Blackout Investigation, not all of today’s Reliability Coordinators are created equal. Some of today’s RC’s have wide area monitoring capabilities with clearly defined lines of authority established, but other RC’s don’t have the same capabilities. This standard was written assuming that the RA would perform the duties assigned to the RA in the Functional Model.

This standard does assume that the entity performing the RA function will have a ‘wide area’ view and reliability oversight similar to that defined for today’s Reliability Coordinators. When the SDT drafted this standard, the SDT did assume that the RA ‘function’ would replace the RC ‘function.’ The Functional Model Version 2 supports this assumption. The Functional Model

Technical Reference (page 38) includes the following section that addresses the confusion between the RA and the RC:

“When the Control Area Criteria Task Force (the FMRTG’s predecessor) began developing the Functional Model in 1999, it assumed that the Reliability Authority would perform the role of the Reliability Coordinator. The Task Force picked a different term because the RC was specifically defined in relation to control areas, and not BAs, Transmission Operators, Generators, and so on. Indeed, the tasks that comprise the Reliability Authority function align closely with those of today’s Reliability Coordinator, though the Model does not include the degree of detail found in the Reliability Coordinator criteria in the Operating Manual.”

### **Great River Energy GRE**

I also need additional clarification on who is the Reliability Authority. Is this the current Reliability Coordinator or is this still a Control Area function?

To the extent that a Reliability Coordinator does (or is responsible for) all of the tasks defined for an RA, those Reliability Coordinators can be RAs. To the extent that vertically integrated utilities do (or are responsible for) all of those tasks then those utilities may be RAs. The Functional Model defines tasks not corporate structure.

While each entity must decide if it wants to become a Reliability Authority, in most cases the Security Coordinator (now called the Reliability Coordinator) can transition to become a Reliability Authority. In some cases, a Control Area may become a Reliability Authority. Each entity must make these decisions for itself, giving consideration to whether it wants to assume the associated responsibilities and giving consideration to the resources required to meet the associated RA Certification standard.

Some entities will perform several functions, as shown in the “Roll up” examples provided in the Functional Model Technical Discussions document. Here is an example:

**Bonneville Power Administration Transmission BPAT**

It is our understanding that the Reliability Authority can delegate the function of calculating IROLs. If that is true, it would be good to clarify that possibility.

The Functional Model Technical Discussions document includes a discussion about delegating tasks. Duplicating this discussion in each of the standards would be redundant.

**MAIN**

Based on information passed on in the OWL web cast, there is confusion on what entity assumes responsibility as Reliability Authority (based on the Functional Model). The industry should not pursue this Standard until all entities clearly understand accountability and responsibility associated with this Standard.

Who will be the Reliability Authority and the Reliability Coordinator in the new NERC functional model will drive this standard to a revision draft.

To the extent that a Reliability Coordinator does (or is responsible for) all of the tasks defined for an RA, those Reliability Coordinators can be RAs. To the extent that vertically integrated utilities

do (or are responsible for) all of those tasks then those utilities may be RAs. The Functional Model defines tasks not corporate structure.

As has been shown through the August 14 Blackout Investigation, not all of today's Reliability Coordinators are created equal. Some of today's RC's have wide area monitoring capabilities with clearly defined lines of authority established, but other RC's don't have the same capabilities. This standard was written assuming that the RA would perform the duties assigned to the RA in the Functional Model.

This standard does assume that the entity performing the RA function will have a 'wide area' view and reliability oversight similar to that defined for today's Reliability Coordinators. When the SDT drafted this standard, the SDT did assume that the RA 'function' would replace the RC 'function.' The Functional Model Version 2 supports this assumption. The Functional Model Technical Reference (page 38) includes the following section that addresses the confusion between the RA and the RC:

“When the Control Area Criteria Task Force (the FMRTG's predecessor) began developing the Functional Model in 1999, it assumed that the Reliability Authority would perform the role of the Reliability Coordinator. The Task Force picked a different term because the RC was specifically defined in relation to control areas, and not BAs, Transmission Operators, Generators, and so on. Indeed, the tasks that comprise the Reliability Authority function align closely with those of today's Reliability Coordinator, though the Model does not include the degree of detail found in the Reliability Coordinator criteria in the Operating Manual.”

### **Midwest Independent Transmission System Operator, Inc.**

The industry and the Standard needs to deal with the reality of the existence of Reliability Coordinators and define their role (Based on the informational Webcast, the drafting team's vision is that the RA is the local operator). There currently exists two tiers of control in the grid, local first response from transmission operators and BAs and a higher level-wider area control by Reliability Coordinators.

The Reliability standard defines tasks that must be carried out at various levels. Those responsibilities are defined in the standard. The RA has the responsibility for ensuring reliability is maintained. To the extent that the RA delegates control responsibility among the entities under its purview, that RA is still responsible for the outcome. It is strictly up to that registered RA how to carry out its tasks.

To the extent that a Reliability Coordinator does (or is responsible for) all of the tasks defined for an RA, those Reliability Coordinators can be RAs. To the extent that vertically integrated utilities do (or are responsible for) all of those tasks then those utilities may be RAs. The Functional Model defines tasks not corporate structure.

As has been shown through the August 14 Blackout Investigation, not all of today's Reliability Coordinators are created equal. Some of today's RC's have wide area monitoring capabilities with clearly defined lines of authority established, but other RC's don't have the same capabilities. Technical Reference (page 38) includes the following section that addresses the confusion between the RA and the RC:

“When the Control Area Criteria Task Force (the FMRTG’s predecessor) began developing the Functional Model in 1999, it assumed that the Reliability Authority would perform the role of the Reliability Coordinator. The Task Force picked a different term because the RC was specifically defined in relation to control areas, and not BAs, Transmission Operators, Generators, and so on. Indeed, the tasks that comprise the Reliability Authority function align closely with those of today’s Reliability Coordinator, though the Model does not include the degree of detail found in the Reliability Coordinator criteria in the Operating Manual.”

**Minnesota Power MP**

There is lack of role clarity regarding coordination of responsibility (and liability) for IROL’s.

The RA is responsible for ensuring that the Reliability Authority Area under its control is operated so that IROLs are not exceeded. The RA may delegate some of its tasks, but may not delegate the responsibility for accomplishing those tasks.

**Minnesota Power MP**

Also, in the MAPP region, the St. Paul Reliability Authority function currently provides services for MISO members, non-jurisdictional entities and non-MISO entities. Some of the non-jurisdictional entities have had traditional “first responder” responsibilities (Policies 2, 4 and 5) because it has been determined that they are the ones most able to quickly restore the system to a safe state. The roles of all such entities with regard to proposed standard 200 would need to be understood.

As further authority for managing such operations transfers to the Reliability Authority, the accountability and legal liability that should accompany such authority must also be transferred.

The Functional Model contains a description of the responsibilities of the RA. Some entities are having difficulty trying to determine if they want to assume responsibility of the RA or the TOP. Each entity must make these decisions for itself.

The Certification Standards (For the RA, Balancing Authority, IA and TOP Functions) should contain requirements that formal agreements be in place that delineate the RAs authority to direct other entities to take actions to preserve the reliability of the interconnection.

### **Mirant Americas Energy Marketing LP MAEM**

The standard does not identify the Compliance Monitor. Is the RRC the monitor? NERC? Certainly have a problem with a RRC monitoring a RA when it is the same entity (e.g., MAAC/PJM).

The Functional Model Technical Discussion includes the following explanation of the Compliance Monitor:

Today, the Regional Councils are the Compliance Monitors in NERC. The Regional compliance plans are audited by the NERC organization.

In those situations where the Compliance Monitor is also the organization performing a reliability service or operating function (such as a Regional Council that is also the Reliability Authority), then the Compliance Monitor for that function should be a third party that is unaffiliated with that organization.

### **South Carolina Electric & Gas Company SCEG**

This standard assumes that all RAs are large enough to affect the interconnection as a whole. An IROL is defined as a limit that if exceeded could lead to instability, uncontrolled separation, etc... that adversely impacts the reliability of the bulk transmission system. Until all RAs have been determined, there is no way of determining if this requirement is applicable to them. The standard does not address the situation where this requirement is not applicable, and assumes that all RAs will have at least one facility subject to an IROL. This is important because an RA that is small enough can blackout its entire system without causing an uncontrolled separation or blackout for the rest of the interconnection.

The Functional Model does not define "large enough". If the registered entity can perform the tasks, then the entity will be certified as an RA. By definition, the calculation and correction of violations of IROLs is an RA responsibility – it may be a task that the RA delegates to some other entity, but it still is the RA's responsibility.

The Functional Model includes the following description (pages 12-13):

#### **Special Considerations**

The Reliability Authority's purview must be broad enough to enable it to calculate Interconnection Reliability Operating Limits, which may be based on the operating parameters of other transmission systems beyond the Transmission Operator's vision. The Transmission Operator is responsible for the reliability of its "local" transmission system, and may not be aware that its system is violating an Interconnection Reliability Operating Limit. Therefore, the Reliability Authority may direct the Transmission Operators or Balancing Authorities to take action to mitigate Interconnection Reliability Operating Limits.

### **Southeastern Electric Reliability Council**

References to the Functional Model are not current and should be.

The references have been updated as suggested.

- **Concerns About Other Standards**

**Pacific Gas & Electric Company PGEU (Electric Generators)**

This posted Standard 200 will have implementation problems. It defines Interconnection Reliability Operating Limit (IROL) to be “a system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system”. Its supporting documents also state that the IROL is a subset of the System Operating Limits to be determined according to Standard 600 – Determine Facility Ratings, System Operating Limits (SOL), and Transfer Capabilities, now being drafted. Standard 600 requires that the SOL be determined such that, among other things, all Facilities are operating within their applicable thermal, frequency and voltage limits, in addition to avoidance of instability, uncontrolled separation, or cascading. As such, this Standard 200 could be operating to limits different from the requirements set forth in Standard 600. This leaves the Reliability Authority in an untenable position – it would either have to operate to a set of IROLs that would not meet the requirements in Standard 600, or a set of IROLs that are different than required by Standard 200.

IROLs are a subset of SOLs – they aren’t in conflict with one another.

**Avista Corp. AVA (Transmission Owners)**

**Avista Corp. Washington Water Power Division AVWP (Generators)**

The implementation date is too soon. The standard relies on the role of the Reliability Authority and another standard (Determine Facility Ratings, System Operating Limits and Transfer Capabilities) both of which are still being drafted. The RA functions need to be clearly defined and approved before implementing this standard.

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard is expected to be balloted before this standard is re-posted for ballot.

The Functional Model contains a description of the responsibilities of the RA. Some entities are having difficulty trying to determine if they want to assume responsibility of the RA or the TOP. Each entity must make these decisions for itself.

**Florida Power & Light FPL**

**FRCC**

**JEA JEA (Transmission Owners)**

**Reedy Creek Improvement District RC (LSEs)**

**Reedy Creek Improvement District RC (TDUs)**

**Reedy Creek Improvement District RC (Generators)**

**Reedy Creek Improvement District Marketing RCM (Brokers)**

**Seminole Electric Cooperative SEC (TDUs)**

**Seminole Electric Cooperative SEC (Generators)**

**Seminole Electric Cooperative SEC (Brokers)**

**Kissimmee Utility Authority**

**Orlando Utilities Commission OUCT**

**Tampa Electric Company TEC (LSEs)**

**Tampa Electric Company TEC (Brokers)**

The implementation plan states (pg 8) that this standard would not be implemented until after the Determine Facility Ratings standard has been implemented. If this is true, it does not make sense to approve this, especially with outstanding issues, until after the Determine Facility Ratings standard is completed and approved. Also, on the Web cast, when we asked about the ability of the RA to direct other RA's (it is not stated in 208), we were told that the Coordinate Operations Standard would take care of that. Does that mean that this standard is also dependent on the Coordinate Operations standard being in place first?

The implementation date was revised to reflect the same dates provided in the associated Implementation Plan.

These new standards are not 'stand-alone' – there are many inter-dependencies between these standards – and the industry needs to recognize that it will not be practical to 'wait' for one standard to be completed before finalizing another standard. Because these standards are being developed in parallel, rather than in series, the SDTs don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay – and that is what the SDTs are trying to do. If NERC had 20 years to develop a new set of standards, then it would be better to develop the standards 'one at a time' – but NERC doesn't have 20 years to develop a new set of standards.

### **Wisconsin Energy Corporation - PM WEC**

The effective date of the standard should not be before all prerequisites have been met.

The implementation date was revised to reflect the same dates provided in the associated Implementation Plan. The Determine Facility Ratings Standard is expected to be balloted before this standard.

### **Southeastern Electric Reliability Council**

The Standard needs to recognize the link between it and the Determine Facility Ratings Standard. This standard should be delayed until the Determine Facility Ratings Standard has been released for vote.

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard is expected to be balloted before this standard is re-posted for ballot.

### **Pacific Gas & Electric Company PGEU (Electric Generators)**

Implementation should address:

Identification of all related standards that must be in place to be enforceable and clearly state what requirements are in force upon approval of each related standard.

These new standards are not 'stand-alone' – there are many inter-dependencies between these standards – and the industry needs to recognize that it will not be practical to 'wait' for one standard to be completed before finalizing another standard. Because these standards are being developed in parallel, rather than in series, the SDTs don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay – and that is what the SDTs are trying to do. If NERC had 20 years to develop a new set of standards, then it would be better to develop the standards 'one at a time' – but NERC doesn't have 20 years to develop a new set of standards.

### **Gainsville Regional Utilities GVL (LSEs)**

#### **City of Tallahassee TAL (Transmission Owners)**

The information provided in the Q&A document and the Implementation Plan indicates that the Operate within Limits will not be implemented until the Determine Facilities Ratings Standard (STD 600) has been implemented. This leads to the following questions:

Why balloting so early? Shouldn't STD 600 be adopted prior to or in conjunction with the IROL standard?

How do the entities know how to establish IROLs with out determining ratings and limits? In addition, there is no common process for developing an IROL and corresponding Tv. It appears from a review of STD 600 that this has not been covered in either standard.

It is unclear if an IROL event is initiated pre-contingency or post-contingency.

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard is expected to be balloted before this standard is re-posted for ballot.

The first requirement of this standard was revised to add a reference to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard. The reference states that IROLs are a subset of the System Operating Limits developed under the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard.

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

IROL's are based on system operating limits that are developed based on study criteria identified in the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard. IROLs are developed based on studies of pre- contingency situations and are updated in real time to address changes in system topology such as a loss of a line or a unit trip

**Southern Company Services SOCO (Generators)**

**Southern Company Services SOCO (Transmission Owners)**

**Carolina Power & Light Company CPL (Transmission Owners)**

**Carolina Power & Light Company CPL (LSEs)**

**Carolina Power & Light Company CPL (Generators)**

**Georgia Power Company (LSEs)**

Standard 200 and the Determine Facility Ratings Standard are inherently strongly linked. However, there is little verbiage in Standard 200 referencing this linkage. In addition, the Determine Facility Ratings Standard is not yet finalized or approved so there is no way to know what will be in the final version. Since many of the underlying principles of Standard 200 relies on the Determine Facility Ratings Standard, the fact that the basis for much of Standard 200 in not approved creates a large unknown. For these reasons, the OPS feels that the Determine Facility Ratings Standard needs to be approved PRIOR to Standard 200.

The first requirement of this standard was revised to add a reference to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard. The reference states that IROLs are a subset of the System Operating Limits developed under the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard.

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard is expected to be balloted before this standard is re-posted for ballot.

**Cinergy Corporation CIN**

The term IROL and its definition remain confusing and leave room for interpretation. Until the requirements for Standard 600 have been agreed upon by the industry, it is difficult to approve this Standard which remains incomplete until Standard 600 is approved. Standard 600 does not even refer to the term IROL.

The first requirement of this standard was revised to add a reference to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard. The reference states that IROLs are a subset of the System Operating Limits developed under the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard.

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard is expected to be balloted before this standard is re-posted for ballot.

**City of Lakeland PLKT**

Should not approve until STD 600 has been completed and approved as this STD dependant on 600.

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard is expected to be balloted before this standard is re-posted for ballot.

**Carolina Power & Light Company CPL (Transmission Owners)**  
**Carolina Power & Light Company CPL (LSEs)**  
**Carolina Power & Light Company CPL (Generators)**

The implementation plan states (pg 8) that this standard would not be implemented until after the Determine Facility Ratings standard has been implemented. If this is true, it does not make sense to approve this, especially with outstanding issues, until after the Determine Facility Ratings standard is completed and approved.

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard is expected to be balloted before this standard is re-posted for ballot.

**Pacific Gas & Electric PGAE**

This posted Standard 200 may be confusing to implement. It defines Interconnection Reliability Operating Limit (IROL) to be “a system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system”. Its supporting documents also state that the IROL is a subset of the System Operating Limits to be determined according to Standard 600 – Determine Facility Ratings, System Operating Limits (SOL), and Transfer Capabilities, now being drafted. Standard 600 requires that the SOL be determined such that, among other things, all Facilities are operating within their applicable thermal, frequency and voltage limits, in addition to avoidance of instability, uncontrolled separation, or cascading. As such, this Standard 200 could be operating to limits different from the requirements set forth in Standard 600. This leaves the Reliability Authority in an untenable position – it would either have to operate to a set of IROLs that would not meet the requirements in Standard 600, or a set of IROLs that are different than required by Standard 200.

There is no conflict between these standards. Standard 200 was revised to add the following reference to Standard 600:

Each IROL is developed by following the requirements in the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard. Standard 600.

**City of Tallahassee TAL**

IROLs will be defined by the unapproved standard "Determine Facility Ratings...". I would prefer to approve the supporting documents before we approve this document. (Coordinated Operations will be another one that may be needed before this one.) Although the Implementation Plan states Prerequisite Approvals, how can the effective date be the "first day of the month following the month that the NERC Board of Trustees adopts the standard" if the supporting documents are not approved first. It does not specify what are ALL the supporting documents.

These new standards are not ‘stand-alone’ – there are many inter-dependencies between these standards – and the industry needs to recognize that it will not be practical to ‘wait’ for one standard to be completed before finalizing another standard. Because these standards are being developed in parallel, rather than in series, the SDTs don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay – and that is what the SDTs are trying to do. If NERC had 20 years to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ – but NERC doesn’t have 20 years to develop a new set of standards.

**Mirant Americas Energy Marketing LP MAEM**

This standard relies on the development of other standards (such as Std. 600 - Determine Facility Ratings, etc.) before it can be implemented. As such, I don't want to pass a standard that is contingent upon the future development of other standards. Along these same lines of thinking, language in the Effective Date and Applicability sections (page 3 of 22) is at a minimum unclear if not contradictory.

These new standards are not 'stand-alone' – there are many inter-dependencies between these standards – and the industry needs to recognize that it will not be practical to 'wait' for one standard to be completed before finalizing another standard. Because these standards are being developed in parallel, rather than in series, the SDTs don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay – and that is what the SDTs are trying to do. If NERC had 20 years to develop a new set of standards, then it would be better to develop the standards 'one at a time' – but NERC doesn't have 20 years to develop a new set of standards.

The 'effective date' was modified to clarify the contradiction.

**Entergy EES (Transmission Owners)**

**STANDARDS DEVELOPMENT – LACK OF COORDINATION OF RESPONSIBILITIES  
AMONG INDUSTRY ENTITIES**

NERC is in the process of converting its Operating Manual to standards. The development of each standard is being done by separate teams, which will lead to disjoint standards. The two standards should be developed and voted on at the same time to ensure proper coordination - Determine Facility Ratings, Operating Limits and Transfer Capability, and this Operate Within IROL standard.

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard is expected to be balloted before this standard is re-posted for ballot.

These new standards are not 'stand-alone' – there are many inter-dependencies between these standards – and the industry needs to recognize that it will not be practical to 'wait' for one standard to be completed before finalizing another standard. Because these standards are being developed in parallel, rather than in series, the SDTs don't have control over the completion of any other standard. **Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

In our opinion, this standard as written invalidates the ratings, transfer capabilities, and limits established under the draft “Standard 600 – Determine Facility Ratings, System Operating Limits, and Transfer Capabilities” because it only provides for enforcement of “Interconnected Reliability Operating Limits,” which are the limits that, when exceeded, “could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system.” The current draft of Standard 600 does not mention “Interconnected Reliability Operating Limits.”

IROLs are a subset of SOLs – they aren’t in conflict with one another. The first requirement of this standard was revised to add a reference to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard. The reference states that IROLs are a subset of the System Operating Limits developed under the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard.

- **Comments about Scope**

**Minnesota Power MP**

In the MAPP region, the North Dakota and Manitoba to USA flowgates can be constrained by either thermal limits or stability limits. How could proposed standard 200 be approved for the stability attributes of these flowgates, without consideration of how the thermal attributes of these flowgates will be administered?

Thermal limits and stability limits can be IROLs if operating outside of these limits could lead to instability, cascading outages or uncontrolled separation that adversely impacts the interconnection. If operating outside of these limits does not lead to instability, cascading outages or uncontrolled separation, then these limits are not IROLs.

**Idaho Power Company IPCO**

Standard unduly restricts unacceptable operation to cascading outages.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Entergy EES (Transmission Owners)**

**GOOD UTILITY PRACTICE**

This standard ignores the concept of Good Utility Practice. The authors of the standard state:

“There is no common definition for Good Utility Practice – consequently it is not possible to enforce compliance with Good Utility Practice.”

Reliability Authorities must be held accountable to the concept of Good Utility Practice even if there is no common definition. Without adherence to this requirement the industry will continue to slowly spiral down in reliability since those in authority will not be held accountable for their actions. FERC has supplied the industry with a definition of Good Utility Practice, which should be good enough for use in NERC standards. Entergy insists this standard not be approved until this standard includes the requirement that RAs conform to Good Utility Practice, preferably as defined by FERC, and all industry participants be held accountable to it.

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

The definition of “Good Utility Practice” provided by FERC is very subjective and would not meet the requirements set for NERC Reliability Standards.

FERC’s definition of Good Utility Practice is repeated here:

Any of the practices, methods, and acts engaged in or approved by a significant portion of the electric utility industry during the relevant time period, or any of the practices, methods, and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety, and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act, to the exclusion of all others, but rather to be a range of acceptable practices, methods, or acts generally accepted in the region. Good Utility Practice shall include, but not be limited to, compliance with Applicable Laws and Regulations, Applicable Standards, the National Electric Safety Code, and the National Electrical Code, as they may be amended from time to time, including the criteria, rules and standards of any successor organizations.

**Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

**Manitoba Hydro MHEB (LSEs)**

**Manitoba Hydro (Transmission Owners)**

NERC need to make a clear statement as to which entities will be responsible for ensuring operation within all of the System Operating Limits, since violations of these limits can lead to equipment damage and increase the risk of more violations and even IROL violations.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Midwest Independent Transmission System Operator, Inc.**

**Minnesota Power MP**

The only requirement in the standard for Control Areas (BAs) and Transmission Operators is to provide data and follow the direction of the RA (which most people assume is the Reliability Coordinator, but there's not agreement on that). There is no requirement for the TO or BA to take any action (other than wait for the RA to direct them).

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Cinergy Corporation CIN**

Cinergy is concerned that retiring existing policies when this Standard goes into affect may allow certain requirements to “fall through the cracks”. Absent clear designation of who this Standard would apply to prior to certification of the Reliability Functions leaves some questions regarding the authority of the control areas. For instance, retiring policy 5C2 suggests a System Operator for a Control Area no longer has the authority, or possibly the requirement to possess the authority, to take actions in the event of an emergency. Does the Standard prevent other operating entities such as transmission or generation operators from taking necessary action if needed to

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

prevent damage to facilities due to communication problems with the Reliability Authority or other factors requiring immediate action?

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

Policy 5C2 states the following:

**Requirement 5.C.2 Operator authority and responsibility.** SYSTEM OPERATORS having responsibility for the reliability of the transmission system within a CONTROL AREA, pool, etc. shall be given and shall exercise specific authority to alleviate OPERATING SECURITY LIMIT violations. The authority shall enable the SYSTEM OPERATOR to take timely and appropriate actions including curtailing transmission service or energy schedules, operating equipment (e.g., generators, phase shifters, breakers), shedding load, etc.

One of the challenges currently being addressed by the OLDTF is the lack of a common understanding of what constitutes an OSL. The OLDTF developed a new term, IRL, to replace OSL. IRLs are equivalent to IROLs. Under the Functional Model, only the RA will have responsibility for ensuring operations within IROLs.

This standard doesn't prevent entities from taking actions to control local operating issues.

**Pacific Gas & Electric Company PGEU (Electric Generators)**

As written, this posted Standard 200 is confusing and could degrade system reliability. The stated goal of operating to avoid instability, uncontrolled separation or cascading is too narrow a focus and not good sound operating practice. In truth, the system should be operated within many limitations, such as equipment thermal ratings, generator capability limits, etc. as well as limits for stable power transfer, uncontrolled separation and cascading.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Midwest Independent Transmission System Operator, Inc.**  
**Minnesota Power MP**

As this Standard is intended to do away with much of Policy 2, 4 and 5, there appears to no longer be a requirement for BA-BA (or TO-TO) communication or coordination.

*MP concurs with similar comments submitted by the MISO regarding lack of clarity of coordination responsibilities.*

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

There are other standards being developed that address other aspects of Policy 2, 4, and 5. The team that was tasked with identifying the scope of an initial set of standards elected to start with a 'clean slate'. The team did not look at each Operating Policy to determine which sections should be translated into a new standard – rather the team listed all the tasks that need to be

accomplished to support reliability, and then tried to organize those tasks into logical groupings. For this reason, most of the new standards are not 'one for one' replacements for existing Operating Policies and Planning Standards.

### **Transmission Agency of Northern California – TANC**

First, the definition of Interconnection Reliability Operating Limit includes the following statement --- “A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system.” This statement seems to imply that it is OK to operate over the established limit if it would not cause cascading, even though it could result in damaging equipment, loss of load, or overloads on another entity’s facilities. We believe that implying that limits are only exceeded if the violation could lead to “instability, uncontrolled separation, or cascading outages” will lead to a degradation of system reliability. For example, a system operator may conclude that it is acceptable to violate an operating limit as long as the consequences are not a cascading outage. We do not believe that this philosophy is acceptable, especially in light of what happened back east on August 14, 2003.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **California Energy Commission**

The definition of Interconnection Reliability Operating Limit includes the following statement --- “A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system.” This seems to imply that it is OK to operate over the established limit if it would not cause cascading, even though it could result in damaging equipment, loss of load, or overloads on another entity’s facilities. We believe that implying that limits are only exceeded if the violation could lead to “instability, uncontrolled separation, or cascading outages” will lead to a degradation of system reliability. For example, a system operator may conclude that it is acceptable to violate an operating limit as long as the consequences are not a cascading outage. This philosophy is not acceptable.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **United States Bureau of Reclamation**

The Bureau of Reclamation is concerned that the proposed standard as written will be difficult to enforce. The standard also seems to imply that operating over limits would be permitted if it did not negatively impact the reliability of the system.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **Nebraska Public Power District NPPD**

NPPD does not believe that this standard goes far enough to protect the integrity of the bulk electric system. As stated in version 2 of the Functional Model the transmission operator has the responsibility to operate and direct the operations of the transmission system within equipment and facility ratings. This standard does nothing to require the transmission operator to take action to return the transmission system to an analyzed safe condition. This standard is too narrowly focused and does not provide the industry with the protection to eliminate a repeat of the August 14th blackout.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **Wisconsin Energy Corporation - PM WEC**

The requirements for either RA's or TO's to manage lower level facility operating limits for protecting assets or ensuring reliable operations in local areas have yet to be determined or initiated in the standards process. These "lower level" operating requirements must be defined and implemented concurrent with this standard.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **Pacific Gas & Electric PGAE**

As written, this posted Standard 200 could degrade system reliability since it only requires that the system be operated to avoid instability, uncontrolled separation or cascading. In truth, the system should also be operated within other limitations, such as equipment thermal ratings, generator capability limits, etc.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **ISO New England Inc ISNE**

This Standard addresses the necessary conditions of instability, separation and cascading outages. However, it does not cover "less severe" reliability concerns which may include, but are not limited to, thermal overloads in one Control Area being caused by poor dispatch, poor system control, or delayed contingency recovery in another Area. Given that the Balancing Standard attempts only to address issues related to system frequency (i.e. CPS 2, and DCS would no longer exist), these "less severe" reliability problems appear not to be addressed by any other standard currently proposed. There seems to be inadequate coordination among the Standards; we would offer a suggestion that NERC appoint a body to oversee and coordinate the Standards so that important criteria are not missed in the process.

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**Public Service Electric and Gas Company**

The present language of the Standard proposed for Ballot must be modified to include the following issues

There must be a provision clearly stating that the Reliability Authorities have authority over all entities that operate within the RA area of responsibility.

There is a requirement in the RA Certification Standard that addresses this. That standard requires the RA to have a written agreement with all of the entities that report to the RA as well as with adjacent RAs that defines the authority of the RA.

**PSEG Energy Resources & Trade LLC PS**

**PSEG Power LLC**

There must be an express provision stating that Reliability Authorities have authority over all entities with facilities or operating within the RA's footprint. (Section 204)

There is a requirement in the RA Certification Standard that addresses this. That standard requires the RA to have a written agreement with all of the entities that report to the RA as well as with adjacent RAs that defines the authority of the RA.

- **Limits Impossible to Define**

**Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

**Manitoba Hydro MHEB (LSEs)**

**Manitoba Hydro (Transmission Owners)**

We find it very difficult to envision the sort of limit that might be an IROL given the differences between this standard and standard 600. We challenge the standard development team to identify the IROLs that were violated in the August 14, 2003 disturbance. Since this standard requires the IROLs to be identified before, not after, the fact we don't believe that any such limits could have been defined for the system that collapsed, except in the final few minutes.

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

- **Suggestions About Format of Standard, Typographical Errors**

**Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

**Manitoba Hydro MHEB (LSEs)**

The individual items in Standards 200 should be presented by order of importance. Therefore the items should be renumbered in the following way:

-Standard 207 should become 204 as per bullet immediately above this one.

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

- Standard 204 “Actions” should be renumbered as 205. -Standard 208 which is linked with “Actions”, but from the perspective of acting on the directives of the RA, should become 206.
- Standard 205 should be renumbered as 207.
- Standard 206 should be renumbered to 208.

The standards will all be entered into a relational database where they can be retrieved by users. When this occurs, the order of the requirements will have little meaning, since most users are expected to retrieve only those requirements that are relevant to them. For example, an entity performing the TOP Function is expected to request just those requirements that are relevant to the TOP.

**Manitoba Hydro Electric Board MHEB (Electricity Brokers, Aggregators, and Marketers)**

**Manitoba Hydro MHEB (LSEs)**

**Manitoba Hydro (Transmission Owners)**

The need for the development of mitigation / corrective actions to be developed, identified and documented for each system condition and any possible violation is very important and this standard does not provide sufficient emphasis on this issue. The standard dealing with this requirement is 207, but we believe it should be better emphasized by placing it immediately after “Analysis and Assessments”.

The range of conditions that may occur on any given day is limitless. It isn’t practical to require that there be detailed plans for every possibility, just plans for those scenarios relative to IROLs that are most probable. There is another standard, “Coordinate Operations” that requires the RA to have a more detailed set of documents to address a wider range of specific operating scenarios. This standard’s focus is limited to IROLs.

**National Grid USA**

**New Brunswick Power Corporation NBPC**

**New York Power Authority NYPA**

**Niagara Mohawk NMPC**

**New York Power Authority MED**

**Northeast Utilities NU**

**Nova Scotia Power NSPI**

**Ontario - Independent Electricity Market Operator IMO**

**ISO New England Inc ISNE**

There is also an inconsistency throughout the Standard. It is titled differently in different places. The document title is “Operate Within Interconnection Reliability Limits” which is correct, however, all the headers within the document appear as “...Interconnected...” The NERC website incorrectly lists the title using the word Interconnected as well.

The titles have been revised so they are consistent.

**Entergy EES (Transmission Owners)**

Last, the title of the draft standard is “Operate Within Interconnected Reliability Operating Limits” Standard. The title should be “Interconnection”, not “Interconnected”.

The titles have been revised so they are consistent.

- **Comments about Sanctions**

**Mirant Americas Energy Marketing LP MAEM**

Concerned with financial sanctions being included at this point. How can this be enforced? My understanding is that not many entities have signed NERC's Reliability Agreement (Agreement for Regional Compliance and Enforcement Programs), enabling the RRCs to enforce compliance programs.

These standards are being written with the assumption that there will be legislation giving NERC the authority to levy financial sanctions. This concept has been adopted by the NERC BOT and is outside the scope of the SDT.

**Hydro One Networks Inc (LSEs)**

Monetary Sanctions Matrix: Hydro One Networks does not support the inclusion of monetary sanctions in NERC Standards.

These standards are being written with the assumption that there will be legislation giving NERC the authority to levy financial sanctions. This concept has been adopted by the NERC BOT and is outside the scope of the SDT.

**New York State Reliability Council**

**LIPA LIPA (Transmission Owners)**

The New York State Reliability Council is opposed to monetary sanctions

The New York State Reliability Council (NYSRC) is opposed to monetary sanctions as the only option for dealing with noncompliance as applied in this and other proposed NERC standards. Unfortunately, direct monetary sanctions invite “gaming the system”, and encourage “business” decisions based on potential profits or savings versus potential penalties. Instead of monetary sanctions, the NYSRC prefers that NERC have authority to issue letters of increasing degrees of severity to communicate non-compliance of standards. The use by the NYSRC and NPCC of letters to regulatory agencies for non-compliance has demonstrated that they are a very effective tool for ensuring adherence to standards; such letters establish the basis for liability in the event of a subsequent criteria violation; and in the case of market participant noncompliance, threaten the violator’s ability to continue to do business with or through an ISO or RTO. Moreover, letters that communicate noncompliance best allow focus on the “root cause” of a violation, as well as its reliability impact. Therefore, the NYSRC strongly recommends removal of monetary sanction matrices from this standard as well as future NERC standards, and consider instead the use of letters such as those presently applied by the NYSRC and NPCC.

