Re: Errata to Petition of the North American Electric Reliability Corporation for Approval of Critical Infrastructure Protection (CIP) Reliability Standards Version 4
FERC Docket No. RM06-22-000

Dear Ms. Bose:

On February 10, 2011, the North American Electric Reliability Corporation ("NERC") submitted a Petition for Approval of Critical Infrastructure Protection (CIP) Reliability Standards Version 4 in the above-referenced docket ("February 10 Petition").[1] NERC is filing these errata to correct several deficiencies in the February 10 Petition. NERC is including with this errata filing a revised set of exhibits to replace those included in the February 10 Petition. NERC is including all of the original exhibits submitted with the February 10 Petition as well as the corrected exhibits included in this errata filing, with the exception of original Exhibit E (Development History) due to the size of the file. Only those items noted below have been corrected in the revised set of exhibits. All other exhibits included in this filing remain unchanged from the version filed in the February 10 Petition.

[1] *Petition of the North American Electric Reliability Corporation for Approval of Critical Infrastructure Protection (CIP) Reliability Standards Version 4*, Docket No. RM06-22-000 (February 10, 2011)

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

ERRATA

1) It has come to NERC's attention that there is a typo on page six of the February 10 Petition. The last sentence of the first full paragraph on page six should be corrected as follows: "While the standard drafting team is still working to determine what form the next version of the CIP Reliability Standards will take, with the revisions in Version 4, an established baseline of cyber protection will be extended to all Bulk Electric System ~~Cyber~~ Critical Assets."

2) The redline included for the proposed CIP-002-4 Reliability Standard was not made with the previous version, CIP-002-3, as its base. **Corrected Exhibit A** to the filing includes the correct redline and clean version of the proposed CIP-002-4 standard.

3) On page 70 and 75 of the February 10 Petition, NERC has identified typographical errors in the proposed CIP-003-4 Reliability Standard, Applicability Section, Part 4.2.4. This section should read "Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets shall only be required to comply with CIP- 003-4 Requirement R2." **Corrected Exhibit A** to this filing includes the redline and clean versions of the proposed CIP-003-4 Reliability Standard with the corrections to the Applicability Section, Part 4.2.4.

4) NERC has identified a correction to the proposed CIP-005-4 Reliability Standard. The Effective date and the Compliance section have been modified for consistency with the rest of the Version 4 CIP standards. The effective date language was filed incorrectly because, at the time of the ballot of the CIP Version 4 standards, the ballot for the Urgent Action Standards Authorization Request for CIP-005 (Project 2010-15) was taking place

concurrently. In both the initial ballot and the successive ballot for the CIP Version 4 standards, NERC stated the following:

> Each of the CIP standards (CIP-003-3 through CIP-009-3) contains at least one reference to CIP-002-3. To maintain clarity, CIP-003-3 through CIP-009-3 have had conforming changes made, so that all cross references within the set of standards are to "CIP Version 4" standards. *(CIP-005-4 – Cyber Security – Electronic Security Perimeter is posted separately, with a set of proposed revisions for expedited processing under Project 2010-15. If CIP-005-4 is not approved under Project 2010-15, it will be returned to this set of CIP standards.)*

Accordingly, because the proposed CIP-005-4 standard balloted as part of Project 2010-15 did not pass the ballot process, the effective date language in the proposed CIP-005-4 standard included in the February 10 Petition should have included the conforming changes consistent with the conforming changes included in the other proposed CIP Version 4 standards included in the February 10 Petition. A clean and redline of the corrections to the effective date language in the CIP-005-4 standard is included in **Corrected Exhibit A** to this filing.

5) In the proposed CIP-005-4 standard, the letter "a" has been added to indicate the FERC approved interpretation included as CIP-005-3a should be carried over to the proposed CIP-005-4 standard and be designated as CIP-005-4a. **Corrected Exhibit A** to this filing includes the corrected redline and clean versions of the proposed CIP-005-4a standard.

6) NERC has added a "c" to CIP-006-4 to correctly indicate that the previously FERC approved interpretation to CIP-006-3c has been carried forward to CIP-006-4, thereby designating the Reliability Standard as CIP-006-4c. **Corrected Exhibit A** to this filing includes the redline and clean versions of CIP-006-4c.

7) In reviewing the development record included as Exhibit E to the February 10 Petition, NERC determined that the meeting notes from the Standard Drafting Team meetings were mistakenly left out of the final version of the exhibit. NERC is hereby including the meeting minutes from the Standard Drafting Team meetings in a new **Exhibit G** to this filing.

8) For completeness, NERC is including in this errata filing the revised, complete set of proposed VRFs and VSLs for the CIP Version 4 standards that was filed by NERC in its March 21, 2011 Compliance filing of CIP VRFs and VSLs.[2] A clean and redline of the VRFs and the VSLs for the CIP Version 4 Reliability Standards carried over from the CIP Versions 2 and 3 VRFs and VSLs that was proposed in the March 31 filing in compliance with the Commission's January 6, 2011 Order,[3] should replace the CIP VRFs and VSLs included in the February 10 Petition to take into account the Commission's January 20 directed changes. A **Corrected Exhibit F** is included with this filing.

NERC respectfully requests that the Commission take note of this errata filing, and issue an order consistent with NERC's filings submitted in this proceeding.

Respectfully submitted,

/s/ Holly A. Hawkins
Holly A. Hawkins
Attorney for North American Electric Reliability Corporation

CORRECTED Exhibit A

Proposed CIP-002-4 through CIP-009-4 Reliability Standards submitted for approval

Corrected CIP-002-4 Clean and Redline

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-4

3. Purpose: NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-4 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of the criteria in Attachment 1.

4. Applicability:

4.1. Within the text of Standard CIP-002-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

B. Requirements

R1. Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update this list as necessary, and review it at least annually.

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually.

For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1.

For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

- The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
- The Cyber Asset uses a routable protocol within a control center; or,
- The Cyber Asset is dial-up accessible.

R3. Annual Approval — The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

M1. The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R1.

M2. The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R2.

M3. The Responsible Entity shall make available its records of approvals as specified in Requirement R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 The Regional Entity shall serve as the Compliance Enforcement Authority with the following exceptions:

- For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.
- For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

- For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

1.3.1 The Responsible Entity shall keep documentation required by Standard CIP-002-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.3.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

1.4.1 None.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	January 16, 2006	R3.2 — Change “Control Center” to “control center”	03/24/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.

CIP-002-4 - Attachment 1

Critical Asset Criteria

The following are considered Critical Assets:

1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW in a single Interconnection.

1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVAR or greater.

1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.

1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan.

1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan.

1.6. Transmission Facilities operated at 500 kV or higher.

1.7. Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.

1.8. Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.9. Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.10. Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3.

1.11. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed.

1.13. Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.

1.14. Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator.

1.15. Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection.

1.16. Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.

1.17. Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-~~3~~4

3. Purpose: NERC Standards CIP-002-~~3~~4 through CIP-009-~~3~~4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-~~3~~4 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of ~~a risk based assessment~~the criteria in Attachment 1.

4. Applicability:

4.1. Within the text of Standard CIP-002-~~3~~4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-~~3~~4:

4.2.1 Facilities regulated by ~~the U.S. Nuclear Regulatory Commission or~~ the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

5. Effective Date: The first day of the ~~third~~eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first

day of the ~~third~~ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

B. Requirements

~~**R1.** Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.~~

~~**R1.1.** The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.~~

~~**R1.2.** The risk-based assessment shall consider the following assets:~~

~~**R1.2.1.** Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.~~

~~**R1.2.2.** Transmission substations that support the reliable operation of the Bulk Electric System.~~

~~**R1.2.3.** Generation resources that support the reliable operation of the Bulk Electric System.~~

~~**R1.2.4.** Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.~~

~~**R1.2.5.** Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.~~

~~**R1.2.6.** Special Protection Systems that support the reliable operation of the Bulk Electric System.~~

~~**R1.2.7.** Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.~~

~~**R2.**~~**R1.** Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the ~~risk-based assessment methodology required~~criteria contained in ~~R1.~~*CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall ~~review~~update this list as necessary, and review it at least annually~~, and update it as necessary~~.

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement ~~R2~~R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. ~~Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange.~~ The Responsible Entity shall ~~review~~update this list as necessary, and review it at least annually~~, and update it as necessary.~~ .

For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1.

~~**R3.**~~ For the purpose of Standard CIP-002-~~3~~4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

~~**R3.1.**~~• The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,

~~**R3.2.**~~• The Cyber Asset uses a routable protocol within a control center; or,

~~**R3.3.**~~• The Cyber Asset is dial-up accessible.

~~R4.~~R3. Annual Approval — The senior manager or delegate(s) shall approve annually the ~~risk-based assessment methodology, the~~ list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1~~, R2,~~ and ~~R3~~R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the ~~risk-based assessment methodology, the~~ list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

~~**M1.** The Responsible Entity shall make available its current risk-based assessment methodology documentation as specified in Requirement R1.~~

~~M2.~~M1. The Responsible Entity shall make available its list of Critical Assets as specified in Requirement ~~R2~~R1.

~~M3.~~M2. The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement ~~R3~~R2.

~~M4.~~M3. The Responsible Entity shall make available its ~~approval~~ records of ~~annual~~ approvals as specified in Requirement ~~R4~~R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 The Regional Entity ~~for Responsible Entities~~shall serve as the Compliance Enforcement Authority with the following exceptions:

- For entities that do not ~~perform delegated tasks~~work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

~~**1.1.1**~~ For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

~~**1.1.2 ERO for Regional Entity.**~~

- ~~Third~~For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

~~**1.1.3**~~ For the ERO, a third-party monitor without vested interest in the outcome for ~~NERC.~~

~~**1.2.**~~ the ERO shall serve as the Compliance ~~**Monitoring Period and Reset Time Frame**~~

- ~~Not applicable~~Enforcement Authority.

~~1.3.~~1.2. **Compliance Monitoring and Enforcement Processes**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

~~1.4.~~1.3. **Data Retention**

~~1.4.1~~1.3.1 The Responsible Entity shall keep documentation required by Standard CIP-002-~~3~~4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

~~1.4.2~~1.3.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

~~1.5.~~1.4. **Additional Compliance Information**

~~1.5.1~~1.4.1 None.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

CIP-002-4 - Attachment 1

Critical Asset Criteria

The following are considered Critical Assets:

1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW in a single Interconnection.

1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVAR or greater.

1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.

1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan.

1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan.

1.6. Transmission Facilities operated at 500 kV or higher.

1.7. Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.

1.8. Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.9. Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.10. Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3.

1.11. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed.

1.13. Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.

1.14. Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator.

1.15. Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection.

1.16. Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.

1.17. Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

Corrected CIP-003-4 Clean and Redline

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-4

3. Purpose: Standard CIP-003-4 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-003-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-003-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets shall only be required to comply with CIP-003-4 Requirement R2.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002-4 through CIP-009-4, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-4 through CIP-009-4.

R2.1. The senior manager shall be identified by name, title, and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002-4 through CIP-009-4, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

R2.4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-4, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

R5.1.1. Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

M1. The Responsible Entity shall make available documentation of its cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2.

M2. The Responsible Entity shall make available documentation of the assignment of, and changes to, its leadership as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the exceptions, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its information protection program as specified in Requirement R4.

M5. The Responsible Entity shall make available its access control documentation as specified in Requirement R5.

M6. The Responsible Entity shall make available its change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Requirement R2 applies to all Responsible Entities, including Responsible Entities which have no Critical Cyber Assets. Modified the personnel identification information requirements in R5.1.1 to include name, title, and the information for which they are responsible for authorizing access (removed the business phone information). Changed compliance monitor to Compliance	

		Enforcement Authority.	
3		Update version number from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update
4	01/24/2011	Board approved Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-~~3~~4

3. Purpose: Standard CIP-003-~~3~~4 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003-~~3~~4 should be read as part of a group of standards numbered Standards CIP-002-~~3~~4 through CIP-009-~~3~~4.

4. Applicability:

4.1. Within the text of Standard CIP-003-~~3~~4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-003-~~3~~4:

4.2.1 Facilities regulated by ~~the U.S. Nuclear Regulatory Commission or~~ the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

~~4.2.3~~4.2.4 Responsible Entities that, in compliance with Standard CIP-002-~~3~~4, identify that they have no Critical Cyber Assets shall only be required to comply with CIP-003-~~3~~4 Requirement R2.

5. Effective Date: The first day of the ~~third~~eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ~~third~~ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002-~~3~~4 through CIP-009-~~3~~4, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-~~3~~4 through CIP-009-~~3~~4.

R2.1. The senior manager shall be identified by name, title, and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002-~~3~~4 through CIP-009-~~3~~4, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

R2.4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-~~3~~4, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

R5.1.1. Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

M1. The Responsible Entity shall make available documentation of its cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2.

M2. The Responsible Entity shall make available documentation of the assignment of, and changes to, its leadership as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the exceptions, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its information protection program as specified in Requirement R4.

M5. The Responsible Entity shall make available its access control documentation as specified in Requirement R5.

M6. The Responsible Entity shall make available its change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity ~~for Responsible Entities that do not perform delegated tasks~~, the Regional Entity shall serve as the Compliance Enforcement Authority.

~~1.1.1~~1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

~~**1.1.2** ERO for Regional Entity.~~

1.2.3 ~~Third~~For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.1.3 For the ERO, a third-party monitor without vested interest in the outcome for ~~NERC.~~

1.2. the ERO shall serve as the Compliance **~~Monitoring Period and Reset Time Frame~~**

1.2.4 ~~Not applicable~~Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

4	01/24/2011	Board approved Update version number from "3" to "4"	Update to conform to changes to CIP-002-4 (Project 2008-06)

CIP-004-4 Clean and Redline

A. Introduction

1. Title: Cyber Security — Personnel & Training

2. Number: CIP-004-4

3. Purpose: Standard CIP-004-4 requires that personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including contractors and service vendors, have an appropriate level of personnel risk assessment, training, and security awareness. Standard CIP-004-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-004-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-004-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Awareness — The Responsible Entity shall establish, document, implement, and maintain a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as:

- Direct communications (e.g., emails, memos, computer based training, etc.);

- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

R2. Training — The Responsible Entity shall establish, document, implement, and maintain an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. The cyber security training program shall be reviewed annually, at a minimum, and shall be updated whenever necessary.

R2.1. This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access except in specified circumstances such as an emergency.

R2.2. Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004-4, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities:

R2.2.1. The proper use of Critical Cyber Assets;

R2.2.2. Physical and electronic access controls to Critical Cyber Assets;

R2.2.3. The proper handling of Critical Cyber Asset information; and,

R2.2.4. Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.

R2.3. The Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.

R3. Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. A personnel risk assessment shall be conducted pursuant to that program prior to such personnel being granted such access except in specified circumstances such as an emergency.

The personnel risk assessment program shall at a minimum include:

R3.1. The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.

R3.2. The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.

R3.3. The Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004-4.

R4. Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.

R4.1. The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.

R4.2. The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.

C. Measures

M1. The Responsible Entity shall make available documentation of its security awareness and reinforcement program as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation of its cyber security training program, review, and records as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the personnel risk assessment program and that personnel risk assessments have been applied to all personnel who have authorized cyber or authorized unescorted physical access to Critical Cyber Assets, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of the list(s), list review and update, and access revocation as needed as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep personnel risk assessment documents in accordance with federal, state, provincial, and local laws.

1.4.2 The Responsible Entity shall keep all other documentation required by Standard CIP-004-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.2.4 — Insert the phrase "for cause" as intended. "One instance of personnel termination for cause…"	03/24/06
1	06/01/06	D.2.1.4 — Change "access control rights" to "access rights."	06/05/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Reference to emergency situations. Modification to R1 for the Responsible Entity to establish, document, implement, and maintain the awareness program. Modification to R2 for the Responsible Entity to establish, document, implement, and maintain the training program; also stating the requirements for the cyber security training program. Modification to R3 Personnel Risk Assessment to clarify that it pertains to personnel having authorized cyber or authorized unescorted physical access to "Critical Cyber Assets". Removal of 90 day window to complete training and 30 day window to complete personnel risk assessments. Changed compliance monitor to Compliance Enforcement Authority.	
3		Update version number from -2 to -3	
3	12/16/09	Approved by NERC Board of Trustees	Update
4	Board approved 01/24/2011	Update version number from "3" to "4"	Update to conform to changes to CIP-002-4 (Project 2008-06)

A. Introduction

1. Title: Cyber Security — Personnel & Training

2. Number: CIP-004-~~3~~4

3. Purpose: Standard CIP-004-~~3~~4 requires that personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including contractors and service vendors, have an appropriate level of personnel risk assessment, training, and security awareness. Standard CIP-004-~~3~~4 should be read as part of a group of standards numbered Standards CIP-002-~~3~~4 through CIP-009-~~3~~4.

4. Applicability:

4.1. Within the text of Standard CIP-004-~~3~~4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-004-~~3~~4:

4.2.1 Facilities regulated by ~~the U.S. Nuclear Regulatory Commission or~~ the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

~~Cyber Assets associated with Cyber Security Plans submitted to and verified by the U. S. Nuclear Regulatory Commission pursuant to 10 C.F.R. Section 73.54.~~

~~4.2.3~~4.2.4 Responsible Entities that, in compliance with Standard CIP-002-~~3~~4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the ~~third~~eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ~~third~~ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Awareness — The Responsible Entity shall establish, document, implement, and maintain a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound

Formatted: Font color: Black

Formatted: Font color: Black

security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

R2. Training — The Responsible Entity shall establish, document, implement, and maintain an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. The cyber security training program shall be reviewed annually, at a minimum, and shall be updated whenever necessary.

R2.1. This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access except in specified circumstances such as an emergency.

R2.2. Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004-~~3~~4, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities:

R2.2.1. The proper use of Critical Cyber Assets;

R2.2.2. Physical and electronic access controls to Critical Cyber Assets;

R2.2.3. The proper handling of Critical Cyber Asset information; and,

R2.2.4. Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.

R2.3. The Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.

R3. Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. A personnel risk assessment shall be conducted pursuant to that program prior to such personnel being granted such access except in specified circumstances such as an emergency.

The personnel risk assessment program shall at a minimum include:

R3.1. The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.

R3.2. The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.

R3.3. The Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004-~~3~~4.

R4. Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.

R4.1. The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.

R4.2. The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.

C. Measures

M1. The Responsible Entity shall make available documentation of its security awareness and reinforcement program as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation of its cyber security training program, review, and records as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the personnel risk assessment program and that personnel risk assessments have been applied to all personnel who have authorized cyber or authorized unescorted physical access to Critical Cyber Assets, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of the list(s), list review and update, and access revocation as needed as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity ~~for Responsible Entities that do not perform delegated tasks~~, the Regional Entity shall serve as the Compliance Enforcement Authority.

~~1.1.1~~1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

~~**1.1.2 ERO for Regional Entity.**~~

1.2.3 ~~Third~~For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1	01/16/06	D.2.2.4 — Insert the phrase "for cause" as intended. "One instance of personnel termination for cause…"	03/24/06
1	06/01/06	D.2.1.4 — Change "access control rights" to "access rights."	06/05/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Reference to emergency situations. Modification to R1 for the Responsible Entity to establish, document, implement, and maintain the awareness program. Modification to R2 for the Responsible Entity to establish, document, implement, and maintain the training program; also stating the requirements for the cyber security training program. Modification to R3 Personnel Risk Assessment to clarify that it pertains to personnel having authorized cyber or authorized unescorted physical access to "Critical Cyber Assets".	

		Removal of 90 day window to complete training and 30 day window to complete personnel risk assessments. Changed compliance monitor to Compliance Enforcement Authority.	
3		Update version number from -2 to -3	
3	12/16/09	Approved by NERC Board of Trustees	Update
4	Board approved 01/24/2011	Update version number from "3" to "4"	Update to conform to changes to CIP-002-4 (Project 2008-06)

Corrected CIP-005-4a Clean and Redline

A. Introduction

1. Title: Cyber Security — Electronic Security Perimeter(s)

2. Number: CIP-005-4a

3. Purpose: Standard CIP-005-4a requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005-4a should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability

4.1. Within the text of Standard CIP-005-4a, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-005-4a:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

4.2.4 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).

R1.1. Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).

R1.2. For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.

R1.3. Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).

R1.4. Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-4a.

R1.5. Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4a Requirements R2 and R3; Standard CIP-006-4c Requirement R3; Standard CIP-007-4 Requirements R1 and R3 through R9; Standard CIP-008-4; and Standard CIP-009-4.

R1.6. The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.

R2. Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).

R2.1. These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.

R2.2. At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.

R2.3. The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).

R2.4. Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.

R2.5. The required documentation shall, at least, identify and describe:

R2.5.1. The processes for access request and authorization.

R2.5.2. The authentication methods.

R2.5.3. The review process for authorization rights, in accordance with Standard CIP-004-4 Requirement R4.

R2.5.4. The controls used to secure dial-up accessible connections.

R2.6. Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.

R3. Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.

R3.1. For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.

R3.2. Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.

R4. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:

R4.1. A document identifying the vulnerability assessment process;

R4.2. A review to verify that only ports and services required for operations at these access points are enabled;

R4.3. The discovery of all access points to the Electronic Security Perimeter;

R4.4. A review of controls for default accounts, passwords, and network management community strings;

R4.5. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R5. Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-4a.

R5.1. The Responsible Entity shall ensure that all documentation required by Standard CIP-005-4a reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-4a at least annually.

R5.2. The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.

R5.3. The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.

C. Measures

M1. The Responsible Entity shall make available documentation about the Electronic Security Perimeter as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation of the electronic access controls to the Electronic Security Perimeter(s), as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of controls implemented to log and monitor access to the Electronic Security Perimeter(s) as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its annual vulnerability assessment as specified in Requirement R4.

M5. The Responsible Entity shall make available access logs and documentation of review, changes, and log retention as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep logs for a minimum of ninety calendar days, unless: a) longer retention is required pursuant to Standard CIP-008-4, Requirement R2; b) directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall keep other documents and records required by Standard CIP-005-4a from the previous full calendar year.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (Developed separately.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.3.1 — Change “Critical Assets,” to “Critical Cyber Assets” as intended.	03/24/06
2	Approved by NERC Board of	Modifications to clarify the requirements and to bring the compliance elements into	Revised.

	Trustees 5/6/09	conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Revised the wording of the Electronic Access Controls requirement stated in R2.3 to clarify that the Responsible Entity shall "implement and maintain" a procedure for securing dial-up access to the Electronic Security Perimeter(s). Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Approved by the NERC Board of Trustees Changed CIP-005-2 to CIP-005-3. Changed all references to CIP Version "2" standards to CIP Version "3" standards. For Violation Severity Levels, changed, "To be developed later" to "Developed separately."	Conforming revisions for FERC Order on CIP V2 Standards (9/30/2009)
2a	02/16/10	Added Appendix 1 — Interpretation of R1.3 approved by BOT on February 16, 2010.	Addition
4a	01/24/2011	Approved by the NERC Board of Trustees	Update to conform to changes to CIP-002-4 (Project 2008-06) Update version number from "3" to "4a"

Appendix 1

Requirement Number and Text of Requirement
Section 4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters. **Requirement R1.3** Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).
Question 1 (Section 4.2.2)
What kind of cyber assets are referenced in 4.2.2 as "associated"? What else could be meant except the devices forming the communication link?
Response to Question 1
In the context of applicability, associated Cyber Assets refer to any communications devices external to the Electronic Security Perimeter, i.e., beyond the point at which access to the Electronic Security Perimeter is controlled. Devices controlling access into the Electronic Security Perimeter are not exempt.
Question 2 (Section 4.2.2)
Is the communication link physical or logical? Where does it begin and terminate?
Response to Question 2
The drafting team interprets the data communication link to be physical or logical, and its termination points depend upon the design and architecture of the communication link.
Question 3 (Requirement R1.3)
Please clarify what is meant by an “endpoint”? Is it physical termination? Logical termination of OSI layer 2, layer 3, or above?
Response to Question 3
The drafting team interprets the endpoint to mean the device at which a physical or logical communication link terminates. The endpoint is the Electronic Security Perimeter access point if access into the Electronic Security Perimeter is controlled at the endpoint, irrespective of which Open Systems Interconnection (OSI) layer is managing the communication.
Question 4 (Requirement R1.3)
If “endpoint” is defined as logical and refers to layer 3 and above, please clarify if the termination points of an encrypted tunnel (layer 3) must be treated as an “access point? If two control centers are

owned and managed by the same entity, connected via an encrypted link by properly applied Federal Information Processing Standards, with tunnel termination points that are within the control center ESPs and PSPs and do not terminate on the firewall but on a separate internal device, and the encrypted traffic already passes through a firewall access point at each ESP boundary where port/protocol restrictions are applied, must these encrypted communication tunnel termination points be treated as "access points" in addition to the firewalls through which the encrypted traffic has already passed?
Response to Question 4
In the case where the “endpoint” is defined as logical and is >= layer 3, the termination points of an encrypted tunnel must be treated as an “access point.” The encrypted communication tunnel termination points referred to above are “access points.”

A. Introduction

1. Title: Cyber Security — Electronic Security Perimeter(s)

2. Number: CIP-005-~~3~~4a

3. Purpose: Standard CIP-005-~~3~~4a requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005-~~3~~4a should be read as part of a group of standards numbered Standards CIP-002-~~3~~4 through CIP-009-~~3~~4.

4. Applicability

4.1. Within the text of Standard CIP-005-~~3~~4a, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-005-~~3~~4a:

4.2.1 Facilities regulated by ~~the U.S. Nuclear Regulatory Commission or~~ the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-~~3~~4, identify that they have no Critical Cyber Assets.

4.2.4 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

5. Effective Date: The first day of the ~~third~~eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).

R1.1. Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).

R1.2. For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.

R1.3. Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).

R1.4. Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-~~3~~4a.

R1.5. Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-~~3~~4; Standard CIP-004-~~3~~4 Requirement R3; Standard CIP-005-~~3~~4a Requirements R2 and R3; Standard CIP-006-~~3~~4c Requirement R3; Standard CIP-007-~~3~~4 Requirements R1 and R3 through R9; Standard CIP-008-~~3~~4; and Standard CIP-009-~~3~~4.

R1.6. The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.

R2. Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).

R2.1. These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.

R2.2. At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.

R2.3. The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).

R2.4. Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.

R2.5. The required documentation shall, at least, identify and describe:

R2.5.1. The processes for access request and authorization.

R2.5.2. The authentication methods.

R2.5.3. The review process for authorization rights, in accordance with Standard CIP-004-~~3~~4 Requirement R4.

R2.5.4. The controls used to secure dial-up accessible connections.

R2.6. Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.

R3. Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.

R3.1. For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.

R3.2. Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.

R4. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:

R4.1. A document identifying the vulnerability assessment process;

R4.2. A review to verify that only ports and services required for operations at these access points are enabled;

R4.3. The discovery of all access points to the Electronic Security Perimeter;

R4.4. A review of controls for default accounts, passwords, and network management community strings;

R4.5. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R5. Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-~~3~~4a.

R5.1. The Responsible Entity shall ensure that all documentation required by Standard CIP-005-~~3~~4a reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-~~3~~4a at least annually.

R5.2. The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.

R5.3. The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-~~3~~4.

C. Measures

M1. The Responsible Entity shall make available documentation about the Electronic Security Perimeter as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation of the electronic access controls to the Electronic Security Perimeter(s), as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of controls implemented to log and monitor access to the Electronic Security Perimeter(s) as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its annual vulnerability assessment as specified in Requirement R4.

M5. The Responsible Entity shall make available access logs and documentation of review, changes, and log retention as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity for Responsible Entities that do not perform delegated tasks, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.1.11.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.1.2 ERO for Regional Entity.

1.2.3 ThirdFor Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.1.3 For the ERO, a third-party monitor without vested interest in the outcome for NERC.

1.2. the ERO shall serve as the Compliance **Monitoring Period and Reset Time Frame**

1.2.4 Not applicableEnforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep logs for a minimum of ninety calendar days, unless: a) longer retention is required pursuant to Standard CIP-008-34, Requirement R2; b) directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall keep other documents and records required by Standard CIP-005-34a from the previous full calendar year.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (To be developed laterDeveloped separately.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.3.1 — Change "Critical Assets," to "Critical Cyber Assets" as intended.	03/24/06
2	Approved by NERC Board of Trustees 5/6/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Revised the wording of the Electronic Access Controls requirement stated in R2.3 to clarify that the Responsible Entity shall "implement and maintain" a procedure for securing dial-up access to the Electronic Security Perimeter(s). Changed compliance monitor to Compliance Enforcement Authority.	Revised.
3	12/16/09	~~Update version from~~ Approved by the NERC Board of Trustees Changed CIP-005-2 to CIP-005-3. Changed all references to CIP Version "2" standards to CIP Version "3" standards. For Violation Severity Levels, changed, "To be developed later" to "Developed separately."	Conforming revisions for FERC Order on CIP V2 Standards (9/30/2009)
2a	02/16/10	Added Appendix 1 — Interpretation of R1.3 approved by BOT on February 16, 2010.	Addition
~~3~~4a	01/24/2011~~12/16/09~~	Approved by the NERC Board of Trustees	~~Update~~Update to conform to changes to CIP-002-4 (Project 2008-06) Update version number from "3" to "4a"

Appendix 1

Requirement Number and Text of Requirement
Section 4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters. **Requirement R1.3** Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).
Question 1 (Section 4.2.2)
What kind of cyber assets are referenced in 4.2.2 as "associated"? What else could be meant except the devices forming the communication link?
Response to Question 1
In the context of applicability, associated Cyber Assets refer to any communications devices external to the Electronic Security Perimeter, i.e., beyond the point at which access to the Electronic Security Perimeter is controlled. Devices controlling access into the Electronic Security Perimeter are not exempt.
Question 2 (Section 4.2.2)
Is the communication link physical or logical? Where does it begin and terminate?
Response to Question 2
The drafting team interprets the data communication link to be physical or logical, and its termination points depend upon the design and architecture of the communication link.
Question 3 (Requirement R1.3)
Please clarify what is meant by an “endpoint”? Is it physical termination? Logical termination of OSI layer 2, layer 3, or above?
Response to Question 3
The drafting team interprets the endpoint to mean the device at which a physical or logical communication link terminates. The endpoint is the Electronic Security Perimeter access point if access into the Electronic Security Perimeter is controlled at the endpoint, irrespective of which Open Systems Interconnection (OSI) layer is managing the communication.
Question 4 (Requirement R1.3)
If “endpoint” is defined as logical and refers to layer 3 and above, please clarify if the termination points of an encrypted tunnel (layer 3) must be treated as an “access point? If two control centers are

owned and managed by the same entity, connected via an encrypted link by properly applied Federal Information Processing Standards, with tunnel termination points that are within the control center ESPs and PSPs and do not terminate on the firewall but on a separate internal device, and the encrypted traffic already passes through a firewall access point at each ESP boundary where port/protocol restrictions are applied, must these encrypted communication tunnel termination points be treated as "access points" in addition to the firewalls through which the encrypted traffic has already passed?
Response to Question 4
In the case where the “endpoint” is defined as logical and is >= layer 3, the termination points of an encrypted tunnel must be treated as an “access point.” The encrypted communication tunnel termination points referred to above are “access points.”

Corrected CIP-006-4c Clean and Redline

A. Introduction

1. Title: Cyber Security — Physical Security of Critical Cyber Assets

2. Number: CIP-006-4c

3. Purpose: Standard CIP-006-4c is intended to ensure the implementation of a physical security program for the protection of Critical Cyber Assets. Standard CIP-006-4c should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-006-4c, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator

4.1.2 Balancing Authority

4.1.3 Interchange Authority

4.1.4 Transmission Service Provider

4.1.5 Transmission Owner

4.1.6 Transmission Operator

4.1.7 Generator Owner

4.1.8 Generator Operator

4.1.9 Load Serving Entity

4.1.10 NERC

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-006-4c:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Physical Security Plan — The Responsible Entity shall document, implement, and maintain a physical security plan, approved by the senior manager or delegate(s) that shall address, at a minimum, the following:

R1.1. All Cyber Assets within an Electronic Security Perimeter shall reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to such Cyber Assets.

R1.2. Identification of all physical access points through each Physical Security Perimeter and measures to control entry at those access points.

R1.3. Processes, tools, and procedures to monitor physical access to the perimeter(s).

R1.4. Appropriate use of physical access controls as described in Requirement R4 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.

R1.5. Review of access authorization requests and revocation of access authorization, in accordance with CIP-004-4 Requirement R4.

R1.6. A visitor control program for visitors (personnel without authorized unescorted access to a Physical Security Perimeter), containing at a minimum the following:

R1.6.1. Logs (manual or automated) to document the entry and exit of visitors, including the date and time, to and from Physical Security Perimeters.

R1.6.2. Continuous escorted access of visitors within the Physical Security Perimeter.

R1.7. Update of the physical security plan within thirty calendar days of the completion of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the Physical Security Perimeter, physical access controls, monitoring controls, or logging controls.

R1.8. Annual review of the physical security plan.

R2. Protection of Physical Access Control Systems — Cyber Assets that authorize and/or log access to the Physical Security Perimeter(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall:

R2.1. Be protected from unauthorized physical access.

R2.2. Be afforded the protective measures specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4a Requirements R2 and R3; Standard CIP-006-4c Requirements R4 and R5; Standard CIP-007-4; Standard CIP-008-4; and Standard CIP-009-4.

R3. Protection of Electronic Access Control Systems — Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter.

R4. Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.
- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets.

R5. Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the

Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008-4. One or more of the following monitoring methods shall be used:

- Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R4.

R6. Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R4.

R7. Access Log Retention — The Responsible Entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.

R8. Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R4, R5, and R6 function properly. The program must include, at a minimum, the following:

R8.1. Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.

R8.2. Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement R8.1.

R8.3. Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.

C. Measures

M1. The Responsible Entity shall make available the physical security plan as specified in Requirement R1 and documentation of the implementation, review and updating of the plan.

M2. The Responsible Entity shall make available documentation that the physical access control systems are protected as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation that the electronic access control systems are located within an identified Physical Security Perimeter as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation identifying the methods for controlling physical access to each access point of a Physical Security Perimeter as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation identifying the methods for monitoring physical access as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation identifying the methods for logging physical access as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation to show retention of access logs as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation to show its implementation of a physical security system maintenance and testing program as specified in Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documents other than those specified in Requirements R7 and R8.2 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 The Responsible Entity may not make exceptions in its cyber security policy to the creation, documentation, or maintenance of a physical security plan.

1.5.2 For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006-4c for that single access point at the dial-up device.

2. Violation Severity Levels (Under development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to remove extraneous information from the requirements, improve readability, and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Replaced the RRO with RE as a responsible entity. Modified CIP-006-1 Requirement R1 to clarify that a physical security plan to protect Critical Cyber Assets must be documented, maintained, implemented, and approved by the senior manager. Revised the wording in R1.2 to identify all "physical" access points. Added Requirement R2 to CIP-006-2 to clarify the requirement to safeguard the Physical Access Control Systems and exclude hardware at the Physical Security Perimeter access point, such as electronic lock control mechanisms and badge readers from the requirement. Requirement R2.1 requires the Responsible Entity to protect the Physical Access Control Systems from unauthorized access. CIP-006-1 Requirement R1.8 was moved to become CIP-006-2 Requirement R2.2. Added Requirement R3 to CIP-006-2, clarifying the requirement for Electronic Access Control Systems to be safeguarded within an identified Physical Security Perimeter. The sub requirements of CIP-006-2 Requirements R4, R5, and R6 were changed from formal requirements to bulleted lists of options consistent with the intent of the requirements. Changed the Compliance Monitor to Compliance Enforcement Authority.	
3		Updated version numbers from -2 to -3 Revised Requirement 1.6 to add a Visitor Control program component to the Physical Security Plan, in response to FERC order issued September 30, 2009. In Requirement R7, the term "Responsible Entity" was capitalized.	
	11/18/2009	Updated Requirements R1.6.1 and R1.6.2 to be responsive to FERC Order RD09-7	
3	12/16/09	Approved by NERC Board of Trustees	Update
1a	2/12/2008	Approved by NERC Board of Trustees Interpretation of R1 and Additional Compliance	Interpretation (Project 2007-27)

		Information Section 1.4.4 (Appendix 1)	
1b/2b	08/05/2009	Approved by NERC Board of Trustees Interpretation of R4 (Appendix 2)	Interpretation (Project 2008-15)
3c	02/16/2010	Approved by the NERC Board of Trustees Interpretation of R1 and R1.1 (Appendix 3)	Interpretation (Project 2009-13)
4c	01/24/2011	Approved by the NERC Board of Trustees Update version number from “3” to “4c”	Update to conform to changes to CIP-002-4 (Project 2008-06)

Appendix 1

Interpretation of Requirement R1.1.

Request: *Are dial-up RTUs that use non-routable protocols and have dial-up access required to have a six-wall perimeters or are they exempted from CIP-006-1 and required to have only electronic security perimeters? This has a direct impact on how any identified RTUs will be physically secured.*

Interpretation:

Dial-up assets are Critical Cyber Assets, assuming they meet the criteria in CIP-002-1, and they must reside within an Electronic Security Perimeter. However, physical security control over a critical cyber asset is not required if that asset does not have a routable protocol. Since there is minimal risk of compromising other critical cyber assets dial-up devices such as Remote Terminals Units that do not use routable protocols are not required to be enclosed within a "six-wall" border.

CIP-006-1 — Requirement 1.1 requires a Responsible Entity to have a physical security plan that stipulate cyber assets that are within the Electronic Security Perimeter also be within a Physical Security Perimeter.

R1. Physical Security Plan — The Responsible Entity shall create and maintain a physical security plan, approved by a senior manager or delegate(s) that shall address, at a minimum, the following:

R1.1. Processes to ensure and document that all Cyber Assets within an Electronic Security Perimeter also reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to the Critical Cyber Assets.

CIP-006-1 — Additional Compliance Information 1.4.4 identifies dial-up accessible assets that use non-routable protocols as a special class of cyber assets that are not subject to the Physical Security Perimeter requirement of this standard.

1.4. Additional Compliance Information

1.4.4 For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006 for that single access point at the dial-up device.

Appendix 2

The following interpretation of CIP-006-1a — Cyber Security — Physical Security of Critical Cyber Assets, Requirement R4 was developed by the standard drafting team assigned to Project 2008-14 (Cyber Security Violation Severity Levels) on October 23, 2008.

Request:

1. *For physical access control to cyber assets, does this include monitoring when an individual leaves the controlled access cyber area?*
2. *Does the term, "time of access" mean logging when the person entered the facility or does it mean logging the entry/exit time and "length" of time the person had access to the critical asset?*

Interpretation:

No, monitoring and logging of access are only required for ingress at this time. The term "time of access" refers to the time an authorized individual enters the physical security perimeter.

Requirement Number and Text of Requirement

R4. Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent:

R4.1. Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method.

R4.2. Video Recording: Electronic capture of video images of sufficient quality to determine identity.

R4.3. Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R2.3.

Appendix 3

Requirement Number and Text of Requirement
R1. Physical Security Plan — The Responsible Entity shall create and maintain a physical security plan, approved by a senior manager or delegate(s) that shall address, at a minimum, the following: R1.1. Processes to ensure and document that all Cyber Assets within an Electronic Security Perimeter also reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to the Critical Cyber Assets.
Question
If a completely enclosed border cannot be created, what does the phrase, "to control physical access" require? Must the alternative measure be physical in nature? If so, must the physical barrier literally prevent physical access e.g. using concrete encased fiber, or can the alternative measure effectively mitigate the risks associated with physical access through cameras, motions sensors, or encryption? Does this requirement preclude the application of logical controls as an alternative measure in mitigating the risks of physical access to Critical Cyber Assets?
Response
For Electronic Security Perimeter wiring external to a Physical Security Perimeter, the drafting team interprets the Requirement R1.1 as not limited to measures that are "physical in nature." The alternative measures may be physical or logical, on the condition that they provide security equivalent or better to a completely enclosed ("six-wall") border. Alternative physical control measures may include, but are not limited to, multiple physical access control layers within a non-public, controlled space. Alternative logical control measures may include, but are not limited to, data encryption and/or circuit monitoring to detect unauthorized access or physical tampering.

A. Introduction

1. Title: Cyber Security — Physical Security of Critical Cyber Assets

2. Number: CIP-006-~~3c~~4c

3. Purpose: Standard CIP-006-~~3~~4c is intended to ensure the implementation of a physical security program for the protection of Critical Cyber Assets. Standard CIP-006-~~3~~4c should be read as part of a group of standards numbered Standards CIP-002-~~3~~4 through CIP-009-~~3~~4.

4. Applicability:

4.1. Within the text of Standard CIP-006-~~3~~4c, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator

4.1.2 Balancing Authority

4.1.3 Interchange Authority

4.1.4 Transmission Service Provider

4.1.5 Transmission Owner

4.1.6 Transmission Operator

4.1.7 Generator Owner

4.1.8 Generator Operator

4.1.9 Load Serving Entity

4.1.10 NERC

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-006-~~3~~4c:

4.2.1 Facilities regulated by ~~the U.S. Nuclear Regulatory Commission or~~ the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

~~4.2.3~~4.2.4 Responsible Entities that, in compliance with Standard CIP-002-~~3~~4, identify that they have no Critical Cyber Assets

5. Effective Date: The first day of the ~~third~~eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ~~third~~ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Physical Security Plan — The Responsible Entity shall document, implement, and maintain a physical security plan, approved by the senior manager or delegate(s) that shall address, at a minimum, the following:

R1.1. All Cyber Assets within an Electronic Security Perimeter shall reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to such Cyber Assets.

R1.2. Identification of all physical access points through each Physical Security Perimeter and measures to control entry at those access points.

R1.3. Processes, tools, and procedures to monitor physical access to the perimeter(s).

R1.4. Appropriate use of physical access controls as described in Requirement R4 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.

R1.5. Review of access authorization requests and revocation of access authorization, in accordance with CIP-004-~~3~~4 Requirement R4.

R1.6. A visitor control program for visitors (personnel without authorized unescorted access to a Physical Security Perimeter), containing at a minimum the following:

R1.6.1. Logs (manual or automated) to document the entry and exit of visitors, including the date and time, to and from Physical Security Perimeters.

R1.6.2. Continuous escorted access of visitors within the Physical Security Perimeter.

R1.7. Update of the physical security plan within thirty calendar days of the completion of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the Physical Security Perimeter, physical access controls, monitoring controls, or logging controls.

R1.8. Annual review of the physical security plan.

R2. Protection of Physical Access Control Systems — Cyber Assets that authorize and/or log access to the Physical Security Perimeter(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall:

R2.1. Be protected from unauthorized physical access.

R2.2. Be afforded the protective measures specified in Standard CIP-003-~~3~~4; Standard CIP-004-~~3~~4 Requirement R3; Standard CIP-005-~~3~~4a Requirements R2 and R3; Standard CIP-006-~~3~~4c Requirements R4 and R5; Standard CIP-007-~~3~~4; Standard CIP-008-~~3~~4; and Standard CIP-009-~~3~~4.

R3. Protection of Electronic Access Control Systems — Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter.

R4. Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.
- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets.

R5. Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the

Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008-~~3~~4. One or more of the following monitoring methods shall be used:

- Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R4.

R6. Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R4.

R7. Access Log Retention — The Responsible Entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-~~3~~4.

R8. Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R4, R5, and R6 function properly. The program must include, at a minimum, the following:

R8.1. Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.

R8.2. Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement R8.1.

R8.3. Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.

C. Measures

M1. The Responsible Entity shall make available the physical security plan as specified in Requirement R1 and documentation of the implementation, review and updating of the plan.

M2. The Responsible Entity shall make available documentation that the physical access control systems are protected as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation that the electronic access control systems are located within an identified Physical Security Perimeter as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation identifying the methods for controlling physical access to each access point of a Physical Security Perimeter as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation identifying the methods for monitoring physical access as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation identifying the methods for logging physical access as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation to show retention of access logs as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation to show its implementation of a physical security system maintenance and testing program as specified in Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity ~~for Responsible Entities that do not perform delegated tasks~~, the Regional Entity shall serve as the Compliance Enforcement Authority.

~~1.1.1~~1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

~~**1.1.2 ERO for Regional Entities.**~~

1.2.3 ~~Third~~For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

~~**1.1.3**~~ For the ERO, a third-party monitor without vested interest in the outcome for ~~NERC.~~

~~**1.2.**~~ the ERO shall serve as the Compliance ~~**Monitoring Period and Reset Time Frame**~~

1.2.4 ~~Not applicable~~Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documents other than those specified in Requirements R7 and R8.2 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 The Responsible Entity may not make exceptions in its cyber security policy to the creation, documentation, or maintenance of a physical security plan.

1.5.2 For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006-~~3~~4c for that single access point at the dial-up device.

2. Violation Severity Levels (Under development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Appendix 1

Interpretation of Requirement R1.1.

Request: *Are dial-up RTUs that use non-routable protocols and have dial-up access required to have a six-wall perimeters or are they exempted from CIP-006-1 and required to have only electronic security perimeters? This has a direct impact on how any identified RTUs will be physically secured.*

Interpretation:

Dial-up assets are Critical Cyber Assets, assuming they meet the criteria in CIP-002-1, and they must reside within an Electronic Security Perimeter. However, physical security control over a critical cyber asset is not required if that asset does not have a routable protocol. Since there is minimal risk of compromising other critical cyber assets dial-up devices such as Remote Terminals Units that do not use routable protocols are not required to be enclosed within a "six-wall" border.

CIP-006-1 — Requirement 1.1 requires a Responsible Entity to have a physical security plan that stipulate cyber assets that are within the Electronic Security Perimeter also be within a Physical Security Perimeter.

R1. Physical Security Plan — The Responsible Entity shall create and maintain a physical security plan, approved by a senior manager or delegate(s) that shall address, at a minimum, the following:

R1.1. Processes to ensure and document that all Cyber Assets within an Electronic Security Perimeter also reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to the Critical Cyber Assets.

CIP-006-1 — Additional Compliance Information 1.4.4 identifies dial-up accessible assets that use non-routable protocols as a special class of cyber assets that are not subject to the Physical Security Perimeter requirement of this standard.

1.4. Additional Compliance Information

1.4.4 For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006 for that single access point at the dial-up device.

Appendix 2

The following interpretation of CIP-006-1a — Cyber Security — Physical Security of Critical Cyber Assets, Requirement R4 was developed by the standard drafting team assigned to Project 2008-14 (Cyber Security Violation Severity Levels) on October 23, 2008.

Request:

1. *For physical access control to cyber assets, does this include monitoring when an individual leaves the controlled access cyber area?*
2. *Does the term, "time of access" mean logging when the person entered the facility or does it mean logging the entry/exit time and "length" of time the person had access to the critical asset?*

Interpretation:

No, monitoring and logging of access are only required for ingress at this time. The term "time of access" refers to the time an authorized individual enters the physical security perimeter.

Requirement Number and Text of Requirement

R4. Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent:

R4.1. Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method.

R4.2. Video Recording: Electronic capture of video images of sufficient quality to determine identity.

R4.3. Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R2.3.

Appendix 3

Requirement Number and Text of Requirement
R1. Physical Security Plan — The Responsible Entity shall create and maintain a physical security plan, approved by a senior manager or delegate(s) that shall address, at a minimum, the following: R1.1. Processes to ensure and document that all Cyber Assets within an Electronic Security Perimeter also reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to the Critical Cyber Assets.
Question
If a completely enclosed border cannot be created, what does the phrase, "to control physical access" require? Must the alternative measure be physical in nature? If so, must the physical barrier literally prevent physical access e.g. using concrete encased fiber, or can the alternative measure effectively mitigate the risks associated with physical access through cameras, motions sensors, or encryption? Does this requirement preclude the application of logical controls as an alternative measure in mitigating the risks of physical access to Critical Cyber Assets?
Response
For Electronic Security Perimeter wiring external to a Physical Security Perimeter, the drafting team interprets the Requirement R1.1 as not limited to measures that are "physical in nature." The alternative measures may be physical or logical, on the condition that they provide security equivalent or better to a completely enclosed ("six-wall") border. Alternative physical control measures may include, but are not limited to, multiple physical access control layers within a non-public, controlled space. Alternative logical control measures may include, but are not limited to, data encryption and/or circuit monitoring to detect unauthorized access or physical tampering.

CIP-007-4 Clean and Redline

A. Introduction

1. Title: Cyber Security — Systems Security Management

2. Number: CIP-007-4

3. Purpose: Standard CIP-007-4 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the other (non-critical) Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-007-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-007-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-4, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

R1.1. The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.

R1.2. The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.

R1.3. The Responsible Entity shall document test results.

R2. Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.

R2.1. The Responsible Entity shall enable only those ports and services required for normal and emergency operations.

R2.2. The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).

R2.3. In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

R3.1. The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.

R3.2. The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4. Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).

R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4.2. The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.1. The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.

R5.1.1. The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-4 Requirement R5.

R5.1.2. The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.

R5.1.3. The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.

R5.2. The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.

R5.2.1. The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.

R5.2.2. The Responsible Entity shall identify those individuals with access to shared accounts.

R5.2.3. Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:

R5.3.1. Each password shall be a minimum of six characters.

R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters.

R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

R6. Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.

R6.1. The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2. The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.

R6.3. The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-4.

R6.4. The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.

R6.5. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.

R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4.

R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.

R8. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:

R8.1. A document identifying the vulnerability assessment process;

R8.2. A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;

R8.3. A review of controls for default accounts; and,

R8.4. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-4 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.

C. Measures

M1. The Responsible Entity shall make available documentation of its security test procedures as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation and records of its security patch management program, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation and records of its malicious software prevention program as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation and records of its account management program as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation and records of its security status monitoring program as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation and records of its program for the disposal or redeployment of Cyber Assets as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation and records of its annual vulnerability assessment of all Cyber Assets within the Electronic Security Perimeters(s) as specified in Requirement R8.

M9. The Responsible Entity shall make available documentation and records demonstrating the review and update as specified in Requirement R9.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall retain security–related system event logs for ninety calendar days, unless longer retention is required pursuant to Standard CIP-008-4 Requirement R2.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards.	

		Removal of reasonable business judgment and acceptance of risk. Revised the Purpose of this standard to clarify that Standard CIP-007-2 requires Responsible Entities to define methods, processes, and procedures for securing Cyber Assets and other (non-Critical) Assets within an Electronic Security Perimeter. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. R9 changed ninety (90) days to thirty (30) days Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version numbers from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	
4	Board approved 01/24/2011	Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)

A. Introduction

1. Title: Cyber Security — Systems Security Management

2. Number: CIP-007-~~3~~4

3. Purpose: Standard CIP-007-~~3~~4 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the other (non-critical) Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007-~~3~~4 should be read as part of a group of standards numbered Standards CIP-002-~~3~~4 through CIP-009-~~3~~4.

4. Applicability:

4.1. Within the text of Standard CIP-007-~~3~~4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-007-~~3~~4:

4.2.1 Facilities regulated by ~~the U.S. Nuclear Regulatory Commission or~~ the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

~~Cyber Assets associated with Cyber Security Plans submitted to and verified by the U. S. Nuclear Regulatory Commission pursuant to 10 C.F.R. Section 73.54.~~

~~4.2.3~~4.2.4 Responsible Entities that, in compliance with Standard CIP-002-~~3~~4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the ~~third~~eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ~~third~~ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-~~3~~4, a significant

Formatted: Font color: Black

Formatted: Font color: Black

change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

R1.1. The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.

R1.2. The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.

R1.3. The Responsible Entity shall document test results.

R2. Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.

R2.1. The Responsible Entity shall enable only those ports and services required for normal and emergency operations.

R2.2. The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).

R2.3. In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003–~~3~~4 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

R3.1. The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.

R3.2. The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4. Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).

R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4.2. The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.1. The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.

R5.1.1. The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-~~3~~4 Requirement R5.

R5.1.2. The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.

R5.1.3. The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-~~3~~4 Requirement R5 and Standard CIP-004-~~3~~4 Requirement R4.

R5.2. The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.

R5.2.1. The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.

R5.2.2. The Responsible Entity shall identify those individuals with access to shared accounts.

R5.2.3. Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:

R5.3.1. Each password shall be a minimum of six characters.

R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters.

R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

R6. Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.

R6.1. The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2. The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.

R6.3. The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-~~3~~4.

R6.4. The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.

R6.5. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.

R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-~~3~~4.

R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.

R8. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:

R8.1. A document identifying the vulnerability assessment process;

R8.2. A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;

R8.3. A review of controls for default accounts; and,

R8.4. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-~~3~~4 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.

C. Measures

M1. The Responsible Entity shall make available documentation of its security test procedures as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation and records of its security patch management program, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation and records of its malicious software prevention program as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation and records of its account management program as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation and records of its security status monitoring program as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation and records of its program for the disposal or redeployment of Cyber Assets as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation and records of its annual vulnerability assessment of all Cyber Assets within the Electronic Security Perimeters(s) as specified in Requirement R8.

M9. The Responsible Entity shall make available documentation and records demonstrating the review and update as specified in Requirement R9.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity ~~for Responsible Entities that do not perform delegated tasks~~, the Regional Entity shall serve as the Compliance Enforcement Authority.

~~1.1.1~~1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

~~**1.1.2 ERO for Regional Entity.**~~

1.2.3 ~~Third~~For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

~~**1.1.3**~~ For the ERO, a third-party monitor without vested interest in the outcome for ~~NERC.~~

~~**1.2.** the ERO shall serve as the~~ Compliance ~~**Monitoring Period and Reset Time Frame**~~

1.2.4 ~~Not applicable~~Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall retain security–related system event logs for ninety calendar days, unless longer retention is required pursuant to Standard CIP-008-~~3~~4 Requirement R2.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information.

CIP-008-4 Clean and Redline

A. Introduction

1. Title: Cyber Security — Incident Reporting and Response Planning

2. Number: CIP-008-4

3. Purpose: Standard CIP-008-4 ensures the identification, classification, response, and reporting of Cyber Security Incidents related to Critical Cyber Assets. Standard CIP-008-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability

4.1. Within the text of Standard CIP-008-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-008-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident response plan shall address, at a minimum, the following:

R1.1. Procedures to characterize and classify events as reportable Cyber Security Incidents.

R1.2. Response actions, including roles and responsibilities of Cyber Security Incident response teams, Cyber Security Incident handling procedures, and communication plans.

R1.3. Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.

R1.4. Process for updating the Cyber Security Incident response plan within thirty calendar days of any changes.

R1.5. Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.

R1.6. Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident.

R2. Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.

C. Measures

M1. The Responsible Entity shall make available its Cyber Security Incident response plan as indicated in Requirement R1 and documentation of the review, updating, and testing of the plan.

M2. The Responsible Entity shall make available all documentation as specified in Requirement R2.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation other than that required for reportable Cyber Security Incidents as specified in Standard CIP-008-4 for the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 The Responsible Entity may not take exception in its cyber security policies to the creation of a Cyber Security Incident response plan.

1.5.2 The Responsible Entity may not take exception in its cyber security policies to reporting Cyber Security Incidents to the ES ISAC.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated Version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by NERC Board of Trustees	Update
4	Board approved 01/24/2011	Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)

A. Introduction

1. Title: Cyber Security — Incident Reporting and Response Planning

2. Number: CIP-008-~~3~~4

3. Purpose: Standard CIP-008-~~3~~4 ensures the identification, classification, response, and reporting of Cyber Security Incidents related to Critical Cyber Assets. Standard CIP-008-~~23~~4 should be read as part of a group of standards numbered Standards CIP-002-~~3~~4 through CIP-009-~~3~~4.

4. Applicability

4.1. Within the text of Standard CIP-008-~~3~~4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-008-~~3~~4:

4.2.1 Facilities regulated by ~~the U.S. Nuclear Regulatory Commission or~~ the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

~~4.2.3~~4.2.4 Responsible Entities that, in compliance with Standard CIP-002-~~3~~4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the ~~third~~eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ~~third~~ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident response plan shall address, at a minimum, the following:

R1.1. Procedures to characterize and classify events as reportable Cyber Security Incidents.

R1.2. Response actions, including roles and responsibilities of Cyber Security Incident response teams, Cyber Security Incident handling procedures, and communication plans.

R1.3. Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.

R1.4. Process for updating the Cyber Security Incident response plan within thirty calendar days of any changes.

R1.5. Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.

R1.6. Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident.

R2. Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.

C. Measures

M1. The Responsible Entity shall make available its Cyber Security Incident response plan as indicated in Requirement R1 and documentation of the review, updating, and testing of the plan.

M2. The Responsible Entity shall make available all documentation as specified in Requirement R2.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity ~~for Responsible Entities that do not perform delegated tasks~~, the Regional Entity shall serve as the Compliance Enforcement Authority.

~~1.1.1~~1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

~~**1.1.2 ERO for Regional Entity.**~~

1.2.3 ~~Third~~For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

~~**1.1.3**~~ For the ERO, a third-party monitor without vested interest in the outcome for ~~NERC.~~

~~**1.2.**~~ the ERO shall serve as the Compliance ~~**Monitoring Period and Reset Time Frame**~~

1.2.4 ~~Not applicable~~Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation other than that required for reportable Cyber Security Incidents as specified in Standard CIP-008-~~3~~4 for the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 The Responsible Entity may not take exception in its cyber security policies to the creation of a Cyber Security Incident response plan.

1.5.2 The Responsible Entity may not take exception in its cyber security policies to reporting Cyber Security Incidents to the ES ISAC.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated Version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued	

		September 30, 2009.	
3	12/16/09	Approved by NERC Board of Trustees	Update
4	Board approved 01/24/2011	Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)

CIP-009-4 Clean and Redline

A. Introduction

1. Title: Cyber Security — Recovery Plans for Critical Cyber Assets

2. Number: CIP-009-4

3. Purpose: Standard CIP-009-4 ensures that recovery plan(s) are put in place for Critical Cyber Assets and that these plans follow established business continuity and disaster recovery techniques and practices. Standard CIP-009-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-009-3, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator

4.1.2 Balancing Authority

4.1.3 Interchange Authority

4.1.4 Transmission Service Provider

4.1.5 Transmission Owner

4.1.6 Transmission Operator

4.1.7 Generator Owner

4.1.8 Generator Operator

4.1.9 Load Serving Entity

4.1.10 NERC

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-009-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Recovery Plans — The Responsible Entity shall create and annually review recovery plan(s) for Critical Cyber Assets. The recovery plan(s) shall address at a minimum the following:

R1.1. Specify the required actions in response to events or conditions of varying duration and severity that would activate the recovery plan(s).

R1.2. Define the roles and responsibilities of responders.

R2. Exercises — The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident.

R3. Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change being completed.

R4. Backup and Restore — The recovery plan(s) shall include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.

R5. Testing Backup Media — Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.

C. Measures

M1. The Responsible Entity shall make available its recovery plan(s) as specified in Requirement R1.

M2. The Responsible Entity shall make available its records documenting required exercises as specified in Requirement R2.

M3. The Responsible Entity shall make available its documentation of changes to the recovery plan(s), and documentation of all communications, as specified in Requirement R3.

M4. The Responsible Entity shall make available its documentation regarding backup and storage of information as specified in Requirement R4.

M5. The Responsible Entity shall make available its documentation of testing of backup media as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-009-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Exhibit B

Implementation Plan for Version 4 Cyber Security Standards CIP-002-4 through CIP-009-4

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before

The term Blackstart Resource, used in CIP-002-4 Attachment 1, was submitted for regulatory approval with Project 2006-03 – System Restoration and Blackstart. The effective date of EOP-005-2 is the date that Criteria 1.4 and 1.5 will be used to determine Critical Assets for Responsible Entity.

Applicable Standards

The following standards are covered by this Implementation Plan:
CIP–002–4 —Cyber Security — Critical Cyber Asset Identification
CIP–003–4 — Cyber Security — Security Management Controls
CIP–004–4 — Cyber Security — Personnel and Training
CIP–005–4 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–4 — Cyber Security — Physical Security
CIP–007–4 —Cyber Security — Systems Security Management
CIP–008–4 — Cyber Security — Incident Reporting and Response Planning
CIP–009–4 — Cyber Security — Recovery Plans for Critical Cyber Assets

These standards are posted for ballot by NERC together with this Implementation Plan. When these standards become effective, all prior versions of these standards are retired.

Compliance with Standards

Once these standards become effective, the Responsible Entities identified in the Applicability section of the standard must comply with the requirements. These Responsible Entities include:
• Reliability Coordinator
• Balancing Authority
• Interchange Authority
• Transmission Service Provider
• Transmission Owner
• Transmission Operator
• Generator Owner
• Generator Operator
• Load Serving Entity
• NERC
• Regional Entity

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

Proposed Effective Date for CIP-002-4 through CIP-009-4

All Facilities Other Than U.S. Nuclear Power Plant Facilities
Responsible Entities shall be compliant with the requirements of CIP-002-4 through CIP-009-4 on the later of (i) the Effective Date specified in the Standard or (ii) the compliance milestones specified in version 3 of the *Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities.*

U.S. Nuclear Power Plant Facilities
For Owners and Operators of U.S. Nuclear Power Plants, Critical Cyber Assets associated with U.S. Nuclear Power Plants identified as Critical Assets shall be compliant with CIP-002-4 through CIP-009-4 by the later of (i) the Effective Date in CIP-002-4 through CIP-009-4, (ii) 6 months following the completion of the first refueling outage beyond the Effective Date of CIP-002-4 for those requirements requiring a refueling outage, or (iii) the compliance milestones specified in version 3 of the *Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities.*

Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

Concurrently submitted with version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4 is a separate Implementation Plan document that would be used by the Responsible Entities to bring any Critical Cyber Assets identified after the effective date of CIP-002-4 into compliance with the Cyber Security Standards, as those assets are identified. The Implementation Plan for newly identified Critical Cyber Assets provides a reasonable schedule for the Responsible Entity to achieve the 'Compliant' state for those newly identified Critical Cyber Assets.
The Implementation Plan for newly identified Critical Cyber Assets also addresses how to achieve the 'Compliant' state for: 1) Responsible Entities that merge with or are acquired by other Responsible Entities; and 2) Responsible Entities that register in the NERC Compliance Registry during or following the completion of the Implementation Plan for Version 4 of the NERC Cyber Security Standards CIP-002-4 to CIP-009-4.

Exhibit C

Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities for CIP Reliability Standards submitted for Approval

Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

This Implementation Plan applies to Cyber Security Standards CIP-002-4 through CIP-009-4.

The term "Compliant" in this Implementation Plan is used in the same way that it is used in the (Revised) Implementation Plan for Cyber Security Standards CIP-002-1 through CIP-009-1: "Compliant means the entity meets the full intent of the requirements and is beginning to maintain required 'data,' 'documents,' 'documentation,' 'logs,' and 'records.'"

The Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities (hereafter referred to as 'this Implementation Plan') defines the schedule for compliance with the requirements of Version 4 of the NERC Reliability Standards CIP-003 through CIP-009[1] on Cyber Security for (a) newly Registered Entities and (b) newly identified Critical Cyber Assets by an existing Registered Entity after the Registered Entity's applicable *Compliant* milestone date has already passed based upon the scenarios identified in the Version 4 CIP-002-4 through CIP-009-4 Implementation Plan.

There are no *Compliant* milestones specified in Table 2 of this Implementation Plan for compliance with NERC Standard CIP-002, since all Responsible Entities are required to be compliant with NERC Standard CIP-002 based on a previous or existing version-specific Implementation Plan[2].

Implementation Plan for Newly Identified Critical Cyber Assets

This Implementation Plan defines the *Compliant* milestone dates in terms of the number of calendar months after designation of the newly identified Cyber Asset as a Critical Cyber Asset, following the process stated in NERC Standard CIP-002. These *Compliant* Milestone dates are included in Table 2 of this Implementation Plan.

The term 'newly identified Critical Cyber Asset' is used when a Registered Entity has been required to be compliant with NERC Reliability Standard CIP-002 for at least one application of the "Critical Asset Criteria" for the identification of Critical Assets. Upon a subsequent annual application of the Critical Asset identification in compliance with requirements of NERC Reliability Standard CIP-002, either a previously non-critical asset has now been determined to be a Critical Asset, and its associated essential Cyber Assets have now been determined to be Critical Cyber Assets, or Cyber Assets associated with an existing Critical Asset have now been identified as Critical Cyber Assets. These newly determined Critical Cyber Assets are referred to in this Implementation Plan as 'newly identified Critical Cyber Assets'.

[1] The reference in this Implementation Plan to 'NERC Standards CIP-002 through CIP-009' is to all versions (i.e., Version 1, Version 2, Version 3, and Version 4) of those standards. If reference to only a specific version of a standard or set of standards is required, a version number (i.e., '-1', '-2','-3', or '-4') will be applied to that particular reference.

[2] Each version of NERC Standards CIP-002 through CIP-009 has its own implementation plan and/or designated effective date when approved by the NERC Board of Trustees or appropriate government authorities.

Table 2 defines the *Compliant* milestone dates for all of the requirements defined in the NERC Reliability Standards CIP-003 through CIP-009 in terms of the number of months following the designation of a newly identified Critical Cyber Asset a Responsible Entity has to become compliant with that requirement. Table 2 further defines the *Compliant* milestone dates for the NERC Reliability Standards CIP-003 through CIP-009 based on the 'Milestone Category', which characterizes the scenario by which the Critical Cyber Asset was identified.

For those NERC Reliability Standard requirements that have an entry in Table 2 annotated as *existing*, the designation of a newly identified Critical Cyber Asset has no bearing on its *Compliant* milestone date, since Responsible Entities are required to be compliant with those requirements as part of an existing CIP compliance implementation program[3], independent of the determination of a newly identified Critical Cyber Asset.

Implementation Plan for Newly Registered Entities

A newly Registered Entity is one that has registered with NERC as of the Effective Date of the CIP-002-4 Standard or thereafter and has not previously undergone the NERC CIP-002 Critical Asset Identification Process. As such, it is presumed that no Critical Cyber Assets have been previously identified and no previously established CIP compliance implementation program exists. The *Compliant* milestone schedule defined in Table 3 of this Implementation Plan document defines the applicable compliance schedule for the newly Registered Entity to the NERC Reliability Standards CIP-002 through CIP-009.

Implementation Milestone Categories

The Implementation Plan milestones and schedule to achieve compliance with the NERC Reliability Standards CIP-002 through CIP-009 for newly identified Critical Cyber Assets and newly Registered Entities are provided in Tables 2 and 3 of this Implementation Plan document.

The Implementation Plan milestones defined in Table 2 are divided into categories based on the scenario by which the Critical Cyber Asset was newly identified. The scenarios that represent the milestone categories are briefly defined as follows:

1. A Cyber Asset is designated as the first Critical Cyber Asset by a Responsible Entity according to the process defined in NERC Reliability Standard CIP-002. No existing CIP compliance implementation program for Standards CIP-003 through CIP-009 is assumed to exist at the Responsible Entity. This category would also apply in the case of a newly Registered Entity (not resulting from a merger or acquisition), if any Critical Cyber Asset was identified according to the process defined in NERC Reliability Standard CIP-002.

2. An existing Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009, *not due to a planned change in the electric system or Cyber Assets by*

[3] The term 'CIP compliance implementation program' is used to mean that a Responsible Entity has programs and procedures in place to comply with the requirements of NERC Reliability Standards CIP-003 through CIP-009 for Critical Cyber Assets. All entities are required to be Compliant with NERC Reliability Standard CIP-002 according to a version specific Implementation Plan.

the Responsible Entity (unplanned changes due to emergency response are handled separately). A CIP compliance implementation program already exists at the Responsible Entity.

3. A new or existing Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009, *due to a planned change in the electric system or Cyber Assets by the Responsible Entity*. A CIP compliance implementation program already exists at the Responsible Entity.

Note that the phrase 'Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009' as used above applies to all Critical Cyber Assets, as well as other (non-critical) Cyber Assets within an Electronic Security Perimeter that must comply with the applicable requirements of NERC Reliability Standards CIP-003 through CIP-009.

Note also that the phrase 'planned change in the electric system or Cyber Assets by the Responsible Entity' refers to any changes of the electric system or Cyber Assets which were planned and implemented by the Responsible Entity.

For example, if a particular transmission substation has been designated a Critical Asset, but there are no Cyber Assets at that transmission substation, then there are no Critical Cyber Assets associated with the Critical Asset at the transmission substation. If an automation modernization activity is performed at that same transmission substation, whereby Cyber Assets are installed that meet the requirements as Critical Cyber Assets, then those newly identified Critical Cyber Assets have been implemented as a result of a planned change of the Critical Asset, and must therefore be in Compliance with NERC Reliability Standards CIP-003 through CIP-009 upon the commissioning of the modernized transmission substation.(Compliant Upon Commissioning below.)

If, however, a particular transmission substation with Cyber Assets does not meet the criteria as a Critical Asset, its associated Cyber Assets are *not* Critical Cyber Assets, as described in the requirements of NERC Reliability Standard CIP-002. Further, if an action is performed outside of that particular transmission substation, such as a transmission line is constructed or retired, a generation plant is modified changing its rated output, or load patterns shift resulting in corresponding transmission flow changes through that transmission substation, that unchanged transmission substation may become a Critical Asset based on the established criteria in the CIP-002-4 *Attachment 1 Critical Asset Criteria* through the application of the Critical Asset identification (required by CIP-002 R1). (Note that the actions that cause the change in power flows may have been performed by a neighboring entity without the full knowledge of the affected Responsible Entity.) Application of those Critical Asset criteria is required annually (by CIP-002 R1), and, as such, it may not be immediately apparent that that particular transmission substation has become a Critical Asset until after the required annual application of the identification methodology. Category 1 Scenario below applies if there was no pre-existing Critical Cyber Assets subject to the standard, and therefore, there was no existing full CIP program. Category 2 Scenario below applies if a CIP program for existing Critical Cyber Assets has been implemented for that Registered Entity.

Figure 1 shows an overall process flow for determining which milestone category a Critical Cyber Asset identification scenario must follow. Following the figure is a more detailed description of each category.

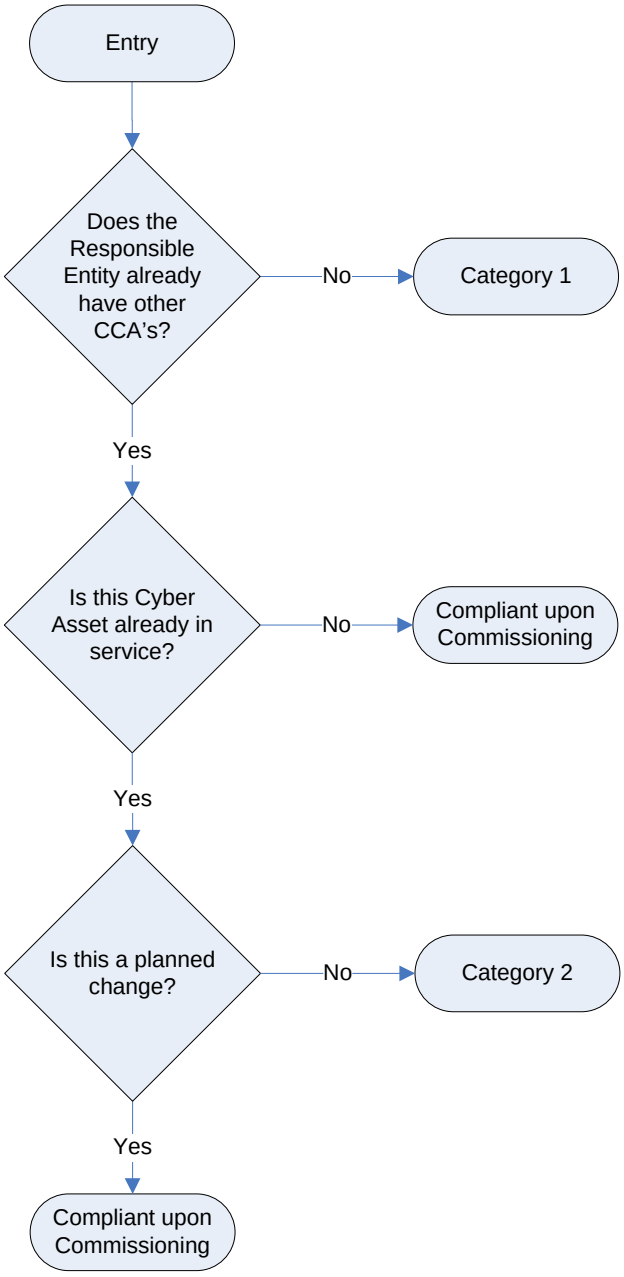

Figure 1: Category Selection Process Flow

Implementation Milestone Categories and Schedules

Based on the Critical Cyber Asset identification scenarios identified above, the implementation milestone categories and schedules for those scenarios are defined and distinguished below for entities with existing registrations in the NERC Compliance Registry. Scenarios resulting from the formation of newly Registered Entities are discussed in a subsequent section of this Implementation Plan.

1. **Category 1 Scenario**: A Responsible Entity that previously has undergone the NERC Reliability Standard CIP-002 Critical Asset identification process for at least one annual review and approval period without ever having previously identified any Critical Cyber Assets associated with Critical Assets, but has now identified one or more Critical Cyber Assets. As such, it is presumed that the Responsible Entity does not have a previously established CIP compliance implementation program.

   The *Compliant* milestones defined for this Category are defined in Table 2 (Milestone Category 1) of this Implementation Plan document.

2. **Category 2 Scenario**: A Responsible Entity has an established NERC Reliability Standards CIP compliance implementation program in place, and has newly identified additional existing Cyber Assets that need to be added to its Critical Cyber Asset list and therefore subject to compliance to the NERC Reliability CIP Standards due to unplanned changes in the electric system or the Cyber Assets. Since the Responsible Entity already has a CIP compliance implementation program, it needs only to implement the NERC Reliability CIP standards for the newly identified Critical Cyber Asset(s). The existing Critical Cyber Assets may remain in service while the relevant requirements of the NERC Reliability CIP Standards are implemented for the newly identified Critical Cyber Asset(s).

   This category applies only when additional in-service Critical Cyber Assets or applicable other Cyber Assets are *identified* as Critical Cyber Assets according to the process defined in the NERC Reliability Standard CIP-002. This category does not apply if the newly identified Critical Cyber Assets are not already in-service, or if the additional Critical Cyber Assets resulted from planned changes to the electric system or the Cyber Assets. In the case where the Critical Cyber Asset is not in service, the Responsible Entity must be compliant with the NERC Reliability Standards CIP-003 through CIP-009 upon commissioning of the new cyber or electric system assets (see "Compliant upon Commissioning" below).

   Unplanned changes due to emergency response, disaster recovery or system restoration activities are handled separately (see "Disaster Recovery and Restoration Activities" below).

3. **Compliant upon Commissioning**: When a Responsible Entity has an established NERC Reliability Standards CIP compliance implementation program and implements a new or replacement Critical Cyber Asset associated with a previously identified or newly

constructed Critical Asset, the Critical Cyber Asset shall be compliant when it is commissioned or activated. This scenario shall apply for the following scenarios:

a) 'Greenfield' construction of an asset that will be declared a Critical Asset (based on the Critical Asset criteria in CIP-002-4 Attachment 1) upon its commissioning or activation
b) Replacement or upgrade of an existing Critical Cyber Asset (or other Cyber Asset within an Electronic Security Perimeter) associated with a previously identified Critical Asset
c) Upgrade or replacement of an existing non-cyber asset with a Cyber Asset (e.g., replacement of an electro-mechanical relay with a microprocessor-based relay) associated with a previously identified Critical Asset and meets other criteria for identification as a Critical Cyber Asset
d) Planned addition of:
    i. a Critical Cyber Asset, or,
    ii. another (i.e., non-critical) Cyber Asset within an established Electronic Security Perimeter

In summary, this scenario applies in any case where a Critical Cyber Asset or applicable other Cyber Asset is being added or modified associated with an existing or new Critical Asset and where that Entity has an established NERC Reliability Standard CIP compliance implementation program.

A special case of a 'greenfield' construction exists where the asset under construction was planned and construction started under the assumption that the asset would not be a Critical Asset. During construction, conditions changed, and the asset will now be a Critical Asset upon its commissioning. In this case, the Responsible Entity must follow the Category 2 milestones from the date of the determination that the asset is a Critical Asset.

Since the assets must be compliant with the NERC Reliability Standards CIP-003 through CIP-009 upon commissioning, no implementation milestones or schedules are provided herein.

Disaster Recovery and Restoration Activities

A special case of restoration as part of a disaster recovery situation (such as storm restoration) shall follow the emergency provisions of the Responsible Entity's policy required by CIP-003 R1.1.

The rationale for this is that the primary task following a disaster is the restoration of the power system, and the ability to serve customer load. Cyber security provisions are implemented to support reliability and operations. If restoration were to be slowed to ensure full implementation of the CIP compliance implementation program, restoration could be hampered, and reliability could be harmed.

However, following the completion of the restoration activities, the entity is obligated to implement the CIP compliance implementation program at the restored facilities, and be able to demonstrate full compliance in a spot-check or audit; or, file a self-report of non-compliance with a mitigation plan describing how and when full compliance will be achieved.

Newly Registered Entity Scenarios

Based on the Critical Cyber Asset identification scenarios identified above, the implementation milestone categories and schedules for those scenarios as they apply to newly Registered Entities are defined and distinguished below.

The following examples of business merger and asset acquisition scenarios may be helpful in explaining the expectations in each of the scenarios. Note that in each case, the predecessor Registered Entities are assumed to already be in compliance with NERC Reliability Standard CIP-002-4.

1. **Newly Registered Entity Scenario 1 (Application of Category 1 Milestones):**

   A Merger of Two or More Registered Entities where None of the Predecessor Registered Entities has Identified any Critical Cyber Asset
   In the case of a business merger or asset acquisition, because there are no identified Critical Cyber Assets in any of the predecessor Registered Entities, a CIP compliance implementation program is not assumed to exist. The only program component required is a Critical Asset and Critical Cyber Asset identification process per NERC Reliability Standard CIP-002-4.

   If either predecessor Registered Entities has identified Critical Assets (but without associated Critical Cyber Assets), the merged Registered Entity must continue to perform annual application of the Critical Asset identification as required in CIP-002 R1, as well as to annually verify whether associated Cyber Assets meet the requirements as newly identified Critical Cyber Assets as required by CIP-002 R2. If newly identified Critical Cyber Assets are found at any point in this process (i.e., during the one calendar year allowance period, or after that one calendar year allowance period), then the implementation milestones, categories and schedules of this Implementation Plan apply regardless of when this newly identified Critical Cyber Assets are determined, and independent of any merger and acquisition discussions contained in this Implementation Plan.

2. **Newly Registered Entity Scenario 2:**

   A Merger of Two or More Registered Entities where Only One of the Predecessor Registered Entities has Identified at Least One Critical Cyber Asset
   Since only one of the predecessor Registered Entities has previously identified Critical Cyber Assets, it is assumed that none of the other predecessor Registered Entities have CIP compliance implementation programs (since they are not required to have them). In

this case, the CIP compliance implementation program from the predecessor Registered Entity with the previously identified Critical Cyber Asset would be expected to be implemented as the CIP compliance implementation program for the merged Registered Entity, and would be expected to apply to any Critical Cyber Assets identified after the effective date of the merger. Since the other predecessor Registered Entities did not have any Critical Cyber Assets, this should present no conflict in any CIP compliance implementation programs.

Note that the discussion of the disposition of any NERC Reliability Standard CIP-002 Critical Asset identification process from Scenario 1 above would apply in this case as well.

3. **Newly Registered Entity Scenario 3:**

A Merger of Two or More Registered Entities where Two or More of the Predecessor Registered Entities has Identified at Least One Critical Cyber Asset
This scenario is the most complicated of the three, since it applies to a merged Registered Entity that has more than one CIP compliance implementation program, which are most likely not in complete agreement with each other. These differences could be due to any number of issues, ranging from something as 'simple' as selection of different anti-virus tools, to something as 'complicated' as the access authorization process.

The merged Responsible Entity has one calendar year from the effective date of the business merger to continue to operate the separate CIP compliance implementation programs while determining how to either combine the CIP compliance implementation programs, or at a minimum, operate the CIP compliance implementation programs under a common Senior Manager and governance structure.

Following the one year analysis period, if the decision is made to continue the operation of separate CIP compliance implementation programs under a common Senior Manager and governance structure, the merged Responsible Entity must update any required Senior Manager and governance issues, and clearly identify which CIP compliance implementation program components apply to each individual Critical Cyber Asset. This is essential to the implementation of the CIP compliance implementation program at the merged Responsible Entity, so that the correct and proper program components are implemented on the appropriate Critical Cyber Assets, as well as to allow the ERO compliance program (in a spot-check or audit) to determine if the CIP compliance implementation program has been properly implemented for each Critical Cyber Asset. Absent this clear identification, it would be possible for the wrong CIP compliance implementation program to be applied to a Critical Cyber Asset, or the wrong CIP compliance implementation program be evaluated in a spot-check or audit, leading to a possible technical non-compliance without real cause.

However, if after the one year analysis period, the decision is made to combine the operation of the separate CIP compliance implementation programs into a single CIP

compliance implementation program, the merged Responsible Entity must develop a plan for merging of the separate CIP compliance implementation programs into a single CIP compliance implementation program, with a schedule and milestones for completion. The programs should be combined as expeditiously as possible, but without causing harm to reliability or operability of the Bulk power System. This 'merged plan' must be made available to the ERO compliance program upon request, and as documentation for any spot-check or audit conducted while the merged plan is being performed. Progress towards meeting milestones and completing the merged plan will be verified during any spot-checks or audits conducted while the plan is being executed.

Example Scenarios

Note that there are no implementation milestones or schedules specified for a Responsible Entity that has a newly identified Critical Asset, but no newly identified Critical Cyber Assets. This situation exists because no action is required by the Responsible Entity upon identification of a Critical Asset without associated Critical Cyber Assets. Only upon identification of Critical Cyber Assets does a Responsible Entity need to become compliant with the NERC Reliability Standards CIP-003 through CIP-009.

As an example, Table 1 provides some sample scenarios, and provides the milestone category for each of the described situations.

Table 1: Example Scenarios

Scenarios	CIP Compliance Implementation Program:	
	No Program (note 1)	Existing Program
Existing asset becomes Critical Asset; associated Cyber Assets become Critical Cyber Assets	Category 1	Category 2
New asset comes online as a Critical Asset; associated Cyber Assets become Critical Cyber Asset	Category 1	Compliant upon Commissioning
Existing Cyber Asset moves into the Electronic Security Perimeter due to network reconfiguration	N/A	Compliant upon Commissioning
New Cyber Asset – never before in service and not a replacement for an existing Cyber Asset – added into a new or existing Electronic Security Perimeter	Category 1	Compliant upon Commissioning
New Cyber Asset replacing an existing Cyber Asset within the Electronic Security Perimeter	N/A	Compliant upon Commissioning
Planned modification or upgrade to existing Cyber Asset that causes it to be reclassified as a Critical Cyber Asset	Category 1	Compliant upon Commissioning
Asset under construction as another (non-critical) asset becomes declared as a Critical Asset during construction	Category 1	Category 2

Scenarios	CIP Compliance Implementation Program:	
	No Program (note 1)	Existing Program
Unplanned modification such as emergency restoration invoked under a disaster recovery situation or storm restoration	N/A	Per emergency provisions as required by CIP-003 R1.1

Note: 1) assumes the entity is already compliant with CIP-002

Table 2 provides the compliance milestones for each of the two identified milestone categories.

Table 2: Implementation milestones for Newly Identified Critical Cyber Assets[4]

CORRECTED Exhibit F

Table of CIP Version 4 Violation Risk Factors and Violation Severity Levels Proposed for Approval - Clean and Redline

CIP Version 4 Violation Severity Levels and Violation Risk Factors

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-002-4	R1.	Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update this list as necessary, and review it at least annually.	N/A	N/A	The Responsible Entity has developed a list of Critical Assets but the list has not been reviewed and updated annually as required.	The Responsible Entity did not develop a list of its identified Critical Assets even if such list is null.
CIP-002-4	R2.	Critical Cyber Asset Identification— Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1. For the purpose of Standard CIP 002-4, Critical Cyber Assets are further qualified to be those having at least	N/A	N/A	The Responsible Entity has developed a list of associated Critical Cyber Assets essential to the operation of the Critical Asset list as per requirement R2 but the list has not been reviewed and updated annually as required.	The Responsible Entity did not develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset list as per requirement R2 even if such list is null. OR A Cyber Asset essential to the operation of the Critical Asset was identified that met at least one of the bulleted characteristics in this requirement but was not included in the Critical Cyber Asset List.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		one of the following characteristics: • The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, • The Cyber Asset uses a routable protocol within a control center; or, • The Cyber Asset is dial-up accessible.				
CIP-002-4	R3.	Annual Approval —The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)	N/A	N/A	The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of the list of Critical Assets. OR The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of the list of Critical Cyber Assets (even if such lists are null.)	The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of both the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)
CIP-003-4	R1.	Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a cyber security

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		Assets. The Responsible Entity shall, at minimum, ensure the following:				policy.
CIP-003-4	R1.1.	The cyber security policy addresses the requirements in Standards CIP-002-4 through CIP-009-4, including provision for emergency situations.	N/A	N/A	N/A	The Responsible Entity's cyber security policy does not address all the requirements in Standards CIP-002 through CIP-009, including provision for emergency situations.
CIP-003-4	R1.2.	The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.	N/A	N/A	N/A	The Responsible Entity's cyber security policy is not readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.
CIP-003-4	R1.3	Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.	N/A	N/A	N/A	The Responsible Entity's senior manager, assigned pursuant to R2, did not complete the annual review and approval of its cyber security policy.
CIP-003-4	R2.	Leadership — The Responsible Entity shall assign a senior manager with overall responsibility for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-4 through CIP-009-4.	N/A	N/A	N/A	The Responsible Entity has not assigned a single senior manager with overall responsibility and authority for leading and

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						managing the entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.
CIP-003-4	R2.1.	The senior manager shall be identified by name, title, and date of designation.	N/A	N/A	N/A	Identification of the senior manager is missing one of the following: name, title, or date of designation.
CIP-003-4	R2.2.	Changes to the senior manager must be documented within thirty calendar days of the effective date.	N/A	N/A	N/A	Changes to the senior manager were not documented within 30 days of the effective date.
CIP-003-4	R2.3.	Where allowed by Standards CIP-002-4 through CIP-009-4, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.	N/A	N/A	The identification of a senior manager's delegate does not include at least one of the following; name, title, or date of the designation, OR The document is not approved by the senior manager, OR	A senior manager's delegate is not identified by name, title, and date of designation; the document delegating the authority does not identify the authority being delegated; the document delegating the authority is not approved by the senior manager;

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
					Changes to the delegated authority are not documented within thirty calendar days of the effective date.	AND changes to the delegated authority are not documented within thirty calendar days of the effective date.
CIP-003-4	R2.4	The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.	N/A	N/A	N/A	The senior manager or delegate(s) did not authorize and document any exceptions from the requirements of the cyber security policy as required.
CIP-003-4	R3.	Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).	N/A	N/A	In Instances where the Responsible Entity cannot conform to its cyber security policy, in R1, exceptions were documented, **but** were not authorized by the senior manager or delegate(s).	In Instances where the Responsible Entity cannot conform to its cyber security policy, in R1, exceptions were not documented.
CIP-003-4	R3.1.	Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).	N/A	N/A	N/A	Exceptions to the Responsible Entity's cyber security policy were not documented within 30 days of being approved by the senior manager or

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						delegate(s).
CIP-003-4	R3.2.	Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.	N/A	N/A	The Responsible Entity has a documented exception to the cyber security policy in R1 but did not include **either**: 1) an explanation as to why the exception is necessary, or 2) any compensating measures.	The Responsible Entity has a documented exception to the cyber security policy in R1 but did not include **both:** 1) an explanation as to why the exception is necessary, and 2) any compensating measures.
CIP-003-4	R3.3.	Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.	N/A	N/A	N/A	Exceptions to the cyber security policy were not reviewed **or** were not approved on an annual basis by the senior manager or delegate(s) to ensure the exceptions are still required and valid or the review and approval is not documented.
CIP-003-4	R4.	Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.	N/A	N/A	N/A	The Responsible Entity did not implement or did not document a program to identify, classify, and protect

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						information associated with Critical Cyber Assets.
CIP-003-4	R4.1.	The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-4, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.	N/A	N/A	The information protection program does not include one of the minimum information types to be protected as detailed in R4.1.	The information protection program does not include two or more of the minimum information types to be protected as detailed in R4.1.
CIP-003-4	R4.2.	The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.	N/A	N/A	N/A	The Responsible Entity did not classify the information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.
CIP-003-4	R4.3.	The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.	N/A	N/A	N/A	The Responsible Entity did not annually assess adherence to its Critical Cyber Asset information protection program, including documentation of the assessment results, OR

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Responsible Entity did not implement an action plan to remediate deficiencies identified during the assessment.
CIP-003-4	R5.	Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.	N/A	N/A	N/A	The Responsible Entity did not implement or did not document a program for managing access to protected Critical Cyber Asset information.
CIP-003-4	R5.1.	The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.	N/A	N/A	The Responsible Entity maintained a list of designated personnel for authorizing either logical or physical access but not both.	The Responsible Entity did not maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.
CIP-003-4	R5.1.1.	Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.	N/A	N/A	The Responsible Entity did identify the personnel by name, title, and the information for which they are responsible for authorizing access, but the business	Personnel are not identified by name, title, or the information for which they are responsible for authorizing access.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
					phone is missing.	
CIP-003-4	R5.1.2.	The list of personnel responsible for authorizing access to protected information shall be verified at least annually.	N/A	N/A	N/A	The Responsible Entity did not verify at least annually the list of personnel responsible for authorizing access to protected information.
CIP-003-4	R5.2.	The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.	N/A	N/A	N/A	The Responsible Entity did not review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.
CIP-003-4	R5.3.	The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.	N/A	N/A	N/A	The Responsible Entity did not assess and document at least annually the processes for controlling access privileges to protected information.
CIP-003-4	R6.	Change Control and Configuration Management — The Responsible	N/A	N/A	N/A	The Responsible Entity has not

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.				established or documented a change control process for the activities required in R6, OR The Responsible Entity has not established or documented a configuration management process for the activities required in R6.
CIP-004-4	R1.	Awareness — The Responsible Entity shall establish, document, implement, and maintain a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as: • Direct communications (e.g. emails, memos, computer based training, etc.); • Indirect communications	N/A	N/A	The Responsible[1] Entity did not provide security awareness reinforcement on at least a quarterly basis.	The Responsible Entity did not establish, implement, maintain, or document a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security

[1] Please note that FERC's January 20, 2011 Order on Version 2 And Version 3 Violation Risk Factors And Violation Severity Levels For Critical Infrastructure Protection Reliability Standards dictated "Responsible Entity" to be changed to "Responsibility Entity." NERC assumes FERC intended the VSL to read "Responsible Entity" and therefore is not making this change. NERC proposes to remove this footnote from the final approved list of VSLs.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		(e.g. posters, intranet, brochures, etc.); • Management support and reinforcement (e.g., presentations, meetings, etc.).				practices.
CIP-004-4	R2.	Training — The Responsible Entity shall establish, document, implement, and maintain an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. The cyber security training program shall be reviewed annually, at a minimum, and shall be updated whenever necessary.	N/A	N/A	The Responsible[2] Entity did not review the training program on an annual basis.	The Responsible Entity did not establish, implement, maintain, or document an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets.
CIP-004-4	R2.1.	This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access except in specified circumstances such as an emergency.	N/A	N/A	N/A	Not all personnel having authorized cyber or unescorted physical access to Critical Cyber Assets, including contractors and service vendors, were trained prior to their being granted such access except in specified circumstances such as an emergency.

[2] Please see previous footnote. NERC proposes to remove this footnote from the final approved list of VSLs.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-004-4	R2.2.	Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004-4, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities:	N/A	N/A	N/A	The training does not include one or more of the minimum topics as detailed in R2.2.1, R2.2.2, R2.2.3, R2.2.4.
CIP-004-4	R2.2.1.	The proper use of Critical Cyber Assets;	N/A	N/A	N/A	N/A
CIP-004-4	R2.2.2.	Physical and electronic access controls to Critical Cyber Assets;	N/A	N/A	N/A	N/A
CIP-004-4	R2.2.3.	The proper handling of Critical Cyber Asset information; and,	N/A	N/A	N/A	N/A
CIP-004-4	R2.2.4.	Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.	N/A	N/A	N/A	N/A
CIP-004-4	R2.3.	The Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.	N/A	N/A	The Responsible Entity did maintain documentation that training is conducted at least annually, but did not include attendance records.	The Responsible Entity did not maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.
CIP-004-4	R3.	Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having	N/A	The Responsible Entity has a personnel risk assessment program, as stated in R3, for personnel having authorized	The Responsible Entity has a personnel risk assessment program as stated in R3, but conducted the personnel risk	The Responsible Entity does not have a documented personnel risk assessment program, as stated in R3, for personnel

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		authorized cyber or authorized unescorted physical access to Critical Cyber Assets. A personnel risk assessment shall be conducted pursuant to that program prior to such personnel being granted such access except in specified circumstances such as an emergency. The personnel risk assessment program shall at a minimum include:		cyber or authorized unescorted physical access, but the program is not documented.	assessment pursuant to that program after such personnel were granted such access except in specified circumstances such as an emergency.	having authorized cyber or authorized unescorted physical access. OR The Responsible Entity did not conduct the personnel risk assessment pursuant to that program for personnel granted such access except in specified circumstances such as an emergency.
CIP-004-4	R3.1.	The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.	N/A	N/A	The Responsible Entity did not ensure that an assessment conducted included an identity verification (e.g., Social Security Number verification in the U.S.) or a seven-year criminal check.	The Responsible Entity did not ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check.
CIP-004-4	R3.2.	The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.	N/A	The Responsible Entity did not update each personnel risk assessment at least	The Responsible Entity did not update each personnel risk assessment for	The Responsible Entity did not update each personnel risk assessment at least

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
				every seven years after the initial personnel risk assessment but did update it for cause when applicable.	cause (when applicable) but did at least updated it every seven years after the initial personnel risk assessment.	every seven years after the initial personnel risk assessment nor was it updated for cause when applicable.
CIP-004-4	R3.3.	The Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004-4.	The Responsible Entity did not document the results of personnel risk assessments for at least one individual but less than 5% of all personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, pursuant to Standard CIP-004.	The Responsible Entity did not document the results of personnel risk assessments for 5% or more but less than 10% of all personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, pursuant to Standard CIP-004.	The Responsible Entity did not document the results of personnel risk assessments for 10% or more but less than 15% of all personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, pursuant to Standard CIP-004.	The Responsible Entity did not document the results of personnel risk assessments for 15% or more of all personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, pursuant to Standard CIP-004.
CIP-004-4	R4.	Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.	The Responsible Entity did not maintain complete list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical	The Responsible Entity did not maintain complete list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical	The Responsible Entity did not maintain complete list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical	The Responsible Entity did not maintain complete list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical

			Cyber Assets, missing at least one individual but less than 5% of the authorized personnel.	Cyber Assets, missing 5% or more but less than 10% of the authorized personnel.	Cyber Assets, missing 10% or more but less than 15%of the authorized personnel.	Cyber Assets, missing 15% or more of the authorized personnel.
CIP-004-4	R4.1.	The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.	N/A	The Responsible Entity did not review the list(s) of its personnel who have access to Critical Cyber Assets quarterly.	The Responsible Entity did not update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, nor any change in the access rights of such personnel.	The Responsible Entity did not review the list(s) of all personnel who have access to Critical Cyber Assets quarterly, nor update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, nor any change in the access rights of such personnel.
CIP-004-4	R4.2.	The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.	N/A	The Responsible Entity did not revoke access within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.	The Responsible Entity did not revoke access to Critical Cyber Assets within 24 hours for personnel terminated for cause.	The Responsible Entity did not revoke access to Critical Cyber Assets within 24 hours for personnel terminated for cause nor within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-005-4	R1.	Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).	N/A	N/A	N/A	The Responsible Entity did not ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. OR The Responsible Entity did not identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).
CIP-005-4	R1.1.	Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).	N/A	N/A	N/A	Access points to the Electronic Security Perimeter(s) do not include all externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).
CIP-005-4	R1.2.	For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.	N/A	N/A	N/A	For one or more dial-up accessible Critical Cyber Assets that use a non-routable protocol, the Responsible Entity did not define an Electronic

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						Security Perimeter for that single access point at the dial-up device.
CIP-005-4	R1.3.	Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).	N/A	N/A	N/A	At least one end point of a communication link within the Electronic Security Perimeter(s) connecting discrete Electronic Security Perimeters was not considered an access point to the Electronic Security Perimeter.
CIP-005-4	R1.4.	Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-4.	N/A	N/A	N/A	One or more noncritical Cyber Asset within a defined Electronic Security Perimeter is not identified. OR Is not protected pursuant to the requirements of Standard CIP-005.
CIP-005-4	R1.5.	Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2	N/A	N/A	N/A	A Cyber Asset used in the access control and/or monitoring of the Electronic Security Perimeter(s) was not afforded one (1) or

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		and R3; Standard CIP-006-4 Requirement R3; Standard CIP-007-4 Requirements R1 and R3 through R9; Standard CIP-008-4; and Standard CIP-009-4.				more of the protective measures as specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4c Requirements R3; Standard CIP-007-4 Requirements R1 and R3 through R9; Standard CIP-008-4; and Standard CIP-009-4.
CIP-005-4	R1.6.	The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.	N/A	N/A	N/A	The Responsible Entity did not maintain documentation of one or more of the following: Electronic Security Perimeter(s), interconnected Critical and noncritical Cyber Assets within the Electronic Security Perimeter(s), electronic access points to the Electronic Security Perimeter(s) and Cyber Assets deployed for the

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						access control and monitoring of these access points.
CIP-005-4	R2.	Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).	N/A	N/A	N/A	The Responsible Entity did not implement or did not document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).
CIP-005-4	R2.1.	These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.	N/A	N/A	N/A	The processes and mechanisms did not use an access control model that denies access by default, such that explicit access permissions must be specified.
CIP-005-4	R2.2.	At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping,	N/A	N/A	N/A	At one or more access points to the Electronic Security Perimeter(s), the Responsible Entity enabled ports and services not required for operations and for

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		the configuration of those ports and services.				monitoring Cyber Assets within the Electronic Security Perimeter, or did not document, individually or by specified grouping, the configuration of those ports and services.
CIP-005-4	R2.3.	The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).	N/A	N/A	N/A	The Responsible Entity did not implement or maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s) where applicable.
CIP-005-4	R2.4.	Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.	N/A	N/A	N/A	Where external interactive access into the Electronic Security Perimeter has been enabled the Responsible Entity did not implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.
CIP-005-4	R2.5.	The required documentation shall, at	N/A	N/A	N/A	The required

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		least, identify and describe:				documentation for R2 did not include one or more of the elements described in R2.5.1 through R2.5.4.
CIP-005-4	R2.5.1.	The processes for access request and authorization.	N/A	N/A	N/A	N/A
CIP-005-4	R2.5.2.	The authentication methods.	N/A	N/A	N/A	N/A
CIP-005-4	R2.5.3.	The review process for authorization rights, in accordance with Standard CIP-004-4 Requirement R4.	N/A	N/A	N/A	N/A
CIP-005-4	R2.5.4.	The controls used to secure dial-up accessible connections.	N/A	N/A	N/A	N/A
CIP-005-4	R2.6.	Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.	The Responsible Entity did not maintain a document identifying the content of the banner. OR Where technically feasible less than 5% electronic access control devices did not display an appropriate use banner on the user screen upon all interactive access attempts.	Where technically feasible 5% but less than 10% of electronic access control devices did not display an appropriate use banner on the user screen upon all interactive access attempts.	Where technically feasible 10% but less than 15% of electronic access control devices did not display an appropriate use banner on the user screen upon all interactive access attempts.	Where technically feasible, 15% or more electronic access control devices did not display an appropriate use banner on the user screen upon all interactive access attempts.
CIP-005-4	R3.	Monitoring Electronic Access — The Responsible Entity shall implement	N/A	N/A	N/A	The Responsible Entity did not

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.				implement or did not document electronic or manual processes monitoring and logging access points.
CIP-005-4	R3.1.	For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.	N/A	N/A	N/A	Where technically feasible, the Responsible Entity did not implement or did not document electronic or manual processes for monitoring at one or more access points to dial-up devices.
CIP-005-4	R3.2.	Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.	N/A	N/A	N/A	Where technically feasible, the Responsible Entity did not implement security monitoring process(es) to detect and alert for attempts at or actual unauthorized accesses. OR The above alerts do not provide for appropriate notification to designated response personnel. OR

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						Where alerting is not technically feasible, the Responsible Entity did not review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.
CIP-005-4	R4.	Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:	N/A	N/A	N/A	The Responsible Entity did not perform a Vulnerability Assessment at least annually for one or more of the access points to the Electronic Security Perimeter(s). OR The vulnerability assessment did not include one (1) or more of the subrequirements R4.1, R4.2, R4.3, R4.4, R4.5.
CIP-005-4	R4.1.	A document identifying the vulnerability assessment process;	N/A	N/A	N/A	N/A
CIP-005-4	R4.2.	A review to verify that only ports and services required for operations at these access	N/A	N/A	N/A	N/A

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		points are enabled;				
CIP-005-4	R4.3.	The discovery of all access points to the Electronic Security Perimeter;	N/A	N/A	N/A	N/A
CIP-005-4	R4.4.	A review of controls for default accounts, passwords, and network management community strings;	N/A	N/A	N/A	N/A
CIP-005-4	R4.5.	Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.	N/A	N/A	N/A	N/A
CIP-005-4	R5.	Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-4.	The Responsible Entity did not review, update, and maintain at least one but less than or equal to 5% of the documentation to support compliance with the requirements of Standard CIP-005.	The Responsible Entity did not review, update, and maintain greater than 5% but less than or equal to 10% of the documentation to support compliance with the requirements of Standard CIP-005.	The Responsible Entity did not review, update, and maintain greater than 10% but less than or equal to 15% of the documentation to support compliance with the requirements of Standard CIP-005.	The Responsible Entity did not review, update, and maintain greater than 15% of the documentation to support compliance with the requirements of Standard CIP-005.
CIP-005-4	R5.1.	The Responsible Entity shall ensure that all documentation required by Standard CIP-005-4 reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-4 at least annually.	N/A	The Responsible Entity did not provide evidence of an annual review of the documents and procedures referenced in Standard CIP-005.	The Responsible Entity did not document current configurations and processes referenced in Standard CIP-005.	The Responsible Entity did not document current configurations and processes and did not review the documents and procedures referenced in Standard CIP-005 at least annually.
CIP-005-4	R5.2.	The Responsible Entity shall update	N/A	N/A	N/A	The Responsible

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		the documentation to reflect the modification of the network or controls within ninety calendar days of the change.				Entity did not update documentation to reflect a modification of the network or controls within ninety calendar days of the change.
CIP-005-4	R5.3.	The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.	The Responsible Entity retained electronic access logs for 75 or more calendar days, but for less than 90 calendar days.	The Responsible Entity retained electronic access logs for 60 or more calendar days, but for less than 75 calendar days.	The Responsible Entity retained electronic access logs for 45 or more calendar days, but for less than 60 calendar days.	The Responsible Entity retained electronic access logs for less than 45 calendar days.
CIP-006-4c	R1.	Physical Security Plan — The Responsible Entity shall document, implement, and maintain a physical security plan, approved by the senior manager or delegate(s) that shall address, at a minimum, the following:	N/A	N/A	The Responsible Entity created a physical security plan but did not gain approval by a senior manager or delegate(s). OR The Responsible Entity created and implemented but did not maintain a physical security plan.	The Responsible Entity did not document, implement, and maintain a physical security plan.
CIP-006-4c	R1.1.	All Cyber Assets within an Electronic Security Perimeter shall reside within an identified Physical Security	N/A	N/A	N/A	The Responsible Entity's physical security plan does

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to such Cyber Assets.				not include processes to ensure and document that all Cyber Assets within an Electronic Security Perimeter also reside within an identified Physical Security Perimeter. OR Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity has not deployed or documented alternative measures to control physical access to such Cyber Assets within the Electronic Security Perimeter.
CIP-006-4c	R1.2.	Identification of all physical access points through each Physical Security Perimeter and measures to control entry at those access points.	N/A	N/A	N/A	The Responsible Entity's physical security plan does not identify all access points through each Physical Security Perimeter or does not identify measures to control entry at those

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						access points.
CIP-006-4c	R1.3	Processes, tools, and procedures to monitor physical access to the perimeter(s).	N/A	N/A	N/A	The Responsible Entity's physical security plan does not include processes, tools, and procedures to monitor physical access to the perimeter(s).
CIP-006-4c	R1.4	Appropriate use of physical access controls as described in Requirement R4 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.	N/A	N/A	N/A	The Responsible Entity's physical security plan does not address the appropriate use of physical access controls as described in Requirement R4.
CIP-006-4c	R1.5	Review of access authorization requests and revocation of access authorization, in accordance with CIP-004-4 Requirement R4.	N/A	N/A	N/A	The Responsible Entity's physical security plan does not address the review of access authorization requests or the revocation of access authorization, in accordance with CIP-004-4 Requirement R4.
CIP-006-4c	R1.6	A visitor control program for visitors (personnel without authorized unescorted access to a Physical Security Perimeter), containing at a minimum the following:	N/A	N/A	N/A	The Responsible Entity did not include or implement a visitor control program in

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						its physical security plan or it does not meet the requirements of continuous escort.
CIP-006-4c	R1.6.1	Logs (manual or automated) to document the entry and exit of visitors, including the date and time, to and from Physical Security Perimeters.	N/A	N/A	N/A	N/A
CIP-006-4c	R1.6.2	Continuous escorted access of visitors within the Physical Security Perimeter	N/A	N/A	N/A	N/A
CIP-006-4c	R1.7	Update of the physical security plan within thirty calendar days of the completion of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the Physical Security Perimeter, physical access controls, monitoring controls, or logging controls.	N/A	N/A	N/A	The Responsible Entity's physical security plan does not address r updating the physical security plan within-thirty calendar days of the completion of a physical security system redesign or within thirty calendar days of the completion of a reconfiguration. OR The plan was not updated within thirty calendar days of the completion of

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						a physical security system redesign or reconfiguration
CIP-006-4c	R1.8	Annual review of the physical security plan.	N/A	N/A	N/A	The Responsible Entity's physical security plan does not address a process for ensuring that the physical security plan is reviewed at least annually.
CIP-006-4c	R2	Protection of Physical Access Control Systems — Cyber Assets that authorize and/or log access to the Physical Security Perimeter(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall:	N/A	N/A	N/A	A Cyber Asset that authorizes and/or logs access to the Physical Security Perimeter(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, was not protected from unauthorized physical access. OR A Cyber Asset that authorizes and/or logs access to the Physical Security Perimeter(s),

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers was not afforded the protective measures specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4c Requirements R4 and R5; Standard CIP-007-4; Standard CIP-008-4; and Standard CIP-009-4.
CIP-006-4c	R2.1.	Be protected from unauthorized physical access.	N/A	N/A	N/A	N/A
CIP-006-4c	R2.2.	Be afforded the protective measures specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4a Requirements R4 and R5; Standard CIP-007-4; Standard CIP-008-4; and Standard CIP-009-4.	N/A	N/A	N/A	N/A
CIP-006-4c	R3	Protection of Electronic Access Control Systems — Cyber Assets	N/A	N/A	N/A	A Cyber Assets used in the access control

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter.				and/or monitoring of the Electronic Security Perimeter(s) does not reside within an identified Physical Security Perimeter.
CIP-006-4c	R4	Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods: • Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another. • Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems. • Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.	N/A	N/A	N/A	The Responsible Entity has not documented or has not implemented the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week using one or more of the following physical access methods: • Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another. • Special Locks: These include, but

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		• Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets				are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems. • Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station. • Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets.
CIP-006-4c	R5	Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008-4.	N/A	N/A.	N/A	The Responsible Entity **has not documented or has not implemented** the technical and procedural controls for monitoring physical access at all access points to the Physical Security Perimeter(s)

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		One or more of the following monitoring methods shall be used: • Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response. • Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R4.				twenty-four hours a day, seven days a week using one or more of the following monitoring methods: • Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response. • Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R4. OR An unauthorized access attempt was not reviewed immediately and

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						handled in accordance with CIP-008-4.
CIP-006-4c	R6	Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent: • Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method. • Video Recording: Electronic capture of video images of sufficient quality to determine identity. • Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R4		N/A	N/A	The Responsible Entity **has not implemented or has not documented** the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent: • Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method, • Video Recording: Electronic capture of video images of sufficient quality to determine identity, or • Manual Logging: A log book or sign-in sheet, or other record of physical access maintained

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						by security or other personnel authorized to control and monitor physical access as specified in Requirement R4. OR The Responsible Entity has not recorded sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week.
CIP-006-4c	R7	Access Log Retention — The responsible entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.	N/A	N/A	N/A	The responsible entity did not retain physical access logs for at least ninety calendar days.
CIP-006-4c	R8	Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R4, R5, and R6 function properly. The program must include, at a minimum, the following:	N/A	N/A	N/A	The Responsible Entity has not implemented a maintenance and testing program to ensure that all physical security systems under Requirements R4,

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						R5, and R6 function properly. OR The implemented program does not include one or more of the requirements; R8.1, R8.2, and R8.3.
CIP-006-4c	R8.1	Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.	N/A	N/A	N/A	N/A
CIP-006-4c	R8.2	Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement R8.1.	N/A	N/A	N/A	N/A
CIP-006-4c	R8.3	Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.	N/A	N/A	N/A	N/A
CIP-007-4	R1.	Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-4, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-	N/A	N/A	N/A	The Responsible Entity did not ensure the prevention of adverse affects described in R1, by not including the required minimum significant changes. OR The Responsible Entity did not address one or more of the following:

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		party software or firmware.				R1.1, R1.2, R1.3.
CIP-007-4	R1.1.	The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.	N/A	N/A	N/A	N/A
CIP-007-4	R1.2.	The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.	N/A	N/A	N/A	N/A
CIP-007-4	R1.3.	The Responsible Entity shall document test results.	N/A	N/A	N/A	N/A
CIP-007-4	R2.	Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.	N/A	N/A	N/A	The Responsible Entity did not establish (implement) or did not document a process to ensure that only those ports and services required for normal and emergency operations are enabled.
CIP-007-4	R2.1.	The Responsible Entity shall enable only those ports and services required for normal and emergency operations.	N/A	N/A	N/A	The Responsible Entity enabled one or more ports or services not required for normal and emergency operations on Cyber Assets inside the Electronic Security Perimeter(s).

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-007-4	R2.2.	The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).	N/A	N/A	N/A	The Responsible Entity did not disable one or more other ports or services, including those used for testing purposes, prior to production use for Cyber Assets inside the Electronic Security Perimeter(s).
CIP-007-4	R2.3.	In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	N/A	N/A	N/A	For cases where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity did not document compensating measure(s) applied to mitigate risk.
CIP-007-4	R3.	Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).	N/A	N/A	N/A	The Responsible Entity **did not establish (implement) or did not document**, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, a

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).
CIP-007-4	R3.1.	The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.	N/A	N/A	N/A	The Responsible Entity did not document the assessment of security patches and security upgrades for applicability as required in Requirement R3 within 30 calendar days after the availability of the patches and upgrades.
CIP-007-4	R3.2.	The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	N/A	N/A	N/A	The Responsible Entity did not document the implementation of applicable security patches as required in R3. OR Where an applicable patch was not

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						installed, the Responsible Entity did not document the compensating measure(s) applied to mitigate risk.
CIP-007-4	R4.	Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).	N/A	N/A	N/A	The Responsible Entity, where technically feasible, did not use anti-virus software or other malicious software ("malware") prevention tools, on one or more Cyber Assets within the Electronic Security Perimeter(s).
CIP-007-4	R4.1.	The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	N/A	N/A	N/A	The Responsible Entity did not document the implementation of antivirus and malware prevention tools for cyber assets within the electronic security perimeter. OR The Responsible Entity did not document the implementation of

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						compensating measure(s) applied to mitigate risk exposure where antivirus and malware prevention tools are not installed.
CIP-007-4	R4.2.	The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.	N/A	N/A	N/A	The Responsible Entity **did not document or did not implement** a process including addressing testing and installing the signatures for the update of anti-virus and malware prevention "signatures."
CIP-007-4	R5.	Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.	N/A	N/A	N/A	The Responsible Entity did not document or did not implement technical and procedural controls that enforce access authentication of, and accountability for, all user activity.
CIP-007-4	R5.1.	The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions	N/A	N/A	N/A	The Responsible Entity did not ensure that individual and shared system accounts and authorized access

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		performed.				permissions are consistent with the concept of "need to know" with respect to work functions performed.
CIP-007-4	R5.1.1.	The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-4 Requirement R5.	N/A	N/A	N/A	One or more user accounts implemented by the Responsible Entity were not implemented as approved by designated personnel.
CIP-007-4	R5.1.2.	The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.	N/A	The Responsible Entity generated logs with sufficient detail to create historical audit trails of individual user account access activity, however the logs do not contain activity for a minimum of 90 days.	The Responsible Entity generated logs with insufficient detail to create historical audit trails of individual user account access activity.	The Responsible Entity did not generate logs of individual user account access activity.
CIP-007-4	R5.1.3.	The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.	N/A	N/A	N/A	The Responsible Entity did not review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						R5 and Standard CIP-004-4 Requirement R4.
CIP-007-4	R5.2.	The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.	N/A	N/A	N/A	The Responsible Entity did not implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.
CIP-007-4	R5.2.1.	The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.	N/A	N/A	The Responsible Entity's policy did not include the removal, disabling, or renaming of such accounts where possible, however for accounts that must remain enabled, passwords were changed prior to putting any system into service.	For accounts that must remain enabled, the Responsible Entity did not change passwords prior to putting any system into service.
CIP-007-4	R5.2.2.	The Responsible Entity shall identify those individuals with access to shared accounts.	N/A	N/A	N/A	The Responsible Entity did not identify all individuals with access to shared accounts.
CIP-007-4	R5.2.3.	Where such accounts must be shared, the Responsible Entity shall	N/A	N/A	N/A	Where such

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).				accounts must be shared, the Responsible Entity has not implemented (one or more components of) a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).
CIP-007-4	R5.3.	At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:	N/A	N/A	N/A	The Responsible Entity **does not require passwords** subject to R5.3.1, R5.3.2, R5.3.3. OR **Does not use passwords** subject to R5.3.1, R5.3.2, R5.3.3.
CIP-007-4	R5.3.1.	Each password shall be a minimum of six characters.	N/A	N/A	N/A	N/A

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-007-4	R5.3.2.	Each password shall consist of a combination of alpha, numeric, and “special” characters.	N/A	N/A	N/A	N/A
CIP-007-4	R5.3.3.	Each password shall be changed at least annually, or more frequently based on risk.	N/A	N/A	N/A	N/A
CIP-007-4	R6.	Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.	N/A	N/A	N/A	The Responsible Entity as technically feasible, did not implement automated tools or organizational process controls, to monitor system events that are related to cyber security on one or more of Cyber Assets inside the Electronic Security Perimeter(s).
CIP-007-4	R6.1.	The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	N/A	N/A	N/A	The Responsible Entity **did not implement or did not document** the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.
CIP-007-4	R6.2.	The security monitoring controls	N/A	N/A	N/A	The Responsible

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		shall issue automated or manual alerts for detected Cyber Security Incidents.				entity's security monitoring controls do not issue automated or manual alerts for detected Cyber Security Incidents.
CIP-007-4	R6.3.	The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-4.	N/A	N/A	N/A	The Responsible Entity did not maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008.
CIP-007-4	R6.4.	The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.	N/A	N/A	N/A	The Responsible Entity did not retain one or more of the logs specified in Requirement R6 for at least 90 calendar days.
CIP-007-4	R6.5.	The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.	N/A	N/A	N/A	The Responsible Entity did not review logs of system events related to cyber security nor maintain records documenting review of logs.
CIP-007-4	R7.	Disposal or Redeployment — The Responsible Entity shall establish	N/A	N/A	The Responsible Entity established	The Responsible Entity did not

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4.			and implemented formal methods, processes, and procedures for redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4 **but** did not address redeployment as specified in R7.2.	establish or implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4. OR The Responsible Entity established formal methods, processes, and procedures for redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4 but did not address disposal as specified in R7.1. OR The Responsible Entity did not

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						maintain records pertaining to disposal or[3] redeployment as specified in R7.3.
CIP-007-4	R7.1.	Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.	N/A	N/A	N/A	N/A
CIP-007-4	R7.2.	Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.	N/A	N/A	N/A	N/A
CIP-007-4	R7.3.	The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.	N/A	N/A	N/A	N/A
CIP-007-4	R8	Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:	N/A	N/A	N/A	The Responsible Entity did not perform a Vulnerability Assessment on one or more Cyber Assets within the Electronic Security Perimeter at least annually.

[3] Please note that FERC's January 20, 2011 Order on Version 2 And Version 3 Violation Risk Factors And Violation Severity Levels For Critical Infrastructure Protection Reliability Standards dictated that this should read "…records pertaining to disposal **of** redeployment as specified in R7.3." (Emphasis added) It has come to NERC's attention that it should read "…records pertaining to disposal **or** redeployment as specified in R7.3." (emphasis added) and NERC has made this change accordingly. NERC proposes to remove this footnote from the final approved list of VSLs.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						OR The vulnerability assessment did not include one (1) or more of the subrequirements 8.1, 8.2, 8.3, 8.4.
CIP-007-4	R8.1.	A document identifying the vulnerability assessment process;	N/A	N/A	N/A	N/A
CIP-007-4	R8.2.	A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;	N/A	N/A	N/A	N/A
CIP-007-4	R8.3.	A review of controls for default accounts; and,	N/A	N/A	N/A	N/A
CIP-007-4	R8.4.	Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.	N/A	N/A	N/A	N/A
CIP-007-4	R9	Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-4 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.	N/A	N/A	The Responsible Entity did not review and update the documentation specified in Standard CIP-007-4 at least annually. 					systems or controls within thirty calendar days of the change being completed.	completed.
CIP-008-4	R1.	Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident response plan shall address, at a minimum, the following:	N/A	N/A	The Responsible Entity has developed a Cyber Security Incident response plan that addresses all of the components required by R1.1 through R1.6 but has not maintained the plan in accordance with those components.	The Responsible Entity has not developed a Cyber Security Incident response plan that addresses all of the components required by R1.1 through R1.6, or has not implemented the plan in response to a Cyber Security Incident.
CIP-008-4	R1.1.	Procedures to characterize and classify events as reportable Cyber Security Incidents.	N/A	N/A	N/A	N/A
CIP-008-4	R1.2.	Response actions, including roles and responsibilities of Cyber Security Incident response teams, Cyber Security Incident handling procedures, and communication plans.	N/A	N/A	N/A	N/A
CIP-008-4	R1.3.	Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.	N/A	N/A	N/A	N/A
CIP-008-4	R1.4.	Process for updating the Cyber	N/A	N/A	N/A	N/A

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		Security Incident response plan within thirty calendar days of any changes.				
CIP-008-4	R1.5.	Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.	N/A	N/A	N/A	N/A
CIP-008-4	R1.6.	Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident.	N/A	N/A	N/A	N/A
CIP-008-4	R2	Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.	N/A	N/A	N/A	The Responsible Entity has not kept relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for at least three calendar years.
CIP-009-4	R1	Recovery Plans — The Responsible Entity shall create and annually review recovery plan(s) for Critical Cyber Assets. The recovery plan(s) shall address at a minimum the following:	N/A	N/A	N/A	The Responsible Entity has not created or has not annually reviewed their recovery plan(s) for Critical Cyber Assets OR has created a plan but did not address one or more of the requirements CIP-009-4 R1.1 **and** R1.2.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-009-4	R1.1.	Specify the required actions in response to events or conditions of varying duration and severity that would activate the recovery plan(s).	N/A	N/A	N/A	N/A
CIP-009-4	R1.2.	Define the roles and responsibilities of responders.	N/A	N/A	N/A	N/A
CIP-009-4	R2	Exercises — The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident.	N/A	N/A	N/A	The Responsible Entity's recovery plan(s) have not been exercised at least annually.
CIP-009-4	R3	Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change being completed.	N/A	N/A	N/A	The Responsible Entity's recovery plan(s) have not been updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. OR The Responsible Entity's recovery plan(s) have been updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident but the updates

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						were not communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change.
CIP-009-4	R4	Backup and Restore — The recovery plan(s) shall include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.	N/A	N/A	N/A	The Responsible Entity's recovery plan(s) do not include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets.
CIP-009-4	R5	Testing Backup Media — Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.	N/A	N/A	N/A	The Responsible Entity's information essential to recovery that is stored on backup media has not been tested at least annually to ensure that the information is available.