These standards are being written with the assumption that there will be legislation giving NERC the authority to levy financial sanctions. This concept has been adopted by the NERC BOT and is outside the scope of the SDT. Further, monetary sanctions are in place in the WECC region and are helping motivate proper performance.

Note that in the Sanctions Table, monetary sanctions are not used as a ‘first response’ for anything but the most severe violations. In most cases, an entity that is not in compliance is sent a letter rather than a fine. In this standard, fines are relatively small – in most cases, the SDT recommended fines that start at a flat \$1,000 and progress if the performance continues to be unacceptable. The only requirement with a fine that is potentially large, is the requirement for operating within IROLs. If an IROL is exceeded for a time greater than its  $T_v$ , then the fine can be quite large, even on the first offense. This is designed to provide motivation to never allow operations to become so out of control that an IROL is exceeded for so long a time that the result

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

could be instability, a cascading outage or uncontrolled separation from the interconnection. For this violation, the SDT recommended a dollar per megawatt sanction. Several balloters recommended improvements to the sanction drafted by the SDT, and the sanction has been revised to ensure that it provides a sanction proportional to the risk placed on the interconnection.

In this standard, fines are used when there is a pattern or repetitive poor performance or for extremely severe instances of violating a critical reliability requirement., such as exceeding an IROL for time greater than  $T_v$ .

**ISO New England Inc ISNE**

The Monetary Sanction Matrix - There is an issue with the inclusion of this monetary sanction matrix and what its implications are. ISO-NE, as well as NPCC, has expressed concern over its inclusion and maintains that the use of market mechanisms where possible, as well as, letters of increasing degrees of severity and notifications to regulatory agencies are more effective in ensuring compliance. Failure of NERC to gain authority through reliability legislation could result in NERC pursuing actions to implement "Plan B," a "voluntary" approach affording NERC the authority to perform these types of monetary sanctions. ISO-NE has indicated that any posted Standard, with the included matrix, will not be supported by ISO-NE. There are, however, proceedings at NERC by the Compliance Certification Committee (CCC) to address alternative sanction proposals and ISO-NE will continue to work to oppose monetary sanctions.

These standards are being written with the assumption that there will be legislation giving NERC the authority to levy financial sanctions. This concept has been adopted by the NERC BOT and is outside the scope of the SDT. Further, monetary sanctions are in place in the WECC region and are helping motivate proper performance.

**United Illuminating UICO**

**Gainsville Regional Utilities GVL (LSEs)**

**City of Tallahassee TAL (Transmission Owners)**

Sanctions – If the performance reset period is 12 months, then the financial sanctions could be minimal. Was that the intent? The identification of IROLS is critical to reliability.

The performance reset period was 12 months without a violation. The way this performance reset period works, performance is measured over the course of a 12 month period of time. If there is any violation during this time, then the performance reset period would not reset and successive violations would result in increasingly more severe sanctions.

Note that in most cases, the financial sanctions in this standard are only \$1,000 or \$2,000. Most of the requirements in this standard are related to 'background' documents or processes that are needed to support operating within IROLS. These items are very important, but don't have the same direct link to reliability as operating outside an IROL. The only violation in this standard that could have a substantial monetary fine is operating outside of an IROL for a time greater than  $T_v$ .

- **Comments Submitted with Postings Need More Attention**

### Calpine Power Management LP

We concur with the issues raised by the Southwest Power Pool as to the readiness of the Standard to be voted on.

The SPP did not submit comments as part of a ballot for this standard. The SDT reviewed again the comments submitted by SPP during the last posting of this draft standard. Following are all of the comments submitted during that posting, and the responses provided to SPP's comments and all comments were addressed by the SDT.

It is very cumbersome and can often times be very confusing when two entities are given responsibility for the same task. The requirements outlined in 1.1, 1.2 and 1.1.2 call for both the reliability authority and the planning authority to identify the facilities that have IROLs and also to identify the IROL. We suggest that the reliability authority should be ultimately responsible for identifying and quantifying the IROLs since these are operating limits. However, the reliability authority should thoroughly coordinate this effort with the planning authority. Wording such as "The reliability authority shall coordinate with the planning authority to identify..." would be better. Following this line of thought with the measures in 2.1, 2.1.1 and 2.2, wording should be changed to reflect the reliability authority's ultimate responsibility. "The reliability authority entity shall establish..." makes a better fit.

Several commenters indicated that the RA should be the only function responsible for this requirement, and that change was made to the standard. It is still unclear as to what duties, if any, will be assigned to the Planning Authority, and the SDT elected to omit specific references to the Planning Authority in this standard.

The performance reset period should be changed to 12 months rather than one calendar year.

There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation" This change supports your recommendation.

The SDT needs to revisit the levels of non-compliance associated with this standard. If compliance is truly a black/white issue with no shades of gray as the proposed levels indicate, why not have just a level one with no financial penalty? The proposed non-compliance level implies that it may be more important to have a list of IROLs rather than a correct list of IROLs. Also, if no IROLs exist, there will be no list which would cause the reliability authority to be in non-compliant. There needs to be consistency throughout all the standards on documentation-type non-compliance.

Several commenters indicated a need to add more levels of non-compliance, and to address 'partial credit' for incomplete lists. Consequently, the standard was modified to require that the lists be updated and to require that the RA have evidence that the lists were updated – and a level three non-compliance was added to give partial credit to RAs who have lists but haven't updated them. This may be equivalent to having an 'incomplete' list. With respect to the appropriateness of levels of non-compliance for documentation - the SDT is only working on this standard, and doesn't have the authority to control what is included in other standards.

Combine 4.3 and 4.3.1 into a revised 4.3 as follows:

"The reliability authority shall have displays with real-time data associated with interconnection reliability operating limits."

References to displays were dropped from this standard since, under some conditions, the RA may not have displays available. The intent is for the RA to demonstrate that it is performing monitoring; therefore the revised wording for 4.3 meets this requirement. In

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

addition, the RA must demonstrate that it has tools needed for monitoring as part of the RA Certification.

The performance reset period should be changed to 12 months rather than one calendar year.

There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation" This change supports your recommendation.

Again the issue of degrees of non-compliance surfaces. Are there shades of gray with non-compliance for this standard or is it strictly a black and white issue? Why jump directly to level four non-compliance? Is progressive non-compliance not an option? For example, if a reliability authority had identified 25 IROLs, he is level four non-compliant if only one of the IROLs is not available for real-time use. Shouldn't there be allowances for such situations? Also, perhaps a letter that lists critical displays and identifies discrepancies would be more beneficial to maintaining interconnection reliability than a monetary penalty.

100 of the 132 commenters were in favor of the proposed levels of non-compliance.

The proposed measures may be too weak. For example, it appears that a reliability authority could satisfy the operational planning analysis by evaluating an invalid case for a given day. While it meets the letter of the measure, it doesn't meet the intent of the measure. Also, does 2.1.2 apply to IROLs that are associated with stability limits? If so, this measure would require a reliability authority to run real-time stability analyses every 30 minutes.

The term, 'analysis' is not synonymous with 'study.' IROLs may be associated with stability limits, but this does not mean that a stability study needs to be conducted every 30 minutes. The standard does not specify what tools must be used to conduct the analysis or the assessment – this is left up to the RA.

Again the issue of degrees of non-compliance surfaces. Are there shades of gray with non-compliance for this standard or is it strictly a black and white issue? Why jump directly to level four non-compliance? Is progressive non-compliance not an option? Is missing an operational planning assessment one day in a month as detrimental as missing it 10-15 days per month? Similarly, is missing one real-time assessment as bad for reliability as missing these assessments for hours, on a regular basis?

The levels of non-compliance were adjusted to reflect changes to the compliance monitoring process. Under the revised standard, a level three non-compliance was added.

The performance reset period should be changed to 12 months rather than one calendar year.

There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation"

Non-compliance items should match the standard's definitions. Section 5.1 should be referred to as a Documentable Interconnection Reliability Operating Limit Violation. Section 5.2 should be referred to as an Interconnection Reliability Operating Limit Violation or a Reportable Interconnection Operating Limit Violation, whichever is correct (see response to Question 1).

The terms, Documentable IROL and Reportable IROL were not used in the last draft of this standard, and several commenters indicated it should be dropped. The terminology

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

used in the levels of non-compliance matches the terminology used in the standard, so this suggestion was not adopted.

Requirements 1.1, 1.2 and 1.3 are too open-ended on the part of the reliability authority. Justification should be required for all requested data to prevent unreasonable and burdensome requests on the part of the reliability authority. The data requested and the timing of the delivery of the data should be mutually agreeable to the reliability authority and the responding entity.

Adding a justification requirement seems to be overly burdensome. If an entity wants to challenge the need for data and can't resolve the issue with its RA, then that entity can use the dispute resolution process.

The SDT should define a minimum, default set of data, such as that spelled out in Appendix 4B, and provide that as a guide for what type of data may be requested.

The industry as a whole is not in favor of a 'minimum' set of data. Any RA is free to copy the contents of Appendix 4B and include this as part of its data specification. Appendix 4B, by itself, would not meet all of the measures in this requirement.

Requirement 1.3 appears to be repeated again as a measure in Measure 2.3. Shouldn't Requirement 1.3 be moved to Standard 206 since it deals with provision of the data? In fact, there is a great deal of material in 205 that is related data provision. Shouldn't all of this be moved to 206? Perhaps additional clarification between 205 and 206 is all that is needed.

There are many different ways of sorting the various requirements in this standard. Industry comments on the first version of the standard indicated a preference for putting related requirements together. If requirement 1.3 were moved to 206, this might increase confusion. In requirement 206, one RA has to provide data to another RA, and it may be confusing as to which RA had to notify the Compliance Monitor when data wasn't provided as specified.

The performance reset period should be changed to 12 months rather than one calendar year.

There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation" This change supports your recommendation.

The cover letter requirement in 4.3.1 is confusing and needs clarification. While such a letter can provide evidence that data has been sent, such a requirement could also prove to be excessive and impractical. Infrequent data transmittals such as impedance changes, ratings, etc, could easily be transmitted under cover letter. However, does this requirement also apply to each bit of real-time data transmitted via ICCP?

Several commenters agreed with your comment about 4.3.1. The standard was revised as follows: Evidence indicating data was sent to the reliability authority or evidence that the entity responsible committed to providing the data on the specification. ~~Copies of transmittal cover letters indicating data was sent to the reliability authority.~~

Only one data point out of potentially thousands of points could cause non-compliance as specified in Section 5. This implies that nothing less than 100% of the data, 100% of the time is sufficient. Is this the intent of the SDT? Is a transducer failure in a remote substation as damaging to reliability of the interconnection as the loss of an entire ICCP link between a responding entity and its reliability authority? Is a failure for one scan cycle as critical as that point not being available for days or weeks? It would appear that non-compliance associated with this standard needs revisiting.

The data specification issued by the RA under requirement 205 must identify how real time data will be supplied when there are telecommunication failures. As long as the data is

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

supplied as specified, there is no sanction. (205.2.1.2 Specification shall address the data provision process to use when automated real-time system operating data is unavailable.)

There appears to be inconsistency between non-compliance in 205 and 206. If a reliability authority makes an unreasonable data request in 205 and doesn't get the requested data within the specified timeframe, then the reliability authority is only penalized at a level one. But if a responding entity loses one data point for one four-second data scan, that responding entity is blasted with a level four penalty. There does not appear to be equity here.

If an entity feels that the data specified by the RA is unreasonable, then that entity can try to resolve the issue with its RA or through the dispute resolution process. Both requirements 205 and 206 were modified to add a provision that if the RA is able to resolve the issue of not receiving the data it needs, then the RA does not need to notify its compliance monitor. There is only a level four non-compliance for requirement 206 if the entity does not provide the data as specified AND the entity is unable to resolve the discrepancy with its RA.

Generator operators need to be added to the entities listed in Requirement 1.1.

The Functional Model provides a 'chain of command' type of functional relationship that has been supported in the development of this standard. This 'chain of command' type of structure doesn't support having the RA direct all entities performing all functions, rather the Functional Model has the RA giving directives to a subset of functions, and this subset of functions then passes on instructions to other functions. The generator operator was not added to the list of functions that must comply with this standard because under the Functional Model, the generator operator takes direction from the balancing authority, not the reliability authority.

Requirement 1.2 is repeated again in Measure 2.1.

Some commenters indicated a preference for including a measure that specifically addresses each of the requirements. The measures are intended to identify the elements that the compliance monitor will look at to determine if the desired performance has been achieved – there is nothing wrong in including the same language in both the requirement and the measures.

The levels of non-compliance need to be reviewed to ensure that they accurately reflect how well the directives were followed. Timing of actions taken with regards to when the directives were issued should also be considered.

In many instances, how well a RA's directives are followed is a function of the communication skills of the system operator providing direction. If the RA's directives include timing, then it is fair to include a consideration of timing when assessing non-compliance. If the RA's directives do not include a timing requirement, then this would be impossible to measure objectively.

The SDT should utilize the NERC functional model and thoroughly review and correct all definitions associated with this standard. Some definitions included in this standard are not needed and others don't appear to belong in the standard. Others are simply the wrong definition. Noting the comment box on page 3 of the standard, we wonder why a definitions section was even included in the standard.

Here are some specific problem definitions:

Real-time Monitoring and the use of vision and hearing to define this term.

The term, 'real-time monitoring' was revised by replacing the phrase, "To use vision and hearing to scan. . ." with the phrase, "The act of scanning . . ."

Real-time – Shouldn't historical time also be included?

It is not clear why historical time should be included in a definition of real time.

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

Self-certification – Why is this term included in this standard? It probably belongs in the Compliance Enforcement Document. The second sentence doesn't appear to be a part of the definition.

Self-certification is used in this standard and hasn't been previously defined in the glossary of terms associated with Reliability Standards. Several entities requested that the term be defined during the last posting of this standard.

Transmission Operator has the wrong definition. The definition given is the definition for Transmission Service Provider.

The definition for Transmission Operator was transposed with the definition for Transmission Service Provider.

Documentable Interconnection Reliability Operating Limit Violation and Interconnection Reliability Operating Limit Event have the exact same definition.

Reportable Interconnection Reliability Operating Limit Violation and Interconnection Reliability Operating Limit Violation are basically the same definition.

Reportable Interconnection Reliability Operating Limit Violation and Interconnection Reliability Operating Limit Violation are not used in the standard and have been dropped from the list of defined terms.

T<sub>v</sub> should be listed as T<sub>v</sub>.

The missing subscript "Tv" rather than "T<sub>v</sub>", is a typo and has been corrected.

This standard does not require the reliability authority to notify those entities not providing data to remind those entities that they should be providing data. The reliability authority should be trying to obtain the missing data and working to resolve differences that prevent delivery of the data. If the reliability authority and the responding entity cannot reach agreement on data delivery, then the reliability authority should notify the compliance monitor.

Agreed – this standard does not require the RA to provide a reminder to those entities that need to provide data. This does not preclude the RA from providing such a reminder.

The performance reset period of one calendar year in 201, 202, 204 and 205 should be changed to 12 months. 206, 270 and 208 should remain 12 months.

There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation" This change supports your recommendation.

Areas where non-compliance is the result of a lack of proper documentation should be consistent throughout each individual standard and across all standards, especially between this standard and Standard 600, Determine Facility Ratings, System Operating Limits and Transfer Capabilities.

Changes in standards are driven by the comments submitted by the industry. A lack of proper documentation in one standard is not necessarily the same as in another standard.

**Westar Energy Generation & Marketing WRGS (Generators)**

Does not meet criteria suggested by SWPP ORWG.

The SWPP did not submit comments as part of a ballot for this standard.

**Westar Energy Generation & Marketing WRGS (Brokers)**

Based on SPP reliability working group recommendations

The SWPP did not submit comments as part of a ballot for this standard.

▪ **Transmission Owners Fiduciary Responsibilities And Liability Concerns**

**Carolina Power & Light Company CPL (Transmission Owners)**

**Carolina Power & Light Company CPL (LSEs)**

**Carolina Power & Light Company CPL (Generators)**

Overall, this standard ignores Transmission Owners' fiduciary responsibilities and liability concerns, thereby ignoring coordination of responsibilities among the industry entities. Transmission Owners must be an integral part of the development of limits, operations to stay within those limits, and monitoring of facilities. Leaving out the concerns of the Transmission Owners would ignore their fiduciary responsibilities and liability concerns. Such a lack of coordination in the planning phase would result in confusion in the operating not unlike that exhibited in the northeast blackout.

The Transmission Owner is responsible for establishing facility ratings for its equipment. The Transmission Owner's facility ratings must be respected by the entities that develop associated system operating limits and Interconnection Reliability Operating Limits. The new standards being developed by NERC are being developed in support of the terminology and concepts in the Functional Model. The Functional Model assigns the Reliability Authority the responsibility for identifying IROLs. To clarify that the Transmission Owner's facility ratings must be respected, this standard has been revised to include a statement indicating that the IROLs are developed from SOLs that are developed according to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard.

**Entergy EES (Transmission Owners)**

The drafting team has completely ignored the fiduciary responsibilities and liability concerns of Transmission Owner. Transmission Owners must be an integral part of the development of the limits, operations to keep the system within those limits and monitoring of the facilities. This standard should be revised to reflect those fiduciary responsibilities and liability concerns.

The Transmission Owner is responsible for establishing facility ratings for its equipment. The Transmission Owner's facility ratings must be respected by the entities that develop associated system operating limits and Interconnection Reliability Operating Limits. The new standards being developed by NERC are being developed in support of the terminology and concepts in the Functional Model. The Functional Model assigns the Reliability Authority the responsibility for identifying IROLs. To clarify that the Transmission Owner's facility ratings must be respected, this standard has been revised to include a statement indicating that the IROLs are developed from SOLs that are developed according to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard.

**Southern Company Services SOCO (Generators)**

**Southern Company Services SOCO (Transmission Owners)**

**Georgia Power Company (LSEs)**

Overall, this standard ignores Good Utility Practice and the Transmission Owners fiduciary responsibilities and liability concerns. It thereby ignores the coordination of responsibilities

**Responses to Operate within IROLs Standard Ballot**  
***Other Comments on Standard***

---

among the industry entities, and the standard should have these two definitions modified. The Transmission Owner is responsible for establishing facility ratings for its equipment. The Transmission Owner's facility ratings must be respected by the entities that develop associated system operating limits and Interconnection Reliability Operating Limits. The new standards being developed by NERC are being developed in support of the terminology and concepts in the Functional Model. The Functional Model assigns the Reliability Authority the responsibility for identifying IROLs. To clarify that the Transmission Owner's facility ratings must be respected, this standard has been revised to include a statement indicating that the IROLs are developed from SOLs that are developed according to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard.

FERC's definition of Good Utility Practice is repeated here:

Any of the practices, methods, and acts engaged in or approved by a significant portion of the electric utility industry during the relevant time period, or any of the practices, methods, and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety, and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act, to the exclusion of all others, but rather to be a range of acceptable practices, methods, or acts generally accepted in the region. Good Utility Practice shall include, but not be limited to, compliance with Applicable Laws and Regulations, Applicable Standards, the National Electric Safety Code, and the National Electrical Code, as they may be amended from time to time, including the criteria, rules and standards of any successor organizations.

- ***IROL Violation Report Form***  
**Southern Company Services SOCO (Generators)**  
**Southern Company Services SOCO (Transmission Owners)**  
**Carolina Power & Light Company CPL (Transmission Owners)**  
**Carolina Power & Light Company CPL (LSEs)**  
**Carolina Power & Light Company CPL (Generators)**  
**Georgia Power Company (LSEs)**

The **IROL violation Report Form** does not appear to capture some pretty important data, such as affected parties and narrative on the event. Also, this is the first opportunity for "the world" to review the actual form. It was only referenced in previous postings.

Some of the data that is contained within the existing report filed as part of Policy 2 is not used in the IROL Violation Report. There are some elements in the existing report that are used to analyze the reason for operating security limit violations. In the set of new Reliability Standards, the analysis of major system events is addressed in the "Monitor and Analyze Disturbances, Events and Conditions Standard." The IROL Violation Report is a compliance form used to collect immediately available data that indicates the severity of the IROL violation.

- **Tools, training, etc.**

**National Grid USA**

**New Brunswick Power Corporation NBPC**

**New York Power Authority NYPA**

**Niagara Mohawk NMPC**

**New York Power Authority MED**

**Northeast Utilities NU**

**Nova Scotia Power NSPI**

**Ontario - Independent Electricity Market Operator IMO**

**Hydro One Networks Inc (LSEs)**

**ISO New England Inc ISNE**

The System Operators must have the tools, training and information to deal with unforeseen circumstances and make the proper decisions to secure the system in an expeditious and orderly manner following a contingency or other event.

There is sufficient time provided in the implementation schedule for each entity to provide its system operators with the tools and training needed to comply with the standard.

The scope of this standard must be within the associated SAR which did not include tools or training of system operators. Both tools and training are addressed in the certification standards for the RA, Balancing Authority, and TOP.

- **Comments about Adherence to Standards Development Process**

**Southern Company Services SOCO (Generators)**

**Southern Company Services SOCO (Transmission Owners)**

**Georgia Power Company (LSEs)**

It appears that there were some standard responses that the SDT developed and used for most of the comments. It did not appear that all comments were given their due consideration.

The SDT has considered every comment submitted with each posting of this standard. Many of the industry comments submitted with ballots were comments that had not been submitted on any of the postings of the draft standard. Many of the comments that the SDT has been unable to resolve are unrelated to this standard – these are comments that relate to elements within the compliance program, an understanding of the standards development process, and an understanding of the functional model.

**Bonneville Power Administration - Power Business BPAP**

Procedurally, it seems that for the number of changes that were made to the standard after the last round of comments, an additional round of comment would have been more appropriate than taking this dramatically changed draft to a final vote.

The first ballot of the Standards Process is equivalent to the ‘Call for the Question’ in Robert’s Rules of Order. The purpose of the “Call for the Question” is to determine if the industry is ready to ballot a standard. From the results of the ballot, it is clear that the industry wants changes to their understanding of the standards process, to the compliance program, to the functional model, and to this standard.

**Tennessee Valley Authority - Transmission/Power Supply (Transmission Owners)**

The resolution of industry concerns as expressed through the comment period is required for this standard to be acceptable. Our region as well as other federal entities have expressed similar concerns.

The SDT has considered every comment submitted with each posting of this standard. Many of the industry comments submitted with ballots were comments that had not been submitted on any of the postings of the draft standard. Many of the comments that the SDT has been unable to resolve are unrelated to this standard – these are comments that relate to elements within the compliance program, an understanding of the standards development process, and an understanding of the functional model.

**Bonneville Power Administration Transmission BPAT**

There should be a Technical Reference, either attached to the Standard or as an appendix to the Standard, with much of the information that is in the Question and Answer document, including the IROL Violation Report form.

The SDT may develop or recommend the development of a Technical Reference to support this standard, however the SDT was unable to develop a Technical Reference in a timeframe that would coincide with the development of this standard. (SDTs are not precluded from drafting informal documents such as ‘FAQs’.) According to the Reliability Standards Process Manual, a Technical Reference must be approved by the Standing Committees. Until the standard is

finalized, it isn't practical to finalize a Technical Reference and submit it to the Standing Committees for approval.

- **Other Miscellaneous Comments**

**Cinergy Corporation CIN**

In light of the events affecting the Eastern Interconnection on August 14, 2003 resulting in the blackout of millions of customers in the United States and Canada, Cinergy feels that the standard may not adequately address recommendations yet to come from the Task Force investigating the event. Cinergy believes that the approval of this standard should wait until recommendations from the Task Force on preventing future blackouts are released.

The SDT has monitored the blackout investigation and interim reports and has not see anything in the blackout findings that indicates a need to change this standard. If the blackout recommendations do indicate a need for additional requirements that are closely related to the topics addressed in this standard, then additional SARs may be developed to address those requirements. The Standards Development Process mandates that this SDT develop a standard that is within the scope of the already approved SAR for this standard. Adding requirements that are outside the scope of the approved SAR is not acceptable within the Standards Development Process.

**Con Edison Company of New York CEPD**  
**Con Edison Company of New York CEPD**  
**Consolidated Edison Co. of New York NYCE**  
**New York State Reliability Council**  
**LIPA LIPA (Transmission Owners)**

It should be stated in Standard 200 that more stringent criteria than specified in the Standard may be adopted by a Region or sub-region, even if not specifically identified in the Regional Differences section.

According to the Reliability Standards Process Manual (pages 20-21), if a Region wants specific language added to a NERC Reliability Standard to reflect a requirement that is only applicable to a Region, then the Region must request a Regional Difference. There weren't any requests for Regional Differences in this Standard. Regions are not precluded from adopting and enforcing more stringent criteria than specified in a NERC Reliability Standard.

**MAIN**

This standard appropriately does not just use the limits described in "(Draft) Standard 600 - Determine Facility Ratings, System Operating Limits and Transfer Capabilities" since the IROLs are to address circumstances that lead to instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. This distinction should be preserved and made more clear.

The first requirement in this standard (201 – IROL Identification) has been revised to include a specific link to Standard 600.

**Wisconsin Energy Corporation - PM WEC**

We agree with requirements 202, 203, 205, 206.

## **Monitor and Assess Short-term Transmission Reliability — Operate within Interconnection Reliability Operating Limits Standard**

### **Background**

The Monitor and Assess Short-term Transmission Reliability — Operate within Interconnection Reliability Operating Limits Standard was posted for a second public comment period from July 1 through August 29, 2003. The SDT asked industry participants to provide feedback on the revisions made to the standard through a special SAR Comment Form. There were 40 sets of comments, including comments from more than 150 different people, submitted via this special Standard Comment Form. The comments can be viewed in their original format at:

<http://www.nerc.com/~filez/sar-approved.html>

The SDT made changes to the definitions and the standard based on the comments submitted by industry participants. The changes the SDT made to the definitions and the language within the standard are highlighted in the first sections of this document. The SDT's consideration of comments is provided in yellow highlighted text immediately under each question.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Director of Standards, Tim Gallagher at 609-452-8060 or at [tim.Gallagher@nerc.com](mailto:tim.Gallagher@nerc.com).

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

### Changes to Definitions (Note that changes are shown in blue text.)

**Balancing Authority:** Integrates resource plans ahead of time, and maintains load-interchange-generation balance within its metered boundary and supports system frequency in real time.

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and bulk transmission system.

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread service interruption, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies.

~~**Documentable Interconnection Reliability Operating Limit Violation:** An instance of exceeding an interconnection reliability operating limit for any length of time.~~

**Generator Operator:** Operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.

**Generator Owner:** The entity that owns the generator.

**Instability:** The inability of the transmission system to maintain a state of equilibrium during normal and abnormal system conditions or disturbances.

**Interconnection Reliability Operating Limit:** A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk transmission system. ~~The reliability authority must log each case of exceeding an interconnection reliability operating limit, and must report (to its compliance monitor) each case of exceeding an interconnection reliability operating limit for a time greater than or equal to  $T_v$ . Note that  $T_v$  may be zero.~~

**Interconnection Reliability Operating Limit Event:** An instance of exceeding an interconnection reliability operating limit for any length of time.

**Interconnection Reliability Operating Limit Event Duration:** The length of time an interconnection reliability operating limit is exceeded. The duration is measured from the point where the limit is first exceeded and ends when the value drops below the limit and remains below the limit for at least 30 seconds.

~~**Interconnection Reliability Operating Limit Violation:** An instance of exceeding an interconnection reliability operating limit for time greater than or equal to  $T_v$ .~~

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

**Load-serving Entity:** Secures energy and transmission (and related generation services) to serve the end user.

**Occurrence period (Performance-reset Period):** The time period in which performance is measured, evaluated, and then reset.

**Operational Planning Analysis:** An analysis of the expected system conditions, given the peak load forecast(s); and known system constraints, some examples being transmission facility outages, generator outages and equipment limitations. ~~The analysis should ensure that no interconnection reliability operating limits will be exceeded during expected normal operation. An operational planning analysis is done up to seven days ahead of the expected conditions.~~

**Real-time:** ~~Immediate~~ Present time as opposed to future time.

**Real-time Assessment:** An ~~evaluation~~ examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data. ~~to determine the status of the electric system. The reliability authority uses real-time data to conduct its real-time~~

**Real-time Data:** Real-time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values – may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-time Monitoring:** ~~To use vision and hearing to scan various real-time sources~~ The act of scanning data and drawing conclusions about what the data indicates. ~~Having the ability to scan real-time data as conditions dictate.~~

**Reliability Authority:** Ensures the reliability of the bulk power transmission system within its Reliability Authority Area.

**Reliability Authority Area:** ~~A defined electrical system bounded by interconnection (tie-line) metering and telemetry under the control of a single reliability authority.~~

The collection of generation, transmission, and loads within the boundaries of the organization performing the reliability authority function. Its boundary coincides with one or more balancing authority areas.

**Reportable Interconnection Reliability Operating Limit Violation:** ~~An instance of exceeding an interconnection reliability operating limit for time greater than or equal to the interconnection reliability operating limit's Tv.~~

**Self-certification:** A process by which ~~whereby~~ an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard. ~~submits a form to its compliance monitor, indicating that the entity is in compliance with a specific requirement or set of requirements for a reliability standard.~~

~~Self-certification forms generally require the signature of an officer of the corporation. Most self-certification forms are completed on an annual basis although they may be required more often~~

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

**T<sub>v</sub>:** ~~The violation time associated with a limit.~~ The maximum time that an interconnection reliability operating limit can be exceeded without compliance sanctions being applied.

**Transmission Operator:** ~~The entity that provides transmission services to qualified market participants under applicable transmission service agreements.~~ The entity that operates the transmission facilities and executes switching orders.

**Transmission Owner:** Owns transmission facilities.

**Uncontrolled Separation:** The unplanned break-up of an interconnection, or portion of an interconnection, that is not the result of automatic action by a special protection system or remedial action scheme operating correctly.

**Wide Area Impact:** The impact of an event that, if left untended, could lead to voltage instability, cascading outages or uncontrolled separation that jeopardizes the reliability of an interconnection. The geographic size of the area affected by such an event is always larger than the local area monitored by a single transmission operator and may also also be larger than a single Reliability Authority.

Note that the numbering scheme used in formatting the standard was revised and is not reflected here. In this version, defined terms are capitalized, but not highlighted as a change to the standard.

## Changes to Standard

### 201 IROL Identification

#### 1. Requirements

- 1.1. The Reliability Authority ~~and planning authority~~ shall identify and document which Facilities (or groups of Facilities) in the Reliability Authority's Reliability ~~Authority~~ Area are subject to Interconnection Reliability Operating Limits.
- 1.2. The Reliability Authority ~~and planning authority~~ shall identify each Interconnection Reliability Operating Limit within the Reliability Authority's Reliability ~~Authority~~ Area.
  - ~~1.2.1.~~ The Reliability Authority ~~or planning authority~~ shall identify a ~~maximum response time ( $T_v$ ) for any each~~ Interconnection reliability Operating Limit ~~.that does not already have a  $T_v$ .~~

#### 2. Measures

- 2.1. The ~~entity responsible~~ Reliability Authority shall ~~establish~~ have a list of Facilities (or groups of Facilities) in the Reliability Authority's Reliability ~~Authority~~ Area that are subject to Interconnection Reliability Operating Limits.
  - 2.1.1. ~~The Reliability Authority shall have evidence it reviews and updates the list of Facilities to reflect changes in system topology~~
- 2.2. The ~~entity responsible~~ Reliability Authority shall ~~establish~~ have a list of Interconnection Reliability Operating Limits for the Reliability Authority's Reliability ~~Authority~~ Area.
  - 2.2.1. The ~~entity responsible~~ Reliability Authority shall ~~establish~~ have a ~~maximum response time ( $T_v$ ) for any each~~ Interconnection Reliability Operating Limit. ~~.that does not already have a  $T_v$ .~~
- 2.3. The Reliability Authority shall update the list of Interconnection Reliability Operating Limit values to reflect current system conditions.

#### 3. Regional Differences

None identified.

#### 4. Compliance Monitoring Process

- 4.1. The ~~entity responsible~~ Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

- 4.2. The performance-reset period shall ~~be one calendar year~~ 12 months from the last violation. The Reliability Authority ~~entity responsible~~ shall keep data on Facilities and limits for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- 4.3. The ~~entity responsible~~ Reliability Authority shall have the following available upon the request of its Compliance Monitor:
  - 4.3.1. List of Facilities (or groups of Facilities) in the Reliability Authority's Reliability Authority Area that are subject to Interconnection Reliability Operating Limits
  - 4.3.2. List of Interconnection Reliability Operating Limits for the Reliability Authority's Reliability Authority Area
  - 4.3.3. Evidence that the list of Facilities subject to Interconnection Reliability Operating Limits and the list of Interconnection Reliability Operating Limits were updated.

### 5. Levels of Non-compliance

- 5.1. Level one: Not applicable
- 5.2. Level two: Not applicable
- 5.3. Level three: ~~Not applicable~~ Either the list of Interconnection Reliability Operating Limits or the list of Facilities subject to Interconnection Reliability Operating Limits was not updated.
- 5.4. Level four: No list of Interconnection Reliability Operating Limits or no list of Facilities subject to Interconnection Reliability Operating Limits ~~exists~~ for the Reliability Authority's Reliability Authority Area.

### 6. Sanctions

- 6.1. Apply sanctions consistent with the NERC Compliance and Enforcement Matrix. ~~(Attached at the end of this draft standard for reference and comment.)~~ In places where financial sanctions are applied for non-compliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## **202 Monitoring**

### **1. Requirements**

- 1.1. The Reliability Authority shall ~~monitor real-time~~ perform Real-Time Monitoring of system operating parameters to determine if ~~it the Reliability Authority Area~~ is operating ~~its reliability area~~ within its Interconnection Reliability Operating Limits.

### **2. Measures**

- 2.1. The Reliability Authority shall have Interconnection Reliability Operating Limits available for its operations personnel's Real-time Use.
- 2.2. The Reliability Authority shall have Rreal-time Data available in a form that system operators can compare to the Interconnection Reliability Operating Limits.
- 2.3. The Reliability Authority shall monitor system operating parameters and compare these against its Interconnection Reliability Operating Limits.