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-002-4	R1.	Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update this list as necessary, and review it at least annually.	HIGH
CIP-002-4	R2.	Critical Cyber Asset Identification— Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion For the purpose of Standard CIP 002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics: • The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, • The Cyber Asset uses a routable protocol within a control center; or, • The Cyber Asset is dial-up accessible.	HIGH
CIP-002-4	R3.	Annual Approval —The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
		approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)	
CIP-003-4	R1.	Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:	MEDIUM
CIP-003-4	R1.1.	The cyber security policy addresses the requirements in Standards CIP-002-4 through CIP-009-4, including provision for emergency situations.	LOWER
CIP-003-4	R1.2.	The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.	LOWER
CIP-003-4	R1.3	Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.	LOWER
CIP-003-4	R2.	Leadership — The Responsible Entity shall assign a senior manager with overall responsibility for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-4 through CIP-009-4.	MEDIUM
CIP-003-4	R2.1.	The senior manager shall be identified by name, title, and date of designation.	LOWER
CIP-003-4	R2.2.	Changes to the senior manager must be documented within thirty calendar days of the effective date.	LOWER
CIP-003-4	R2.3.	Where allowed by Standards CIP-002-4 through CIP-009-4, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.	LOWER
CIP-003-4	R2.4	The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.	LOWER
CIP-003-4	R3.	Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).	LOWER
CIP-003-4	R3.1.	Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).	LOWER
CIP-003-4	R3.2.	Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.	LOWER
CIP-003-4	R3.3.	Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-003-4	R4.	Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.	MEDIUM
CIP-003-4	R4.1.	The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-4, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.	MEDIUM
CIP-003-4	R4.2.	The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.	LOWER
CIP-003-4	R4.3.	The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.	LOWER
CIP-003-4	R5.	Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.	LOWER
CIP-003-4	R5.1.	The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.	LOWER
CIP-003-4	R5.1.1.	Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.	LOWER
CIP-003-4	R5.1.2.	The list of personnel responsible for authorizing access to protected information shall be verified at least annually.	LOWER
CIP-003-4	R5.2.	The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.	LOWER
CIP-003-4	R5.3.	The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.	LOWER
CIP-003-4	R6.	Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.	LOWER
CIP-004-4	R1.	Awareness — The Responsible Entity shall establish, document, implement, and maintain a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as:	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
		• Direct communications (e.g. emails, memos, computer based training, etc.); • Indirect communications (e.g. posters, intranet, brochures, etc.); • Management support and reinforcement (e.g., presentations, meetings, etc.).	
CIP-004-4	R2.	Training — The Responsible Entity shall establish, document, implement, and maintain an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. The cyber security training program shall be reviewed annually, at a minimum, and shall be updated whenever necessary.	LOWER
CIP-004-4	R2.1.	This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access except in specified circumstances such as an emergency.	MEDIUM
CIP-004-4	R2.2.	Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004-4, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities:	MEDIUM
CIP-004-4	R2.2.1.	The proper use of Critical Cyber Assets;	LOWER
CIP-004-4	R2.2.2.	Physical and electronic access controls to Critical Cyber Assets;	LOWER
CIP-004-4	R2.2.3.	The proper handling of Critical Cyber Asset information; and,	LOWER
CIP-004-4	R2.2.4.	Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.	MEDIUM
CIP-004-4	R2.3.	The Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.	LOWER
CIP-004-4	R3.	Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. A personnel risk assessment shall be conducted pursuant to that program prior to such personnel being granted such access except in specified circumstances such as an emergency. The personnel risk assessment program shall at a minimum include:	MEDIUM
CIP-004-4	R3.1.	The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-004-4	R3.2.	The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.	LOWER
CIP-004-4	R3.3.	The Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004-4.	LOWER
CIP-004-4	R4.	Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.	LOWER
CIP-004-4	R4.1.	The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.	LOWER
CIP-004-4	R4.2.	The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.	LOWER
CIP-005-4	R1.	Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).	MEDIUM
CIP-005-4	R1.1.	Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).	MEDIUM
CIP-005-4	R1.2.	For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.	MEDIUM
CIP-005-4	R1.3.	Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).	MEDIUM
CIP-005-4	R1.4.	Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-4.	MEDIUM
CIP-005-4	R1.5.	Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4 Requirement R3; Standard CIP-007-4 Requirements R1 and R3	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
		through R9; Standard CIP-008-4; and Standard CIP-009-4.	
CIP-005-4	R1.6.	The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.	LOWER
CIP-005-4	R2.	Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).	MEDIUM
CIP-005-4	R2.1.	These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.	MEDIUM
CIP-005-4	R2.2.	At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.	MEDIUM
CIP-005-4	R2.3.	The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).	MEDIUM
CIP-005-4	R2.4.	Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.	MEDIUM
CIP-005-4	R2.5.	The required documentation shall, at least, identify and describe:	LOWER
CIP-005-4	R2.5.1.	The processes for access request and authorization.	LOWER
CIP-005-4	R2.5.2.	The authentication methods.	LOWER
CIP-005-4	R2.5.3.	The review process for authorization rights, in accordance with Standard CIP-004-4 Requirement R4.	LOWER
CIP-005-4	R2.5.4.	The controls used to secure dial-up accessible connections.	LOWER
CIP-005-4	R2.6.	Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.	LOWER
CIP-005-4	R3.	Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-005-4	R3.1.	For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.	MEDIUM
CIP-005-4	R3.2.	Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.	MEDIUM
CIP-005-4	R4.	Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:	MEDIUM
CIP-005-4	R4.1.	A document identifying the vulnerability assessment process;	LOWER
CIP-005-4	R4.2.	A review to verify that only ports and services required for operations at these access points are enabled;	MEDIUM
CIP-005-4	R4.3.	The discovery of all access points to the Electronic Security Perimeter;	MEDIUM
CIP-005-4	R4.4.	A review of controls for default accounts, passwords, and network management community strings;	MEDIUM
CIP-005-4	R4.5.	Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.	MEDIUM
CIP-005-4	R5.	Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-4.	LOWER
CIP-005-4	R5.1.	The Responsible Entity shall ensure that all documentation required by Standard CIP-005-4 reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-4 at least annually.	LOWER
CIP-005-4	R5.2.	The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.	LOWER
CIP-005-4	R5.3.	The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.	LOWER
CIP-006-4c	R1.	Physical Security Plan — The Responsible Entity shall document, implement, and maintain a physical security plan, approved by the senior manager or delegate(s) that shall address, at a minimum, the following:	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-006-4c	R1.1.	All Cyber Assets within an Electronic Security Perimeter shall reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to such Cyber Assets.	MEDIUM
CIP-006-4c	R1.2.	Identification of all physical access points through each Physical Security Perimeter and measures to control entry at those access points.	MEDIUM
CIP-006-4c	R1.3	Processes, tools, and procedures to monitor physical access to the perimeter(s).	MEDIUM
CIP-006-4c	R1.4	Appropriate use of physical access controls as described in Requirement R4 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.	MEDIUM
CIP-006-4c	R1.5	Review of access authorization requests and revocation of access authorization, in accordance with CIP-004-4 Requirement R4.	MEDIUM
CIP-006-4c	R1.6	A visitor control program for visitors (personnel without authorized unescorted access to a Physical Security Perimeter), containing at a minimum the following:	MEDIUM
CIP-006-4c	R1.6.1	Logs (manual or automated) to document the entry and exit of visitors, including the date and time, to and from Physical Security Perimeters.	MEDIUM
CIP-006-4c	R1.6.2	Continuous escorted access of visitors within the Physical Security Perimeter	MEDIUM
CIP-006-4c	R1.7	Update of the physical security plan within thirty calendar days of the completion of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the Physical Security Perimeter, physical access controls, monitoring controls, or logging controls.	LOWER
CIP-006-4c	R1.8	Annual review of the physical security plan.	LOWER
CIP-006-4c	R2	Protection of Physical Access Control Systems — Cyber Assets that authorize and/or log access to the Physical Security Perimeter(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall:	MEDIUM
CIP-006-4c	R2.1.	Be protected from unauthorized physical access.	MEDIUM
CIP-006-4c	R2.2.	Be afforded the protective measures specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4a Requirements R4 and R5; Standard CIP-007-4; Standard CIP-008-4; and Standard CIP-009-4.	MEDIUM
CIP-006-4c	R3	Protection of Electronic Access Control Systems — Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
		identified Physical Security Perimeter.	
CIP-006-4c	R4	Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods: • Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another. • Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems. • Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station. • Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets	MEDIUM
CIP-006-4c	R5	Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008-4. One or more of the following monitoring methods shall be used: • Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response. • Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R4.	MEDIUM
CIP-006-4c	R6	Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent: • Computerized Logging: Electronic logs produced by the Responsible Entity's	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
		selected access control and monitoring method. • Video Recording: Electronic capture of video images of sufficient quality to determine identity. • Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R4	
CIP-006-4c	R7	Access Log Retention — The responsible entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.	LOWER
CIP-006-4c	R8	Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R4, R5, and R6 function properly. The program must include, at a minimum, the following:	MEDIUM
CIP-006-4c	R8.1	Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.	MEDIUM
CIP-006-4c	R8.2	Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement R8.1.	LOWER
CIP-006-4c	R8.3	Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.	LOWER
CIP-007-4	R1.	Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-4, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.	MEDIUM
CIP-007-4	R1.1.	The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.	LOWER
CIP-007-4	R1.2.	The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.	LOWER
CIP-007-4	R1.3.	The Responsible Entity shall document test results.	LOWER
CIP-007-4	R2.	Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.	MEDIUM
CIP-007-4	R2.1.	The Responsible Entity shall enable only those ports and services required for normal	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
		and emergency operations.	
CIP-007-4	R2.2.	The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).	MEDIUM
CIP-007-4	R2.3.	In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	MEDIUM
CIP-007-4	R3.	Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).	LOWER
CIP-007-4	R3.1.	The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.	LOWER
CIP-007-4	R3.2.	The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	LOWER
CIP-007-4	R4.	Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).	MEDIUM
CIP-007-4	R4.1.	The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	MEDIUM
CIP-007-4	R4.2.	The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.	MEDIUM
CIP-007-4	R5.	Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.	LOWER
CIP-007-4	R5.1.	The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.	MEDIUM
CIP-007-4	R5.1.1.	The Responsible Entity shall ensure that user accounts are implemented as approved by	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
		designated personnel. Refer to Standard CIP-003-4 Requirement R5.	
CIP-007-4	R5.1.2.	The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.	LOWER
CIP-007-4	R5.1.3.	The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.	MEDIUM
CIP-007-4	R5.2.	The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.	LOWER
CIP-007-4	R5.2.1.	The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.	MEDIUM
CIP-007-4	R5.2.2.	The Responsible Entity shall identify those individuals with access to shared accounts.	LOWER
CIP-007-4	R5.2.3.	Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).	MEDIUM
CIP-007-4	R5.3.	At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:	LOWER
CIP-007-4	R5.3.1.	Each password shall be a minimum of six characters.	LOWER
CIP-007-4	R5.3.2.	Each password shall consist of a combination of alpha, numeric, and “special” characters.	LOWER
CIP-007-4	R5.3.3.	Each password shall be changed at least annually, or more frequently based on risk.	MEDIUM
CIP-007-4	R6.	Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.	LOWER
CIP-007-4	R6.1.	The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	MEDIUM
CIP-007-4	R6.2.	The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.	MEDIUM
CIP-007-4	R6.3.	The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-4.	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-007-4	R6.4.	The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.	LOWER
CIP-007-4	R6.5.	The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.	LOWER
CIP-007-4	R7.	Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4.	LOWER
CIP-007-4	R7.1.	Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.	LOWER
CIP-007-4	R7.2.	Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.	LOWER
CIP-007-4	R7.3.	The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.	LOWER
CIP-007-4	R8	Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:	LOWER
CIP-007-4	R8.1.	A document identifying the vulnerability assessment process;	LOWER
CIP-007-4	R8.2.	A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;	MEDIUM
CIP-007-4	R8.3.	A review of controls for default accounts; and,	MEDIUM
CIP-007-4	R8.4.	Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.	MEDIUM
CIP-007-4	R9	Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-4 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.	LOWER
CIP-008-4	R1.	Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident response plan shall address, at a minimum, the following:	LOWER
CIP-008-4	R1.1.	Procedures to characterize and classify events as reportable Cyber Security Incidents.	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-008-4	R1.2.	Response actions, including roles and responsibilities of Cyber Security Incident response teams, Cyber Security Incident handling procedures, and communication plans.	LOWER
CIP-008-4	R1.3.	Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.	LOWER
CIP-008-4	R1.4.	Process for updating the Cyber Security Incident response plan within thirty calendar days of any changes.	LOWER
CIP-008-4	R1.5.	Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.	LOWER
CIP-008-4	R1.6.	Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident.	LOWER
CIP-008-4	R2	Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.	LOWER
CIP-009-4	R1	Recovery Plans — The Responsible Entity shall create and annually review recovery plan(s) for Critical Cyber Assets. The recovery plan(s) shall address at a minimum the following:	MEDIUM
CIP-009-4	R1.1.	Specify the required actions in response to events or conditions of varying duration and severity that would activate the recovery plan(s).	MEDIUM
CIP-009-4	R1.2.	Define the roles and responsibilities of responders.	MEDIUM
CIP-009-4	R2	Exercises — The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident.	LOWER
CIP-009-4	R3	Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change being completed.	LOWER
CIP-009-4	R4	Backup and Restore — The recovery plan(s) shall include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.	LOWER
CIP-009-4	R5	Testing Backup Media — Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.	LOWER

CIP Version 4 Violation Severity Levels and Violation Risk Factors

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-002-4	R1.	Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update this list as necessary, and review it at least annually.	N/A	N/A	The Responsible Entity has developed a list of Critical Assets but the list has not been reviewed and updated annually as required.	The Responsible Entity did not develop a list of its identified Critical Assets even if such list is null.
CIP-002-4	R2.	Critical Cyber Asset Identification— Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1. For the purpose of Standard CIP 002-4, Critical Cyber Assets are further qualified to be those having at least	N/A	N/A	The Responsible Entity has developed a list of associated Critical Cyber Assets essential to the operation of the Critical Asset list as per requirement R2 but the list has not been reviewed and updated annually as required.	The Responsible Entity did not develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset list as per requirement R2 even if such list is null. OR A Cyber Asset essential to the operation of the Critical Asset was identified that met at least one of the bulleted characteristics in this requirement but was not included in the Critical Cyber Asset List.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		one of the following characteristics: • The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, • The Cyber Asset uses a routable protocol within a control center; or, • The Cyber Asset is dial-up accessible.				
CIP-002-4	R3.	Annual Approval —The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)	N/A	N/A~~The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of the risk-based assessment methodology, the list of Critical Assets or the list of Critical Cyber Assets (even if such lists are null.)~~	The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of the list of Critical Assets. OR The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of the list of Critical Cyber Assets (even if such lists are null.) ~~The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual~~	The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of both the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.) ~~The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s) annual approval of 1) A risk based assessment methodology for identification of Critical Assets, 2) a signed and dated approval of the list of Critical Assets,~~

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
					~~approval of two of the following: the risk-based assessment methodology, the list of Critical Assets or the list of Critical Cyber Assets (even if such lists are null.)~~	~~nor 3) a signed and dated approval of the list of Critical Cyber Assets (even if such lists are null.)~~
CIP-003-4	R1.	Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a cyber security policy.
CIP-003-4	R1.1.	The cyber security policy addresses the requirements in Standards CIP-002-4 through CIP-009-4, including provision for emergency situations.	N/A	N/A	N/A	The Responsible Entity's cyber security policy does not address all the requirements in Standards CIP-002 through CIP-009, including provision for emergency situations.
CIP-003-4	R1.2.	The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.	N/A	N/A	N/A	The Responsible Entity's cyber security policy is not readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-003-4	R1.3	Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.	N/A	N/A	N/A	The Responsible Entity's senior manager, assigned pursuant to R2, did not complete the annual review and approval of its cyber security policy.
CIP-003-4	R2.	Leadership — The Responsible Entity shall assign a senior manager with overall responsibility for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-4 through CIP-009-4.	N/A	N/A	N/A	The Responsible Entity has not assigned a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.
CIP-003-4	R2.1.	The senior manager shall be identified by name, title, and date of designation.	N/A	N/A	N/A	~~The senior manager is not identified by name, title, and date of designation.~~ Identification of the senior manager is missing one of the following: name, title, or date of designation.
CIP-003-4	R2.2.	Changes to the senior manager must be documented within thirty calendar days of the effective date.	N/A	N/A	N/A	Changes to the senior manager were not documented within

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						30 days of the effective date.
CIP-003-4	R2.3.	Where allowed by Standards CIP-002-4 through CIP-009-4, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.	N/A	N/A	The identification of a senior manager's delegate does not include at least one of the following; name, title, or date of the designation, OR The document is not approved by the senior manager, OR Changes to the delegated authority are not documented within thirty calendar days of the effective date.	A senior manager's delegate is not identified by name, title, and date of designation; the document delegating the authority does not identify the authority being delegated; the document delegating the authority is not approved by the senior manager; AND changes to the delegated authority are not documented within thirty calendar days of the effective date.
CIP-003-4	R2.4	The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.	N/A	N/A	N/A	The senior manager or delegate(s) did not authorize and document any exceptions from the requirements of the cyber security policy as required.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-003-4	R3.	Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).	N/A	N/A	In Instances where the Responsible Entity cannot conform to its cyber security policy, in R1, exceptions were documented, **but** were not authorized by the senior manager or delegate(s).	In Instances where the Responsible Entity cannot conform to its cyber security policy, in R1, exceptions were not documented.
CIP-003-4	R3.1.	Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).	N/A	N/A	N/A	Exceptions to the Responsible Entity's cyber security policy were not documented within 30 days of being approved by the senior manager or delegate(s).
CIP-003-4	R3.2.	Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.	N/A	N/A	The Responsible Entity has a documented exception to the cyber security policy ~~(pertaining to CIP 002 through CIP 009)~~in R1 but did not include **either**: 1) an explanation as to why the exception is necessary, or 2) any compensating	The Responsible Entity has a documented exception to the cyber security policy in R1~~(pertaining to CIP 002 through CIP 009)~~ but did not include **both:** 1) an explanation as to why the exception is necessary, and 2) any compensating measures.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
					measures.	
CIP-003-4	R3.3.	Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.	N/A	N/A	N/A	Exceptions to the cyber security policy were not reviewed **or** were not approved on an annual basis by the senior manager or delegate(s) to ensure the exceptions are still required and valid or the review and approval is not documented.
CIP-003-4	R4.	Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.	N/A	N/A	N/A	The Responsible Entity did not implement or did not document a program to identify, classify, and protect information associated with Critical Cyber Assets.
CIP-003-4	R4.1.	The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-4, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.	N/A	N/A	The information protection program does not include one of the minimum information types to be protected as detailed in R4.1.	The information protection program does not include two or more of the minimum information types to be protected as detailed in R4.1.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-003-4	R4.2.	The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.	N/A	N/A	N/A	The Responsible Entity did not classify the information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.
CIP-003-4	R4.3.	The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.	N/A	N/A	N/A	The Responsible Entity did not annually assess adherence to its Critical Cyber Asset information protection program, including documentation of the assessment results, OR The Responsible Entity did not implement an action plan to remediate deficiencies identified during the assessment.
CIP-003-4	R5.	Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.	N/A	N/A	N/A	The Responsible Entity did not implement or did not document a program for managing access to protected Critical

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						Cyber Asset information.
CIP-003-4	R5.1.	The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.	N/A	N/A	The Responsible Entity maintained a list of designated personnel for authorizing either logical or physical access but not both.	The Responsible Entity did not maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.
CIP-003-4	R5.1.1.	Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.	N/A	N/A	The Responsible Entity did identify the personnel by name, title, and the information for which they are responsible for authorizing access, but the business phone is missing.	Personnel are not identified by name, title, or the information for which they are responsible for authorizing access.
CIP-003-4	R5.1.2.	The list of personnel responsible for authorizing access to protected information shall be verified at least annually.	N/A	N/A	N/A	The Responsible Entity did not verify at least annually the list of personnel responsible for authorizing access to protected information.
CIP-003-4	R5.2.	The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they	N/A	N/A	N/A	The Responsible Entity did not review at least annually the access privileges to protected

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.				information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.
CIP-003-4	R5.3.	The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.	N/A	N/A	N/A	The Responsible Entity did not assess and document at least annually the processes for controlling access privileges to protected information.
CIP-003-4	R6.	Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.	N/A	N/A	N/A	The Responsible Entity has not established or documented a change control process for the activities required in R6, OR The Responsible Entity has not established or documented a configuration management process for the activities required in

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						R6.
CIP-004-4	R1.	Awareness — The Responsible Entity shall establish, document, implement, and maintain a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as: • Direct communications (e.g. emails, memos, computer based training, etc.); • Indirect communications (e.g. posters, intranet, brochures, etc.); • Management support and reinforcement (e.g., presentations, meetings, etc.).	N/A~~The Responsible Entity established, implemented, and maintained but did not document a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices.~~	N/A~~The Responsibility Entity did not provide security awareness reinforcement on at least a quarterly basis.~~	~~The Responsible Entity did document but did not establish, implement, nor maintain a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices.~~ The Responsible[1] Entity did not provide security awareness reinforcement on at least a quarterly basis.	The Responsible Entity did not establish, implement, maintain, ~~n~~or document a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices.
CIP-004-4	R2.	Training — The Responsible Entity shall establish, document, implement, and maintain an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. The	N/A~~The Responsible Entity established, implemented, and maintained but did not document an annual cyber security training~~	N/A~~The Responsibility Entity did not review the training program on an annual basis.~~	~~The Responsible Entity did document but did not establish, implement, nor maintain an annual cyber security~~	The Responsible Entity did not establish, implement, maintain, ~~n~~or document an annual cyber security

[1] Please note that FERC's January 20, 2011 Order on Version 2 And Version 3 Violation Risk Factors And Violation Severity Levels For Critical Infrastructure Protection Reliability Standards dictated "Responsible Entity" to be changed to "Responsibility Entity." NERC assumes FERC intended the VSL to read "Responsible Entity" and therefore is not making this change. NERC proposes to remove this footnote from the final approved list of VSLs.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL

			rights to Critical Cyber Assets, missing at least one individual but less than 5% of the authorized personnel.	rights to Critical Cyber Assets, missing 5% or more but less than 10% of the authorized personnel.	rights to Critical Cyber Assets, missing 10% or more but less than 15%of the authorized personnel.	rights to Critical Cyber Assets, missing 15% or more of the authorized personnel.
CIP-004-4	R4.1.	The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.	N/A	The Responsible Entity did not review the list(s) of its personnel who have access to Critical Cyber Assets quarterly.	The Responsible Entity did not update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, nor any change in the access rights of such personnel.	The Responsible Entity did not review the list(s) of all personnel who have access to Critical Cyber Assets quarterly, nor update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, nor any change in the access rights of such personnel.
CIP-004-4	R4.2.	The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.	N/A	The Responsible Entity did not revoke access within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.	The Responsible Entity did not revoke access to Critical Cyber Assets within 24 hours for personnel terminated for cause.	The Responsible Entity did not revoke access to Critical Cyber Assets within 24 hours for personnel terminated for cause nor within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-005-4	R1.	Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).	N/A	N/A	N/A	The Responsible Entity did not ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. OR The Responsible Entity did not identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).
CIP-005-4	R1.1.	Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).	N/A	N/A	N/A	Access points to the Electronic Security Perimeter(s) do not include all externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).
CIP-005-4	R1.2.	For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.	N/A	N/A	N/A	For one or more dial-up accessible Critical Cyber Assets that use a non-routable protocol, the Responsible Entity did not define an Electronic

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						Security Perimeter for that single access point at the dial-up device.
CIP-005-4	R1.3.	Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).	N/A	N/A	N/A	At least one end point of a communication link within the Electronic Security Perimeter(s) connecting discrete Electronic Security Perimeters was not considered an access point to the Electronic Security Perimeter.
CIP-005-4	R1.4.	Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-4.	N/A	N/A	N/A	One or more noncritical Cyber Asset within a defined Electronic Security Perimeter is not identified. OR Is not protected pursuant to the requirements of Standard CIP-005.
CIP-005-4	R1.5.	Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2	N/A~~A Cyber Asset used in the access control and/or monitoring of the Electronic Security Perimeter(s) is provided with all but~~	N/A~~A Cyber Asset used in the access control and/or monitoring of the Electronic Security Perimeter(s) is provided with all but~~	N/A~~A Cyber Asset used in the access control and/or monitoring of the Electronic Security Perimeter(s) is provided with all but~~	A Cyber Asset used in the access control and/or monitoring of the Electronic Security Perimeter(s) was not afforded ~~is~~

CIP-005-4	R1.6.	The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.	N/A	N/A	N/A	The Responsible Entity did not maintain documentation of one or more of the following: Electronic Security Perimeter(s), interconnected Critical and noncritical Cyber Assets within the Electronic Security Perimeter(s), electronic access

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						points to the Electronic Security Perimeter(s) and Cyber Assets deployed for the access control and monitoring of these access points.
CIP-005-4	R2.	Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).	N/A	N/A	N/A	The Responsible Entity did not implement or did not document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).
CIP-005-4	R2.1.	These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.	N/A	N/A	N/A	The processes and mechanisms did not use an access control model that denies access by default, such that explicit access permissions must be specified.
CIP-005-4	R2.2.	At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services	N/A	N/A	N/A	At one or more access points to the Electronic Security Perimeter(s), the

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.				Responsible Entity enabled ports and services not required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, or did not document, individually or by specified grouping, the configuration of those ports and services.
CIP-005-4	R2.3.	The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).	N/A	N/A	N/A~~The Responsible Entity did implement but did not maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s) where applicable.~~	The Responsible Entity did not implement ~~n~~or maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s) where applicable.
CIP-005-4	R2.4.	Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.	N/A	N/A	N/A	Where external interactive access into the Electronic Security Perimeter has been enabled the Responsible Entity did not implement strong procedural or technical controls at the access points to ensure authenticity

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						of the accessing party, where technically feasible.
CIP-005-4	R2.5.	The required documentation shall, at least, identify and describe:	N/A	N/A	N/A	The required documentation for R2 did not include one or more of the elements described in R2.5.1 through R2.5.4.
CIP-005-4	R2.5.1.	The processes for access request and authorization.	N/A	N/A	N/A	N/A
CIP-005-4	R2.5.2.	The authentication methods.	N/A	N/A	N/A	N/A
CIP-005-4	R2.5.3.	The review process for authorization rights, in accordance with Standard CIP-004-4 Requirement R4.	N/A	N/A	N/A	N/A
CIP-005-4	R2.5.4.	The controls used to secure dial-up accessible connections.	N/A	N/A	N/A	N/A
CIP-005-4	R2.6.	Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.	The Responsible Entity did not maintain a document identifying the content of the banner. OR Where technically feasible less than 5% electronic access control devices did not display an appropriate use banner on the user screen upon all	Where technically feasible 5% but less than 10% of electronic access control devices did not display an appropriate use banner on the user screen upon all interactive access attempts.	Where technically feasible 10% but less than 15% of electronic access control devices did not display an appropriate use banner on the user screen upon all interactive access attempts.	Where technically feasible, 15% or more electronic access control devices did not display an appropriate use banner on the user screen upon all interactive access attempts.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
			interactive access attempts.			
CIP-005-4	R3.	Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.	N/A	N/A	N/A	The Responsible Entity did not implement or did not document electronic or manual processes monitoring and logging access points.
CIP-005-4	R3.1.	For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.	N/A	N/A	N/A	Where technically feasible, the Responsible Entity did not implement or did not document electronic or manual processes for monitoring at one or more access points to dial-up devices.
CIP-005-4	R3.2.	Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.	N/A	N/A	N/A	Where technically feasible, the Responsible Entity did not implement security monitoring process(es) to detect and alert for attempts at or actual unauthorized accesses. OR The above alerts do not provide for appropriate

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						notification to designated response personnel. OR Where alerting is not technically feasible, the Responsible Entity did not review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.
CIP-005-4	R4.	Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:	N/A	N/A	N/A	The Responsible Entity did not perform a Vulnerability Assessment at least annually for one or more of the access points to the Electronic Security Perimeter(s). OR The vulnerability assessment did not include one (1) or more of the subrequirements R4.1, R4.2, R4.3, R4.4, R4.5.
CIP-005-4	R4.1.	A document identifying the	N/A	N/A	N/A	N/A

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		vulnerability assessment process;				
CIP-005-4	R4.2.	A review to verify that only ports and services required for operations at these access points are enabled;	N/A	N/A	N/A	N/A
CIP-005-4	R4.3.	The discovery of all access points to the Electronic Security Perimeter;	N/A	N/A	N/A	N/A
CIP-005-4	R4.4.	A review of controls for default accounts, passwords, and network management community strings;	N/A	N/A	N/A	N/A
CIP-005-4	R4.5.	Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.	N/A	N/A	N/A	N/A
CIP-005-4	R5.	Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-4.	The Responsible Entity did not review, update, and maintain at least one but less than or equal to 5% of the documentation to support compliance with the requirements of Standard CIP-005.	The Responsible Entity did not review, update, and maintain greater than 5% but less than or equal to 10% of the documentation to support compliance with the requirements of Standard CIP-005.	The Responsible Entity did not review, update, and maintain greater than 10% but less than or equal to 15% of the documentation to support compliance with the requirements of Standard CIP-005.	The Responsible Entity did not review, update, and maintain greater than 15% of the documentation to support compliance with the requirements of Standard CIP-005.
CIP-005-4	R5.1.	The Responsible Entity shall ensure that all documentation required by Standard CIP-005-4 reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-4 at least annually.	N/A	The Responsible Entity did not provide evidence of an annual review of the documents and procedures referenced in Standard CIP-005.	The Responsible Entity did not document current configurations and processes referenced in Standard CIP-005.	The Responsible Entity did not document current configurations and processes and did not review the documents and procedures

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						referenced in Standard CIP-005 at least annually.
CIP-005-4	R5.2.	The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.	N/A	N/A	N/A	The Responsible Entity did not update documentation to reflect a modification of the network or controls within ninety calendar days of the change.
CIP-005-4	R5.3.	The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.	The Responsible Entity retained electronic access logs for 75 or more calendar days, but for less than 90 calendar days.	The Responsible Entity retained electronic access logs for 60 or more calendar days, but for less than 75 calendar days.	The Responsible Entity retained electronic access logs for 45 or more calendar days, but for less than 60 calendar days.	The Responsible Entity retained electronic access logs for less than 45 calendar days.
CIP-006-4c	R1.	Physical Security Plan — The Responsible Entity shall document, implement, and maintain a physical security plan, approved by the senior manager or delegate(s) that shall address, at a minimum, the following:	N/A	N/A	The Responsible Entity created a physical security plan but did not gain approval by a senior manager or delegate(s). OR The Responsible Entity created and implemented but did not maintain a physical security	The Responsible Entity did not document, implement, and maintain a physical security plan.

		limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.				disabled due to technical limitations, the Responsible Entity did not document compensating measure(s) applied to mitigate risk. ~~exposure or state an acceptance of risk.~~
CIP-007-4	R3.	Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).	N/A~~The Responsible Entity established (implemented) and documented, either separately or as a component of the documented configuration management process specified in CIP-003-3 Requirement R6, a security patch management program **but** did not include one or more of the following: tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).~~	N/A~~The Responsible Entity **established (implemented) but did not document**, either separately or as a component of the documented configuration management process specified in CIP-003-3 Requirement R6, a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).~~	N/A~~The Responsible Entity **documented but did not establish (implement)**, either separately or as a component of the documented configuration management process specified in CIP-003-3 Requirement R6, a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).~~	The Responsible Entity **did not establish (implement) ~~n~~or did not document**, either separately or as a component of the documented configuration management process specified in CIP-003-~~3~~4 Requirement R6, a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-007-4	R3.1.	The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.	N/A	N/A	N/A	The Responsible Entity did not document the assessment of security patches and security upgrades for applicability as required in Requirement R3 within 30 calendar days after the availability of the patches and upgrades.
CIP-007-4	R3.2.	The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	N/A	N/A	N/A	The Responsible Entity did not document the implementation of applicable security patches as required in R3. OR Where an applicable patch was not installed, the Responsible Entity did not document the compensating measure(s) applied to mitigate risk. ~~exposure or an acceptance of risk.~~
CIP-007-4	R4.	Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software (“malware”) prevention	N/A	N/A	N/A	The Responsible Entity, where technically feasible,

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).				did not use anti-virus software or other malicious software ("malware") prevention tools, on one or more Cyber Assets within the Electronic Security Perimeter(s).
CIP-007-4	R4.1.	The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	N/A	N/A	N/A	The Responsible Entity did not document the implementation of antivirus and malware prevention tools for cyber assets within the electronic security perimeter. OR The Responsible Entity did not document the implementation of compensating measure(s) applied to mitigate risk exposure where antivirus and malware prevention tools are not installed.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-007-4	R4.2.	The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.	N/A	N/A	N/A	The Responsible Entity **did not document or did not implement** a process including addressing testing and installing the signatures for the update of anti-virus and malware prevention "signatures."
CIP-007-4	R5.	Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.	N/A	N/A	N/A	The Responsible Entity did not document or did not implement technical and procedural controls that enforce access authentication of, and accountability for, all user activity.
CIP-007-4	R5.1.	The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.	N/A	N/A	N/A	The Responsible Entity did not ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.
CIP-007-4	R5.1.1.	The Responsible Entity shall ensure that user accounts are implemented	N/A	N/A	N/A	One or more user

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		as approved by designated personnel. Refer to Standard CIP-003-4 Requirement R5.				accounts implemented by the Responsible Entity were not implemented as approved by designated personnel.
CIP-007-4	R5.1.2.	The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.	N/A	The Responsible Entity generated logs with sufficient detail to create historical audit trails of individual user account access activity, however the logs do not contain activity for a minimum of 90 days.	The Responsible Entity generated logs with insufficient detail to create historical audit trails of individual user account access activity.	The Responsible Entity did not generate logs of individual user account access activity.
CIP-007-4	R5.1.3.	The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.	N/A	N/A	N/A	The Responsible Entity did not review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-~~4~~3 Requirement R5 and Standard CIP-004-~~3~~4 Requirement R4.
CIP-007-4	R5.2.	The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and	N/A	N/A	N/A	The Responsible Entity did not implement a policy to minimize and

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		other generic account privileges including factory default accounts.				manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.
CIP-007-4	R5.2.1.	The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.	N/A	N/A	The Responsible Entity's policy did not include the removal, disabling, or renaming of such accounts where possible, however for accounts that must remain enabled, passwords were changed prior to putting any system into service.	For accounts that must remain enabled, the Responsible Entity did not change passwords prior to putting any system into service.
CIP-007-4	R5.2.2.	The Responsible Entity shall identify those individuals with access to shared accounts.	N/A	N/A	N/A	The Responsible Entity did not identify all individuals with access to shared accounts.
CIP-007-4	R5.2.3.	Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example,	N/A	N/A	N/A	Where such accounts must be shared, the Responsible Entity has not implemented (one or more components of) a policy for managing

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		change in assignment or termination).				the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).
CIP-007-4	R5.3.	At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:	N/A	N/A	N/A	The Responsible Entity **does not require passwords** subject to R5.3.1, R5.3.2, R5.3.3. OR **Does not use passwords** subject to R5.3.1, R5.3.2, R5.3.3.
CIP-007-4	R5.3.1.	Each password shall be a minimum of six characters.	N/A	N/A	N/A	N/A
CIP-007-4	R5.3.2.	Each password shall consist of a combination of alpha, numeric, and “special” characters.	N/A	N/A	N/A	N/A
CIP-007-4	R5.3.3.	Each password shall be changed at least annually, or more frequently based on risk.	N/A	N/A	N/A	N/A
CIP-007-4	R6.	Security Status Monitoring — The Responsible Entity shall ensure that	N/A	N/A	N/A	The Responsible Entity as technically

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.				feasible, did not implement automated tools or organizational process controls, to monitor system events that are related to cyber security on one or more of Cyber Assets inside the Electronic Security Perimeter(s).
CIP-007-4	R6.1.	The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	N/A	N/A	N/A	The Responsible Entity **did not implement or did not document** the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.
CIP-007-4	R6.2.	The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.	N/A	N/A	N/A	The Responsible entity's security monitoring controls do not issue automated or manual alerts for detected Cyber Security Incidents.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-007-4	R6.3.	The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-4.	N/A	N/A	N/A	The Responsible Entity did not maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008.
CIP-007-4	R6.4.	The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.	N/A	N/A	N/A	The Responsible Entity did not retain one or more of the logs specified in Requirement R6 for at least 90 calendar days.
CIP-007-4	R6.5.	The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.	N/A	N/A	N/A	The Responsible Entity did not review logs of system events related to cyber security nor maintain records documenting review of logs.
CIP-007-4	R7.	Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4.	N/A~~The Responsible Entity established and implemented formal methods, processes, and procedures for disposal and redeployment of Cyber Assets within the Electronic~~	N/A~~The Responsible Entity established and implemented formal methods, processes, and procedures for disposal of Cyber Assets within the Electronic Security~~	The Responsible Entity established and implemented formal methods, processes, and procedures for redeployment of Cyber Assets within the Electronic Security	The Responsible Entity did not establish or implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic

CIP-008-4	R1.3.	Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.	N/A	N/A	N/A	N/A
CIP-008-4	R1.4.	Process for updating the Cyber Security Incident response plan within thirty calendar days of any	N/A	N/A	N/A	N/A

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		changes.				
CIP-008-4	R1.5.	Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.	N/A	N/A	N/A	N/A
CIP-008-4	R1.6.	Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident.	N/A	N/A	N/A	N/A
CIP-008-4	R2	Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.	N/A	N/A	N/A	The Responsible Entity has not kept relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for at least three calendar years.
CIP-009-4	R1	Recovery Plans — The Responsible Entity shall create and annually review recovery plan(s) for Critical Cyber Assets. The recovery plan(s) shall address at a minimum the following:	N/A	N/A	N/A	The Responsible Entity has not created or has not annually reviewed their recovery plan(s) for Critical Cyber Assets OR has created a plan but did not address one or more of the requirements CIP-009-~~4~~3 R1.1 **and** R1.2.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-009-4	R1.1.	Specify the required actions in response to events or conditions of varying duration and severity that would activate the recovery plan(s).	N/A	N/A	N/A	N/A
CIP-009-4	R1.2.	Define the roles and responsibilities of responders.	N/A	N/A	N/A	N/A
CIP-009-4	R2	Exercises — The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident.	N/A	N/A	N/A	The Responsible Entity's recovery plan(s) have not been exercised at least annually.
CIP-009-4	R3	Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change being completed.	N/A~~The Responsible Entity's recovery plan(s) have been updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident but the updates were communicated to personnel responsible for the activation and implementation of the recovery plan(s) in more than30 but less than or equal to 120 calendar days of the change.~~	N/A~~The Responsible Entity's recovery plan(s) have been updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident but the updates were communicated to personnel responsible for the activation and implementation of the recovery plan(s) in more than 120 but less than or equal to 150 calendar days of the change.~~	N/A~~The Responsible Entity's recovery plan(s) have been updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident but the updates were communicated to personnel responsible for the activation and implementation of the recovery plan(s) in more than 150 but less than or equal to 180 calendar days of the change.~~	The Responsible Entity's recovery plan(s) have not been updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. OR The Responsible Entity's recovery plan(s) have been updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident but the updates

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						were not communicated to personnel responsible for the activation and implementation of the recovery plan(s) within in thirty ~~more than 180~~ calendar days of the change.
CIP-009-4	R4	Backup and Restore — The recovery plan(s) shall include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.	N/A	N/A	N/A	The Responsible Entity's recovery plan(s) do not include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets.
CIP-009-4	R5	Testing Backup Media — Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.	N/A	N/A	N/A	The Responsible Entity's information essential to recovery that is stored on backup media has not been tested at least annually to ensure that the information is available.

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-002-4	R1.	Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update this list as necessary, and review it at least annually.	HIGH
CIP-002-4	R2.	Critical Cyber Asset Identification— Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion For the purpose of Standard CIP 002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics: • The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, • The Cyber Asset uses a routable protocol within a control center; or, • The Cyber Asset is dial-up accessible.	HIGH
CIP-002-4	R3.	Annual Approval —The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
		approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)	
CIP-003-4	R1.	Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:	MEDIUM
CIP-003-4	R1.1.	The cyber security policy addresses the requirements in Standards CIP-002-4 through CIP-009-4, including provision for emergency situations.	LOWER
CIP-003-4	R1.2.	The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.	LOWER
CIP-003-4	R1.3	Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.	LOWER
CIP-003-4	R2.	Leadership — The Responsible Entity shall assign a senior manager with overall responsibility for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-4 through CIP-009-4.	~~LOWER~~MEDIUM
CIP-003-4	R2.1.	The senior manager shall be identified by name, title, and date of designation.	LOWER
CIP-003-4	R2.2.	Changes to the senior manager must be documented within thirty calendar days of the effective date.	LOWER
CIP-003-4	R2.3.	Where allowed by Standards CIP-002-4 through CIP-009-4, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.	LOWER
CIP-003-4	R2.4	The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.	LOWER
CIP-003-4	R3.	Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).	LOWER
CIP-003-4	R3.1.	Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).	LOWER
CIP-003-4	R3.2.	Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.	LOWER
CIP-003-4	R3.3.	Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-003-4	R4.	Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.	MEDIUM
CIP-003-4	R4.1.	The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-4, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.	MEDIUM
CIP-003-4	R4.2.	The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.	LOWER
CIP-003-4	R4.3.	The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.	LOWER
CIP-003-4	R5.	Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.	LOWER
CIP-003-4	R5.1.	The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.	LOWER
CIP-003-4	R5.1.1.	Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.	LOWER
CIP-003-4	R5.1.2.	The list of personnel responsible for authorizing access to protected information shall be verified at least annually.	LOWER
CIP-003-4	R5.2.	The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.	LOWER
CIP-003-4	R5.3.	The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.	LOWER
CIP-003-4	R6.	Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.	LOWER
CIP-004-4	R1.	Awareness — The Responsible Entity shall establish, document, implement, and maintain a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as:	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
		• Direct communications (e.g. emails, memos, computer based training, etc.); • Indirect communications (e.g. posters, intranet, brochures, etc.); • Management support and reinforcement (e.g., presentations, meetings, etc.).	
CIP-004-4	R2.	Training — The Responsible Entity shall establish, document, implement, and maintain an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. The cyber security training program shall be reviewed annually, at a minimum, and shall be updated whenever necessary.	LOWER
CIP-004-4	R2.1.	This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access except in specified circumstances such as an emergency.	MEDIUM
CIP-004-4	R2.2.	Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004-4, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities:	MEDIUM
CIP-004-4	R2.2.1.	The proper use of Critical Cyber Assets;	LOWER
CIP-004-4	R2.2.2.	Physical and electronic access controls to Critical Cyber Assets;	LOWER
CIP-004-4	R2.2.3.	The proper handling of Critical Cyber Asset information; and,	LOWER
CIP-004-4	R2.2.4.	Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.	MEDIUM
CIP-004-4	R2.3.	The Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.	LOWER
CIP-004-4	R3.	Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. A personnel risk assessment shall be conducted pursuant to that program prior to such personnel being granted such access except in specified circumstances such as an emergency. The personnel risk assessment program shall at a minimum include:	MEDIUM
CIP-004-4	R3.1.	The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-004-4	R3.2.	The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.	LOWER
CIP-004-4	R3.3.	The Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004-4.	LOWER
CIP-004-4	R4.	Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.	LOWER
CIP-004-4	R4.1.	The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.	LOWER
CIP-004-4	R4.2.	The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.	LOWER
CIP-005-4	R1.	Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).	MEDIUM
CIP-005-4	R1.1.	Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).	MEDIUM
CIP-005-4	R1.2.	For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.	MEDIUM
CIP-005-4	R1.3.	Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).	MEDIUM
CIP-005-4	R1.4.	Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-4.	MEDIUM
CIP-005-4	R1.5.	Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4 Requirement R3; Standard CIP-007-4 Requirements R1 and R3	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
		through R9; Standard CIP-008-4; and Standard CIP-009-4.	
CIP-005-4	R1.6.	The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.	LOWER
CIP-005-4	R2.	Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).	MEDIUM
CIP-005-4	R2.1.	These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.	MEDIUM
CIP-005-4	R2.2.	At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.	MEDIUM
CIP-005-4	R2.3.	The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).	MEDIUM
CIP-005-4	R2.4.	Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.	MEDIUM
CIP-005-4	R2.5.	The required documentation shall, at least, identify and describe:	LOWER
CIP-005-4	R2.5.1.	The processes for access request and authorization.	LOWER
CIP-005-4	R2.5.2.	The authentication methods.	LOWER
CIP-005-4	R2.5.3.	The review process for authorization rights, in accordance with Standard CIP-004-4 Requirement R4.	LOWER
CIP-005-4	R2.5.4.	The controls used to secure dial-up accessible connections.	LOWER
CIP-005-4	R2.6.	Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.	LOWER
CIP-005-4	R3.	Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-005-4	R3.1.	For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.	MEDIUM
CIP-005-4	R3.2.	Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.	MEDIUM
CIP-005-4	R4.	Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:	MEDIUM
CIP-005-4	R4.1.	A document identifying the vulnerability assessment process;	LOWER
CIP-005-4	R4.2.	A review to verify that only ports and services required for operations at these access points are enabled;	MEDIUM
CIP-005-4	R4.3.	The discovery of all access points to the Electronic Security Perimeter;	MEDIUM
CIP-005-4	R4.4.	A review of controls for default accounts, passwords, and network management community strings;	MEDIUM
CIP-005-4	R4.5.	Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.	MEDIUM
CIP-005-4	R5.	Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-4.	LOWER
CIP-005-4	R5.1.	The Responsible Entity shall ensure that all documentation required by Standard CIP-005-4 reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-4 at least annually.	LOWER
CIP-005-4	R5.2.	The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.	LOWER
CIP-005-4	R5.3.	The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.	LOWER
CIP-006-4c	R1.	Physical Security Plan — The Responsible Entity shall document, implement, and maintain a physical security plan, approved by the senior manager or delegate(s) that shall address, at a minimum, the following:	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-006-4c	R1.1.	All Cyber Assets within an Electronic Security Perimeter shall reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to such Cyber Assets.	MEDIUM
CIP-006-4c	R1.2.	Identification of all physical access points through each Physical Security Perimeter and measures to control entry at those access points.	MEDIUM
CIP-006-4c	R1.3	Processes, tools, and procedures to monitor physical access to the perimeter(s).	MEDIUM
CIP-006-4c	R1.4	Appropriate use of physical access controls as described in Requirement R4 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.	MEDIUM
CIP-006-4c	R1.5	Review of access authorization requests and revocation of access authorization, in accordance with CIP-004-4 Requirement R4.	MEDIUM
CIP-006-4c	R1.6	A visitor control program for visitors (personnel without authorized unescorted access to a Physical Security Perimeter), containing at a minimum the following:	MEDIUM
CIP-006-4c	R1.6.1	Logs (manual or automated) to document the entry and exit of visitors, including the date and time, to and from Physical Security Perimeters.	MEDIUM
CIP-006-4c	R1.6.2	Continuous escorted access of visitors within the Physical Security Perimeter	MEDIUM
CIP-006-4c	R1.7	Update of the physical security plan within thirty calendar days of the completion of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the Physical Security Perimeter, physical access controls, monitoring controls, or logging controls.	LOWER
CIP-006-4c	R1.8	Annual review of the physical security plan.	LOWER
CIP-006-4c	R2	Protection of Physical Access Control Systems — Cyber Assets that authorize and/or log access to the Physical Security Perimeter(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall:	MEDIUM
CIP-006-4c	R2.1.	Be protected from unauthorized physical access.	MEDIUM
CIP-006-4c	R2.2.	Be afforded the protective measures specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4a Requirements R4 and R5; Standard CIP-007-4; Standard CIP-008-4; and Standard CIP-009-4.	MEDIUM
CIP-006-4c	R3	Protection of Electronic Access Control Systems — Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
		identified Physical Security Perimeter.	
CIP-006-4c	R4	Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods: • Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another. • Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems. • Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station. • Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets	MEDIUM
CIP-006-4c	R5	Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008-4. One or more of the following monitoring methods shall be used: • Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response. • Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R4.	MEDIUM
CIP-006-4c	R6	Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent: • Computerized Logging: Electronic logs produced by the Responsible Entity's	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
		selected access control and monitoring method. • Video Recording: Electronic capture of video images of sufficient quality to determine identity. • Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R4	
CIP-006-4c	R7	Access Log Retention — The responsible entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.	LOWER
CIP-006-4c	R8	Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R4, R5, and R6 function properly. The program must include, at a minimum, the following:	MEDIUM
CIP-006-4c	R8.1	Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.	MEDIUM
CIP-006-4c	R8.2	Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement R8.1.	LOWER
CIP-006-4c	R8.3	Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.	LOWER
CIP-007-4	R1.	Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-4, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.	MEDIUM
CIP-007-4	R1.1.	The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.	LOWER
CIP-007-4	R1.2.	The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.	LOWER
CIP-007-4	R1.3.	The Responsible Entity shall document test results.	LOWER
CIP-007-4	R2.	Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.	MEDIUM
CIP-007-4	R2.1.	The Responsible Entity shall enable only those ports and services required for normal	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
		and emergency operations.	
CIP-007-4	R2.2.	The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).	MEDIUM
CIP-007-4	R2.3.	In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	MEDIUM
CIP-007-4	R3.	Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).	LOWER
CIP-007-4	R3.1.	The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.	LOWER
CIP-007-4	R3.2.	The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	LOWER
CIP-007-4	R4.	Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).	MEDIUM
CIP-007-4	R4.1.	The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	MEDIUM
CIP-007-4	R4.2.	The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.	MEDIUM
CIP-007-4	R5.	Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.	LOWER
CIP-007-4	R5.1.	The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.	MEDIUM
CIP-007-4	R5.1.1.	The Responsible Entity shall ensure that user accounts are implemented as approved by	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
		designated personnel. Refer to Standard CIP-003-4 Requirement R5.	
CIP-007-4	R5.1.2.	The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.	LOWER
CIP-007-4	R5.1.3.	The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.	MEDIUM
CIP-007-4	R5.2.	The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.	LOWER
CIP-007-4	R5.2.1.	The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.	MEDIUM
CIP-007-4	R5.2.2.	The Responsible Entity shall identify those individuals with access to shared accounts.	LOWER
CIP-007-4	R5.2.3.	Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).	MEDIUM
CIP-007-4	R5.3.	At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:	LOWER
CIP-007-4	R5.3.1.	Each password shall be a minimum of six characters.	LOWER
CIP-007-4	R5.3.2.	Each password shall consist of a combination of alpha, numeric, and “special” characters.	LOWER
CIP-007-4	R5.3.3.	Each password shall be changed at least annually, or more frequently based on risk.	MEDIUM
CIP-007-4	R6.	Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.	LOWER
CIP-007-4	R6.1.	The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	MEDIUM
CIP-007-4	R6.2.	The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.	MEDIUM
CIP-007-4	R6.3.	The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-4.	MEDIUM

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-007-4	R6.4.	The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.	LOWER
CIP-007-4	R6.5.	The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.	LOWER
CIP-007-4	R7.	Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4.	LOWER
CIP-007-4	R7.1.	Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.	LOWER
CIP-007-4	R7.2.	Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.	LOWER
CIP-007-4	R7.3.	The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.	LOWER
CIP-007-4	R8	Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:	LOWER
CIP-007-4	R8.1.	A document identifying the vulnerability assessment process;	LOWER
CIP-007-4	R8.2.	A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;	MEDIUM
CIP-007-4	R8.3.	A review of controls for default accounts; and,	MEDIUM
CIP-007-4	R8.4.	Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.	MEDIUM
CIP-007-4	R9	Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-4 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.	LOWER
CIP-008-4	R1.	Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident response plan shall address, at a minimum, the following:	LOWER
CIP-008-4	R1.1.	Procedures to characterize and classify events as reportable Cyber Security Incidents.	LOWER

Standard Number	Requirement Number	Text of Requirement	VRF
CIP-008-4	R1.2.	Response actions, including roles and responsibilities of Cyber Security Incident response teams, Cyber Security Incident handling procedures, and communication plans.	LOWER
CIP-008-4	R1.3.	Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.	LOWER
CIP-008-4	R1.4.	Process for updating the Cyber Security Incident response plan within thirty calendar days of any changes.	LOWER
CIP-008-4	R1.5.	Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.	LOWER
CIP-008-4	R1.6.	Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident.	LOWER
CIP-008-4	R2	Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.	LOWER
CIP-009-4	R1	Recovery Plans — The Responsible Entity shall create and annually review recovery plan(s) for Critical Cyber Assets. The recovery plan(s) shall address at a minimum the following:	MEDIUM
CIP-009-4	R1.1.	Specify the required actions in response to events or conditions of varying duration and severity that would activate the recovery plan(s).	MEDIUM
CIP-009-4	R1.2.	Define the roles and responsibilities of responders.	MEDIUM
CIP-009-4	R2	Exercises — The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident.	LOWER
CIP-009-4	R3	Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change being completed.	LOWER
CIP-009-4	R4	Backup and Restore — The recovery plan(s) shall include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.	LOWER
CIP-009-4	R5	Testing Backup Media — Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.	LOWER

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team

DRAFT ORGANIZATIONAL MEETING SUMMARY

EXECUTIVE SUMMARY

The Chair and Vice Chair welcomed the members and reviewed with the Standard Development Team (SDT) and participants the proposed meeting agenda. Team Members introduced themselves highlighting a broad spectrum of expertise and industry and governmental perspectives and a shared expectation that they would keep the needs of the industry in mind, but do the right thing. Several noted the importance of engaging and involving Canada in the standards development process. Others pointed to the fact the industry must successfully respond to the cyber security challenges facing the bulk electric system or risk a regulatory response and imposed "solution."

Following the Team and staff introductions, Michael Assante, NERC's Chief Security Officer, offered welcoming remarks and opening comments for the Team's consideration. He noted that this was an unusual standards development process surrounded by an increased level of attention and some sense of urgency. He urged the Team to focus on their standards development task and to take the time necessary to build consensus and answer the critical challenge of coming up with practical solutions that address the directives of FERC and the concerns of the industry. NERC is providing its staff expertise and facilitation assistance to do everything it can to make this effort a success. Mr. Assante also noted the context of President Rick Sergel's recent industry stakeholder letter and congressional testimony highlighting the industry's commitment to making a priority of enhancing security leadership and situational awareness of the urgency of the threat while improving the industry response to cyber security and critical infrastructure protection concerns for the bulk power system in North America.

David Taylor, NERC Manager of Standards Development, reviewed with the Team the need to comply with NERC's Antitrust Guidelines. He then provided an overview of the Cyber Security Order 706 SDT scope, process and roles. Mr. Taylor noted that the 24-member Drafting Team will be responsible for: producing technically sound and complete standard(s) that meets stakeholder and regulatory approval; developing a realistic implementation plan; and preserving the open ANSI process. The Team discussed general comments on the scope, communication networks, serial communications, what should be included in critical assets, comparing NIST and CIP Standards, glossary definitions, bulk power system vs. bulk electric system, responsibility for standards and NERC Standards Development.

Mr. Taylor noted the 24 members of the Team appointed by the Standards Committee will be led by the Chair, Jeri Domingo-Brewer and the Vice Chair, Kevin Perry, who were appointed by the Standards Committee. NERC is committed to providing considerable NERC staff support and expertise as represented by those attending this organizational meeting and by neutral facilitation being provided by a team from Florida State University's FCRC-Consensus Solutions Center.

Bob Jones, with the FCRC Consensus Solutions facilitation team, provided an overview of how consensus could be defined and used by the drafting team as well as meeting ground-rules. He suggested that the Team

agree to the ground-rules and review the consensus process again at the next meeting with an eye towards adopting a procedure going forward.

David Taylor and Gerry Adamski noted that NERC will be developing, in consultation with the Team, a communications effort to the industry to explain what is going on in standards development process so that the industry has a heads up and does not have to digest the entire standards revision in a short period just prior to balloting. NERC would like to see the SDT complete its work within an 18 to 24 month time frame. An FAQ document may be developed by the SDT.

Members discussed who they are serving, i.e. who is the beneficiary, not who does the standards apply to in this process? Is the Congress, the FERC, the auditor, and/or the asset owner? One member suggested the SDT is serving North American society as a whole in working to protect critical infrastructure. The facilitator suggested bringing this back at the next meeting as the SDT reviews, refines and adopts a purpose statement.

The Chair noted that the FERC Order 706 directs NERC to consider the NIST framework. Keith Stouffer, team member and NIST employee, presented an introduction of the NIST approach to standards development to the Team. Stuart Katzke presented on the NIST framework and approach. Marshall Abrams presented a comparison of the NIST and NERC CIP Standards.

Prior to the meeting Scott Mix, Manager of Situation Awareness & Infrastructure Security at NERC, reviewed the FERC Order 706 and created and presented a straw man red-lined version of the CIP standards as an Approach to Phase I issues at the meeting. The facilitator then suggested the Team use the acceptability ranking tool to both test support and focus discussion on a threshold question of whether to proceed with a single phase or more than one phase. The Team ranked and agreed on the following project roadmap proposition: The SDT should proceed with an approach with two or more phases and products for ballot body consideration.

The SDT reviewed and agreed to apply the following draft criteria for consideration of issues to address in Phase-1:

- It represents an "Editorial" item
- It is a must-do item per Order 706 to meet the July 1, 2009 time frame
- It will not preclude the Team changing standards language in Phase 2

The Chair and Vice Chair suggested that the Team review and offer suggestions and concerns with the "straw man" phase 1 proposal that Scott Mix had put together as a "redline" draft of the CIP 002-009 standards in response to FERC Order 706. During the course of the Team's Tuesday afternoon's review of the redline, changes were made to the redline draft. The revised redline draft from Tuesday was then reviewed by the Team and ranked for acceptability and further refined on Wednesday morning. Below is the final draft of the changes in CIP-002-009:

CIP 002 – CRITICAL CYBER ASSET IDENTIFICATION

CIP-002 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Critical Cyber Asset Identification
A2. Number: CIP-002-~~1~~2
A3. Purpose *(2nd paragraph)*
These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R4. Annual Approval — A senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

CIP 003 — CYBER SECURITY — SECURITY MANAGEMENT CONTROLS

CIP-003 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Security Management Controls
A2. Number: CIP-003-~~1~~2
A3. Purpose *(2nd paragraph)*
Standard CIP-003 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R2. Leadership — The Responsible Entity shall assign a senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.
R2. 3Where allowed by Standards CIP-002 through CIP-009, the senior manager may delegate authority for specific actions to a named delegate. These delegations must be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

R2.~~3~~ 4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

CIP 004 – CYBER SECURITY — PERSONNEL & TRAINING

CIP-004 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Cyber Security — Personnel & Training
A2. Number: CIP-004-~~1~~2
A3. Purpose:
Standard CIP-004 requires that personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including contractors and service vendors, have an appropriate level of personnel risk assessment, training, and security awareness. Standard CIP-004 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment~~.
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R1. Awareness — The Responsible Entity shall establish, maintain, and document and implement a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to critical cyber security assets receive on-going reinforcement in sound security practices…
R2. Training — The Responsible Entity shall establish, maintain, and document and implement an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and review the program annually and update as necessary.
R2.1. This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access. ~~within ninety calendar days of such authorization.~~
R3. Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access. A personnel risk assessment shall be conducted pursuant to that program prior to ~~within thirty days of~~ such personnel being granted such access.

CIP 005 – ELECTRONIC SECURITY PERIMETER(S)

CIP-005 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Electronic Security Perimeter(s)
A2. Number: CIP-005-~~1~~2
A3. Purpose:
Standard CIP-005 requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009.~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment~~.
A4. Applicability:
Add: 4.1.12 Regional Entities.

A5. Effective Date: ~~June 1, 2006~~

B. Requirements

R1.5. Cyber Assets used in the access control and monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP- 003, Standard CIP-004 Requirement R3, Standard CIP-005 Requirements R2 and R3, Standard CIP-006 Requirements R2 and R3, Standard CIP-007, Requirements R1 and R3 through R9, Standard CIP-008, and Standard CIP-009. *(Staff will correct the citations)*

R2.3. The Responsible Entity shall maintain and implement a procedure for securing dial-up access to the Electronic Security Perimeter(s).

CIP 006 – PHYSICAL SECURITY OF CRITICAL CYBER ASSETS

CIP-006 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Physical Security of Critical Cyber Assets
A2. Number: CIP-006-~~1~~2
A3. Purpose:
Standard CIP-006 is intended to ensure the implementation of a physical security program for the protection of Critical Cyber Assets. Standard CIP-006 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements

R1. Physical Security Plan — The Responsible Entity shall create ~~and~~ maintain and implement a physical security plan, approved by the ~~a~~ senior manager or delegate(s) that shall address, at a minimum, the following:
R1.2. Processes to identify all access points through each Physical Security Perimeter and implement measures to control entry at those access points.
R1.4. Procedures for and the implementation of the appropriate use of physical access controls as described in Requirement R3 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.
R1.6. Procedures for and implementation of escorted access within the physical security perimeter of personnel not authorized for unescorted access.
R1.7. Process for updating the physical security plan within ~~ninety~~ thirty calendar days of implementation of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the physical security perimeter, physical access controls, monitoring controls, or logging controls.
R1.8. Cyber Assets used in the access control and monitoring of the Physical Security Perimeter(s) shall be afforded the protective measures specified in Standard CIP-003, Standard CIP-004 Requirement R3, Standard CIP-005 Requirements R2 and R3, Standard CIP-006 Requirement Standard CIP-009. *(Staff will correct the citations)*

CIP 007 SYSTEMS SECURITY MANAGEMENT

CIP-007 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Systems Security Management
A2. Number: CIP-007-~~1~~2
A3. Purpose:
Standard CIP-007 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the non-critical Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R2. Ports and Services — The Responsible Entity shall establish and document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.
R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003 Requirement R6, shall establish, ~~and~~ document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches…
R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure. ~~or an acceptance of risk~~.
R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005.
R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007 at least annually. Changes resulting from modifications to the systems or controls shall be documented within ~~ninety~~ thirty calendar days of the change being completed.

CIP 008 INCIDENT RESPONSE & REPORTING

CIP-008 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Incident Reporting and Response Planning
A2. Number: CIP-008-~~1~~2
A3. Purpose:
Standard CIP-008 ensures the identification, classification, response, and reporting of Cyber Security Incidents related to Critical Cyber Assets. Standard CIP-008 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R1. Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident Response plan shall address, at a minimum…
R1.4. Process for updating the Cyber Security Incident response plan within ~~ninety~~ thirty calendar days of any changes.
R1.6. Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident. Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test.

CIP 009 RECOVERY PLANS FOR CRITICAL CYBER ASSETS

CIP-009 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Recovery Plans for Critical Cyber Assets
A2. Number: CIP-009-~~1~~2
A3. Purpose:
Standard CIP-009 ensures that recovery plan(s) are put in place for Critical Cyber Assets and that these plans follow established business continuity and disaster recovery techniques and practices. Standard CIP-009 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment~~.
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R3. Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within ~~ninety~~ thirty calendar days of the change being completed.

On Wednesday morning, the Team engaged in a brief exercise to highlight the members' individual preferences for problem solving and decision making. Finally the Team reviewed and agreed to the Phase 1 meeting schedule (both in-person and Webex conference call drafting meetings) and drafting assignments. At the conclusion of the meeting, the Team offered an evaluation of the process including what worked and what could be improved. *The meeting adjourned at Noon on Wednesday October 8, 2008*.

Cyber Security Order 706 Standard Drafting Team

DRAFT ORGANIZATIONAL MEETING SUMMARY

A. INTRODUCTIONS, AGENDA REVIEW AND WELCOMING REMARKS

The Chair, and Vice Chair welcomed the members and asked NERC staff Harry Tom to conduct a roll call of members and participants in the room and on the conference call *(See appendix #3*). They then reviewed with the Team and participants the proposed meeting agenda *(See appendix #1*).

Team Members introduced themselves highlighting a broad spectrum of expertise and industry and governmental perspectives and a shared expectation that they would keep the needs of the industry in mind, but do the right thing. Several noted the importance of engaging and involving Canada in the standards development process. Others pointed to the fact the industry must successfully respond to the cyber security challenges facing the bulk electric system or risk a regulatory response and imposed "solution." In addition, several Team members noted their participation on the first CIP drafting team.

Following the Team and staff introductions, Michael Assante, NERC's Chief Security Officer, offered welcoming remarks and opening comments for the Team's consideration. He noted that he joined NERC as the new Chief Security Officer in September, 2008, moving from Idaho and the Department of Energy's Idaho National Labs (INL) in the fields of security and infrastructure protection to Princeton. He noted prior to his work with INL he served as Chief Security Officer at American Electric Power. Overseeing NERC's plan, at the Electric Reliability Organization, to improve response to cyber and critical infrastructure protection, he noted he will lead the effort in establishing a new core Critical Infrastructure Program at NERC including the critical task of related standards development and compliance.

He noted that this was an unusual standards development process surrounded by an increased level of attention and some sense of urgency. He urged the Team to focus on their standards development task and to take the time necessary to build consensus and answer the critical challenge of coming up with practical solutions that address the directives of FERC and the concerns of the industry. He noted that the Team will not be following someone's model, since no sector has taken this standards issue on. The Team needs to focus on producing just and reasonable standards that are not unduly discriminatory or preferential and that are in the public interest. NERC is providing its staff expertise and facilitation assistance to do everything it can to make this effort a success.

Mr. Assante also noted the context of President Rick Sergel's recent industry stakeholder letter and congressional testimony highlighting the industry's commitment to making a priority of enhancing security leadership and situational awareness of the urgency of the threat while improving the industry response to cyber security and critical infrastructure protection concerns for the bulk power system in North America. The leaders in the sector believe we have a great "culture of compliance" and that the ERO is about achieving real security. He noted that cyber security is a fast evolving area in terms of tools and approaches where there needs to be a balancing of the security value with establishing good measurable standards in a dynamic system. The experience with the Maritime

Security Act of 2002 highlights what lack of flexibility can produce. NERC's hope is to strengthen the regime to protect assets and demonstrate a confidence and willingness to do this right.

Mr. Assante suggested the Team should consider as part of its scope:

- The merits of blackout report recommendations;
- "Must do's" in the short term;
- Eliminate reasonable business judgment in the standards
- How to address acceptance of risk exceptions and accountability.
- Develop specific conditions that a reasonable entity must satisfy to invoke the "technical feasibility" exception;
- Data as a critical cyber asset and help to defining critical assets- and what external review and procedures may be involved and who should be involved in that process;
- Application of a measurable "defense in depth" to create an electronic security perimeter. Different definitions by different world- network view of the world vs. operations.
- What strong controls are needed and how much change triggers an "active vulnerability assessment" (change controls).
- What is a representative system that will allow you to say the testing is enough.
- Security standards and operations realities different, E.g. "resilience," efficiency is the evil to resilience? Philosophically how to protect assets and how to best operate to get to reliability.
- Timetable- One hard date in FERC Order 706 is to remove "using reasonable business judgment" before the compliance audits commence in July, 2009.
- Satisfy what needs to be done in the short term while taking the longer view in the standards development. Are there approaches that might allow addressing important issues sooner?

Finally, Mr. Assante noted that everything the Team will do will be part of an open process guided by the ANSI framework and procedures and, "If we get this right, we can provide a model for the industry and that others can utilize."

B. REVIEW OF ANTITRUST GUIDELINES

David Taylor, NERC Manager of Standards Development, reviewed with the Team the need to comply with NERC's Antitrust Guidelines (See, Appendix #3). He urged the Team and other participants in the process to carefully review these as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive in nature.

C. SDT PROJECT PROCESS, SCOPE, ROLES AND CONSENSUS GUIDELINES

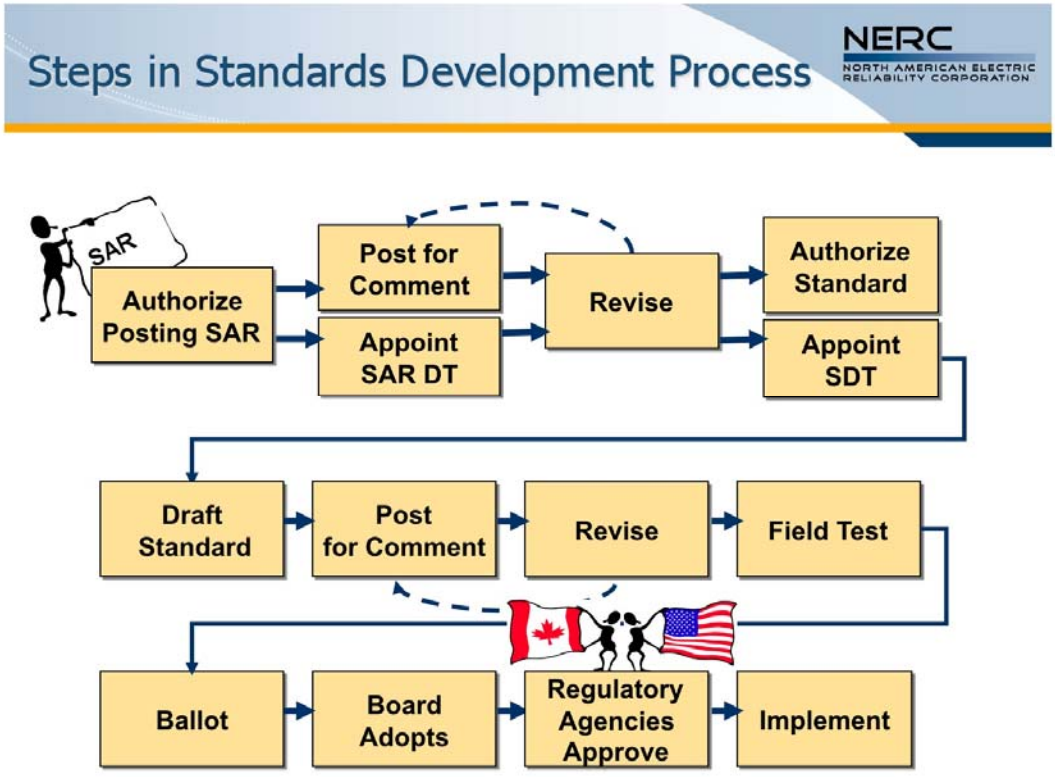
David Taylor, Manager of Standards Development at NERC, provided an overview of the SDT Project scope, process and roles. (See, power point presentation at: http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html

1. Standards Development Process and SAR Scope

Mr. Taylor reviewed with the Team the development and adoption of the Standard Authorization Request (SAR), Revisions to Critical Infrastructure Protection Standards (revisions to CIP-002 through CIP-009, June 9, 2008) (See, http://www.nerc.com/docs/standards/sar/SAR_Modify_CIP_Stds_D2_clean_07Jul08.pdf . He noted that the Standards Committee appointed the Standards Drafting Team with an eye towards member expertise and representation of both geographic and industry segment perspectives. The 24-member Drafting Team will be responsible for:

- Producing technically sound and complete standard(s) that meets stakeholder and regulatory approval;
- Producing a realistic implementation plan; and
- Preserving the open ANSI process.