### **3. Regional Differences**

None identified.

### **4. Compliance Monitoring Process**

- 4.1. The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- 4.2. The Performance-reset Period shall be ~~one calendar year~~ 12 months from the last violation. The Reliability Authority shall keep data on limits for three calendar years. The compliance monitor shall keep audited data for three calendar years.
- 4.3. The Rreliability Authority shall ~~have demonstrate~~ the following ~~available~~ upon the request of the Compliance Monitor:
  - 4.3.1. ~~Display(s) with real time data associated with interconnection reliability operating limits~~ System operators actively monitoring and comparing Real-time system operating parameters associated with Interconnection Reliability Operating Limits.

### **5. Levels of Non-compliance**

- 5.1. Level one: Not applicable
- 5.2. Level two: Not applicable
- 5.3. Level three: Not applicable

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

- 5.4. Level four: A level four non-compliance occurs if any of the following conditions are present:
  - 5.4.1. Interconnection Reliability Operating Limits not available to operations personnel for real time use; or
  - 5.4.2. Real-time Data not available in a form that can be compared to the Interconnection Reliability Operating Limits; or
  - 5.4.3. System operating parameters not monitored and compared against Interconnection Reliability Operating Limits.

### 6. Sanctions

- ~~6.1.~~ Apply sanctions consistent with the NERC Compliance and Enforcement Matrix. *(Attached at the end of this draft standard for reference and comment.)* In places where financial sanctions are applied for non-compliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## **203 Analyses and Assessments**

### **1. Requirements**

- 1.1. The Reliability Authority shall perform Operational Planning Analyses to ~~verify that its~~ assess whether the planned Bulk Electric System operations ~~within the Reliability Authority's Reliability Authority Area~~ will ~~not~~ exceed any of its Interconnection Reliability Operating Limits.
- 1.2. The Reliability Authority shall perform Real-time Assessments to ~~verify that it is not determine~~ if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits ~~or is expected to exceed any Interconnection Reliability Operating Limits~~.

### **2. Measures**

- 2.1. The Reliability Authority shall identify operating situations or events that impact its ~~ability to operate its~~ Reliability Authority Area's ~~ability to operate~~ without exceeding any Identified Interconnection Reliability Operating Limits.
  - 2.1.1. The Reliability Authority shall conduct an Operational Planning Analysis at least once each day, evaluating the next day's projected system operating conditions.
  - 2.1.2. The Reliability Authority shall conduct a Real-time Assessment periodically, but at least once every 30 minutes.

### **3. Regional Differences**

None identified.

### **4. Compliance Monitoring Process**

- 4.1. The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, and investigations upon complaint, to assess performance.
- 4.2. The Performance-reset Period shall be ~~one day~~ 12 months from the last violation. The Compliance Monitor shall keep audited data for three calendar years.
- ~~4.3.~~ The Reliability Authority shall ~~demonstrate~~ identify the following upon the request of the Compliance Monitor:
  - ~~4.3.1. Ability to perform an operational planning analysis~~-The time the most recent Operational Planning Analysis was conducted
  - ~~4.3.2. Ability to perform a real time assessment~~-Whether the planned Bulk Electric System operations within the Reliability Authority's Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits
  - 4.3.3. The time the most recent Real-time Assessment was conducted

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

- 4.3.4. Whether the assessment identified if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits

### 5. Levels of Non-compliance — ~~Penalties Shall be Applied Separately~~

#### ~~Operational Planning Analysis~~

- 5.1. Level one: Not applicable
- 5.2. Level two: Not applicable
- 5.3. Level three: ~~Not applicable~~—A level three non-compliance exists if any of the following conditions are present:
- 5.3.1. No indication that an Operational Planning Analysis was conducted at least once each day
- 5.3.2. No indication that a Real-time Assessment was conducted at least once each 30 minutes
- 5.4. Level four: ~~Operational planning analysis was not conducted at least once each day~~—A level four non-compliance exists if either of the following conditions are present:
- 5.4.1. The Reliability Authority could not identify whether the planned Bulk Electric System operations within the Reliability Authority's Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits, based on the results of the most recent Operational Planning Analysis
- 5.4.2. The Reliability Authority could not identify whether the most recent Real-time Assessment identified if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits

### 6. Sanctions

- ~~6.1.~~ Apply sanctions consistent with the NERC Compliance and Enforcement Matrix. ~~(Attached at the end of this draft standard for reference and comment.)~~ In places where financial sanctions are applied for non-compliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## **204 Actions**

### **1. Requirements**

- 1.1. The Reliability Authority shall act<sup>1</sup> or direct others to act to:
  - 1.1.1. Prevent instances where Interconnection Reliability Operating Limits may be exceeded
  - 1.1.2. Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded
- 1.2. The Reliability Authority shall document instances of exceeding Interconnection Reliability Operating Limits and shall document and complete an Interconnection Reliability Operating Limit Violation Report for instances of exceeding Interconnection Reliability Operating Limits for time greater than ~~or equal to~~  $T_v$ .
  - 1.2.1. The Reliability Authority shall measure the duration of the event from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limits for a minimum of 30 seconds.

### **2. Measures**

- 2.1. The Reliability Authority shall document each instance ~~where actions are taken or directives are issued to mitigate the magnitude and duration~~ of exceeding an Interconnection Reliability Operating Limit:
  - 2.1.1. The reliability authority shall document, via an operations log or other data source, the actions taken or directives issued, the magnitude of the event, and the duration of the event. (This data may be from an operating log, may be from the entity's energy management system, or may be from some other source.)
- 2.2. The Reliability Authority shall report each instance of exceeding an Interconnection Reliability Operating Limit for time greater than ~~or equal to~~  $T_v$ :
  - 2.2.1. The Reliability Authority shall complete an Interconnection Reliability Operating Limit Violation Report and shall file the report with its Compliance Monitor within five business days of the initiation of the event. (The report includes the date and time of the event, identification of which Interconnection Reliability Operating Limit was violated and the  $T_v$  for that limit, magnitude and duration of exceeding the Interconnection Reliability Operating Limit, actions taken or directives issued ~~and the time these were initiated or issued~~, and explanation of results of actions or directives.)

### **3. Regional Differences**

---

<sup>1</sup> Note that the reliability authority may choose to take 'no overt action' and this may be an acceptable action ~~as long as it is documented~~. Taking 'no overt action' is not the same as ignoring the problem.

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

None identified.

### 4. Compliance Monitoring Process

- 4.1. The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- 4.2. The Performance-reset Period shall ~~be one calendar year~~ 12 months from the last violation. The Reliability Authority shall keep Interconnection Reliability Operating Limit Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- 4.3. The Reliability Authority shall have the following available upon the request of its Compliance Monitor:
  - 4.3.1. Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an Interconnection Reliability Operating Limit and the actions or directives issued for each of these instances
  - 4.3.2. Interconnection Reliability Operating Limit Violation Reports

### 5. Levels of Non-compliance <sup>2</sup>

- 5.1. Level one: Interconnection Reliability Operating Limit exceeded for a time less than or equal to  $T_v$  and no documentation to indicate actions taken or directives issued to mitigate the instance.
- 5.2. Level two: Not applicable
- 5.3. Level three: Not applicable
- 5.4. Level four: Interconnection Reliability Operating Limit exceeded for time greater than ~~or equal to~~  $T_v$  minutes

### 6. Sanctions

- ~~6.1.~~ Apply sanctions consistent with the NERC Compliance and Enforcement Matrix. *(Attached at the end of this draft standard for reference and comment.)* Level one non-compliance sanctions, shall be the fixed dollar sanctions listed in the matrix, not the per MW sanctions. Level four non-compliance sanctions shall be the greater of the fixed dollar sanctions listed in the matrix, or the number of megawatts above the Interconnection Reliability Operating Limit multiplied by the dollar value for the number of times non-compliant.

---

<sup>2</sup> Note that the Reliability Authority may choose to take ‘no overt action’ and this may be an acceptable action as long as it is documented. Taking ‘no overt action’ is not the same as ignoring the problem.

## **205 Data Specification & Collection**

### **1. Requirements**

- 1.1. The Reliability Authority shall specify and collect the data it needs to support Real-time Monitoring, Operational Planning Analyses and Real-time Assessments conducted relative to operating within its Reliability Authority Area's Interconnection Reliability Operating Limits. The Reliability Authority shall collect this data from the entities performing functions that have Facilities monitored by the Reliability Authority, and from entities that provide Facility status to the Reliability Authority. This includes specifying and collecting data from the following:
  - 1.1.1. **Balancing Authorities**
  - 1.1.2. Generator Owners
  - 1.1.3. Generator Operators
  - 1.1.4. **Load Serving Entities**
  - 1.1.5. Reliability Authorities
  - 1.1.6. Transmission Operators
  - 1.1.7. Transmission Owners
- 1.2. The Reliability Authority shall specify when to supply data (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses.)
- 1.3. The Reliability Authority shall notify its Compliance Monitor when both of the following conditions are present:
  - 1.3.1. An entity that has data needed to support Real-time Monitoring, Operational Planning **Analyses** or Real-time Assessments relative to operating within the Reliability Authority's Reliability **Authority** Area has not provided data as specified, and
  - 1.3.2. The Reliability Authority was unable to resolve the issue with the entity responsible for providing the data

### **2. Measures**

- 2.1. The Reliability Authority shall have a documented specification for data needed to build and maintain models needed to support Real time Monitoring, Operational Planning Analyses and Real-time Assessments relative to Interconnection Reliability Operating Limits.
  - 2.1.1. Specification shall include a list of required data, a mutually agreeable format, and timeframe and periodicity for providing data.

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

- 2.1.2. Specification shall address the data provision process to use when automated Real-time system operating data is unavailable.
- 2.2. The Reliability Authority shall **have evidence it has distributed** its data specification to the entities that have Facilities monitored by the Reliability Authority and to entities that provide Facility status to the Reliability Authority.
- 2.3. The Reliability Authority shall notify its Compliance Monitor when an entity that has Facilities monitored by the Reliability Authority, or an entity that provides Facility status to the Reliability Authority, does not provide data as specified.
  - 2.3.1. The notification shall take place within five business days of discovering that the data is missing.

### 3. Regional Differences

None identified.

### 4. Compliance Monitoring Process

- 4.1. The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- 4.2. The Performance-reset Period shall be **one calendar year 12 months from the last violation**. The Reliability Authority shall keep its data specification(s) for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- 4.3. The Reliability Authority shall have the following available upon the request of the Compliance Monitor:
  - 4.3.1. Data specification(s)
  - 4.3.2. Proof of distribution of the data specification(s)

### 5. Levels of Non-compliance

- 5.1. Level one: Data specification incomplete (missing either the list of required data, a mutually agreeable format, a timeframe for providing data, or a data provision process to use when automated Real-time system operating data is unavailable.)
- 5.2. Level two: No data specification or the specification not distributed to the entities that have Facilities monitored by the Reliability Authority and the entities that provide the Reliability Authority with Facility status
- 5.3. Level three: Not applicable
- 5.4. Level four: Not applicable

**6. Sanctions**

- 6.1. Apply sanctions consistent with the NERC Compliance and Enforcement Matrix. ~~(Attached at the end of this draft standard for reference and comment.)~~ In places where financial sanctions are applied for non-compliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## **206 Data Provision**

### **1. Requirements**

- 1.1. Each entity performing one of the following functions shall provide data, as specified, to the Reliability Authority(ies) with which it has a reliability relationship. ~~The data is limited to data needed by the Reliability Authority to support Real-time Monitoring, Operational Planning Analyses and Real-time Assessments conducted relative to operating within its Reliability Authority Area's Interconnection Reliability Operating Limits.~~

1.1.1. ~~Balancing Authorities~~

1.1.2. ~~Generator Owners~~

1.1.3. ~~Generator Operators~~

1.1.4. ~~Load Serving Entities~~

1.1.5. ~~Reliability Authorities~~

1.1.6. ~~Transmission Operators~~

1.1.7. ~~Transmission Owners~~

### **2. Measures**

- 2.1. The entity responsible shall ~~have evidence it has~~ provided data, as specified, to the requesting Reliability Authority, within the time frame specified, in the mutually agreed upon format., ~~or the responsible entity shall have evidence it has committed to providing the data, as specified, to the Reliability Authority, within the timeframe specified, in the mutually agreed upon format~~

### **3. Regional Differences**

None identified.

### **4. Compliance Monitoring Process**

- 4.1. The entity responsible shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. ~~The compliance monitor shall seek confirmation of the data transmission by checking with the receiving reliability authority.~~ The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- 4.2. The Performance-reset Period is 12 months ~~without a violation~~ from the ~~time of the~~ last violation. The responsible entity shall keep data transmittal documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

4.3. The entity responsible shall have the following available upon the request of the Compliance Monitor:

~~4.3.1. Evidence indicating data was sent to the Reliability Authority or evidence that the entity responsible committed to providing the data on the specification. Copies of transmittal cover letters indicating data was sent to the reliability authority.~~

### 5. Levels of Non-compliance

5.1. Level one: Not applicable

5.2. Level two: Not applicable

5.3. Level three: Not applicable

5.4. Level four: Data was not provided to the Reliability Authority as specified and the situation was not resolved with the Reliability Authority.

### 6. Sanctions

~~6.1. Apply sanctions consistent with the NERC Compliance and Enforcement Matrix. (Attached at the end of this draft standard for reference and comment.)~~ In places where financial sanctions are applied for non-compliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollar per megawatt sanctions.

**207 Action Plan**

**1. Requirements**

- 1.1. The Reliability Authority shall have an action plan that identifies actions it shall take or actions it shall direct others to take, to prevent or mitigate instances of exceeding its Interconnection Reliability Operating Limits.

**2. Measures**

- 2.1. The Reliability Authority shall have a documented action plan that addresses preventing and mitigating instances of exceeding Interconnection Reliability Operating Limits. The plan shall **identify and** be coordinated with those entities responsible for acting and with those entities impacted by such actions.
  - 2.1.1. The action plan may be a process or procedure for preventing or mitigating instances of exceeding Interconnected Reliability Operating Limits. (Note: an emergency operations plan may be used to satisfy this requirement if the emergency operations plan addresses actions to prevent and mitigate instances of exceeding interconnected reliability operating limits.)

**3. Regional Differences**

None identified.

**4. Compliance Monitoring Process**

- 4.1. The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- 4.2. The Performance-reset Period is 12 months **from the last violation**. The Reliability Authority shall keep its action plan for three calendar years. The Compliance Monitor shall keep audit records for three calendar years.
- 4.3. The Reliability Authority shall make the following available for inspection by the Compliance Monitor upon request:
  - 4.3.1. Action plan

**5. Levels of Non-compliance**

- 5.1. Level one: Action plan exists but wasn't coordinated with all involved and impacted entities
- 5.2. Level two: Action plan exists but wasn't coordinated with any involved or any impacted entities
- 5.3. Level three: Not applicable.
- 5.4. Level four: No action plan

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

### 6. Sanctions

- 6.1. Apply sanctions consistent with the NERC Compliance and Enforcement Matrix. ~~(Attached at the end of this draft standard for reference and comment.)~~ In places where financial sanctions are applied for non-compliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## **208 Reliability Authority Directives**

### **1. Requirements**

- 1.1. The Transmission Operator, Balancing Authority, And Interchange Authority shall follow the Reliability Authority's directives to:
  - 1.1.1. Prevent instances where Interconnection Reliability Operating Limits may be exceeded
  - 1.1.2. Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded
- 1.2. The entity responsible shall document the reliability authority's directives and the actions taken

### **2. Measures**

- 2.1. The entity responsible shall follow the Reliability Authority's directives and shall document the directives and actions taken to meet the directives
- 2.2. The entity responsible shall document via an operations log or other data source, the following for each directive it receives relative to an Interconnection Reliability Operating Limit:
  - 2.2.1. Date and time of directive received
  - 2.2.2. Directive issued
  - 2.2.3. Actions taken in response to directive

### **3. Regional Differences**

None identified.

### **4. Compliance Monitoring Process**

- 4.1. The entity responsible shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint to assess performance.
- 4.2. The Performance-reset Period is 12 months [from the last violation](#). The entity responsible shall keep its documentation for three calendar years. The Compliance Monitor shall keep audit records for three calendar years.
- 4.3. The entity responsible shall make the following available for inspection by the Compliance Monitor upon request:
  - 4.3.1. Operations log or other data source(s) to show the following for each instance of being issued a Reliability Authority directive relative to an Interconnection Reliability Operating Limit:

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Changes to Definitions and Standard

---

4.3.1.1. Date and time of each of directive received

4.3.1.2. Directive issued

4.3.1.3. Actions taken in response to directive

### 5. Levels of Non-compliance

5.1. Level one: ~~Not applicable.~~ Entity followed Reliability Authority's directives relative to preventing or mitigating instances of exceeding Interconnection Reliability Operating Limits but did not document the data and time of each directive received, the directive received and the actions taken in response to the directive.

5.2. Level two: Not applicable.

5.3. Level three: Not applicable.

5.4. Level four: Entity did not follow the Reliability Authority's directives.

### 6. Sanctions

6.1. Apply sanctions consistent with the NERC Compliance and Enforcement Matrix. ~~(Attached at the end of this draft standard for reference and comment.)~~ In places where financial sanctions are applied for non-compliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

<b>The standard was revised so the reliability authority is the only entity responsible for this requirement.</b>			
<u>Compliance Subcommittee</u>			Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

			<p>information submittal to the compliance monitor, either on or off site at the compliance monitors discretion.</p> <p>4.2 Subsequent to the initial compliance review, the entity responsible shall demonstrate compliance through self-certification submitted to its compliance monitor annually.</p> <p>4.3 Compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation) method, or review of information submitted as requested, at the discretion of the compliance monitor.</p> <p>Change 4.2 and 4.3 to 4.4 and 4.5</p>
<p>The suggested language changes were not adopted for the following reasons.</p> <ul style="list-style-type: none"> <li>- "Information submittal" is an undefined term. Industry commenters have asked that the compliance elements be as specific as possible so that there won't be huge variations from region to region in the application of the compliance monitoring. If an 'information submittal' is the same as a self-certification document, then this is already covered in the original language. Including language that gives each compliance monitor the flexibility to assess this requirement however it chooses, does not conform with the industry's requests for standardization in the compliance monitoring process.</li> </ul> <p>The only significant change between the original language and the proposed new section 4.2 is the addition of the concept that the compliance monitor has the freedom to either conduct an audit per a schedule, or just show up unscheduled. Again, this does not support the industry's request for increased standardization in the compliance monitoring process. The original language included the option of conducting an 'investigation upon compliant' and this seems more appropriate than unscheduled audits.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

**Requirement 201 - Interconnection Reliability Operating Limit Identification –Other Comments**

**Summary Consideration:** While there were many comments recommending specific changes, most commenters indicated support of the requirement, its measures, the compliance monitoring process and the levels of non-compliance. The following changes were made to further improve the level of consensus on this requirement:

- The planning authority was removed from the list of functions that must comply with this requirement.
- The requirement and measures were modified to reflect that the RA must modify its lists so they reflect changes to the system.
- The compliance monitoring process was modified to change the performance reset period to '12 months from the last violation'
- An additional level of non-compliance was added to address situations where an entity may have lists but these lists have not been updated to reflect system changes.

The SDT was unable to accommodate the changes recommending that the Transmission Owner and Transmission Operator be added to this requirement. The Functional Model assigns responsibility for establishing reliability limits to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model.

Commenter	Comments
Ron Falsetti IMO #2	<p>IMO believes that the present definition of Tv, which is 'self-defined, as so broad that the re-preparation time of thirty minutes has been lost. It is unclear if this was indeed the intent based on Section 203 requirements 1.1 and 1.2 and measure 2.1.2.</p> <p>The reliability authority or planning authority identifying Tv must establish and present the process through which Tv is derived, or the re-preparation time of thirty minutes should become the standard default absent such a process.</p> <p>The reliability authority or planning authority identifying Tv in one region/area must have a peer review and dispute resolution process with its neighboring region(s)/area(s) to ensure a mutually acceptable Tv.</p> <p>Additionally, Section 1.1 suggest s the need for a demonstrated process to “. . . identify and document which facilities (or groups of facilities) in the reliability authority’s reliability area are subject to interconnection reliability operating limits.” The mechanism to determine this critical element of the definition cannot be left open-ended. Without a recognized and accepted process, significant inconsistencies will result throughout the interconnections.</p>
<p>Thirty minutes is not a 'perfect' Tv for all IROLs. Not all IROLs are the same and the risk associated with exceeding IROLs for a pre-determined period of time is not the same for all IROLs. This standard allows each RA to establish a Tv that is appropriate for each of its IROLs.</p>	
<p>The standard was revised to place responsibility for this requirement on the reliability authority. The reliability authority may use whatever processes or tools it wants to use to determine an appropriate Tv for its IROLs. There is nothing in this standard that would preclude an RA from establishing '30-minutes' as a Tv for all of its IROLs. However, industry comments have indicated a preference for allowing unique Tv,s for IROLs because this is less prohibitive to energy markets and may also be a better protector of reliability. There may be technical reasons for establishing Tv at a value other than 30 minutes.</p>	
<p>IROLs are a subset of System Operating Limits and must be developed following a standard methodology as required in the Determine Facility Ratings Standard. Peer review is not currently a requirement in the development of system operating limits.</p>	

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

<p>Stuart Goza TVA #1</p>	<p>The statements in sections 1.1.1 and 1.1.2 imply that the Planning Authority Area is the same size as the Reliability Authority Area. Entities that perform planning authority functions may not cover the same geographical area as their respective reliability authorities. The statements should be changed as follows: “The reliability authority and planning authority(ies) shall...”</p> <p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. This Standard could be improved by formatting (where possible) Measurement 2.1 to relate to Requirement 1.1 and Measurement 2.2 to relate to Requirement 1.2, etc. rather than listing the measures and requirements arbitrarily and independently. In order to tie the OEC’s to the Measures, Section 4 should be clarified to read:</p> <p>4.3. The entity responsible shall have the following Objective Evidence for Compliance available upon the request of its compliance monitor:</p> <ul style="list-style-type: none"> <li>4.3.1. List of interconnection reliability operating limits for the reliability authority’s reliability area <b>as described in Measure 2.1 above</b></li> <li>4.3.2. List of facilities (or groups of facilities) in the reliability authority’s reliability area that are subject to interconnection reliability operating limits <b>as described in Measure 2.2 above</b></li> </ul>
<p><b>The standard was revised to indicate that the reliability authority is the only function that must comply with this requirement. The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</b></p>	
<p><u>NPCC CP9</u>  Michael Schiavone National Grid USA #1  Roger Champagne Hydro-Quebec TransEnergie #1  Ralph Rufrano New York Power Authority #1  David Little Nova Scotia Power Inc. #1  David Kiguel Hydro One Networks #1  Michael Potishnak ISO-New England #2  Barry Gee National Grid USA #1  Dan Stosick ISO-New England #2  Fernando Saavedra ISO-New England #2  Greg Campoli New York ISO #2</p>	<p>IROL will not always be known ahead of time. An unusual combination of events could create an IROL type event that was unplanned for. Some of the IROL may be time variant so the Compliance Monitoring Process section needs to address this.</p> <p>Regarding levels of compliance it is suggested that less severe levels of non-compliance be associated with incompleteness or inaccuracy of the list. NPCC suggests that compliance with only IROLs for planned system conditions be the requirement.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

<b>The standard was revised to reflect these suggestions.</b>	
<p><u>Southern Co Transmission Planning #1</u>          Todd Lucas Southern Co          Joe Payne Mississippi Power Company          Travis Koval Southern Co          Bill Pope Gulf Power Company          John Clark Southern Co          David Johnson Savannah Electric          Mike Miller Southern Co          Jim Griffith Southern Co          Monroe Landrum Southern Co</p>	<p>Should Transmission Owner be added to this?</p>
<b>Under the Functional Model, the Transmission Owner is responsible for developing Facility Ratings – and the Reliability Authority has responsibility for establishing reliability limits (System Operating Limits and IROLs). In establishing the reliability limits, the RA must respect the facility ratings established by the Transmission Owner.</b>	
<p>Charles Yeung Reliant #5</p>	<p>It is unclear what a “responsible entity” is. Why are the functional model “functions” not specifically referenced in the “Measures” and “Compliance Monitoring Process” sections? Specific functions should be identified to eliminate conflict and dispute</p>
<b>The standard was revised to indicate that the reliability authority is the only entity responsible for this requirement. There are places in this standard where the term, ‘entity responsible’ is used. In these cases, more than one entity may be responsible for complying with the requirement – and a decision was made that the standard would be less cumbersome to read if the term, ‘the entity responsible’ was used rather than listing all the entities that must comply.</b>	
<p>Terry Bilke Midwest ISO #2</p>	<p>Who is ‘the entity responsible’?          It would be preferable to have limits populated in a common database available to all reliability entities so that there’s no miscommunication of limits between PA, TO and RA or misunderstanding of one RA’s impact on another. Also, the RA wouldn’t be hit with a level 4 compliance violation for failing to produce a piece of paper during a site visit.          The Planning Authority is to provide limits used by the RA. The posted functional model has no details on the planning authority. Perhaps the standard should say, the planning authority and/or Transmission Operator.</p>
<b>The standard was revised to indicate that the reliability authority is the only entity responsible for this requirement. There are places in this standard where the term, ‘entity responsible’ is used. **Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

<p>Bill Thompson Dominion Trans #1</p>	<p>Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s), RA, PA(s), TSP, and TOP(s), and recommend all functional entities be identified in Standard 201 part 1.1 and 1.2.</p> <p>What happens if you identify another (unexpected) limit during real-time that is not on the list? Are you not responsible for this case as well? We all know that planning studies cannot predict all the challenges that are faced in real-time.</p> <p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. This Standard could be improved by formatting (where possible) Measurement 2.1 to relate to Requirement 1.1 and Measurement 2.2 to relate to Requirement 1.2, etc. rather than listing the measures and requirements arbitrarily and independently.</p> <p>In order to tie the OEC's to the Measures, Section 4 should be clarified to read:</p> <p>4.3. The entity responsible shall have the following Objective Evidence for Compliance available upon the request of its compliance monitor:</p> <p>4.3.1. List of interconnection reliability operating limits for the reliability authority's reliability area as described in Measure 2.1 above</p> <p>4.3.2. List of facilities (or groups of facilities) in the reliability authority's reliability area that are subject to interconnection reliability operating limits as described in Measure 2.2 above</p>
<p>The standard was revised to indicate that the reliability authority is the only function that must comply with this requirement. Under the Functional Model, each major activity must be assigned to just one function – and the functional model assigns responsibility for establishing reliability –related limits to the Reliability Authority. This does not preclude the RA from working with other entities to develop these limits, and does not preclude the RA from having to respect the facility limits established by the facility owners (Generator Owners and Transmission Owners).</p> <p>The standard was revised to address the concern that limits will need to be changed as system conditions change.</p> <p>The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</p>	
<p>Gerald Rheault Manitoba Hydro #1, 3, 5, 6</p>	<p>Manitoba Hydro believes that it will be very difficult to identify the IROL subset from the SOLs determined for operation of the transmission facilities in the geographical footprint</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

	<p>for which the RA has operational responsibility. Any SOL provides protection for the worst contingency, so if the limit is respected, events such as system collapse, cascading loss of lines and other major events are extremely unlikely, unless there are multiple near-simultaneous contingencies. However, most system operating limits (SOL) could lead to significant system disturbances if they are exceeded by a large amount or exceeded for a significant period of time, or both. While any SOL will have been established such that the next contingency should not have any impacts if operation is within the SOL, operation outside of the SOL, accompanied by even one contingency, could lead to cascading loss of lines (thermal limits) or system instability (voltage or angular stability limits). It is Manitoba Hydro's belief that it is very difficult to identify such situations without exhaustive studies on very detailed models.</p> <p>The normal approach for developing system operating limits will likely incorporate some reliability margins for dealing with some of the lack of detail (for example, overcurrent protection is often not modelled, phase shifter action is assumed to occur without being studied at all possible positions) but, if system operation is to be investigated beyond such limits, small details become very important.</p> <p>It is important that NERC instill a culture of respect for limits of all types and values. There is a risk that a focus on the nebulous concept of an IROL will diffuse the respect for all other limits and the frustration of identifying such IROL's will further reduce the number classified as IROL's. NERC should clearly state how IROL's are to be identified and how NERC or the regions can address the other limits which may be important (among other things, the regional standards must either be developed through a separate standards process or flow from a NERC standard – the current proposal does not let the other limits flow from this standard).</p> <p>In item 201.2.1.1 the words at the end of this sentence (that does not already have a T<sub>v</sub>) should be removed.</p>
<p>The concept of identifying a subset of system operating limits that, if exceeded, could lead to 'evil things' is not new. The IRLs currently undergoing field testing are equivalent to the IROLs addressed in this requirement.</p> <p>Several months ago the SDT sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.</p> <p>The recommended change to 201.2.1.1 was made.</p>	
<p><u>FRCC Op, Eng &amp; Mkt Int</u> Linda Campbell FRCC #2 Paul Elwing Lakeland Electric # 3</p>	<p>In 1.2.1 of the requirement, T<sub>v</sub> is called a "response time", but on the definition page it is called a "violation time". Consistency is needed. We did not agree with the measures because the measures state "the entity responsible" which is not specific enough. Who</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

<p>John Shaffer FPL #1          Bob Remley Clay Elec Coop #4          Patti Metro FRCC #2          Eirc Grant Progress Energy – FL #1          Joe Roos Ocala Electric Utility #3          Joe Krupar FL Muni Pwr Agency #3          Richard Gilbert Lakeland Electric #3          7. Bill Slater Progress Energy – FL #1          Amy Long Lakeland Electric #1          Roger Westphal Gainesville Regional Util #5          Bob Goss SEPA #5          Steve Wallace Seminore Electric Coop #4          Ted Hobson JEA #1</p>	<p>is the entity responsible? We do not have any problems with the steps of the compliance monitoring process, but again, the phrase "the entity responsible" is used throughout and this should be more specific. We do agree with the intent of the non-compliance level listed in 5.4; however do have a concern that it presumes that all transmission systems will have an IROL. This may not be true for radial systems. Perhaps 5.4 could be reworded as follows, "No documented analysis of possible IROLs or list of facilities subject to IROLs for the RA's reliability area was provided. Finally, Section 6, Sanctions should be removed completely. The compliance monitoring process and non-compliance levels are appropriate parts of the reliability standard. However, the sanctions and penalties are part of the compliance program and are separate. The enforcement matrix should not be attached to this document, even for information only, as that gives the appearance of being part of the standard. The sanctions and penalties, along with the enforcement matrix are the responsibility of the new Compliance and Certification Committee (CCC). If the matrix is attached to the standard, every time the CCC changes it, the standard will need to be revised which is not something we should set ourselves up to do.</p>
<p>The mismatch between the language in the standard and the definition of <math>T_v</math> has been corrected.          The standard was revised to indicate that all of the measures in this requirement must be met by the reliability authority.          If an entity has no IROLs, then its list(s) will be empty.          The levels of non-compliance could not be changed as recommended because the standard does not require that the reliability authority document its analyses conducted to identify IROLs. The analyses conducted to identify IROLs may be done on an ongoing basis, and collecting this documentation would be cumbersome.          The enforcement matrix was attached at the recommendation of NERC's Vice President and Legal Counsel to ensure that reviewers understood the penalty structure.</p>	
<p>Dan Boezio &amp; Raj Rana AEP #1, 3, 5, 6</p>	<ol style="list-style-type: none"> <li>1. In 201.1.2.1 Consider: The Reliability Authority or Planning Authority shall establish a maximum response time (<math>T_v</math>) for all Interconnected Reliability Operating Limits.</li> <li>2. In 201.5.4 "States NO list of Interconnected Reliability Operating Limits or NO list of facilities ....." Should it be "Incomplete" lists?</li> <li>3. Defined terms should be capitalized, such as "Reliability Authority", "Interconnected Reliability Operating Limits", etc.</li> <li>4. Who is the ultimate arbiter of what is the "complete list" of facilities and limits? Should the RA and PA be required to have studies available that support their IROLs or is just having a list of facilities with associated limits enough? If having studies is to be required, then what is the penalty if studies show other facilities should have had an IROL but the RA or PA did not specify a limit for that facility? Is the real concern identifying what facilities have an IROL or is it that we want to ensure that the RA does not operate in violation of identified IROLs? This version of the Standard has requirements for both, but leaves a lot of unanswered</li> </ol>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard  
Requirement 201 – IROL Identification**

---

	<p>questions.</p> <p>5. 201.1.1: How will the Reliability Authority and Planning Authority identify and document the facilities subject to operating limits jointly? What is the course of action if there is disagreement? Which functional entity has the final say? We believe the Standard should specify only one entity to be ultimately responsible. For this requirement we suggest it should be the RA. Suggested rewording: “The Reliability Authority in coordination with the Planning Authority shall identify and document . . .”</p> <p>201.1.2: Suggested rewording: “The Reliability Authority in coordination with the Planning Authority shall identify . . .”</p> <p>201.1.2.1: Suggested rewording: “The Reliability Authority in coordination with the Planning Authority shall identify a maximum . . .”</p> <p>6. 201.4.2: We believe the performance-reset period should be 12 months from the date of the infraction not one calendar year.</p> <p>7. 201.5 Levels of Non-compliance: We disagree with the SDT’s perspective that there is no gray area where partial credit is appropriate. Requirement 201 is a documentation and communication requirement, The RA needs to have documented IROLs and have such documentation of limits available to the RA system operators. As such this requirement is similar to the communication requirements 602, 604, and 606 in the “Determine Facility Ratings, System Operating Limits, and Transfer Capabilities Standard.” In those requirements, it is proposed that there be multiple levels of non-compliance. We believe that is prudent and should be the case with this requirement too. As presently stated, if an RA has an incomplete list of IROLs or incomplete list of facilities requiring IROLs, he is still compliant. The RA is only non-compliant if they have “no list.” We believe this is too lenient. We suggest that the levels of non-compliance should address both completeness (all identified facilities have associated IROL and <math>T_v</math> value) and quality (all appropriate facilities have been identified and the limits and <math>T_v</math> values are reasonable).</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