He described the potential phases of a standards development process featured in the graphic below:



Mr. Taylor noted that if there is anything that needs to be changed in the standard, the group should raise the issue. Historically SARs have been narrowly focused. He noted that Volume #1 of Standards Development Plan outlines that the scope of the standards

development process and directs teams to effectively deal with standards overall to produce an effective standard. Taylor expects the majority of the time to be spent on Requirements and on accompanying Measures. In the past the requirements may not have been written to provide clarity. David Taylor and Maureen Long of NERC will review the Team's products for completeness and clarity prior to posting. If the requirements are not clear, modification will be required. All requirements must be measurable. If the requirement cannot be clearly measured, then the drafting team will be asked to re-write the requirement and measure. The measures must be precise and understandable by both the entities and the auditors.

The drafting team should address all the issues identified in the Issues Database prior to posting and the standard should meet NERC benchmarks for reliability standards. The expectation is that each of the existing requirements and modifications and an implementation plan should be addressed and the drafting team will be expected to respond to all comments. He noted that the Team will need to decide fairly early on if they are going to address something with a revision to the standard or address a FERC directive via external guidance documents.

Mr. Taylor addressed the following SDT Scope items:

Balloting and Implementation
- What is directed in Order 706
- There is a spreadsheet that lists the items in Order 706 to be addressed by the drafting team.
- Determine the optimal implementation plan

Clarify Existing Requirements
- Consider the need for different requirements for different environments, i.e., control centers, substations, generation, etc.

Other items including interpretations.
- The team may believe it should consider clarifying interpretations, etc.
- E.g., Within an ESP, the wiring over which data flows should be protected.
- E.g., Application of CIP to Nuclear

Industry education
- FAQ document revision/replacement
- Development of guideline documents such as those for extended LAN's over multiple geographically dispersed locations

Finally, he noted the following products that must accompany a standard change and are used by the NERC compliance staff:

- A standards requirements document (saying what the entity shall do but not how they do it).
- An SDT Implementation Plan for the Standard(s)
- A Comment Form which presents an opportunity for the Team to tell the "story" behind the proposed standard and asks some very pointed questions for industry to respond to in providing input.

- A document describing Violation Risk Factors –focusing on Severity of impact and are used by auditors to determine, along with other mitigating factors, the initial sanction "price point."
- A document describing the Violation Severity Level — i.e. how badly off from the compliance mark was the entity being audited? This will expand on the measure. Note that VSLs were not a part of the original CIP standard development, instead there was a separate team working on initial VSL. This team will revise VSLs as part of its process.

Finally, Mr. Taylor noted the following reference documents that had been sent in advance to the Team:

- Reliability Standards Development Plan — Volume I
- Reliability Standards Development Procedure
- Standard Drafting Team Guidelines — the SDT bible
- Pages 7–11 of the SAR gives a lot of really good information.

Team Member Comments and Questions on SAR Scope

- **General Comments on Scope**

- Extended WAN — consider Ethernet Over SONET.
- Consider the impact of Smart Grid (AMI, etc.).
- Try to stand back and look at the bigger picture.
- The word "etc." in the requirement to consider other information sources is believed to give the SDT the latitude to go wherever it needs to.
- Need to be more explicit where the ESP begins and ends.
- Need to be cognizant of the use of high speed communication and cost models.
- Need to look at CIP-002, including the RAWG guideline and the NIST framework. Does not mean we throw out the CIP standards and wholesale replace them with the NIST standards.
- Perhaps there is a minimum set of requirements that apply to all cyber assets and an elevated set of requirements that apply to critical cyber assets. The NIST/FISMA risk framework gives you this latitude.
- The fear is the threat of financial sanctions. That is the big roadblock against moving away from the existing cherry-pick approach.
- The RAWG guideline looks at the problem from a functional perspective (generation, transmission, systems, and special controls). The CIP-002 as it exists today does not organize the same way.
- Verizon data breach study — victims are not taking upstream/downstream connections seriously. No longer a predominately internal threat.
- Is everything fair game as far as the SAR is concerned? Answer: There is an item in the SAR that provides freedom to include other related items as appropriate.

- Are **Communication networks** today out of scope in terms of the SAR? Answer: If the communications are disrupted via the end points, such as the meters, the

question of who is responsible is not clear under today's standards. The communications provider is not responsible. Issues similar to this should be within the scope under "other items". However, the standards drafting team will probably not have authority to decide this issue.

- **Serial Communications**: a strategy of moving IP based systems away from IP communications and back to serial communications by some industry participants may not be a good idea. FERC intends to address this issue in the future.
- **What should be included in Critical Asset?** Could the definition of Critical Asset be expanded to cover a broader set of reliability standards? The answer is yes, it is within scope of the SDT. RAWG is leading the process of developing a guideline for Critical Asset identification in support of the existing CIP standard. Jay Cribb, chair of the RAWG and member of this Team can be a conduit between this drafting team and the work of the RAWG.
- **NIST and CIP Standards.** Federal strategy is to try to adapt existing NIST standards to new environments. For example, applicability of SP 800-53 to control systems. Very difficult to apply. Added additional information to a good number of 800-53 requirements to specifically apply to control systems (Became SP 800-53, Rev 2). We can learn from the NIST experience. NIST will provide as little or as much detail and assistance as the SDT wants. NIST 800-39 provides some directives. NIST 800-39 should be looked at very closely because we have been directed to do so and because it makes sense when studied. We may not be able to provide cyber security protection of the systems that support the electric grid using the Critical Asset directives contained in CIP 002. The drafting team should be free to replace CIP 002 with the NIST framework if they determine this is the right course of action. NIST 800-39 may provide a framework that can be used over time. Based on risk, there are different levels of security that may be applied to different assets at different levels of risk.
- **Glossary Definitions.** Definitions that are global to NERC, how does the drafting team work with them? Answer: NERC Glossary terms used in standards are capitalized. All glossary terms must be universal and not specific only to the cyber security context. Changing the way a word is defined in the NERC glossary could have a ripple effect throughout other standards where the word is referenced. If it is in the NERC glossary, that is the definition the drafting team should use or propose a change to the glossary. The drafting team may want to propose that new definitions are added to the glossary.
- **Bulk power system vs. bulk electric system.** The terms "bulk power system" and "bulk electric system" may be contingent upon the regional definitions. What term will the Team use? Answer: BES will be used until further direction is provided by FERC. BPS is more expansive than BES, but FERC did not probably expect imminent compliance across industry. FERC expects eventually that all the NERC standards will apply to the BPS and not just to the BES.
- **Responsibility for Standards.** Who is responsible for published standards? Answer: NERC is responsible in conjunction with the industry for ERO standards. NIST is responsible for publishing their standards.

- **NERC Standard Development**. Will or can we limit the number of revisions? Answer: Based on experiences to date, the Team should expect 2 or 3 drafts in responding to comments. The plan is have a good idea of what the industry wants prior to submitting the standards for ballot. Can the standards be separated or do they need to be balloted as a group? Answer: This is part of the road map for development. This question will be decided over the next couple of days. The ballot body is not typically expert in cyber security matters and companies will turn to their experts for guidance. Is this process of 18 to 24 months soon enough to satisfy the regulators? Answer: NERC's responsibility is to assist the group. There is urgency but CSO's role is to assure reasonable expectations. The Team should have time to 'get it right.'

2. Roles in the SDT Process

Mr. Taylor noted the 24 members of the Team appointed by the Standards Committee will be led by the Chair, Jeri Domingo-Brewer and the Vice Chair, Kevin Perry, who were appointed by the Standards Committee. NERC is committed to providing considerable NERC staff support and expertise as represented by those attending this organizational meeting and by neutral facilitation being provided by a team from Florida State University's FCRC-Consensus Solutions Center.

3. Proposed SDT Consensus Guidelines and Meeting Ground Rules

Bob Jones, with the FCRC Consensus Solutions facilitation team, provided an overview of how consensus could be defined and used by the drafting team *(See Appendix #6)*. He noted that consensus can be understood as having three meanings in a group process: it is an attitude of each of the team members, it is an outcome or decision rule for the team, and it is a structured problem solving process. He suggested that the Team has some flexibility to define what a 'consensus' decision should mean for the Team's process. He noted that among the ballot body, a standard requires at least a 2/3 majority of all of the industry segments to be adopted. The Team may want to establish a higher supermajority for agreement (perhaps +75%) to assure 2/3 acceptance of the ballot body. He suggested that this could serve as a default standard and that the process would be designed to seek 100% acceptance of the Team. He suggested that the Team review this again at the next meeting with an eye towards adopting a procedure going forward.

Mr. Jones proposed a set of ground rules for the meeting. *(See, Appendix #6)*.

Team Comments on Ground rules

- Perhaps some additional phone protocols
- Say your name at the start if you are on the phone — "comment on the phone" with name to get in the queue to speak on an issue
- Check with team members on the phone to include their acceptability ranking as needed
- In past group this large need to clearly state what we are trying to get consensus on to aid in staying on issue and avoid drift

4. Expectations of Drafting Team

David Taylor and Gerry Adamski noted that NERC will be developing, in consultation with the Team, a communications effort to the industry to explain what is going on in standards development process so that the industry has a heads up and does not have to digest the entire standards revision in a short period just prior to balloting. NERC would like to see the SDT complete its work within an 18 to 24 month time frame. An FAQ document may be developed by the SDT.

Members discussed who they are serving, i.e. who is the beneficiary, not who do the standards apply to in this process? Is the Congress, the FERC, the auditor, and/or the asset owner? One member suggested the SDT is serving North American society as a whole in working to protect critical infrastructure. The facilitator suggested bringing this back at the next meeting as the SDT reviews, refines and adopts a purpose statement.

D. REVIEWING THE NIST FRAMEWORK AND COMPARISON WITH THE NERC CIP STANDARDS (002-009)

The Chair noted that the FERC Order 706 directs NERC to consider the NIST framework.

1. NIST Framework

Keith Stouffer, team member and NIST employee, presented an introduction of the NIST approach to standards development to the Team. He noted that he does not believe a wholesale swap out of NIST for the CIP is prudent, but he believes there is quite a bit to be gained for the SDT in reviewing the NIST approach. He noted that the NIST strategy has been to look to see if they can add additional guidance to their framework to support applications such as control systems environment. The first thing they looked at was 800-53 requirements by bringing stakeholders together to determine what concerns exist. They determined 800-53 as written would not apply well to control systems so they created a Revision #2 to 800-53 for entities which operate control systems and must comply with NIST requirements. Keith noted that NIST is ready to help as much or as little as the drafting team wants. NIST provides an alternative way of looking at the standards.

Keith Stouffer then reviewed a presentation that he gave to the NERC Standards Committee. His power point presentation is available for review at: http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html. Key points in Keith's presentation included:

- NIST keeps measurement standards, but they also create principle-based standards.
- 800 series contains information systems guidelines. Auditing done by GAO. There are about 115 of the 800 series documents.
- FIPS — standards approved by the Secretary of Commerce.

- NIST 800 documents go through a 3 stage public vetting process, but do not require Secretary of Commerce's approval.
- Connection between FIPS and 800 documents includes a reference in FIPS to the 800 series documents. Therefore a change in a reference in FIPS to an 800 series document does not require Secretary of Commerce's approval.
- NIST approach to Standards Development in order of priority
- Seek commercial sector involvement and attempt to adapt an existing document.
- Review other existing standards to see if one of those can be adopted.
- Create a new document.
- 800-53 is the document used for securing Federal information systems.
- Over 800 comments received on the initial public draft
- In response NIST streamlined the controls
- Revised in 2006 and again to revise for control systems in late 2007.
- NIST brought in industry companies covered by 800-53 and determined why implementing the controls created problems for the companies covered by the document.
- There are 3 levels assessed for each control. For example, for a system categorized as low the particular control may not apply or only parts of the control may apply.
- 800-53 cannot be used for both general information systems and control systems.
- The following framework allows the organization to tailor the controls to their systems:
  - Low Impact: Selection of a subset of security controls – Non hazardous materials
  - Moderate builds a low baseline. Selection of subset of control from the master catalog – Some hazardous material & some proprietary information
  - High Impact: Highest level - Protect human life
- Federal Government approach
- Use the existing NIST risk framework
- Make modifications
- Apply to control systems
- 800-82 provides guidance on how to implement 800-53.
- Final public draft released in September of 2008 with 60 days for comments
- Used in the private sector for control systems

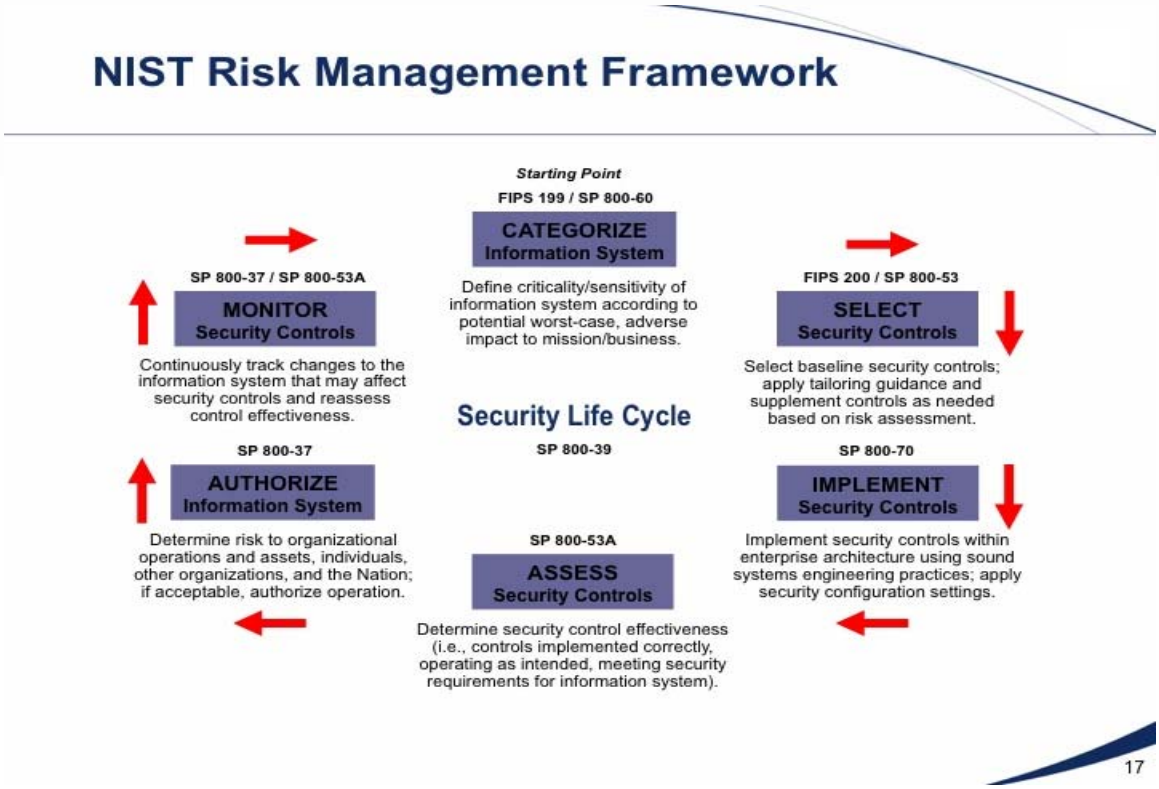
Stuart Katzke presented on the NIST framework and approach, (see, http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html) including the following key points:

- Control mapping was the easy part. Harder part was looking at model and the underlying model for CIPs.
- NIST is a "Plug and play" framework-
- FIPS and 800 documents — are security standards and guidelines.
- Tasked under FISMA to do 3 things:
  - Categorization scheme for info and info systems;
  - Guidelines for categorization;
  - Create minimum standards for categories.
- 3 buckets- low, mod, high based on worst case impacts and decide which bucket.
- Minimums imply more is required. Not a good 1 size fits all solution.

- Put flexibility in standard by fixing the standard and have the guideline allow you to tailor it.
- Look for ways to compensate.
- Minimum control smacks of a compliance/regulatory view. Inclined toward understand and accept risks.
- When system is ready to go- controls will be in place and operating. This goes into authorization to operate (accreditation) decision.
- Certification- assessment of security controls
- Problem- evolved into a paper work exercise — boon for consultants.
- Accreditation/certification woven into the process vs. an end checkpoint.

Team and Participant Comments on the Presentations

- NIST approach includes understanding risks under assessment and the intent of the controls. If the controls cannot be implemented, the users must understand the intent of what the control is trying to accomplish and implement controls which compensate for the intent of the control which will not be implemented.
- NIST approach includes continually assessing level of security. Therefore, following the NIST model correctly will result in being in compliance.
- The framework of NIST occurs within the information system development lifecycle. Today's CIP standards apply to Critical Assets, which may include control centers, generation plants, and substations.
- 800-39 presents a broader view for inter-connected information systems and external entities.
- 800-53 sets standards but doesn't tell how.
- Reviewed all controls. Provide guidance re problems in applying controls to this environment.
- 17 control families; 171 controls (requirements).
- Control enhancement to original control. Low/Mod/High. Based on level of impacts if system is compromised. Additional rigor as you go up to high.
- 800-53 took about 1 year to develop draft.



- NIST Risk Management Framework/Security Lifecycle
  - FIPS 199/800-60 — Categorize information Systems (low, medium, high)
  - Level of rigor is based on the categorization
  - FIPS 200/800-53 — Select Security controls
  - SP 800-70 — Implement Security controls
  - SP 800-53A — Assess Security Controls
  - Security Assessment plan is required & independent assessor is required for moderate and high impact systems
  - SP 800-37 — Authorize Information System
  - SP 800-37/SP 800-53A — Monitor Security State
- NIST does not perform the assessments or audits. NIST gets feedback from the GAO surrounding changes that may be required to NIST standards.
  Merging systems together- depends on circumstances.
- Assess controls when a security event occurs.
- How does system hold up to scrutiny — NIST relatively new.
- Look at control sets following events —
- Would the BES need an organization to manage family of controls, to assess etc.?
- GAO reports on incidents.
- Consider Total cost of ownership — with a life cycle framework approach. Need to think through the care and feeding.

- Assessment based upon what the org decided are its goals in an area. Measurable and $$. Tendency to shoot low. What are they assessed against for standards. How to encourage how to set their goals high.
- Assessment against controls vs. goals? Assess security controls- audit focusing on $$. Adopt lower level of controls.
- Adequately secure vs. meeting controls.

Team and Participant Comments on the NIST Framework

- For control system how are federal agencies categorizing systems- which baselines using? FIPS 199.
- Assignment clause — organization defined list of inappropriate or unusual activities that are to result in alerts? The organization determines within the framework of control.
- "regularly reviews" -organization determines the frequency.
- CIP standards — for not keeping 1 document up to date is a potential violation that is not consequential to security. Evaluating the level of control vs. small pieces = violation.
- NOPR in 706- might provide too much angst.
- Compliance elements- onerous.
- "If it ain't written down, it didn't happen."- This captures the old view.
- If we go down more prescriptive route- have to clarify the costs of putting this in place. Intensive to implement controls.
- Tell me exactly what I have to do. Flexibility factor is providing
- Control and enhancements. Low mod high — lots of variation.
- Changes- didn't change any of the controls in 800-53. Instead provided additional guidance to 645 of 171 controls to address ICS (industrial control systems)
- Control systems- not all in BES context.
- DOD interested in this approach — now they use their own.
- 882 supplemental- security process controls — 800-53 revision 2 is requirement
- Security baselines- low, mod, high.
- 800-53- tailoring baseline security controls to fit needs.
- Industrial control systems security guide
- 800-82- Sept 08 final public draft. Out by end of the year.
- 90% of ICS are industry.
- ISA 99- Bryan Singer. ANSI — Industrial Automation and Control Equipment
- IEC 62443- Tom Phinney.
- Not just compliant – compliance with baseline does not equal security.
- Must define minimums.
- Life cycle management? Not a maturity element. Degrees of rigor come in depending on impact level.
- One large interconnected system- what is the system? Each separate or one?
- What is the info system (accreditation boundary- what you have control over)
- NIST Protecting info systems. CIP speaks to critical cyber assets and non-critical not necessarily systems. Apply all the CIPs.

- Framework- differences- NIST- system level approach requires high degree of system/state awareness of context of components. CIP – make judgment about critical assets and apply approach.
- Accreditation boundary — are we Industrial control systems or not?
- Draw boundary around set of components and consider as a holistic system.
- Evolved to enterprise wide view of activities. (mission, role, impacts on organizations and other depending on organization.
- Information system: accreditation boundary- components within- people, processes and technical- management operational and technical controls.
- "Common controls"-training, physical security) provided to system from external sources.
- NERC standards- cyber security not factored into overall trainers as a common control. Should be doing this going forward. Operators are first line of defense.
- Assignment of responsibility- asset/system owner. Where does responsibility lie that everyone getting access to critical asset is properly trained?
- Flexibility to flavor requirements specific to each environment within organization.
- CIP- accountable executive- responsibility assigned. It is there? Yes but not as prescriptive as NIST standards. Needs to be open enough, not too prescriptive. Split into different number because ANSI. Not being read as one standard.
- ESP boundary in CIPS vs. the NIST boundary and everything within.

2. Comparison of NIST and NERC Cyber Standards

Marshall Abrams presented a comparison of the NIST and NERC CIP Standards. (See, his PowerPoint presentation at: http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html

He noted both the similarities between CIP vs. NIST (e.g. concepts of internal/exterior boundaries, etc.) and the differences between CIP vs. NIST (e.g. NIST uses information system view rather than NERC Critical Asset/CCA view, NIST allows holistic defense in depth approach through system design, etc.) Other points included:

- Under CIP security requirements are applied to all components whether the components are capable of supporting the security requirements or not (i.e., legacy substation devices);
- Under CIP Treating boundary and contents separately (CIP 005 and 007) creates problems;
- Wireless is addressed in NIST but not in CIP.

Mr. Abrams handed out a NIST augmented CIP and NIST Example of Augmentation of CIP 005. See, http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html

Team Discussion of NIST compared with the NERC CIP:

- NIST staff performed the mapping of the CIP vs. the NIST standards to assist Federal entities which had to comply with both NIST and CIP.

- CIP 002-009 standards should be taken as a whole and that many of the concerns which have been raised can be answered in either one of the other CIP standards or in the CIP FAQ.
- The Chair and Vice Chair reminded the Team that they have an obligation to set aside partisan opinions of whether members support NIST or CIP but to do the right thing for enhancement of cyber security standards.
- A mapping of what is? Indicates controls or part of controls added CIP requirements.
- Gap assessment- e.g. Least Privilege- mapped to 007?
- Identification and authentication- not adequately address to CIP.
- Configuration management- adequate records/documentation, who can make change.
- Auditing and accountability- e.g. time stamps missing?
- Risk Assessment- R4 renamed- vulnerability assessment and testing.
- System and Communication protection
- Certification, accreditation.- CIP examining controls, managing as intended.
- Security assessment suggestions: security assessment requirement- Responsible entity
- This is not easy. It is on 007.
- Forced by ANSI process. All 1300 were one standard. Read as one standard 2-9.
- Are ANSI rules being cited correctly?
- Technical feasibility with an exception process.
- Suggest level of review- exception plan. Annual audit compliance.
- Physical security?
- CIP Standards- 002-009 should be read as one. It is stated in each in the purpose statement.
- What value might this add- square peg through round hole?
- Let's not spend our time defending the CIP standards.
- Size and risk aren't correlated in CIP?
- Restrict access- assess risk posture of business partners.
- Not try to defend but point out where it was taken care of in the standard.
- Lots of things we need to fix. Gives options to fix few things.
- Procedures written by each company is where NIST and CIP standards come together.
- E.g. "reference we are meeting NIST standard to meet CIP requirements."
- Look at comparison paper on NIST website- Marshall et al.
- Red guide- restricted distribution. Undergoing future review and modification.
- NIST standard has more specificity in all areas. What has to be done not how to do it.
- Team has an opportunity to do what is right. Re-write, incorporate as much or little of 800 framework. Set aside love of one or other. What do we need to do to achieve the goal. This should not be about pleasing auditor or pleasing FERC, but about improving security of the BES for benefit for North America.

E. REVIEW OF HOW TO STRUCTURE THE SDT PROJECT ROADMAP

1. Initial Overview of "Straw Man" Multi-Phased Approach

Prior to the meeting Scott Mix, Manager of Situation Awareness & Infrastructure Security at NERC, reviewed the FERC Order 706 and created and presented a straw man red-lined version of the CIP standards as an Approach to Phase I issues at the meeting. The facilitator then suggested the Team

use the acceptability ranking tool to both test support and focus discussion on a threshold question of whether to proceed with a single phase or more than one phase. The Team ranked and agreed on the following project roadmap proposition: The SDT should proceed with an approach with two or more phases and products for ballot body consideration. (*See, power point, "Cyber Security Standards: Development Proposal at)*. His key points included:

- Violation Severity Level process is beginning for all requirements
- The only date-certain in FERC Order 706 is for the required change is removal of " using reasonable business judgment" by end of June 2009.
- NERC is developing training for NERC regional compliance auditor staff on CIP
- Meeting frequency for the Team- may have to meet face to face every other week for 2 to 3 days
- Proposing 3 phases with doing the "easier" and "must do" work first:

  1. Low hanging fruit — high priority — Reasonable business judgment needs to be removed
  - Complete & to Commission in 6 months (March of 2009)
  - Mostly non-contentious issues
  - NER staff has a proposal of these items

  2. Moderate/Majority of issues
  - Complete and to the Commission 18 months following #1 (October of 2010)

  3. Large challenging, complex, controversial issues — Take a long time to get through
  - Following #2 above – exact timing depends on how many and how long
  - Extremely large and challenging issues.

- Guidelines need to be addressed. Guidelines are NOT standards and are NOT requirements. Cannot be sanctioned for not following a guideline. This drafting teams needs to determine whether a topic needs to be addressed in the standard or in a guideline. CIPC is ready to write guidelines. The Team needs to identify what needs to be done and whether or not CIPC needs to be the writer. About 25 guideline topics have been identified in the FERC Order 706. What can be started now because the subject requirement is not expected to change?
- Develop modification to standards language
- Develop Violation Risk Factor/Violation Severity Level
- Develop implementation timeline and effective date — Less complicated
- Industry review and comment
- Industry ballot
- BOT Approval
- Submit to FERC prior to spring of 2009 and prior to the beginning of CIP audits.

Scott then reviewed a red-lined straw man draft for the Team's consideration that included:

CIP 002 – CRITICAL CYBER ASSET IDENTIFICATION
Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Newly identified Critical Assets was put into the parking lot.
- Annual approval by Sr. Manager of the Risk Based Assessment in addition to the CA list

CIP 003 – CYBER SECURITY — SECURITY MANAGEMENT CONTROLS

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Slight modification to the specifics requested for the designated senior manager

CIP 004 – CYBER SECURITY — PERSONNEL & TRAINING

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- The individuals shall be trained prior to being granted access rather than within 90 days of access
- Individuals shall be background screened prior to being granted access rather than within 30 days of access

CIP 005 – ELECTRONIC SECURITY PERIMETER(S)

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Minor editorial changes only

CIP 006 – PHYSICAL SECURITY OF CRITICAL CYBER ASSETS

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Several items where the word 'implement' was added to clarify that requirements must be both documented and implemented
- Item concerning the fact that dial up accessible CCA's using dial up only do not require physical security was put onto parking lot

CIP 007- SYSTEMS SECURITY MANAGEMENT

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Removed acceptance of risk from Malicious Software Prevention (R4.1).
- Added implement under R7 Asset disposal or Redeployment.
- Editing to cite revision number
- Document maintenance was changed from review in 90 days to review documents within 30 of changes

CIP 008- INCIDENT RESPONSE & REPORTING

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Added implement when necessary to R1
- Added that testing the Cyber Security Plan does not require taking the component out of service.

CIP 009- RECOVERY PLANS FOR CRITICAL CYBER ASSETS

Proposed language changes include

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.

- Changes must be incorporated into the plan within 30 days of the change

2. Discussion of More than One Phase

The facilitator suggested the Team use the acceptability ranking tool to test support and identify issues on a threshold question of whether to proceed with a single phase or more than one phase.

Team Clarifying Questions:

- Need to see what is "low-hanging" to see if time frame works or not
- Why the spring deadline? See, Letter of Response from NERC President Rick Sergel.
- Do we have to wait for the beginning of a phase to begin addressing the issue identified for that phase? No, can work on some key issues for phase two during the first phase while waiting on balloting for example
- CIP2 — concept of critical asset based assessment (NIST) versus security approach (NERC – CIP)? If tackle that then could look at current standards. The low-hanging could improve some of the current standards. If change course then earlier the better. Address some of the issues and standards before then. An incremental change over what we have now.
- If something is put up for ballot, does that preclude changes that impact it later? Identify and address first phase then address additional issues. Do not want to readdress issues a second time in phase two. Creates confusion and doubt in the industry.
- Concern is with phase two — put off more complex issue to third phase there the danger increases for addressing issues twice
- What happens in first ballot and someone votes no but it is not anything we thought about changing, is irrelevant to modifications in the ballot? There are no provisions against that happening. ANSI offers opportunities to address but upfront. Other bodies have provision saying you cannot object to something not in the proposed revision.
- Clarifying that phase one is low contention and easy and everything else is pushed to future phase(s)
- If it is in phase one does it impact the audits starting next July? Could establish a tiered approach to implementation of items in Phase One to address this.
- Only alternative is one monolithic approach rather than this proposal to break it up.
- Yes, but the "reasonable business" standard would still need to be removed by next July no matter which approach

***Roadmap Strawman Proposition*:**
"The SDT should proceed with an approach with two or more phases and products for ballot body consideration."
(This proposition does not identify what might be in each phase, just that there can be multiple phases. If a multi-phased approach is not adopted, then the approach would be that all standards changes are made within a single phase.)

First Poll on	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable*	*1 — Not acceptab*

More than 1 phase			*if major issues are addressed*	
Avg.=3.4	**11**	**8**	**2**	**0**

Team Comments following the First Ranking

- *2 ranking*-at least two items proposed for first phase concern me — first phase include easy ones but reasonable business standard needs to be deleted and then addressed in the next phase
- *2 ranking*. It is intuitive that low hanging fruit like the reasonable business exceptions language should be separated from this group while this we tackles tougher issues. However dealing with "low hanging fruit" in first phase may signal to the industry that the current standards are generally fine and we may encounter resistance when we come back to address the phase 2 tough standards issues.
- Would it be possible to address the FERC "reasonable business exception" issue and low hanging separately outside this group? Could NERC address the reasonable business standard separately? Alternates to this committee? Not given the approved SAR assigns this to the Team.
- *3 ranking*. Timetable for phase one is a concern — need more time, can we ask for an April, 2009 vs. March, 2009 deadline?
- *3 ranking*. Support a two phase but not four phase effort.
- FERC said "you must remove" and then President Rick Sergel committed getting something done quickly to be responsive to those with oversight.
- Can you just send out an advisory note saying the reasonable business judgment is no longer valid? Not appropriate to make such a statement outside the drafting process – some immediacy emergency alert exceptions to close gaps in a short order and it is not an action order, not super-ceding an existing standard as indicated here
- Another way to deal with? Issue a separate SAR and standard with red-line striping it out for comment

Following the comments and discussions regarding concerns revealed in the first poll, the Team ranked the same proposition with the following result.

Second Poll on More than 1 phase	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptab*
Avg.=3.5	**14**	**5**	**3**	**0**

The Chair suggested that SDT should review and seek to agree on identifying "low hanging fruit" and must do propositions for early comments and ballot testing. The Vice Chair suggested that the question is not how many phases should there be, rather how to separate out those issues which can be quickly resolved from those items which require a longer time for resolution.

3. Draft Criteria for Inclusion of Issues in Phase-1 Product(s)

The Facilitator proposed draft criteria for inclusion of issues in Phase 1 for the Team's consideration and refinement:

- **It represents an "Editorial" item**

- **It is a must-do item per Order 706 to meet the July 1, 2009 time frame**
- **It will not preclude the Team changing standards language in Phase 2**

==========

- ~~Clarification item to design and implementation~~
- ~~Little known industry resistance~~
- ~~Limited complexity~~
- ~~Builds confidence~~
- ~~Correct known or obvious deficiencies~~

Team Comments on Draft Criteria

- "Clarification item"? I may not be able to live with this – too broad. May turn an FAQ into a guideline.
- Drop the "builds confidence" — I would say correct known or obvious deficiencies
- Correct known or obvious deficiencies (**I cannot live with this — too broad**)
- Builds confidence (** How measured? ** — just a reason for doing)
- I would add after third bullet "per 706" — that handles efficiency, drop the rest of the list as political optics — first three enough
- "Clarification" could still be very contentious
- "Building confidence"? do not know which those are?
- Okay with simple edit and per 706 must do removal of reasonable business standard
- The more we put in then the tougher it is to do it quickly
- Editing and must do should be included
- "Clarification" is just change 'design and implementation'? The "that is what we meant last time" items
- Removal of Reasonable Business Judgment, coupled with leaving some other things in that FERC wants addressed, will give the entities some latitude.
- Will FERC reject the phase 1 revisions because not everything else has been addressed? FERC staff will be attending the meetings and reporting back to the Commission on the progress, with a recommendation for approval or not, notwithstanding the fact that there are other changes pending.
- Issue of new CA/CCA does not need to be in the standard. Could possibly be handled via new Implementation plan table.
- Difficulty with the level of this discussion, it feels down in the weeds — expressing what could be in or not in phase one —
- Industry on the whole sees these issues as moving targets. The danger is if we have to go back and readdress an issue it will cause confusion in the industry.

F. PHASE I STRAWMAN REVIEW AND CONSENSUS TESTING- CIP 002-009

The Chair and Vice Chair suggested that the Team review and offer suggestions and concerns with the "strawman" phase 1 proposal that Scott Mix had put together as a "redline" draft of the CIP 002-009 standards in response to FERC Order 706. During the course of Tuesday afternoon's review of the redline draft, changes were made to the redline draft. On Wednesday morning the Team reflected on Tuesday's work and offered the following comments:

- I heard we want to get first piece out and into the process, then take some time with remaining issues — deal with time directive, then take time to look at meat of the problem.
- Is there a risk that we are toothless tiger if there is not enough progress in the first phase — will industry look up and say is that all?
- Extremely short time for change with a time certain — in communication plan must clearly let industry know there is a lot more work to come and just dealing with an immediate issue — do not put a show stopper in that keeps us from getting immediate need done.
- Higher risk to putting too much in than too little — will cause dissension and make us look like we do not know what we are doing.
- Communication plan important — get message out that we will be dealing with tougher issues.
- Two edge sword — hardest part of implementation comes in June — too much in and the industry will ask what are we doing to them — need to address FERC's request
- We say more by saying less in Phase 1.
- Implementation plan for new assets — consider addressing that and it will let industry know we are being responsive
- Go through redlines and test comfort level with what we did yesterday – some can be dealt with as implementation — create a new table 5 for implementation with groups permission and later review and approval.
- Industry may want to make comments on the requirements, measures and implementation plan – if there are controversial issues with the draft, the Team has the option of removing them before balloting.

The revised redline draft from Tuesday was then reviewed by the Team and ranked for acceptability and further refined on Wednesday morning.

OVERALL

Removing Reasonable Business Judgment Language discussion:

- If we remove the references to reasonable business judgment in CIP, what does the drafting team tell the industry they will replace for the phrases that are being removed?
- NERC staff noted there will need to be a communication plan so that the industry understands the changes that are being balloted and why the changes are being made.
- This same type of communication will need to occur at FERC so that FERC does not review the language with the elimination of reasonable business judgment but not approve the new version because it fails to address the bulk of other required changes.

CIP 002 – CRITICAL CYBER ASSET IDENTIFICATION

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Newly identified Critical Assets was put into the parking lot.

- Annual approval by Sr. Manager of the Risk Based Assessment in addition to the CA list

Tuesday Comments on 1st Review of the Redline

- "Reasonable business judgment" – just eliminating the end of the sentence or the whole sentence?
- Confusion if leave in the first part of that sentence — eliminate the whole sentence
- Eliminate whole sentence and avoid confusion
- Have to remove it — but must convince ballot body that it has been replaced by something somewhere
- Need supporting discussion as to why — eliminate because FERC asked us to and continuing to address the issue — acknowledge it is a small step in the right direction but only the first step
- Two main issues: based on finance not reliability — better ways to go dealing with risk management in other places in the document — kept "technical feasibility to retain flexibility but explain why
- Rather than just strike and assume dealt with below — struck for legal interpretation – should we still have the flexibility in managing to give industry flexibility without this statement
- We are meeting deadline and continuing to deal with the issue carefully - assurances we are dealing with it
- Application of exceptions must have a plan to address mitigation of the exception
- Suggest keeping both RRO and RE — later as .12

R3 – Critical Asset Identification Review?

- Don't list all the entities
- Take out the word "submit" – shall review
- Thus bump it off and address later
- Put in periodicity

R4 Newly identified critical asset

- Bump it
- Need to address when in compliance once merger takes affect — asset piece is on line — newly identified or acquired asset
- For nuclear folks they will balk at one year — evolving issue of applicability — understanding or grace period for those late to the game —
- This does not address a brand new asset — can be handled through table 5
- Requires more discussion — move it to later
- Handle through additional to implementation table — not the standard
- Cover acquisition as a separate issue?
- Add "acquired"?
- Important to address the issue — impacts when and how to bid on a system — when do I have to bring it into compliance — base line issue
- Put into early phase — phase one — but not today
- Put into phase two — but early in that phase both R4 and R5

Old R4: okay

CIP- 002 Wednesday Morning Rank, Review and Refinement

Poll on CIP 002	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptab.*
Avg.=3.5	**22**	**0**	**1**	**2**

Team and Participant Comments after the Ranking

- Version updates and excise reasonable business issues (for all sections)
- Senior managers approval the only change
- Measures okay but will make change to table at the bottom
- Risk assessments changing next year — need newly identified assets here or somewhere else — comfortable with this going forward if reassured about the proposed implementation table 5 — if abandon from requirements then need somewhere
- Newly identified assets — new definition in glossary? No, put language at top of table
- Newly constructed assets? Can handle within the table but is a different issue

CIP 002 – CRITICAL CYBER ASSET IDENTIFICATION

CIP-002 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Critical Cyber Asset Identification
A2. Number: CIP-002-~~1~~2
A3. Purpose *(2nd paragraph)*
These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R4. Annual Approval — A senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

CIP 003 – CYBER SECURITY — SECURITY MANAGEMENT CONTROLS

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Slight modification to the specifics requested for the designated senior manager

Tuesday Comments on 1st Review of the Redline

- Same issue of "reasonable"

- Same issue of RRO and RE's

R2.1 senior manager clarification

- Use the word fiduciary responsibility
- Can't sue the federal govt.
- Clarifying response to comments received
- "a manager" is just one, not a set of?
- In some cases it is the senior manager of each business unit within the organization
- Defining a single person for compliance when there is a second person responsible for implementation — and the two are not responsible to each other
- Intent is to establish a clear line of authority to give cyber security a higher level of importance — a person with clear line of authority who can delegate authority
- Delegation language down in R2.4
- Any thought given to how it applies in and organization with nuclear and non-nuclear facilities — depends on whether or not each is held out as a separate legal entity — how is the entity registered?
- "Senior manager accountable for"? Language here is quoted from the FERC order
- no opposition to including
- R2.4 establishes the paper trail for delegation — the form for R2.1 should include requirement to list delegation — "documented in the same manner as R2.2 and R2.3"
- Promulgating more and more documentation that creates little value — phone number changes and you are not in compliance
- Strike business phone and address
- Senior delegation — add a line regarding what a senior manager cannot sign off on? More definition to what can be by saying what can not.
- Must say "or delegate" or it cannot be delegated
- But that implies confusion — must clarify that can only be delegated where specified
- R2.1 – single manager per entity?
- Instead add "single" up in R2 and can strike R2.1? But retain the language from the directive by moving up into R2 itself
- Replace "in adherence with" with "ongoing compliance with"
- Change to make previous changes in compliance with striking R2.1 — scriveners correction

R5.3

- Punt this one for now
- Also need to add definition for "escort"

CIP- 003 Wednesday Morning Rank, Review and Refinement

Poll on CIP 003	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptabl*
Avg.=	**19**	**3**	**1**	**0**

Team and Participant Comments after the first Ranking

R2 changes

- R2.3 - provides audit trail for delegation by senior manager

- In this document might take out quotes to "senior" manager — universal edit
- This is set to deal with typical response of policy — not response to requirements
- Will deal with when take up the whole body
- Auditor can only look at and audit the policy
- Why have measures?
- Instructor training for auditors to audit to the standard, not to the policy unless the standard says to audit to the policy
- Discussion in 706 about where policy says something beyond the standard — an entry in the SAR
- Quotes around "senior" have a purpose? Put in glossary? If not capitalized then glossary does not apply
- Issue beyond standard should be in policy but does not trigger a penalty
- Look at wording single senior manager — separate responsibility between compliance and operation manager — must find single senior manager above both, who can delegate specific responsibility on particular issues
- "2"- Enough question about senior and delegation of responsibility not to put it in the first phase – difficult for large company to comply with it — prefer to pull from phase one box
- One individual signs off on certification to NERC — wrinkle is when nuclear involved and not under the same umbrella — can manage but potentially problematic
- Painting CEO into being the senior manager – but that may not be the best person
- Between a 3 and 2 — are we designing the organization? Cojoining implementation and compliance which are separate in large organizations, percolates this responsibility to the top — take direct and comprehensive language out
- Part of problem is how is the organization registered versus functional model for purposes of the standards — we have three separate entities with fiduciary vice presidents at the head of each — each entity has two separate functional entities — does that mean six filings?
- Anything commensurate with this in other sections? No
- Need to resolve issue with FERC on registered entity — suspend this and clarify then revisit
- Clarify language of legislative intent
- For many entities this will be moot at the end of the calendar year — intent of FERC is whoever is signing is prominent level and influence the positive allocation of resources to improve security of the power system
- FERC focused on "single" to be sure responsibility
- Issue is the authority to correct non-compliance and that enough resources are available to comply — person who certifies needs to be the one who can direct the resources needed to address non-compliance — that is the intent, need someone with authority to correct, not just manage
- Suggest R2 changes be removed but keep change in R2.3 and 2.1 — re-poll issue
- This assignment has to be made now
- But are we making it worse with the language in R2? Compliance has a specific meaning in the industry

- We want the guy responsible for making implementation possible — in longer term revisit the "one single" person responsible
- Minor comment — "responsibility" — we delegate authority but responsibility belongs to senior manager — replace with "authority"
- Diluting the changes despite original vote — are we letting the minority rule and water down proposals? This is not a voting tool but a way to focus discussion. Grateful that points of contention are raised — this is a good thing and is a way of strengthening the language.
- This sets up the auditability of the delegation — without the paper trail, unclear whether lower levels have authority.

2nd Poll on CIP 003 As revised	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptabl*
Avg.=	**22**	**0**	**0**	**1**

Comments following 2nd Rank

- 1 Rank. The problem is that you can assign responsibility but without authority to make changes — need both words in the language
- Works for everyone else
- Check with NERC General Counsel as to the meaning of the two words and the difference between the two? Suggest members check with their counsels
- We do not have accountability assigned in this
- Heads of agencies may not be allowed to delegate accountability if it is in the law – means need to add to R2.

CIP 003 – CYBER SECURITY — SECURITY MANAGEMENT CONTROLS

CIP-003 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Security Management Controls
A2. Number: CIP-003-~~1~~2
A3. Purpose *(2nd paragraph)*
Standard CIP-003 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R2. Leadership — The Responsible Entity shall assign a senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.
R2. 3Where allowed by Standards CIP-002 through CIP-009, the senior manager may delegate authority for specific actions to a named delegate. These delegations must be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

R2.~~3~~ 4. The senior manager or delegate(s), shall authorize and document any exception from the

requirements of the cyber security policy.

CIP 004 – Cyber Security — Personnel & Training

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- The individuals shall be trained prior to being granted access rather than within 90 days of access
- Individuals shall be background screened prior to being granted access rather than within 30 days of access

Tuesday Comments on 1st Review of the Redline

CIP 004

- Same notes for first two

R1

- "and implement"

R2

- Lots of "ensure"s
- "carelessness"?
- some one on windows platform goes on the web for job related search — training needed to ensure they do not make mistakes
- "accidental" "unauthorized" "inadvertent" rather than "carelessness"
- more appropriate for a guidance document
- training cannot ensure but can encourage
- proper use of cyber assets includes not web surfing — already included in standards
- established who the training is for
- what was the comment that the sentence responds to?
- Move to phase two if debatable and not immediate
- Do we need to transplant everything from the FERC order into the standards?
- Depends on the wording offered by FERC — use words whenever possible, paraphrase or rephrase only as needed
- Second half of paragraph is removed and punted to next phase

R2.1.1 Emergencies

- Standard post storm procedure — puts it into the standard
- Tough on a substation but works in a center?
- Might belong in a different section , not training
- Might get questions on what constitutes and emergency
- Everything the temporary person did? That is a bit much for compliance — need alternate language — too much documentation
- Punt to phase two?
- Suggest leave in 2.1.1 and punt 2.1.2
- Change 2.1.2 to "defensive measures remain in effect"
- Move both to next phase?
- Now have no emergency provision
- Put in the parking lot the whole R2.1 section for review in phase two

R2.2

- R2.2.5-7 additional training
- Say "other security issues"
- This is where the escort training came from
- Clarification in 2.2.5 — in conflict with networking hardware?
- "security issues of electronic interconnectivity"? what does it mean?
- Three types of training — manager, real live and general awareness — maybe spell it out that simply
- 2.2.7 is a rehash and should be stricken
- But is a reply to a comment to clarify question
- Covered above
- 2.2.5 needs more work — punt to phase two — punt the whole section

R3

- Can only escort physical access not cyber access
- Okay

R3.4

- Punted under training. Moved here?
- Punt here to phase two along with R3.5 and 3.6
- What does limited escort mean? Strike "limited"

CIP- 004 Wednesday Morning Rank, Review and Refinement

1st Poll on CIP 004	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptabl*
Avg.=3.5	**18**	**2**	**3**	**0**

R1

- Problem and comments about granting access electronically — not the physical escorted access — we will get lots of comments
- 2 ranking- requirement to train prior to granting access — no provision for emergency process or technical exception — will not fly with industry —
- 2 ranking — must tie to R2 above — Prior to granting access?
- R2 applies to the sub parts
- Add below in R2.1 to avoid confusion
- "Prior to" is the question — lack of emergency provision or even ongoing access to trainer before access to facilities could be a problem
- Question of physical versus electronic access — also what about the GE rep who comes in to work on equipment, cannot get him agency specific training or afford to have someone stand over his shoulder full time.
- Still required to train GE representative regardless — question is whether train before or after access; that is the correction here
- Only fix is to treat emergencies as a technical exception
- Did we put language in C3 to address this situation? Put security training in with the safety training
- We have to give access electronically to technicians in Japan
- "granted such access"?

- C3 — R1.1 deals with emergency of the storm and crews coming in to work — not the maintenance from Japan
- Contractors and vendors training? Must be equivalent to what you give employees
- C3 says write policy so that emergency storm situation would not violate the standard
- If contractor is called in for maintenance or warranty, then must be trained before being allowed access
- In an emergency situation cannot put into policy
- That is already dealt with in C3 – deals with emergency
- Good example of separating out substation, control centers, etc.

2nd Poll on CIP 004	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptabl*
Avg.=3.5	**15**	**1**	**6**	**0**

Comments After 2nd Ranking

- Anything we can keep here and defer the controversy?
- The issue is timing of training and PRAs
- Propose a small team to try and redraft. Steve Vandenberg would like to be on the team

CIP 004 – CYBER SECURITY — PERSONNEL & TRAINING

CIP-004 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Cyber Security — Personnel & Training
A2. Number: CIP-004-~~1~~2
A3. Purpose:
Standard CIP-004 requires that personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including contractors and service vendors, have an appropriate level of personnel risk assessment, training, and security awareness. Standard CIP-004 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment~~.
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R1. Awareness — The Responsible Entity shall establish, maintain, and document and implement a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to critical cyber security assets receive on-going reinforcement in sound security practices…
R2. Training — The Responsible Entity shall establish, maintain, and document and implement an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and review the program annually and update as necessary.
R2.1. This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access. ~~within ninety calendar~~

~~days of such authorization.~~
R3. Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access. A personnel risk assessment shall be conducted pursuant to that program prior to ~~within thirty days of~~ such personnel being granted such access.

CIP 005 – ELECTRONIC SECURITY PERIMETER(S)

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Minor editorial changes only

Tuesday Comments on 1st Review of the Redline

R1.5

- Editorial
- The rest are fine
- Address specific call outs in R1.5 as needed

CIP- 005 Wednesday Morning Rank, Review and Refinement

Poll on CIP 005	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptabl*
Avg.=3.5	**22**	**0**	**0**	**0**

CIP 005 revisited

R1.5

- If used only for monitoring or control does it fall under this – put in "and/or" monitoring.
- Same issue under CIP 006

CIP 005 – ELECTRONIC SECURITY PERIMETER(S)

CIP-005 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Electronic Security Perimeter(s)
A2. Number: CIP-005-~~1~~2
A3. Purpose:
Standard CIP-005 requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009.~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment~~.
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements

R1.5. Cyber Assets used in the access control and monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP- 003, Standard CIP-004 Requirement R3, Standard CIP-005 Requirements R2 and R3, Standard CIP-006 Requirements R2 and R3, Standard CIP-007, Requirements R1 and R3 through R9, Standard CIP-008, and Standard CIP-009. *(Staff will correct the citations)*

R2.3. The Responsible Entity shall maintain and implement a procedure for securing dial-up access to the Electronic Security Perimeter(s).

CIP 006 – PHYSICAL SECURITY OF CRITICAL CYBER ASSETS

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Change RRO to RRO and also include RE.
- Several items where the word 'implement' was added to clarify that requirements must be both documented and implemented
- Item concerning the fact that dial up accessible CCA's using dial up only do not require physical security was put onto parking lot

Tuesday Comments on 1st Review of the Redline

R.1

- "The" senior manager not "a" senior manager
- "implementing"
- R1.7 — back it down to thirty days from completion of any physical system
- Same specific call outs as in CIP005
- Interpretation sce&g RFI

CIP- 006 Wednesday Morning Rank, Review and Refinement

Poll on CIP 006	*4 - Acceptable*	*3 – Minor Issues*	*2 – Only Acceptable if major issues are addressed*	*1 – Not acceptable*
Avg.=3.5	**0**	**0**	**0**	**0**

Tabled, hand off to a drafting team

Comments after Ranking

- Request for R4 — physical access include individual leaving facility — for physical access include when individual leaves as written — what is the intent?
- Only time of access not time ended or duration
- This is contentious to industry — pull until later
- "Thirty" calendar days — make it from completion of implementation, to capture the spirit and intent
- 1.4 and 1.6 need "procedures for and implementation of"
- this applies to physical facility plans
- 1.8 — must change to right numbers to match version two for consistency
- 1.7 — bad English — remove "completion of"
- Punt to a scrivener team
- prefer the original language — confuses implementation and procedures

- wordsmith starting with R1 to clean up — hand off to a team
- Interpretation of R1.1 about non-routable protocols?
- Important but recommend deferring until after FERC renders initial judgment
- Agree, but defer
- But not filed with FERC yet — will never go to FERC to act on for procedural reasons. Then handle in phase two

CIP 006 – PHYSICAL SECURITY OF CRITICAL CYBER ASSETS

CIP-006 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Physical Security of Critical Cyber Assets
A2. Number: CIP-006-~~1~~2
A3. Purpose:
Standard CIP-006 is intended to ensure the implementation of a physical security program for the protection of Critical Cyber Assets. Standard CIP-006 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R1. Physical Security Plan — The Responsible Entity shall create ~~and~~ maintain and implement a physical security plan, approved by the ~~a~~ senior manager or delegate(s) that shall address, at a minimum, the following:
R1.2. Processes to identify all access points through each Physical Security Perimeter and implement measures to control entry at those access points.
R1.4. Procedures for and the implementation of the appropriate use of physical access controls as described in Requirement R3 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.
R1.6. Procedures for and implementation of escorted access within the physical security perimeter of personnel not authorized for unescorted access.
R1.7. Process for updating the physical security plan within ~~ninety~~ thirty calendar days of implementation of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the physical security perimeter, physical access controls, monitoring controls, or logging controls.
R1.8. Cyber Assets used in the access control and monitoring of the Physical Security Perimeter(s) shall be afforded the protective measures specified in Standard CIP-003, Standard CIP-004 Requirement R3, Standard CIP-005 Requirements R2 and R3, Standard CIP-006 Requirement Standard CIP-009. *(Staff will correct the citations)*

CIP 007 SYSTEMS SECURITY MANAGEMENT

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Change RRO to RRO and also include RE.
- Removed acceptance of risk from Malicious Software Prevention (R4.1).
- Added implement under R7 Asset disposal or Redeployment.
- Editing to cite revision number
- Document maintenance was changed from review in 90 days to review documents within 30 of changes

Tuesday Comments on 1st Review of the Redline

CIP- 007

R2

- Implement

R4.1

- The use of anti-virus — document the use of and implement anti-virus
- Implement and document the use of
- Need more definition of "technical feasibility" not necessarily remove it
- What does 4.1 add that is not already in R4 — first sentence is redundant
- Return 4.1 to its original language — remove proposed edits
- Strike or an acceptance of risk from the end of the sentence

R5

- Editorial corrections

R7.1

- "sufficiently" is vague – why use it?
- Remove
- Clarify what you mean by unauthorized retrieval of data
- Punt it for now
- Look at NIST and DOD language
- Not changing approved language but parking the data storage requirements

R9

- Ninety to thirty days

CIP- 007 Wednesday Morning Rank, Review and Refinement

Poll on CIP 007	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptabl*
Avg.=3.5	**21**	**1**	**0**	**0**

Team and Participant Comments Following the Ranking

- Clarifications?
- What do we gain by saying establish and implement rather than document – should we be consistent
- R4.1?
- Can not just accept risk

- Explain how technical feasibility exception applies for a virus? Must have mitigating measures.
- If you have a system that can not use anti-virus software such as a substation or that would be adverse impacts if installed – best option is a network filtering anti-virus
- Is it acceptable to say there are not mitigations available if cannot use anti-virus – un-hackability is acceptable but be documented
- Is there such a thing as unhackable software?
- Developing a formal cyber security plan discussion yesterday? C6 requires a physical security plan but nothing requires a cyber security plan

CIP 007 SYSTEMS SECURITY MANAGEMENT

CIP-007 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Systems Security Management
A2. Number: CIP-007-~~1~~2
A3. Purpose:
Standard CIP-007 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the non-critical Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R2. Ports and Services — The Responsible Entity shall establish and document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.
R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003 Requirement R6, shall establish, ~~and~~ document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches…
R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure. ~~or an acceptance of risk~~.
R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005.
R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007 at least annually. Changes resulting from modifications to the systems or controls shall be documented within ~~ninety~~ thirty calendar days of the change being completed.

CIP 008 INCIDENT RESPONSE & REPORTING

Proposed language changes include:

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Added implement when necessary to R1
- Added that testing the Cyber Security Plan does not require taking the component out of service.

Tuesday Comments on 1st Review of the Redline

CIP 008

R1

- Implement when you have an incident — when necessary
- When necessary applies grammatically to the "prepare and maintain" phrase too
- Move "implement when necessary" to the end of the sentence.

R1.4 & 1.5

- Why have requirement after action has occurred — getting approval for what you did after the fact
- You have an approved plan but realize it is not adequate and you take additional steps — now need to document that and ask if you can modify the plan
- The wording is implicit that plan has prescribed reaction to prescribe incident — depends on level of detail in a plan
- Detailed prescriptive plan that anyone after you can follow
- What are we adding here if we review plan every year?
- After action reports to revise plan for those plans that were inadequate for dealing with the plan —
- Tested your plan but cannot anticipate every possibility
- Lessons learned in 686 is different than words used here
- Punt and deal with in phase 2 for both items

R1.6

- Improving plan in response to lessons learned
- Keep "thirty days" — punt the "resulting from implementing the plan"

R1.8

- Change is good

CIP- 008 Wednesday Morning Rank, Review and Refinement

Poll on CIP 008	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptabl*
Avg.=3.5	**20**	**2**	**0**	**0**

C8

- Need to explain R1 to industry
- Better to say implement when an incident occurs – refines the word "necessary"
- In response to a Cyber Security Incident – a defined term in the NERC glossary
- Need to say suspected incident – say "potential" instead
- That creates issues – we have potential incidents all the time and do not invoke the plan – if you don't know – should be a know incident with a measurable impact
- Need to anticipate suspected or potential to invoke and update the plan as needed
- Table this for now – problem with a one level plan – defined a process to address multiple levels of plans – needs more discussion in phase two
- Someone fat fingers their password – is that an incident? Must the plan be invoked?
- Important thing is that the plan has to be implemented in response to an event – type of event does not matter – if never implemented it is because you never had an event
- Adding "potential" confuses things
- Take out "potential" – adds confusion
- Consider changing cyber security incidents by removing "a"
- Needs to be some thought or wordsmithing on a few areas – need to review suggested changes
- Any drafting need to be done before next meeting or take up in two weeks?
- Still unsettled but not sure why
- Like to revisit the whole thing in next phase
- Also concerned as to why this statement is even there

- Probably not harmful to leave in but creating an opportunity for comments that we have to respond to
- Point to industry comment and FERC order to explain why it is being addressed
- Consider second sentence: plan will be implemented in response to an cyber security incident
- Put in "implement the plan in response"
- May need to address cyber security incident definition in the next phase
- No assignment needed to address language prior to next meeting

CIP 008 INCIDENT RESPONSE & REPORTING

CIP-008 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Incident Reporting and Response Planning
A2. Number: CIP-008-~~1~~2
A3. Purpose:
Standard CIP-008 ensures the identification, classification, response, and reporting of Cyber Security Incidents related to Critical Cyber Assets. Standard CIP-008 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment~~
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R1. Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident Response plan shall address, at a minimum…
R1.4. Process for updating the Cyber Security Incident response plan within ~~ninety~~ thirty calendar days of any changes.
R1.6. Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident. Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test.

CIP 009 RECOVERY PLANS FOR CRITICAL CYBER ASSETS

Proposed language changes include

- Language to address 706 concerns to remove 'reasonable business judgment."
- Add RE in addition to RRO.
- Changes must be incorporated into the plan within 30 days of the change

Tuesday Comments on 1st Review of the Redline
CIP- 009
R1.3 & 1.4

- Similar to CIP008 – but language from the order
- Imply the action must be approved by the senior manager?

- If the document was wrong and following it would have cause problems then you need to apply the lesson, revise the plan and get it approved
- Is 1.4 a restatement of 1.3? No, first is a justification and 1.4 is revise the plan
- This does not read right
- Punt this one for redraft

R3

- "Thirty days"

CIP-009 Wednesday Morning Rank, Review, and Refinement

Poll on CIP 009	*4 — Acceptable*	*3 — Minor Issues*	*2 — Only Acceptable if major issues are addressed*	*1 — Not acceptable*
Avg.=4.0	**22**	**0**	**0**	**0**

CIP-009 DRAFT REDLINE LANGUAGE AS OF END OF MEETING, 10-8-08

A1. Title: Cyber Security — Recovery Plans for Critical Cyber Assets
A2. Number: CIP-009-~~1~~2
A3. Purpose:
Standard CIP-009 ensures that recovery plan(s) are put in place for Critical Cyber Assets and that these plans follow established business continuity and disaster recovery techniques and practices. Standard CIP-009 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment~~.
A4. Applicability:
Add: 4.1.12 Regional Entities.
A5. Effective Date: ~~June 1, 2006~~

B. Requirements
R3. Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within ~~ninety~~ thirty calendar days of the change being completed.

G. TEAM BUILDING- GO LEFT- GO RIGHT PREFERENCES

The Team engaged in a brief exercise to highlight the members' individual preferences for problem solving and decision-making. *(See Appendix #7 for the results of the exercise)* Following the exercise the facilitator noted that a sign of a well balanced group includes a diversity of work styles. For example having some who prefer to pay attention to task and others who prefer to pay attention to people issues can be very helpful. These are not either/or preferences but signal for the Team how they individually and collectively come at the issues. Finally they can help group leaders and those assisting in process by, for example, noting a distinct preference for morning and trying not to take on the hardest issues late in the afternoon.