<ol style="list-style-type: none"> <li>1. 201.1.2.1 was changed to: The reliability authority shall identify a T<sub>v</sub> for each interconnection reliability operating limit. This supports the intent of your recommended change, but also respects the comments of others who indicated the RA should be the only function assigned this responsibility.</li> <li>2. 201.5.4 was not changed to 'incomplete list' because this would be very difficult to measure objectively. Some entities have programs that run in real time to keep this list as up to date as possible, while other entities update the list through more manual processes. The standard was changed to require that the lists be updated and that entities have evidence that the lists were updated.</li> <li>3. The suggestion that defined terms be capitalized has been adopted and is reflected in the revised standard.</li> <li>4. The standard does not require that entities have a 'complete' list because this would be very difficult to measure. In addition, some entities have programs that run in real time to keep this list as up to date as possible, while other entities update the list through more manual processes. Requiring that analyses be documented could be unwieldy for entities that use automated processes.</li> <li>5. 201.1.1, 201.1.2, 201.1.2.1– The standard was revised to clarify that the Reliability Authority is the only function with responsibility for this requirement and its associated measures. The RA may work with other functions such as the Planning Authority in developing the limits, but the RA has ultimate responsibility for the limits being developed.</li> <li>6. There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation" This change supports your recommendation.</li> <li>7. The levels of non-compliance were adjusted to give partial credit for lists that were developed but hadn't been updated. Given the dynamic nature of IROLs, it would be very difficult to objectively measure 'incomplete' lists.</li> </ol>	
<p>Tom Pruitt Duke Power #1</p>	<p>Reword measures to state what is measured and to refer to the associated requirements. Section 201.5.3 should read "List exists, but is not complete or lacks technical merit (is not good utility practice)."</p>
<p>The suggested change was not made because determining whether a list is incomplete or lacks technical merit may be difficult or impossible to measure. The standard was modified to require that the lists be updated and to require that the RA have evidence that the lists were updated – and a level three non-compliance was added to give partial credit to RAs who have lists but haven't updated them. This may be equivalent to having an 'incomplete' list.</p>	
<p><u>Operating Reliability Working Group SPP</u>          Gerry Burrows KCP&amp;L #1          Bob Cochran SPS #1          Peter Kuebeck OG&amp;E #1          Scott Moore AEP #1          Tom Stuchlik Westar #1          Dan Boezio AEP #1          Matt Bordelon CLECO #1          Mike Crouch WFEC #1</p>	<ol style="list-style-type: none"> <li>1. It is very cumbersome and can often times be very confusing when two entities are given responsibility for the same task. The requirements outlined in 1.1, 1.2 and 1.1.2 call for both the reliability authority and the planning authority to identify the facilities that have IROLs and also to identify the IROL. We suggest that the reliability authority should be ultimately responsible for identifying and quantifying the IROLs since these are operating limits. However, the reliability authority should thoroughly coordinate this effort with the planning authority. Wording such as "The reliability authority shall coordinate with the planning authority to identify..." would be better. Following this line of thought with the measures in 2.1, 2.1.1 and 2.2, wording should be changed to reflect the reliability authority's ultimate responsibility.</li> </ol>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

<p>Mike Gammon KCP&amp;L #1          Kevin Goolsby SPP #2          Bo Jones Westar #1          Allen Klassen Westar #1          Thad Ness AEP #1          Harold Wyble KCP&amp;L #1          Robert Rhodes SPP #2</p>	<p>“The reliability authority entity shall establish...” makes a better fit.</p> <ol style="list-style-type: none"> <li>The performance reset period should be changed to 12 months rather than one calendar year.</li> <li>The SDT needs to revisit the levels of non-compliance associated with this standard. If compliance is truly a black/white issue with no shades of gray as the proposed levels indicate, why not have just a level one with no financial penalty? The proposed non-compliance level implies that it may be more important to have a list of IROLs rather than a correct list of IROLs. Also, if no IROLs exist, there will be no list which would cause the reliability authority to be in non-compliant. There needs to be consistency throughout all the standards on documentation-type non-compliance.</li> </ol>
<ol style="list-style-type: none"> <li>Several commenters indicated that the RA should be the only function responsible for this requirement, and that change was made to the standard. It is still unclear as to what duties, if any, will be assigned to the Planning Authority, and the SDT elected to omit specific references to the Planning Authority in this standard.</li> <li>There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: “12 months from the last violation” This change supports your recommendation.</li> <li>Several commenters indicated a need to add more levels of non-compliance, and to address ‘partial credit’ for incomplete lists. Consequently, the standard was modified to require that the lists be updated and to require that the RA have evidence that the lists were updated – and a level three non-compliance was added to give partial credit to RAs who have lists but haven’t updated them. This may be equivalent to having an ‘incomplete’ list. With respect to the appropriateness of levels of non-compliance for documentation - the SDT is only working on this standard, and doesn’t have the authority to control what is included in other standards.</li> </ol>	
<p><u>Southern Co Transmission Planning</u>          Todd Lucas Southern Co #1          Joe Payne Mississippi Pwr Co #3          Travis Koval Southern Co #1          Bill Pope Gulf Pwr Co #3          John Clark Southern Co #1          David Johnson Savannah Electric #3</p>	<p>The Transmission Owner should be added to this requirement if they can be held liable for violating IROL's.</p>
<p>The Transmission Owner is responsible for establishing facility ratings for its facilities – and that is addressed in the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard. The reliability authority is the only function responsible for Requirement 201.</p>	
<p><u>MAAP Ops Subcommittee #2</u>          Llyod Linke MAPP          Allan Silk Manitoba Hydro          Paul Brune NPPD          Tod Gosnell Omaha Public Pwr Dist          Paul Koskela Minnesota Pwr</p>	<p>The requirement to produce a list of IROLs must include the notion that if the failure to identify an existing IROL results in the system experiencing cascading outages, instability, or uncontrolled separation - a consequence occurs. The requirement, as written, provides no monitoring or non-compliance provisions for the failure to properly identify an IROL – an entity is compliant if they have a list of one IROL – even if in the last year they caused multiple bulk reliability catastrophes due to not identifying other IROLs on their system.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

<p>Larry Larson Otter Tail Power  Derrick Moe WAPA  Dick Pursley Great River Energy  Martin Trencle Xcel Energy  Joseph Knight MAPPCOR</p>	<p>The order of 2.1 and 2.2 should be swapped to agree with 1.1 and 1.2 order.</p>
<p>These new standards are being developed so that there should be only a single sanction for a single infraction. If an entity violates an IROL for time greater than the IROL's <math>T_v</math>, then that entity will be sanctioned for that infraction under requirement 204. Requirement 201 was revised to indicate that the lists must be updated, and an additional level of non-compliance was added to address situations where entities do not update their lists. It would be very difficult for a compliance monitor to make judgements about the technical accuracy or completeness of any entity's lists.</p> <p>The recommended reorganization of the measures was adopted and is reflected in the revised standard.</p>	
<p><u>BPA Adm TBL #1</u>  James Murphy Mike Viles  James Randall Al Johnson  Jeff Newby Jim Gronquist  Sylvia Wiggerhaus Brian Tuck  Dick Spence Tracy Rolstad  Steve Hitchens</p>	<p>Should remove planning authority to obtain a single point of responsibility. Also, Remove maximum response time and use just <math>T_v</math>, this will apply to the entire definition associated with <math>T_v</math>.</p>
<p>Both of the recommended changes were adopted and are reflected in the revised standard.</p>	
<p>Darrell Richardson Illinois Power #1, 3</p>	<p>We agree with the current list but wonder if their should be a category for an "incomplete list".</p>
<p>Several commenters indicated a need to add more levels of non-compliance, and to address 'partial credit' for incomplete lists. Consequently, the standard was modified to require that the lists be updated and to require that the RA have evidence that the lists were updated – and a level three non-compliance was added to give partial credit to RAs who have lists but haven't updated them. This may be equivalent to having an 'incomplete' list.</p>	
<p>Ed Davis Entergy Services #1</p>	<p>Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO, RA, PA, TSP, and TOP, and recommend all functional entities be identified in Standard 201 part 1.1 and 1.2.</p> <p>Standard 201 part 1.2.1 should have the "RA or PA" replaced with the "Transmission Owner or Transmission Operator" as the functional entities responsible for establishing the maximum response time (<math>T_v</math>) for any IROL that does not already have one.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

	<p>In the measures sections 2.1 and 2.2, replace the “entity responsible” with the “TO, RA, PA, TSP, and TOP” as the entities establishing a list of IROLs.</p> <p>Measures section 2.1.1 should have the “entity responsible” replaced with the “TO” being responsible for establishing the maximum value of Tv.</p> <p>In the Compliance Monitoring Process section, the “entity responsible” should be replaced with the “Transmission Owner” in each occurrence of that term.</p>
<p>The Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard addresses the development of both facility ratings and system operating limits. That standard requires that the equipment owners establish facility ratings, and that the facility ratings be respected in the development of system operating limits.</p> <p>The Functional Model assigns responsibility for establishing facility ratings to equipment owners (Generator Owners and Transmission Owners) – and assigns the responsibility for establishing reliability limits to the RA and limits associated with local networks to the TOP.</p> <p>The Functional Model does not preclude the delegation of activities from the RA to other functions. However, the Functional Model is built on the assumption that there is one function with ultimate responsibility for each reliability-related activity, and the Functional Model assigns the RA the responsibility for establishing reliability limits. The RA can delegate this responsibility to TOPs, but even if the RA delegates this responsibility, the RA would be held responsible for compliance with the requirement. The SDT was also concerned about completely removing the requirements for the TOP, and sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.</p>

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. This Standard could be improved by formatting (where possible) Measurement 2.1 to relate to Requirement 1.1 and Measurement 2.2 to relate to Requirement 1.2, etc. rather than listing the measures and requirements arbitrarily and independently.</li> <li>11. In order to tie the OEC’s to the Measures, Section 4 should be clarified to read:</li> <li>12. The entity responsible shall have the following Objective Evidence for Compliance available upon the request of its compliance monitor:</li> <li>13. List of interconnection reliability operating limits for the reliability authority’s reliability area <b>as described in Measure 2.1 above</b></li> </ol>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification**

	<p><b>14.</b> 4.3.2. List of facilities (or groups of facilities) in the reliability authority's reliability area that are subject to interconnection reliability operating limits <b>as described in Measure 2.2 above</b></p>
<p>The standard was revised to indicate that the lists must be updated, but the standard does not include a provision for the compliance monitor to assess the 'quality' of the lists. Some IROLs are updated through studies, and others are updated as operating conditions change on a minute-to-minute basis.</p> <p>The reliability authority establishes the T<sub>v</sub> component of the IROL. The standard was revised to state this more clearly.</p> <p>The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</p>	
<p>Alan Johnson Mirant Americas Energy Mktg #6</p>	<p>Don't understand why the standard references the Planning Authority and "entity responsible. Isn't the Reliability Authority the function ultimately responsible for determining IROLs?</p> <p>Also believe that section 1.2.1 should be revised to read: "The reliability authority shall identify a maximum response time (T<sub>v</sub>) for all interconnection reliability operating limits within its reliability area." Regarding the levels of non-compliance, believe there should be a level (level 3?) for a partial list of IROLs.</p>
<p>The standard was revised to clearly indicate that the reliability authority is the only function with responsibility for this requirement.</p> <p>Requirement 1.2.1 was revised as follows: The reliability authority shall identify a T<sub>v</sub> for each interconnection reliability operating limit. Several commenters indicated that including "T<sub>v</sub>" and the phrase, "maximum response time" was redundant.</p> <p>Several commenters indicated a need to add more levels of non-compliance, and to address 'partial credit' for incomplete lists. Consequently, the standard was modified to require that the lists be updated and to require that the RA have evidence that the lists were updated – and a level three non-compliance was added to give partial credit to RAs who have lists but haven't updated them. This may be equivalent to having an 'incomplete' list.</p>	
<p><u>Southern Company Generation &amp; Energy Mktg</u>          Roman Carter # 5, 6          Joel Dison #5,6          Tony Reed #5,6          Lucius Burris #5,6          David Deerman #5,6          Clifford Shepard #5,6          Michael Smith #5,6</p>	<p>The Transmission Owner should be added to 201 1.1.1 and 201 1.2.1.</p>

<p>Lloyd Barnes SCGEM 5,6          Gary Miller SCGEM 5,6          Terry Crawley Southern Generation 5          Roger Green Southern Generation 5</p>	
<p>The Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard addresses the development of both facility ratings and system operating limits. That standard requires that the equipment owners establish facility ratings, and that the facility ratings be respected in the development of system operating limits.</p> <p>The Functional Model assigns responsibility for establishing facility ratings with equipment owners (Generator Owners and Transmission Owners) – and assigns the responsibility for establishing reliability limits to the RA and limits associated with local networks to the TOP.</p> <p>The Functional Model does not preclude the delegation of activities from the RA to other functions. However, the Functional Model is built on the assumption that there is one function with ultimate responsibility for each reliability-related activity, and the Functional Model assigns the RA the responsibility for establishing reliability limits. The RA can delegate this responsibility to TOPs, but even if the RA delegates this responsibility, the RA would be held responsible for compliance with the requirement. The SDT was also concerned about completely removing the requirements for the TOP, and sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.</p>	
<p>Kathleen Goodman ISO-NE #2</p>	<p>ISO New England does not believe that we should identify specific limits which must be reported on. Rather, we advocate internally reporting on every violation which does not clear within 30 minutes (as defined in NERC policy). Subsequently, each reported violation will be studied/examined to see if it would have caused instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk power transmission system (have an Inter-Area impact outside of the New England Area following next contingency). If so, ISO New England would report this "OSL violation" to NPCC and NERC within 72 hours. If there would not have been an Inter-Area impact (i.e. the impact would have been localized within the offending Control Area's boundary), no external reporting will occur. We suggest this approach be adopted.</p> <p>By restricting reporting to pre-identified limits, NERC may not be getting the information they seek through this Standard. Only through a post-operational assessment, can a true analysis (with the correct system configuration) be performed and an adequate judgement be made on the potential impact to the bulk power system.</p> <p>We also believe that data should not be archived unless the limit is not cleared within 30 minutes. We do not advocate archiving data for every limit violation if it cleared in less than 30 minutes.</p>

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 201 – IROL Identification

---

This standard is based on the assumption that while all system operating limits are important, a subset of limits is most critical to the reliability of the interconnection, and exceeding these limits could lead to voltage instability, cascading outages, or uncontrolled separation. By identifying these limits in advance, system operators can pay extra attention to these limits, and can be better prepared to take (or direct) actions to prevent and mitigate instances of exceeding these limits. Some of these limits really shouldn't be exceeded for 30 minutes – and that is one of the reasons why the industry supported modifying the language that is in current Operating Policy, and allowing each RA to establish a  $T_v$  that is most appropriate to each limit.

The decision on whether or not to report an instance of exceeding an IROL is based on the length of time the IROL was exceeded. Lists of IROLs are not expected to remain static – these must be updated to conform with changes to the system.

This requirement is addressing the identification of IROLs and doesn't have anything to do with real-time performance in exceeding one of those IROLs. When an IROL is exceeded, the documentation required is that which is typically found on the system operations log, and shouldn't require any additional effort to develop. Many entities keep operations logs for an indefinite period of time – and this standard requires keeping the data for just 3 years to ensure that there is some data on site when the Compliance Monitor conducts a scheduled audit once every 3 years.

<u>Compliance Subcommittee</u>			Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion. Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation of complaint) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor. Re-number 4.2 and 4.3 to 4.3 and 4.4
<p>The suggested language changes were not adopted for the following reasons.</p> <ul style="list-style-type: none"> <li>- "Information submittal" is an undefined term. Industry commenters have asked that the compliance elements be as specific as possible so that there won't be huge variations from region to region in the application of the compliance monitoring. If an 'information submittal' is the same as a self-certification document, then this is already covered in the original language. Including language that gives each compliance monitor the flexibility to assess this requirement however it chooses, does not conform with the industry's requests for standardization in the compliance monitoring process.</li> </ul> <p>The only significant change between the original language and the proposed new section 4.2 is the addition of the concept that the compliance monitor has the freedom to either conduct an audit per a schedule, or just show up unscheduled. Again, this does not support the industry's request for increased standardization in the compliance monitoring process. The original language included the option of conducting an 'investigation upon compliant' and this seems more appropriate than unscheduled audits.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 202 - Monitoring**

**Requirement 202 - Monitoring –Other comments**

**Summary Consideration:** While there were many comments recommending specific changes, most commenters indicated support of the requirement, its measures, the compliance monitoring process and the levels of non-compliance. The following changes were made to further improve the level of consensus on this requirement:

- The requirement was re-phrased to clarify that the RA is not operating its reliability area.
- The compliance monitoring process was modified to change the performance reset period to ‘12 months from the last violation’. The compliance monitoring process was also revised to eliminate references to ‘displays’. New language was added to indicate that compliance could be demonstrated by having system operators actively monitoring and comparing real-time system operating parameters associated with interconnection reliability operating limits

The SDT was unable to accommodate the changes recommending that the Transmission Owner and Transmission Operator be added to this requirement. The Functional Model assigns responsibility for establishing reliability limits to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The SDT was also concerned about completely removing the requirements for the TOP, and sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.

Commenter	Comments
Ron Falsetti IMO #2	The term, “real-time” as used in the above {The RA shall monitor real-time system operating parameters to . . . } lacks clarity in defining how well the RA monitors data (ie how often – every 2 sec; 10 seconds, etc). As an example a RA may sample data instantly (real time), but only monitor once every 30 minutes. It is IMO’s view, such sampling frequency satisfies the above measures, however, its adequacy for maintaining reliability must be questioned.
The term, ‘real time monitoring’ was included in the list of defined terms. Several commenters suggested changes to the draft definition, and the revised definition is as follows: “The act of scanning data and drawing conclusions about what the data indicates.” The definition of real time indicates that the associated activity is occurring in the present time period. Specifying a periodicity for monitoring seems to indicate that the monitoring doesn’t need to take place on a continuous basis – and that is not what was intended.	
Stuart Goza TVA #1	It appears from the wording of this draft standard Section 202 Monitoring, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded: <div style="margin-left: 40px;">1.1. The reliability authority shall monitor real-time system operating parameters to determine if the reliability area is operating within its interconnection reliability operating limits.</div> <p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 202 - Monitoring**

	<p>Section 4.3.1 is too specific for the measures it supports. It may be a practical solution that the real-time data and interconnection reliability operating limits be made available to operators in the form of a “display”, however this solution is not prescribed in the measures and should not be listed exclusively.</p> <p>Suggest that section 4.3.1 be rewritten to read:</p> <p style="color: red;">4.3.1. Process used for monitoring and comparing real time data associated with interconnection reliability operating limits in accordance with Measure 2.3 above. This may be accomplished through the use of an operator display and should demonstrate compliance with Measures 2.1 and 2.2.</p>
<p>The requirement was modified to more accurately reflect that the RA is not operating its reliability area.</p> <p>The process used to determine if an IROL is being approached or exceeded should be addressed in the RA Certification standard. This requirement is focused on whether the system operators are actively monitoring, and the ability of the compliance monitor to assess this. If the system operator is actively monitoring, that system operator can tell, in his or her own words, whether any IROLs are being approached or exceeded. If the system operator can't answer this question, then that system operator has not been actively monitoring as required. Section 4.3.1 was modified to read as follows: “System operators actively monitoring and comparing real-time system operating parameters associated with interconnection reliability operating limits.”</p>	
<p><u>Southern Co Transmission Planning #1</u>          Todd Lucas Southern Co          Joe Payne Mississippi Power Company          Travis Koval Southern Co          Bill Pope Gulf Power Company          John Clark Southern Co          David Johnson Savannah Electric          Mike Miller Southern Co          Jim Griffith Southern Co          Monroe Landrum Southern Co</p>	<p>The Transmission Operator should also be included in this requirement for "the areas for which they are responsible".</p>
<p>Under the Functional Model, the TOP does monitor some limits, but not IROLs. While the RA may delegate responsibility for monitoring IROLs to its TOPs, the RA would still be held accountable for compliance with this requirement. Under the Functional Model, only one function is ultimately responsible for each major activity – and the Functional Model assigns the monitoring of system reliability limits to the RA, not the TOP.</p>	
<p>Terry Bilke Midwest ISO #2</p>	<p>TO's should also be monitoring this.          What if other authorities refuse to provide data or provide corrupt data to the RA? It appears the RA is accountable, which doesn't seem appropriate.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard  
Requirement 202 - Monitoring**

<p>Under the Functional Model, the TOP does monitor some limits, but not IROLs. While the RA may delegate responsibility for monitoring IROLs to its TOPs, the RA would still be held accountable for compliance with this requirement. Under the Functional Model, only one function is ultimately responsible for each major activity – and the Functional Model assigns the monitoring of system reliability limits to the RA, not the TOP.</p>	
<p>Charles Yeung Reliant #5</p>	<p>Please consider having compliance levels 1 thru 3 for this Requirement. It may be beneficial for reliability to progressively measure adherence to the Requirements for situations where a RA is implementing a phased in start up of operations or transition from existing systems to new systems.</p>
<p>For an entity to obtain RA certification, that entity must have a process in place for monitoring system parameters. These standards are being written for entities that are RAs, and there should not be a phase-in. If an entity wants to operate as an RA, then that entity must be prepared to monitor and assess system conditions. A phase-in will be recommended for the initial implementation of this standard, to give entities time to come into compliance with the new requirements and associated measures.</p>	
<p>Susan Morris SERC #2 Bill Reinke SERC #2 Sam Stryker Fayettevill PWC #3, 4, 5 Carter Edge SEPA #4, 5 Bill Thompson Dominion Trans #1</p>	<p>Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s) and RA. Therefore, we suggest that every occurrence of the term “reliability authority” in all of this section 202 be replaced with “reliability authority and transmission owner(s)”.</p> <p>It should also be acknowledged that entities such as the RA and the TO(s) may delegate their respective monitoring responsibilities to the TOP(s).</p> <p>In addition, it appears from the wording of this draft standard Section 202 Monitoring, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded: The reliability authority shall monitor real-time system operating parameters to determine if the reliability area is operating within its interconnection reliability operating limits.</p> <p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.</p> <p>Section 4.3.1 is too specific for the measures it supports. It may be a practical solution that the real-time data and interconnection reliability operating limits be made available to operators in the form of a “display”, however this solution is not prescribed in the measures and should not be listed exclusively.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 202 - Monitoring**

	<p>We suggest that section 4.3.1 be rewritten to read:</p> <p>Process used for monitoring and comparing real time data associated with interconnection reliability operating limits in accordance with Measure 2.3 above. This may be accomplished through the use of an operator display and should demonstrate compliance with Measures 2.1 and 2.2.</p>
<p>Under the Functional Model, the TOP does monitor some limits, but not IROLs. While the RA may delegate responsibility for monitoring IROLs to its TOPs, the RA would still be held accountable for compliance with this requirement. Under the Functional Model, only one function is ultimately responsible for each major activity – and the Functional Model assigns the monitoring of system reliability limits to the RA, not the TOP.</p> <p>The wording of the requirement was modified as suggested to clarify that the RA is not operating its reliability area.</p> <p>The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</p>	
<p>Gerald Rheault Manitoba Hydro #1, 3, 5, 6</p>	<p>In 202.4.3.1, what is meant by a display ? How does one make a display available.</p>
<p>The reference to a display was dropped from the revised standard.</p>	
<p>FRCC Op, Eng &amp; Mkt Int  Linda Campbell FRCC #2  Paul Elwing Lakeland Electric #3  John Shaffer FPL #1  Bob Remley Clay Elec Coop #4  Patti Metro FRCC #2  Eirc Grant Progress Energy – FL #1  Joe Roos Ocala Electric Utility #3  Joe Krupar FL Muni Pwr Agency #3  Richard Gilbert Lakeland Electric #3  Bill Slater Progress Energy – FL #1  Amy Long Lakeland Electric #1  Roger Westphal Gainesville Regional Util #5  Bob Goss SEPA #5  Steve Wallace Seminore Electric Coop #4</p>	<p>Measure 2.3 needs to be clarified to state "The RA shall monitor real-time system operating parameters.." rather than just system operating parameters.</p> <p>We have the same concern that we identified in the comments to Requirement 201 regarding 5.4, the level of non-compliance. <i>(We do agree with the intent of the non-compliance level listed in 5.4; however do have a concern that it presumes that all transmission systems will have an IROL. This may not be true for radial systems. Perhaps 5.4 could be reworded as follows, "No documented analysis of possible IROLs or list of facilities subject to IROLs for the RA's reliability area was provided.)</i></p> <p>Section 6, Sanctions should be removed completely. The compliance monitoring process and non-compliance levels are appropriate parts of the reliability standard. However, the sanctions and penalties are part of the compliance program and are separate. The enforcement matrix should not be attached to this document, even for information only, as that gives the appearance of being part of the standard. The sanctions and penalties, along with the enforcement matrix are the responsibility of the new Compliance and Certification Committee (CCC). If the matrix is attached to the standard, every time the CCC changes it, the standard will need to be revised which is not something we should set ourselves up to do.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 202 - Monitoring**

Ted Hobson JEA #1	
<p>The term, 'real time' was added to measure 2.3 as suggested.          If an entity has no IROLs, then the list will be empty.          The enforcement matrix was attached at the recommendation of NERC's Vice President and Legal Counsel to ensure that reviewers understood the penalty structure.</p>	
Alan Boesch NPPD #1	<p>Step 4.3.1 appears to assume that the RA will use computer displays for real time data. What if some other method that works equally as well is used. As written this is a "how" statement. I would suggest that the statement be "Provide evidence of tools used to monitor real time data".</p>
<p>The reference to a display was dropped from the revised standard.</p>	
Dan Boezio & Raj Rana AEP #1, 3, 5, 6	<p>For clarity consider rewording 202.1.1 as "The Reliability Authority shall perform Real-time Monitoring of applicable operating parameters to determine if....."          Defined terms should be capitalized, such as "Reliability Authority", "Interconnected Reliability Operating Limits", etc.          202.4.2: The performance reset period should be 12 months from the time of the infraction not one calendar year.          Suggest combining 202.4.3 and 202.4.3.1 and rewording as: "The Reliability Authority shall have display(s) with real time data associated with interconnection reliability operating limits.</p>
<p>The requirement was modified to read, "The RA shall perform real-time monitoring of system operating parameters . . ." Adding the adjective, "applicable" would not add any clarity to the standard and was not adopted.</p>	
<p>The suggested forat change of capitalizing defined terms has been adopted and is reflected in the revised standard.</p>	
<p>There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation" This change supports your recommendation.</p>	
<p>References to displays were dropped from this standard since, under some conditions, the RA may not have displays available. The intent is for the RA to demonstrate that it is performing monitoring; therefore the revised wording for 4.3 meets this requirement. In addition, the RA must demonstrate that it has tools needed for monitoring as part of the RA Certification.</p>	
<p><u>Operating Reliability Working Group SPP</u>          Gerry Burrows KCP&amp;L #1          Bob Cochran SPS #1          Peter Kuebeck OG&amp;E #1          Scott Moore AEP #1          Tom Stuchlik Westar #1          Dan Boezio AEP #1</p>	<p>Combine 4.3 and 4.3.1 into a revised 4.3 as follows:          "The reliability authority shall have displays with real-time data associated with interconnection reliability operating limits."          The performance reset period should be changed to 12 months rather than one calendar year.          Again the issue of degrees of non-compliance surfaces. Are there shades of gray with non-compliance for this standard or is it strictly a black and white issue? Why jump</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 202 - Monitoring**

<p>Matt Bordelon CLECO #1  Mike Crouch WFEC #1  Mike Gammon KCP&amp;L #1  Kevin Goolsby SPP #2  Bo Jones Westar #1  Allen Klassen Westar #1  Thad Ness AEP #1  Harold Wyble KCP&amp;L #1  Robert Rhodes SPP #2</p>	<p>directly to level four non-compliance? Is progressive non-compliance not an option? For example, if a reliability authority had identified 25 IROLs, he is level four non-compliant if only one of the IROLs is not available for real-time use. Shouldn't there be allowances for such situations? Also, perhaps a letter that lists critical displays and identifies discrepancies would be more beneficial to maintaining interconnection reliability than a monetary penalty.</p>
<p>There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation" This change supports your recommendation.</p> <p>References to displays were dropped from this standard since, under some conditions, the RA may not have displays available. The intent is for the RA to demonstrate that it is performing monitoring; therefore the revised wording for 4.3 meets this requirement. In addition, the RA must demonstrate that it has tools needed for monitoring as part of the RA Certification.</p> <p>100 of the 132 commenters were in favor of the proposed levels of non-compliance.</p>	
<p><u>Southern Co Transmission Planning</u>  Todd Lucas Southern Co #1  Joe Payne Mississippi Pwr Co #3  Travis Koval Southern Co #1  Bill Pope Gulf Pwr Co #3  John Clark Southern Co #1  David Johnson Savannah Electric #3</p>	<p>The Transmission Operator should also be included in this requirement for "the areas for which they are responsible".</p>
<p>Under the Functional Model, the TOP does monitor some limits, but not IROLs. While the RA may delegate responsibility for monitoring IROLs to its TOPs, the RA would still be held accountable for compliance with this requirement. Under the Functional Model, only one function is ultimately responsible for each major activity – and the Functional Model assigns the monitoring of system reliability limits to the RA, not the TOP.</p>	
<p>Ed Davis Entergy Services #1</p>	<p>Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO and RA. Therefore, we suggest that every occurrence of the term "reliability authority" in all of this section 202 be replaced with "reliability authority and transmission owner".</p> <p>In addition, it appears from the wording of this draft standard Section 202 Monitoring, 1.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 202 - Monitoring**

	<p>Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded: The reliability authority shall monitor real-time system operating parameters to determine if the reliability area is operating within its interconnection reliability operating limits.</p>
<p>Under the Functional Model, the TOW does not monitor limits. While the RA may delegate responsibility for monitoring IROLs to other functions, the RA would still be held accountable for compliance with this requirement. Under the Functional Model, only one function is ultimately responsible for each major activity – and the Functional Model assigns the monitoring of system reliability limits to the RA, not the TOW.</p> <p>The wording of the requirement was modified as suggested to clarify that the RA is not operating its reliability area.</p>

In addition, the RA must demonstrate that it has tools needed for monitoring as part of the RA Certification.</p>	
<p>Alan Johnson Mirant Americas Energy Mktg #6</p>	<p>Regarding compliance monitoring, suggest that section 4.3.2 be added to allow compliance monitor inspection of RA audited limit data. With respect to levels of non-compliance, seems that items 5.4.2 and 5.4.3 should have some sort of time boundaries</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 202 - Monitoring**

	associated with them before sanctions can be assessed. For example, is the sanction the same regardless of whether real-time data is unavailable for 5 minutes or 5 days?
<p>The compliance monitor assembles the audit data and therefore has unlimited access to the data.</p> <p>The standard was revised to clarify that real time data may be obtained from manual collection as well as from automated sources. This change was made to prevent automatic penalties for telemetry failures. Under the revised standard, the RA's data specification must address how data will be provided when there is loss of automated systems.</p>	
<p><u>Southern Company Generation &amp; Energy Mktg</u>          Roman Carter # 5, 6          Joel Dison #5,6          Tony Reed #5,6          Lucius Burris #5,6          David Deerman #5,6          Clifford Shepard #5,6          Michael Smith #5,6          Lloyd Barnes SCGEM 5,6          Gary Miller SCGEM 5,6          Terry Crawley Southern Generation 5          Roger Green Southern Generation 5</p>	<p>Transmission Operator should be added to 202 1.1.1</p>
<p>Under the Functional Model, the TOP does monitor some limits, but not IROLs. While the RA may delegate responsibility for monitoring IROLs to its TOPs, the RA would still be held accountable for compliance with this requirement. Under the Functional Model, only one function is ultimately responsible for each major activity – and the Functional Model assigns the monitoring of system reliability limits to the RA, not the TOP.</p>	
<p><u>Kathleen Goodman ISO-NE #2</u></p>	<p>ISO-NE believes that, as stated above, data should not be archived unless the limit is not cleared within 30 minutes. Additionally, we suggest the data retention requirement of three years be modified to a 12-month rolling retention.</p>
<p>When an IROL is exceeded, the documentation required is that which is typically found on the system operations log, and shouldn't require any additional effort to develop. Many entities keep operations logs for an indefinite period of time – and this standard requires keeping the data for just 3 years to ensure that there is some data on site when the Compliance Monitor conducts a scheduled audit once every 3 years.</p>

Darrell Richardson	Illinois Power #1, 3	x	
David Thorne	Pepco #1	x	
Tony Jankowski	We Energies #4		x 4.2 Not sure how the matrix resets daily?
The standard was modified so that the reset period is 12 months from the time of violation.			
<u>Compliance Subcommittee</u>			Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion. Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation of complaint) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor. Re-number 4.2 and 4.3 to 4.3 and 4.4
<p>The suggested language changes were not adopted for the following reasons.</p> <ul style="list-style-type: none"> <li>- "Information submittal" is an undefined term. Industry commenters have asked that the compliance elements be as specific as possible so that there won't be huge variations from region to region in the application of the compliance monitoring. If an 'information submittal' is the same as a self-certification document, then this is already covered in the original language. Including language that gives each compliance monitor the flexibility to assess this requirement however it chooses, does not conform with the industry's requests for standardization in the compliance monitoring process.</li> </ul> <p>The only significant change between the original language and the proposed new section 4.2 is the addition of the concept that the compliance monitor has the freedom to either conduct an audit per a schedule, or just show up unscheduled. Again, this does not support the industry's request for increased standardization in the compliance monitoring process. The original language included the option of conducting an 'investigation upon compliant' and this seems more appropriate than unscheduled audits.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 203 - Analyses**

**Requirement 203 - Analyses and Assessments - Other comments?**

**Summary Consideration:** While there were many comments recommending specific changes, most commenters indicated support of the requirement, and its measures. There were several suggestions for changing the compliance monitoring process and the levels of non-compliance so they better align with the measures and so the levels of non-compliance eliminate sanctions for the temporary loss of telemetry.