H. REVIEW OF PHASE I MEETING SCHEDULE AND DRAFTING ASSIGNMENTS

1. In Person Meetings and WebEx Schedule

Session Type	Dates	Agenda
Webex/Conf call session	Oct 15	Individual sub team Webex's to review their respective Phase I assignment deliverables in advance of full team review during October 21-22 meeting in Sacramento.
In person meeting at SMUD (Sacramento, Kevin Sherlin)	October 21-22 Full/Full	Review and comment upon sub team straw proposals.
Webex/Conf call session	Oct 29	Finalize the Phase I posting documents and submit to MEL
WebEx/conf call session	Nov 5 - NERC staff feedback	Review and conform drafts per feedback from MEL
In person meeting at Princeton, NJ (confirmed)	Nov 12-14 Half/Full/Half	Phase II
WebEx/conf call session	Nov 18 Webex/Conf call	Phase II
In person meeting at FERC offices or Charlotte	December 4-5 Full/Full	Phase II
In person meeting at APS (Phoenix, Bill Winters) or BPA (Portland WA, Jon Stanford)	January 7-9 Half/Full/Half	Consider Comments to Phase I posting

2. Assignments

	Task	Leader	Sub team	Due Date
1	CIP-004 R2 and R3	Jackie Collett	Chris Peters, John Varnell, Sharon Edwards	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
2	CIP-006 R1	Kevin Perry	Joe Doetzl, Scott Fixmer, Thomas Hofstetter	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
3	Review Measures	Jerry Freese	Keith Stouffer,	Straw Proposal due to

	associated with changes in CIP-002 to CIP-009		Roger Lampila, Todd Thompson	sub team leader on October 14 in advance of sub team WebEx on October 15
4	Implementation Plan – update to address newly identified CA	Scott Mix	Michael Winters, Dave Norton, Kevin Perry	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
5	Implementation Plan update to address revised Requirements from Phase I and Mapping document – matrix that compares current version of standard with revised version with a comment that explains what changed.	Phil Huff	Kevin Sherlin, Scott Rosenberger, Jon Stanford, Scott Mix	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
6	Comment Form – including an extensive write-up of the background, rationale for revisions, explanatory text.	Jeri Domingo-Brewer	Steve Vandenberg, Harry Tom, Sharon Edwards, John Lim	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
7	Review VRFs associated with changes in CIP-002 to CIP-009	Todd Thompson	Roger Lampila	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15

I. AFTER-ACTION REVIEW AND EVALUATION

At the conclusion of the meeting, the Team offered an evaluation of the process including what worked and what could be improved. *(See Appendix # 4 for the Team's review and suggestions.)*

Adjourned at noon on Wednesday October 8, 2008.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix # 1

SDT Cyber Security Order 706 1st Meeting Agenda

October 6, 2008 — 1 PM to 5 PM EST
October 7, 2008 — 8 AM to 5 PM EST
October 8, 2008 — 8 AM to 12 Noon EST

National Institute of Standards & Technology
100 Bureau Drive
Gaithersburg, MD

WebEx Password: standards	Conf Call dial-in number (732) 694-2061
WebEx Meeting numbers: Monday 711 925 616 Tuesday 713 677 232 Wednesday 712 239 082	Conference Codes: Monday 12081006082 Tuesday 12081007081 Wednesday 12081008082

Monday October 6, 2008

1. Opening remarks — Michael Assante, CSO, NERC
2. Review NERC Antitrust Compliance Guidelines — Harry Tom
3. Welcome and Introductions — Jeri Domingo-Brewer/Kevin Perry
4. Overview of NERC Standards Development Process — Gerry Adamski/Dave Taylor
5. Review of CSO706 SAR — Dave Norton

Tuesday October 7, 2008

6. Overview of NIST Risk Management Framework — Keith Stouffer
7. Comparison of NIST and NERC Cyber Standards — Keith Stouffer
8. Project Roadmap – Jeri Domingo-Brewer with facilitation assistance

Wednesday October 8, 2008

9. Project Roadmap Wrap-up (facilitated)
10. Next Steps
11. Plan future meetings schedule

Appendix # 2

Cyber Security for Order 706 Standard Drafting Team and Attendees List
Project 2008-06 — CSO 706 SDT

D. Jack Bernhardsen	President/Manager Pacific Northwest Security Coordinator, Inc.
Jeri Domingo Brewer, Chair	U.S. Bureau of Reclamation
Jackie Collett	Manitoba Hydro
Jay S. Cribb	Information Security Analyst, Principal, Southern Company Services, Inc.
Joe Doetzl	Manager, Information Security. Kansas City Power & Light Co
Sharon Edwards	Project Manager, Duke Energy
Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corporation
Gerald S. Freese	Director, Enterprise Information Security American Electric Power
Tom Hofstetter	Midwest ISO, Inc.
Philip Huff	Arkansas Electric Cooperative Corporation
John Lim,	CISSP, Department Manager, Consolidated Edison Co. of New York
David L. Norton	Policy Consultant - CIP Entergy Corporation
Kevin B. Perry, Vice Chair	Director, IT-Infrastructure, Southwest Power Pool
Christopher A. Peters	ICF International
David S. Revill	Georgia Transmission Corporation
Scott Rosenberger	Luminant Energy
Kevin Sherlin	Sacramento Municipal Utility District
Bryan Singer	Wurldtech Security Technologies
Jon Stanford	Bonneville Power Administration
Keith Stouffer	National Institute of Standards & Technology
Steve Vandenberg	BC Hydro Power Supply
John D. Varnell	Technology Director, Tenaska Power Services Co.
Michael Winters	Arizona Public Service Co.
William Winters	Hydro One Networks, Inc.
Roger Lampila	*NERC Regional Compliance Program Coordinator*
Scott Mix	*NERC Manager of Situation Awareness and Infrastructure Security,*
Todd Thompson	*NERC Regional Compliance Program Coordinator*
Harry Tom	*NERC Standards Development Coordinator*
Bob Jones, Stuart Langton, Hal Beardall	*Facilitators, FSU/ FCRC Consensus Solutions Center*

List of Attendees — Cyber Security Order 706

Standard Drafting Team Meeting
National Institute of Standards & Technology — Gaithersburg, MD
October 6–8, 2008

Attending in Person- Team Members

1. D. Jack Bernhardsen	President/Manager Pacific Northwest Security Coordinator, Inc.
2. Jeri Domingo Brewer, Chair	U.S. Bureau of Reclamation
3. Jackie Collett	Manitoba Hydro
4. Jay S. Cribb	Information Security Analyst, Principal, Southern Company Services, Inc.
5. Joe Doetzl	Manager, Information Security. Kansas City Power & Light Co
6. Sharon Edwards	Project Manager, Duke Energy
7. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corporation
8. Gerald S. Freese	Director, Enterprise Information Security American Electric Power
9. Tom Hofstetter	Midwest ISO, Inc.
10. Philip Huff	Arkansas Electric Cooperative Corporation
11. John Lim,	CISSP, Department Manager, Consolidated Edison Co. of New York
12. David L. Norton	Policy Consultant - CIPEntergy Corporation
13. Kevin B. Perry, Vice Chair	Director, IT-Infrastructure, Southwest Power Pool
14. Christopher A. Peters	ICF International
15. David S. Revill	Georgia Transmission Corporation
16. Scott Rosenberger	Luminant Energy
17. Kevin Sherlin	Sacramento Municipal Utility District
18. Jon Stanford	Bonneville Power Administration
19. Keith Stouffer	National Institute of Standards & Technology
20. John D. Varnell	Technology Director, Tenaska Power Services Co.
21. Michael Winters	Arizona Public Service Co.
22. William Winters	Hydro One Networks, Inc.
1. David Taylor	*NERC*
2. Harry Tom	*NERC*
3. Michael Assante	*NERC*
4. Roger Lampila	*NERC*
5. Scott R Mix	*NERC*
6. Todd Thompson	*NERC*
7. Gerry Adamski	*NERC*
8. Robert Jones	*FSU/FCRC Consensus Solutions Center*
9. Stuart Langton	*FSU/FCRC Consensus Solutions Center*
10. Hal Beardall	*FSU/FCRC Consensus Solutions Center*

SDT Team Member Attending via Webex *(in order of roll call, October 6)*

1. Steve Vandenberg	BC Hydro

SDT Members Unable to Attend or Participate by Webex

1. Bryan L. Singer*	Kenexis

Attending in Person- Participants

	NAME	COMPANY
1	Marshall Abrams	MITRE
2	Markus Braendle	ABB
3	James Brenton	ERCOT

4	Jerome Farquharson	Burns & McDonnell Engineering
5	Roger Fradenburgh	Network & Security Technologies
6	Stu Katzke	NIST
7	John Joseph McGlynn IV	PJM
8	Steve McElwee	PJM Interconnection
9	Dan Mishra	Midwest ISO
10	Peter Nelson	Network & Security Technologies
11	Mike Peters	FERC *(October 6 & 7 in person, October 8 by phone)*
12	Mark Simon	Encari
13	Michael Toecker	Burns & McDonnell Engineering

Attending via Webex- Participants *(in order of roll call, October 6)*

2	Mike Mertz	Southern California Edison
4	Alex Tatistcheff	Idaho Power
5	Regis Binder	FERC
6	Mike Fischette	Lansing Board of Water and Light
7	Phil Sobol	Corporate Risk Solutions, Inc
8	David Dunn	IESO
9	Dan Thanos	GE
10	Vicki O'Leary	NGRID
11	Boyd Nation	Southern Company
12	Dave Batz	Alliant Energy
13	John Friday	Reliant Energy
14	Rodney O'Brian	Southern Company
15	Steve Brezina	WAPA
16	Matt Schnell	Nebraska Public Power District
17	Karen Yoder	First Energy
18	Mike Puscas	United Illuminating
19	Doug Johnson	Commonwealth Edison
20	Chip Lees	
21	Ameren — Hoang Ngo	Reliant
22	James Bassett	IPC

Appendix # 3
NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participants' marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and

subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 4
After Action Review and Team Process Evaluation

What did you think was most effective about the meeting?

- This is a high performance group with experience and openness to listen and work together through disagreements — everyone participated
- Meeting preparation — Scott 's Phase 1"strawman" was something we could discuss and that was key. Information Harry sent in advance was very helpful
- Members and participants offered constructive solutions that we could rally around
- Helped to have someone else to push us through (i.e. facilitate) allowing the chair and vice chair to more fully participate without having to worry or focus on process
- First time with an outside facilitator for some members- very much helped
- Having senior NERC staff on hand (Gerry, David, Harry, Scott) saved lots of time and helped Team understand how this works.
- Sharon's note taking was well done, very helpful and will help the facilitators produce an accurate summary and record of the sessions
- Thank NIST for all their hard work — their review will benefit us as we move forward into Phase 2.
- Harry responding to everyone's requests was very helpful
- Thank you to the facilitators — positive experience to share with other drafting teams
- Thanks to Keith for hosting and all of his work behind the scenes to pulling this meeting off

Suggestions for next meeting – Should we do anything differently?

- Larger room would have helped
- Need more microphones for those on the phone to hear what those in the room are saying — need to assure quality of system too. This is an important investment in those participating beyond the team members.
- Internet access during the meeting to pull up documents as needed — and power strips for computers.
- Computer running projection should be separate from the WebEx computer — one running WebEx and a second to access research m whatever is running the projector should be separate from meeting host — allows you to use raise hand tool on WebEx

Other suggestions:

- Table purpose statement and any other organizational issues (consensus procedures, roles, etc.) until next full meeting

- Team meeting presentation materials will be posted on the NERC Team webpage. They will be referenced in the meeting summary as appendices and links. They will be clearly labeled as presentation and informational briefing materials for the Team's consideration, not Team products. This will also be made clear in the meeting summary.

Appendix # 6 SDT Draft Consensus Guidelines

DRAFT CONSENSUS GUIDELINES

CONSENSUS DEFINED

Consensus is a **process**, **an attitude and an outcome**. Consensus processes can produce better quality more informed products.

A. Consensus is a problem solving process in which all members:

1. Jointly distinguish their concerns
2. Educate each other
3. Jointly develop alternatives and then
4. Adopt recommendations everyone can embrace or at least live with.

In a consensus process, members can honestly say:

- I believe that other members understand my point of view
- I believe I understand other members' points of view
- Whether or not I prefer this decision, I support it because it was arrived at openly and fairly and because it is the best solution for us at this time

B. Consensus as an attitude provides that each member commits to work toward agreements that meet their own and other member needs and that all can support the outcome.

C. Consensus as an outcome means that agreement is reached by all members or by a significant majority of members. The level of enthusiasm for the agreement may not be the same among all members on any issue, but on balance all should be able to live with the overall package. **Levels of consensus** can include:

- Participants strongly support the solution
- Participants can "live with" the solution
- Some participants do not support the solution but agree not to veto it.

DRAFT CONSENSUS GUIDELINES

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards including assessment of the reliability and market interface impacts.

General consensus is a participatory process whereby, on matters of substance, the members strive for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for the final package of recommended revisions, and the Team finds that 100% acceptance or support is not achievable, final consensus recommendations will require at least 75% favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing consensus throughout the process on substantive issues with the participation of all members. In instances where the Team finds that even 80% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team.

The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Team members, NERC staff and facilitators will be the only participants seated at the table. Only Team members may participate in discussions and vote on proposals and recommendations. The Chair and Vice Chair may request specific clarification from observers in order to assist the Team in understanding an issue. Observers/members of the public are welcome to speak during a public comment period that will be provided at each meeting, and all written comments submitted on the comment forms will be included in the Team and facilitators' summary reports.

To enhance the possibility of constructive discussions as members educate themselves on the issues and engage in consensus-building, members agree to refrain from public statements that may prejudge the outcome of the Team's consensus process. In discussing the Team process with the media, members agree to be careful to present only their own views and not the views or statements of other participants and/or may direct such inquiries to the Team Chair and Vice Chair. In addition, in order to provide balance to the Team process, members agree to represent and consult with their stakeholder interest group.

MEETING GUIDELINES FOR PARTICIPANTS

Participants' role in meetings:

- Explore possibilities
- Listen to understand (Respect) (limit sidebar conversations)
- Be focused and concise. (Avoid repetition. No need to offer comments in "strong agreement.")

- Focus on issues, not personalities.
- Offer options to address others' concerns.
- No sidebars.

Facilitators/Staff role in meetings:

- Assist the Chair and Vice Chair in helping the Team stay on task
- Help the group follow agreed upon ground rules
- Design the meeting and problem solving process in consultation with the Chair and Vice Chair
- Facilitate discussion participation of the Team and other participants
- Prepare agenda packets and reports

CONSENSUS BUILDING TECHNIQUES

- **Brainstorming.** (green light thinking — not judgmental) At certain points, the facilitator may ask the group to suspend judgment and get ideas onto the table before debating.

- **Name Stacking in Team Discussions.** This helps the facilitator determine the speaking order. Team and participants will raise name tent to speak. Facilitator(s) will call on participants in turn. The Facilitator(s) may interrupt the stack (change the speaking order) in order to promote discussion on a specific issue or, to balance participation and allow those who have not spoken on a issue an opportunity to do so before others on the list who have already spoken on the issue.

- **"Parking Lot" —** a list of issues that are raised but set aside to be addressed at a later time in the meeting or subsequent meeting.

- **Acceptability Consensus Ranking Scale**
  - Use a consensus acceptability scale to help focus discussion and test support in reviewing substantive issues.
  - Use to guide and focus discussion, not used as a voting mechanism. Rather it is a poll to see where folks are.
  - Must be prepared to offer refinements and suggestions to address serious concerns.

  4 = Proposal is acceptable as it is
  3 = Proposal is acceptable; I can live with it but there are minor concerns to address
  2 = Proposal is not acceptable. Proposal may be acceptable if the major concerns are addressed
  1 = Proposal is not acceptable

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Agenda – Project 2008-06
Cyber Security Order 706 Standard Drafting Team

October 6, 2008 | 1–5 p.m. EST
October 7, 2008 | 8 a.m.–5 p.m. EST
October 8, 2008 | 8 a.m.–noon EST
National Institute of Standards & Technology
100 Bureau Drive
Gaithersburg, MD
Note: The conference call and WebEx information is provided in the table on page two.

Monday, October 6, 2008

1. **Opening Remarks — Michael Assante, CSO, NERC**
2. **Review NERC Antitrust Compliance Guidelines — Harry Tom**
3. **Welcome and Introductions — Jeri Domingo-Brewer and Kevin Perry**
4. **Overview of NERC Standards Development Process — Gerry Adamski and Dave Taylor**
5. **Review of CSO706 SAR — Dave Norton**

Tuesday, October 7, 2008

6. **Overview of NIST Risk Management Framework — Keith Stouffer**
7. **Comparison of NIST and NERC Cyber Standards — Keith Stouffer**
8. **Project Roadmap — Jeri Domingo-Brewer**

Wednesday, October 8, 2008

9. **Project Roadmap Wrap-up**
10. **Next Steps**
11. **Plan future meetings schedule**

Roles

- NERC Staff
  - Harry Tom
  - Scott Mix
  - Maureen Long
  - Others
- Chair (Jeri Domingo-Brewer)
- Vice-chair (Kevin Perry)
- Florida State University Conflict Resolution Consortium

Expectations of Standards Drafting Team

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- Produce a technically sound, complete standard that meets stakeholder and regulatory authorities approval
- Produce a realistic implementation plan
- Preserve ‘open’ process

Drafting a Standard

- **Applicability** — functional entities required to comply and any facility limits
- **Requirements** — who must do what under what conditions for what outcome
- **Measures** — what will be reviewed to determine if entity is compliant
- **Violation Risk Factors** — impact to reliability of violating the requirement
- **Violation Severity Levels** — how badly an entity ‘missed’ being fully compliant with a requirement

Applicability

SDT must decide — do requirements apply to:

- All Transmission Owners?
- All Generator Owners?
- All Distribution Providers?
- Others?

Requirements

Tells — **Who** shall do **what** under what **conditions** for what **outcome**

R1. Within 10 calendar days of a notice from NERC that a BES Disturbance is under investigation, the TO shall submit the disturbance data recorded by its DMEs to NERC for disturbance analysis.

Requirements

- Written in ‘active voice’ (‘shall be’ is passive)
- Identify the responsible entity or entities
- Include a ‘shall’ statement
- Identify the ‘conditions’ under which the performance is required
- Identify the required performance or outcome
- Avoid:
  - ‘Negatives’
  - Ambiguous or subjective terms
  - ‘How’
- Must be measurable

Avoid Use of Ambiguous Words

- Adequate
- Data
- Immediately
- Timely
- Detailed
- Sufficient
- Comprehensive
- As appropriate
- Coordinate

Measures

- Each Requirement must have at least one measure to identify what will use to assess compliance
- Avoid requiring specific types of evidence unless that is the **only** way to demonstrate compliance

Violation Risk Factors (VRFs)

- Each Requirement must have an associated VRF
  - Sub-requirements **do not need individual VRFs**
- VRFs identify the reliability-related impact to the BES of violating a requirement
- VRFs are used to determine sanctions

Violation Severity Levels (VSLs)

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- Violation Severity Levels (VSLs) tell how badly the entity ‘missed’ being fully compliant with a requirement or sub-requirement
- VSLs do not identify importance of a violation
- VSLs do not identify reliability-related impact of a violation
- Each requirement needs a set of violation severity levels

Ready to Post?

- Did the drafting team address all issues identified in Issues Database?
- Does the standard meet NERC's benchmarks for reliability standards?

Implementation Plan

- Tells stakeholders how and when the standard will be implemented and identifies:
  - Any prerequisites for implementation — such as another standard that needs to be implemented first
  - Any already approved standards that should be modified as a result of the proposed standards
  - Functions that must comply
  - When entities must be compliant
  - Reasons for any recommended delay in implementation such as time to develop procedures, time to provide training, or to modify software

Comment Forms

- Ask very pointed questions
- Ask only questions that will result in responses that you will use
- If you've made changes, ask for feedback
- If you've defined terms, ask for feedback on the terms
- Ask for feedback on implementation plan
- Ask if field testing is needed

Responding to Comments

- Read through comments to get a ‘sense’ of stakeholders’ reactions
- Consider & respond to every comment
  - Responses must be respectful
  - Responses should provide a justification
- Develop a ‘summary response’ to each question
- Make conforming changes to the standard
- Can’t expand scope of SAR but can develop a standard that is smaller than the scope of the SAR

Questions?

NERC

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Standards: Development Proposal

Scott Mix, CISSP

Manager of Situation Awareness and Infrastructure Security

SDT Kickoff Meeting

NIST Headquarters

October 6, 2008

to ensure the reliability of the bulk power system

VSL Development

- VSLs now required for each requirement of a standard (currently also for sub-requirements)
- Project Team to complete VSLs for approved (existing) standards has formed
- Announcement at September 22-23, 2008 Standards Committee meeting
- Note: VSL (and VRF) development for revised standards will be developed by SDT as part of the normal standard development process (this process)

CIP Auditor Training

- NERC is developing training for NERC and Regional compliance auditor staff
  - Restricted to NERC and Regional Compliance Audit staff
- Multiple training sessions have been scheduled for the remainder of this year, and early next year

Future Plans

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- All very tentative pending discussions with SDT
  - Meet Face-to-Face every other week ~2 – 3 days
  - Teleconference / WebEx capability at meetings
  - Proposing 3 (3+) phases
    1. “Low Hanging Fruit”, high priority items
    2. Majority of issues
    3. Large, challenging issues

       3+ Extremely large and challenging issues
- Guidelines will need to be addressed

Development Schedule

- Three development phases
  1. Low Hanging Fruit and High Priority Items
     - "Easy" and "Need-to-do" issues
     - Complete to Commission in 6 months (March, 2009)
  2. Majority of Issues
     - Not hard, but lots of them
     - Complete and to Commission 18 months following #1 (October 2010)
  3. Challenging Issues
     - Expect difficulty in reaching consensus
     - Following #2 (exact time depends on how many and how hard)

Guidelines

- FERC Order 706 provides for the development of reference documents (guidelines) to assist with compliance
  - Guidelines are not Standards nor Requirements
  - Compliance with a guideline is optional
- About 25 guideline topics have been identified in the order
- The SDT will need to determine whether a topic should be addressed through a guideline, modifications to the requirements of a standard, or both
  - Choice must be made on a topic by topic basis
  - Guideline development will be controlled by the SDT's decision on these options

Process

- Develop modifications to Standards Language
  - Requirements, Measures, etc
- Develop VRF / VSL for requirements
  - Effort for existing standards as a starting point
- Develop implementation timeline and effective date
  - Less complicated than existing implementation plan
  - Tie to FERC approval date?
  - Tie to existing implementation plan timeline?
- Industry review and comment
- Industry Ballot
- BoT Approval
- Submit to Commission

Low-Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- Mostly non-contentious issues
- Initial edits “easy”
  - But final language may not be
- NERC Staff proposal for consideration by the SDT
- Other areas may be added so long as they do not adversely effect the schedule

Phase 1 schedule

- Working backwards:
  - Submit to Commission (end of) March 2009
  - BoT approval March 23
  - BoT notice Feb 20 (30 days)
  - Second Ballot Feb 5 (includes responses to comments)
  - First Ballot Jan 15
  - Ballot posting Dec 15 (30 days) (includes responses to comments)
  - Draft to industry for comments on October 30 (45 days)
- May be able to cut back on some posting timeframes (but not all)

Need-to-do issues

- Reasonable Business Judgment
  - NERC Staff edit to remove sentence in all standards
- Critical Asset Identification
  - Needs work
  - See Critical Asset Identification Guideline for ideas
- Risk Acceptance / Technical Feasibility
  - Needs Work
  - NIST Framework for ideas
  - NERC Filings to FERC for ideas

Low Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- Proposed edits done by NERC Staff
  - Minor formatting (version numbers, etc)
  - Removal of “Reasonable Business Judgment” language from all standards
  - Change “Regional Reliability Organization” to “Regional Entity”
    - Question: do we need to keep both?
  - No work preformed on Measures or Compliance sections

Low Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- CIP-002
  - Newly identified Critical Assets
  - Newly identified Critical Cyber Assets
  - Senior Manager approval of Risk-based Asset Identification Methodology
  - Reliability Coordinator approval of lists

Low Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- CIP-003
  - Clarification of who the Senior manager is
  - Senior Manager Delegation process
  - Escorting clarification

Low Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- CIP-004
  - “Implement” awareness and training programs
  - Clarification for training program
  - Train prior to access
  - Additional mandatory elements of training program
  - PRA prior to access
  - PRA clarifications for new hires and emergencies

Low Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- CIP-005
  - Implement secure dial-up procedure
  - Update documentation in 30 days (from 90)

Low Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- CIP-006
  - Implement Physical Security plan and physical security procedures
  - Update procedures in 30 days (from 90)

Low Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- CIP-007
  - Implement procedures
  - Update documentation in 30 days (from 90)

Low Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- CIP-008
  - Implement procedures
  - Update procedures in 30 days (from 90)
  - Procedures for when documented procedures are not followed
  - Update of response plans for new situations
  - Clarification on testing – not required to remove equipment from service to test

Low Hanging Fruit

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- CIP-009
  - Update procedures in 30 days (from 90)
  - Procedures for when documented procedures are not followed
  - Update of response plans for new situations

Need-do-do Issues

- Edits *not* performed by NERC staff:
  - Critical Cyber Asset identification updates (CIP-002)
  - Technical Feasibility and Risk Management (CIP-003)
- Work teams and schedules need to be developed at this meeting

Majority of Issues

- Lots of issues
  - List available
  - Everything that is neither a “Low Hanging Fruit” issues nor a “challenging” issue
- May include sub-phases
- Items may move into phase 3 if consensus cannot be reached in allocated timeframe
- Can start tackling some now if resources available

Challenging Issues

- May have 2 sub-phases
  - Will be based on SDT resource and industry comment
- Will include issues that we can't come to consensus with in phase 2
- Will take time to reach consensus in SDT
  - Will take longer to reach industry consensus
- Can start at any time (pending resources)
  - Should not hold up our ability to submit at the 18-month development milestone for phase 2

Challenging Issues

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- Proposed list of Phase 3 issues:
  - Design Basis Threat (258) **
  - Misuse of control centers (282)
  - Non-routable protocols (285)
  - “immediate” revocation of access privileges (460, 461)
  - Two or more defensive measures in a defense in depth posture when constructing an electronic security perimeter (496, etc)

** -- may be a Phase “3+”

Challenging Issues

- Exception process and demonstration of untolerable delays for defense in depth electronic security perimeter (498)
- Fail-safe defensive measures (500)
- Specific verification technologies, authentication technology in general (511)
- Use of encryption (511)
- Log review processes, response to log review alerts, log sampling (525 - 528)

Challenging Issues

- Vulnerability Assessments (541, 543, 544, 547)
- “Full live vulnerability Assessments” (542) **
- “Two or more different security procedures when establishing a physical security perimeter” (572 - 575)
- Test environment requirements (609 - 611)
- Safeguards against introduction of malware (621, 622)
- Log review procedures (628, 629)

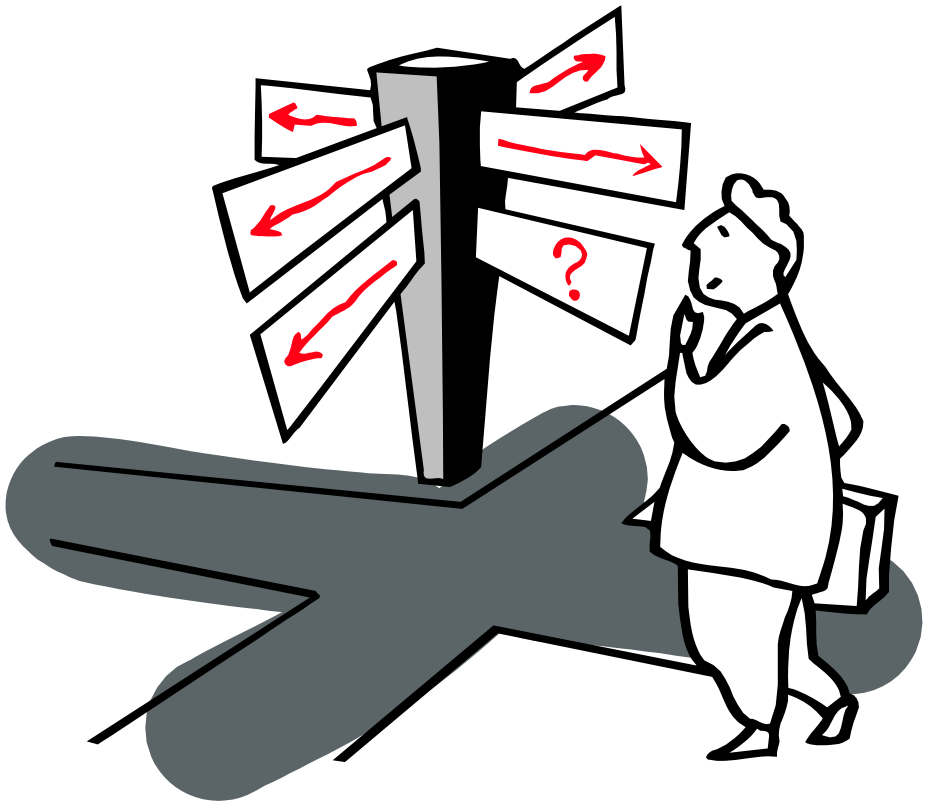
** -- may be a Phase “3+”

Challenging Issues

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- Vulnerability Assessments (643)
- Incident reporting (661)
- Mandatory government reporting (673, 675)
- Report time requirements (674, 676)
- Relationship between CIP-001 and CIP-008 (677)
- Forensic data practices (706 – 710)
- Recovery exercises (725)
- Backup, storage, testing of media (739 – 740, 748)

Questions



Scott Mix, CISSP
Manager of Situation Awareness
and Infrastructure Security
Scott.Mix@NERC.net
215-853-8204

NIST Objectives

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- Describe the NIST Risk Management Framework and related NIST standards and guidelines (hereafter referred to as the "RMF model")
- Present our understanding of the NERC CIP model
- Compare the RMF model with the NERC CIP model
- Explore harmonizing the NERC CIPs with NIST SP 800-53, Rev 2 Moderate Baseline
- Suggest modifications to the NERC CIPs
- Assist NERC in adopting the modifications, if requested

Setting the Stage

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- Attempting to do a fair analysis and comparison of the two approaches
- Acknowledge we may not have full understanding of the NERC approach/model — encourage discussion on this topic as we more forward
- Want to provide NERC drafting committee with a better understanding of the NIST approach/model
- Share insights learned performing analysis/comparison of the two approaches
- Committee decides on direction of the modified CIPs
- NIST is ready to help if the committee wishes to incorporate any of the NIST approach into the CIPs

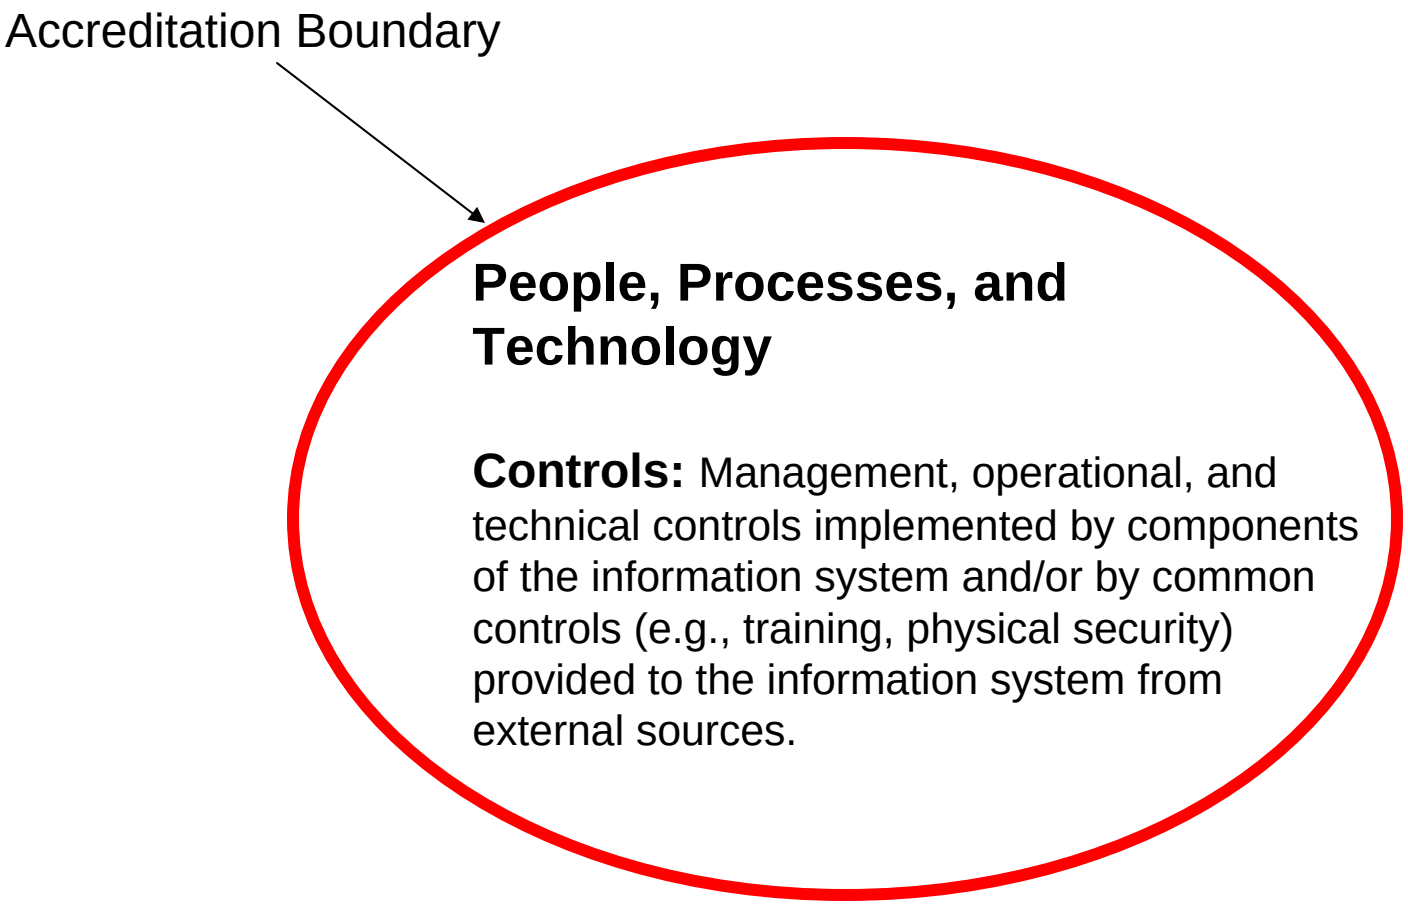
NIST Risk Management Framework

Terms from the NIST Glossary:

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

- **Information System:** [44 U.S.C., Sec. 3502][OMB Circular A-130, Appendix III] A discrete set of information resources organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information. [Note: Information systems consist of people, processes, and technology.]
- **Accreditation (authorization to operate):** [FIPS 200, NIST SP 800-37] The official management decision given by a senior agency official to authorize operation of an information system and to explicitly accept the risk to agency operations (including mission, functions, image, or reputation), agency assets, or individuals, based on the implementation of an agreed-upon set of security controls.
- **Certification (assessment of security controls):** [FIPS 200, NIST SP 800-37] A comprehensive assessment of the management, operational, and technical security controls in an information system, made in support of security accreditation, to determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements for the system.
- **Accreditation Boundary:** [NIST SP 800-37] All components of an information system to be accredited by an authorizing official and excludes separately accredited systems, to which the information system is connected. Synonymous with the term security perimeter defined in CNSS Instruction 4009 and DCID 6/3.

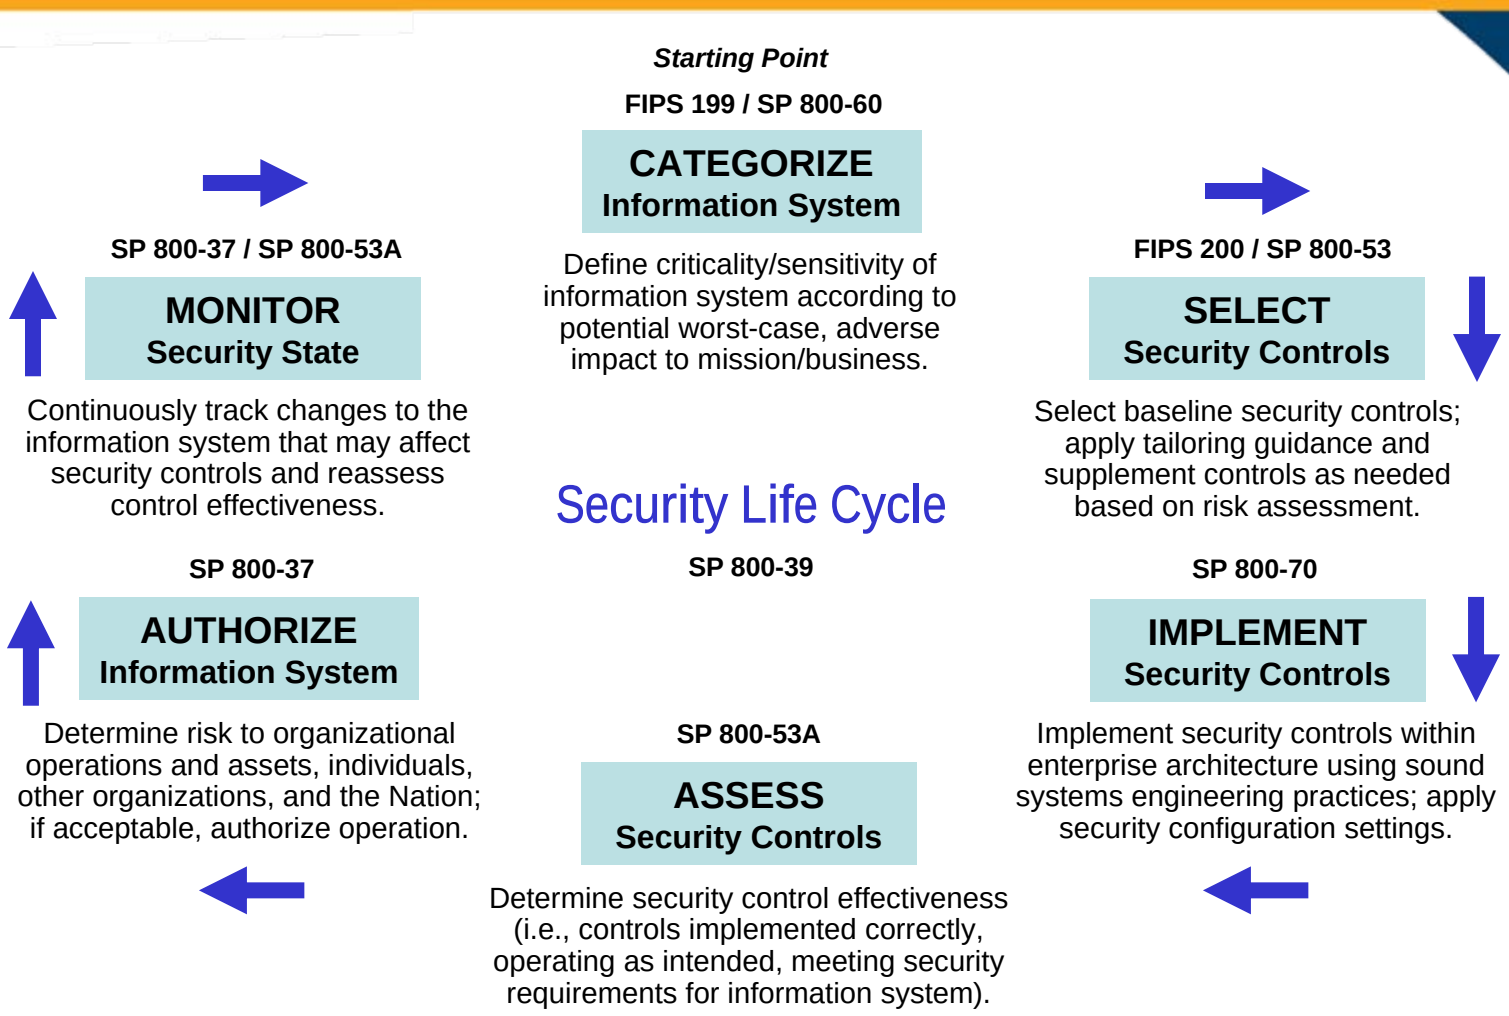
Information System



NIST Risk Management Framework

- The information/control system under consideration is defined by the accreditation boundary.
- All information system components are within the logical boundary (i.e., there are no information system components on the boundary, unlike the ESP boundary defined in the CIPs).
- Selected security controls from SP 800-53 (i.e., requirements) are satisfied by the information system components and/or by common controls.
- Common controls (e.g., training, physical security) are provided to the information system from external sources.
- Security controls are implemented within the components of the information system as determined (i.e., allocated) by the system design and engineering
- Security controls are not expected to be implemented in every component of the information system, unlike the CIPs.

Risk Management Framework



Important Concepts within the RMF

- Information system focus, including accreditation boundary concept (all components of the information system are within the accreditation boundary)
- Risk management framework defines overall risk management process to be followed for an information system
- Categorization of potential impact required (Low, Moderate, High)
- Level of rigor is based on categorization
- Information system control selection includes baseline, tailoring, and supplementation based on risk assessment
- Security Plan required for each information system
- Security controls are implemented:
  - Within the components of the information system as determined (i.e., allocated) by the system design and engineering
  - By common controls (e.g., training, physical security) provided to the information system from external sources.

Important Concepts within the RMF

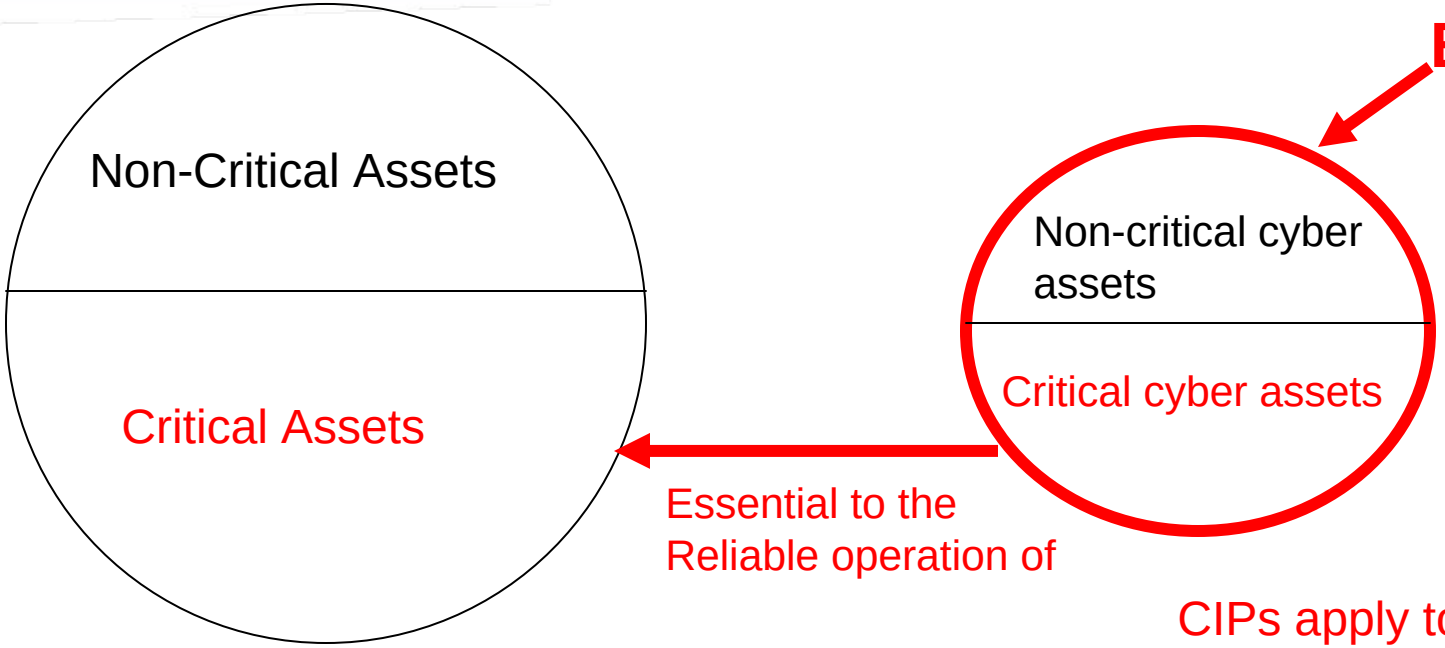
- Security assessment plan is required
  - Control-specific assessment procedures are defined
  - Assessment of controls by independent assessor
- Organization official authorizes system operation based on acceptance of residual risk
- Continuous monitoring of the status of security controls and system configuration changes
- Addresses trust model and trust relationships with business partners and external service providers

NERC and CIP Model

Terms from the NERC Glossary:

- **Assets:** Facilities, systems, and equipment
- **Critical Assets:** Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.
- **Cyber Assets:** Programmable electronic devices and communication networks including hardware, software, and data.
- **Critical Cyber Assets:** Cyber Assets essential to the reliable operation of Critical Assets.

CIP Model



Assets: Facilities, systems, and equipment

Critical Assets: Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.

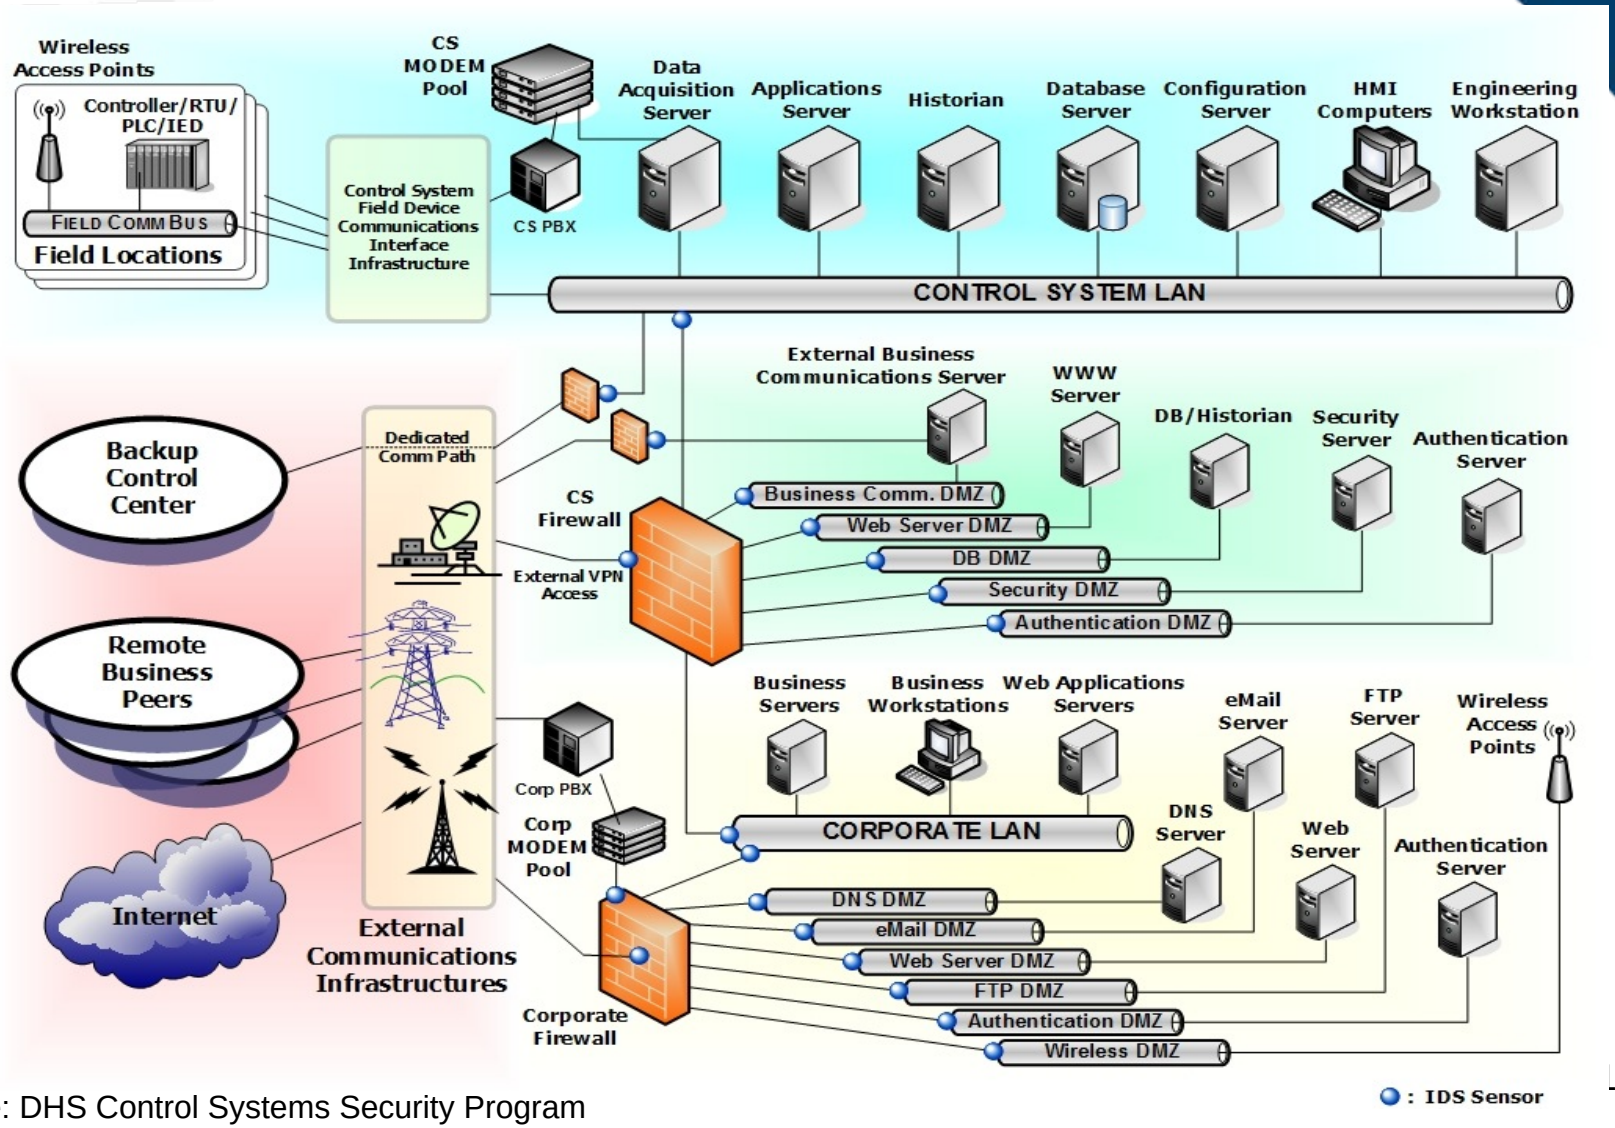
CIPs apply to the ESP and cyber assets within the ESP

The ESP contains critical cyber assets and, possibly non-critical cyber assets.

CIP Applicability

- ESP (CIP 005)
- Cyber assets within the ESP (CIP 007)
- Support of cyber assets
  - Security management (CIP 003)
  - Personal & training (CIP 004)
  - Physical security (CIP 006)
  - Incident reporting & response planning (CIP 008)
  - Recover plans for critical cyber assets (CIP 009)

Generic Control System Model



Source: DHS Control Systems Security Program

Electronic Security Perimeter

- The logical border surrounding a network to which Critical Cyber Assets are connected and for which access is controlled.
  - CIP-005 R.1 & R1.4 imply that an ESP contains both critical and non-critical cyber assets
  - Critical and non-critical cyber assets within an ESP are under the control of the Responsible Entity (RE).

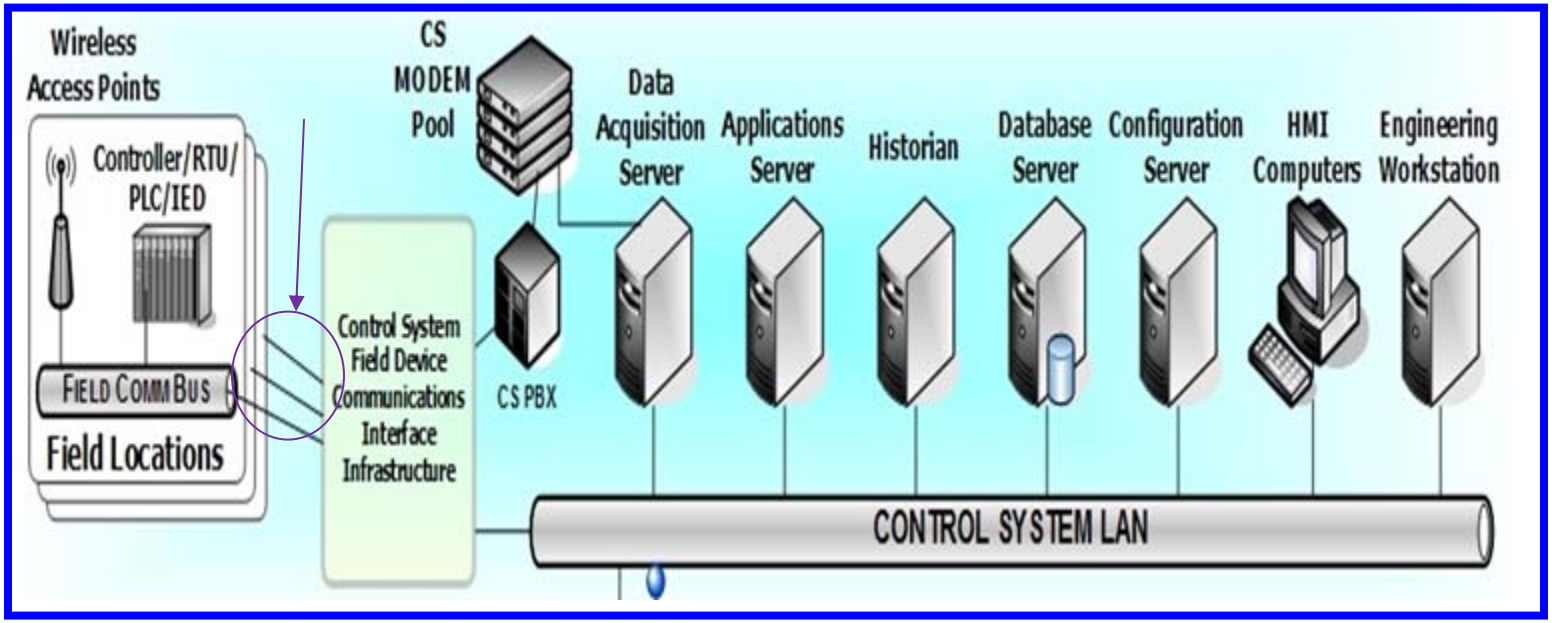
R1. Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).

R1.4. Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005.

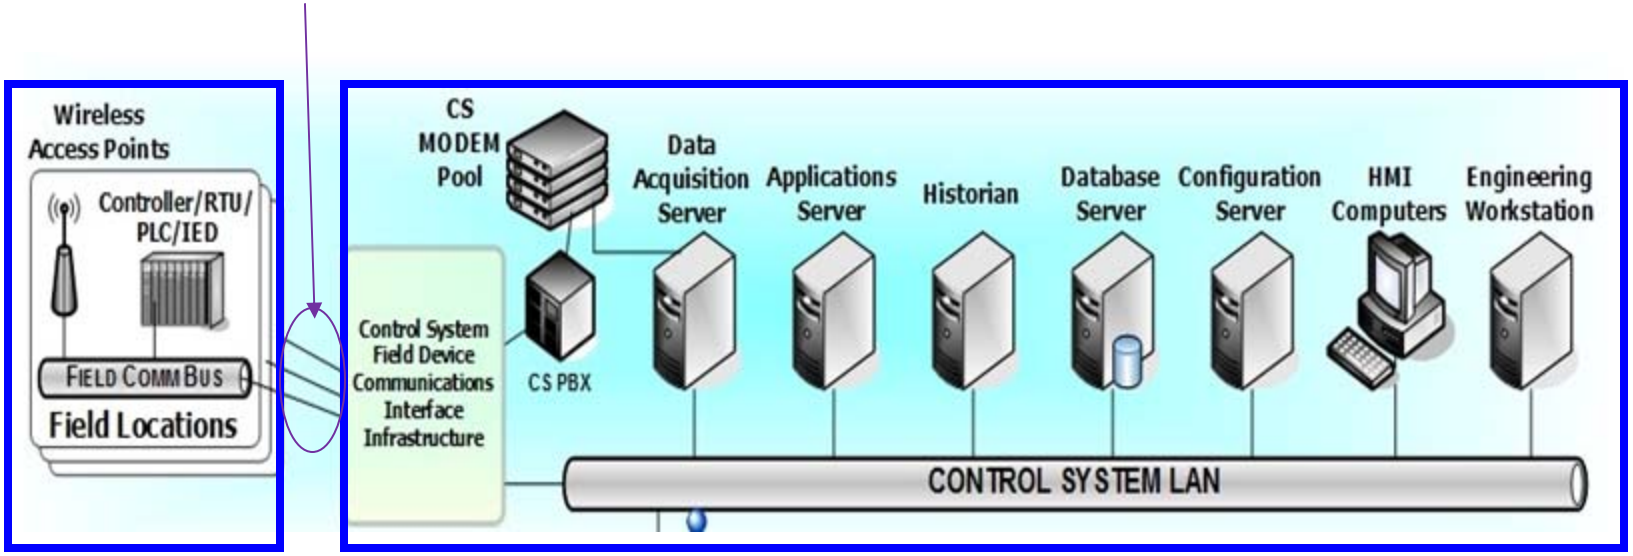
Determining the ESP (or ESPs) in the Generic Control System Model.

Are all of the following reasonable ESP configurations?

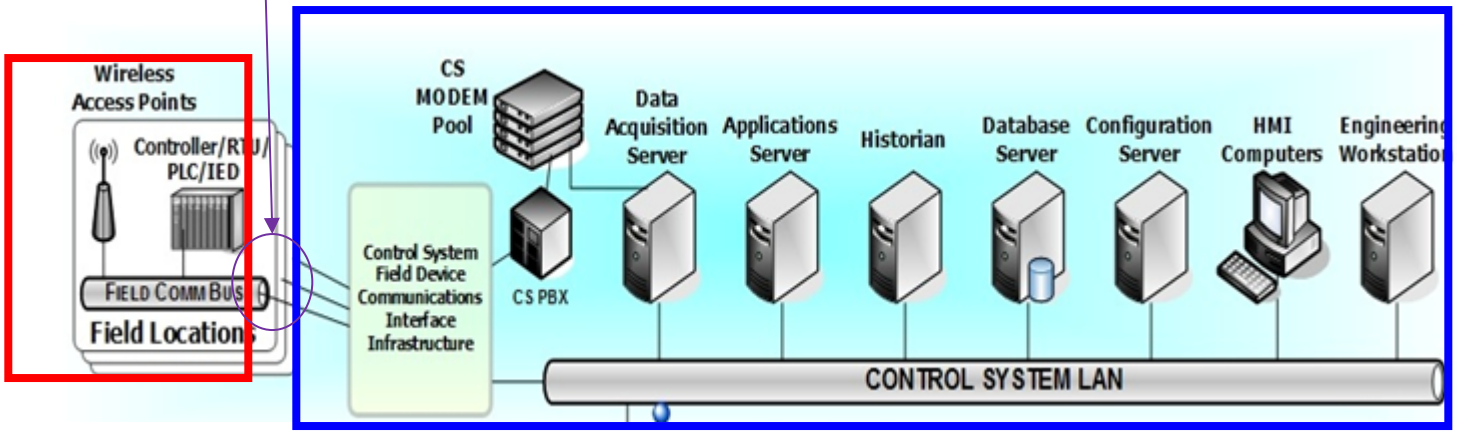
One ESP: All cyber assets, including the communication paths, are under the control of the Responsible Entity (RE)



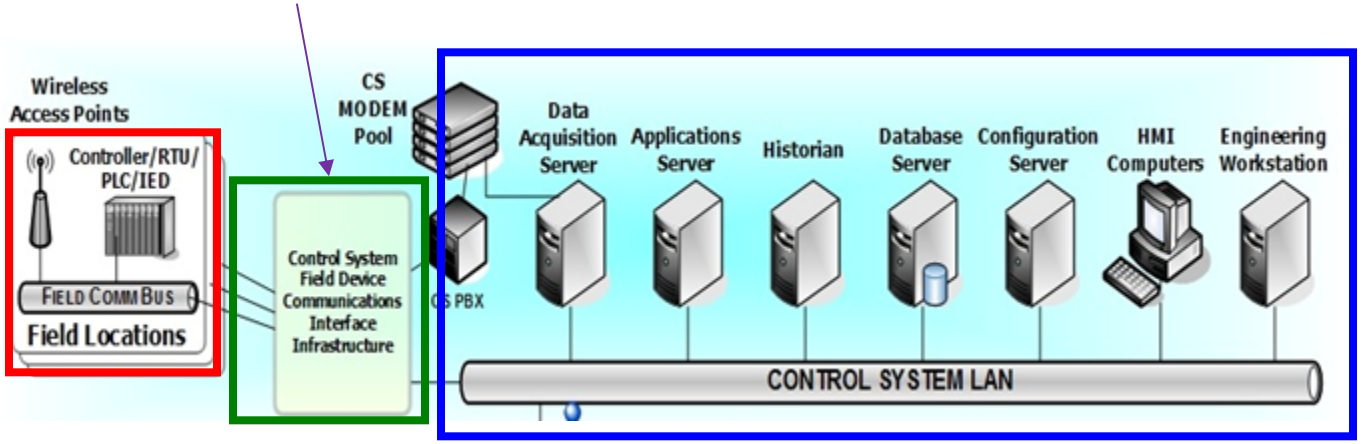
One ESP: All cyber assets, except the communication paths, are under the control of the Responsible Entity (RE)



Two ESPs: The ESPs are under the control of different REs. The communications paths are not under the control of either RE.



Three ESPs: The communications are in an ESP. Each ESP is under the control of a different RE.



Compare NIST & the NERC/CIP approach

Similarities

- Holistic approaches: both address technology, management & operational aspects of security
- Concepts of external/internal to boundary (ESP & accreditation boundary)

Conceptual Model Differences

- NIST
  - Information system view
  - All information system components are within accreditation boundary, including people, processes, and technology
  - Security requirements are allocated to components
  - Allows holistic defense-in-depth approach through system design & engineering
- NERC
  - Critical asset, cyber asset, & critical cyber asset view
  - Concept of protecting perimeter (i.e., ESP) & contents within ESP; contents only include cyber assets. People & processes addressed by additional CIPs.
  - Security requirements are applied to all components (i.e., all cyber assets)
  - Treating boundary and contents separately (e.g., in CIPs 5 & 7) can lead to inefficiency, inconsistency, and vulnerabilities

Additional Differences

- RMF concepts
  - Management of risk vs. compliance with requirements (CIPs)
  - Categorization of potential impact (Low, Moderate, High)
  - Security plan
  - Security testing and evaluation procedures and methods
  - Authorization to operate
  - Continuous Monitoring
  - Common controls
  - Trust model as basis for trust between business partners & external service providers
- Wireless not addressed in CIPs

Explore Harmonizing the NERC CIPs with NIST's Moderate Baseline

- Add material to make the NERC CIPs comparable to NIST's Moderate baseline
  - Policy requirement to each CIP
  - Guidance
  - Augment CIP requirements
  - Security Test and Evaluation
- Replace the concept of technical feasibility with an exception process
- Merge CIPs 005 & 007

Example of CIP Augmentation

- Process followed
  - Examined mapping exercise results
  - Reviewed CIP 005 & 800-53 Moderate baseline to identify gaps
  - Added material to existing requirements or added new requirements to close gaps
- Provide CIP 005 augmentation example to NERC development team
- Assist NERC in augmenting remaining CIPs, if requested

Example CIP-005 Policy Requirement

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

B. Requirements

R0. Cyber Security Perimeter Policy and Procedures — The Responsible Entity shall: develop, disseminate, and periodically review update: (i) a formal, documented, policy on the protection of all Cyber Security Perimeter(s), the cyber assets contained within, and identification and authentication. This policy shall address purpose, scope, roles, responsibilities, management commitment, coordination among Responsible Entity's sub-entities, and compliance; and (ii) formal, documented procedures to facilitate the implementation of this policy and associated controls.

GUIDANCE: this requirement does not prescribe an organization structure for the Responsible Entity 's cyber security policy. The Cyber Security Perimeter Policy and Procedures may be included as part of the general information security policy for the Responsible Entity, or the ICS cyber security policy.

——— Indicates controls (or part of controls) added to CIP requirement

Security Assessment Suggestions

- Add a new security assessment requirement based on:
  - SP 800-53 CA-2 Security Assessments
  - SP 800-53A Section 3.2 contains security assessment requirements
- **Example requirement:** Responsible Entity must develop detailed information security testing standards, processes, and procedures that provide direction and guidance on security testing.
  - See example augmented CIP-005 R4 for additional details
- SP 800-53A *Guide for Assessing the Security Controls in Federal Information Systems* can serve as the basis for selection and tailoring of processes and procedures.

Suggestion for Replacing “Technical Feasibility” with an “Exception Process”

- The Responsible Entity may take exception to any Requirement based on specified conditions. See example augmented CIP-005 Section A.6 for details
- The Responsible Entity shall document all exceptions in an Exception Plan provided to the ERO and Regional Reliability Organization.
- The Exception Plan must be approved annually by a Responsibility Entity senior manager.
- The Exception Plan must be approved annually by the Regional Reliability Organization, or the ERO if there is no applicable RRO.
- The ERO must annually audit compliance with the Exception Plan and provide FERC with an annual high-level, wide-area analysis regarding the effects of all exceptions on the reliability of the Bulk-Power System.