The following changes were made to further improve the level of consensus on this requirement:

- The requirement and measures were modified to clarify that the RA is not ‘operating’ its reliability area but instead is monitoring it.
- The compliance monitoring process was modified to change the performance reset period to ‘12 months from the last violation’.
- The compliance monitoring process was also modified to eliminate the need to demonstrate the ability to conduct operational planning analyses and real time assessments – and to add language to indicate that the RA needs to be able to identify that it has conducted an operational planning analysis and real time assessments.
- Levels of non-compliance were adjusted to conform to the new language used to identify how the RA could demonstrate it is in compliance.

The SDT was unable to accommodate the changes recommending that the Transmission Owner and Transmission Operator be added to this requirement. The Functional Model assigns responsibility for monitoring operating reliability limits to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model.

Commenter	Comments
Terry Bilke Midwest ISO #2	<p>There can be up to 365 of both “real time assessment’ and ‘planning analysis’ violations in a year. Although it’s not likely many will occur, probably every RA will have occurrences of data transmission problems or EMS outages of 30 minutes in a year. Keep in mind the RA relies on data provided by others.</p> <p>Since this is self-reported, its akin to a person sending an annual letter to their state patrol telling them how many times they were speeding during the year so that they can receive back the proper number of tickets in the mail.</p> <p>To accrue a level 4 violation for each data hiccup or EMS outage doesn’t seem appropriate.</p>
	<p>There were several commenters who suggested changes to the performance reset period, and the standard was revised so that all requirements in this standard have the following language: “12 months from the last violation” This change supports your recommendation.</p> <p>Self-certification is just one method used to demonstrate compliance. The compliance monitor is also required to conduct an audit and may use investigations upon complaint to see if this requirement is being met.</p> <p>The language in the standard was revised so that there is not an automatic sanction for the temporary loss of data. Sanctions are tied to the inability to demonstrate that analyses and assessments were conducted.</p>
Ron Falsetti IMO #2	<p>The standard must provide a clear distinction between i) how often IROL’s are assessed, whether in real time or for operational planning analyses and ii) how quickly an IROL violation must be resolved. Requirement 1.2 “ . . . to verify that it is not</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard  
Requirement 203 - Analyses**

	<p>exceeding any interconnection reliability operating limits” can be, in IMO’s opinion, interrupted as to how quickly an IROL violation must be resolved . . . ie: each time it is detected in real-time, which shall be within 30 minutes or less in accordance with measure 2.1.2. This requirement belongs in section 201.</p>
<p>Requirement 202 requires that the RA perform real-time monitoring of system operating parameters to determine if its reliability area is operating within its interconnection reliability operating limits.</p> <p>Requirement 203 (this requirement) addresses the minimum frequency for conducting operational planning analyses and real time assessments to assess whether the planned bulk electric system operations within the reliability authority’s reliability area will exceed any of its interconnection reliability operating limits and to determine if the RA’s reliability area is exceeding any interconnection reliability operating limits or is expected to exceed any interconnection reliability operating limits</p> <p>Each IROL has an associated <math>T_v</math> – <math>T_v</math> represents the maximum time that an IROL can be exceeded without compliance sanctions being applied. This is addressed in Requirement 204 – Actions. The <math>T_v</math> is the element that determines how much time the RA has to resolve an IROL – and it is not necessarily 30 minutes.</p>	
<p>Stuart Goza TVA #1</p>	<p>It appears from the wording of this draft standard Section 203 Analysis and Assessments, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded:</p> <p>1.1. The reliability authority shall perform operational planning analyses to verify that the planned bulk electric system operations will not exceed any of its interconnection reliability operating limits.</p> <p>The wording of Item 1.2 should also be revised:</p> <p>1.2. The reliability authority shall perform real-time assessments to verify that <b>the power system</b> it is not exceeding any interconnection reliability operating limits.</p> <p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.</p> <p>Section 4.3 should be rewritten to read:</p> <p>4.3. <b>The reliability authority shall demonstrate in accordance with Measure 2.1, the following upon the request of the compliance monitor:</b></p> <p>4.3.1. <b>Ability to perform an operational planning analysis</b></p> <p>4.3.2. <b>Ability to perform a real time assessment</b></p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 203 - Analyses**

1.1 was revised as follows: "The Reliability Authority shall assess whether the planned Bulk Electric System operations within the Reliability Authority's Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits." Although this does not match your suggested change on a word-for-word basis, it supports the intent of your suggestion.

1.2 was revised as follows: "The reliability authority shall perform real-time assessments to verify that it is not determine if its reliability authority area is exceeding any interconnection reliability operating limits or is expected to exceed any interconnection reliability operating limits." Although this does not match your suggested change on a word-for-word basis, it supports the intent of your suggestion.

The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.

Kathleen Goodman ISO-NE #2  
NPCC CP9  
 Michael Schiavone National Grid USA #1  
 Roger Champagne Hydro-Quebec TransEnergie #1  
 Ralph Rufrano New York Power Authority #1  
 David Little Nova Scotia Power Inc. #1  
 David Kiguel Hydro One Networks #1

 Barry Gee National Grid USA #1  
 Dan Stosick ISO-New England #2  
 Fernando Saavedra ISO-New England #2  
 Greg Campoli New York ISO #2

NPCC (ISO-NE) requests the drafting team to provide their thoughts and incorporate allowances in the compliance area for EMS "down time" for maintenance or to switch over to backup system should problems arise.

Although we agree with the measures stated, we would suggest that more frequent in-day analyses based on changed system conditions to predict system performance in the coming hours be required.

The compliance monitoring process and the levels of non-compliance were adjusted so that there should not be any 'automatic' sanctions for temporary loss of telemetry. The revisions made to the standard improve the links between the compliance monitoring process, the levels of non-compliance and the measures.

The standard does set 'minimum' requirements. An RA observing changing system conditions needs to monitor and assess its system more closely, but this is difficult to convey in a standard that must have objective measures.

The Transmission Operator should also be included in this requirement for "the areas for which they are responsible".

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 203 - Analyses**

<p>Jim Griffith Southern Co Monroe Landrum Southern Co</p>	
<p>The Functional Model assigns the RA responsibility for performing reliability analyses and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The Transmission Operator is responsible for local network integrity, not the reliability of the bulk transmission system.</p>	
<p>Susan Morris SERC #2 Bill Reinke SERC #2 Sam Stryker Fayettevill PWC #3, 4, 5 Carter Edge SEPA #4, 5 Bill Thompson Dominion Trans #1</p>	<ol style="list-style-type: none"> <li>1. Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s) and RA. Therefore, we suggest that every occurrence of the term “reliability authority” in all of this section 203 be replaced with “reliability authority and transmission owner(s)”.</li> <li>2. In addition, it appears from the wording of this draft standard Section 203 Analysis and Assessments, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded:  <ul style="list-style-type: none"> <li>The reliability authority shall perform operational planning analyses to verify that the planned bulk electric system operations will not exceed any of its interconnection reliability operating limits.</li> </ul> </li> <li>3. The wording of Item 1.2 should also be revised to make it clear the RA and TO(s) verify the power system operation is not exceeding IROL limits:  <ul style="list-style-type: none"> <li>The reliability authority shall perform real-time assessments to verify that the power system it is not exceeding any interconnection reliability operating limits.</li> <li>The transmission owner(s) shall perform real-time assessments to verify its equipment is not exceeding any interconnection reliability operating limits.</li> </ul> </li> <li>4. Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.  Section 4.3 should be rewritten to read:  <ul style="list-style-type: none"> <li>4.3. The reliability authority shall demonstrate in accordance with Measure 2.1, the following upon the request of the compliance monitor: <ul style="list-style-type: none"> <li>4.3.1. Ability to perform an operational planning analysis</li> <li>4.3.2. Ability to perform a real time assessment</li> </ul> </li> </ul> </li> </ol>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 203 - Analyses**

<ol style="list-style-type: none"> <li>1. The Functional Model assigns the RA responsibility for performing reliability analyses and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The Transmission Owner is responsible for establishing transmission facility ratings, but is not assigned any responsibility for conducting reliability analyses.</li> <li>2. The intent of the suggested revision to requirement 1.1 is reflected in the changes made to the standard. The requirement was revised as follows: The reliability authority shall perform operational planning analyses to <del>verify that its</del> <b>assess whether the</b> planned bulk electric system operations <b>within the reliability authority's reliability authority area</b> will <del>not</del> exceed any of its interconnection reliability operating limits.</li> <li>3. The TOW was not added to the list of functions that must comply with requirement 203.1.2 because under the Functional Model the Transmission Owner is not responsible for conducting reliability assessments.</li> <li>4. The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures –and in many cases this is not true.</li> </ol>	
<p>Gerald Rheault Manitoba Hydro #1, 3, 5, 6</p>	<p>In item 203.1.1 the words “will not exceed” are used. The correct phrase should be “should not exceed” since the ability to predict is only valid for events studied, not for unanticipated system conditions.</p> <p>In item 203.2.1.1, there should be a statement indicating the range of studies required. Should the contingencies applicable to SOL's be used or should the range of studies be broader?</p>
<p>Requirement 203.1.1 was revised as follows: “The reliability authority shall perform operational planning analyses to <del>verify that its</del> <b>assess whether the</b> planned bulk electric system operations <b>within the reliability authority's reliability authority area</b> will <del>not</del> exceed any of its interconnection reliability operating limits.”</p> <p>While the revised wording does not match word-for-word the suggested change, the intent of the recommended change is supported in the revisions that were made.</p> <p>Different RAs use different tools to conduct these analyses, and specifying what tools should be used seems beyond the scope of this standard. Note that the standard does not require any specific ‘study’.</p>	
<p><u>FRCC Op, Eng &amp; Mkt Int</u>          Linda Campbell FRCC #2          Paul Elwing Lakeland Electric # 3          John Shaffer FPL #1          Bob Remley Clay Elec Coop #4          Patti Metro FRCC #2          Eirc Grant Progress Energy – FL #1</p>	<ol style="list-style-type: none"> <li>1. In 1.1 it states that the RA is performing operational planning analyses to "verify that its planned bulk electric system operations will not exceed.." Is that really what they are doing? It would seem to us that this operation planning is being done to determine if there is a potential problem so that actions can be directed to alleviate or mitigate the problem so that IROL violations will not occur. The SDT may want to consider rewording this for clarification.</li> <li>2. Also, 1.2 states that real time assessments are to verify that it is not exceeding IROLs. Again, verify does not seem to be the correct word.</li> </ol>

<p>Joe Roos Ocala Electric Utility #3          Joe Krupar FL Muni Pwr Agency #3          Richard Gilbert Lakeland Electric #3          Bill Slater Progress Energy – FL #1          Amy Long Lakeland Electric #1          Roger Westphal Gainesville Regional Util #5          Bob Goss SEPA #5          Steve Wallace Seminore Electric Coop #4          Ted Hobson JEA #1</p>	<ol style="list-style-type: none"> <li>3. The reason we have stated that we do not agree with the compliance monitoring process is that the performance reset period of one day seems much too frequent. Even though the measures are to be done daily, the performance monitoring period should not be more often than monthly. If one day is kept, it would be a great burden on both the RA and the compliance monitor and we are not sure that would really improve reliability.</li> <li>4. Since we believe the reset period should be monthly, the non-compliance levels should be adjusted to reflect level one for a small number of days, and level 4 being every day of the month.</li> <li>5. We also have a question about 5.4 level of non-compliance for operational planning. Does the SDT assume these analyses are load flow studies? If so, we agree with the daily measure. However; if the intent was to also include daily stability studies, we do not agree. Stability studies should only be required to be performed annual and prior to scheduled maintenance outages that create potential for IROLs. Please see our earlier comments about section 6 - Sanctions.</li> </ol>
<ol style="list-style-type: none"> <li>1. Requirement 203.1.1 was revised to reflect the suggested change: “The reliability authority shall perform operational planning analyses to <del>verify that its assess whether the</del> planned bulk electric system operations <del>within the reliability authority's reliability authority area will not</del> exceed any of its interconnection reliability operating limits.”</li> <li>2. Requirement 203.1.2 was revised to reflect the suggested change: “The reliability authority shall perform real-time assessments to <del>verify that it is not determine</del> if its reliability authority area is exceeding any interconnection reliability operating limits <del>or is expected to exceed any interconnection reliability operating limits.</del>”</li> <li>3. There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: “12 months from the last violation” The 12 months was adopted because several entities indicated that shorter periods would be unwieldy for all involved in the process.</li> <li>4. Levels of non-compliance were adjusted to conform to the new language used to identify how the RA could demonstrate it is in compliance.</li> <li>5. The standard does not specify what analyses the RA must use – only that analyses and assessments must be conducted. It would be unrealistic to expect the RA to conduct a stability study each day, and this is not what was intended.</li> </ol>	
<p>Alan Boesch NPPD #1</p>	<p>Why was 30 minutes used for a real time assessment? Is one day a good target to be performing planning Analysis? If a generator or transmission operator is planning an outage will the RA tell the generator or transmission operator the day before the outage that is OK to proceed with the outage? Is that process covered in some other standard?</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 203 - Analyses**

The 30 minute timeframe for conducting real-time assessments was suggested to the industry as the minimum timeframe between assessments. Current Operating Policy (Policy 9) requires that an operational planning analysis be conducted at least once each day looking at the day ahead.

The collection of data needed to conduct an operational planning analysis and a real-time assessment is addressed in the data specification requirement of this standard. In that requirement, the RA must document what data it needs, and when it needs that data – and data associated with outages should be included in that data specification

Dan Boezio & Raj Rana AEP #1, 3, 5, 6

1. Wording of 203.1 implies that a specific favorable outcome of Operational Planning Analyses and Real-time Assessments is required. Consider reword as:  
 203.1.1 The Reliability Authority shall perform Operational Planning Analyses to assess if the planned Bulk Electric System operations will result in any of its Interconnection Reliability Operating Limits being exceeded. The Reliability Authority will modify planned operations if analyses indicate such a violation.  
 203.1.2 The Reliability Authority shall perform Real-time assessments to assess if any Interconnection Reliability Operating Limits are being exceeded. Any identified violated will be addressed immediately.
2. Defined terms should be capitalized, such as “Reliability Authority”, “Operational Planning Analyses”, “Interconnected Reliability Operating Limits”, etc
3. 203.4 Compliance Monitoring Process: Today we require the Reliability Coordinators to have available for review and investigation study case results and related documentation for a rolling three month period (refer to compliance template P9 T1). Maintaining this compliance requirement may prove beneficial during investigations due to complaints and would not add any additional reporting burden beyond today’s process.

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard  
Requirement 203 - Analyses**

<p>1. Requirement 203.1.1 was revised to reflect the first part of the suggested change: “The reliability authority shall perform operational planning analyses to <del>verify that its</del> assess whether the planned bulk electric system operations within the reliability authority’s reliability authority area will <del>not</del> exceed any of its interconnection reliability operating limits.”</p> <p>The second part of the suggested change was not made because taking action based on the results of the operational planning analysis or as a result of a real-time assessment is addressed in Requirement 204 – Actions.</p> <p>Requirement 203.1.2 was revised to reflect the first part of the suggested change: “The reliability authority shall perform real-time assessments to <del>verify that it is not determine</del> if its reliability authority area is exceeding any interconnection reliability operating limits or is expected to exceed any interconnection reliability operating limits.”</p> <p>The second part of the suggested change was not made because taking action based on the results of the operational planning analysis or as a result of a real-time assessment is addressed in Requirement 204 – Actions.</p> <p>2. The suggested format change of capitalizing defined words has been adopted and is reflected in the revised standard.</p> <p>3. RA Certification requires that the RA have tools in place to conduct analyses. This requirement is looking at whether or not the RA is using these tools on a regular basis as an aid in protecting reliability. The Compliance Monitoring section of this requirement was revised to focus more on the real-time use of these tools.</p>	
<p>Tom Pruitt Duke Power #1</p>	<p>Modify section 203.1.1 to read "The reliability authority shall perform, or direct performance of, operational planning analyses . . . ". Modify 203.4.2 to read "The performance-reset period shall be one year. The . . ."</p>
<p>For consistency, the phrase, “or direct . . .” is being used where the Functional Model indicates that the RA directs others. For this requirement, the Functional Model assigns sole responsibility for conducting reliability analyses to the RA, so the phrase, “. . .or direct” was not added. The RA may delegate any of its tasks to others, but the standards are not being written to suggest this delegation.</p> <p>There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: “12 months from the last violation”</p>	

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 203 - Analyses**

<p><u>Operating Reliability Working Group SPP</u>          Gerry Burrows KCP&amp;L #1          Bob Cochran SPS #1          Peter Kuebeck OG&amp;E #1          Scott Moore AEP #1          Tom Stuchlik Westar #1          Dan Boezio AEP #1          Matt Bordelon CLECO #1          Mike Crouch WFEC #1          Mike Gammon KCP&amp;L #1          Kevin Goolsby SPP #2          Bo Jones Westar #1          Allen Klassen Westar #1          Thad Ness AEP #1          Harold Wyble KCP&amp;L #1          Robert Rhodes SPP #2</p>	<p>The proposed measures may be too weak. For example, it appears that a reliability authority could satisfy the operational planning analysis by evaluating an invalid case for a given day. While it meets the letter of the measure, it doesn't meet the intent of the measure. Also, does 2.1.2 apply to IROLs that are associated with stability limits? If so, this measure would require a reliability authority to run real-time stability analyses every 30 minutes.</p> <p>Again the issue of degrees of non-compliance surfaces. Are there shades of gray with non-compliance for this standard or is it strictly a black and white issue? Why jump directly to level four non-compliance? Is progressive non-compliance not an option? Is missing an operational planning assessment one day in a month as detrimental as missing it 10-15 days per month? Similarly, is missing one real-time assessment as bad for reliability as missing these assessments for hours, on a regular basis?</p>
<p>The term, 'analysis' is not synonymous with 'study.' IROLs may be associated with stability limits, but this does not mean that a stability study needs to be conducted every 30 minutes. The standard does not specify what tools must be used to conduct the analysis or the assessment – this is left up to the RA.</p> <p>The levels of non-compliance were adjusted to reflect changes to the compliance monitoring process. Under the revised standard, a level three non-compliance was added.</p>	
<p>BPA Adm TBL #1          James Murphy Mike Viles          James Randall Al Johnson          Jeff Newby Jim Gronquist          Sylvia Wiggerhaus Brian Tuck          Dick Spence Tracy Rolstad          Steve Hitchens</p>	<p>2.1.1 There should be no time frame, as long as the analysis is done prior to the need it shouldn't matter.</p> <p>5.1 Remove - to indicate actions taken or directives issued to mitigate the instance. This additional verbage is not needed, the discription of the documentation is already covered in the requirements.</p> <p>5.4 Remove at least once each day.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 203 - Analyses**

The timeframe is needed to ensure that all RAs commit to doing these analyses and assessments on a regular basis. The timeframes suggested represent the minimum acceptable timeframes. Note that the operational planning analysis does not need to be a detailed, documented study – it merely needs to “. . . examine the expected system conditions, given the load forecast(s), known system constraints such as facility outages, and generator outages and limitations, etc. “

The comment about 5.1 is addressing Requirement 204. When these new standards are fully developed, they will be available to the industry through a relational database. We are trying to maintain enough clarity in the measures so that if these were downloaded as a result of a query (e.g. – a report of all measures which the RA is responsible for meeting), the measures would contain enough definition to be understandable.

Darrell Richardson Illinois Power #1, 3

We agree with this but think there should possibly be some room for “extenuating circumstances” (i.e., computer problems, in middle of restoration, etc.).

The requirement was revised to shift emphasis from demonstrating that the tools used to conduct analyses and assessments were working to demonstrating that the analyses and assessments were being conducted by humans, using whatever methods available. This shift in emphasis supports your suggestion.

Ed Davis Entergy Services #1

1. Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO and RA. Therefore, we suggest that every occurrence of the term “reliability authority” in all of this section 203 be replaced with “reliability authority and transmission owner”.
2. In addition, it appears from the wording of this draft standard Section 203 Analysis and Assessments, 1. Requirements, Item 1.1 that the RA is operating the power system. This requirement must be reworded:  
 The reliability authority shall perform operational planning analyses to verify that the planned bulk electric system operations will not exceed any of its interconnection reliability operating limits.
3. The wording of Item 1.2 should also be revised to make it clear the RA and TO verify the power system operation is not exceeding IROL limits:  
  
 1.2. The reliability authority shall perform real-time assessments to verify that the power system is not exceeding any interconnection reliability operating limits. The transmission owner shall perform real-time assessments to verify its equipment is not exceeding any interconnection reliability operating limits.

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 203 - Analyses**

The Functional Model assigns the RA responsibility for performing reliability analyses and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The Transmission Owner is responsible for establishing transmission facility ratings, but is not assigned any responsibility for conducting reliability analyses.

The intent of the suggested revision to requirement 1.1 is reflected in the changes made to the standard. The requirement was revised as follows: The reliability authority shall perform operational planning analyses to ~~verify that its~~ assess whether the planned bulk electric system operations within the reliability authority's reliability authority area will ~~not~~ exceed any of its interconnection reliability operating limits.

The TOW was not added to the list of functions that must comply with requirement 203.1.2 because under the Functional Model the Transmission Owner is not responsible for conducting reliability assessments.

SERC Operations Planning Subcommittee

Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.

Section 4.3 should be rewritten to read:

The reliability authority shall demonstrate in accordance with Measure 2.1, the following upon the request of the compliance monitor:

- 4.3.1. Ability to perform an operational planning analysis
- 4.3.2. Ability to perform a real time assessment

The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.

<p><u>Southern Company Generation &amp; Energy Mktg</u>          Roman Carter # 5, 6          Joel Dison #5,6          Tony Reed #5,6          Lucius Burris #5,6          David Deerman #5,6          Clifford Shepard #5,6          Michael Smith #5,6          Lloyd Barnes SCGEM 5,6          Gary Miller SCGEM 5,6          Terry Crawley Southern Generation 5          Roger Green Southern Generation 5</p>	<p>x</p>		
<p><u>Compliance Subcommittee</u></p>			<p>Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion.          Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor.          Re-number 4.2 and 4.3 to 4.3 and 4.4</p>
<p>The suggested language changes were not adopted for the following reasons.</p> <ul style="list-style-type: none"> <li>- "Information submittal" is an undefined term. Industry commenters have asked that the compliance elements be as specific as possible so that there won't be huge variations from region to region in the application of the compliance monitoring. If an 'information submittal' is the same as a self-certification document, then this is already covered in the original language. Including language that gives each compliance monitor the flexibility to assess this requirement however it chooses, does not conform with the industry's requests for standardization in the compliance monitoring process.</li> </ul> <p>The only significant change between the original language and the proposed new section 4.2 is the addition of the concept that the compliance monitor has the freedom to either conduct an audit per a schedule, or just show up unscheduled. Again, this does not support the industry's request for increased standardization in the compliance monitoring process. The original language included the option of conducting an 'investigation upon compliant' and this seems more appropriate than unscheduled audits.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 204 - Actions**

**Requirement 204 - Actions – Other comments**

**Summary Consideration:** While there were many comments recommending specific changes, most commenters indicated support of the requirement, its measures and compliance elements. There were several suggestions for changing the levels of non-compliance so they better align with the measures. The following changes were made to further improve the level of consensus on this requirement:

- The requirement was revised to clarify how to measure the duration of an ‘event’.
- To conform with the requested changes to the definition of  $T_v$ , the requirement was changed to clarify that only instances of exceeding (rather than meeting or exceeding) the  $T_v$  need to be reported to the compliance monitor.
- The measures were revised to add more explanatory text to clarify the circumstances under which the measure is applicable
- The compliance monitoring process was modified to change the performance reset period to ‘12 months from the last violation’.
- Levels of non-compliance were adjusted to conform to the new language used for  $T_v$

The SDT was unable to accommodate the changes recommending that the RA be exempt from sanctions if the RA directed to take actions, but those actions did not achieve the desired results and an IROL was exceeded for a time greater than  $T_v$ . The industry is divided on this issue – and 20 of the 125 respondents indicated a preference for exempting the RA from sanctions if the RA directed others to take action and those actions either weren’t taken or didn’t achieve the desired results.

The SDT was unable to accommodate the changes recommending that the RA not be held accountable for exceeding an IROL. Several commenters indicated that the measures require only documentation and reporting, and don’t address instances of exceeding an IROL. Measures are elements the Compliance Managers use to determine if the requirement has been met. The Compliance Managers do not have access to the real-time data that would indicate instances of approaching or exceeding IROLs. The documentation and reports required in the measures are the physical evidence the compliance managers need to assess compliance with the requirement. The requirement clearly indicates that the RA shall act or direct others to act to prevent or mitigate instances of exceeding IROLs and shall document these actions.

Commenter	Comments
Terry Bilke Midwest ISO #2	<p>In this section, the RA gets a level 4 compliance violation if a limit is exceeded, the RA takes action and the limit is exceeded for <math>T_v</math>. It appears the RA is accountable if they take timely action (direct corrective measures) and the other authorities (IA, BA, TO) fail to respond.</p> <p>Also it appears that the same penalty is assessed whether the RA failed to act for one event or 100 events for the year.</p>
	<p>The seriousness of exceeding an IROL for a time greater than the IROL’s <math>T_v</math> seems to warrant a serious sanction. An IROL should not be exceeded for any length of time. In this posting cycle, the SDT provided its reasoning for having this infraction be a level four non-compliance, and most of the commenters indicated support for this position.</p> <p>The compliance sanctions table is multidimensional and is built to apply more stringent sanctions for successive instances of non-compliant behavior within a performance reset period. The sanction applied for a single instance of exceeding an IROL for time greater than <math>T_v</math> is much less than for the fourth instance in a 12 month period.</p>
Stuart Goza TVA #1	RA should only be penalized if the RA failed to direct action. If an operating entity fails to implement the directed action then the RA should not be penalized (if the RA does not have direct operational control.)

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 204 - Actions**

	<p>Section 5.4 should be amended to include “and RA failed to direct action.”</p> <p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.</p> <p>Section 4.3 should be re-written to read:</p> <p style="padding-left: 40px;">4.3. The reliability authority shall have the following available upon the request of its compliance monitor:</p> <p style="padding-left: 80px;">4.3.1. Operations logs or other documentation <b>in accordance with Measure 2.1</b> and the actions or directives issued for each of these instances</p> <p style="padding-left: 80px;">4.3.2. Interconnection Reliability Operating Limit Violation Reports <b>completed in accordance with Measure 2.2</b></p>
<p>Under the Functional Model, the RA has ultimate responsibility for reliability of the bulk electric system. The RA needs to have agreements in place with the entities operating under the RA’s direction as part of the RA Certification process – and these agreements need to address the RA’s authority with respect to these other entities. Most of the industry commenters agreed that the RA should be held responsible when an IROL is exceeded for a time greater than <math>T_v</math>. If the RA’s directives are not followed, the entities involved are subject to sanctions under this standard’s Requirement 208 – RA Directives.</p> <p>The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</p>	
<p><u>NPCC CP9</u>  Michael Schiavone National Grid USA #1  Roger Champagne Hydro-Quebec TransEnergie #1  Ralph Rufrano New York Power Authority #1  David Little Nova Scotia Power Inc. #1  David Kiguel Hydro One Networks #1  Michael Potishnak ISO-New England #2  Barry Gee National Grid USA #1  Dan Stosick ISO-New England #2  Fernando Saavedra ISO-New England #2  Greg Campoli New York ISO #2</p>	<p>NPCC also suggests adding “footnote 1” that appears on page 10 to the Level one non-compliance measure to capture the thought that no overt action is sometimes an acceptable action</p>
<p>The footnote was added to the heading for the levels of non-compliance.</p>

We have a general concern that the Reliability Authority is the only function held responsible for instances where the IROL is exceeded. Currently, not all RAs have operating responsibility over their systems. Some functions are delegated. With this in mind, the levels of non-compliance would pertain only to RAs, while they may not have direct control. For instance, the operating entities could choose not to follow the RA’s direction. It seems that there should be a complementary standard that would penalize operating entities for not adhering to the direction of the RA. The penalties should be ranked according to the severity of the situation. In other words, the entities that actually have the operating responsibility must be held accountable.</li> <li>2. Has the Interconnection Reliability Operating Limit Violation Report been developed yet? Is this the existing NERC Operating Policy 5, Appendix 5F as modified with the results of the Reliability Coordinator IRLV Field Test? Will this report become part of this standard?</li> <li>3. Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.</li> <li>4. In section 2, the measures do not capture the requirement to PREVENT instances where IROLs may be exceeded. The following re-wording is suggested. Section 4, below is also slightly modified to align with change in the measurement.</li> </ol> <p style="color: red;">The reliability authority shall document each instance where actions are taken to prevent exceeding or to mitigate the magnitude and duration of interconnection reliability operating limit:</p> <p>The reliability authority shall document, via an operations log or other data source, the actions taken or directives issued, the magnitude of the event, and the duration of the event. (This data may be from an operating log, may be from the entity’s energy management system, or may be from some other source.)</p> <p>2.2. The reliability authority shall report each instance of exceeding an interconnection reliability operating limit for time greater than or equal to Tv:</p> <p>2.2.1. The reliability authority shall complete an Interconnection Reliability Operating Limit Violation Report and shall file the report with its compliance monitor within five</p>
---	---

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 204 - Actions**

	<p>business days of the initiation of the event. (The report includes the date and time of the event, identification of which interconnection reliability operating limit was violated and the Tv for that limit, magnitude and duration of exceeding the interconnection reliability operating limit, actions taken or directives issued, and explanation of results of actions or directives.)</p> <p>The reliability authority shall have the following available upon the request of its compliance monitor:          Operations logs or other documentation in accordance with Measure 2.1 indicating the magnitude and duration of each interconnection reliability operating limit event and the actions or directives issued for each of these instances</p> <p>4.3.2. Interconnection Reliability Operating Limit Violation Reports completed in accordance with Measure 2.2</p>
<ol style="list-style-type: none"> <li>1. Requirement 208 of this standard requires that the entities supporting the RA follow the RA's directives. If those entities fail to follow the RA's directives, they would be sanctioned under Requirement 208, so if an IROL is exceeded for a time greater than that IROL's T<sub>v</sub>, the RA is not necessarily the only entity that would be subject to sanctions. It is also envisioned that the RA will have contractual relationships with BAs and others to perform as instructed.</li> <li>2. The IROL Violation Report is a compliance document and has been developed for the Compliance Monitors. The report will be appended to the end of this document so that everyone can see the report. The report was not made part of this standard because in the future there may be automated systems that could be used to simplify the reporting process, and we didn't want to have to update this standard just to accommodate that improvement. The IROL Violation Report does not ask for any data that isn't identified in the standard. The IROL Violation Report is not an exact duplication of the report currently found in Appendix 5F, and is not an exact duplication of the report currently being field tested by the OLDTF. The report in Appendix 5F and the report being field tested by the OLDT both ask for more data than is needed by the Compliance Monitor, and is outside the scope of this standard.</li> <li>3. The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures –and in many cases this is not true.</li> <li>4. The recommended change to measure 2.1 would require a great deal of data collection and was not adopted. System Operators are continually working to prevent instances of exceeding IROLs.</li> </ol>	
<p>FRCC Op, Eng &amp; Mkt Int          Linda Campbell FRCC #2          Paul Elwing Lakeland Electric # 3          John Shaffer FPL #1          Bob Remley Clay Elec Coop #4</p>	<ol style="list-style-type: none"> <li>1. Both requirement 1.2 and measure 2.2 are about reporting IROL violations when the time is greater than or equal to Tv. We do not agree with the equal to portion of this. To us, Tv is analogous to a speed limit. You would not report if you were equal, but only if in excess. We do not understand the reasoning for equal to being included.</li> <li>2. We do not agree with the levels of non-compliance because level 4 is based on an</li> </ol>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 204 - Actions**

<p>Patti Metro FRCC #2          Eirc Grant Progress Energy – FL #1          Joe Roos Ocala Electric Utility #3          Joe Krupar FL Muni Pwr Agency #3          Richard Gilbert Lakeland Electric #3          Bill Slater Progress Energy – FL #1          Amy Long Lakeland Electric #1          Roger Westphal Gainesville Regional Util #5          Bob Goss SEPA #5          Steve Wallace Seminore Electric Coop #4          Ted Hobson JEA #1</p>	<p>IROL being exceeded for a time greater or equal to Tv. This does not agree with the measures listed. The measures are to document actions taken or report violations that occurred. The levels of non-compliance should be based on what we are measuring. Please see our earlier comments on Section 6 - sanctions.</p> <p>3. This requirement in particular brought a question to mind about what the RA really is. Does this requirement assume the RA is the Reliability Coordinator of today who looks at "the big picture", or does it mean today's control area operator? It is still unclear to us what the RA really is. Is there a hole in the functional model that needs to be filled? We do not think we are the only participants in the industry still confused, so work needs to be done to clarify exactly who or what the RA is.</p>
<p>1. Your suggestion for revising the T<sub>v</sub> so this was a limit you could meet but not exceed was adopted and is reflected in the revised definition for Tv as well as in the language in this requirement.</p> <p>2. Measures are an indication that the compliance managers can use to determine if the requirement's performance has been met. The Compliance Managers do not have access to the real-time data that would indicate instances of approaching or exceeding IROLs. The documentation and reports are the physical evidence the compliance managers need to assess compliance with the requirement. The requirement clearly indicates that the RA shall act or direct others to act to prevent or mitigate instances of exceeding IROLs.</p> <p>3. The work that needs to be done in clarifying the Functional Model needs to be done by the Functional Model Review Task Group and is outside the scope of the SDT.</p>	
<p>Alan Boesch NPPD #1</p>	<p>The level four non-compliance does not match the measure. The measure only requires a report and does not hold the RA responsible for exceeding the operating limit.</p>
<p>Measures are an indication that the compliance managers can use to determine if the requirement's performance has been met. The documentation and reports are the physical evidence the compliance managers need to assess compliance with the requirement. The requirement clearly indicates that the RA shall act or direct others to act to prevent or mitigate instances of exceeding IROLs.</p>	
<p>Dan Boezio &amp; Raj Rana AEP #1, 3, 5, 6</p>	<p>1. Defined terms should be capitalized, such as "Reliability Authority", "Operational Planning Analyses", "Interconnected Reliability Operating Limits", etc</p>
<p><b>The suggestion that defined terms be capitalized has been adopted and is reflected in the revised standard.</b></p>	

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 204 - Actions**

<p><u>Operating Reliability Working Group SPP</u>  Gerry Burrows KCP&amp;L #1  Bob Cochran SPS #1  Peter Kuebeck OG&amp;E #1  Scott Moore AEP #1  Tom Stuchlik Westar #1  Dan Boezio AEP #1  Matt Bordelon CLECO #1  Mike Crouch WFEC #1  Mike Gammon KCP&amp;L #1  Kevin Goolsby SPP #2  Bo Jones Westar #1  Allen Klassen Westar #1  Thad Ness AEP #1  Harold Wyble KCP&amp;L #1  Robert Rhodes SPP #2</p>	<p>The performance reset period should be changed to 12 months rather than one calendar year.  Non-compliance items should match the standard's definitions. Section 5.1 should be referred to as a Documentable Interconnection Reliability Operating Limit Violation. Section 5.2 should be referred to as an Interconnection Reliability Operating Limit Violation or a Reportable Interconnection Operating Limit Violation, whichever is correct (see response to Question 1).</p>
<p>There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation"</p> <p>The terms, Documentable IROL and Reportable IROL were not used in the last draft of this standard, and several commenters indicated it should be dropped. The terminology used in the levels of non-compliance matches the terminology used in the standard, so this suggestion was not adopted.</p>	
<p><u>MAAP Ops Subcommittee #2</u>  Llyod Linke MAPP  Allan Silk Manitoba Hydro  Paul Brune NPPD  Tod Gosnell Omaha Public Pwr Dist  Paul Koskela Minnesota Pwr  Larry Larson Otter Tail Power  Derrick Moe WAPA  Dick Pursley Great River Energy  Martin Trencé Xcel Energy  Joseph Knight MAPPCOR</p>	<p>The Measure 2.1.1 should include the explicit provision that this log is a publicly available document. The actions so logged by the RA should be independent and consistent, and the log is one way of enhancing visibility to assure this is the case.</p>
<p>There is no reliability-related reason to make this a public document, and this change was not adopted.</p>	

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 204 - Actions**

<p><u>BPA Adm TBL #1</u>          James Murphy      Mike Viles          James Randall      Al Johnson          Jeff Newby          Jim Gronquist          Sylvia Wiggerhaus   Brian Tuck          Dick Spence        Tracy Rolstad          Steve Hitchens</p>	<p>5.4 Remove minutes, TV may be seconds and TV is already a time period by definition.</p>
<p><b>Agreed. The revised standard reflects this change.</b></p>	
<p>Kathleen Goodman ISO-NE #2</p>	<p>ISO-NE also suggests adding “footnote 1” that appears on page 10 to the Level one non-compliance measure to capture the thought that no overt action is sometimes an acceptable action.</p> <p>ISO New England does not believe that we should identify specific limits which must be reported on. Rather, we advocate internally reporting on every violation which does not clear within 30 minutes (as defined in NERC policy). Subsequently, each reported violation will be studied/examined to see if it would have caused instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk power transmission system (have an Inter-Area impact outside of the New England Area following next contingency). If so, ISO New England would report this "OSL violation" to NPCC and NERC within 72 hours. If there would not have been an Inter-Area impact (i.e. the impact would have been localized within the offending Control Area's boundary), no external reporting will occur. We suggest this approach be adopted.</p> <p>By restricting reporting to pre-identified limits, NERC may not be getting the information they seek through this Standard. Only through a post-operational assessment, can a true analysis (with the correct system configuration) be performed and an adequate judgement be made on the potential impact to the bulk power system.</p> <p>We also believe that data should not be archived unless the limit is not cleared within 30 minutes. We do not advocate archiving data for every limit violation if it cleared in less than 30 minutes.</p>

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 204 - Actions

---

The footnote was added to the heading for the levels of non-compliance.