Merge CIP-005 & CIP-007

- CIP-005 R4 and CIP-007 R8 are quite similar.
  - CIP-005 addresses the perimeter
  - CIP-007 addresses the contents of the perimeter.
- Treating perimeter and contents separately can lead to inefficiency, inconsistency, and vulnerabilities

NIST Standards Development Process

A Partnership Between Government and Industry

Keith Stouffer
National Institute of Standards and Technology

US Federal Standards and Guidelines

- Measurement standards
  - Length
  - Mass
  - Time
  - Ohm
  - Etc.
- Principle-based and prescriptive standards and guidelines
  - Federal Information Processing Standards (FIPS)
  - Special Publication (SP) 800 Series documents
- NIST does not perform enforcement – Government Accountability Office (GOA) and Inspector Generals (IGs)

Federal Information Standards (FIPS)

- Approved by the Secretary of Commerce
- Compulsory and binding standards for federal agencies non-national security information systems
- Voluntary adoption by federal national security community and private sector
- Examples
  - FIPS 140-2 Security Requirements for Cryptographic Modules
  - FIPS 200 - Minimum Security Requirements for Federal Information and Information Systems

Special Publication (SP) 800 Series Documents

- Special Publications in the 800 series are documents of general interest to the computer security community, established in 1990
- Reports on guidance, research, and outreach efforts in computer security, and collaborative activities with industry, government, and academic organizations
- Documents receive 3 public vetting cycles before being finalized
  - Initial public draft - 90 day review period
  - 2nd public draft - 60 day review period
  - Final public draft - 30 day review period
- Agencies must follow 800 series guidance documents, but 800 series documents generally allow agencies latitude in their application
- Voluntary adoption by private sector – heavily used
- FIPS may mandate specific 800 series documents
  - FIPS 200 mandates NIST SP 800-53 security controls

NIST Approach to Standards Development

- NIST standards only apply to non-national security part of US government (USG)
- NSA standards apply to the national security part of the USG (i.e., classified systems, intelligence-related systems)
- Use of NIST standards is mandatory by government agencies; guidelines require mandatory “consideration”
- Use of NIST standards and guidelines is always voluntary by the commercial sector

NIST Approach to Standards Development

- In order of priority:
  - Adopt or adapt existing voluntary industry standards, if available and acceptable
  - Join voluntary industry standards efforts to develop common government-industry standards; adopt or adapt the completed standard for government use.
  - Use NIST mandated authority and internal resources to develop standards and guidelines for federal agencies

NIST Approach to Standards Development

- Seek heavy commercial sector involvement
- Attempt to develop “dual use” standards
  - Appropriate for use by government & industry
  - Contributions to voluntary standards groups (IEEE, ISO)
- Accept technical contributions from all parties
- Hold open workshops & public briefings
- Have open public comment periods
- Revisions based on public comments
- International coordination & cooperation
  - For example: Japan & India

Why This Approach?

- 90% of critical infrastructure (CI) is owned by the private sector
- All systems within a CI need appropriate, consistent, & comparable protection-should be seamless protection across government & private CI systems
- Government approach is to encourage private sector to strengthen its CI protection
- Private sector is more likely to adopt standards and guidelines if these are developed in an open consensus environment

Why This Approach?

- Product developers are more likely to implement/meet standards if developed in an open consensus environment (e.g., DES, AES, FIPS 140) due to larger market
- Results in larger selection of products for all sectors to chose from
- Results in best possible/stronger standards
  - Wide diversity of technical advice
  - Realistic view of what is technically feasible

Why This Approach?

- Often considered as “best practice” or “due diligence” by private sector
  - “Good enough for government is good enough for us”
  - Promoted through government CI sector liaisons to their CI counterparts
- Better interoperability between government & private sector systems
- Provides general public/citizens with visibility & comfort into how the government is protecting systems that contain personal/private information about them

Consensus-Building Process

NIST Special Publication 800-53

- Employ extensive vetting process for Special Publication 800-53
  - Three full published drafts of document
  - Three public comment periods to obtain feedback from the public and private sectors
- Carefully assess feedback received during the public comment periods; incorporate material into publication, as appropriate
- Provide sufficient time for organizations to become familiar with Special Publication 800-53 before transitioning to FIPS 200

Special Publication 800-53

- Formal and informal comments received from a wide variety of constituencies in the public and private sectors including—
  - Federal, State, and Local Governments
  - Critical Infrastructure Entities (e.g., power companies, telecommunications providers)
  - Fortune 500 Companies
  - Healthcare Providers
  - Financial Industry
  - Consortia (e.g., National Realtors Association)
  - Private citizens

Significant Comments

- Received over 800 comments on the initial public draft of Special Publication 800-53
- Comments indicated that—
  - ✓ Security controls contained too much implementation detail
  - ✓ Security control baselines (low, moderate, high) included too many controls for a minimum set
  - ✓ There was insufficient flexibility in the security control selection process for organizations to effectively apply the controls in specific operational environments
  - ✓ The “high-water mark” approach required organizations to employ unnecessary security controls

NIST Response

- In response to the initial public comments, NIST re-engineered Special Publication 800-53
- Fundamental changes included—
  - ✓ Streamlining the security control structure and control content to focus on “token-level” requirements
  - ✓ Redesigning the security control enhancement approach to facilitate ease-of-use for organizations requiring additional security controls based on risk assessment
  - ✓ Incorporating scoping guidance to help organizations effectively apply the NIST guidance in specific operational environments
  - ✓ Reducing the number of security controls in the control baselines

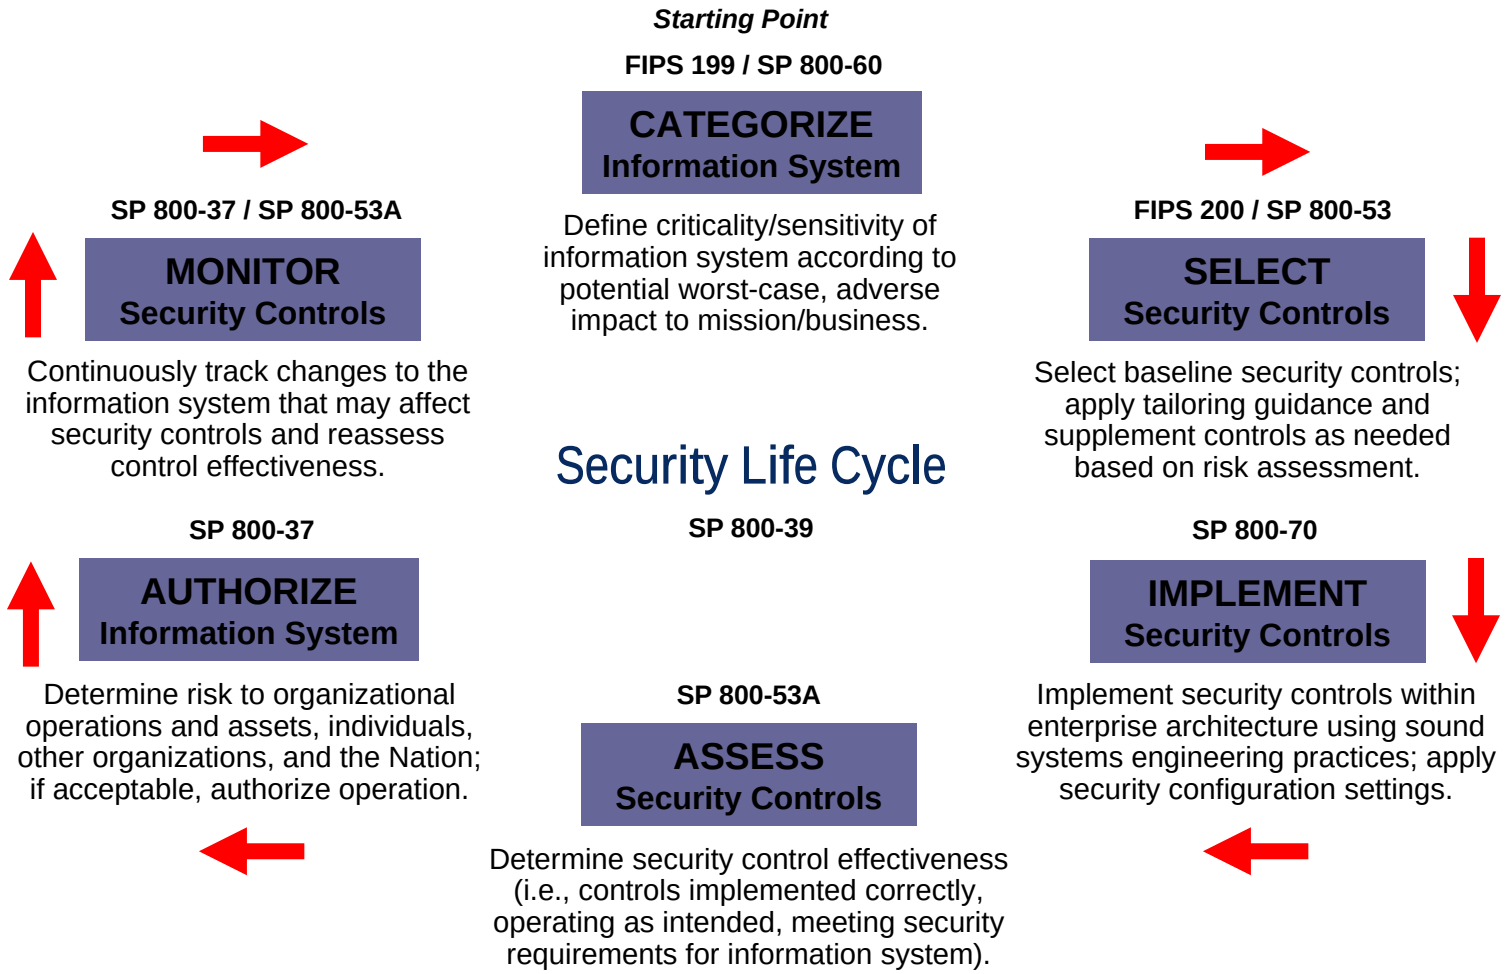
Key Milestones

- NIST Special Publication 800-53
  - Initial Public Draft **(October 2003)**
  - Second Public Draft **(September 2004)**
  - Final Public Draft **(January 2005)**
  - Final Publication **(February 2005)**
- FIPS 200
  - Initial Public Draft **(Projected for May 2005)**
  - Second Public Draft **(Projected for August 2005)**
  - Final Publication **(Projected for December 2005)**

Summary

- Public vetting process proved extremely effective and allowed NIST to build a truly consensus-based security guideline to serve both public and private sector needs
- Extended development cycle and expanded public review periods allowed federal agencies to be better prepare for the transition to FIPS 200, when the security controls become mandatory
- Increasing voluntary acceptance of NIST Special Publication 800-53 by the private sector will help provide greater information security for the nation's critical infrastructure

NIST Risk Management Framework



Federal ICS Security Standards and Guidelines Strategy

- Add control systems domain expertise to:
  - Already available IT security Risk Management Framework
  - Provide workable, practical solutions for control systems – without causing more harm than the incidents we are working to prevent

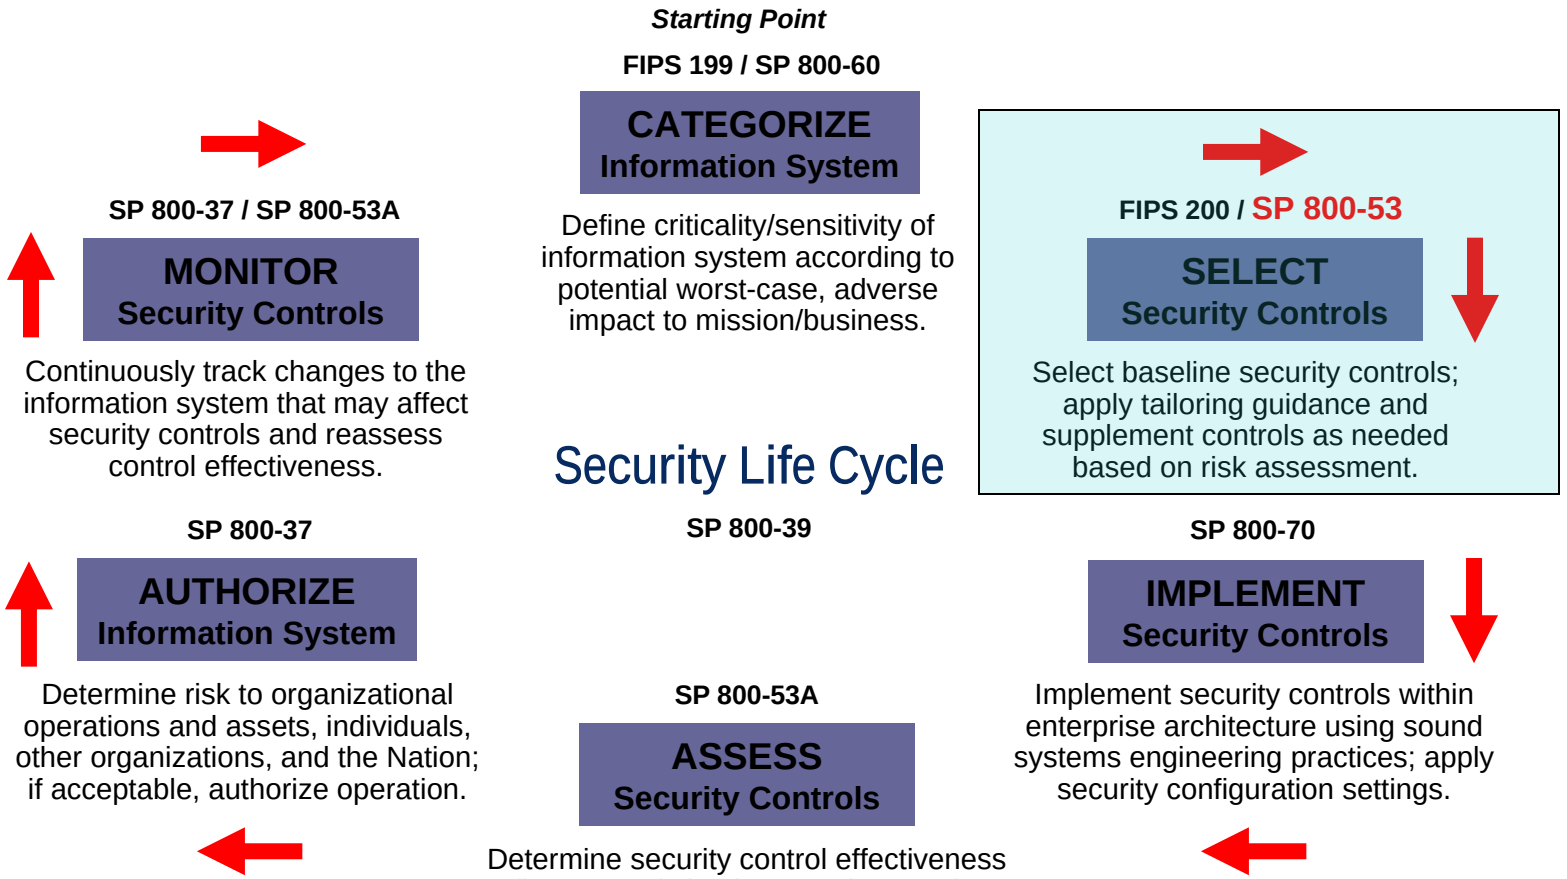
- This expertise takes the form of specific cautions, recommendations & requirements for application to control systems - throughout both technologies and programs
  - ICS Augmentation of NIST SP 800-53 *Recommended Security Controls for Federal Information Systems*
  - NIST SP 800-82 *Guide to Industrial Control System (ICS) Security*

NIST ICS Security Project

- Joint MEL/ITL project, in collaboration with federal and industry stakeholders, to develop standards, guidelines and test methods to help secure these critical control systems in harmony with their demanding safety and reliability requirements.

http://csrc.nist.gov/sec-cert/ics

NIST Risk Management Framework



NIST SP 800-53

- NIST SP 800-53 *Recommended Security Controls for Federal Information Systems*, which was developed for traditional IT systems, contains mandatory information security requirements for all non-national security information and information systems that are owned, operated, or controlled by federal agencies.
- NIST SP 800-53 provides the security controls that need to be applied to secure the system. It does not specify how the controls need to be implemented.
- When organizations attempted to utilize SP 800-53 to protect ICS, difficulties were encountered in implementing SP 800-53 counter-measures because of ICS-unique needs
- Held 2 Workshops (April 2006 and March 2007) with stakeholders to discuss issues and develop ICS material for SP 800-53. 2 drafts were released for public vetting before finalized in December 2007.

NIST SP 800-53 Structure

17 Control Families
171 Controls (Requirements)

- Access Control
- Awareness and Training
- Audit and Accountability
- Certification, Accreditation, and Security Assessments
- Configuration Management
- Contingency Planning
- Identification and Authentication
- Incident Response
- Maintenance
- Media Protection
- Physical and Environmental
- Planning
- Personnel Security
- Risk Assessment
- Systems and Services Acquisition
- System and Communications Protection
- System and Information

NIST SP 800-53 Control Example

AU-6 AUDIT MONITORING, ANALYSIS, AND REPORTING

Control: The organization regularly reviews/analyzes information system audit records for indications of inappropriate or unusual activity, investigates suspicious activity or suspected violations, reports findings to appropriate officials, and takes necessary actions.

Supplemental Guidance: Organizations increase the level of audit monitoring and analysis activity within the information system whenever there is an indication of increased risk to organizational operations, organizational assets, or individuals based on law enforcement information, intelligence information, or other credible sources of information.

Control Enhancements:

(1) The organization employs automated mechanisms to integrate audit monitoring, analysis, and reporting into an overall process for investigation and response to suspicious activities.

(2) The organization employs automated mechanisms to alert security personnel of the following inappropriate or unusual activities with security implications: [*Assignment: organization-defined list of inappropriate or unusual activities that are to result in alerts*].

LOW Not Selected	**MOD** AU-6 (2)	**HIGH** AU-6 (1) (2)

Changes made to NIST SP 800-53 to address ICS

- Original NIST SP 800-53 controls were not changed
- Additional guidance was added to 65 of 171 controls to address ICS
  - ICS Supplemental Guidance
  - ICS Enhancement Supplemental Guidance
- ICS Supplemental Guidance provides information on how the control applies in ICS environments, or provides information as to why the control may not be applicable in ICS environments.

Example:

SC-13 USE OF CRYPTOGRAPHY

ICS Supplemental Guidance:

ICS security objectives typically follow the priority of availability, integrity and confidentiality, in that order. The use of cryptography is determined after careful consideration of the security needs and the potential ramifications on system performance. For example, the organization considers whether latency induced from the use of cryptography would adversely impact the operational performance of the ICS.

Key Take Away

- NIST SP 800-53, Revision 2 is a security standard that addresses both general IT systems as well as ICS. This allows federal agencies, as well as the private sector if desired, to use one document to determine the proper security controls for their IT systems as well as to effectively secure their industrial control systems while addressing their unique requirements.

  http://csrc.nist.gov/publications/nistpubs/800-53-Rev2/sp800-53-rev2-final.pdf

- Federal ICS using NIST SP 800-53, Revision 2
  - Bonneville Power Administration (BPA)
  - Southwestern Power Administration (SWPA)
  - Tennessee Valley Authority (TVA)
  - Western Area Power Administration (WAPA)
  - Federal Aviation Administration (FAA)
  - Department of the Interior, Bureau of Reclamation

NIST SP 800-53 Security Baselines

- LOW Baseline - Selection of a subset of security controls from the master catalog consisting of ***basic*** level controls
- MOD Baseline - Builds on LOW baseline. Selection of a subset of controls from the master catalog—***basic*** level controls, additional controls, and control ***enhancements***
- HIGH Baseline - Builds on MOD baseline. Selection of a subset of controls from the master catalog—***basic*** level controls, additional controls, and control ***enhancements***

- ***How do we categorize ICS?***

Low Impact System

Possible ICS Impact Level Definitions

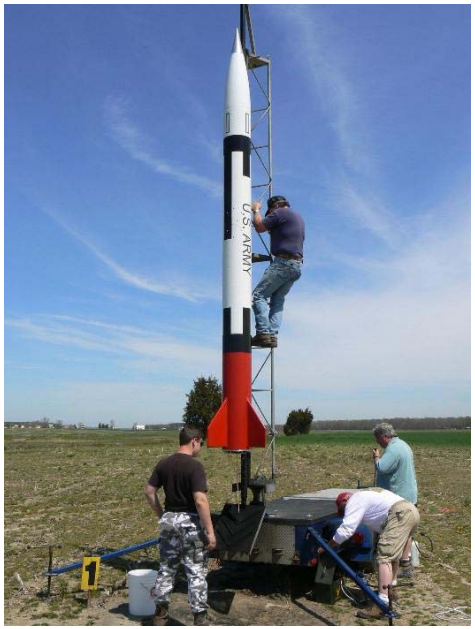
- **Low Impact**
  - **Product Controlled:** Non hazardous materials or products, Non-ingested consumer products
  - **Industry Examples:** Plastic Injection Molding, Warehouse Applications
  - **Security Concerns:** Protecting people, Capital investment, Ensuring uptime

Moderate Impact Systems

Possible ICS Impact Level Definitions

- **Moderate Impact**
  - **Product Controlled:** Some hazardous products and/or steps during production, High amount of proprietary information
  - **Industry Examples:** Automotive Metal Industries, Pulp & Paper, Semi-conductors
  - **Security Concerns:** Protecting people, Trade secrets, Capital investment, Ensuring uptime

High Impact System



High Impact System !!!

Possible ICS Impact Level Definitions

- **High Impact**
  - **Product Controlled:** Critical Infrastructure, Hazardous Materials, Ingested Products
  - **Industry Examples:** Utilities, PetroChemical, Food & Beverage, Pharmaceutical
  - **Security Concerns:** Protecting human life, Ensuring basic social services, Protecting environment

NIST Example Augmentation of Standard CIP–005

Cyber Security — Cyber Security Perimeter Protection

October 7, 2008

========== General comments ==========

Discussion (set off by "======" and colored blue) is not part of the NIST augmentation. It is provided to assist the drafting committee.

Order 706 ¶ 61 gives the ERO direction to provide additional guidance in the CIPs or in a separate reference document. For convenience, the guidance is placed in this manuscript. This guidance is part of NIST's augmentation.

==========

A. Introduction

1. Title: Cyber Security — ~~Electronic~~ Cyber Security Perimeter~~(s)~~ (CSP) Protection

2. Number: CIP-005-~~1~~2

3. Purpose: Standard CIP-005 requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 ~~using reasonable business judgment~~.

4. Applicability

4.1. [4.1] Within the text of Standard CIP-005, "Responsible Entity" shall mean all entities that could affect the reliability of the bulk electric grid by virtue of cyber connection to any control system component of the bulk electric system.. Responsible Entities include, but are not limited to:

==========

NIST recommends that all entities that could affect the reliability of the bulk electric grid should be included. Advances in digital electronics technology and computer hardware and software have obsoleted prior distinctions among computing, communications, and control systems. Today, all are collectively considered Information Technology (IT). Until recently, Industrial Control Systems (ICS) had little resemblance to traditional information systems in that they were isolated systems running proprietary software and control protocols. However, as these systems have been increasingly integrated more closely into mainstream organizational information systems to promote connectivity, efficiency, and remote access capabilities, they have started to resemble the more traditional information systems. Increasingly, ICS use the same commercially available hardware and software components as are used in the Responsible Entity's traditional information systems. While the change in industrial control system architecture supports new information system capabilities, it also provides significantly less isolation from the outside world for these systems, introducing many of the same vulnerabilities that exist in current networked information systems. The result is an even greater need to secure ICS.

The interconnection of infrastructures has obsoleted prior distinctions. Distribution Systems and Energy Management Systems should be included. Enumeration can be helpful as examples, providing the enumeration states "including, but not limited to."

==========

- Reliability Coordinator.
- Balancing Authority.
- Interchange Authority.
- Transmission Service Provider.

- Transmission Owner.
- Transmission Operator.
- Generator Owner.
- Generator Operator.
- Load Serving Entity.
- NERC.
- Regional Reliability Organizations.

4.2. [4.2] The following are exempt from Standard CIP-005:

4.2.1 [4.2.1] Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

==========

NIST notes that on September 18, 2008 FERC issued the following Proposed Clarification: facilities within a nuclear generation plant in the United States that are not regulated by the U.S. Nuclear Regulatory Commission are subject to compliance with the eight mandatory "CIP" Reliability Standards approved in Commission Order No. 706.

==========

4.2.2 [4.2.2] Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters that are not under the direct control and management of the Responsible Entity..

4.2.3 [4.3.3] Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~TBD

~~5.~~6. Exceptions

==========

In Order No. 706 FERC directed the development of a framework to provide accountability when a Responsible Entity relies on technical infeasibility or certain other factors to take exception to specific Requirements. FERC specified that the structural elements of this framework include mitigation steps, a remediation plan, a timeline for eliminating use of the technical feasibility exception unless appropriate justification otherwise is provided, regular review of whether it continues to be necessary to invoke the exception, internal approval by the senior manager, wide-area approval through the ERO's audit process, and cooperation with the ERO to provide the Commission with high-level, wide-area analysis regarding the effects the technical feasibility exception on the reliability of the Bulk-Power System. See ¶ 152, 157-163, 178-187, 192-195, and 209-222.

==========

6.1. The Responsible Entity may take exception to any Requirement based on the Responsible Entity's determination that any of the following conditions apply:

- The Requirement interferes with ICS functions
- The Requirement poses a risk to the reliability of the bulk electric grid
- The ICS cannot support the use of the required mechanisms or implement the required function
- The Requirement will have a significant adverse impact on performance, safety, or reliability

6.2. The Responsible Entity shall document all exceptions in an Exception Plan provided to the ERO and Regional Reliability Organization containing:

6.2.1 A convincing argument why the exception is necessary

6.2.2 Compensating controls or mitigation steps to address the intent of the Requirement

6.2.3 A plan of action, milestones, and schedule for implementing the compensating controls or mitigation steps

6.3. The Exception Plan must be approved annually by a Responsibility Entity senior manager.

6.4. The Exception Plan must be approved annually by the Regional Reliability Organization, or the ERO if there is no applicable RRO.

6.5. The ERO must annually audit compliance with the Exception Plan and provide FERC with an annual high-level, wide-area analysis regarding the effects of all exceptions on the reliability of the Bulk-Power System.

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-005:

==========

Information may be stored, transmitted, and processed using multiple digital and analog media including electro-magnetic fields in space on media in frequencies commonly described as electrical and optical. For example, fiber optic, infrared, and radio wireless communications are all common, but are not "electronic." NIST believes that "Electronic" is too limited a term and has replaced it with "Cyber" as being more inclusive. "Logical" is another term that could be used.

==========

R0. Cyber Security Perimeter Policy and Procedures — The Responsible Entity shall: develop, disseminate, and periodically review and update: (i) a formal, documented, policy on the protection of all Cyber Security Perimeter(s), the cyber assets contained within, and identification and authentication. This policy shall address purpose, scope, roles, responsibilities, management commitment, coordination among Responsible Entity's sub-entities, and compliance; and (ii) formal, documented procedures to facilitate the implementation of this policy and associated controls.

GUIDANCE: This requirement does not prescribe an organization structure for the Responsible Entity 's cyber security policy. The Cyber Security Perimeter Policy and Procedures may be included as part of the general information security policy for the Responsible Entity, or the ICS cyber security policy.

========== based on AC-1 & IA-1 ==========

~~R0.~~R1. [R1] ~~Electronic~~ Cyber Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within a~~n Electronic~~ Cyber Security Perimeter. The Responsible Entity shall identify and document the ~~Electronic~~ Cyber Security Perimeter(s) and all access points to the perimeter(s).

~~R0.1.~~R1.1. [R1.1] Access points to the ~~Electronic~~ Cyber Security Perimeter(s) shall include any externally connected communication ~~end~~ interface point (for example, dial-up modems) terminating at any device at ~~within~~ the ~~Electronic~~ Cyber Security Perimeter(s).

==========

The concept of logically locating the modem at the Perimeter eliminates the need to physically protect the circuit between the modem and the Perimeter, as required in CIP-006.

==========

~~R0.2.~~R1.2. [R1.2] For a dial-up accessible Critical Cyber ~~Asset that~~Asset that uses a non-routable protocol, the Responsible Entity shall define an ~~Electronic~~ Cyber Security Perimeter for that single access point at the dial-up device or shall include the Asset within a defined Cyber Security Perimeter.~~.~~

~~R0.3.~~R1.3. [R1.3] Communication links that are not under the direct control and management of any Responsible Entity connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, ~~end~~ interface points of these communication links ~~within~~ at the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).

==========

The interface between assets controlled by the Responsible Entity and assets controlled by another party is not necessarily the end point for communication. The interface may simply be the demarcation between two domains of responsibility and may also provide changes in information representation or addressing (e.g., optical to electronic, network access translation (NAT)).

==========

~~R0.4.~~R1.4. [R1.4] Any non-critical Cyber Asset within a defined ~~Electronic~~ Cyber Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005.

~~R0.5.~~R1.5. [R1.5] Cyber Assets used in the access control and monitoring of the ~~Electronic~~ Cyber Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003, Standard CIP-004 Requirement R3, Standard CIP-005 Requirements R2 and R3, Standard CIP-006 Requirements R2 and R3, Standard CIP-007, Requirements R1 and R3 through R9, Standard CIP-008, and Standard CIP-009.

~~R0.6.~~R1.6. [R1.6] The Responsible Entity shall maintain documentation of ~~Electronic~~ Cyber Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all ~~electronic~~ access points to the ~~Electronic~~ Cyber Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.

GUIDANCE: Any connections to the Internet, or other external networks, communication systems, cyber assets, or information systems that are not under the control of the Responsible Entity, occur through managed interfaces consisting of appropriate boundary protection devices (e.g., proxies, gateways, routers, firewalls, guards, encrypted tunnels) arranged in an effective architecture (e.g., routers protecting firewalls and application gateways residing on a protected subnetwork commonly referred to as a demilitarized zone or DMZ). Cyber assets at any designated alternate processing sites are provided the same levels of protection as that of the primary site.

As part of a defense-in-depth protection strategy, the Responsible Entity considers partitioning higher-impact cyber assets into separate physical domains (or environments) and applying the concepts of managed interfaces described above to restrict or prohibit network access in accordance with the Responsible Entity's assessment of risk .

The Responsible Entity carefully considers the intrinsically shared nature of commercial telecommunications services in the implementation of security controls associated with the use of such services. Commercial telecommunications services are

commonly based on network components and consolidated management systems shared by all attached commercial customers, and may include third party provided access lines and other service elements. Consequently, such interconnecting transmission services may represent sources of increased risk despite contract security provisions. Therefore, when this situation occurs, the Responsible Entity implements appropriate compensating security controls.

========== guidance based on SC-7 ==========

R1.7. The Responsible Entity physically allocates publicly accessible cyber assets to separate subnetworks with separate, physical network interfaces.

GUIDANCE: Publicly accessible cyber assets include, for example, emergency cut-off activators. Generally, public access to ICS information is not permitted.

========== based on SC-7 control enhancement 1 Appx F & I==========

R1.8. The Responsible Entity shall prevent public access into the Responsible Entity's internal networks except as appropriately mediated.

========== based on SC-7 control enhancement 2 ==========

~~R0.7.~~R1.9. The Responsible Entity shall limit the number of access points to the Cyber Security Perimeter to allow for better monitoring of inbound and outbound network traffic.

========== based on SC-7 enhancement 3 ==========

~~R0.8.~~R1.10. The Responsible Entity shall implement a managed interface (boundary protection devices in an effective security architecture) with any external telecommunication service, implementing controls appropriate to the required protection of the confidentiality and integrity of the information being transmitted.

========== based on SC-7 enhancement 4 ==========

~~R1.~~R2. [R2] ~~Electronic~~ Cyber Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of ~~electronic~~ cyber access at all ~~electronic~~ cyber access points ~~to~~ at the ~~Electronic~~ Cyber Security Perimeter(s)~~.~~, and at key internal boundaries within the Cyber Security Perimeter(s).

~~R1.1.~~R2.1. [R2.5] The required documentation shall, at least, identify and describe:

~~R1.1.1.~~R2.1.1. [R2.5.1] The processes for access request and authorization.

~~R1.1.2.~~R2.1.2. [R2.5.2]The authentication methods.

~~R1.1.3.~~R2.1.3. [R2.5.3] The review process for authorization rights, in accordance with Standard CIP-004 Requirement R4.

~~R1.1.4.~~R2.1.4. [R2.5.4] The controls used to secure dial-up accessible connections.

GUIDANCE: Any connections to the Internet, or other external networks or information systems, occur through managed interfaces consisting of appropriate boundary protection devices (e.g., proxies, gateways, routers, firewalls, guards, encrypted tunnels) arranged in an effective architecture (e.g., routers protecting firewalls and application gateways residing on a protected subnetwork commonly referred to as a demilitarized zone or DMZ). Cyber security boundary protections at any designated alternate processing sites provide the same levels of protection as that of the primary site.

As part of a defense-in-depth protection strategy, the Responsible Entity considers partitioning higher-impact information systems into separate physical domains (or

environments) and applies the concepts of managed interfaces described above to restrict or prohibit network access in accordance with an Responsible Entity's assessment of risk.

The Responsible Entity carefully considers the intrinsically shared nature of commercial telecommunications services in the implementation of security controls associated with the use of such services. Commercial telecommunications services are commonly based on network components and consolidated management systems shared by all attached commercial customers, and may include third party provided access lines and other service elements. Consequently, such interconnecting transmission services may represent sources of increased risk despite contract security provisions.

========== based on SC-7 ==========

~~R1.2.~~R2.2. [R2.1] These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.

R2.3. [R2.3] The Responsible Entity shall maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s). The Responsible Entity shall:

R2.3.1. Employ automated mechanisms to facilitate the monitoring and control of dial-up access.

R2.3.2. Determine if cryptography is required to protect the confidentiality and integrity of dial-up access sessions.

R2.3.3. Permit dial-up access for privileged functions only for compelling operational needs and documents the rationale for such access in the security plan for the Cyber Security Perimeter .

GUIDANCE: The Responsible Entity restricts access achieved through dial-up connections (e.g., limiting dial-up access based upon source of request) or protects against unauthorized connections or subversion of authorized connections (e.g., using virtual private network technology). NIST Special Publication 800-63 provides guidance on remote electronic authentication. NIST Special Publication 800-77 provides guidance on IPsec-based virtual private networks.

Dial-up access to ICS locations (e.g., control centers, field locations) is only enabled when necessary, approved, and authenticated. In situations where the ICS cannot support the use of automated mechanisms for monitoring and control of dial-up access methods, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls (e.g., following manual authentication, dial-in remote access may be enabled for a specified period of time or a call may be placed from the ICS site to the authenticated remote entity).

Cryptography is used for the protection of information and communications. At the core of all products offering cryptographic services is the cryptographic module. Weaknesses such as poor design or weak algorithms can render a product insecure and place highly sensitive information at risk. Adequate testing and validation of the cryptographic module and its underlying cryptographic algorithms against established standards is essential to provide security assurance.

The NIST Cryptographic Module Validation Program (CMVP) validates commercial cryptographic modules to Federal Information Processing Standard (FIPS) 140-2 and other cryptography based standards such as algorithms.

ICS security objectives typically follow the priority of availability, integrity and confidentiality, in that order. The use of cryptography is determined after careful

consideration of the security needs and the potential ramifications on system performance. For example, the Responsible Entity considers whether latency induced from the use of cryptography would adversely impact the operational performance of the ICS.

In situations where the ICS cannot support the use of cryptographic mechanisms to protect the confidentiality and integrity of remote sessions, or the components cannot use cryptographic mechanisms due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs appropriate compensating controls (e.g., providing increased auditing measures for remote sessions or limiting remote access privileges to key personnel).

==== based on AC-17, IA-7 Appx F&I and other NIST publications===

~~R1.3.~~R2.4. The Responsible Entity shall authorize and document all connections between cyber assets inside the Cyber Security Perimeter and cyber assets outside of the Cyber Security Perimeter.

GUIDANCE: The Responsible Entity carefully considers the risks that may be introduced when cyber assets are connected to other cyber assets with different security requirements and security controls, both within the Responsible Entity and external to the Responsible Entity. Risk considerations also include cyber assets sharing the same networks.

========== additions based on CA-3 ==========

~~R1.4.~~R2.5. [R2.4] Where ~~external interactive~~ access through ~~into~~ the ~~Electronic~~ Cyber Security Perimeter has been authorized and enabled, the Responsible Entity shall implement multifactor ~~strong~~ procedural or technical controls at the access points to ensure authenticity of the accessing ~~party~~parties, ~~where technically feasible~~and monitors/controls the access on an ongoing basis.

GUIDANCE: Multifactor authentication is a system wherein more than one different factors are used to authenticate, thereby delivering a higher level of authentication assurance. Using more than one factor is sometimes called strong authentication.

========== based on IA-2 control enhancement 1 ==========

R2.6. The Responsible Entity shall:

R2.6.1. Employ automated mechanisms to facilitate the monitoring and control of remote access methods.

R2.6.2. Determine if cryptography is required to protect the confidentiality and integrity of remote access sessions.

R2.6.3. Control all remote accesses through a limited number of managed access control points.

R2.6.4. Permit remote access for privileged functions only for compelling operational needs and documents the rationale for such access in the security plan for the Cyber Security Perimeter .

GUIDANCE: Remote access is any access to an Cyber Security Perimeter by a user (or a cyber asset) communicating through an external network not under the control of the Responsible Entity (e.g., the Internet, public switched telephone network). Examples of remote access methods include dial-up, broadband, and wireless. The Responsible Entity protects against unauthorized connections or subversion of authorized connections (e.g., using virtual private network technology). NIST Special

Publication 800-63 provides guidance on remote electronic authentication. NIST Special Publication 800-77 provides guidance on IPsec-based virtual private networks.

Remote access to ICS locations (e.g., control centers, field locations) is only enabled when necessary, approved, and authenticated. In situations where the ICS cannot support the use of automated mechanisms for monitoring and control of remote access methods, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls.

Cryptography is used for the protection of information and communications. At the core of all products offering cryptographic services is the cryptographic module. Weaknesses such as poor design or weak algorithms can render a product insecure and place highly sensitive information at risk. Adequate testing and validation of the cryptographic module and its underlying cryptographic algorithms against established standards is essential to provide security assurance.

The NIST Cryptographic Module Validation Program (CMVP) validates commercial cryptographic modules to Federal Information Processing Standard (FIPS) 140-2 and other cryptography based standards such as algorithms.

ICS security objectives typically follow the priority of availability, integrity and confidentiality, in that order. The use of cryptography is determined after careful consideration of the security needs and the potential ramifications on system performance. For example, the Responsible Entity considers whether latency induced from the use of cryptography would adversely impact the operational performance of the ICS.

In situations where the ICS cannot support the use of cryptographic mechanisms to protect the confidentiality and integrity of remote sessions, or the components cannot use cryptographic mechanisms due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs appropriate compensating controls (e.g., providing increased auditing measures for remote sessions or limiting remote access privileges to key personnel).

==== based on AC-17, IA-7 Appx F&I and other NIST publications====

R2.7. The Responsible Entity shall:

R2.7.1. Develop a list of privileged functions

R2.7.2. Develop a list of authorized actions that can be taken with respect to privileged functions

~~R1.4.1.~~**R2.7.3.** Document the criteria and procedures for granting authorization to identified persons and entities.

The Responsible Entity shall manage cyber asset accounts, including establishing, activating, modifying, reviewing, disabling, and removing accounts. Privilege authorizations shall be granted in accordance with established policy and recorded. The Responsible Entity shall determine and implement the frequency for reviewing said accounts, at least annually.

GUIDANCE: Account management includes the identification of account types (i.e., individual, group, and system), establishment of conditions for group membership, and assignment of associated authorizations. The Responsible Entity identifies authorized users of the cyber assets and specifies access rights/privileges. The Responsible Entity grants access to the cyber assets based on: (i) a valid need-to-know/need-to-share that is determined by assigned official duties and satisfying all personnel security criteria; and (ii) intended usage. The Responsible Entity requires proper identification for

requests to establish accounts and approves all such requests. The Responsible Entity specifically authorizes and monitors the use of guest/anonymous accounts and removes, disables, or otherwise secures unnecessary accounts. Account managers are notified when cyber asset users are terminated or transferred and associated accounts are removed, disabled, or otherwise secured. Account managers are also notified when users' cyber asset usage or need-to-know/need-to-share changes.

==========requirement and guidance based on AC-2 ==========

~~R1.5.~~R2.8. The cyber assets shall enforce assigned authorizations for controlling access in accordance with applicable policy.

GUIDANCE: Access control policies (e.g., identity-based policies, role-based policies, rule-based policies) and associated access enforcement mechanisms (e.g., access control lists, access control matrices, cryptography) are employed to control access between users (or processes acting on behalf of users) and objects (e.g., devices, files, records, processes, programs, domains) within the cyber security perimeter. In addition to controlling access at the network layer of the ISO Reference Architecture, access enforcement mechanisms are employed at the application layer, when necessary, to provide increased information security. Consideration is given to the implementation of a controlled, audited, and manual override of automated mechanisms in the event of emergencies or other serious events.

The Responsible Entity ensures that access enforcement mechanisms do not adversely impact the operational performance of the ICS.

========== requirement & guidance based on AC-3 Appx F & I ==========

~~R1.6.~~R2.9. The cyber assets shall restrict access to privileged functions (deployed in hardware, software, and firmware) and security-relevant information to explicitly authorized personnel.

GUIDANCE: Explicitly authorized personnel include, for example, security administrators, system and network administrators, and other privileged users. Privileged users are individuals who have access to system control, monitoring, or administration functions (e.g., system administrators, information system security officers, maintainers, system programmers).

Within ICS, it is commonly the case that having access to specific devices (e.g., workstations, remote terminal units, field devices) is the equivalent to having privileged access; thereby restricting access to these devices is also restricting access to privileged functions and security-relevant information.

========== requirement & guidance based on AC-3 Appx F & I ==========

~~R1.7.~~R2.10. The Responsible Entity shall specify privileged functions that have impacts on facility, public, and environmental safety that require dual authorization.

GUIDANCE: The Responsible Entity does not employ dual-approval mechanisms when an immediate response is necessary to ensure public and environmental safety.

========== requirement & guidance based on AC-3 ICS-1 ==========

~~R1.8.~~R2.11. The cyber assets shall enforce assigned authorizations for controlling the flow of information within the Cyber Security Perimeter and between interconnected Cyber Security Perimeters in accordance with applicable policy.

GUIDANCE: Information flow control regulates where information is allowed to travel within a Cyber Security Perimeter and between Cyber Security Perimeters (as

opposed to who is allowed to access the information) and without explicit regard to subsequent accesses to that information. A few, of many, generalized examples of possible restrictions that are better expressed as flow control than access control are: keeping export controlled information from being transmitted in the clear to the Internet, blocking outside traffic that claims to be from within the Responsible Entity, and not passing any web requests to the Internet that are not from the internal web proxy. Information flow control policies and enforcement mechanisms are commonly employed by Responsible Entities to control the flow of information between designated sources and destinations (e.g., networks, individuals, devices) within Cyber Security Perimeters and between interconnected Cyber Security Perimeters. Flow control is based on the characteristics of the information and/or the information path. Specific examples of flow control enforcement can be found in boundary protection devices (e.g., proxies, gateways, guards, encrypted tunnels, firewalls, and routers) that employ rule sets or establish configuration settings that restrict information system services or provide a packet filtering capability.

========== requirement & guidance based on AC-4 ==========

~~R1.9.~~R2.12. The Responsible Entity shall identify roles and responsibilities where separation of duties is necessary. The cyber assets enforces separation of duties through assigned access authorizations.

GUIDANCE: The Responsible Entity establishes appropriate divisions of responsibility and separates duties as needed to eliminate conflicts of interest in the responsibilities and duties of individuals. There is access control software on the cyber assets that prevents users from having all of the necessary authority or information access to perform fraudulent activity without collusion. Examples of separation of duties include: (i) mission functions and distinct support functions are divided among different individuals/roles; (ii) different individuals perform cyber asset support functions (e.g., system management, systems programming, quality assurance/testing, configuration management, and network security); and (iii) security personnel who administer access control functions do not administer audit functions. In situations where the ICS cannot support the differentiation of roles or a single individual performs all roles within the ICS, the Responsible Entity shall employ appropriate compensating controls (e.g., providing increased personnel security and auditing measures).

========== requirement & guidance based on AC-5 Appx F&I ==========

R2.13. The Responsible Entity shall:

R2.13.1. Approve individual access privileges and enforce cyber access restrictions associated with changes to the critical cyber assets

~~R1.9.1.~~R2.13.2. Generate, retain, and review records reflecting all such changes.

GUIDANCE: Planned or unplanned changes to the hardware, software, and/or firmware components of the cyber assets can have significant effects on the overall security of the system. Accordingly, only qualified and authorized individuals obtain access to information system components for purposes of initiating changes, including upgrades, and modifications. In situations where the ICS cannot support the use of automated mechanisms to enforce access restrictions and support auditing of enforcement actions, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls

======== based on CM-5 from Appendixes F & I ==========

~~R1.10.~~R2.14. [R2.2] At all access points to the ~~Electronic~~ Cyber Security Perimeter(s) and at all Cyber Assets contained within the Perimeter, the Responsible Entity ~~shall enable~~shall enable only ports, functions, capabilities, and/or ~~services required~~services required for operations ~~and for~~ including monitoring Cyber Assets within the ~~Electronic~~ Cyber Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports, functions, capabilities, and services.

GUIDANCE: Cyber Assets are capable of providing a wide variety of functions and services. Some of the functions and services, provided by default, may not be necessary to support essential Responsible Entity operations (e.g., key missions, functions). Additionally, it is sometimes convenient to provide multiple services from a single component of a Cyber Asset, but doing so increases risk over limiting the services provided by any one component. The Responsible Entity limits component functionality to a single function per device (e.g., email server or web server, not both). The functions and services provided by Cyber Assets, or individual components of Cyber Assets, should be carefully reviewed to determine which functions and services are candidates for elimination (e.g., Voice Over Internet Protocol, Instant Messaging, File Transfer Protocol, Hyper Text Transfer Protocol, file sharing).

========== additions to requirement based on CM-7 ==========

R2.15. The Responsible Entity shall define and the cyber assets shall automatically enforce:

R2.15.1. A limit of consecutive invalid access attempts by a user during a specified time period, and restrictions on further accesses including

R2.15.2. A defined time period to lock the account, preventing access

~~R1.10.1.~~R2.15.3. A defined time period and algorithm to delays next login prompt.

GUIDANCE: Due to the potential for denial of service, automatic lockouts initiated by the cyber assets are usually temporary and automatically release after a predetermined time period established by the Responsible Entity.

In situations where the ICS cannot support account/node locking or delayed login attempts, or the ICS cannot perform account/node locking or delayed logins due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs appropriate compensating controls (e.g., logging or recording all unsuccessful login attempts and alerting security personnel though alarms or other means when the number of Responsible Entity-defined consecutive invalid access attempts is exceeded).

========== additions to requirement based on AC-7 Appx F & I ==========

~~R1.11.~~R2.16. The Responsible Entity shall define an interval of user inactivity after which the cyber assets shall initiate a session lock. The session lock remains in effect until the user reestablishes access using appropriate identification and authentication procedures.

GUIDANCE: Users can directly initiate session lock mechanisms. The ICS employs session lock to prevent access to specified workstations/nodes. The ICS activates session lock mechanisms automatically after a time period defined by the Responsible Entity for designated workstations/nodes on the ICS. In some cases, session lock for ICS operator workstations/nodes is not advised (e.g., when immediate operator responses are required in emergency situations). Session lock is not a substitute for logging out of the ICS. In situations where the ICS cannot support session lock, the Responsible Entity employs appropriate compensating controls (e.g., providing increased physical security, personnel security, and auditing measures)

========== additions based on AC-11 Appx F & I ==========

~~R1.12.~~R2.17. For remote access sessions, the Responsible Entity shall define an interval of user inactivity after which the cyber assets shall automatically terminate the session.

GUIDANCE: In situations where the ICS cannot support the automatic termination of remote sessions after a specified period of inactivity, or the ICS cannot automatically terminate remote sessions due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls (e.g., providing increased auditing measures for such sessions or limiting remote access privileges to key personnel).

========== based on AC-12 Appx F & I ==========

~~R1.13.~~R2.18. The Responsible Entity shall identify and document specific user actions that can be performed on the cyber assets without identification or authentication.

GUIDANCE: Emergency switches to stop operations are accessible to any individual with authorized physical access.

========== based on AC-14 ==========

~~R1.14.~~R2.19. [R2.6] Appropriate Use Banner — ~~Where technically feasible, electronic~~ ~~a~~Access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The banner shall inform potential users: (i) that the user is accessing a private system; (ii) that system usage may be monitored, recorded, and subject to audit; (iii) that unauthorized use of the system is prohibited and subject to criminal and civil penalties; and (iv) that use of the system indicates consent to monitoring and recording. The banner shall provides appropriate privacy and security notices (based on associated privacy and security policies or summaries) and remains on the screen until the user takes explicit actions to log on. The Responsible Entity shall maintain a document identifying the content of the banner.

========== additions to requirement based on AC-8 ==========

~~R2.~~R3. [R3] Monitoring ~~Electronic~~ Cyber Access — The Responsible Entity shall define, periodically review, and update, a list of auditable events and uses that list to generate audit records. The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging audit records for these events ~~access at access points to the Electronic Security Perimeter(s)~~twenty-four hours a day, seven days a week.

========== additions to requirement based on AU-2 ==========

GUIDANCE: The purpose of monitoring and logging audit records is to identify important events which need to be audited as significant and relevant to the reliability of the bulk electric grid. The Responsible Entity specifies which events require auditing and how the audition is implemented. Auditing activity can affect system performance. Therefore, the Responsible Entity decides, based upon a risk assessment, which events require auditing on a continuous basis and which events require auditing in response to specific situations. Audit records can be generated at various levels of abstraction, including at the packet level as information traverses the network. Selecting the right level of abstraction for audit record generation is a critical aspect of an audit capability and can facilitate the identification of root causes to problems. Additionally, the security audit function is coordinated with the network health and status monitoring function to enhance the mutual support between the two functions by the selection of information to be recorded by each function. The checklists and configuration guides at http://csrc.nist.gov/pcig/cig.html provide recommended lists of auditable events. The Responsible Entity defines auditable events that are adequate to support after-the-fact investigations of security incidents. Most auditing occurs at the application level. In situations where the Responsible Entity cannot support the use of automated mechanisms to generate

audit records, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls

========== based on AU-2 Appendix F & I ==========

~~R2.1.~~R3.1. Cyber assets shall produce audit records that contain sufficient information to establish what events occurred, the sources of the events, and the outcomes of the events. Cyber assets shall provide the capability to include additional, more detailed information in the audit records for audit events identified by type, location, or subject.

GUIDANCE: Audit record content includes, for most audit records: (i) date and time of the event; (ii) the component of the information system (e.g., software component, hardware component) where the event occurred; (iii) type of event; (iv) user/subject identity; and (v) the outcome (success or failure) of the event.

========== based on AU-3 ==========

~~R2.2.~~R3.2. The Responsible Entity allocates sufficient audit record storage capacity and configures auditing to reduce the likelihood of such capacity being exceeded.

========== based on AU-4 ==========

~~R2.3.~~R3.3. The Responsible Entity shall define actions to be taken in the event of an audit processing failure (e.g., overwrite oldest audit records, stop generating audit records). Cyber assets that perform auditing shall alert appropriate Responsible Entity officials and take these actions in the event of an audit processing failure.

GUIDANCE: Audit processing failures include, for example, software/hardware errors, failures in the audit capturing mechanisms, and audit storage capacity being reached or exceeded. In general, audit record processing is not performed on the ICS, but on a separate information system. In situations where the ICS cannot support auditing including response to audit failures, the Responsible Entity employs compensating controls (e.g., providing an auditing capability on a separate information system).

========== requirement based on AU-5 Appx F & I ==========

~~R2.4.~~R3.4. [R3.1] For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device~~, where technically feasible.~~.

~~R2.5.~~R3.5. [R3.2] ~~Where technically feasible, t~~The Responsible Entity's security monitoring process(es) shall regularly review/analyze audit records with respect to the enforcement and usage of cyber asset access controls for indications of inappropriate or unusual activity, investigate suspicious activity or suspected violations, detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel who take necessary actions. The Responsible Entity shall employ automated mechanisms to facilitate the review of user activities. If the Responsible Entity takes an exception to ~~Where~~ alerting ~~is not technically feasible~~as specified in section A.6, the Responsible Entity shall review or otherwise assess ~~access logs~~audit records for attempts at or actual unauthorized ~~accesses~~ activities at least every ninety calendar days.

GUIDANCE: The Responsible Entity reviews audit records (e.g., user activity logs) for inappropriate activities in accordance with Responsible Entity procedures. The Responsible Entity investigates any unusual cyber asset-related activities and periodically reviews changes to access authorizations. The Responsible Entity reviews more frequently the activities of users with significant cyber asset roles and

responsibilities. In situations where the ICS cannot support the use of automated mechanisms for reviewing user activities, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls.

Responsible Entities increase the level of audit monitoring and analysis activity within the system whenever there is an indication of increased risk based on law enforcement information, intelligence information, or other credible sources of information.

========== based on AC-13 Appx F & I and AU-6 ==========

~~R2.6.~~R3.6. The Responsible Entity shall define a list of inappropriate or unusual activities with security implications that are to result in automated alerts that shall be sent to designated security personnel.

========== requirements based on AU-6 ==========

R3.7. The Responsible Entity shall provide an audit reduction and report generation capability. The audit reduction and report generation system shall provide the capability to automatically process audit records for events of interest based upon selectable, event criteria..

GUIDANCE: Audit reduction, review, and reporting tools support after-the-fact investigations of security incidents without altering original audit records. In general, audit record processing is not performed on the Critical Cyber Asset, but on a separate cyber asset.

========== based on AU-7 Appx F & I ==========

~~R2.7.~~R3.8. The Responsible Entity shall employ time stamps in audit record generation. The Responsible Entity shall define the frequency for synchronizing internal clocks. The cyber assets shall synchronize internal system clocks at this frequency.

GUIDANCE: Time stamps (including date and time) of audit records are generated using internal system clocks.

========== requirement based on AU-8 ==========

~~R2.8.~~R3.9. The Responsible Entity shall protect audit information and audit tools from unauthorized access, modification, and deletion.

GUIDANCE: Audit information includes all information (e.g., audit records, audit settings, and audit reports) needed to successfully audit information system activity

========== based on AU-9 ==========

R4. -Cyber Security Perimeter Assessment — The Responsible Entity shall establish a program to assess the security of the Cyber Security Perimeter.

R4.1. The Responsible Entity shall develop detailed Cyber Security Perimeter testing standards, processes, and procedures (called "CSP Security Assessment Guide") to provide direction and guidance on security testing; the Guides must:

R4.1.1. Identify who is to be held accountable and responsible for ensuring that information security tests comply with Responsible Entity requirements.

R4.1.2. Identify the Responsible Entity requirements with which security tests must comply, i.e., test scenarios must map to and support security requirements, must specify the minimum set of security controls evaluated during tests, as well as the depth and breadth of tests.

R4.1.3. Specify the appropriate roles and responsibilities, i.e., there must be well-qualified personnel in both security testing and analysis, and care must be

taken to ensure separation of duties when testing; for example, testing and analysis must be performed by an independent person(s).

R4.1.4. Adhere to established methodology that identify and test for security controls for the types of testing being performed, viz., NIST guidelines describe these methods as interview, examine and test.

R4.1.5. Specify a testing environment and criteria to be added per NIST SP 800-53A and SP 800-115 and describe these methods, such as the use of dedicated test equipment that must be used for security testing.

R4.1.6. State the frequency of assessmentswhen and how often testing is to be performed.

R4.1.7. Provide the documentation requirements, such as test plans and test results; i.e., adequately securing the results and analysis information and artifacts from testing.

R4.1.8. Specify the criteria for the analysis of the tests and the dissemination of results and recommendations.

R4.1.9. Develop a plan of action, milestones, and schedule to correct deficiencies found during testing.

~~R2.9.~~R4.2. [R4] Cyber Vulnerability Assessment — The Responsible Entity shall employ a qualified independent agent or team to conduct assessment of (a) ~~perform a~~ cyber vulnerabilities ~~y assessment~~ of the ~~electronic~~ access points to the ~~Electronic~~ Cyber Security Perimeter(s)- at least annually, or when significant new vulnerabilities potentially affecting the cyber assets are identified and reported.. The vulnerability assessment shall be conducted in accordance with the CSP Security Assessment Guide. The vulnerability assessment shall include, at a minimum, the following:

========== based on CA-4 and RA-5 ==========

~~R2.9.1.~~R4.2.1. [R4.1] A document identifying the vulnerability assessment process;

~~R2.9.2.~~R4.2.2. [R4.2] A review to verify that only ports and services required for operations at these access points are enabled;

~~R2.9.3.~~R4.2.3. [R4.3] The discovery of all access points to the ~~Electronic~~ Cyber Security Perimeter;

~~R2.9.4.~~R4.2.4. [R4.4] A review of controls for default accounts, passwords, and network management community strings; ~~and,~~

~~R2.9.5.~~R4.2.5. [R4.5] Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

========== based on CA-4 ==========

GUIDANCE: Vulnerability scanning is conducted using appropriate scanning tools and techniques. The Responsible Entity trains selected personnel in the use and maintenance of vulnerability scanning tools and techniques. Vulnerability scans are scheduled and/or random in accordance with Responsible Entity policy and assessment of risk. The information obtained from the vulnerability scanning process is freely shared with appropriate personnel throughout the Responsible Entity to help eliminate similar vulnerabilities in other cyber assets. Vulnerability analysis for custom software and applications may require additional, more specialized approaches (e.g., vulnerability scanning tools for applications, source code reviews, static analysis of source code).

Vulnerability scanning tools are used with care on ICS networks to ensure that ICS functions are not adversely impacted by the scanning process. Production ICS may need to be taken off-line, or replicated to the extent feasible, before scanning can be conducted. If ICS are taken off-line for scanning, scans are scheduled to occur during planned ICS outages whenever possible. If vulnerability scanning tools are used on non-ICS networks, extra care is taken to ensure that they do not scan the ICS network. In situations where the Responsible Entity cannot, for operational reasons, conduct vulnerability scanning on a production ICS, the Responsible Entity employs compensating controls (e.g., providing a replicated system to conduct scanning)

========== guidance based on RA-5 Appx F & I ==========

~~R2.10.~~R4.3. Cyber Control Assessment - The Responsible Entity shall employ a qualified independent agent or team to conduct an assessment of the implementation of all the cyber security controls in the Cyber Security Perimeter at least annually, or when significant new vulnerabilities potentially affecting the cyber assets are identified and reported. The implementation assessment shall -determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements. The implementation assessment shall be conducted in accordance with the CSP Security Assessment Guide.

~~R3.~~R5. [R5] Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005.

R5.1. The Responsible Entity shall develop, document, and maintain a current inventory of the cyber assets in the Cyber Security Perimeter and relevant ownership information. The Responsible Entity shall update the inventory of cyber assets as an integral part of component installations.

GUIDANCE: The Responsible Entity determines the appropriate level of granularity for the cyber asset components included in the inventory that are subject to management control (i.e., tracking, and reporting). The inventory of cyber asset components includes any information determined to be necessary by the Responsible Entity to achieve effective property accountability (e.g., manufacturer, model number, serial number, software license information, system/component owner). The component inventory is consistent with the Cyber Security Perimeter.

========== based on CM-8 ==========

R5.2. The Responsible Entity shall develop, document, and maintain a current baseline configuration of all the cyber assets in the Cyber Security Perimeter.

GUIDANCE: This requirement establishes a baseline configuration for the cyber assets. The baseline configuration provides information about a particular component's makeup (e.g., the standard software load for a workstation or notebook computer including updated patch information) and the component's logical placement within the cyber assets architecture. The baseline configuration also provides the Responsible Entity with a well-defined and documented specification to which the cyber assets are built and deviations, if required, are documented in support of mission needs/objectives.

========== based on CM-2 ==========

R5.3. [R5.1] The Responsible Entity shall ensure that all documentation required by Standard CIP-005 reflect the current ~~configurations~~baseline configurations and processes and

shall review the documents and procedures referenced in Standard CIP-005 at least annually.

========== based on CM-2 ==========

R5.4. The Responsible Entity shall:

R5.4.1. Authorize, document, and control changes to the cyber assets in the Cyber Security Perimeter.

R5.4.2. Test, validate, and document changes (e.g., patches and updates) before implementing the changes on the operational CSP.

~~R3.1.1.~~R5.4.3. Employ automated mechanisms to: (i) document proposed changes to the cyber assets; (ii) notify appropriate approval authorities; (iii) highlight approvals that have not been received in a timely manner; (iv) inhibit change until necessary approvals are received; and (v) document completed changes to the cyber assets.

GUIDANCE: The Responsible Entity manages configuration changes to the information system using an Responsible Entity-approved process (e.g., a chartered Configuration Control Board). Configuration change control involves the systematic proposal, justification, implementation, test/evaluation, review, and disposition of changes to the information system, including upgrades and modifications. Configuration change control includes changes to the configuration settings for information technology products (e.g., operating systems, firewalls, routers). The Responsible Entity includes emergency changes in the configuration change control process, including changes resulting from the remediation of flaws. The approvals to implement a change to the information system include successful results from the security analysis of the change. The Responsible Entity audits activities associated with configuration changes to the information system.

The Responsible Entity ensures that testing does not interfere with ICS functions. The individual/group conducting the tests fully understands the Responsible Entity information security policies and procedures, the ICS security policies and procedures, and the specific health, safety, and environmental risks associated with a particular facility and/or process. A production ICS may need to be taken off-line, or replicated to the extent feasible, before testing can be conducted. If an ICS must be taken off-line for testing, the tests are scheduled to occur during planned ICS outages whenever possible. In situations where the Responsible Entity cannot, for operational reasons, conduct live testing of a production ICS, the Responsible Entity employs compensating controls (e.g., providing a replicated system to conduct testing).

In situations where the ICS cannot support the use of automated mechanisms to implement configuration change control, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls.

========== based on CM-3 ==========

~~R3.2.~~R5.5. [R5.2] The Responsible Entity shall update the documentation to reflect the modification of the cyber assets in the Cyber Security Perimeter~~network or controls~~ within ninety calendar days of the change.

R5.6. The Responsible Entity shall:

R5.6.1. Establish mandatory configuration settings for cyber assets employed within the Cyber Security Perimeter

R5.6.2. Configure the security settings of cyber assets to the most restrictive mode consistent with operational requirements

R5.6.3. Document the configuration settings

R5.6.4. Enforce the configuration settings in all cyber assets

R5.6.5. Employ automated mechanisms to centrally manage, apply, and verify configuration settings. In situations where the cyber assets cannot support the use of automated mechanisms to centrally manage, apply, and verify configuration settings, the Responsible Entity shall employ nonautomated mechanisms or procedures as compensating controls.

==========requirement based on CM-6 Appx F & I ==========

~~R3.3.~~R5.7. [R5.3] The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008.

R6. Identification and Authentication — The Responsible Entity shall maintain identification and authentication to support access control.

~~R3.4.~~R6.1. The Responsible Entity shall require critical cyber assets to uniquely identify and authenticate users (or processes acting on behalf of users).

GUIDANCE: Authentication is the process of establishing confidence in user identities presented. Authentication of user identities is accomplished through the use of passwords, tokens, biometrics, or in the case of multifactor authentication, some combination thereof. Human authentication factors are generally classified into three cases: (1) Something the user has (e.g., ID card, security token, software token, phone, or cell phone); (2) Something the user knows (e.g., a password, pass phrase, or personal identification number (PIN)); and (3) Something the user is or does (e.g., fingerprint or retinal pattern, DNA sequence (there are assorted definitions of what is sufficient), signature or voice recognition, unique bio-electric signals, or another biometric identifier)[1]. The Office of Management and Budget (OMB) has issued guidance that defines levels of authentication[2]. NIST has published further guidance[3].

Where users function as a single group (e.g., control room operators), user identification and authentication may be role-based, group-based, or device-based. For certain ICS, the capability for immediate operator interaction is critical. Local emergency actions for ICS must not be hampered by identification or authentication requirements. Access to these systems may be restricted by appropriate physical security controls. In situations where the ICS cannot support user identification and authentication, or the Responsible Entity determines it is not advisable to perform user identification and authentication due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs appropriate compensating controls (e.g., providing increased physical security, personnel security, and auditing measures). For example, manual voice authentication of remote personnel and local, manual actions may be required in order to establish a remote access.

Local and remote user access to ICS components is enabled only when necessary, approved, and authenticated. Remote access refers to access to a cyber asset by a user

[1] Derived from *Wikipedia* http://en.wikipedia.org/wiki/Two-factor_authentication, there being no authoritative definition available.

[2] *E-Authentication Guidance for Federal Agencies*, Office of Management and Budget memorandum M 04-04, December 2003.

[3] *Electronic Authentication Guideline*, NIST Special Publication 800-63 Version 1.0.1, September 2004.

(or a cyber asset) communicating through an external network not controlled by the Responsible Entity.

========== based on CA-3 & IA-2 Appx F&I ==========

~~R3.5.~~R6.2. The Responsible Entity shall manage user identifiers by:

- Uniquely identifying each user
- Verifying the identity of each user
- Receiving authorization to issue a user identifier from an appropriate Responsible Entity official
- Issuing the user identifier to the intended party
- Define and implement a period of inactivity for disabling a user identifier
- Archiving user identifiers.

GUIDANCE: Where users function as a single group (e.g., control room operators), user identification may be role-based, group-based, or device-based.

==========requirement based on IA-4 Appx F&I ==========

~~R3.6.~~R6.3. The cyber assets shall identify and authenticate specific devices before establishing a connection.

GUIDANCE: In situations where the ICS cannot support device identification and authentication (e.g., serial devices), the Responsible Entity employs compensating controls

========= requirements and guidance based on IA-3 Appx F&I ==========

R6.4. The Responsible Entity shall manage authenticators by:

R6.4.1. Defining initial authenticator content

R6.4.2. Establishing administrative procedures for initial authenticator distribution, for lost/compromised, or damaged authenticators, and for revoking authenticators

R6.4.3. Changing default authenticators upon information system installation

~~R3.6.1.~~R6.4.4. Changing/refreshing authenticators periodically.

GUIDANCE: Authenticators include, for example, tokens, PKI certificates, biometrics, passwords, and key cards. Users take reasonable measures to safeguard authenticators including maintaining possession of their individual authenticators, not loaning or sharing authenticators with others, and reporting lost or compromised authenticators immediately. For password-based authentication, the cyber assets: (i) protects passwords from unauthorized disclosure and modification when stored and transmitted; (ii) prohibits passwords from being displayed when entered; (iii) enforces password minimum and maximum lifetime restrictions; and (iv) prohibits password reuse for a specified number of generations. For PKI-based authentication, the cyber assets: (i) validates certificates by constructing a certification path to an accepted trust anchor; (ii) establishes user control of the corresponding private key; and (iii) maps the authenticated identity to the user account.

Many ICS devices and software are shipped with factory default authentication credentials to allow for initial installation and configuration. However, factory default authentication credentials are often well known, easily discoverable, present a great

security risk, and therefore must be changed. Authentication may be role-based, group-based, or device-based.

========== requirement and guidance based on IA-5 Appx F&I ==========

~~R3.7.~~R6.5. Cyber Assets shall obscure feedback of authentication information during an interactive human authentication process to protect the information from possible exploitation/use by unauthorized individuals.

GUIDANCE: The feedback from the cyber assets does not provide information that would allow an unauthorized user to compromise the authentication mechanism. Displaying asterisks when a user types in a password is an example of obscuring feedback of authentication information.

========== based on IA-6 ==========

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-005. Responsible entities may document controls either individually or by specified applicable grouping.

M1. Documents about the Electronic Security Perimeter as specified in Requirement R1.

M2. Documentation of the electronic access controls to the Electronic Security Perimeter(s), as specified in Requirement R2.

M3. Documentation of controls implemented to log and monitor access to the Electronic Security Perimeter(s) as specified in Requirement R3.

M4. Documentation of the Responsible Entity's ~~annual vulnerability~~Cyber Security Perimeter assessment as specified in Requirement R4.

M5. Access logs and documentation of review, changes, and log retention as specified in Requirement R5.

M6. Documentation of the indetification and authentication controls as specified in Requirement R6.

~~M5.~~M7. Documentation of the Exception Plans as specified in Section A.6 Exemptions.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep logs for a minimum of ninety calendar days, unless longer retention is required pursuant to Standard CIP-008, Requirement R2.

1.3.2 The Responsible Entity shall keep other documents and records required by Standard CIP-005 from the previous full calendar year.

1.3.3 The compliance monitor shall keep audit records for three years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in noncompliance. Refer to CIP-003 Requirement R3.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 All document(s) identified in CIP-005 exist, but have not been updated within ninety calendar days of any changes as required; or,

2.1.2 Access to less than 15% of electronic security perimeters is not controlled, monitored; and logged;

2.1.3 Document(s) exist confirming that only necessary network ports and services have been enabled, but no record documenting annual reviews exists; or,

2.1.4 At least one, but not all, of the Electronic Security Perimeter vulnerability assessment items has been performed in the last full calendar year.

2.1.5 The Exception Plan exists but has been approved, but not in the last full calendar year by a Responsibility Entity senior manager.

2.2. Level 2:

2.2.1 All document(s) identified in CIP-005 but have not been updated or reviewed in the previous full calendar year as required; or,

2.2.2 Access to between 15% and 25% of electronic security perimeters is not controlled, monitored; and logged; or,

2.2.3 Documentation and records of vulnerability assessments of the Electronic Security Perimeter(s) exist, but a vulnerability assessment has not been performed in the previous full calendar year.

~~2.2.3~~2.2.4 The Exception Plan exists and has been approved in the last full calendar year by a Responsibility Entity senior manager, but has not been approved in the last full calendar year by the Regional Reliability Organization.

2.3. Level 3:

2.3.1 A document defining the Electronic Security Perimeter(s) exists, but there are one or more Critical Cyber Assets not within the defined Electronic Security Perimeter(s); or,

2.3.2 One or more identified non-critical Cyber Assets is within the Electronic Security Perimeter(s) but not documented; or,

2.3.3 Electronic access controls document(s) exist, but one or more access points have not been identified; or

2.3.4 Electronic access controls document(s) do not identify or describe access controls for one or more access points; or,

2.3.5 Electronic Access Monitoring:

2.3.5.1 Access to between 26% and 50% of Electronic Security Perimeters is not controlled, monitored; and logged; or,

2.3.5.2 Access logs exist, but have not been reviewed within the past ninety calendar days; or,

2.3.6 Documentation and records of vulnerability assessments of the Electronic Security Perimeter(s) exist, but a vulnerability assessment has not been performed for more than two full calendar years.

~~2.3.6~~2.3.7 The Exception Plan exists but has not has been approved in the last full calendar year by a Responsibility Entity senior manager, and has not been approved in the last full calendar year by the Regional Reliability Organization.

2.4. Level 4:

2.4.1 No documented Electronic Security Perimeter exists; or,

2.4.2 No records of access exist; or,

2.4.3 51% or more Electronic Security Perimeters are not controlled, monitored, and logged; or,

2.4.4 Documentation and records of vulnerability assessments of the Electronic Security Perimeter(s) exist, but a vulnerability assessment has not been performed for more than three full calendar years; or,

2.4.5 No documented vulnerability assessment of the Electronic Security Perimeter(s) process exists.

2.4.6 The Exception Plan does not exists.

E. Regional Differences

None identified.

~~**Version History**~~

~~Version~~	~~Date~~	~~Action~~	~~Change Tracking~~

NIST Augmented CIP Glossary

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Critical Assets: Those facilities, systems, and equipment which, if destroyed, damaged, degraded, or otherwise rendered unavailable, would have a significant impact on the ability to serve large quantities of customers for an extended period of time, would have a detrimental impact on the reliability or operability of the Bulk Electric System, or would cause significant risk to public health and safety.

Cyber Assets: Those programmable electronic devices and communication networks including hardware, software, and data.

Critical Cyber Assets: Those Cyber Assets essential to the reliable operation of Critical Assets.

Cyber Security Incident: Any malicious act or suspicious event that:

. • Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or,

. • Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset.

~~Electronic~~ Cyber Security Perimeter: The logical border surrounding a network to which Critical Cyber Assets are connected ~~and~~, for which access is controlled. Critical and non-critical Cyber Asset within a defined Cyber Security Perimeter shall protected pursuant to the requirements of the CIPs.

==========

[Discussion is not part of the recommendation. It is provided to assist the drafting committee.]

Information may be stored, transmitted, and processed using multiple ditital and analog media including electro-magnetic fields in space on on media in frequencies commonly described as electrical and optical. For example, fibre optic, infrared, and radio wireless communications are all common, but are not “electronic.” NIST believes that “Electronic” is too limited a term and has replaced it with “Cyber” as being more inclusive.

The last sentence is added to incorporate CIP-005 requirement R1.4.

==========

Dial-up: Use of public or private switched telephone network to establish data communication between modems. Call establishment in the switched telephone network occurs prior to the data communication.

Industrial Control System (ICS): An information system (e.g., a discrete set of information resources) used to control industrial processes such as the bulk electric grid. Industrial control systems include supervisory control and data acquisition (SCADA) systems used to control geographically dispersed assets, as well as distributed control systems (DCS) and smaller control systems using programmable logic controllers to control localized processes. All cyber assets within the Cyber Security Perimeter are part of the ICS.

=========Based on SP 800-53 glossary and 44 U.S.C., Sec. 3502==========

Multifactor Authentication: Electronic authentication (E-authentication) is the process of establishing confidence in user identities electronically presented to an information system. Multifactor authentication is a system wherein more than one different factors are used to authenticate, thereby delivering a higher level of authentication assurance. Using more than one factor is sometimes called strong authentication. Human authentication factors are generally classified into three cases: (1) Something the user has (e.g., ID card, security token, software token, phone, or cell phone); (2) Something the user knows (e.g., a password, pass phrase, or personal identification number (PIN)); and (3) Something the user is or does (e.g., fingerprint or retinal pattern, DNA sequence (there are assorted definitions of what is sufficient), signature or voice recognition, unique bio-electric signals, or another biometric identifier).

===Based on PC Magazine Encyclopedia http://www.pcmag.com/category2/0,2806,1846380,00.asp===

Physical Security Perimeter: The physical six-wall border surrounding computer rooms, telecommunications rooms, operations centers, and other locations in which Critical Cyber Assets are housed and for which access is controlled.

Remote Access: Any access to an Cyber Security Perimeter by a user (or a cyber asset) communicating through an external network not under the control of the Responsible Entity (e.g., the Internet, public switched telephone network).

==========Based on SP 800-53 glossary ==========

Routing of Data Communications Protocols:

Data communication protocols consist of a header, which contains addressing and other information, followed by user data. Data communication protocols can be Routable or Non-routable.

In Routable protocols, the header contains a network address as well as a device address. The network address allows message units (packets or frames) to be

forwarded from a device in one network to a device in another. Examples of routable protocols are TCP/IP, IPX, and DECnet.

In Non-routable protocols, the header contains only a device address and not a network address. They do not incorporate an addressing scheme for sending data from one network to another (i.e., the communicating devices must reside in the same network). Examples of non-routable protocols are NetBIOS and DEC's LAT protocols.

Security Plan: Formal document that provides an overview of the security requirements for the Cyber Security Perimeter and all cyber assets within the Cyber Security Perimeter, and describes the security controls in place or planned for meeting those requirements.

==========Based on SP 800-53 glossary ==========

NIST Example Augmentation of Standard CIP–005

Cyber Security — Cyber Security Perimeter Protection

October 7, 2008

========== General comments ==========

Discussion (set off by "======" and colored blue) is not part of the NIST augmentation. It is provided to assist the drafting committee.

Order 706 ¶ 61 gives the ERO direction to provide additional guidance in the CIPs or in a separate reference document. For convenience, the guidance is placed in this manuscript. This guidance is part of NIST's augmentation.

==========

A. Introduction

1. Title: Cyber Security — ~~Electronic~~ Cyber Security Perimeter~~(s)~~ (CSP) Protection

2. Number: CIP-005-~~1~~2

3. Purpose: Standard CIP-005 requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 ~~using reasonable business judgment~~.

4. Applicability

4.1. [4.1] Within the text of Standard CIP-005, "Responsible Entity" shall mean all entities that could affect the reliability of the bulk electric grid by virtue of cyber connection to any control system component of the bulk electric system.. Responsible Entities include, but are not limited to:

==========

NIST recommends that all entities that could affect the reliability of the bulk electric grid should be included. Advances in digital electronics technology and computer hardware and software have obsoleted prior distinctions among computing, communications, and control systems. Today, all are collectively considered Information Technology (IT). Until recently, Industrial Control Systems (ICS) had little resemblance to traditional information systems in that they were isolated systems running proprietary software and control protocols. However, as these systems have been increasingly integrated more closely into mainstream organizational information systems to promote connectivity, efficiency, and remote access capabilities, they have started to resemble the more traditional information systems. Increasingly, ICS use the same commercially available hardware and software components as are used in the Responsible Entity's traditional information systems. While the change in industrial control system architecture supports new information system capabilities, it also provides significantly less isolation from the outside world for these systems, introducing many of the same vulnerabilities that exist in current networked information systems. The result is an even greater need to secure ICS.

The interconnection of infrastructures has obsoleted prior distinctions. Distribution Systems and Energy Management Systems should be included. Enumeration can be helpful as examples, providing the enumeration states "including, but not limited to."

==========

- Reliability Coordinator.
- Balancing Authority.
- Interchange Authority.
- Transmission Service Provider.

- Transmission Owner.
- Transmission Operator.
- Generator Owner.
- Generator Operator.
- Load Serving Entity.
- NERC.
- Regional Reliability Organizations.

4.2. [4.2] The following are exempt from Standard CIP-005:

4.2.1 [4.2.1] Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

==========

NIST notes that on September 18, 2008 FERC issued the following Proposed Clarification: facilities within a nuclear generation plant in the United States that are not regulated by the U.S. Nuclear Regulatory Commission are subject to compliance with the eight mandatory "CIP" Reliability Standards approved in Commission Order No. 706.

==========

4.2.2 [4.2.2] Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters that are not under the direct control and management of the Responsible Entity..

4.2.3 [4.3.3] Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~TBD

~~5.~~6. Exceptions

==========

In Order No. 706 FERC directed the development of a framework to provide accountability when a Responsible Entity relies on technical infeasibility or certain other factors to take exception to specific Requirements. FERC specified that the structural elements of this framework include mitigation steps, a remediation plan, a timeline for eliminating use of the technical feasibility exception unless appropriate justification otherwise is provided, regular review of whether it continues to be necessary to invoke the exception, internal approval by the senior manager, wide-area approval through the ERO's audit process, and cooperation with the ERO to provide the Commission with high-level, wide-area analysis regarding the effects the technical feasibility exception on the reliability of the Bulk-Power System. See ¶ 152, 157-163, 178-187, 192-195, and 209-222.

==========

6.1. The Responsible Entity may take exception to any Requirement based on the Responsible Entity's determination that any of the following conditions apply:

- The Requirement interferes with ICS functions
- The Requirement poses a risk to the reliability of the bulk electric grid
- The ICS cannot support the use of the required mechanisms or implement the required function
- The Requirement will have a significant adverse impact on performance, safety, or reliability

6.2. The Responsible Entity shall document all exceptions in an Exception Plan provided to the ERO and Regional Reliability Organization containing:

6.2.1 A convincing argument why the exception is necessary

6.2.2 Compensating controls or mitigation steps to address the intent of the Requirement

6.2.3 A plan of action, milestones, and schedule for implementing the compensating controls or mitigation steps

6.3. The Exception Plan must be approved annually by a Responsibility Entity senior manager.

6.4. The Exception Plan must be approved annually by the Regional Reliability Organization, or the ERO if there is no applicable RRO.

6.5. The ERO must annually audit compliance with the Exception Plan and provide FERC with an annual high-level, wide-area analysis regarding the effects of all exceptions on the reliability of the Bulk-Power System.

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-005:

==========

Information may be stored, transmitted, and processed using multiple digital and analog media including electro-magnetic fields in space on media in frequencies commonly described as electrical and optical. For example, fiber optic, infrared, and radio wireless communications are all common, but are not "electronic." NIST believes that "Electronic" is too limited a term and has replaced it with "Cyber" as being more inclusive. "Logical" is another term that could be used.

==========

R0. Cyber Security Perimeter Policy and Procedures — The Responsible Entity shall: develop, disseminate, and periodically review and update: (i) a formal, documented, policy on the protection of all Cyber Security Perimeter(s), the cyber assets contained within, and identification and authentication. This policy shall address purpose, scope, roles, responsibilities, management commitment, coordination among Responsible Entity's sub-entities, and compliance; and (ii) formal, documented procedures to facilitate the implementation of this policy and associated controls.

GUIDANCE: This requirement does not prescribe an organization structure for the Responsible Entity 's cyber security policy. The Cyber Security Perimeter Policy and Procedures may be included as part of the general information security policy for the Responsible Entity, or the ICS cyber security policy.

========== based on AC-1 & IA-1 ==========

~~R0.~~R1. [R1] ~~Electronic~~ Cyber Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within a~~n Electronic~~ Cyber Security Perimeter. The Responsible Entity shall identify and document the ~~Electronic~~ Cyber Security Perimeter(s) and all access points to the perimeter(s).

~~R0.1.~~R1.1. [R1.1] Access points to the ~~Electronic~~ Cyber Security Perimeter(s) shall include any externally connected communication ~~end~~ interface point (for example, dial-up modems) terminating at any device at ~~within~~ the ~~Electronic~~ Cyber Security Perimeter(s).

==========

The concept of logically locating the modem at the Perimeter eliminates the need to physically protect the circuit between the modem and the Perimeter, as required in CIP-006.

==========

~~R0.2.~~R1.2. [R1.2] For a dial-up accessible Critical Cyber ~~Asset that~~Asset that uses a non-routable protocol, the Responsible Entity shall define an ~~Electronic~~ Cyber Security Perimeter for that single access point at the dial-up device or shall include the Asset within a defined Cyber Security Perimeter.~~.~~

~~R0.3.~~R1.3. [R1.3] Communication links that are not under the direct control and management of any Responsible Entity connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, ~~end~~ interface points of these communication links ~~within~~ at the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).

==========

The interface between assets controlled by the Responsible Entity and assets controlled by another party is not necessarily the end point for communication. The interface may simply be the demarcation between two domains of responsibility and may also provide changes in information representation or addressing (e.g., optical to electronic, network access translation (NAT)).

==========

~~R0.4.~~R1.4. [R1.4] Any non-critical Cyber Asset within a defined ~~Electronic~~ Cyber Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005.

~~R0.5.~~R1.5. [R1.5] Cyber Assets used in the access control and monitoring of the ~~Electronic~~ Cyber Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003, Standard CIP-004 Requirement R3, Standard CIP-005 Requirements R2 and R3, Standard CIP-006 Requirements R2 and R3, Standard CIP-007, Requirements R1 and R3 through R9, Standard CIP-008, and Standard CIP-009.

~~R0.6.~~R1.6. [R1.6] The Responsible Entity shall maintain documentation of ~~Electronic~~ Cyber Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all ~~electronic~~ access points to the ~~Electronic~~ Cyber Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.

GUIDANCE: Any connections to the Internet, or other external networks, communication systems, cyber assets, or information systems that are not under the control of the Responsible Entity, occur through managed interfaces consisting of appropriate boundary protection devices (e.g., proxies, gateways, routers, firewalls, guards, encrypted tunnels) arranged in an effective architecture (e.g., routers protecting firewalls and application gateways residing on a protected subnetwork commonly referred to as a demilitarized zone or DMZ). Cyber assets at any designated alternate processing sites are provided the same levels of protection as that of the primary site.

As part of a defense-in-depth protection strategy, the Responsible Entity considers partitioning higher-impact cyber assets into separate physical domains (or environments) and applying the concepts of managed interfaces described above to restrict or prohibit network access in accordance with the Responsible Entity's assessment of risk .

The Responsible Entity carefully considers the intrinsically shared nature of commercial telecommunications services in the implementation of security controls associated with the use of such services. Commercial telecommunications services are

commonly based on network components and consolidated management systems shared by all attached commercial customers, and may include third party provided access lines and other service elements. Consequently, such interconnecting transmission services may represent sources of increased risk despite contract security provisions. Therefore, when this situation occurs, the Responsible Entity implements appropriate compensating security controls.

========== guidance based on SC-7 ==========

R1.7. The Responsible Entity physically allocates publicly accessible cyber assets to separate subnetworks with separate, physical network interfaces.

GUIDANCE: Publicly accessible cyber assets include, for example, emergency cut-off activators. Generally, public access to ICS information is not permitted.

========== based on SC-7 control enhancement 1 Appx F & I==========

R1.8. The Responsible Entity shall prevent public access into the Responsible Entity's internal networks except as appropriately mediated.

========== based on SC-7 control enhancement 2 ==========

~~R0.7.~~R1.9. The Responsible Entity shall limit the number of access points to the Cyber Security Perimeter to allow for better monitoring of inbound and outbound network traffic.

========== based on SC-7 enhancement 3 ==========

~~R0.8.~~R1.10. The Responsible Entity shall implement a managed interface (boundary protection devices in an effective security architecture) with any external telecommunication service, implementing controls appropriate to the required protection of the confidentiality and integrity of the information being transmitted.

========== based on SC-7 enhancement 4 ==========

~~R1.~~R2. [R2] ~~Electronic~~ Cyber Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of ~~electronic~~ cyber access at all ~~electronic~~ cyber access points ~~to~~ at the ~~Electronic~~ Cyber Security Perimeter(s)~~.~~, and at key internal boundaries within the Cyber Security Perimeter(s).

~~R1.1.~~R2.1. [R2.5] The required documentation shall, at least, identify and describe:

~~R1.1.1.~~R2.1.1. [R2.5.1] The processes for access request and authorization.

~~R1.1.2.~~R2.1.2. [R2.5.2]The authentication methods.

~~R1.1.3.~~R2.1.3. [R2.5.3] The review process for authorization rights, in accordance with Standard CIP-004 Requirement R4.

~~R1.1.4.~~R2.1.4. [R2.5.4] The controls used to secure dial-up accessible connections.

GUIDANCE: Any connections to the Internet, or other external networks or information systems, occur through managed interfaces consisting of appropriate boundary protection devices (e.g., proxies, gateways, routers, firewalls, guards, encrypted tunnels) arranged in an effective architecture (e.g., routers protecting firewalls and application gateways residing on a protected subnetwork commonly referred to as a demilitarized zone or DMZ). Cyber security boundary protections at any designated alternate processing sites provide the same levels of protection as that of the primary site.

As part of a defense-in-depth protection strategy, the Responsible Entity considers partitioning higher-impact information systems into separate physical domains (or

environments) and applies the concepts of managed interfaces described above to restrict or prohibit network access in accordance with an Responsible Entity's assessment of risk.

The Responsible Entity carefully considers the intrinsically shared nature of commercial telecommunications services in the implementation of security controls associated with the use of such services. Commercial telecommunications services are commonly based on network components and consolidated management systems shared by all attached commercial customers, and may include third party provided access lines and other service elements. Consequently, such interconnecting transmission services may represent sources of increased risk despite contract security provisions.

========== based on SC-7 ==========

~~R1.2.~~R2.2. [R2.1] These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.

R2.3. [R2.3] The Responsible Entity shall maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s). The Responsible Entity shall:

R2.3.1. Employ automated mechanisms to facilitate the monitoring and control of dial-up access.

R2.3.2. Determine if cryptography is required to protect the confidentiality and integrity of dial-up access sessions.

R2.3.3. Permit dial-up access for privileged functions only for compelling operational needs and documents the rationale for such access in the security plan for the Cyber Security Perimeter .

GUIDANCE: The Responsible Entity restricts access achieved through dial-up connections (e.g., limiting dial-up access based upon source of request) or protects against unauthorized connections or subversion of authorized connections (e.g., using virtual private network technology). NIST Special Publication 800-63 provides guidance on remote electronic authentication. NIST Special Publication 800-77 provides guidance on IPsec-based virtual private networks.

Dial-up access to ICS locations (e.g., control centers, field locations) is only enabled when necessary, approved, and authenticated. In situations where the ICS cannot support the use of automated mechanisms for monitoring and control of dial-up access methods, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls (e.g., following manual authentication, dial-in remote access may be enabled for a specified period of time or a call may be placed from the ICS site to the authenticated remote entity).

Cryptography is used for the protection of information and communications. At the core of all products offering cryptographic services is the cryptographic module. Weaknesses such as poor design or weak algorithms can render a product insecure and place highly sensitive information at risk. Adequate testing and validation of the cryptographic module and its underlying cryptographic algorithms against established standards is essential to provide security assurance.

The NIST Cryptographic Module Validation Program (CMVP) validates commercial cryptographic modules to Federal Information Processing Standard (FIPS) 140-2 and other cryptography based standards such as algorithms.

ICS security objectives typically follow the priority of availability, integrity and confidentiality, in that order. The use of cryptography is determined after careful

consideration of the security needs and the potential ramifications on system performance. For example, the Responsible Entity considers whether latency induced from the use of cryptography would adversely impact the operational performance of the ICS.

In situations where the ICS cannot support the use of cryptographic mechanisms to protect the confidentiality and integrity of remote sessions, or the components cannot use cryptographic mechanisms due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs appropriate compensating controls (e.g., providing increased auditing measures for remote sessions or limiting remote access privileges to key personnel).

==== based on AC-17, IA-7 Appx F&I and other NIST publications===

~~R1.3.~~R2.4. The Responsible Entity shall authorize and document all connections between cyber assets inside the Cyber Security Perimeter and cyber assets outside of the Cyber Security Perimeter.

GUIDANCE: The Responsible Entity carefully considers the risks that may be introduced when cyber assets are connected to other cyber assets with different security requirements and security controls, both within the Responsible Entity and external to the Responsible Entity. Risk considerations also include cyber assets sharing the same networks.

========== additions based on CA-3 ==========

~~R1.4.~~R2.5. [R2.4] Where ~~external interactive~~ access through ~~into~~ the ~~Electronic~~ Cyber Security Perimeter has been authorized and enabled, the Responsible Entity shall implement multifactor ~~strong~~ procedural or technical controls at the access points to ensure authenticity of the accessing ~~party~~parties, ~~where technically feasible~~and monitors/controls the access on an ongoing basis.

GUIDANCE: Multifactor authentication is a system wherein more than one different factors are used to authenticate, thereby delivering a higher level of authentication assurance. Using more than one factor is sometimes called strong authentication.

========== based on IA-2 control enhancement 1 ==========

R2.6. The Responsible Entity shall:

R2.6.1. Employ automated mechanisms to facilitate the monitoring and control of remote access methods.

R2.6.2. Determine if cryptography is required to protect the confidentiality and integrity of remote access sessions.

R2.6.3. Control all remote accesses through a limited number of managed access control points.

R2.6.4. Permit remote access for privileged functions only for compelling operational needs and documents the rationale for such access in the security plan for the Cyber Security Perimeter .

GUIDANCE: Remote access is any access to an Cyber Security Perimeter by a user (or a cyber asset) communicating through an external network not under the control of the Responsible Entity (e.g., the Internet, public switched telephone network). Examples of remote access methods include dial-up, broadband, and wireless. The Responsible Entity protects against unauthorized connections or subversion of authorized connections (e.g., using virtual private network technology). NIST Special

Publication 800-63 provides guidance on remote electronic authentication. NIST Special Publication 800-77 provides guidance on IPsec-based virtual private networks.

Remote access to ICS locations (e.g., control centers, field locations) is only enabled when necessary, approved, and authenticated. In situations where the ICS cannot support the use of automated mechanisms for monitoring and control of remote access methods, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls.

Cryptography is used for the protection of information and communications. At the core of all products offering cryptographic services is the cryptographic module. Weaknesses such as poor design or weak algorithms can render a product insecure and place highly sensitive information at risk. Adequate testing and validation of the cryptographic module and its underlying cryptographic algorithms against established standards is essential to provide security assurance.

The NIST Cryptographic Module Validation Program (CMVP) validates commercial cryptographic modules to Federal Information Processing Standard (FIPS) 140-2 and other cryptography based standards such as algorithms.

ICS security objectives typically follow the priority of availability, integrity and confidentiality, in that order. The use of cryptography is determined after careful consideration of the security needs and the potential ramifications on system performance. For example, the Responsible Entity considers whether latency induced from the use of cryptography would adversely impact the operational performance of the ICS.

In situations where the ICS cannot support the use of cryptographic mechanisms to protect the confidentiality and integrity of remote sessions, or the components cannot use cryptographic mechanisms due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs appropriate compensating controls (e.g., providing increased auditing measures for remote sessions or limiting remote access privileges to key personnel).

==== based on AC-17, IA-7 Appx F&I and other NIST publications====

R2.7. The Responsible Entity shall:

R2.7.1. Develop a list of privileged functions

R2.7.2. Develop a list of authorized actions that can be taken with respect to privileged functions

~~R1.4.1.~~**R2.7.3.** Document the criteria and procedures for granting authorization to identified persons and entities.

The Responsible Entity shall manage cyber asset accounts, including establishing, activating, modifying, reviewing, disabling, and removing accounts. Privilege authorizations shall be granted in accordance with established policy and recorded. The Responsible Entity shall determine and implement the frequency for reviewing said accounts, at least annually.

GUIDANCE: Account management includes the identification of account types (i.e., individual, group, and system), establishment of conditions for group membership, and assignment of associated authorizations. The Responsible Entity identifies authorized users of the cyber assets and specifies access rights/privileges. The Responsible Entity grants access to the cyber assets based on: (i) a valid need-to-know/need-to-share that is determined by assigned official duties and satisfying all personnel security criteria; and (ii) intended usage. The Responsible Entity requires proper identification for

requests to establish accounts and approves all such requests. The Responsible Entity specifically authorizes and monitors the use of guest/anonymous accounts and removes, disables, or otherwise secures unnecessary accounts. Account managers are notified when cyber asset users are terminated or transferred and associated accounts are removed, disabled, or otherwise secured. Account managers are also notified when users' cyber asset usage or need-to-know/need-to-share changes.

==========requirement and guidance based on AC-2 ==========

~~R1.5.~~R2.8. The cyber assets shall enforce assigned authorizations for controlling access in accordance with applicable policy.

GUIDANCE: Access control policies (e.g., identity-based policies, role-based policies, rule-based policies) and associated access enforcement mechanisms (e.g., access control lists, access control matrices, cryptography) are employed to control access between users (or processes acting on behalf of users) and objects (e.g., devices, files, records, processes, programs, domains) within the cyber security perimeter. In addition to controlling access at the network layer of the ISO Reference Architecture, access enforcement mechanisms are employed at the application layer, when necessary, to provide increased information security. Consideration is given to the implementation of a controlled, audited, and manual override of automated mechanisms in the event of emergencies or other serious events.

The Responsible Entity ensures that access enforcement mechanisms do not adversely impact the operational performance of the ICS.

========== requirement & guidance based on AC-3 Appx F & I ==========

~~R1.6.~~R2.9. The cyber assets shall restrict access to privileged functions (deployed in hardware, software, and firmware) and security-relevant information to explicitly authorized personnel.

GUIDANCE: Explicitly authorized personnel include, for example, security administrators, system and network administrators, and other privileged users. Privileged users are individuals who have access to system control, monitoring, or administration functions (e.g., system administrators, information system security officers, maintainers, system programmers).

Within ICS, it is commonly the case that having access to specific devices (e.g., workstations, remote terminal units, field devices) is the equivalent to having privileged access; thereby restricting access to these devices is also restricting access to privileged functions and security-relevant information.

========== requirement & guidance based on AC-3 Appx F & I ==========

~~R1.7.~~R2.10. The Responsible Entity shall specify privileged functions that have impacts on facility, public, and environmental safety that require dual authorization.

GUIDANCE: The Responsible Entity does not employ dual-approval mechanisms when an immediate response is necessary to ensure public and environmental safety.

========== requirement & guidance based on AC-3 ICS-1 ==========

~~R1.8.~~R2.11. The cyber assets shall enforce assigned authorizations for controlling the flow of information within the Cyber Security Perimeter and between interconnected Cyber Security Perimeters in accordance with applicable policy.

GUIDANCE: Information flow control regulates where information is allowed to travel within a Cyber Security Perimeter and between Cyber Security Perimeters (as

opposed to who is allowed to access the information) and without explicit regard to subsequent accesses to that information. A few, of many, generalized examples of possible restrictions that are better expressed as flow control than access control are: keeping export controlled information from being transmitted in the clear to the Internet, blocking outside traffic that claims to be from within the Responsible Entity, and not passing any web requests to the Internet that are not from the internal web proxy. Information flow control policies and enforcement mechanisms are commonly employed by Responsible Entities to control the flow of information between designated sources and destinations (e.g., networks, individuals, devices) within Cyber Security Perimeters and between interconnected Cyber Security Perimeters. Flow control is based on the characteristics of the information and/or the information path. Specific examples of flow control enforcement can be found in boundary protection devices (e.g., proxies, gateways, guards, encrypted tunnels, firewalls, and routers) that employ rule sets or establish configuration settings that restrict information system services or provide a packet filtering capability.

========== requirement & guidance based on AC-4 ==========

~~R1.9.~~R2.12. The Responsible Entity shall identify roles and responsibilities where separation of duties is necessary. The cyber assets enforces separation of duties through assigned access authorizations.

GUIDANCE: The Responsible Entity establishes appropriate divisions of responsibility and separates duties as needed to eliminate conflicts of interest in the responsibilities and duties of individuals. There is access control software on the cyber assets that prevents users from having all of the necessary authority or information access to perform fraudulent activity without collusion. Examples of separation of duties include: (i) mission functions and distinct support functions are divided among different individuals/roles; (ii) different individuals perform cyber asset support functions (e.g., system management, systems programming, quality assurance/testing, configuration management, and network security); and (iii) security personnel who administer access control functions do not administer audit functions. In situations where the ICS cannot support the differentiation of roles or a single individual performs all roles within the ICS, the Responsible Entity shall employ appropriate compensating controls (e.g., providing increased personnel security and auditing measures).

========== requirement & guidance based on AC-5 Appx F&I ==========

R2.13. The Responsible Entity shall:

R2.13.1. Approve individual access privileges and enforce cyber access restrictions associated with changes to the critical cyber assets

~~R1.9.1.~~R2.13.2. Generate, retain, and review records reflecting all such changes.

GUIDANCE: Planned or unplanned changes to the hardware, software, and/or firmware components of the cyber assets can have significant effects on the overall security of the system. Accordingly, only qualified and authorized individuals obtain access to information system components for purposes of initiating changes, including upgrades, and modifications. In situations where the ICS cannot support the use of automated mechanisms to enforce access restrictions and support auditing of enforcement actions, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls

======== based on CM-5 from Appendixes F & I ==========

~~R1.10.~~R2.14. [R2.2] At all access points to the ~~Electronic~~ Cyber Security Perimeter(s) and at all Cyber Assets contained within the Perimeter, the Responsible Entity ~~shall enable~~shall enable only ports, functions, capabilities, and/or ~~services required~~services required for operations ~~and for~~ including monitoring Cyber Assets within the ~~Electronic~~ Cyber Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports, functions, capabilities, and services.

GUIDANCE: Cyber Assets are capable of providing a wide variety of functions and services. Some of the functions and services, provided by default, may not be necessary to support essential Responsible Entity operations (e.g., key missions, functions). Additionally, it is sometimes convenient to provide multiple services from a single component of a Cyber Asset, but doing so increases risk over limiting the services provided by any one component. The Responsible Entity limits component functionality to a single function per device (e.g., email server or web server, not both). The functions and services provided by Cyber Assets, or individual components of Cyber Assets, should be carefully reviewed to determine which functions and services are candidates for elimination (e.g., Voice Over Internet Protocol, Instant Messaging, File Transfer Protocol, Hyper Text Transfer Protocol, file sharing).

========== additions to requirement based on CM-7 ==========

R2.15. The Responsible Entity shall define and the cyber assets shall automatically enforce:

R2.15.1. A limit of consecutive invalid access attempts by a user during a specified time period, and restrictions on further accesses including

R2.15.2. A defined time period to lock the account, preventing access

~~R1.10.1.~~R2.15.3. A defined time period and algorithm to delays next login prompt.

GUIDANCE: Due to the potential for denial of service, automatic lockouts initiated by the cyber assets are usually temporary and automatically release after a predetermined time period established by the Responsible Entity.

In situations where the ICS cannot support account/node locking or delayed login attempts, or the ICS cannot perform account/node locking or delayed logins due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs appropriate compensating controls (e.g., logging or recording all unsuccessful login attempts and alerting security personnel though alarms or other means when the number of Responsible Entity-defined consecutive invalid access attempts is exceeded).

========== additions to requirement based on AC-7 Appx F & I ==========

~~R1.11.~~R2.16. The Responsible Entity shall define an interval of user inactivity after which the cyber assets shall initiate a session lock. The session lock remains in effect until the user reestablishes access using appropriate identification and authentication procedures.

GUIDANCE: Users can directly initiate session lock mechanisms. The ICS employs session lock to prevent access to specified workstations/nodes. The ICS activates session lock mechanisms automatically after a time period defined by the Responsible Entity for designated workstations/nodes on the ICS. In some cases, session lock for ICS operator workstations/nodes is not advised (e.g., when immediate operator responses are required in emergency situations). Session lock is not a substitute for logging out of the ICS. In situations where the ICS cannot support session lock, the Responsible Entity employs appropriate compensating controls (e.g., providing increased physical security, personnel security, and auditing measures)

========== additions based on AC-11 Appx F & I ==========

~~R1.12.~~R2.17. For remote access sessions, the Responsible Entity shall define an interval of user inactivity after which the cyber assets shall automatically terminate the session.

GUIDANCE: In situations where the ICS cannot support the automatic termination of remote sessions after a specified period of inactivity, or the ICS cannot automatically terminate remote sessions due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls (e.g., providing increased auditing measures for such sessions or limiting remote access privileges to key personnel).

========== based on AC-12 Appx F & I ==========

~~R1.13.~~R2.18. The Responsible Entity shall identify and document specific user actions that can be performed on the cyber assets without identification or authentication.

GUIDANCE: Emergency switches to stop operations are accessible to any individual with authorized physical access.

========== based on AC-14 ==========

~~R1.14.~~R2.19. [R2.6] Appropriate Use Banner — ~~Where technically feasible, electronic~~ ~~a~~Access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The banner shall inform potential users: (i) that the user is accessing a private system; (ii) that system usage may be monitored, recorded, and subject to audit; (iii) that unauthorized use of the system is prohibited and subject to criminal and civil penalties; and (iv) that use of the system indicates consent to monitoring and recording. The banner shall provides appropriate privacy and security notices (based on associated privacy and security policies or summaries) and remains on the screen until the user takes explicit actions to log on. The Responsible Entity shall maintain a document identifying the content of the banner.

========== additions to requirement based on AC-8 ==========

~~R2.~~R3. [R3] Monitoring ~~Electronic~~ Cyber Access — The Responsible Entity shall define, periodically review, and update, a list of auditable events and uses that list to generate audit records. The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging audit records for these events ~~access at access points to the Electronic Security Perimeter(s)~~twenty-four hours a day, seven days a week.

========== additions to requirement based on AU-2 ==========

GUIDANCE: The purpose of monitoring and logging audit records is to identify important events which need to be audited as significant and relevant to the reliability of the bulk electric grid. The Responsible Entity specifies which events require auditing and how the audition is implemented. Auditing activity can affect system performance. Therefore, the Responsible Entity decides, based upon a risk assessment, which events require auditing on a continuous basis and which events require auditing in response to specific situations. Audit records can be generated at various levels of abstraction, including at the packet level as information traverses the network. Selecting the right level of abstraction for audit record generation is a critical aspect of an audit capability and can facilitate the identification of root causes to problems. Additionally, the security audit function is coordinated with the network health and status monitoring function to enhance the mutual support between the two functions by the selection of information to be recorded by each function. The checklists and configuration guides at http://csrc.nist.gov/pcig/cig.html provide recommended lists of auditable events. The Responsible Entity defines auditable events that are adequate to support after-the-fact investigations of security incidents. Most auditing occurs at the application level. In situations where the Responsible Entity cannot support the use of automated mechanisms to generate

audit records, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls

========== based on AU-2 Appendix F & I ==========

~~R2.1.~~R3.1. Cyber assets shall produce audit records that contain sufficient information to establish what events occurred, the sources of the events, and the outcomes of the events. Cyber assets shall provide the capability to include additional, more detailed information in the audit records for audit events identified by type, location, or subject.

GUIDANCE: Audit record content includes, for most audit records: (i) date and time of the event; (ii) the component of the information system (e.g., software component, hardware component) where the event occurred; (iii) type of event; (iv) user/subject identity; and (v) the outcome (success or failure) of the event.

========== based on AU-3 ==========

~~R2.2.~~R3.2. The Responsible Entity allocates sufficient audit record storage capacity and configures auditing to reduce the likelihood of such capacity being exceeded.

========== based on AU-4 ==========

~~R2.3.~~R3.3. The Responsible Entity shall define actions to be taken in the event of an audit processing failure (e.g., overwrite oldest audit records, stop generating audit records). Cyber assets that perform auditing shall alert appropriate Responsible Entity officials and take these actions in the event of an audit processing failure.

GUIDANCE: Audit processing failures include, for example, software/hardware errors, failures in the audit capturing mechanisms, and audit storage capacity being reached or exceeded. In general, audit record processing is not performed on the ICS, but on a separate information system. In situations where the ICS cannot support auditing including response to audit failures, the Responsible Entity employs compensating controls (e.g., providing an auditing capability on a separate information system).

========== requirement based on AU-5 Appx F & I ==========

~~R2.4.~~R3.4. [R3.1] For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device~~, where technically feasible.~~.

~~R2.5.~~R3.5. [R3.2] ~~Where technically feasible, t~~The Responsible Entity's security monitoring process(es) shall regularly review/analyze audit records with respect to the enforcement and usage of cyber asset access controls for indications of inappropriate or unusual activity, investigate suspicious activity or suspected violations, detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel who take necessary actions. The Responsible Entity shall employ automated mechanisms to facilitate the review of user activities. If the Responsible Entity takes an exception to ~~Where~~ alerting ~~is not technically feasible~~as specified in section A.6, the Responsible Entity shall review or otherwise assess ~~access logs~~audit records for attempts at or actual unauthorized ~~accesses~~ activities at least every ninety calendar days.

GUIDANCE: The Responsible Entity reviews audit records (e.g., user activity logs) for inappropriate activities in accordance with Responsible Entity procedures. The Responsible Entity investigates any unusual cyber asset-related activities and periodically reviews changes to access authorizations. The Responsible Entity reviews more frequently the activities of users with significant cyber asset roles and

responsibilities. In situations where the ICS cannot support the use of automated mechanisms for reviewing user activities, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls.

Responsible Entities increase the level of audit monitoring and analysis activity within the system whenever there is an indication of increased risk based on law enforcement information, intelligence information, or other credible sources of information.

========== based on AC-13 Appx F & I and AU-6 ==========

~~R2.6.~~R3.6. The Responsible Entity shall define a list of inappropriate or unusual activities with security implications that are to result in automated alerts that shall be sent to designated security personnel.

========== requirements based on AU-6 ==========

R3.7. The Responsible Entity shall provide an audit reduction and report generation capability. The audit reduction and report generation system shall provide the capability to automatically process audit records for events of interest based upon selectable, event criteria..

GUIDANCE: Audit reduction, review, and reporting tools support after-the-fact investigations of security incidents without altering original audit records. In general, audit record processing is not performed on the Critical Cyber Asset, but on a separate cyber asset.

========== based on AU-7 Appx F & I ==========

~~R2.7.~~R3.8. The Responsible Entity shall employ time stamps in audit record generation. The Responsible Entity shall define the frequency for synchronizing internal clocks. The cyber assets shall synchronize internal system clocks at this frequency.

GUIDANCE: Time stamps (including date and time) of audit records are generated using internal system clocks.

========== requirement based on AU-8 ==========

~~R2.8.~~R3.9. The Responsible Entity shall protect audit information and audit tools from unauthorized access, modification, and deletion.

GUIDANCE: Audit information includes all information (e.g., audit records, audit settings, and audit reports) needed to successfully audit information system activity

========== based on AU-9 ==========

R4. -Cyber Security Perimeter Assessment — The Responsible Entity shall establish a program to assess the security of the Cyber Security Perimeter.

R4.1. The Responsible Entity shall develop detailed Cyber Security Perimeter testing standards, processes, and procedures (called "CSP Security Assessment Guide") to provide direction and guidance on security testing; the Guides must:

R4.1.1. Identify who is to be held accountable and responsible for ensuring that information security tests comply with Responsible Entity requirements.

R4.1.2. Identify the Responsible Entity requirements with which security tests must comply, i.e., test scenarios must map to and support security requirements, must specify the minimum set of security controls evaluated during tests, as well as the depth and breadth of tests.

R4.1.3. Specify the appropriate roles and responsibilities, i.e., there must be well-qualified personnel in both security testing and analysis, and care must be

taken to ensure separation of duties when testing; for example, testing and analysis must be performed by an independent person(s).

R4.1.4. Adhere to established methodology that identify and test for security controls for the types of testing being performed, viz., NIST guidelines describe these methods as interview, examine and test.

R4.1.5. Specify a testing environment and criteria to be added per NIST SP 800-53A and SP 800-115 and describe these methods, such as the use of dedicated test equipment that must be used for security testing.

R4.1.6. State the frequency of assessmentswhen and how often testing is to be performed.

R4.1.7. Provide the documentation requirements, such as test plans and test results; i.e., adequately securing the results and analysis information and artifacts from testing.

R4.1.8. Specify the criteria for the analysis of the tests and the dissemination of results and recommendations.

R4.1.9. Develop a plan of action, milestones, and schedule to correct deficiencies found during testing.

~~R2.9.~~R4.2. [R4] Cyber Vulnerability Assessment — The Responsible Entity shall employ a qualified independent agent or team to conduct assessment of (a) ~~perform a~~ cyber vulnerabilities ~~y assessment~~ of the ~~electronic~~ access points to the ~~Electronic~~ Cyber Security Perimeter(s)- at least annually, or when significant new vulnerabilities potentially affecting the cyber assets are identified and reported.. The vulnerability assessment shall be conducted in accordance with the CSP Security Assessment Guide. The vulnerability assessment shall include, at a minimum, the following:

========== based on CA-4 and RA-5 ==========

~~R2.9.1.~~R4.2.1. [R4.1] A document identifying the vulnerability assessment process;

~~R2.9.2.~~R4.2.2. [R4.2] A review to verify that only ports and services required for operations at these access points are enabled;

~~R2.9.3.~~R4.2.3. [R4.3] The discovery of all access points to the ~~Electronic~~ Cyber Security Perimeter;

~~R2.9.4.~~R4.2.4. [R4.4] A review of controls for default accounts, passwords, and network management community strings; ~~and,~~

~~R2.9.5.~~R4.2.5. [R4.5] Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

========== based on CA-4 ==========

GUIDANCE: Vulnerability scanning is conducted using appropriate scanning tools and techniques. The Responsible Entity trains selected personnel in the use and maintenance of vulnerability scanning tools and techniques. Vulnerability scans are scheduled and/or random in accordance with Responsible Entity policy and assessment of risk. The information obtained from the vulnerability scanning process is freely shared with appropriate personnel throughout the Responsible Entity to help eliminate similar vulnerabilities in other cyber assets. Vulnerability analysis for custom software and applications may require additional, more specialized approaches (e.g., vulnerability scanning tools for applications, source code reviews, static analysis of source code).

Vulnerability scanning tools are used with care on ICS networks to ensure that ICS functions are not adversely impacted by the scanning process. Production ICS may need to be taken off-line, or replicated to the extent feasible, before scanning can be conducted. If ICS are taken off-line for scanning, scans are scheduled to occur during planned ICS outages whenever possible. If vulnerability scanning tools are used on non-ICS networks, extra care is taken to ensure that they do not scan the ICS network. In situations where the Responsible Entity cannot, for operational reasons, conduct vulnerability scanning on a production ICS, the Responsible Entity employs compensating controls (e.g., providing a replicated system to conduct scanning)

========== guidance based on RA-5 Appx F & I ==========

~~R2.10.~~R4.3. Cyber Control Assessment - The Responsible Entity shall employ a qualified independent agent or team to conduct an assessment of the implementation of all the cyber security controls in the Cyber Security Perimeter at least annually, or when significant new vulnerabilities potentially affecting the cyber assets are identified and reported. The implementation assessment shall -determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements. The implementation assessment shall be conducted in accordance with the CSP Security Assessment Guide.

~~R3.~~R5. [R5] Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005.

R5.1. The Responsible Entity shall develop, document, and maintain a current inventory of the cyber assets in the Cyber Security Perimeter and relevant ownership information. The Responsible Entity shall update the inventory of cyber assets as an integral part of component installations.

GUIDANCE: The Responsible Entity determines the appropriate level of granularity for the cyber asset components included in the inventory that are subject to management control (i.e., tracking, and reporting). The inventory of cyber asset components includes any information determined to be necessary by the Responsible Entity to achieve effective property accountability (e.g., manufacturer, model number, serial number, software license information, system/component owner). The component inventory is consistent with the Cyber Security Perimeter.

========== based on CM-8 ==========

R5.2. The Responsible Entity shall develop, document, and maintain a current baseline configuration of all the cyber assets in the Cyber Security Perimeter.

GUIDANCE: This requirement establishes a baseline configuration for the cyber assets. The baseline configuration provides information about a particular component's makeup (e.g., the standard software load for a workstation or notebook computer including updated patch information) and the component's logical placement within the cyber assets architecture. The baseline configuration also provides the Responsible Entity with a well-defined and documented specification to which the cyber assets are built and deviations, if required, are documented in support of mission needs/objectives.

========== based on CM-2 ==========

R5.3. [R5.1] The Responsible Entity shall ensure that all documentation required by Standard CIP-005 reflect the current ~~configurations~~baseline configurations and processes and

shall review the documents and procedures referenced in Standard CIP-005 at least annually.

========== based on CM-2 ==========

R5.4. The Responsible Entity shall:

R5.4.1. Authorize, document, and control changes to the cyber assets in the Cyber Security Perimeter.

R5.4.2. Test, validate, and document changes (e.g., patches and updates) before implementing the changes on the operational CSP.

~~R3.1.1.~~R5.4.3. Employ automated mechanisms to: (i) document proposed changes to the cyber assets; (ii) notify appropriate approval authorities; (iii) highlight approvals that have not been received in a timely manner; (iv) inhibit change until necessary approvals are received; and (v) document completed changes to the cyber assets.

GUIDANCE: The Responsible Entity manages configuration changes to the information system using an Responsible Entity-approved process (e.g., a chartered Configuration Control Board). Configuration change control involves the systematic proposal, justification, implementation, test/evaluation, review, and disposition of changes to the information system, including upgrades and modifications. Configuration change control includes changes to the configuration settings for information technology products (e.g., operating systems, firewalls, routers). The Responsible Entity includes emergency changes in the configuration change control process, including changes resulting from the remediation of flaws. The approvals to implement a change to the information system include successful results from the security analysis of the change. The Responsible Entity audits activities associated with configuration changes to the information system.

The Responsible Entity ensures that testing does not interfere with ICS functions. The individual/group conducting the tests fully understands the Responsible Entity information security policies and procedures, the ICS security policies and procedures, and the specific health, safety, and environmental risks associated with a particular facility and/or process. A production ICS may need to be taken off-line, or replicated to the extent feasible, before testing can be conducted. If an ICS must be taken off-line for testing, the tests are scheduled to occur during planned ICS outages whenever possible. In situations where the Responsible Entity cannot, for operational reasons, conduct live testing of a production ICS, the Responsible Entity employs compensating controls (e.g., providing a replicated system to conduct testing).

In situations where the ICS cannot support the use of automated mechanisms to implement configuration change control, the Responsible Entity employs nonautomated mechanisms or procedures as compensating controls.

========== based on CM-3 ==========

~~R3.2.~~R5.5. [R5.2] The Responsible Entity shall update the documentation to reflect the modification of the cyber assets in the Cyber Security Perimeter~~network or controls~~ within ninety calendar days of the change.

R5.6. The Responsible Entity shall:

R5.6.1. Establish mandatory configuration settings for cyber assets employed within the Cyber Security Perimeter

R5.6.2. Configure the security settings of cyber assets to the most restrictive mode consistent with operational requirements

R5.6.3. Document the configuration settings

R5.6.4. Enforce the configuration settings in all cyber assets

R5.6.5. Employ automated mechanisms to centrally manage, apply, and verify configuration settings. In situations where the cyber assets cannot support the use of automated mechanisms to centrally manage, apply, and verify configuration settings, the Responsible Entity shall employ nonautomated mechanisms or procedures as compensating controls.

==========requirement based on CM-6 Appx F & I ==========

~~R3.3.~~R5.7. [R5.3] The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008.

R6. Identification and Authentication — The Responsible Entity shall maintain identification and authentication to support access control.

~~R3.4.~~R6.1. The Responsible Entity shall require critical cyber assets to uniquely identify and authenticate users (or processes acting on behalf of users).

GUIDANCE: Authentication is the process of establishing confidence in user identities presented. Authentication of user identities is accomplished through the use of passwords, tokens, biometrics, or in the case of multifactor authentication, some combination thereof. Human authentication factors are generally classified into three cases: (1) Something the user has (e.g., ID card, security token, software token, phone, or cell phone); (2) Something the user knows (e.g., a password, pass phrase, or personal identification number (PIN)); and (3) Something the user is or does (e.g., fingerprint or retinal pattern, DNA sequence (there are assorted definitions of what is sufficient), signature or voice recognition, unique bio-electric signals, or another biometric identifier)[1]. The Office of Management and Budget (OMB) has issued guidance that defines levels of authentication[2]. NIST has published further guidance[3].

Where users function as a single group (e.g., control room operators), user identification and authentication may be role-based, group-based, or device-based. For certain ICS, the capability for immediate operator interaction is critical. Local emergency actions for ICS must not be hampered by identification or authentication requirements. Access to these systems may be restricted by appropriate physical security controls. In situations where the ICS cannot support user identification and authentication, or the Responsible Entity determines it is not advisable to perform user identification and authentication due to significant adverse impact on performance, safety, or reliability, the Responsible Entity employs appropriate compensating controls (e.g., providing increased physical security, personnel security, and auditing measures). For example, manual voice authentication of remote personnel and local, manual actions may be required in order to establish a remote access.

Local and remote user access to ICS components is enabled only when necessary, approved, and authenticated. Remote access refers to access to a cyber asset by a user

[1] Derived from *Wikipedia* http://en.wikipedia.org/wiki/Two-factor_authentication, there being no authoritative definition available.

[2] *E-Authentication Guidance for Federal Agencies*, Office of Management and Budget memorandum M 04-04, December 2003.

[3] *Electronic Authentication Guideline*, NIST Special Publication 800-63 Version 1.0.1, September 2004.

(or a cyber asset) communicating through an external network not controlled by the Responsible Entity.

========== based on CA-3 & IA-2 Appx F&I ==========

~~R3.5.~~R6.2. The Responsible Entity shall manage user identifiers by:

- Uniquely identifying each user
- Verifying the identity of each user
- Receiving authorization to issue a user identifier from an appropriate Responsible Entity official
- Issuing the user identifier to the intended party
- Define and implement a period of inactivity for disabling a user identifier
- Archiving user identifiers.

GUIDANCE: Where users function as a single group (e.g., control room operators), user identification may be role-based, group-based, or device-based.

==========requirement based on IA-4 Appx F&I ==========

~~R3.6.~~R6.3. The cyber assets shall identify and authenticate specific devices before establishing a connection.

GUIDANCE: In situations where the ICS cannot support device identification and authentication (e.g., serial devices), the Responsible Entity employs compensating controls

========= requirements and guidance based on IA-3 Appx F&I ==========

R6.4. The Responsible Entity shall manage authenticators by:

R6.4.1. Defining initial authenticator content

R6.4.2. Establishing administrative procedures for initial authenticator distribution, for lost/compromised, or damaged authenticators, and for revoking authenticators

R6.4.3. Changing default authenticators upon information system installation

~~R3.6.1.~~R6.4.4. Changing/refreshing authenticators periodically.

GUIDANCE: Authenticators include, for example, tokens, PKI certificates, biometrics, passwords, and key cards. Users take reasonable measures to safeguard authenticators including maintaining possession of their individual authenticators, not loaning or sharing authenticators with others, and reporting lost or compromised authenticators immediately. For password-based authentication, the cyber assets: (i) protects passwords from unauthorized disclosure and modification when stored and transmitted; (ii) prohibits passwords from being displayed when entered; (iii) enforces password minimum and maximum lifetime restrictions; and (iv) prohibits password reuse for a specified number of generations. For PKI-based authentication, the cyber assets: (i) validates certificates by constructing a certification path to an accepted trust anchor; (ii) establishes user control of the corresponding private key; and (iii) maps the authenticated identity to the user account.

Many ICS devices and software are shipped with factory default authentication credentials to allow for initial installation and configuration. However, factory default authentication credentials are often well known, easily discoverable, present a great

security risk, and therefore must be changed. Authentication may be role-based, group-based, or device-based.

========== requirement and guidance based on IA-5 Appx F&I ==========

~~R3.7.~~R6.5. Cyber Assets shall obscure feedback of authentication information during an interactive human authentication process to protect the information from possible exploitation/use by unauthorized individuals.

GUIDANCE: The feedback from the cyber assets does not provide information that would allow an unauthorized user to compromise the authentication mechanism. Displaying asterisks when a user types in a password is an example of obscuring feedback of authentication information.

========== based on IA-6 ==========

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-005. Responsible entities may document controls either individually or by specified applicable grouping.

M1. Documents about the Electronic Security Perimeter as specified in Requirement R1.

M2. Documentation of the electronic access controls to the Electronic Security Perimeter(s), as specified in Requirement R2.

M3. Documentation of controls implemented to log and monitor access to the Electronic Security Perimeter(s) as specified in Requirement R3.

M4. Documentation of the Responsible Entity's ~~annual vulnerability~~Cyber Security Perimeter assessment as specified in Requirement R4.

M5. Access logs and documentation of review, changes, and log retention as specified in Requirement R5.

M6. Documentation of the indetification and authentication controls as specified in Requirement R6.

~~M5.~~M7. Documentation of the Exception Plans as specified in Section A.6 Exemptions.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep logs for a minimum of ninety calendar days, unless longer retention is required pursuant to Standard CIP-008, Requirement R2.

1.3.2 The Responsible Entity shall keep other documents and records required by Standard CIP-005 from the previous full calendar year.

1.3.3 The compliance monitor shall keep audit records for three years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in noncompliance. Refer to CIP-003 Requirement R3.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 All document(s) identified in CIP-005 exist, but have not been updated within ninety calendar days of any changes as required; or,

2.1.2 Access to less than 15% of electronic security perimeters is not controlled, monitored; and logged;

2.1.3 Document(s) exist confirming that only necessary network ports and services have been enabled, but no record documenting annual reviews exists; or,

2.1.4 At least one, but not all, of the Electronic Security Perimeter vulnerability assessment items has been performed in the last full calendar year.

2.1.5 The Exception Plan exists but has been approved, but not in the last full calendar year by a Responsibility Entity senior manager.

2.2. Level 2:

2.2.1 All document(s) identified in CIP-005 but have not been updated or reviewed in the previous full calendar year as required; or,

2.2.2 Access to between 15% and 25% of electronic security perimeters is not controlled, monitored; and logged; or,

2.2.3 Documentation and records of vulnerability assessments of the Electronic Security Perimeter(s) exist, but a vulnerability assessment has not been performed in the previous full calendar year.

~~2.2.3~~2.2.4 The Exception Plan exists and has been approved in the last full calendar year by a Responsibility Entity senior manager, but has not been approved in the last full calendar year by the Regional Reliability Organization.

2.3. Level 3:

2.3.1 A document defining the Electronic Security Perimeter(s) exists, but there are one or more Critical Cyber Assets not within the defined Electronic Security Perimeter(s); or,

2.3.2 One or more identified non-critical Cyber Assets is within the Electronic Security Perimeter(s) but not documented; or,

2.3.3 Electronic access controls document(s) exist, but one or more access points have not been identified; or

2.3.4 Electronic access controls document(s) do not identify or describe access controls for one or more access points; or,

2.3.5 Electronic Access Monitoring:

2.3.5.1 Access to between 26% and 50% of Electronic Security Perimeters is not controlled, monitored; and logged; or,

2.3.5.2 Access logs exist, but have not been reviewed within the past ninety calendar days; or,

2.3.6 Documentation and records of vulnerability assessments of the Electronic Security Perimeter(s) exist, but a vulnerability assessment has not been performed for more than two full calendar years.

~~2.3.6~~2.3.7 The Exception Plan exists but has not has been approved in the last full calendar year by a Responsibility Entity senior manager, and has not been approved in the last full calendar year by the Regional Reliability Organization.

2.4. Level 4:

2.4.1 No documented Electronic Security Perimeter exists; or,

2.4.2 No records of access exist; or,

2.4.3 51% or more Electronic Security Perimeters are not controlled, monitored, and logged; or,

2.4.4 Documentation and records of vulnerability assessments of the Electronic Security Perimeter(s) exist, but a vulnerability assessment has not been performed for more than three full calendar years; or,

2.4.5 No documented vulnerability assessment of the Electronic Security Perimeter(s) process exists.

2.4.6 The Exception Plan does not exists.

E. Regional Differences

None identified.

~~**Version History**~~

~~Version~~	~~Date~~	~~Action~~	~~Change Tracking~~
~~1~~	~~01/16/06~~	~~D.2.3.1 Change "Critical Assets," to "Critical Cyber Assets" as intended.~~	~~03/24/06~~

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-~~1~~2

3. Purpose: NERC Standards CIP-002 through CIP-009 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of a risk-based assessment.

4. Applicability:

4.1. Within the text of Standard CIP-002, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Reliability Organizations~~.~~

4.1.12 Regional Entities.

4.2. The following are exempt from Standard CIP-002:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-002:

R1. Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.

R1.1. The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.

R1.2. The risk-based assessment shall consider the following assets:

R1.2.1. Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.

R1.2.2. Transmission substations that support the reliable operation of the Bulk Electric System.

R1.2.3. Generation resources that support the reliable operation of the Bulk Electric System.

R1.2.4. Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.

R1.2.5. Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

R1.2.6. Special Protection Systems that support the reliable operation of the Bulk Electric System.

R1.2.7. Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.