This standard is based on the assumption that while all system operating limits are important, a subset of limits is most critical to the reliability of the interconnection, and exceeding these limits could lead to voltage instability, cascading outages, or uncontrolled separation. By identifying these limits in advance, system operators can pay extra attention to these limits, and can be better prepared to take (or direct) actions to prevent and mitigate instances of exceeding these limits. Some of these limits really shouldn't be exceeded for 30 minutes – and that is one of the reasons why the industry supported modifying the language that is in current Operating Policy, and allowing each RA to establish a  $T_v$  that is most appropriate to each limit.

The decision on whether or not to report an instance of exceeding an IROL is based on the length of time the IROL was exceeded. Lists of IROLs are not expected to remain static – these must be updated to conform with changes to the system.

When an IROL is exceeded, the documentation required is that which is typically found on the system operations log, and shouldn't require any additional effort to develop. Many entities keep operations logs for an indefinite period of time – and this standard requires keeping the data for just 3 years to ensure that there is some data on site when the Compliance Monitor conducts a scheduled audit once every 3 years.

<p><u>Compliance Subcommittee</u></p>			<p>Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion.          Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor.          Re-number 4.2 and 4.3 to 4.3 and 4.4</p>
<p>The suggested language changes were not adopted for the following reasons:</p> <ul style="list-style-type: none"> <li>- "Information submittal" is an undefined term. Industry commenters have asked that the compliance elements be as specific as possible so that there won't be huge variations from region to region in the application of the compliance monitoring. If an 'information submittal' is the same as a self-certification document, then this is already covered in the original language. Including language that gives each compliance monitor the flexibility to assess this requirement however it chooses, does not conform with the industry's requests for standardization in the compliance monitoring process.</li> </ul> <p>The only significant change between the original language and the proposed new section 4.2 is the addition of the concept that the compliance monitor has the freedom to either conduct an audit per a schedule, or just show up unscheduled. Again, this does not support the industry's request for increased standardization in the compliance monitoring process. The original language included the option of conducting an 'investigation upon compliant' and this seems more appropriate than unscheduled audits.</p>

**Requirement 205 - Data Specification –Other comments**

**Summary Consideration:**

The BA and LSE were added to the list of functions the RA may send a data specification because the entities performing these functions may have data the RA needs to support real-time monitoring, operational planning analyses and real-time assessments conducted relative to operating within its reliability area’s IROLs.

Additional language was added to clarify that the RA shall report incidents of not receiving data as specified if the RA has been unable to resolve the issue. This should provide entities an opportunity to resolve issues without involving sanctions.

The compliance monitoring process was modified to change the performance reset period to ‘12 months from the last violation’

The SDT was unable to accommodate the changes recommending that the Transmission Owner and Transmission Operator be added to this requirement. The Functional Model assigns responsibility for monitoring operating reliability limits and for conducting operating reliability analyses to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The data being addressed in this requirement is data needed to support real time monitoring and operational planning analyses and real-time assessments relative to IROLs. The Transmission Operator is responsible for local network integrity, not the reliability of the bulk transmission system and does not need the data for this standard.

Commenter	Comments
Ken Githens Allegheny Energy Supply #5	<p><i>However, refer to comment under question 37.</i></p> <p>(RA data collection and communication is required under Std. 200 and 600 with financial sanction for noncompliance under both. An organization should not be hit with financial sanctions under both standards for not communicating the data. Only one standard should apply.)</p>
<p>The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard does require that equipment owners provide facility ratings data to the RA for the development of System Operating Limits. If the same data is needed by the RA for both standards, then it is up to the compliance manager to determine the appropriate sanction. We sent a suggestion to the Director, Compliance, recommending that the Compliance Enforcement Program develop a formal way of addressing situations such as this, but preventing this from happening is beyond the scope of the SDT.</p>	

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 205 – Data Specification**

<p>Terry Bilke Midwest ISO #2</p>	<p>Why does the RA have to notify the Compliance Monitor within 5 days if an entity doesn't provide data to the RA if 'data provision' is monitored via annual self-certification?</p> <p>The standard requires the RA to be responsible for collecting data from all participants in a 'mutually agreeable' format. This seems to be saying that each generator owner, BA, TP can ask for a different format. If the RA doesn't agree to this, the RA becomes non-compliant because it is failing to collect data.</p> <p>The RA should have the authority to require consistent data formats from each participant group (the participant group as a whole should have a say in the data format, not each individual participant).</p>
<p>By requesting that the RA notify the Compliance Monitor if data is not provided, the RA is providing the Compliance Monitor with the justification for conducting an 'investigation upon complaint'. The Compliance Monitor would then conduct an 'investigation upon complaint' (under Requirement 206). If the RA doesn't notify the Compliance Monitor and let the Compliance Monitor know that data isn't being provided, then the Compliance Monitor doesn't have justification to conduct an investigation to determine why the data isn't being provided. Note that this requirement was modified to give the RA an opportunity to resolve the issue first, and only notify the Compliance Monitor when the RA is unable to resolve the issue of not being provided the data as specified.</p> <p>Requiring consistent data formats for each participant group seems outside the scope of this standard, but there is nothing to preclude an RA from attempting to use this technique to reach consensus on agreeable formats.</p>	
<p>Stuart Goza TVA #1</p>	<p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.</p> <p>Section 4.3 should be rewritten to read:</p> <p style="padding-left: 40px;">4.3. The reliability authority shall have the following available upon the request of the compliance monitor:</p> <p style="padding-left: 80px;">4.3.1. Data specification(s) in accordance with Measure 2.1</p> <p style="padding-left: 80px;">4.3.2. Proof of distribution of the data specification(s) in accordance with Measure 2.2</p>
<p>The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</p>	
<p>Southern Co Transmission Planning #1</p>	<p>The Transmission Operator should also be included in this requirement for "the areas</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 205 – Data Specification**

<p>Todd Lucas Southern Co          Joe Payne Mississippi Power Company          Travis Koval Southern Co          Bill Pope Gulf Power Company          John Clark Southern Co          David Johnson Savannah Electric          Mike Miller Southern Co          Jim Griffith Southern Co          Monroe Landrum Southern Co</p>	<p>for which they are responsible".</p>
<p>The Functional Model assigns responsibility for monitoring operating reliability limits and for conducting operating reliability analyses to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The data being addressed in this requirement is data needed to support real time monitoring and operational planning analyses and real-time assessments relative to IROLs. The Transmission Operator is responsible for local network integrity, not the reliability of the bulk transmission system and does not need the data for this standard.</p>	
<p>Charles Yeung Reliant #5</p>	<p>The data obtained through this reliability requirement have significant commercial significance. NERC must ensure that the entities who receive such information have their employees maintain confidentiality of the data from market participants including their affiliated generators, transmission providers, load serving entities, marketers or other relevant market participants. Although a confidentiality agreement or confidentiality requirement is not a specific reliability need, NERC must be cognizant of and sympathetic to these commercial concerns in its reliability requirements. The confidentiality agreement itself may be developed and administered through some other standard setting organization.</p>
<p>The requirement limits the data to that which is needed for real time monitoring and for analyses and assessments relative to IROLs. This standard does not address sharing of data collected by the RA.          The RA Certification SAR includes the following requirements:</p> <ul style="list-style-type: none"> <li>- Documentation identifying that the organization has signed the NERC Confidentiality Agreement.</li> <li>- Documentation identifying that the Reliability Authority personnel are aware of their obligations and responsibilities under the NERC Confidentiality Agreement.</li> <li>- Documentation identifying the code of conduct for personnel performing the Reliability Authority responsibilities.</li> <li>- Documentation identifying that the Reliability Authority personnel are aware of their obligations and responsibilities under the code of conduct.</li> </ul>	
<p>FRCC Op. Eng &amp; Mkt Int          Linda Campbell FRCC #2          Paul Elwing Lakeland Electric # 3          John Shaffer FPL #1          Bob Remley Clay Elec Coop #4</p>	<p>Is requirement 1.1.3 really meant to be RA's other than themselves? Again, confusion about who/what the RA really is. Depending on who/what is the RA, we may have concern over what data is being requested. There needs to be a reliability justification for the data requested. What happens if there is a disagreement over what data should be supplied? In regards to the levels of non-compliance, why only levels 1 and 2 in this requirement and level 4 in all the others? Does this imply that this standard is not as</p>

<p>RA's monitor parts of other RA's systems and will need to collect and share data with one another. The reliability authority is defined in the functional model.</p> <p>The reliability justification for the data being specified is addressed in the requirement. The data is limited to that which is needed for real-time monitoring, operational planning analyses and real-time assessments relative to IROLs.</p> <p>Regions do have a dispute resolution process, and so does NERC. This can be used by any entity to clarify such matters, and doesn't need to be specifically addressed in each standard.</p> <p>Exceeding an IROL for time greater than the IROL's <math>T_v</math> does seem to be a more important measure than having a complete data specification.</p>	

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 205 – Data Specification**

---

<p>Dan Boezio &amp; Raj Rana AEP #1, 3, 5, 6</p>	<ol style="list-style-type: none"><li>1. Defined terms should be capitalized, such as “Reliability Authority”, “Operational Planning Analyses”, “Interconnected Reliability Operating Limits”, etc</li><li>2. This section should only deal with the data specification. The data collection portion should either be its own section or be combined with section 206 at a minimum. Items 1.3 and 2.3 of this section should be a part of that new section or merged into section 206.</li><li>3. The standard as it is written assumes that 100 percent of the data that is required for real-time monitoring, operational planning analyses and real-time assessments can be collected 100 percent of the time. The availability of real-time data is subject to many controllable and uncontrollable factors of both the Reliability Authority and the entity providing the data.</li><li>4. The Reliability Authority and the entity providing the data should have documented protocols for the acceptable level of data quality and availability specific to the data type, need, and other factors. This information is outside the scope of this standard, but this standard should ensure that the documentation does exist and the requirements established in the protocols are enforced. This will enable the requirement of the entity to provide the data sufficient for the Reliability Authority to perform its functions and require the Reliability Authority to report any non-compliance without the ambiguity of what is an acceptable failure or not.</li><li>5. What is the dispute resolution process for disagreements with requirements established by the Reliability Authority? Can the entity say they cannot provide the data requested and justify why not to some group or entity? We suggest that there should be a provision that the data requested by the RA is reasonable and needed and that the NERC Regional Reliability Councils will be the arbiter for disputes.</li><li>6. We continue to maintain that there needs to be an industry minimum specification for the type of data required, similar to Appendix 4B “Electric System Security Data.”</li><li>7. There should be a requirement that the data specification, including scan rates, data transmission rates, and data quality, is mutually agreed upon between the RA and their data supplier.</li></ol>
--	---

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 205 – Data Specification**

1. The suggested change, that defined terms be capitalized, has been adopted and is reflected in the revised standard.
2. There is nothing in the standards development process that requires the type of separation of requirements suggested. During the initial posting of this Standard, the industry indicated a preference for grouping related requirements, and the SDT has tried to meet this directive.
3. The data specification needs to address actions to provide data when automated data collection systems are not operational. There should not be a sanction if this process is followed to provide the RA with data upon the loss of an automated system.
4. Including data quality protocols goes beyond the scope of the standard.
5. Regions do have a dispute resolution process, and so does NERC. This can be used by any entity to clarify such matters, and doesn't need to be specifically addressed in each standard.
6. The industry as a whole is not in favor of a 'minimum' set of data. Any RA is free to copy the contents of Appendix 4B and include this as part of its data specification. Appendix 4B, by itself, would not meet all of the measures in this requirement.
7. The standard does require that data be provided in a 'mutually agreed upon format'. This was intended to protect the interests of the RA and the entities that must provide the RA with data. The data specification is not limited to the elements that are listed in the standard. The RA may add more elements to the data specification, but these additional elements will not be reviewed for compliance.

Requirements 1.1, 1.2 and 1.3 are too open-ended on the part of the reliability authority. Justification should be required for all requested data to prevent unreasonable and burdensome requests on the part of the reliability authority. The data requested and the timing of the delivery of the data should be mutually agreeable to the reliability authority and the responding entity.

The SDT should define a minimum, default set of data, such as that spelled out in Appendix 4B, and provide that as a guide for what type of data may be requested.

Requirement 1.3 appears to be repeated again as a measure in Measure 2.3. Shouldn't Requirement 1.3 be moved to Standard 206 since it deals with provision of the data? In fact, there is a great deal of material in 205 that is related data provision. Shouldn't all of this be moved to 206? Perhaps additional clarification between 205 and 206 is all that is needed.

The performance reset period should be changed to 12 months rather than one calendar year.

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 205 – Data Specification

---

1. Adding a justification requirement seems to be overly burdensome. If an entity wants to challenge the need for data and can't resolve the issue with its RA, then that entity can use the dispute resolution process.
2. The industry as a whole is not in favor of a 'minimum' set of data. Any RA is free to copy the contents of Appendix 4B and include this as part of its data specification. Appendix 4B, by itself, would not meet all of the measures in this requirement.
3. There are many different ways of sorting the various requirements in this standard. Industry comments on the first version of the standard indicated a preference for putting related requirements together. If requirement 1.3 were moved to 206, this might increase confusion. In requirement 206, one RA has to provide data to another RA, and it may be confusing as to which RA had to notify the Compliance Monitor when data wasn't provided as specified.
4. There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation" This change supports your recommendation.

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 205 – Data Specification**

<ol style="list-style-type: none"> <li>1. The Functional Model assigns responsibility for monitoring operating reliability limits and for conducting operating reliability analyses to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The data being addressed in this requirement is data needed to support real time monitoring and operational planning analyses and real-time assessments relative to IROLs. The Transmission Owner is not responsible for the same activities – so addressing the Transmission Owner’s data collection needs is outside the scope of this standard.</li> <li>2. The suggested change would link data collection with an instance of exceeding an IROL, and that could result in a multiple sanctions for the same violation. The standards are being drafted so that there will only be a single sanction for a single violation.</li> <li>3. The suggestion that the term, ‘minimum’ be added was not adopted since this is a subjective term and leaves room for arguments as to what minimum means.</li> <li>4. The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures –and in many cases this is not true.</li> </ol>	
<p>Alan Johnson Mirant Americas Energy Mktg #6</p>	<p>A little concerned that the entities required to provide data not have to submit the same data to multiple authorities. For example, some of the data that the RA will want from a generator operator for its models, should be the same data required by the PA for its models. The generator operator should only have to submit this data one time (to some central data collecting point), to be utilized by all functions that have a need for it. This should make the data collection processes more efficient for all and decrease the possibility of data errors.</p>
<p>Because of the way we are developing these new reliability standards, data collection is addressed in several standards. It did not seem possible to identify all the data that needs to be collected and distributed to all functions for all standards in advance of those standards being developed and approved. This standard is limited to collecting and providing data relative to monitoring, analyzing and assessing the bulk system relative to IROLs.</p>	
<p><u>Trans Subcommittee</u>          Robert E. **Requirement 206 - Data Provision –Other comments**

**Summary Consideration:** While there were many comments recommending specific changes, most commenters indicated support of the requirement, its measures and compliance elements. The following changes were made to further improve the level of consensus on this requirement:

- The BA and LSE were added to the list of functions that must comply with this requirement – this change was made to conform with the changes made to requirement 205.
- A sentence was added to the requirement to clarify that the data to be provided under this requirement is limited to data needed by the RA to support real-time monitoring, operational planning analyses and real-time assessments conducted relative to operating within its reliability area’s IROLs.
- The compliance monitoring process was modified to change the performance reset period to ‘12 months from the last violation’.
- The compliance monitoring process was also modified to broaden the scope of evidence that could be used to demonstrate compliance. As many commenters indicated, a cover letter is not sent with real-time data and it isn’t reasonable to request this. The standard was revised as follows: Evidence indicating data was sent to the reliability authority or evidence that the entity responsible committed to providing the data on the specification. Copies of transmittal cover letters indicating data was sent to the reliability authority.

The SDT was unable to accommodate the changes recommending that the TOP and TOW be added to the list of recipients for data. The data being provided in this requirement is data needed to monitor, analyze and assess the system with respect to IROLs – and this activity is assigned to the RA, not the TOP or the TOW.

The recommendation that additional levels of non-compliance be added was not adopted. Most industry commenters favored the levels of non-compliance as proposed, and the result of having data supplied, but not in the agreed upon format, having data supplied late, and having incomplete data is all the same – the RA doesn’t have the data it needs to support monitoring, analyses and assessments relative to IROLs for its reliability area. The level four non-compliance was adjusted to add language to indicate that there is only a level four if data was not provided as specified and the RA was unable to resolve the issue. This should preclude any sanctions for omissions that can be resolved between the entities involved.

Commenter	Comments
Terry Bilke Midwest ISO #2	<p>This section appears to have an “all or nothing” format. The RA needs a great deal of information to fulfill its obligations. The “level 4” violation should only be for failure to provide data on IROL elements. There should perhaps be some scaled compliance level for failure to provide other data, such as:</p> <p>Level 1: failure to provide 10% of the RA’s required data or data transmission failures greater than X% of the year.</p> <p>Level 2: failure to provide 10% of the RA’s required data or data transmission failures greater than X% of the year.</p> <p>Level 3: failure to provide 10% of the RA’s required data or data transmission failures greater than X% of the year</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision**

	Level 4: failure to provide data for any IROL or pre-contingent condition.
<p>The standard has been revised to clarify that the only data addressed by this requirement is data the RA needs to monitor, analyze and assess the system with respect to IROLs.</p>	
<p>The level four non-compliance was adjusted to add language to indicate that there is only a level four if data was not provided as specified and the RA was unable to resolve the issue. This should preclude any sanctions for omissions that can be resolved between the entities involved.</p>	
Ken Githens Allegheny Energy Supply #5	<p>However, refer to comment under question 37.</p> <p>(RA data collection and communication is required under Std. 200 and 600 with financial sanction for noncompliance under both. An organization should not be hit with financial sanctions under both standards for not communicating the data. Only one standard should apply.)</p>
<p>The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard does require that equipment owners provide facility ratings data to the RA for the development of System Operating Limits. If the same data is needed by the RA for both standards, then it is up to the compliance manager to determine the appropriate sanction. We sent a letter to the Director, Compliance, suggesting that the Compliance Enforcement Program develop a formal way of addressing situations such as this, but preventing this from happening is beyond the scope of the SDT.</p>	
Stuart Goza TVA #1	<p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.</p> <p>Section 4.3.1 is too specific for the measure it supports. A possible solution might be:</p> <p>4.3.1. Documentation indicating data was sent to the reliability authority in accordance with Measure 2.1</p> <p>Non-compliance in data submission could take several forms and levels of impact to reliability. Section 5 should be modified as follows:</p> <p>5. Levels of Non-compliance:</p> <p>5.1. Level one: Data was provided, but not in the mutually agreed format</p> <p>5.2. Level two: Data was provided, but not within the time-frame specified</p> <p>5.3. Level three: Incomplete data was provided</p> <p>5.4. Level four: Data was not provided to the reliability authority as specified.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision**

The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.

The result of having data supplied, but not in the agreed upon format, having data supplied late, and having incomplete data is all the same – the RA doesn't have the data it needs to support monitoring, analyses and assessments relative to IROLs for its reliability area. The level four non-compliance was adjusted to add language to indicate that there is only a level four if data was not provided as specified and the RA was unable to resolve the issue. This should preclude any sanctions for omissions that can be resolved between the entities involved.

 Dan Stosick ISO-New England #2  
 Fernando Saavedra ISO-New England #2  
 Greg Campoli New York ISO #2

Regarding the level of non-compliance for not providing data to the reliability authority, NPCC (ISO-NE) feels that there should be some differentiation between not submitting any data and submitting partial data or new/additional data and perhaps there needs to be some more granularity in the description of what constitutes non-compliance.

The result of having data supplied, but not in the agreed upon format, having data supplied late, and having incomplete data is all the same – the RA doesn't have the data it needs to support monitoring, analyses and assessments relative to IROLs for its reliability area. The level four non-compliance was adjusted to add language to indicate that there is only a level four if data was not provided as specified and the RA was unable to resolve the issue. This should preclude any sanctions for omissions that can be resolved between the entities involved.

The Transmission Operator should also be included in this requirement for "the areas for which they are responsible".

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision**

The Functional Model assigns responsibility for monitoring operating reliability limits and for conducting operating reliability analyses to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The data being provided in this requirement is data needed to support real time monitoring and operational planning analyses and real-time assessments relative to IROLs. The Transmission Operator is responsible for local network integrity, not the reliability of the bulk transmission system and does not need to receive the data identified in this requirement.

Susan Morris SERC #2  
 Bill Reinke SERC #2  
 Sam Stryker Fayettevill PWC #3, 4, 5  
 Carter Edge SEPA #4, 5  
 Bill Thompson Dominion Trans #1

1. Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s) and RA. Therefore, we suggest that every occurrence of the term “reliability authority” in all of this section 206 be replaced with “reliability authority and transmission owner(s)”.
2. Add planning authority(ies) to the list of functions in section 1.1.1 that have a reliability relationship and shall provide data (particularly results of dynamic analysis) to the reliability authority and transmission owner(s).
3. Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.
4. Section 4.3.1 is too specific for the measure it supports. A possible solution might be:  
  
Documentation indicating data was sent to the reliability authority in accordance with Measure 2.1
5. Non-compliance in data submission could take several forms and levels of impact to reliability. Section 5 should be modified as follows:  
  
5. Levels of Non-compliance:
  - 5.1. Level one: Data was provided, but not in the mutually agreed format
  - 5.2. Level two: Data was provided, but not within the time-frame specified
  - 5.3. Level three: Incomplete data was provided
  - 5.4. Level four: Data was not provided to the reliability authority as specified.

## Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision

---

1. The Functional Model assigns responsibility for monitoring operating reliability limits and for conducting operating reliability analyses to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The data being provided in this requirement is data needed to support real time monitoring and operational planning analyses and real-time assessments relative to IROLs. The Transmission Owner is not responsible for the reliability of the bulk transmission system and does not need to receive this data identified in this requirement.
2. The latest version of the draft changes to the Functional Model did not address the suggested addition, so it was not added.
3. The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures –and in many cases this is not true.
4. Agreed. The suggestion made improves upon the original language, but doesn't address evidence that real time data has been sent. Section 4.3.1 was changed as follows. Evidence indicating data was sent to the reliability authority or evidence that the entity responsible committed to providing the data on the specification. ~~Copies of transmittal cover letters indicating data was sent to the reliability authority.~~
5. The result of having data supplied, but not in the agreed upon format, having data supplied late, and having incomplete data is all the same – the RA doesn't have the data it needs to support monitoring, analyses and assessments relative to IROLs for its reliability area.

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision**

<p>Alan Boesch NPPD #1</p>	<p>Step 4.3.1 is not necessarily going to be required. Real time data will not have a cover letter. I would suggest that it should be re-worded to say: "Provide evidence that data was sent to the reliability authority."          The measure and level of non-compliance does not address failure to provide data because of broken equipment. If an entity temporarily fails to provide real time data because of a failure of a RTU would it be considered a level four non-compliance?</p>
<p>The compliance monitoring section of the standard was revised to reflect your suggestions: Evidence indicating data was sent to the reliability authority or evidence that the entity responsible committed to providing the data on the specification. Copies of transmittal cover letters indicating data was sent to the reliability authority.</p> <p>The data specification issued by the RA under requirement 205 must identify how real time data will be supplied when there are telecommunication failures. As long as the data is supplied as specified, there is no sanction. (205.2.1.2 Specification shall address the data provision process to use when automated real-time system operating data is unavailable.)</p>	
<p>Dan Boezio &amp; Raj Rana AEP #1, 3, 5, 6</p>	<ol style="list-style-type: none"> <li>1. Defined terms should be capitalized, such as "Reliability Authority", "Operational Planning Analyses", "Interconnected Reliability Operating Limits", etc</li> <li>2. The compliance sections of Requirements 205 and 206 are not complimentary. If the RA doesn't have a data specification for an entities data, even if the RA really needs and should have that data, the maximum level of non-compliance for the RA is a level two. However, if an entity does not provide the data as specified, that entity is level 4 non-compliant, even if the data requested is not critical. Depending on how the RA writes his specification, an entity could be in violation of Requirement 206 if only a few pieces of individual data are missing, regardless of the criticality of that data.</li> <li>3. Need to refer to non-compliance of meeting the data quality and availability protocols (see comments for section 205) established by the Reliability Authority.</li> <li>4. Additionally, Section 205 1.3 and 2.3 should either be placed in a new section regarding data collection by the Reliability Authority or they should be contained within this section.</li> <li>5. 206.4.3.1: "Copies of transmittal cover letters indicating data was sent to the reliability authority." This is too vague. A lot of the data covered by this requirement is real-time or near real-time data that is sent via an ICCP connection. Is the required transmittal letter the letter that initially set up the link between the two parties? As worded one could even take the position that the entity responsible is required to send a transmittal cover letter every time they send data via the ICCP link. The SDT should rewrite this requirement to better reflect their desired intent.</li> <li>6. An example to consider: A RA has in his data specification the requirement that a certain piece or pieces of data be provided to the RA every 5 seconds. However,</li> </ol>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision**

	<p>the entity with the data has systems in place that only report/refresh the desired data on an exception basis, such as breaker status is provided only when the breaker changes states. Per requirement 206, the data providing entity would be level 4 non-compliant. However, the RA would have the data they need in order to perform their required assessments and monitor the system. So why would the data providing entity still be able to be found non-compliant? This also goes to the heart of the issue of the RA having to justify the reasonableness of his data specification before a data providing entity would be required to spend significant dollars in order to meet the RA's arbitrary specification.</p>
<ol style="list-style-type: none"> <li>1. The suggestion that defined terms be capitalized has been adopted and is reflected in the revised standard.</li> <li>2. Both requirements 205 and 206 were modified to add a provision that if the RA is able to resolve the issue of not receiving the data it needs, then the RA does not need to notify its compliance monitor. There is only a level four non-compliance for requirement 206 if the entity does not provide the data as specified AND the entity is unable to resolve the discrepancy with its RA.</li> <li>3. Addressing data quality and protocols is outside the scope of this standard.</li> <li>4. Most industry commenters requested that related requirements be grouped together.</li> <li>5. The standard was revised as follows: Evidence indicating data was sent to the reliability authority or evidence that the entity responsible committed to providing the data on the specification. Copies of transmittal cover letters indicating data was sent to the reliability authority.</li> <li>6. The SDT tried to accommodate most industry commenters by balancing the needs of the RA against the needs of other functions. Under the Functional Model, the RA has been assigned a great deal of responsibility. Other functions must work cooperatively with the RA so the RA has the information needed, when needed, to make reasonable decisions to protect the interconnected transmission system. The standard includes language to indicate that the data must be provided in a 'mutually agreed upon format'. This language was included to try and address the RA's needs as well as the needs of the rest of the industry. Requiring that every element of the data specification be, 'mutually agreeable' seemed unwieldy, and requiring the RA to justify every element of its data specification also seems unwieldy.</li> </ol>	
<p>Tom Pruitt Duke Power #1</p>	<p>For consistency with previous sections, replace the first sentence in section 206.4.2 with "The performance-reset period shall be one calendar year."</p>
<p>There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: "12 months from the last violation" This change supports your recommendation.</p>	

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision**

<p><u>Operating Reliability Working Group SPP</u>          Gerry Burrows KCP&amp;L #1          Bob Cochran SPS #1          Peter Kuebeck OG&amp;E #1          Scott Moore AEP #1          Tom Stuchlik Westar #1          Dan Boezio AEP #1          Matt Bordelon CLECO #1          Mike Crouch WFEC #1          Mike Gammon KCP&amp;L #1          Kevin Goolsby SPP #2          Bo Jones Westar #1          Allen Klassen Westar #1          Thad Ness AEP #1          Harold Wyble KCP&amp;L #1          Robert Rhodes SPP #2</p>	<ol style="list-style-type: none"> <li>1. The cover letter requirement in 4.3.1 is confusing and needs clarification. While such a letter can provide evidence that data has been sent, such a requirement could also prove to be excessive and impractical. Infrequent data transmittals such as impedance changes, ratings, etc, could easily be transmitted under cover letter. However, does this requirement also apply to each bit of real-time data transmitted via ICCP?</li> <li>2. Only one data point out of potentially thousands of points could cause non-compliance as specified in Section 5. This implies that nothing less than 100% of the data, 100% of the time is sufficient. Is this the intent of the SDT? Is a transducer failure in a remote substation as damaging to reliability of the interconnection as the loss of an entire ICCP link between a responding entity and its reliability authority? Is a failure for one scan cycle as critical as that point not being available for days or weeks? It would appear that non-compliance associated with this standard needs revisiting.</li> <li>3. There appears to be inconsistency between non-compliance in 205 and 206. If a reliability authority makes an unreasonable data request in 205 and doesn't get the requested data within the specified timeframe, then the reliability authority is only penalized at a level one. But if a responding entity loses one data point for one four-second data scan, that responding entity is blasted with a level four penalty. There does not appear to be equity here.</li> </ol>
<ol style="list-style-type: none"> <li>1. Several commenters agreed with your comment about 4.3.1. The standard was revised as follows: Evidence indicating data was sent to the reliability authority or evidence that the entity responsible committed to providing the data on the specification. <del>Copies of transmittal cover letters indicating data was sent to the reliability authority.</del></li> <li>2. The data specification issued by the RA under requirement 205 must identify how real time data will be supplied when there are telecommunication failures. As long as the data is supplied as specified, there is no sanction. (205.2.1.2 Specification shall address the data provision process to use when automated real-time system operating data is unavailable.)</li> <li>3. If an entity feels that the data specified by the RA is unreasonable, then that entity can try to resolve the issue with its RA or through the dispute resolution process. Both requirements 205 and 206 were modified to add a provision that if the RA is able to resolve the issue of not receiving the data it needs, then the RA does not need to notify its compliance monitor. There is only a level four non-compliance for requirement 206 if the entity does not provide the data as specified AND the entity is unable to resolve the discrepancy with its RA.</li> </ol>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision**

<p>Larry Larson Otter Tail Power  Derrick Moe WAPA  Dick Pursley Great River Energy  Martin Trencé Xcel Energy  Joseph Knight MAPPCOR</p>	
<p>Agreed. The data specification issued by the RA under requirement 205 must identify how real time data will be supplied when there are telecommunication failures. As long as the data is supplied as specified, there is no sanction. (205.2.1.2 Specification shall address the data provision process to use when automated real-time system operating data is unavailable.) In addition, both requirements 205 and 206 were modified to add a provision that if the RA is able to resolve the issue of not receiving the data it needs, then the RA does not need to notify its compliance monitor. There is only a level four non-compliance for requirement 206 if the entity does not provide the data as specified AND the entity is unable to resolve the discrepancy with its RA.</p>	
<p>Ed Davis Entergy Services #1</p>	<p>Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO and RA. Therefore, we suggest that every occurrence of the term “reliability authority” in all of this section 206 be replaced with “reliability authority and transmission owner”.</p>
<p>The Functional Model assigns responsibility for monitoring operating reliability limits and for conducting operating reliability analyses to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The data being provided in this requirement is data needed to support real time monitoring and operational planning analyses and real-time assessments relative to IROLs. The Transmission Owner is not responsible for the reliability of the bulk transmission system and does not need to receive this data identified in this requirement.</p>	
<p><u>SERC Operations Planning Subcommittee</u>  Carter Edge SEPA #4, 5  William Gaither So Carolina Pub Serv Auth #1  Mike Miller Southern Co #1  Roger Brand Muni Elec Auth GA #1  Phil Creech Progress Energy – CP&amp;L #1  Gene Delk So Carolina Elec &amp; Gas #1  Al McMeekin So Carolina Elec &amp; Gas #1  Greg Ott Alcoa-Yadkin #1  Doug Newbaue GA System Operations #1  Mike Clements TVA #1  Don Reichenbach Duke Energy #1</p>	<p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures.  Section 4.3.1 is too specific for the measure it supports. A possible solution might be:  <b>Documentation</b> indicating data was sent to the reliability authority <b>in accordance with Measure 2.1</b></p> <p>Non-compliance in data submission could take several forms and levels of impact to reliability. Section 5 should be modified as follows:  5. Levels of Non-compliance:  5.1. Level one: <b>Data was provided, but not in the mutually agreed format</b>  5.2. Level two: <b>Data was provided, but not within the time-frame specified</b></p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision**

<p>Lynna Estep SERC #2 Mark Creech TVA #1</p>	<p>5.3. Level three: <b>Incomplete data was provided</b> 5.4. Level four: Data <b>was</b> not provided to the reliability authority as specified.</p>
<p>The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</p> <p>The result of having data supplied, but not in the agreed upon format, having data supplied late, and having incomplete data is all the same – the RA doesn't have the data it needs to support monitoring, analyses and assessments relative to IROLs for its reliability area. Both requirements 205 and 206 were modified to add a provision that if the RA is able to resolve the issue of not receiving the data it needs, then the RA does not need to notify its compliance monitor. There is only a level four non-compliance for requirement 206 if the entity does not provide the data as specified AND the entity is unable to resolve the discrepancy with its RA.</p>	
<p>Alan Johnson Mirant Americas Energy Mktg #6</p>	<p>In the requirements and measures section, would like to see language added that will be more specific as to where entities can obtain RA specifications for data provision. For example, section 1.1 could be modified to read as follows: “ Each entity performing one of the following functions shall provide data, as specified <i>in the RA's business practice manual</i>, to the reliability authority(ies) with which is has a reliability relationship.”</p> <p>Regarding the compliance monitoring process, section 4.3.1 may be inconsistent since the method of transmitting data is not specified.</p>
<p>Each RA may develop its own data specification – so including a title for RA's data specification documents is beyond the scope of this standard. The standard was drafted to give RAs flexibility – some RA's may have a data specification in a single document, while other RAs may have multiple data specifications.</p> <p>Section 4.3.1 was modified as follows. “The standard was revised as follows: Evidence indicating data was sent to the reliability authority or evidence that the entity responsible committed to providing the data on the specification. <del>Copies of transmittal cover letters indicating data was sent to the reliability authority.</del>”</p>	
<p><u>Centerpoint Energy #1</u> Richard Sikes John Jonte Wayne Kemper Glenn Hemperley Brad Calhoun</p>	<p>We believe the reliability of the real-time bulk transmission system is a coordinated effort between the Reliability Authority and Transmission Operator and the data should be provided to both functions.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 206 – Data Provision**

---

<p>The Functional Model assigns responsibility for monitoring operating reliability limits and for conducting operating reliability analyses to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The data being provided in this requirement is data needed to support real time monitoring and operational planning analyses and real-time assessments relative to IROLs. The Transmission Operator is not responsible for the reliability of the bulk transmission system and does not need to receive all of the same data identified in this requirement. The TOP does need some of this data to monitor local network integrity, but requiring that data be provided to the TOPs is beyond the scope of this standard.</p>	
<p>Kathleen Goodman ISO-NE #2</p>	<p>Under the Section 4.3.1 “Copies of transmittal cover letters...” may not be an appropriate measure for instances of notification of missing data. For example, most of the data required is transmitted electronically from field equipment, through ICCP/SCADA, and into the EMS. Where would such “cover letters” fall in this process?</p>
<p>The compliance monitoring process was modified to broaden the scope of evidence that could be used to demonstrate compliance. As many commenters indicated, a cover letter is not sent with real-time data and it isn’t reasonable to request this. The standard was revised as follows: Evidence indicating data was sent to the reliability authority or evidence that the entity responsible committed to providing the data on the specification. <del>Copies of transmittal cover letters indicating data was sent to the reliability authority.</del></p>

<u>Compliance Subcommittee</u>			Change 4.1 to: The responsible entity shall demonstrate compliance to the compliance monitor within the first year that this standard becomes effective or the first year the entity commences operation by information submittal to the compliance monitor, either on or off site at the compliance monitors discretion. Add new 4.2 Subsequent to the initial compliance review, compliance will be re-verified at least every three years using a scheduled on-site review method or un-scheduled (investigation) method, review of information submitted as requested, or through self-certification, at the discretion of the compliance monitor. Re-number 4.2 and 4.3 to 4.3 and 4.4
The suggested language changes were not adopted for the following reasons.			
<ul style="list-style-type: none"> <li>- "Information submittal" is an undefined term. Industry commenters have asked that the compliance elements be as specific as possible so that there won't be huge variations from region to region in the application of the compliance monitoring. If an 'information submittal' is the same as a self-certification document, then this is already covered in the original language. Including language that gives each compliance monitor the flexibility to assess this requirement however it chooses, does not conform with the industry's requests for standardization in the compliance monitoring process.</li> <li>- The only significant change between the original language and the proposed new section 4.2 is the addition of the concept that the compliance monitor has the freedom to either conduct an audit per a schedule, or just show up unscheduled. Again, this does not support the industry's request for increased standardization in the compliance monitoring process. The original language included the option of conducting an 'investigation upon compliant' and this seems more appropriate than unscheduled audits.</li> </ul>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 207 – Action Plan**

**Requirement 207 - Action Plan – Other comments?**

**Summary Consideration:** While there were many comments recommending specific changes, most commenters indicated support of the requirement, its measures and compliance elements. The following changes were made:

- Measure 2.1 was modified to indicate that the Action Plan must 'identify' as well as be coordinated with entities that take actions and with entities that are affected by such actions.

The Performance Reset period was modified to include the following language: "12 months from the last violation"

Suggestions to change the format of the compliance so that it cross referenced measures (e.g., ". . .as described in measure 2.1") and were not adopted. When the standards are entered into a relational database and reports are generated, cross-references will be difficult to understand.

The SDT was unable to accommodate the changes recommending that Transmission Owner and Transmission Operator be added to the list of functions that must develop Action Plans. The Functional Model assigns responsibility for reliability of the transmission system to the Reliability Authority, and these new standards are being developed to support the delineation of responsibility outlined in the Functional Model.

Commenter	Comments
Terry Bilke Midwest ISO #2	How do you demonstrate coordination of an action plan?
<p>The compliance manager could contact the entities listed in the plan and ask them if they were invited to participate in the development of the plan.</p>	
<p>Stuart Goza TVA #1</p> <p><u>SERC Operations Planning Subcommittee</u></p> <p>Carter Edge SEPA #4, 5</p> <p>William Gaither So Carolina Pub Serv Auth #1</p> <p>Mike Miller Southern Co #1</p> <p>Roger Brand Muni Elec Auth GA #1</p> <p>Phil Creech Progress Energy – CP&amp;L #1</p> <p>Gene Delk So Carolina Elec &amp; Gas #1</p> <p>Al McMeekin So Carolina Elec &amp; Gas #1</p> <p>Greg Ott Alcoa-Yadkin #1</p> <p>Doug Newbaue GA System Operations #1</p> <p>Mike Clements TVA #1</p> <p>Don Reichenbach Duke Energy #1</p> <p>Lynna Estep SERC #2</p> <p>Mark Creech TVA #1</p>	<p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. The Levels of non-compliance should be objectively determined based on the evidence.</p> <p>Measure 2.1 should be modified to include:</p> <p style="padding-left: 40px;">2.1. The reliability authority shall have a documented action plan that addresses preventing and mitigating instances of exceeding interconnection reliability operating limits. The plan shall <b>identify and</b> be coordinated with those entities responsible for acting and with those entities impacted by such actions.</p> <p>Section 4.3 should be modified to include:</p> <p style="padding-left: 40px;">4.3. The reliability authority shall make the following available for inspection by the compliance monitor upon request:</p> <p style="padding-left: 80px;">4.3.1 Action plan <b>developed in accordance with Measure 2.1</b></p> <p>Section 5 should be modified to include:</p> <p style="padding-left: 40px;">5. Levels of Non-compliance</p> <p style="padding-left: 80px;">5.1. Level one: Action plan exists but wasn't coordinated with all involved</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 207 – Action Plan**

<p>Susan Morris SERC #2          Bill Reinke SERC #2          Sam Stryker Fayettevill PWC #3, 4, 5          Carter Edge SEPA #4, 5          Bill Thompson Dominion Trans #1</p>	<p>and impacted entities</p> <p>5.2. Level two: Action plan exists but wasn't coordinated with any involved or any impacted entities</p> <p>5.3. Level three: <b>Action plan is incomplete</b></p> <p>5.4. Level four: No action plan</p>
<p>The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</p> <p>The suggestion to add, 'and identify' was adopted and is reflected in the revised standard.          The suggestion to add, "action plan incomplete" for a level three non-compliance was not added because this would be difficult to objectively measure.</p>	
<p>NPCC CP9          Michael Schiavone National Grid USA #1          Roger Champagne Hydro-Quebec TransEnergie #1          Ralph Rufrano New York Power Authority #1          David Little Nova Scotia Power Inc. #1          David Kiguel Hydro One Networks #1          Michael Potishnak ISO-New England #2          Barry Gee National Grid USA #1          Dan Stosick ISO-New England #2          Fernando Saavedra ISO-New England #2          Greg Campoli New York ISO #2</p>	<p>NPCC suggests that there be timeframe requirement added instead of "upon request" to providing the Action plan and suggests 20 business days.</p>
<p>If the plan exists, there should not be a need to have 20 business days to show the plan. This suggestion was not adopted since it could have the affect of encouraging non-compliant performance.</p>	
<p>Charles Yeung Reliant #5</p>	<p>The requirement is silent on whether the Action Plan must comply with any tariff or market requirements. As written, it is allowable for an RA to submit a "command and control" schedule reduction or load-shedding procedure as its Action Plan to meet this Requirement. Reliant understands that NERC believes such Action Plans have significant commercial consequences and should be developed by other standard setting organizations. However, without the RA and control area operators' agreement that such Action Plans are effective, the industry effort to develop such plans will be slow and cumbersome. Reliant recommends that this SDT coordinate with the appropriate standards setting organization(s) to ensure the Action Plans are effective. Further, this Requirement should include a requirement that these Action Plans are the</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 207 – Action Plan**

	primary means of mitigating Reliability Operating Limit violations and not a “command and control” or “Emergency” procedure.
<p>NERC’s reliability standards are being developed to support reliability and making specific references to tariffs and market issues is outside the scope of these new standards. However, the standards are being developed in a manner that should protect the markets. This standard includes the following specific language that was intended to ensure that entities impacted by an Action Plan would have an opportunity to participate in the development of the plan: “The plan shall identify and be coordinated with those entities responsible for acting and with those entities impacted by such actions. “</p> <p>Action Plans are intended to be unique to each RA, not generic to the industry. The SDT does not have a role in developing the individual RA’s Action Plans, and therefore the SDT has no role in coordinating the development of these action plans with other standards-setting organizations.</p> <p>Language in the standard specifically states that if an existing ‘emergency procedure’ addresses the prevention and mitigation of IROLs, then that procedure could be used to meet this requirement. The intent is to ensure that RAs are not forced to revise existing documents that already address this requirement.</p>	
<p>Susan Morris SERC #2          Bill Reinke SERC #2          Sam Stryker Fayettevill PWC #3, 4, 5          Carter Edge SEPA #4, 5          Bill Thompson Dominion Trans #1          Ed Davis Entergy Services #1</p>	<p>Please see the comment to question (2), above, concerning the TOs responsibility and role with respect to this standard. If the developers of the standard insist on only one functional entity being responsible for this activity, then that functional entity should be the Transmission Owner. However, we view this activity as a shared activity between the TO(s) and RA. Therefore, we suggest that every occurrence of the term “reliability authority” in all of this section 207 be replaced with “reliability authority and transmission owner(s)”.</p>
<p>The Functional Model assigns responsibility for reliability of the bulk transmission system to the Reliability Authority and these new standards must be written in a manner that supports the delineation of responsibility outlined in the Functional Model. The Transmission Owner is not responsible for the reliability of the bulk transmission system.</p>	
<p><u>FRCC Op, Eng &amp; Mkt Int</u>          Linda Campbell FRCC #2          Paul Elwing Lakeland Electric #3          John Shaffer FPL #1          Bob Remley Clay Elec Coop #4          Patti Metro FRCC #2          Eirc Grant Progress Energy – FL #1          Joe Roos Ocala Electric Utility #3          Joe Krupar FL Muni Pwr Agency #3          Richard Gilbert Lakeland Electric #3          Bill Slater Progress Energy – FL #1          Amy Long Lakeland Electric #1</p>	<p>We are not convinced that this requirement is needed. The requirements in 204 (Actions) seem to already cover this area. There could be many actions to take to prevent or mitigate instances of exceeding IROLs, so it could be extremely burdensome to document every conceivable action. Truly the proof is in the 204 requirement so we would suggest deleting this one.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 207 – Action Plan**

Roger Westphal Gainesville Regional Util #5 Bob Goss SEPA #5 Steve Wallace Seminore Electric Coop #4 Ted Hobson JEA #1	
Most industry commenters supported the inclusion of this requirement, so it was not dropped from the standard.	
Dan Boezio & Raj Rana AEP #1, 3, 5, 6	Defined terms should be capitalized, such as “Reliability Authority”, “Operational Planning Analyses”, “Interconnected Reliability Operating Limits”, etc
The suggestion that defined terms be capitalized has been adopted and is reflected in the revised standard.	
Tom Pruitt Duke Power #1	For consistency with previous sections, replace the first sentence in section 207.4.2 with “The performance-reset period shall be one calendar year.”
There were several commenters who suggested changes to the reset period, and the standard was revised so that all requirements in this standard have the following language: “12 months from the last violation” This change supports your recommendation.	
Alan Johnson Mirant Americas Energy Mktg #6	Suggest adding a requirement that the RA notify those entities impacted by the action plan, of their responsibilities within the action plan. This will enable them to incorporate the required actions into their own operating plans.
The standard requires that those impacted be involved in the development of the plan. The requirement includes the following language intended to ensure that those impacted would have some involvement in the development of the Action Plan. “The plan shall identify and be coordinated with those entities responsible for acting and with those entities impacted by such actions.”	
<u>Centerpoint Energy #1</u> Richard Sikes John Jonte Wayne Kemper Glenn Hemperley Brad Calhoun	We believe that for an action plan to mitigate events it must be coordinated between involved parties, i.e. Reliability Authorities and Transmission Operators.
The standard includes language to support this: “The plan shall identify and be coordinated with those entities responsible for acting and with those entities impacted by such actions.” If the TOP is responsible for taking actions, then the TOP is required to be involved in the development of the plan.	
Kathleen Goodman ISO-NE #2	ISO-NE again suggests that provisions be made for mitigating actions which were not previously identified by study, but cleared the limit violation. If these provisions are not included, it may restrict the actions that may be taken and, ultimately, adversely impact reliability (i.e. there may be actions that can be taken in real-time, given an existing network configuration which was not envisioned at the time the operational analysis was done; however, if NERC Standards mandate that an action plan be followed, these

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 207 – Action Plan**

---

	<p>actions may not be taken or seriously considered).</p> <p>All data retention requirements of three years should be modified to a 12-month rolling retention.</p>
<p>This requirement states, “The reliability authority shall have an action plan that identifies actions it shall take or actions it shall direct others to take, to prevent or mitigate instances of exceeding its interconnection reliability operating limits.” The intent is to ensure that the RA’s system operators have a plan to follow in advance of being faced with an IROL event. Note that, for the reasons you’ve stated, this standard does not require that the RA’s system operators follow the Action Plan. The drafting team feels that any action taken, whether part of a plan or not, or any deliberate decision to take no action, meets the standard. The decision to not take any action must show up in the documentation.</p> <p>This standard requires keeping the data for just 3 years to ensure that there is some data on site when the Compliance Monitor conducts a scheduled audit once every 3 years.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 208 – RA Directives**

**Requirement 208 – Reliability Authority Directives - Other comments**

**Summary Consideration:** While there were many comments recommending specific changes, most commenters indicated support of the requirement, its measures and compliance elements.

- A level one non-compliance was added for instances where an entity followed the RA’s directives but did not document this.
- The performance reset period was modified so that it is consistent throughout this standard. The revised performance reset period , “12 months from the last violation”.

Suggestions to change the format of the compliance so that it cross referenced measures (e.g., “. . .as described in measure 2.1”) and were not adopted. When the standards are entered into a relational database and reports are generated, cross-references will be difficult to understand.

The Generator Operator was not added to the list of functions that must comply with RA directives because under the Functional Model, the RA directs the BA and the BA directs the Generators.

Commenter	Comments
Terry Bilke Midwest ISO #2	The “measures” section only say that the various authorities only have to document the directive and the actions they took (not that they actually followed the directive).
Both the requirement and the measure clearly stated that the entity responsible “. . . shall follow the reliability authority’s directives. . . “	
Stuart Goza TVA #1	<p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. Non-compliance could take several forms and levels of impact to reliability. The Levels of non-compliance should be objectively determined based on the evidence.</p> <p>Section 4.3.1 should be modified to read:</p> <p style="margin-left: 40px;">4.3.1. Operations log or other data source(s) to show the following for each instance of being issued a reliability authority directive relative to an interconnection reliability operating limit:</p> <p style="margin-left: 80px;">4.3.1.1. Date and time of each of directive received</p> <p style="margin-left: 80px;">4.3.1.2. Directive issued</p> <p style="margin-left: 80px;">4.3.1.3. Actions taken in response to directive <b>in accordance with Measure 2.1</b></p> <p>Section 5 should be modified as follows:</p> <p>5. Levels of Non-compliance</p> <p style="margin-left: 20px;">5.1 Level one: <b>Operations log or other data source(s) do not show one of the following:</b></p> <p style="margin-left: 40px;"><b>5.1.1 Date and time of each of directive received</b></p> <p style="margin-left: 40px;"><b>5.1.2 Directive issued</b></p> <p style="margin-left: 40px;"><b>5.1.3 Actions taken in response to directive</b></p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 208 – RA Directives**

	<p>5.2 Level two: Operations log or other data source(s) do not show any of the following:</p> <p>5.1.4 Date and time of each of directive received</p> <p>5.1.5 Directive issued</p> <p>5.1.6 Actions taken in response to directive</p> <p>5.3 Level three: Not applicable.</p> <p>5.4 Level four: Did not follow directives.</p>
<p>The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</p> <p>Other commenters also suggested additional levels of non-compliance. A level one was added to address situations where the directives were followed, but weren't documented.</p>	
<p>Kathleen Goodman ISO-NE #2  <u>NPCC CP9</u>  Michael Schiavone National Grid USA #1  Roger Champagne Hydro-Quebec TransEnergie #1  Ralph Rufrano New York Power Authority #1  David Little Nova Scotia Power Inc. #1  David Kiguel Hydro One Networks #1  Michael Potishnak ISO-New England #2  Barry Gee National Grid USA #1  Dan Stosick ISO-New England #2  Fernando Saavedra ISO-New England #2  Greg Campoli New York ISO #2</p>	<p>Although we agree with the level four instance of non-compliance it would be beneficial for the compliance monitor to require data and other information surrounding the inaction.</p>
<p>If there were inaction, the RA would most likely notify the compliance monitor, and the compliance monitor would conduct a triggered investigation. During the triggered investigation, the compliance monitor may ask for additional details to determine the reason for not following the RA's directives.</p>	
<p>Peter Burke ATC #1</p>	<p>Opinion within ATC was divided over requirement 208. One side could agree with the requirement, its measures, and its monitoring process. The other side could not agree and specifically cited 208.1.2, 208.2.1, and 208.2.2, and those requirements to document directives and actions taken, as onerous.</p>
<p>The documentation should not be onerous as it is typically the same documentation currently logged in control rooms by system operators.</p>	
<p>Charles Yeung Reliant #5</p>	<p>The RA should have contractual arrangements in place with generators, transmission providers, control area operators and any entity that is required to respond to the "Actions" and "Action Plan" that expressly provides the RA the authority to execute this</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 208 – RA Directives**

	Requirement.
	<p>The RA Certification SAR includes the following language: "Agreements must be in place defining the responsibilities and authority of the RELIABILITY AUTHORITY with respect to all Balancing Authorities, Interchange Authorities, Transmission Operators, Transmission Service Provider and all other applicable functional entities within the reliability area and with other Reliability Authorities. Agreements shall address both normal and emergency operations."</p> <p>This requirement places sanctions on entities that do not follow the RA's directives and assumes that the authority for issuing those directives has already been agreed upon as part of the RA Certification process.</p>
<p>Susan Morris SERC #2            Bill Reinke SERC #2            Sam Stryker Fayettevill PWC #3, 4, 5            Carter Edge SEPA #4, 5            Bill Thompson Dominion Trans #1</p>	<p>We believe the wording of this draft standard Section 208 Reliability Authority Directives, 1. Requirements, Item 1.1 is restricted to too few entities, needs to be expanded to encompass all functions and users of the power system, should recognize the RA is required to issue directives consistent with applicable tariffs and contract, and the RA is required to use Good Utility Practices. This requirement must be reworded:</p> <p>1.1. The reliability authority shall use applicable tariffs, contracts, and Good Utility Practice when directing use of the power system and all users of the power system shall follow the reliability authority's directives to:</p> <p>Prevent instances where interconnection reliability operating limits may be exceeded</p> <p>Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded</p> <p>Generally, the Measures should be tied to the Requirements and the Objective Evidence for Compliance (OEC) should be tied to the Measures. Non-compliance could take several forms and levels of impact to reliability. The Levels of non-compliance should be objectively determined based on the evidence.</p> <p>Section 4.3.1 should be modified to read:</p> <p>4.3.1. Operations log or other data source(s) to show the following for each instance of being issued a reliability authority directive relative to an interconnection reliability operating limit:</p> <p>4.3.1.1. Date and time of each of directive received</p> <p>4.3.1.2. Directive issued</p> <p>4.3.1.3. Actions taken in response to directive in accordance with Measure 2.1</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 208 – RA Directives**

	<p>Section 5 should be modified as follows:          Levels of Non-compliance          5.3 Level one: Operations log or other data source(s) do not show one of the following:              Date and time of each of directive received              Directive issued              Actions taken in response to directive          5.4 Level two: Operations log or other data source(s) do not show any of the following:          5.1.10 Date and time of each of directive received          5.1.11 Directive issued          5.1.12 Actions taken in response to directive          5.5 Level three: Not applicable.          Level four: Did not follow directives.</p>
<p>The Functional Model provides a 'chain of command' type of functional relationship that has been supported in the development of this standard. This 'chain of command' type of structure doesn't support having the RA direct all entites performing all functions, rather the Functional Model has the RA giving directives to a subset of functions, and this subset of functions then passes on instructions to other functions.</p> <p>Including specific language that references tariffs and market issues is outside the scope of NERC's reliability standards. There is no common definition for Good Utility Practice –consequently it is not possible to enforce compliance with Good Utility Practice.</p> <p>The suggested format change was not adopted. The standards have been drafted to be as succinct as possible – and the additional words do not add anything to the standard. In addition, when the standards are completed, they will be available to the industry in a relational database with search capabilities. If the suggested cross-referencing were adopted, and someone downloaded a report that listed just the compliance elements for this standard, the cross references would lead the reader to believe that additional information could be found in the measures – and in many cases this is not true.</p> <p>Other commenters also suggested additional levels of non-compliance. A level one was added to address situations where the directives were followed, but weren't documented.</p>	
<p>Gerald Rheault Manitoba Hydro #1, 3, 5, 6</p>	<p>the documentation in 4.1 is incomplete. For purpose of determining the acceptability of this item it was assumed that the intent was for the documentation to be similar to the wording for 207 item 4.1</p>
<p>The posted document was missing some data, but this was corrected and the missing information was added after the first few days of the 60-day posting.</p>	
<p>FRCC Op, Eng &amp; Mkt Int Linda Campbell FRCC #2</p>	<p>Clarification of who is the entity responsible needs to be made throughout this requirement 208.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 208 – RA Directives**

<p>Paul Elwing Lakeland Electric # 3          John Shaffer FPL #1          Bob Remley Clay Elec Coop #4          Patti Metro FRCC #2          Eirc Grant Progress Energy – FL #1          Joe Roos Ocala Electric Utility #3          Joe Krupar FL Muni Pwr Agency #3          Richard Gilbert Lakeland Electric #3          Bill Slater Progress Energy – FL #1          Amy Long Lakeland Electric #1          Roger Westphal Gainesville Regional Util #5          Bob Goss SEPA #5          Steve Wallace Seminore Electric Coop #4          Ted Hobson JEA #1</p>	<p>Step 4.1 of the compliance monitoring process is not complete. It would seem that this 208 is a complement to 204. In 204 the RA is already documenting the actions directed, along with information if a violation occurred. This states that a level 4 is obtained if they did not follow directives. It would seem to make sense to only have this if they did not follow directives and a violation occurred. Perhaps consideration needs to be given to a lower non-compliance level for not documenting their actions, or lack of actions taken when given a directive.</p>
<p>There are places in this standard where the term, 'entity responsible' is used. In these cases, more than one entity may be responsible for complying with the requirement – and a decision was made that the standard would be less cumbersome to read if the term, 'the entity responsible' was used rather than listing all the entities that must comply. For this requirement, the entities responsible include entities performing the following functions: transmission operator, balancing authority and interchange authority</p> <p>The posted document was missing some data, but this was corrected and the missing information was added after the first few days of the 60-day posting.</p> <p>Other commenters also suggested additional levels of non-compliance. A level one was added to address situations where the directives were followed, but weren't documented.</p>	
<p>Alan Boesch NPPD #1</p>	<p>Documentation is not a reliability issue          The entity should only document the actions taken. The RA should document the directive.          The level of non-compliance only deals with following the directives. Why are there measurements (documentation) that are not compliance issues? Either they should not be measurements (my choice because failure to document is not a reliability issue), or the should have a compliance measure.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 208 – RA Directives**

<p>When it isn't possible or practical to measure performance in 'real time', the compliance monitor may use physical evidence like documentation, to assess compliance. The standard requires that both the RA and the entities following the RA's directives document the directives issued. In areas where the RA's directives weren't followed, and the compliance monitor conducts a triggered investigation, any mismatch between the records could help in the investigation.</p> <p>Several commenters suggested additional levels of non-compliance. A level one was added to address situations where the directives were followed, but weren't documented.</p>	
<p>Dan Boezio &amp; Raj Rana AEP #1, 3, 5, 6</p>	<p>Defined terms should be capitalized, such as "Reliability Authority", "Operational Planning Analyses", "Interconnected Reliability Operating Limits", etc</p> <p>208.1.1: Add generator operator.</p> <p>208.2.1: The requirement for the entity responsible to follow the Reliability Authority's directives is already stated in the requirements section and does not need to be restated in the measures section. Suggest rewording as follows: "The entity responsible shall document the directives of the Reliability Authority and the actions taken to meet those directives."</p>
<p>The suggestion that defined terms be capitalized has been adopted and is reflected in the revised standard.</p> <p>The generator operator was not added to the list of functions that must comply with this standard because under the Functional Model, the generator operator takes direction from the balancing authority, not the reliability authority.</p> <p>Some commenters indicated a preference for including a measure that specifically addresses each of the requirements. The measures are intended to identify the elements that the compliance monitor will look at to determine if the desired performance has been achieved –there is nothing wrong in including the same language in both the requirement and the measures.</p>	
<p>Tony Jankowski We Energies #4</p>	<p>Modify section 208.5.1 to read "Level one: Did not properly document an issued directive and/or the subsequent action taken."</p>
<p>Several commenters suggested additional levels of non-compliance. A level one was added to address situations where the directives were followed, but weren't documented.</p>	
<p>Michael Sidiropoulos Pacificorp</p>	<p>Suggestion: Include generator operator in section 1.1</p>
<p>The generator operator was not added to the list of functions that must comply with this standard because under the Functional Model, the generator operator takes direction from the balancing authority, not the reliability authority.</p>	

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 208 – RA Directives**

<p><u>Operating Reliability Working Group SPP</u>  Gerry Burrows KCP&amp;L #1  Bob Cochran SPS #1  Peter Kuebeck OG&amp;E #1  Scott Moore AEP #1  Tom Stuchlik Westar #1  Dan Boezio AEP #1  Matt Bordelon CLECO #1  Mike Crouch WFEC #1  Mike Gammon KCP&amp;L #1  Kevin Goolsby SPP #2  Bo Jones Westar #1  Allen Klassen Westar #1  Thad Ness AEP #1  Harold Wyble KCP&amp;L #1  Robert Rhodes SPP #2</p>	<p>Generator operators need to be added to the entities listed in Requirement 1.1.</p> <p>Requirement 1.2 is repeated again in Measure 2.1.</p> <p>The levels of non-compliance need to be reviewed to ensure that they accurately reflect how well the directives were followed. Timing of actions taken with regards to when the directives were issued should also be considered.</p>
<p>The Functional Model provides a 'chain of command' type of functional relationship that has been supported in the development of this standard. This 'chain of command' type of structure doesn't support having the RA direct all entites performing all functions, rather the Functional Model has the RA giving directives to a subset of functions, and this subset of functions then passes on instructions to other functions. The generator operator was not added to the list of functions that must comply with this standard because under the Functional Model, the generator operator takes direction from the balancing authority, not the reliability authority.</p> <p>Some commenters indicated a preference for including a measure that specifically addresses each of the requirements. The measures are intended to identify the elements that the compliance monitor will look at to determine if the desired performance has been achieved –there is nothing wrong in including the same language in both the requirement and the measures.</p> <p>In many instances, how well a RA's directives are followed is a function of the communication skills of the system operator providing direction. If the RA's directives include timing, then it is fair to include a consideration of timing when assessing non-compliance. If the RA's directives do not include a timing requirement, then this would be impossible to measure objectively.</p>	
<p><u>MAAP Ops Subcommittee #2</u>  Llyod Linke MAPP  Allan Silk Manitoba Hydro  Paul Brune NPPD  Tod Gosnell Omaha Public Pwr Dist  Paul Koskela Minnesota Pwr  Larry Larson Otter Tail Power</p>	<p>Please clarify if the intention here is for entities to comply with the RAs directives in cases that those directives are proscribed by an existing operating guide – or in all cases? If a Reliability Authority is issuing an order that conflicts with a standing operating guide, then the RA must first explicitly/formally invalidate the guide prior to issuing the directive. Please provide information regarding how liability will be assigned for actions that are found to be improper that result in harm.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 208 – RA Directives**

<p>Derrick Moe WAPA  Dick Pursley Great River Energy  Martin Trency Xcel Energy  Joseph Knight MAPPCOR</p>	
<p>This requirement addresses following the RAs directives issued relative to preventing or mitigating instances of exceeding IROLs. These directives may include proscribed actions from the RAs Action Plan (requirement 207) or may be a new set of actions based on the current operating conditions. In some cases, the RA doesn't have time to provide a detailed explanation of why an Action Plan isn't being followed. Addressing liability issues is outside the scope of the SDT but may be addressed in formal agreements with the RA.</p>	
<p>Darrell Richardson Illinois Power #1, 3</p>	<p>This does not allow for a directive to be challenged. It is either comply with the directive or don't and suffer the results. It would seem that you should have the right to request additional or further discussion surrounding the directive.</p>
<p>In some cases, the RA doesn't have time to provide a detailed explanation of why an Action Plan isn't being followed. In some circumstances, an RA must contact several different entities, asking each entity to take a different action. Requesting additional information from the RA or holding a discussion with the RA may be possible, and there is nothing in this standard that precludes that.</p>	
<p>Ed Davis Entergy Services #1</p>	<p>We believe the wording of this draft standard Section 208 Reliability Authority Directives, 1. Requirements, Item 1.1 is restricted to too few entities, needs to be expanded to encompass all functions and users of the power system, should recognize the RA is required to issue directives consistent with applicable tariffs and contract, and the RA is required to use Good Utility Practices. This requirement must be reworded:</p> <p style="color: red;">1.1. The reliability authority shall use applicable tariffs, contracts, and Good Utility Practice when directing use of the power system, and all users of the power system shall follow the reliability authority's directives to:</p> <p>1.1.1.1. Prevent instances where interconnection reliability operating limits may be exceeded</p> <p>1.1.1.2. Mitigate the magnitude and duration of instances where interconnection reliability operating limits have been exceeded</p>
<p>The Functional Model provides a 'chain of command' type of functional relationship that has been supported in the development of this standard. This 'chain of command' type of structure doesn't support having the RA direct all entites performing all functions, rather the Functional Model has the RA giving directives to a subset of functions, and this subset of functions then passes on instructions to other functions.</p> <p>Including specific language that references tariffs and market issues is outside the scope of NERC's reliability standards. There is no common definition for Good Utility Practice –consequently it is not possible to enforce compliance with Good Utility Practice .</p>

A level one was added to address situations where the directives were followed, but weren't documented.</p>	

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard Requirement 208 – RA Directives**

<p>Alan Johnson Mirant Americas Energy Mktg #6</p>	<p>Suggest that the generator operator function be added to section 1.1. Regarding the levels of non-compliance, agree that an entity should be penalized for not following a RA's directive, but question whether it is appropriate to take every violation to level four.</p>
<p>The generator operator was not added to the list of functions that must comply with this standard because under the Functional Model, the generator operator takes direction from the balancing authority, not the reliability authority.</p> <p>Most industry commenters supported a level four violation for not following the RA's directives.</p>	
<p><u>Southern Company Generation &amp; Energy Mktg</u>          Roman Carter # 5, 6          Joel Dison #5,6          Tony Reed #5,6          Lucius Burris #5,6          David Deerman #5,6          Clifford Shepard #5,6          Michael Smith #5,6          Lloyd Barnes SCGEM 5,6          Gary Miller SCGEM 5,6          Terry Crawley Southern Generation 5          Roger Green Southern Generation 5</p>	<p>If the RA makes an unreasonable request for data, whether it be the type of data needed or the timing of the data, the Transmission Operator, Balancing Authority, and the Interchange Authority will be considered totally (level 4) out of compliance if they do not fully comply. Therefore, a graduated scale is recommended.</p>
<p>This requirement is for RA directives relative to preventing or mitigating instances of exceeding IROLs. The data provision requirement was modified to indicate that there will only be a level four non-compliance if data is not provided as specified and the entities involved aren't able to resolve the situation. If an RA makes an unreasonable request for data, then the entity required to provide the data could try to resolve the issue with the RA or could use the dispute resolution process to resolve the issue. Note that the requirement that addresses the RA's Data Specification was modified to state more clearly that the data addressed by the data specification is limited to the data needed by the RA for monitoring and assessments relative to IROLs.</p>	

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

---

**Do you agree with the definitions provided in the front of this standard?**

**Summary Consideration:** The SDT made the following changes based on comments submitted by industry participants.

The following definitions are not used in the standard and have been eliminated:

- Documentable Interconnection Reliability Operating Limit Violation
- Interconnection Reliability Operating Limit Violation
- Reportable Interconnection Reliability Operating Limit Violation.

Two new terms were added, “Event Duration” and “Wide Area Impact”

Real-time Monitoring and Real-time Assessments were revised to improve the distinction between the two terms. Real-time Monitoring is more passive than Real-time Assessments and the revised definitions help clarify this.

The term, “Reliability Authority Area” was revised to conform with the definition provided in the draft changes to the Functional Model.

The term, “Self-certification” was revised to better reflect the intent of the self-certification process.

The term, “T<sub>v</sub>” was revised to better align with its application in this standard.

The term, “Real-time” was revised to better convey what was intended when this term is used in the standard.

Where a definition had included additional language to explain how the term applied to this standard, the additional language was dropped from the definition. This approach was applied to the following terms:

- Interconnection Reliability Operating Limit
- Operational Planning Analysis

The definition for Transmission Operator was transposed with that for Transmission Service Provider and this has been corrected.

Where an individual comment was submitted recommending a change to a term that was approved as part of the NERC Glossary of Terms, the definition was not changed.

- Bulk Electric System
- Cascading Outages
- Real – time Assessment
- Self - certification

Other minor ‘wordsmithing’ changes were made

Commenter	Yes	No	Comments
FRCC Op, Eng & Mkt Int Linda Campbell FRCC #2 Paul Elwing Lakeland Electric # 3	x		Most of the definitions are very helpful. However, we do have some questions on a few of them. - There is a definition for Real-time Monitoring and one for Real-time

The monitoring definition states "To use vision and hearing.." while the assessment definition states to collect and review immediately available data. It seems to us that the monitoring definition is really unnecessary, as we believe the intent is really covered in the assessment definition.</p> <ul style="list-style-type: none"> <li>- The definition for Operational Planning Analysis states, "The analysis should ensure that no IROLs will be exceeded." Is that really true for the analysis? Doesn't the analysis identify potential problems that need to be acted upon, so that it is really the actions of entities, not the analysis itself, that ensures no limit will be exceeded?</li> <li>- The definition of transmission operator in this document does not agree with the definition of transmission operator in the Functional Model. This definition actually is the same as the transmission service provider function. It appears there is still confusion over the functions defined in the functional model which is alarming since we are developing the reliability standards based on those functions.</li> </ul>
<p>The definitions for real-time monitoring and real-time assessments were revised to better distinguish between monitoring and assessing. The revised definitions clarify that assessing is more active than monitoring.</p> <p>The definition of the Operational Planning Analysis was revised as follows: <b>Operational Planning Analysis:</b> An examination of the expected system conditions, given the load forecast(s) and known system constraints, some examples being transmission facility outages, generator outages and equipment limitations. <del>"The analysis should ensure that no interconnection reliability operating limits will be exceeded during expected normal operation. An operational planning analysis is done up to seven days ahead of the expected conditions."</del> The descriptive information following the first sentence was dropped because it was not really part of the definition.</p> <p>As noted, the definition of Transmission Operator was incorrectly copied from the Functional Model. This was a transposition error, not an indication of confusion over the definitions.</p>			
<p><u>Centerpoint Energy #1</u>          Richard Sikes          John Jonte          Wayne Kemper          Glenn Hemperley          Brad Calhoun</p>	<p>x</p>		<p>We do not understand the total reason for changing Operations Security Limit to Interconnection Reliability Operating Limit, given its implications.</p>
<p>The Operating Limits Definitions Task Force (OLDTF) met with the Standards Drafting Team (SDT) and encouraged the SDT to adopt as much of the work of the OLDTF as possible. The OLDTF determined that the term, "Operations Security Limit" was interpreted to mean different things by different entities, and recommended that the SDT avoid use of the term, "Operations Security Limit".</p>			
<p>John Horakh MAAC #2</p>	<p>x</p>		<p>The definitions involving Interconnection Reliability Operating Limit need to be cleaned up to increase clarity and to eliminate duplication.</p>

			right definition is in the functional model.
As noted, the definition of Transmission Operator was incorrectly copied from the Functional Model.			
Dan Boezio & Raj Rana AEP #1, 3, 5, 6		x	<p>“Documentable Interconnection Reliability Operating Limit Violation” and “Interconnection Reliability Operating Limit Event” have identical definitions. Two terms having the same definition leads to confusion. Eliminate one of the terms and modify Standard accordingly.</p> <p>“Interconnection Reliability Operating Limit” definition - Second sentence contains a reporting requirement for the Reliability Authority. A definition should simply define the term. Required actions are to be contained in the standard itself. Delete sentence two. First sentence is confusing it that it appears to imply that there just may be certain situations where “instability, uncontrolled separation, or cascading outages” may NOT “adversely impact the reliability of the bulk transmission system”. Assuming this is not the intent, consider rewording as:</p> <p>Interconnection Reliability Operating Limit: A System Operating Limit on the Bulk Electric System that if exceeded, could lead to instability, uncontrolled separation, or cascading outages.</p> <p>Real-time Monitoring: Standard 202 implies that “Real-time Monitoring” is an activity to be performed as opposed to equipment in place that simply facilitates that function. Consider rewording as:</p> <p>Real-time Monitoring: Draw conclusions from various Real-time Data sources.</p> <p>Operational Planning Analysis: The last sentence specifies that such an analysis is performed up to seven days ahead of expected conditions. Sentence is unnecessary and confusing. Neither 203.1 or 203.2 does not specify a time horizon for the Operational Planning Analysis beyond the ‘next day’.</p> <p>Real-time: definition not necessary, consider deleting.</p> <p>Real-time Data: Consider rewording as “ Readily available measured values of existing system parameters, state estimator values.....”</p> <p>Tv: Definition confusion. Consider: Minimum time of a system parameter that exceeds an Interconnection Reliability Operating Limit</p>

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

		<p>that requires a report to the Compliance Monitor.</p> <p>Real-time Assessment: The second sentence is not needed. Required actions are to be contained in the standard itself. Additionally, real-time assessments can be performed others, not just the RA.</p> <p>“Interconnection Reliability Operating Limit Violation” and “Reportable Interconnection Reliability Operating Limit Violation” have the same definition. Two terms having the same definition leads to confusion. Eliminate one of the terms and modify Standard accordingly.</p> <p>Self-certification: Remove the second and third sentences. They are editorial comments that do not belong in a definition. If the comments are relevant to a particular standard, then they belong in the Compliance Monitoring Process section of the Standard.</p> <p>Transmission Operator: The definition given sounds more like the definition of a Transmission Service Provider. The Functional Model Review Task Force in their January 1, 2003 Group Report defined Transmission Operator as: “The entity that operates the transmission facilities and executes switching orders.”</p>

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

1. The definition for Documentable IROL is not used in the standard and has been dropped.
2. Explanatory information that identified how the term, "IROL" would be applied in this standard is not needed and has been dropped. Suggested change to remove the phrase, ". . . adversely impact the reliability of the bulk transmission system." Was not adopted. This language has been used in the standard since the initial posting of the SAR.
3. The definition of "Real-time Monitoring" was modified to read as follows: "The act of scanning data and drawing conclusions about what the data indicates." This supports the recommended change while retaining the words needed to reinforce the concept that this requires some physical activity.
4. The definition of "Operational Planning Analysis" was truncated so that the explanatory information was dropped from the definition.
5. The definition was added at the request of several industry participants.
6. The definition of "Real-time data" was not changed as suggested. Although the suggested change would keep from using part of the term in the definition of the term, the suggested change did not improve the understandability of the definition and was not adopted.
7. The definition of  $T_v$  was revised to read as follows: "The maximum time that an IROL can be exceeded without compliance sanctions being applied." This supports the recommended change as well as changes recommended by others.
8. The definition of "Real-time Assessment" was truncated so that the explanatory information was dropped from the definition.
9. The definition for Reportable IROL Violation is not used in the standard and has been dropped.
10. The definition of "Self-certification" was truncated so that the explanatory information was dropped from the definition. The definition was further revised to more clearly identify the intent of the self-certification process, based on changes recommended by others.
14. As noted, the definition of Transmission Operator was incorrectly copied from the Functional Model.

John Blazekovich Exelon Corp #1, 3, 5, 6		x	<p>Exelon recommends the following definition changes to eliminate terminology from the definitions that is vague and therefore can lead to different interpretations and uncertainty as to whether there is a violation of the standard.</p> <p>Cascading Outages: The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread service interruption, which cannot be restrained from sequentially spreading. <del>beyond an area predetermined by appropriate studies.</del></p> <p>Interconnection Reliability Operating Limit: A system operating limit that, if exceeded, could lead to instability, uncontrolled separation, or cascading outages. <del>that adversely impact the reliability of the bulk transmission system.</del> The reliability authority must log each case of</p>

**Comments on Definitions**

			exceeding an interconnection reliability operating limit, and must report (to its compliance monitor) each case of exceeding an interconnection reliability operating limit for a time greater than or equal to Tv. Note that Tv may be zero.
<p>The term, “Cascading Outages” was not changed. The original definition better relays the ideas supported in this standard. In addition, the original definition was reviewed and approved as part of the NERC Glossary of Terms.</p> <p>Suggested change to remove the phrase, “. . . adversely impact the reliability of the bulk transmission system.” was not adopted. This language has been used in the standard since the initial posting of the SAR.</p>			
Tom Pruitt Duke Power #1		x	A definition for Minimum Return Time should be included (the minimum period in seconds that a value must remain below an IROL limit after an excursion has occurred. If the value again exceeds IROL before this time limit, the event continues.).
<p>The definition was not added because it is no longer needed. Specific language was added to the standard to identify that the duration of exceeding any IROL is measured from the point in time where the IROL is first exceeded to the point in time where the parameter’s value remains at a level at or below the IROL for a minimum of 30 seconds.</p>			
Tony Jankowski We Energies #4		x	Real time monitoring: Vision and hearing does not comply with the Americans with Disabilities Act. “To use human or automated means” Reliability Authority Area: “interconnection (tie-line) metering”. This provision is for a Balancing Authority and Energy Management, not the RA. The Reliability Authority area consists of all assets under the control and responsibility of the RA.
<p>The Americans with Disabilities Act does not preclude any organization from establishing physical requirements based on the ‘essential duties’ of a specific job. Monitoring system conditions is an essential system operator duty. The term, ‘real-time monitoring’ was revised by replacing the phrase, “To use vision and hearing to scan. . .” with the phase, “The act of scanning . . .”</p> <p>The “Reliability Authority Area” was not defined in the original Functional Model. The latest draft of proposed changes to the Functional Model does include a definition of the Reliability Authority Area and this was adopted in the changes to this standard.</p>			
Michael Sidiropoulos Pacificorp		x	In the definition of cascading outages the term “beyond an area predetermined by appropriate studies” should be specifically defined. Suggestion: “beyond the control area of the initial disturbance”.
<p>These new reliability standards are being written assuming that the industry is organized using the terminology in the Functional Model – so in the new standards the Reliability Authority Reliability Area is used instead of a Control Area. Some relays are installed as a result of joint studies conducted to look at a sequence of actions that may occur in a region that is greater than a single Reliability Authority’s Reliability Area.</p>			
Operating Reliability Working Group SPP Gerry Burrows KCP&L #1 Bob Cochran SPS #1		x	The SDT should utilize the NERC functional model and thoroughly review and correct all definitions associated with this standard. Some definitions included in this standard are not needed and others don’t

<p>Operational Planning Analysis - The descriptive information following the first sentence was dropped because it was not really part of the definition.</p>			
<p>T<sub>v</sub> – The definition was revised to include a reference to maximum response time. The revised definition is: "The maximum time that an IROL can be exceeded without compliance sanctions being applied"</p>			
<p>Donald Idzior Consumers Energy #4</p>		<p>x</p>	<p>I would recommend the definition Tv and section 1.2.1 be made consistent. As the standard now reads, the definition of Tv is the violation time associated with a limit. Section 1.2.1 refers to the identification of Tv as a response time. Those are two very different things.</p>

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

			<p>The response limit must be the total time from when a flow/voltage/stability limit is first violated to when operator action is initiated and finally the system (transaction curtailments/generation redispatch/switching/load control action...) responds to bring the violated operating limit back to below the limit.</p> <p>The definition should be changed to bring it in line with the usage in the standard.</p>
<p><b>T<sub>v</sub> – The definition was revised to include a reference to maximum response time. The revised definition is: “The maximum time that an IROL can be exceeded without compliance sanctions being applied“</b></p>			
<p>Ed Davis Entergy Services #1</p> <p>Susan Morris SERC #2</p> <p>Bill Reinke SERC #2</p> <p>Sam Stryker Fayettevill PWC #3, 4, 5</p> <p>Carter Edge SEPA #4, 5</p> <p>Bill Thompson Dominion Trans #1</p>		<p>x</p>	<p>Operational Planning analyses are conducted for time periods up to 13-months into the future. Please revise the definition as follows: Operational Planning Analysis: “ .... An operational planning analysis is done for the next day’s operation and up to 13-months ahead of the expected conditions.”</p> <p>The Transmission Owner has fiduciary responsibility for his owned facilities. Therefore he has ultimate responsibility and liability for owning, maintaining and operating his facilities to protect his stockholders’ and lending institutions’ investments. The Transmission Owner then is ultimately responsible for establishing system operating limits, including T<sub>v</sub>, for his facilities. Therefore, the definition of T<sub>v</sub> should be revised to: “T<sub>v</sub>: The violation time associated with a limit that is determined by the Transmission Owner for equipment-based limits, and by the Reliability Authority and Planning Authority for system-based limits.”</p> <p>The responsibilities of the RA are to “monitor” the system, not “control” the system. Therefore, we suggest the following change: Reliability Authority Area: A defined electrical system bounded by interconnection (tie-line) metering and telemetry monitored by a single reliability authority.</p>

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

The definition of “Operational Planning Analysis” was truncated to omit the language that explained how the term applied to this standard. The revised definition of Operational Planning Analysis is as follows: “An examination of the expected system conditions, given the load forecast(s), known system constraints some examples being transmission facility outages, generator outages and equipment limitations.”

The recommended change to T<sub>v</sub> was not made, because the responsibility for establishing reliability-related limits is assigned to the Reliability Authority, not the equipment owners. The Determine Facility Ratings SDT is working on the standard that establishes the facility owners’ rights to establish facility ratings – and requires the entities that develop operating limits to respect the facility ratings in developing the operating limits.

The term, “Reliability Authority Area” was revised to conform with the definition provided in the draft changes to the Functional Model. Your recommendation that the standard reflect that the RA monitor rather than control the system was adopted and is reflected in the changes made to the monitoring requirement (202).

In particular, Reliability Authority Area and Transmission Operator have different wording than the Functional Model</p>
<p>The approved Functional Model does not contain any definition for Reliability Authority Area. The latest set of proposed changes to the Functional Model did contain a draft definition for the “Reliability Authority Area” and this was used in the changes made to the standard.</p>			
<p>The definition for Transmission Operator was transposed with that for the Transmission Service Provider and this has been corrected.</p>			
<p>Gerald Rheault Manitoba Hydro #1, 3, 5, 6</p>		x	<p>Interconnection Reliability Operating Limit The first sentence is the complete definition. The rest is a description of activities related to this definition and should not be included here.</p> <p>Real-time Monitoring. This should be modified to “The act of using human vision and hearing or computer software to scan various real-time data sources and draw conclusions about what the data indicates.</p> <p>Real-time The word present time should be used instead of immediate.</p> <p>The words present or presently should be used instead of immediate or immediately in context to real-time in any definition contained in this Standard.</p> <p>Self-certification should be changed to “ A process by which an entity does a self evaluation to determine if it is compliant with the specific requirements for a reliability standard”. The rest can remain the same.</p>

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

<p>The definition of IROL was revised so the explanatory information following the first sentence has been dropped.</p> <p>The suggested revision to “Real-time Monitoring” was adopted.</p> <p>The intent of the revision to “Real-time” was adopted – the new definition uses the word, ‘present’ instead of ‘immediate’. Placing the word, ‘present’ in all definitions containing the phrase, ‘real-time’ led to cumbersome phraseology and didn’t seem necessary.</p> <p>The suggested change for self-certification was adopted.</p>			
Ron Falsetti IMO #2		x	<p>Tv – This definition seems to reflect the compliance violation time frame, but the usage of the Tv term in the draft standard is the ‘maximum acceptable response time’ as determined by the RA/PA BPS (Bulk Power System) - Definition for BPS Is required Reliability Authority does not have “control” of the system, but provides direction to the asset owners/operators. Therefore, suggest the following change:</p> <p>Reliability Authority Area: A defined electrical system bounded by interconnection (tie-line) metering and telemetry under the direction of a single reliability authority.</p> <p>The definition of “Documentable Interconnection Reliability Operating Limit Violation” appears to be redundant to the definition of “Interconnection Reliability Operating Limit Event.” Suggest deletion of “Documentable Interconnection Reliability Limit Violation.”</p>
<p>T<sub>v</sub> – The definition was revised to include a reference to maximum response time. The revised definition is: “The maximum time that an IROL can be exceeded without compliance sanctions being applied“</p> <p>The term, “Bulk Power System” has been defined and was included in the last posting of the standard. This term was copied from the NERC Glossary of Terms. “A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and bulk transmission system.”</p> <p>The term, “Reliability Authority Area” was revised to conform with the proposed definition in the latest draft changes to the Functional Model.</p> <p>The term, “Documentable Interconnection Reliability Limit Violation” was dropped from the standard.</p>

**Do you agree with the SDT that the redundant requirements for the Transmission Operator should be deleted from this standard?**

**Summary Consideration:** Most commenters agreed with the elimination of the redundant TOP requirements. The SDT sent a request to the Director-Standards, asking that action be taken to determine if another SAR is needed to address system operating limits that are not included in this standard. This request was forwarded to the Operating Committee for their consideration. If this standard is approved and is implemented prior to RA Certification, each control area would be responsible for compliance with this standard.

Commenter	Yes	No	Comments
Stuart Goza TVA #1	x		This standard should be modified to specify non-redundant requirements for the TO responsibilities for operating within system operating limits or a separate standard created for this issue.
The SDT sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits.			
Gerald Rheault Manitoba Hydro #1, 3, 5, 6	x		The responsibility for monitoring IROLs, addressed in this Standard, rests with the Reliability Authority as defined in the Functional Model. However Manitoba Hydro believes there is also a reliability requirement to monitor real-time operations for all other system operating limits (SOL) which are not identified as IROLs. If it is not appropriate to include these monitoring requirements in this Standard, then another Standard should be created to address this requirement.
The SDT sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits.			
Tony Jankowski We Energies #4	x		Comments: The Transmission Operator should have operating performance requirements developed in another Standard.
The SDT sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits.			
<u>SERC Operations Planning Subcommittee</u> Carter Edge SEPA #4, 5 William Gaither So Carolina Pub Serv Auth #1 Mike Miller Southern Co #1	x		This should not preclude the Transmission Operator from conducting independent analysis.

<p>The SDT sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.</p> <p>Coordination between RAs is being addressed in the Coordinate Operations Standard. During the development of the Coordinate Operations SAR, the consensus of the comments submitted indicated that the Coordinate Operations Standard should focus on RA to RA coordination. The SAR DT sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses the coordination between an RA and its underlying functions – and to address the coordination between TOPs.</p>			
Michael Sidiropoulos Pacificorp		x	Page 3, paragraph 3 says: “Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages”. Considering the events leading to the recent blackout, this section may have to be revised. Suggestion: allow a system to exceed local operating limits only if a controlled islanding scheme is in place, which can be shown to prevent cascading for the operating condition in question.

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

<p>While the results of the blackout investigation have not been published, it doesn't seem likely that the blackout was the result of exceeding an individual system operating limit. However, even before the August 14 blackout, there was concern that this standard may not have a broad enough scope and the SDT sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.</p> <p>There is another standard called, "Design, Install, and Coordinate Control and Protection Systems" that addresses system protection.</p>			
John Blazekovich	Exelon Corp	#1, 3, 5, 6	<p>x</p> <p>Based on recent events of August 14, 2003 Exelon Corporation is not as confident as the SAR authors in stating, "Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages". We ask that this Standard be put on "hold" until investigations are completed and root cause has been established.</p> <p>Exelon Corporation feels that ultimately the reliability of the interconnection lies with the Reliability Authority, but Transmission Operators should not be eliminated from contributing/participating in actions that enhance reliability.</p>
<p>While the results of the blackout investigation have not been published, it doesn't seem likely that the blackout was the result of exceeding an individual system operating limit. However, even before the August 14 blackout, there was concern that this standard may not have a broad enough scope and the SDT sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. <p>The Functional Model is built on the assumption that there is one function with ultimate responsibility for each reliability-related activity, and the Functional Model assigns the RA the responsibility for establishing reliability limits. The RA can delegate this responsibility to TOPs, but even if the RA delegates this responsibility, the RA would be held responsible for compliance with the requirement. The SDT was also concerned about completely removing the requirements for the TOP, and sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.</p>			

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

Ed Davis Entergy Services #1	x	<p>Given the significant changes to this draft standard, the RA is now monitoring the facilities with identified and documented IROLs. We do not agree with this blanket statement until we are able to review all the requirements of all the functional entities. For instance, this draft standard does not recognize that the TO has fiduciary responsibility to his stockholders' and lending institutions' investments and that neither NERC standards, nor the Functional Model, can take that responsibility and liability away. This fiduciary responsibility requires the TO establish thermal ratings, and associated Tv, for its equipment and then monitor that equipment. If those thermal ratings are the lesser of the thermal, stability or voltage limits, then the TO has established the IROL limit. Therefore, we suggest the requirements identified in this standard are not redundant requirements but are requirements met by several entities (functions), not met by one entity (function).</p> <p>Also, the requirements should be changed to the TO, from the TOP. The TO may delegate some parts of that function to another entity, at the TO's option. However, for the purposes of this standard, the Transmission Owner must be added to all parts of this standard.</p> <p>In addition, what functional entity is monitoring all the transmission facilities with system operating limits not included in the IROLs? What functional entity is monitoring all the other transmission facilities? The answer is that the TO, and maybe the TOP, must be added to the list of entities (functions) monitoring the real-time system to ensure all the transmission facilities are being operated within limits.</p> <p>If the TO is not added to this standard, then there is a major piece missing to the monitoring of the power system and the reliability of the system. That missing piece is the monitoring of the system operating limits.</p> <p>Therefore, another standard needs to be written with a title something like – "Operate Within Limits – All Transmission and System Operating Limits Other Than Interconnection Reliability Operating Limits".</p>
------------------------------	---	--

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

<p>The Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard addresses the development of both facility ratings and system operating limits. This standard requires that the equipment owners establish facility ratings, and that the facility ratings be respected in the development of system operating limits.</p> <p>The Functional Model assigned responsibility for establishing facility ratings with equipment owners (Generator Owners and Transmission Owners) – and assigned the responsibility for establishing reliability limits to the RA and limits associated with local networks to the TOP.</p> <p>The Functional Model does not preclude the delegation of activities from the RA to other functions. However, the Functional Model is built on the assumption that there is one function with ultimate responsibility for each reliability-related activity, and the Functional Model assigns the RA the responsibility for establishing reliability limits. The RA can delegate this responsibility to TOPs, but even if the RA delegates this responsibility, the RA would be held responsible for compliance with the requirement. The SDT was also concerned about completely removing the requirements for the TOP, and sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.</p>			
Terry Bilke	Midwest ISO #2	x	<p>There should be some responsibilities for both RA (present day Reliability Coordinator) and the Transmission Operator. They aren't necessarily the same requirements.</p> <p>The TO-RA relationship is akin to the pilot-air traffic controller relationship. Both monitor some common items. In general, one view is local, the other is broader and at a higher level. Both have a responsibility for air safety.</p>
<p>None of the 'Set of 11 Standards' addresses the coordination that takes place between the RA and the TOP. The Coordinate Operations SAR DT sent a letter to the Director-Standards asking that the NERC Operating Committee be informed of this omission, and investigate the need for an additional SAR.</p>

<p>Southern Company Generation &amp; Energy Mktg  Roman Carter # 5, 6  Joel Dison #5,6  Tony Reed #5,6  Lucius Burris #5,6  David Deerman #5,6  Clifford Shepard #5,6  Michael Smith #5,6  Lloyd Barnes SCGEM 5,6  Gary Miller SCGEM 5,6  Terry Crawley Southern Generation 5  Roger Green Southern Generation 5</p>		x	<p>It would be appropriate to leave the requirements for the Transmission Operator in the Standard as long as it is better clarified that the Transmission Operator is responsible for the local network system and not duplicating the Reliability Authority’s responsibility for the overall Bulk electric system.</p> <p>Furthermore, the comment on page 3, third paragraph in the Comment Form, <u>“Exceeding a system operating limit associated with the local network integrity is important, but is not likely, by itself, to put the interconnection at risk of instability, uncontrolled separation or cascading outages”</u> may need to be reworded or possibly removed in light of the recent Blackout. Does Local Network Integrity need to be addressed in a Standard itself?</p>
<p>The scope of the SAR included the following language that seemed to preclude including limits associated with local networks. “This standard requires adherence to established operating limits<sup>3</sup> identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. “ Even before the August 14 blackout, the SDT was concerned about that the scope of the standard may not be comprehensive enough, and an additional SAR may be needed. The SDT sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.</p>			
<p>Susan Morris SERC #2  Bill Reinke SERC #2  Sam Stryker Fayettevill PWC #3, 4, 5  Carter Edge SEPA #4, 5  Bill Thompson Dominion Trans #1</p>		x	<p>This should not preclude the Transmission Operator(s) from conducting independent analysis.</p> <p>This draft standard does not recognize that the TO has fiduciary responsibility for its owned facilities and neither NERC standards, nor the Functional Model, can take that responsibility and liability away. This fiduciary responsibility requires the TO to establish thermal ratings, and associated Tv, for its equipment and then monitor that equipment. If those thermal ratings are the lesser of the thermal, stability or voltage limits, then the TO has established the IROL limit. Therefore, we suggest the requirements identified in this standard are not redundant requirements but are requirements met by several entities (functions), not met by one entity (function).</p> <p>It should also be acknowledged that entities such as the RA and the TO(s) may delegate their respective monitoring responsibilities to the TOP.</p>

<sup>3</sup> These are the limits established through the standard, “Determine Facility Ratings, Operating Limits and Transfer Capabilities”

**Consideration of Comments on 2<sup>nd</sup> Posting of Operate Within Interconnection Reliability Operating Limits Standard  
Comments on Definitions**

		<p>The following is an excerpt from page three of this document: <i>“This reliability standard focuses on the subset of system operating limits that, if exceeded, could cause instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system and is clearly under the responsibility of the Reliability Authority.”</i> For Tos/TOPs, system operating limits should not include only those limits which have been identified as leading to cascading outages, instability, or uncontrolled separation. This is a major issue in terms of the scope. As conceived, this standard does not result in any entity assuring that bulk power system is operating within limits. It only results in operating within those limits for which violations result in instability/cascading outage risk. Any defined operating limit, which has been identified as potentially threatening bulk reliability and thereby requiring consistent monitoring and adherence, should be covered by a standard.</p>
<p>The Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard addresses the development of both facility ratings and system operating limits. This standard requires that the equipment owners establish facility ratings, and that the facility ratings be respected in the development of system operating limits.</p> <p>The Functional Model assigned responsibility for establishing facility ratings with equipment owners (Generator Owners and Transmission Owners) – and assigned the responsibility for establishing reliability limits to the RA and limits associated with local networks to the TOP.</p> <p>The Functional Model does not preclude the delegation of activities from the RA to other functions. However, the Functional Model is built on the assumption that there is one function with ultimate responsibility for each reliability-related activity, and the Functional Model assigns the RA the responsibility for establishing reliability limits. The RA can delegate this responsibility to TOPs, but even if the RA delegates this responsibility, the RA would be held responsible for compliance with the requirement. The SDT was also concerned about completely removing the requirements for the TOP, and sent a letter to the Director-Standards recommending that action be taken to review the need for a separate standard that addresses operating within system operating limits. In turn, the Director-Standards informed the NERC Operating Committee (OC) and asked that the OC initiate action to determine if an additional SAR is needed.</p>

Other Questions**

**Notifying the Compliance Monitor – Include in standard or in a Compliance Enforcement Program (CEP) Document**

**Summary Consideration:** Most commenters indicated a preference for keeping this in the standard, so the references were kept in the revised standard.

Commenter	Std	CEP	Comments
Terry Bilke Midwest ISO #2	x		There does not appear to be a need to make submissions within 5 business days. It may take a while to sort out a problem.
The intent in selecting 5 business days was to select a timeframe that would be short enough so that entities wouldn't forget about the situation, yet long enough that entities could verify that they hadn't received the data.			
Susan Morris SERC #2 Bill Reinke SERC #2 Sam Stryker Fayettevill PWC #3, 4, 5 Carter Edge SEPA #4, 5 Bill Thompson Dominion Trans #1	x		We believe that it is appropriate to include this in the standard with the comments noted in Section 205. <i>(The requirement for data collection should be tied to its impact on reliability. Requirement 1.3 should be modified to read:</i>  <i>The reliability authority shall notify its compliance monitor when an entity that has facilities monitored by the reliability authority does not provide data as specified and this lack of data has an impact on reliability.</i>  <i>Measurement 2.3.1 should be rewritten to read:</i>  <i>2.3.1. The notification shall take place within five business days of discovering that the data having an impact on reliability is missing.)</i>
The suggested change to Requirement 205 was not adopted because it would link data collection with an instance of exceeding an IROL, and that could result in a multiple sanctions for the same violation. The standards are being drafted so that there will only be a single sanction for a single violation.			
<u>FRCC Op, Eng &amp; Mkt Int</u> Linda Campbell FRCC #2 Paul Elwing Lakeland Electric #3 John Shaffer FPL #1 Bob Remley Clay Elec Coop #4 Patti Metro FRCC #2 Eirc Grant Progress Energy – FL #1 Joe Roos Ocala Electric Utility #3 Joe Krupar FL Muni Pwr Agency #3 Richard Gilbert Lakeland Electric #3	x		We agree with including it in the standard because there needs to be some place for recognition of not getting the data that is needed. We are not entirely sure what steps the compliance monitor would then take, but are assuming the compliance monitor would follow up with the entity not supplying the needed information. In FRCC, if our Security Coordinator does not get the requested information, our Operating Reliability Subcommittee is informed so that follow up can take place. Ultimately, our Security Process (Reliability Plan) requires the operating entities to supply required reliability data and our ORS and OC are the back stop to ensure it is supplied.

The CEP is likely to undergo some changes as a result of the new committee structure – and one of those changes may be increased standardization in the implementation of the Regional Compliance Programs. If this happens, this procedure could be revised so that the same requirement doesn't appear in multiple documents.

Dan Boezio & Raj Rana AEP #1, 3, 5, 6		x	We would encourage the Reliability Authority to work with the entities not providing the specified data and try to resolve the dispute prior to reporting the issue to the Compliance Monitor. Additionally, we believe the requirement for the Reliability Authority to notify the Compliance Monitor does not need to be contained within this standard.
<b>The standard was revised to include the provision that the RA only notify its compliance monitor if it is unable to resolve an issue involving data not being provided as specified.</b>

Terry Bilke Midwest ISO #2	In general, the level of compliance violation should be proportional to its impact on reliability (not the size of the entity).
<b>Agreed. The new compliance committees intend to address that issue.</b>	
Ron Falsetti IMO #2	A further concern with the draft is the continuing difficulty of defining wide area impact versus local impact. There is no guidance on how the parameters are to be defined which would permit the identification of the local area and the widespread area. It also fails to recognize that a local area problem may evolve into a wider area problem depending on the load, time of day, recent contingencies and other factors. A well defined process for determining what is (and what is not) a reportable event is essential.
<b>A definition for Wide Area Impact has been developed.</b>	
Stuart Goza TVA #1	Please note that throughout the standard the Tv term is used but is not formatted the same (Tv vs. T <sub>v</sub> ). This is a minor, formatting issue, but should be consistent throughout to reduce confusion.