R2. Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology required in R1. The Responsible Entity shall review this list at least annually, and update it as necessary.

R3. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R2, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

R3.1. The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,

R3.2. The Cyber Asset uses a routable protocol within a control center; or,

R3.3. The Cyber Asset is dial-up accessible.

R4. Annual Approval — A senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-002:

M1. The risk-based assessment methodology documentation as specified in Requirement R1.

M2. The list of Critical Assets as specified in Requirement R2.

M3. The list of Critical Cyber Assets as specified in Requirement R3.

M4. The records of annual approvals as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep documentation required by Standard CIP-002 from the previous full calendar year

1.3.2 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1 Level 1: The risk assessment has not been performed annually.

2.2 Level 2: The list of Critical Assets or Critical Cyber Assets exist, but has not been approved or reviewed in the last calendar year.

2.3 Level 3: The list of Critical Assets or Critical Cyber Assets does not exist.

2.4 Level 4: The lists of Critical Assets and Critical Cyber Assets do not exist.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	R3.2 — Change “Control Center” to “control center”	03/24/06

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-~~1~~2

3. Purpose: Standard CIP-003 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment~~.

4. Applicability:

4.1. Within the text of Standard CIP-003, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Reliability Organizations~~.~~

4.1.12 Regional Entities.

4.2. The following are exempt from Standard CIP-003:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-003:

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002 through CIP-009, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.

R2.1. The senior manager shall be identified by name, title, ~~business phone, business address,~~ and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002 through CIP-009, the senior manager may delegate authority for specific actions to a named delegate. These delegations must be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

~~**R2.3.**~~**R2.4.** The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures, or a statement accepting risk.

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

R5.1.1. Personnel shall be identified by name, title, business phone and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-003:

M1. Documentation of the Responsible Entity's cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2.

M2. Documentation of the assignment of, and changes to, the Responsible Entity's leadership as specified in Requirement R2.

M3. Documentation of the Responsible Entity's exceptions, as specified in Requirement R3.

M4. Documentation of the Responsible Entity's information protection program as specified in Requirement R4.

M5. The access control documentation as specified in Requirement R5.

M6. The Responsible Entity's change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year.

1.3.2 The compliance monitor shall keep audit records for three years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Refer to CIP-003, Requirement R3. Duly authorized exceptions will not result in non-compliance.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 Changes to the designation of senior manager were not documented in accordance with Requirement R2.2; or,

2.1.2 Exceptions from the cyber security policy have not been documented within thirty calendar days of the approval of the exception; or,

2.1.3 An information protection program to identify and classify information and the processes to protect information associated with Critical Cyber Assets has not been assessed in the previous full calendar year.

2.2. Level 2:

2.2.1 A cyber security policy exists, but has not been reviewed within the previous full calendar year; or,

2.2.2 Exceptions to policy are not documented or authorized by the senior manager or delegate(s); or,

2.2.3 Access privileges to the information related to Critical Cyber Assets have not been reviewed within the previous full calendar year; or,

2.2.4 The list of designated personnel responsible to authorize access to the information related to Critical Cyber Assets has not been reviewed within the previous full calendar year.

2.3. Level 3:

2.3.1 A senior manager has not been identified in accordance with Requirement R2.1; or,

2.3.2 The list of designated personnel responsible to authorize logical or physical access to protected information associated with Critical Cyber Assets does not exist; or,

2.3.3 No changes to hardware and software components of Critical Cyber Assets have been documented in accordance with Requirement R6.

2.4. Level 4:

2.4.1 No cyber security policy exists; or,

2.4.2 No identification and classification program for protecting information associated with Critical Cyber Assets exists; or,

2.4.3 No documented change control and configuration management process exists.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. Title: Cyber Security — Personnel & Training

2. Number: CIP-004-~~1~~2

3. Purpose: Standard CIP-004 requires that personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including contractors and service vendors, have an appropriate level of personnel risk assessment, training, and security awareness. Standard CIP-004 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

4. Applicability:

4.1. Within the text of Standard CIP-004, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Reliability Organizations~~.~~

4.1.12 Regional Entities.

4.2. The following are exempt from Standard CIP-004:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-004:

R1. Awareness — The Responsible Entity shall establish, maintain, ~~and~~ document and implement a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);

Formatted: Indent: Left: 0.25", Hanging: 0.38", Tab stops: 0.63", Left + Not at 1.8"

- Management support and reinforcement (e.g., presentations, meetings, etc.).

R2. Training — The Responsible Entity shall establish, maintain, ~~and~~ document and implement an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and review the program annually and update as necessary.

Formatted: Indent: Left: 0.25", Hanging: 0.38", Tab stops: 0.63", Left

R2.1. This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained ~~within ninety calendar days of such authorization~~prior to their being granted such access.

R2.2. Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities:

R2.2.1. The proper use of Critical Cyber Assets;

R2.2.2. Physical and electronic access controls to Critical Cyber Assets;

R2.2.3. The proper handling of Critical Cyber Asset information; and,

R2.2.4. Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.

R2.3. The Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.

R3. Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access. A personnel risk assessment shall be conducted pursuant to that program ~~within thirty days of~~prior to such personnel being granted such access. Such program shall at a minimum include:

Formatted: Indent: Left: 0.25", Hanging: 0.38", Tab stops: 0.63", Left + Not at 1.8"

R3.1. The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.

R3.2. The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.

R3.3. The Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004.

R4. Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.

Formatted: Indent: Left: 0.25", Hanging: 0.38", Tab stops: 0.63", Left + Not at 1.8"

R4.1. The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.

R4.2. The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-004:

M1. Documentation of the Responsible Entity's security awareness and reinforcement program as specified in Requirement R1.

M2. Documentation of the Responsible Entity's cyber security training program, review, and records as specified in Requirement R2.

M3. Documentation of the personnel risk assessment program and that personnel risk assessments have been applied to all personnel who have authorized cyber or authorized unescorted physical access to Critical Cyber Assets, as specified in Requirement R3.

M4. Documentation of the list(s), list review and update, and access revocation as needed as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep personnel risk assessment documents in accordance with federal, state, provincial, and local laws.

1.3.2 The Responsible Entity shall keep all other documentation required by Standard CIP-004 from the previous full calendar year.

1.3.3 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in non-compliance. Refer to CIP-003 Requirement R3.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 Awareness program exists, but is not conducted within the minimum required period of quarterly reinforcement; or,

2.1.2 Training program exists, but records of training either do not exist or reveal that personnel who have access to Critical Cyber Assets were not trained as required; or,

2.1.3 Personnel risk assessment program exists, but documentation of that program does not exist; or,

2.1.4 List(s) of personnel with their access rights is available, but has not been reviewed and updated as required.

2.1.5 One personnel risk assessment is not updated at least every seven years, or for cause; or,

2.1.6 One instance of personnel (employee, contractor or service provider) change other than for cause in which access to Critical Cyber Assets was no longer needed was not revoked within seven calendar days.

2.2. Level 2:

2.2.1 Awareness program does not exist or is not implemented; or,

2.2.2 Training program exists, but does not address the requirements identified in Standard CIP-004; or,

2.2.3 Personnel risk assessment program exists, but assessments are not conducted as required; or,

2.2.4 One instance of personnel termination for cause (employee, contractor or service provider) in which access to Critical Cyber Assets was not revoked within 24 hours.

2.3. Level 3:

2.3.1 Training program exists, but has not been reviewed and updated at least annually; or,

2.3.2 A personnel risk assessment program exists, but records reveal program does not meet the requirements of Standard CIP-004; or,

2.3.3 List(s) of personnel with their access control rights exists, but does not include service vendors and contractors.

2.4. Level 4:

2.4.1 No documented training program exists; or,

2.4.2 No documented personnel risk assessment program exists; or,

2.4.3 No required documentation created pursuant to the training or personnel risk assessment programs exists.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.2.4 — Insert the phrase "for cause" as intended. "One instance of personnel termination for cause…"	03/24/06
1	06/01/06	D.2.1.4 — Change "access control rights" to "access rights."	06/05/06

A. Introduction

1. Title: Cyber Security — Electronic Security Perimeter(s)

2. Number: CIP-005-~~1~~2

3. Purpose: Standard CIP-005 requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

4. Applicability

4.1. Within the text of Standard CIP-005, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entities

~~4.1.11~~**4.1.12** Regional Reliability Organizations.

4.2. The following are exempt from Standard CIP-005:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-005:

R1. Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).

R1.1. Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).

R1.2. For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.

R1.3. Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).

R1.4. Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005.

R1.5. Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003~~,~~; Standard CIP-004-1 Requirement R3~~,~~; Standard CIP-005-1 Requirements R2 and R3~~,~~; Standard CIP-006-1 Requirements R2 and R3~~,~~; Standard CIP-007-1, Requirements R1 and R3 through R9~~,~~; Standard CIP-008~~,~~; and Standard CIP-009.

R1.6. The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.

R2. Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).

R2.1. These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.

R2.2. At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.

R2.3. The Responsible Entity shall maintain and implement a procedure for securing dial-up access to the Electronic Security Perimeter(s).

R2.4. Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.

R2.5. The required documentation shall, at least, identify and describe:

R2.5.1. The processes for access request and authorization.

R2.5.2. The authentication methods.

R2.5.3. The review process for authorization rights, in accordance with Standard CIP-004-1 Requirement R4.

R2.5.4. The controls used to secure dial-up accessible connections.

R2.6. Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.

R3. Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.

R3.1. For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.

R3.2. Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.

R4. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:

R4.1. A document identifying the vulnerability assessment process;

R4.2. A review to verify that only ports and services required for operations at these access points are enabled;

R4.3. The discovery of all access points to the Electronic Security Perimeter;

R4.4. A review of controls for default accounts, passwords, and network management community strings; and,

R4.5. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R5. Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005.

R5.1. The Responsible Entity shall ensure that all documentation required by Standard CIP-005 reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005 at least annually.

R5.2. The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.

R5.3. The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-005. Responsible entities may document controls either individually or by specified applicable grouping.

M1. Documents about the Electronic Security Perimeter as specified in Requirement R1.

M2. Documentation of the electronic access controls to the Electronic Security Perimeter(s), as specified in Requirement R2.

M3. Documentation of controls implemented to log and monitor access to the Electronic Security Perimeter(s) as specified in Requirement R3.

M4. Documentation of the Responsible Entity's annual vulnerability assessment as specified in Requirement R4.

M5. Access logs and documentation of review, changes, and log retention as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep logs for a minimum of ninety calendar days, unless longer retention is required pursuant to Standard CIP-008, Requirement R2.

1.3.2 The Responsible Entity shall keep other documents and records required by Standard CIP-005 from the previous full calendar year.

1.3.3 The compliance monitor shall keep audit records for three years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in noncompliance. Refer to CIP-003 Requirement R3.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 All document(s) identified in CIP-005 exist, but have not been updated within ninety calendar days of any changes as required; or,

2.1.2 Access to less than 15% of electronic security perimeters is not controlled, monitored; and logged;

2.1.3 Document(s) exist confirming that only necessary network ports and services have been enabled, but no record documenting annual reviews exists; or,

2.1.4 At least one, but not all, of the Electronic Security Perimeter vulnerability assessment items has been performed in the last full calendar year.

2.2. Level 2:

2.2.1 All document(s) identified in CIP-005 but have not been updated or reviewed in the previous full calendar year as required; or,

2.2.2 Access to between 15% and 25% of electronic security perimeters is not controlled, monitored; and logged; or,

2.2.3 Documentation and records of vulnerability assessments of the Electronic Security Perimeter(s) exist, but a vulnerability assessment has not been performed in the previous full calendar year.

2.3. Level 3:

2.3.1 A document defining the Electronic Security Perimeter(s) exists, but there are one or more Critical Cyber Assets not within the defined Electronic Security Perimeter(s); or,

2.3.2 One or more identified non-critical Cyber Assets is within the Electronic Security Perimeter(s) but not documented; or,

2.3.3 Electronic access controls document(s) exist, but one or more access points have not been identified; or

2.3.4 Electronic access controls document(s) do not identify or describe access controls for one or more access points; or,

2.3.5 Electronic Access Monitoring:

2.3.5.1 Access to between 26% and 50% of Electronic Security Perimeters is not controlled, monitored; and logged; or,

2.3.5.2 Access logs exist, but have not been reviewed within the past ninety calendar days; or,

2.3.6 Documentation and records of vulnerability assessments of the Electronic Security Perimeter(s) exist, but a vulnerability assessment has not been performed for more than two full calendar years.

2.4. Level 4:

2.4.1 No documented Electronic Security Perimeter exists; or,

2.4.2 No records of access exist; or,

2.4.3 51% or more Electronic Security Perimeters are not controlled, monitored, and logged; or,

2.4.4 Documentation and records of vulnerability assessments of the Electronic Security Perimeter(s) exist, but a vulnerability assessment has not been performed for more than three full calendar years; or,

2.4.5 No documented vulnerability assessment of the Electronic Security Perimeter(s) process exists.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.3.1 — Change “Critical Assets,” to “Critical Cyber Assets” as intended.	03/24/06

A. Introduction

1. Title: Cyber Security — Physical Security of Critical Cyber Assets

2. Number: CIP-006-~~1~~2

3. Purpose: Standard CIP-006 is intended to ensure the implementation of a physical security program for the protection of Critical Cyber Assets. Standard CIP-006 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

4. Applicability:

4.1. Within the text of Standard CIP-006, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entities

~~4.1.11~~**4.1.12** Regional Reliability Organizations.

4.2. The following are exempt from Standard CIP-006:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-006:

R1. Physical Security Plan — The Responsible Entity shall create ~~and~~ , maintain and implement a physical security plan, approved by ~~a~~ the senior manager or delegate(s) that shall address, at a minimum, the following:

R1.1. Processes to ensure and document that all Cyber Assets within an Electronic Security Perimeter also reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to the Critical Cyber Assets.

R1.2. Processes to identify all access points through each Physical Security Perimeter and implement measures to control entry at those access points.

R1.3. Processes, tools, and procedures to monitor physical access to the perimeter(s).

R1.4. Procedures for and implemention of the appropriate use of physical access controls as described in Requirement R3 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.

R1.5. Procedures for reviewing access authorization requests and revocation of access authorization, in accordance with CIP-004 Requirement R4.

R1.6. Procedures for and implemention of escorted access within the physical security perimeter of personnel not authorized for unescorted access.

R1.7. Process for updating the physical security plan within ~~ninety~~thirty calendar days of implementation of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the physical security perimeter, physical access controls, monitoring controls, or logging controls.

R1.8. Cyber Assets used in the access control and/or monitoring of the Physical Security Perimeter(s) shall be afforded the protective measures specified in Standard CIP-003~~,~~-1; Standard CIP-004-1 Requirement R3~~,~~; Standard CIP-005-1 Requirements R2 and R3~~,~~; Standard CIP-006-1 Requirement R2 and R3~~,~~; Standard CIP-007~~,~~-1; Standard CIP-008-1; and Standard CIP-009-1.

R1.9. Process for ensuring that the physical security plan is reviewed at least annually.

R2. Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods:

R2.1. Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.

R2.2. Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.

R2.3. Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

R2.4. Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets.

R3. Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008. One or more of the following monitoring methods shall be used:

R3.1. Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response.

R3.2. Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R2.3.

R4. Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent:

R4.1. Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method.

R4.2. Video Recording: Electronic capture of video images of sufficient quality to determine identity.

R4.3. Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R2.3.

R5. Access Log Retention — The responsible entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008.

R6. Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R2, R3, and R4 function properly. The program must include, at a minimum, the following:

R6.1. Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.

R6.2. Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement R6.1.

R6.3. Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-006:

M1. The physical security plan as specified in Requirement R1 and documentation of the review and updating of the plan.

M2. Documentation identifying the methods for controlling physical access to each access point of a Physical Security Perimeter as specified in Requirement R2.

M3. Documentation identifying the methods for monitoring physical access as specified in Requirement R3.

M4. Documentation identifying the methods for logging physical access as specified in Requirement R4.

M5. Access logs as specified in Requirement R5.

M6. Documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep documents other than those specified in Requirements R5 and R6.2 from the previous full calendar year.

1.3.2 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in noncompliance. Refer to Standard CIP-003 Requirement R3.

1.4.3 The Responsible Entity may not make exceptions in its cyber security policy to the creation, documentation, or maintenance of a physical security plan.

1.4.4 For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006 for that single access point at the dial-up device.

Comment [th1]: Address SCE&G RFI

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 The physical security plan exists, but has not been updated within ninety calendar days of a modification to the plan or any of its components; or,

2.1.2 Access to less than 15% of a Responsible Entity's total number of physical security perimeters is not controlled, monitored, and logged; or,

2.1.3 Required documentation exists but has not been updated within ninety calendar days of a modification.; or,

2.1.4 Physical access logs are retained for a period shorter than ninety days; or,

2.1.5 A maintenance and testing program for the required physical security systems exists, but not all have been tested within the required cycle; or,

2.1.6 One required document does not exist.

2.2. Level 2:

2.2.1 The physical security plan exists, but has not been updated within six calendar months of a modification to the plan or any of its components; or,

2.2.2 Access to between 15% and 25% of a Responsible Entity's total number of physical security perimeters is not controlled, monitored, and logged; or,

2.2.3 Required documentation exists but has not been updated within six calendar months of a modification; or

2.2.4 More than one required document does not exist.

2.3. Level 3:

2.3.1 The physical security plan exists, but has not been updated or reviewed in the last twelve calendar months of a modification to the physical security plan; or,

2.3.2 Access to between 26% and 50% of a Responsible Entity's total number of physical security perimeters is not controlled, monitored, and logged; or,

2.3.3 No logs of monitored physical access are retained.

2.4. Level 4:

2.4.1 No physical security plan exists; or,

2.4.2 Access to more than 51% of a Responsible Entity's total number of physical security perimeters is not controlled, monitored, and logged; or,

2.4.3 No maintenance or testing program exists.

A. Introduction

1. Title: Cyber Security — Systems Security Management

2. Number: CIP-007-~~1~~2

3. Purpose: Standard CIP-007 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the non-critical Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

4. Applicability:

4.1. Within the text of Standard CIP-007, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entities

~~4.1.11~~4.1.12 Regional Reliability Organizations.

4.2. The following are exempt from Standard CIP-007:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-007 for all Critical Cyber Assets and other Cyber Assets within the Electronic Security Perimeter(s):

R1. Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

R1.1. The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.

R1.2. The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.

R1.3. The Responsible Entity shall document test results.

R2. Ports and Services — The Responsible Entity shall establish ~~and~~ , document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.

R2.1. The Responsible Entity shall enable only those ports and services required for normal and emergency operations.

R2.2. The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).

R2.3. In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure or an acceptance of risk.

R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-1 Requirement R6, shall establish ~~and~~ , document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

R3.1. The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.

R3.2. The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure or an acceptance of risk.

R4. Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).

R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure ~~or an acceptance of risk~~.

R4.2. The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.1. The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.

R5.1.1. The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-1 Requirement R5.

R5.1.2. The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.

R5.1.3. The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-1 Requirement R5 and Standard CIP-004-1 Requirement R4.

R5.2. The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.

R5.2.1. The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.

R5.2.2. The Responsible Entity shall identify those individuals with access to shared accounts.

R5.2.3. Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:

R5.3.1. Each password shall be a minimum of six characters.

R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters.

R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

R6. Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.

R6.1. The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2. The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.

R6.3. The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008.

R6.4. The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.

R6.5. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.

R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005.

R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.

R8. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:

R8.1. A document identifying the vulnerability assessment process;

R8.2. A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;

R8.3. A review of controls for default accounts; and,

R8.4. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007 at least annually. Changes resulting from modifications to the systems or controls shall be documented within ~~ninety~~thirty calendar days of the change being completed.

Formatted: Font: 11 pt

Formatted: Font: 11 pt

Formatted: Font: 11 pt

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-007:

M1. Documentation of the Responsible Entity's security test procedures as specified in Requirement R1.

M2. Documentation as specified in Requirement R2.

M3. Documentation and records of the Responsible Entity's security patch management program, as specified in Requirement R3.

M4. Documentation and records of the Responsible Entity's malicious software prevention program as specified in Requirement R4.

M5. Documentation and records of the Responsible Entity's account management program as specified in Requirement R5.

M6. Documentation and records of the Responsible Entity's security status monitoring program as specified in Requirement R6.

M7. Documentation and records of the Responsible Entity's program for the disposal or redeployment of Cyber Assets as specified in Requirement R7.

M8. Documentation and records of the Responsible Entity's annual vulnerability assessment of all Cyber Assets within the Electronic Security Perimeters(s) as specified in Requirement R8.

M9. Documentation and records demonstrating the review and update as specified in Requirement R9.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year.

1.3.2 The Responsible Entity shall retain security–related system event logs for ninety calendar days, unless longer retention is required pursuant to Standard CIP-008 Requirement R2.

1.3.3 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information.

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in non-compliance. Refer to Standard CIP-003 Requirement R3.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 System security controls are in place, but fail to document one of the measures (M1-M9) of Standard CIP-007; or

2.1.2 One of the documents required in Standard CIP-007 has not been reviewed in the previous full calendar year as specified by Requirement R9; or,

2.1.3 One of the documented system security controls has not been updated within ninety calendar days of a change as specified by Requirement R9; or,

2.1.4 Any one of:

- Authorization rights and access privileges have not been reviewed during the previous full calendar year; or,
- A gap exists in any one log of system events related to cyber security of greater than seven calendar days; or,
- Security patches and upgrades have not been assessed for applicability within thirty calendar days of availability.

2.2. Level 2:

2.2.1 System security controls are in place, but fail to document up to two of the measures (M1-M9) of Standard CIP-007; or,

2.2.2 Two occurrences in any combination of those violations enumerated in Noncompliance Level 1, 2.1.4 within the same compliance period.

2.3. Level 3:

2.3.1 System security controls are in place, but fail to document up to three of the measures (M1-M9) of Standard CIP-007; or,

2.3.2 Three occurrences in any combination of those violations enumerated in Noncompliance Level 1, 2.1.4 within the same compliance period.

2.4. Level 4:

2.4.1 System security controls are in place, but fail to document four or more of the measures (M1-M9) of Standard CIP-007; or,

2.4.2 Four occurrences in any combination of those violations enumerated in Noncompliance Level 1, 2.1.4 within the same compliance period.

2.4.3 No logs exist.

E. Regional Differences

None identified.

A. Introduction

1. Title: Cyber Security — Incident Reporting and Response Planning

2. Number: CIP-008-~~1~~2

3. Purpose: Standard CIP-008 ensures the identification, classification, response, and reporting of Cyber Security Incidents related to Critical Cyber Assets. Standard CIP-008 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

4. Applicability

4.1. Within the text of Standard CIP-008, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entities

~~4.1.11~~**4.1.12** Regional Reliability Organizations.

4.2. The following are exempt from Standard CIP-008:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-008:

R1. Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident Response plan shall address, at a minimum, the following:

R1.1. Procedures to characterize and classify events as reportable Cyber Security Incidents.

R1.2. Response actions, including roles and responsibilities of incident response teams, incident handling procedures, and communication plans.

R1.3. Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES–<u>–</u>ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES–<u>–</u>ISAC either directly or through an intermediary.

R1.4. Process for updating the Cyber Security Incident response plan within ~~ninety~~<u>thirty</u> calendar days of any changes.

R1.5. Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.

R1.6. Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident.<u> Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test.</u>

R2. Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of CIP-008:

M1. The Cyber Security Incident response plan as indicated in R1 and documentation of the review, updating, and testing of the plan

M2. All documentation as specified in Requirement R2.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep documentation other than that required for reportable Cyber Security Incidents as specified in Standard CIP-008 for the previous full calendar year.

1.3.2 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in non-compliance. Refer to Standard CIP-003 Requirement R3.

1.4.3 The Responsible Entity may not take exception in its cyber security policies to the creation of a Cyber Security Incident response plan.

1.4.4 The Responsible Entity may not take exception in its cyber security policies to reporting Cyber Security Incidents to the ES ISAC.

2. Levels of Noncompliance

2.1. Level 1: A Cyber Security Incident response plan exists, but has not been updated within ninety calendar days of changes.

2.2. Level 2:

2.2.1 A Cyber Security Incident response plan exists, but has not been reviewed in the previous full calendar year; or,

2.2.2 A Cyber Security Incident response plan has not been tested in the previous full calendar year; or,

2.2.3 Records related to reportable Cyber Security Incidents were not retained for three calendar years.

2.3. Level 3:

2.3.1 A Cyber Security Incident response plan exists, but does not include required elements Requirements R1.1, R1.2, and R1.3 of Standard CIP-008; or,

2.3.2 A reportable Cyber Security Incident has occurred but was not reported to the ES ISAC.

2.4. Level 4: A Cyber Security Incident response plan does not exist.

E. Regional Differences

None identified.

A. Introduction

1. Title: Cyber Security — Recovery Plans for Critical Cyber Assets

2. Number: CIP-009-~~1~~2

3. Purpose: Standard CIP-009 ensures that recovery plan(s) are put in place for Critical Cyber Assets and that these plans follow established business continuity and disaster recovery techniques and practices. Standard CIP-009 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

4. Applicability:

4.1. Within the text of Standard CIP-009, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator

4.1.2 Balancing Authority

4.1.3 Interchange Authority

4.1.4 Transmission Service Provider

4.1.5 Transmission Owner

4.1.6 Transmission Operator

4.1.7 Generator Owner

4.1.8 Generator Operator

4.1.9 Load Serving Entity

4.1.10 NERC

4.1.11 Regional Entities

~~4.1.11~~4.1.12 Regional Reliability Organizations

4.2. The following are exempt from Standard CIP-009:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-009:

R1. Recovery Plans — The Responsible Entity shall create and annually review recovery plan(s) for Critical Cyber Assets. The recovery plan(s) shall address at a minimum the following:

R1.1. Specify the required actions in response to events or conditions of varying duration and severity that would activate the recovery plan(s).

R1.2. Define the roles and responsibilities of responders.

R2. Exercises — The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident.

R3. Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within ~~ninety~~thirty calendar days of the change being completed.

R4. Backup and Restore — The recovery plan(s) shall include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.

R5. Testing Backup Media — Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-009:

M1. Recovery plan(s) as specified in Requirement R1.

M2. Records documenting required exercises as specified in Requirement R2.

M3. Documentation of changes to the recovery plan(s), and documentation of all communications, as specified in Requirement R3.

M4. Documentation regarding backup and storage of information as specified in Requirement R4.

M5. Documentation of testing of backup media as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep documentation required by Standard CIP-009 from the previous full calendar year.

1.3.2 The Compliance Monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in non-compliance. Refer to Standard CIP-003 Requirement R3.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 Recovery plan(s) exist and are exercised, but do not contain all elements as specified in Requirement R1; or,

2.1.2 Recovery plan(s) are not updated and personnel are not notified within ninety calendar days of the change.

2.2. Level 2:

2.2.1 Recovery plan(s) exist, but have not been reviewed during the previous full calendar year; or,

2.2.2 Documented processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets do not exist.

2.3. Level 3:

2.3.1 Testing of information stored on backup media to ensure that the information is available has not been performed at least annually; or,

2.3.2 Recovery plan(s) exist, but have not been exercised during the previous full calendar year.

2.4. Level 4:

2.4.1 No recovery plan(s) exist; or,

2.4.2 Backup of information required to successfully restore Critical Cyber Assets does not exist.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking

Access Control System – a system which provides for Authentication, Authorization and frequently Accounting of access through either a Physical Security Perimeter or an Electronic Security Perimeter. An Access Control System may be a single computer system which performs all three functions, or may be a combination of two or more computer sub-systems which work together to accomplish all three functions.

1. Authentication is the process of verifying a user's or object's identity.

2. Authorization is the process for granting an authenticated user or object, the authority and access to perform a certain operation.

3. Accounting provides an audit trail of access, and includes logging of access by identification and time.

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-~~1~~2

3. Purpose: NERC Standards CIP-002 through CIP-009 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of a risk-based assessment.

4. Applicability:

4.1. Within the text of Standard CIP-002, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Reliability Organizations~~.~~

4.1.12 Regional Entities.

4.2. The following are exempt from Standard CIP-002:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-002:

R1. Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.

R1.1. The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.

R1.2. The risk-based assessment shall consider the following assets:

R1.2.1. Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.

R1.2.2. Transmission substations that support the reliable operation of the Bulk Electric System.

R1.2.3. Generation resources that support the reliable operation of the Bulk Electric System.

R1.2.4. Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.

R1.2.5. Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

R1.2.6. Special Protection Systems that support the reliable operation of the Bulk Electric System.

R1.2.7. Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.

R2. Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology required in R1. The Responsible Entity shall review this list at least annually, and update it as necessary.

R3. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R2, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

R3.1. The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,

R3.2. The Cyber Asset uses a routable protocol within a control center; or,

R3.3. The Cyber Asset is dial-up accessible.

R4. Annual Approval — ~~A~~ The senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-002:

M1. The risk-based assessment methodology documentation as specified in Requirement R1.

M2. The list of Critical Assets as specified in Requirement R2.

M3. The list of Critical Cyber Assets as specified in Requirement R3.

M4. The records of annual approvals as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep documentation required by Standard CIP-002 from the previous full calendar year

1.3.2 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1 Level 1: The risk assessment has not been performed annually.

2.2 Level 2: The list of Critical Assets or Critical Cyber Assets exist, but has not been approved or reviewed in the last calendar year.

2.3 Level 3: The list of Critical Assets or Critical Cyber Assets does not exist.

2.4 Level 4: The lists of Critical Assets and Critical Cyber Assets do not exist.

E. Regional Differences

None identified.

Version History

1	01/16/06	R3.2 — Change “Control Center” to “control center”	03/24/06

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-~~1~~2

3. Purpose: Standard CIP-003 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment~~.

4. Applicability:

4.1. Within the text of Standard CIP-003, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Reliability Organizations~~.~~

4.1.12 Regional Entities.

4.2. The following are exempt from Standard CIP-003:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets shall only be required to comply with CIP-003-2 Requirement R2.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-003:

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002 through CIP-009, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.

R2.1. The senior manager shall be identified by name, title, ~~business phone, business address,~~ and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002 through CIP-009, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations must be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

~~R2.3.~~R2.4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures~~, or a statement accepting risk~~.

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

Formatted: Highlight

R5.1.1. Personnel shall be identified by name, title, business phone and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-003:

M1. Documentation of the Responsible Entity's cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2.

M2. Documentation of the assignment of, and changes to, the Responsible Entity's leadership as specified in Requirement R2.

M3. Documentation of the Responsible Entity's exceptions, as specified in Requirement R3.

M4. Documentation of the Responsible Entity's information protection program as specified in Requirement R4.

M5. The access control documentation as specified in Requirement R5.

M6. The Responsible Entity's change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year.

1.3.2 The compliance monitor shall keep audit records for three years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Refer to CIP-003, Requirement R3. Duly authorized exceptions will not result in non-compliance.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 Changes to the designation of senior manager were not documented in accordance with Requirement R2.2; or,

2.1.2 Exceptions from the cyber security policy have not been documented within thirty calendar days of the approval of the exception; or,

2.1.3 An information protection program to identify and classify information and the processes to protect information associated with Critical Cyber Assets has not been assessed in the previous full calendar year.

2.2. Level 2:

2.2.1 A cyber security policy exists, but has not been reviewed within the previous full calendar year; or,

2.2.2 Exceptions to policy are not documented or authorized by the senior manager or delegate(s); or,

2.2.3 Access privileges to the information related to Critical Cyber Assets have not been reviewed within the previous full calendar year; or,

2.2.4 The list of designated personnel responsible to authorize access to the information related to Critical Cyber Assets has not been reviewed within the previous full calendar year.

2.3. Level 3:

2.3.1 A senior manager has not been identified in accordance with Requirement R2.1; or,

2.3.2 The list of designated personnel responsible to authorize logical or physical access to protected information associated with Critical Cyber Assets does not exist; or,

2.3.3 No changes to hardware and software components of Critical Cyber Assets have been documented in accordance with Requirement R6.

2.4. Level 4:

2.4.1 No cyber security policy exists; or,

2.4.2 No identification and classification program for protecting information associated with Critical Cyber Assets exists; or,

2.4.3 No documented change control and configuration management process exists.

E. **Regional Differences**

None identified.

4.2. The following are exempt from Standard CIP-003:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets shall only be required to comply with CIP-003-2 Requirement R2.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-003:

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002 through CIP-009, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the~~-~~ entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.

R2.1. The senior manager shall be identified by name, title, ~~business phone, business address,~~ and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002 through CIP-009, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations must be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

~~R2.3.~~R2.4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures~~, or a statement accepting risk~~.

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

R5.1.1. Personnel shall be identified by name, title, business phone and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-003:

M1. Documentation of the Responsible Entity's cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2.

M2. Documentation of the assignment of, and changes to, the Responsible Entity's leadership as specified in Requirement R2.

M3. Documentation of the Responsible Entity's exceptions, as specified in Requirement R3.

M4. Documentation of the Responsible Entity's information protection program as specified in Requirement R4.

M5. The access control documentation as specified in Requirement R5.

M6. The Responsible Entity's change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year.

1.3.2 The compliance monitor shall keep audit records for three years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Refer to CIP-003, Requirement R3. Duly authorized exceptions will not result in non-compliance.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 Changes to the designation of senior manager were not documented in accordance with Requirement R2.2; or,

2.1.2 Exceptions from the cyber security policy have not been documented within thirty calendar days of the approval of the exception; or,

2.1.3 An information protection program to identify and classify information and the processes to protect information associated with Critical Cyber Assets has not been assessed in the previous full calendar year.

2.2. Level 2:

2.2.1 A cyber security policy exists, but has not been reviewed within the previous full calendar year; or,

2.2.2 Exceptions to policy are not documented or authorized by the senior manager or delegate(s); or,

2.2.3 Access privileges to the information related to Critical Cyber Assets have not been reviewed within the previous full calendar year; or,

2.2.4 The list of designated personnel responsible to authorize access to the information related to Critical Cyber Assets has not been reviewed within the previous full calendar year.

2.3. Level 3:

2.3.1 A senior manager has not been identified in accordance with Requirement R2.1; or,

2.3.2 The list of designated personnel responsible to authorize logical or physical access to protected information associated with Critical Cyber Assets does not exist; or,

2.3.3 No changes to hardware and software components of Critical Cyber Assets have been documented in accordance with Requirement R6.

2.4. Level 4:

2.4.1 No cyber security policy exists; or,

2.4.2 No identification and classification program for protecting information associated with Critical Cyber Assets exists; or,

2.4.3 No documented change control and configuration management process exists.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. Title: Cyber Security — Personnel & Training

2. Number: CIP-004-~~1~~2

3. Purpose: Standard CIP-004 requires that personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including contractors and service vendors, have an appropriate level of personnel risk assessment, training, and security awareness. Standard CIP-004 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

4. Applicability:

4.1. Within the text of Standard CIP-004, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Reliability Organizations~~.~~

4.1.12 Regional Entities.

4.2. The following are exempt from Standard CIP-004:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-004:

R1. Awareness — The Responsible Entity shall establish, maintain, ~~and~~ document and implement a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);

Formatted: Indent: Left: 0.25", Hanging: 0.38", Tab stops: 0.63", Left + Not at 1.8"

Formatted: French (France)

- Management support and reinforcement (e.g., presentations, meetings, etc.).

R2. Training — The Responsible Entity shall establish, maintain, ~~and~~ document and implement an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. The cyber security training program shall be annually ~~, and~~ reviewed ~~the program annually~~ and updated as necessary.

Formatted: Indent: Left: 0.25", Hanging: 0.38", Tab stops: 0.63", Left

R2.1. This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained ~~within ninety calendar days of such authorization~~prior to their being granted such access. Provisions for emergency situations shall be handled in accordance with CIP-003-2 R1.1.

R2.2. Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities:

R2.2.1. The proper use of Critical Cyber Assets;

R2.2.2. Physical and electronic access controls to Critical Cyber Assets;

R2.2.3. The proper handling of Critical Cyber Asset information; and,

R2.2.4. Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.

R2.3. The Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.

R3. Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access. A personnel risk assessment shall be conducted pursuant to that program ~~within thirty days of~~prior to such personnel being granted such access except in specified circumstances such as an emergency. ~~Provisions for emergency situations shall be handled in accordance with CIP-003-2 R1.1.~~

Formatted: Indent: Left: 0.25", Hanging: 0.38", Tab stops: 0.63", Left + Not at 1.8"

~~**R3.**~~ ~~Such~~ The Personnel Risk Assessment program shall at a minimum include:

R3.1. The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.

R3.2. The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.

R3.3. The Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004.

R4. Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.

Formatted: Indent: Left: 0.25", Hanging: 0.38", Tab stops: 0.63", Left + Not at 1.8"

R4.1. The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the

access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.

R4.2. The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-004:

M1. Documentation of the Responsible Entity's security awareness and reinforcement program as specified in Requirement R1.

M2. Documentation of the Responsible Entity's cyber security training program, review, and records as specified in Requirement R2.

M3. Documentation of the personnel risk assessment program and that personnel risk assessments have been applied to all personnel who have authorized cyber or authorized unescorted physical access to Critical Cyber Assets, as specified in Requirement R3.

M4. Documentation of the list(s), list review and update, and access revocation as needed as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep personnel risk assessment documents in accordance with federal, state, provincial, and local laws.

1.3.2 The Responsible Entity shall keep all other documentation required by Standard CIP-004 from the previous full calendar year.

1.3.3 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in non-compliance. Refer to CIP-003 Requirement R3.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 Awareness program exists, but is not conducted within the minimum required period of quarterly reinforcement; or,

2.1.2 Training program exists, but records of training either do not exist or reveal that personnel who have access to Critical Cyber Assets were not trained as required; or,

2.1.3 Personnel risk assessment program exists, but documentation of that program does not exist; or,

2.1.4 List(s) of personnel with their access rights is available, but has not been reviewed and updated as required.

2.1.5 One personnel risk assessment is not updated at least every seven years, or for cause; or,

2.1.6 One instance of personnel (employee, contractor or service provider) change other than for cause in which access to Critical Cyber Assets was no longer needed was not revoked within seven calendar days.

2.2. Level 2:

2.2.1 Awareness program does not exist or is not implemented; or,

2.2.2 Training program exists, but does not address the requirements identified in Standard CIP-004; or,

2.2.3 Personnel risk assessment program exists, but assessments are not conducted as required; or,

2.2.4 One instance of personnel termination for cause (employee, contractor or service provider) in which access to Critical Cyber Assets was not revoked within 24 hours.

2.3. Level 3:

2.3.1 Training program exists, but has not been reviewed and updated at least annually; or,

2.3.2 A personnel risk assessment program exists, but records reveal program does not meet the requirements of Standard CIP-004; or,

2.3.3 List(s) of personnel with their access control rights exists, but does not include service vendors and contractors.

2.4. Level 4:

2.4.1 No documented training program exists; or,

2.4.2 No documented personnel risk assessment program exists; or,

2.4.3 No required documentation created pursuant to the training or personnel risk assessment programs exists.

E. Regional Differences

None identified.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entities

~~4.1.11~~**4.1.12** Regional Reliability Organizations.

4.2. The following are exempt from Standard CIP-006:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: XXXX~~June 1, 2006~~

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-006:

R1. Physical Security Plan — The Responsible Entity shall ~~create~~document, ~~and~~ maintain, and implement a physical security plan, approved by the~~a~~ senior manager or delegate(s) that shall address, at a minimum, the following:

R1.1. ~~Processes to ensure and document that a~~All Cyber Assets within an Electronic Security Perimeter ~~also~~ shall reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to ~~the~~ such~~Critical~~ Cyber Assets.

R1.2. ~~Processes to identify~~ Identification of all access points through each Physical Security Perimeter and measures to control entry at those access points.

R1.3. Processes, tools, and procedures to monitor physical access to the perimeter(s).

R1.4. ~~Procedures for the a~~Appropriate use of physical access controls as described in Requirement R3 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.

R1.5. ~~Procedures for r~~Review~~ing~~ of access authorization requests and revocation of access authorization, in accordance with CIP-004 Requirement R4.

R1.6. Continuous e~~Procedures for e~~Escorted access within the ~~p~~Physical ~~s~~Security ~~p~~Perimeter of personnel not authorized for unescorted access., ~~including procedures for the active monitoring of escorted persons at all times within the Physical Security Perimeter. Escorts are required to actively monitor escorted person at all times while within the Physical Security Perimeter.~~

R1.7. ~~Process for u~~Updat~~inge~~ of the physical security plan within thirty~~ninety~~ calendar days of the completion of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the ~~p~~Physical ~~s~~Security ~~p~~Perimeter, physical access controls, monitoring controls, or logging controls.

R1.8. Annual review of the physical security plan.

R2. Protection of Physical Access Control Systems — Cyber Assets that authorize and/or ~~monitoring~~log ~~used in the~~ access ~~control and monitoring~~ ~~of~~ to the Physical Security Perimeter(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall:

R2.1. be protected from unauthorized physical access.

R2.2. ~~hardware at the Physical Security Perimeter access point such as and badge readers, systems controlling access to cyber assets shall physically monitored~~ be afforded the protective measures specified in Standard CIP-003-1;~~CIP-003,~~ Standard CIP-004-1 Requirement R3;~~R3,~~ Standard CIP-005-1 Requirements R2 and R3;~~R3,~~ Standard CIP-006-2 Requirements ~~-R4R2~~ and R5;~~R3,~~ Standard CIP-007-1;~~CIP-007,~~ Standard CIP-008-1; and Standard CIP-009-1.~~CIP-009.~~

R3. Protection of Electronic Access Control Systems — Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter.

~~**R1.8.**~~

~~**R1.9.** Process for ensuring that the physical security plan is reviewed at least annually.~~

~~**R2.**~~**R4.** Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods:

~~**R2.1.a)**~~ Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.

~~**R2.2.b)**~~ Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.

~~R2.3.~~c) Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

~~R2.4.~~d) Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets.

~~R3.~~R5. Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008. One or more of the following monitoring methods shall be used:

~~R3.1.~~a) Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response.

~~R3.2.~~b) Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R~~2~~4.3.

~~R4.~~R6. Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent:

~~R4.1.~~a) Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method.

~~R4.2.~~b) Video Recording: Electronic capture of video images of sufficient quality to determine identity.

~~R4.3.~~c) Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R~~2~~4.3.

~~R5.~~R7. Access Log Retention — The responsible entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008.

~~R6.~~R8. Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R~~2~~4, R~~3~~5, and R~~4~~6 function properly. The program must include, at a minimum, the following:

~~R6.1.~~R8.1. Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.

~~R6.2.~~R8.2. Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement ~~R6~~R8.1.

~~R6.3.~~R8.3. Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-006:

M1. The physical security plan as specified in Requirement R1 and documentation of the implementation, review and updating of the plan.

Formatted: Outline numbered + Level: 2 + Numbering Style: a, b, c, … + Start at: 1 + Alignment: Left + Aligned at: 0.69" + Tab after: 1.19" + Indent at: 1.19"

Formatted: Outline numbered + Level: 2 + Numbering Style: a, b, c, … + Start at: 1 + Alignment: Left + Aligned at: 0.69" + Tab after: 1.19" + Indent at: 1.19"

M2. Documentation that the physical access control systems are protected as specified in Requirement R2.

M3. Documentation that the electronic access control systems are located within an identified Physical Security Perimeter as specified in Requirement R3.

M4. Documentation identifying the methods for controlling physical access to each access point of a Physical Security Perimeter as specified in Requirement R4.

~~**M1.**~~

~~**M2.** Documentation identifying the methods for controlling physical access to each access point of a Physical Security Perimeter as specified in Requirement R2.~~

~~M3.~~M5. Documentation identifying the methods for monitoring physical access as specified in Requirement R~~3~~5.

~~M4.~~M6. Documentation identifying the methods for logging physical access as specified in Requirement R~~4~~6.

~~M5.~~M7. Access logs as specified in Requirement R~~5~~7.

~~M6.~~M8. Documentation as specified in Requirement R~~6~~8.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep documents other than those specified in Requirements ~~R5~~ R7 and ~~R6~~R8.2 from the previous full calendar year.

1.3.2 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in noncompliance. Refer to Standard CIP-003 Requirement R3.

1.4.3 The Responsible Entity may not make exceptions in its cyber security policy to the creation, documentation, or maintenance of a physical security plan.

1.4.4 For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006 for that single access point at the dial-up device~~.device.~~

2. Levels of Noncompliance

2.1. Level 1:

Formatted: Indent: Left: 0.65", No bullets or numbering

Comment [KBP3]: The SCE&G interpretation is at considerable risk of being rejected by FERC. I strongly recommend it be deferred in order to not put a timely Phase I acceptance in jeopardy.

Comment [th4]: Address SCE&G RFI

Comment [KBP5]: OK to defer to Phase II

2.1.1 The physical security plan exists, but has not been updated within ninety calendar days of a modification to the plan or any of its components; or,

2.1.2 Access to less than 15% of a Responsible Entity's total number of physical security perimeters is not controlled, monitored, and logged; or,

2.1.3 Required documentation exists but has not been updated within ninety calendar days of a modification.; or,

2.1.4 Physical access logs are retained for a period shorter than ninety days; or,

2.1.5 A maintenance and testing program for the required physical security systems exists, but not all have been tested within the required cycle; or,

2.1.6 One required document does not exist.

2.2. Level 2:

2.2.1 The physical security plan exists, but has not been updated within six calendar months of a modification to the plan or any of its components; or,

2.2.2 Access to between 15% and 25% of a Responsible Entity's total number of physical security perimeters is not controlled, monitored, and logged; or,

2.2.3 Required documentation exists but has not been updated within six calendar months of a modification; or

2.2.4 More than one required document does not exist.

2.3. Level 3:

2.3.1 The physical security plan exists, but has not been updated or reviewed in the last twelve calendar months of a modification to the physical security plan; or,

2.3.2 Access to between 26% and 50% of a Responsible Entity's total number of physical security perimeters is not controlled, monitored, and logged; or,

2.3.3 No logs of monitored physical access are retained.

2.4. Level 4:

2.4.1 No physical security plan exists; or,

~~2.4.1~~2.4.2 The physical security plan has not been implemented; or,

~~2.4.2~~2.4.3 Access to more than 51% of a Responsible Entity's total number of physical security perimeters is not controlled, monitored, and logged; or,

~~2.4.3~~2.4.4 No maintenance or testing program exists.

E. **Regional Differences**

None identified.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. Title: Cyber Security — Systems Security Management

2. Number: CIP-007-~~1~~2

3. Purpose: Standard CIP-007 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the ~~non-critical~~other Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should interpret and apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

4. Applicability:

4.1. Within the text of Standard CIP-007, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entities

~~4.1.11~~4.1.12 Regional Reliability Organizations.

4.2. The following are exempt from Standard CIP-007:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-007 for all Critical Cyber Assets and other Cyber Assets within the Electronic Security Perimeter(s):

R1. Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

R1.1. The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.

R1.2. The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.

R1.3. The Responsible Entity shall document test results.

R2. Ports and Services — The Responsible Entity shall establish ~~and~~ , document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.

R2.1. The Responsible Entity shall enable only those ports and services required for normal and emergency operations.

R2.2. The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).

R2.3. In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure or an acceptance of risk.

R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-1 Requirement R6, shall establish ~~and~~ , document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

R3.1. The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.

R3.2. The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure or an acceptance of risk.

R4. Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).

R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure ~~or an acceptance of risk~~.

R4.2. The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.1. The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.

R5.1.1. The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-1 Requirement R5.

R5.1.2. The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.

R5.1.3. The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-1 Requirement R5 and Standard CIP-004-1 Requirement R4.

R5.2. The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.

R5.2.1. The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.

R5.2.2. The Responsible Entity shall identify those individuals with access to shared accounts.

R5.2.3. Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:

R5.3.1. Each password shall be a minimum of six characters.

R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters.

R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

R6. Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.

R6.1. The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2. The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.

R6.3. The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008.

R6.4. The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.

R6.5. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.

R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005.

R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.

R8. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:

R8.1. A document identifying the vulnerability assessment process;

R8.2. A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;

R8.3. A review of controls for default accounts; and,

R8.4. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007 at least annually. Changes resulting from modifications to the systems or controls shall be documented within ~~ninety~~thirty calendar days of the change being completed.

Formatted: Font: 11 pt

Formatted: Font: 11 pt

Formatted: Font: 11 pt

C. Measures

The following measures will be used to demonstrate compliance with the requirements of Standard CIP-007:

M1. Documentation of the Responsible Entity's security test procedures as specified in Requirement R1.

M2. Documentation as specified in Requirement R2.

M3. Documentation and records of the Responsible Entity's security patch management program, as specified in Requirement R3.

M4. Documentation and records of the Responsible Entity's malicious software prevention program as specified in Requirement R4.

M5. Documentation and records of the Responsible Entity's account management program as specified in Requirement R5.

M6. Documentation and records of the Responsible Entity's security status monitoring program as specified in Requirement R6.

M7. Documentation and records of the Responsible Entity's program for the disposal or redeployment of Cyber Assets as specified in Requirement R7.

M8. Documentation and records of the Responsible Entity's annual vulnerability assessment of all Cyber Assets within the Electronic Security Perimeters(s) as specified in Requirement R8.

M9. Documentation and records demonstrating the review and update as specified in Requirement R9.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year.

1.3.2 The Responsible Entity shall retain security–related system event logs for ninety calendar days, unless longer retention is required pursuant to Standard CIP-008 Requirement R2.

1.3.3 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information.

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in non-compliance. Refer to Standard CIP-003 Requirement R3.

2. Levels of Noncompliance

2.1. Level 1:

2.1.1 System security controls are in place, but fail to document one of the measures (M1-M9) of Standard CIP-007; or

2.1.2 One of the documents required in Standard CIP-007 has not been reviewed in the previous full calendar year as specified by Requirement R9; or,

2.1.3 One of the documented system security controls has not been updated within ninety calendar days of a change as specified by Requirement R9; or,

2.1.4 Any one of:

- Authorization rights and access privileges have not been reviewed during the previous full calendar year; or,
- A gap exists in any one log of system events related to cyber security of greater than seven calendar days; or,
- Security patches and upgrades have not been assessed for applicability within thirty calendar days of availability.

2.2. Level 2:

2.2.1 System security controls are in place, but fail to document up to two of the measures (M1-M9) of Standard CIP-007; or,

2.2.2 Two occurrences in any combination of those violations enumerated in Noncompliance Level 1, 2.1.4 within the same compliance period.

2.3. Level 3:

2.3.1 System security controls are in place, but fail to document up to three of the measures (M1-M9) of Standard CIP-007; or,

2.3.2 Three occurrences in any combination of those violations enumerated in Noncompliance Level 1, 2.1.4 within the same compliance period.

2.4. Level 4:

2.4.1 System security controls are in place, but fail to document four or more of the measures (M1-M9) of Standard CIP-007; or,

2.4.2 Four occurrences in any combination of those violations enumerated in Noncompliance Level 1, 2.1.4 within the same compliance period.

2.4.3 No logs exist.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. Title: Cyber Security — Incident Reporting and Response Planning

2. Number: CIP-008-~~1~~2

3. Purpose: Standard CIP-008 ensures the identification, classification, response, and reporting of Cyber Security Incidents related to Critical Cyber Assets. Standard CIP-008 should be read as part of a group of standards numbered Standards CIP-002 through CIP-009. ~~Responsible Entities should apply Standards CIP-002 through CIP-009 using reasonable business judgment.~~

4. Applicability

4.1. Within the text of Standard CIP-008, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entities

~~4.1.11~~**4.1.12** Regional Reliability Organizations.

4.2. The following are exempt from Standard CIP-008:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002, identify that they have no Critical Cyber Assets.

5. Effective Date: ~~June 1, 2006~~XXXX

B. Requirements

The Responsible Entity shall comply with the following requirements of Standard CIP-008:

R1. Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident ~~Response~~ response plan shall address, at a minimum, the following:

R1.1. Procedures to characterize and classify events as reportable Cyber Security Incidents.

R1.2. Response actions, including roles and responsibilities of Cyber Security Incident~~incident~~ response teams, Cyber Security Incident~~incident~~ handling procedures, and communication plans.

R1.3. Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES–ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES–ISAC either directly or through an intermediary.

R1.4. Process for updating the Cyber Security Incident response plan within ~~ninety~~thirty calendar days of any changes.

R1.5. Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.

R1.6. Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the Cyber Security Incident ~~incident~~ response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident. Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test.

R2. Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.

C. Measures

The following measures will be used to demonstrate compliance with the requirements of CIP-008:

M1. The Cyber Security Incident response plan as indicated in R1 and documentation of the review, updating, and testing of the plan

M2. All documentation as specified in Requirement R2.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

1.1.1 Regional Reliability Organizations for Responsible Entities.

1.1.2 NERC for Regional Reliability Organization.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually.

1.3. Data Retention

1.3.1 The Responsible Entity shall keep documentation other than that required for reportable Cyber Security Incidents as specified in Standard CIP-008 for the previous full calendar year.

1.3.2 The compliance monitor shall keep audit records for three calendar years.

1.4. Additional Compliance Information

1.4.1 Responsible Entities shall demonstrate compliance through self-certification or audit, as determined by the Compliance Monitor.

1.4.2 Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and approved by the designated senior manager or delegate(s). Duly authorized exceptions will not result in non-compliance. Refer to Standard CIP-003 Requirement R3.

1.4.3 The Responsible Entity may not take exception in its cyber security policies to the creation of a Cyber Security Incident response plan.

1.4.4 The Responsible Entity may not take exception in its cyber security policies to reporting Cyber Security Incidents to the ES ISAC.

2. Levels of Noncompliance

2.1. Level 1: A Cyber Security Incident response plan exists, but has not been updated within ninety calendar days of changes.

2.2. Level 2:

2.2.1 A Cyber Security Incident response plan exists, but has not been reviewed in the previous full calendar year; or,

2.2.2 A Cyber Security Incident response plan has not been tested in the previous full calendar year; or,

2.2.3 Records related to reportable Cyber Security Incidents were not retained for three calendar years.

2.3. Level 3:

2.3.1 A Cyber Security Incident response plan exists, but does not include required elements Requirements R1.1, R1.2, and R1.3 of Standard CIP-008; or,

2.3.2 A reportable Cyber Security Incident has occurred but was not reported to the ES ISAC.

2.4. Level 4: A Cyber Security Incident response plan does not exist.

E. Regional Differences

None identified.

- Train prior to access
- PRA prior to access
- Update plans (etc) 30 days after implementation of change
- Remove “acceptance or risk” for malware
- Clarity testing does not require removing an asset from service

Phase 1 To-Do

- CIP-006 Dial-up accessible assets interpretation (SCG&E)
- CIP-006 Cabling Interpretation (Progress Energy)
- Wording changes in CIP-004
- Review Measures with respect to revised requirements
- Implementation Plan – newly identified assets
- Implementation Plan – revised requirements & mapping matrix
- Comment Form

Phase 1 Issues dropped from initial proposal

- CIP-002:
  - Approval of CA list by external entity (i.e., RC, RE, etc)
  - Newly identified assets (as a requirement – working group for implementation plan addendum formed)
- CIP-003:
  - “single” senior manager
  - Escort requirements

Phase 1 Issues dropped from initial proposal

- CIP-004:
  - Training “ensure” language
  - Training “emergency” language, including post-emergency review activities
  - Networking hardware and software included in training
  - Training on escort requirements
  - Training must be appropriate to trainees responsibilities
  - Limited escorted access for new hires or transfers
  - Emergency provision for increased access and approval, including post-emergency review activities

Phase 1 Issues dropped from initial proposal

- CIP-008:
  - Procedures when a documented plan is not followed
  - Requirement to update plan to include response to an event for which there is no documented plan
- CIP-009:
  - Procedures when a documented plan is not followed
  - Requirement to update plan to include recovery to an event for which there is no documented plan

Technical Feasibility Process Strawman

- Constraints:
  - All requirements of a standard must be adhered to
    - No exceptions
  - Self-report of an non-compliance (exception) with Mitigation Plan is allowed
  - FERC Order 706

FERC Order 706 Language

"The Commission continues to view the term 'acceptance of risk' as representing an uncontrolled exception from compliance." (150)

"… any alternative language that provides a similar opportunity for a responsible entity to opt out of compliance would be subject to remand." (151)

"…alternative language that deals with such issues in terms of technical feasibility is preferable." (151)

"… we have adopted the concept of technical feasibility to encompass a broader range of valid justifications." (151)

FERC Order 706 Language

"Expanding the use of the technical feasibility conditions would address the desire for flexibility expressed by some commenters while providing the control that the Commission finds to be necessary." (152)

"…we note that we have found that technical feasibility should not be limited simply to whether something is technically possible but also whether it is technically safe and operationally reasonable." (152)

FERC Order 706 Language

"… we note that a long-established practice of risk acceptance by senior management does not mean that a continuation of this practice is appropriate under a new system of mandatory cyber security Reliability Standards." (153)

"The commission's concern in the CIP NOPR was with the lack of appropriate controls, and eliminating references to acceptance or risk does not imply that all risk can be eliminated." (154)

FERC Order 706 Language

"The Commission … directs the ERO to develop a set of conditions or criteria that a responsible entity must follow when relying on the technical feasibility exception contained in specific Requirements of the CIP Reliability Standards." (178)

"… conditions for invoking technical feasibility exception should allow for operational considerations." (178)

FERC Order 706 Language

"… did not propose to eliminate references to technical feasibility from the CIP Reliability Standards, only that the term be interpreted narrowly…" (178)

"… underlying rationale for a technical feasibility exception … are an acknowledged concern." (178)

"… acknowledge that the possibility of being required to replace equipment before the end of its useful life is a valid concern." (180)

FERC Order 706 Language

"… disagrees … that technical feasibility should be interpreted to apply to future assets also." (181)

"… technical feasibility exceptions may be permitted if appropriate conditions are in place. The term technical feasibility should be interpreted narrowly not to include consideration of business judgment, but we agree … that is should include operational and safety considerations." (186)

FERC Order 706 Language

"… the Commission adopts the CIP NOPR proposal for a three step structure to require accountability when a responsible entity relies on technical feasibility as the basis for exception. We address mitigation and remediation in this section and direct he ERO to develop: (1) a requirement that the responsible entity must develop, document and implement a mitigation plan that achieves a comparable level of security to the requirement; and, (2) a requirement that the use of the technical feasibility exception by a responsible entity must be accompanied by a remediation plan and timeline for elimination of the technical feasibility exemption. … a date certain for remediation may not be possible in some instances." (192)

FERC Order 706 Language

"… technical feasibility exemptions should be reported and justified and subject to approval by the ERO or the relevant Regional Entity." (209)

"… we continue to believe that internal approval is an important component of an overall framework of accountability with regard to use of the technical feasibility exemption. … direct the ERO to include approval of mitigation and remediation steps by the senior manager…" (211)

FERC Order 706 Language

"… Regional Entities should, in the first instance, receive and catalog notices of technical feasibility exceptions that are claimed." (213)

"… actual evaluation and approval of technical feasibility exceptions should be performed in the first instance in the audit process. … include personnel in audit teams with sufficient expertise to judge the need for a technical feasibility exception and the sufficiency of preferred mitigation measures." (214)

FERC Order 706 Language

"… initial audits of technical feasibility exceptions should be expedited, i.e., performed earlier than otherwise, including moving the audit to an earlier year." (215)

"… rather than a pre-approval process, we direct the ERO to design and conduct an approval process through the Regional Entities and the compliance audit process. … the ERO or a Regional Entity to approve any technical feasibility exception, taking into account whether the technical feasibility exception is needed and whether the mitigation and remediation steps are adequate to the circumstance." (218)

FERC Order 706 Language

"… we direct NERC, in developing the accountability structure for the technical feasibility exception, to include appropriate provisions to assure that governmental entities … can safeguard sensitive information." (219)

"… we direct the ERO to develop a set of criteria to provide accountability when a responsible entity relies on the technical feasibility exceptions…" (222)

FERC Order 706 Language

"… framework to include mitigation steps, a remediation plan, a timeline for eliminating the use of the technical feasibility exception unless appropriate justification otherwise is provided, regular review of whether it continues to be necessary to invoke the exception, internal approval by the senior manager, wide-area approval through the ERO's audit process, and cooperation with the ERO to provide the Commission with high-level, wide-area analysis regarding th eeffects of the technical feasibility exception on the reliability of the Bulk-Power System." (222)

FERC Technical Feasibility Process

- Document the exception,
- Document mitigation steps,
- Document a remediation plan,
- Document a timeline for eliminating the use of the technical feasibility exception unless appropriate justification otherwise is provided,
- Provide regular review of whether it continues to be necessary to invoke the exception,
- Document internal approval by the senior manager,
- Document wide-area approval through the ERO's audit process, and
- Provide cooperation with the ERO to provide the Commission with high-level, wide-area analysis regarding the effects of the technical feasibility exception on the reliability of the Bulk-Power System

Current Self-report Process

- Document non-compliance to a specific requirement
- Provide explanation of the non-compliance
- Describe reliability impact
- Describe any external or extraneous factors
- Provide a mitigation plan
- Provide a mitigation schedule
- Senior Officer signature
- Catalog and Approval by Regional Entity
- Catalog and Approval by ERO
- Submit to FERC (US entities)

Conclusion

- A Technical Feasibility report becomes a special case Self-report of Non-compliance:
  - New “CIP-003 R4”
    - or is it a Guideline?
  - Discussion of ‘impact to reliability’ if the Technical Feasibility exemption is not taken
    - Also includes statement of technical incompatibility
  - Mandatory compensating / mitigating measures while the Technical Feasibility exemption is in effect
  - Documented justification for not supplying a mitigation plan (i.e., an alternative measure)

Conclusion (cont'd)

- Annual review and re-approval by Responsible Entity, RE, and ERO regardless of mitigation plan status
- ERO to develop separate annual report to FERC
  - Report will contain sensitive information – must be CEII protected
  - Analyzes the combined impact of all Technical Feasibility exemptions
- May trigger accelerated audit schedule

Comment Form

Background Information ~~(John Lim)~~

~~The purpose of Project 2008-06 Cyber Security Order 706 is to update and revise the following Cyber Security Standards as scoped out in the Standard Authorization Request and FERC Order 706 to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system:~~

~~CIP-002-1 Critical Cyber Asset Identification~~
~~CIP-003-1 Security Management Controls~~
~~CIP-004-1 Personnel & Training~~
~~CIP-005-1 Electronic Security Perimeter(s)~~
~~CIP-006-1 Physical Security of Critical Cyber Assets~~
~~CIP-007-1 Systems Security Management~~
~~CIP-008-1 Incident Reporting and Response Planning~~
~~CIP-009-1 Recovery Plans for Critical Cyber Assets~~

~~The SDT is responsible for producing just and reasonable standards that are not unduly discriminatory or preferential and that are in the public interest. The SDT is to consider the scope items in the SAR and FERC Order 706, when revising the CIP Standards, including:~~

- ~~Blackout report recommendations;~~
- ~~Eliminate the phrase "reasonable business judgment" in the standards before the compliance audits commence in July 2009.~~
- ~~How to address acceptance of risk exceptions and accountability.~~
- ~~Develop specific conditions that a reasonable entity must satisfy to invoke the "technical feasibility" exception;~~
- ~~Data as a critical cyber asset and help to defining critical assets - and what external review and procedures may be involved and who should be involved in that process;~~
- ~~Application of a measurable "defense in depth" to create an electronic security perimeter. Different definitions by different world - network view of the world vs. operations.~~
- ~~What strong controls are needed and how much change triggers an "active vulnerability assessment" (change controls).~~
- ~~Modify the standards to conform to the ERO Rules of Procedure as outlined in the Standard Review Guidelines~~
- ~~Multi-phase approach to satisfy what needs to be done in the short term~~

On July 10th, 2008, the NERC Standards Committee approved the Standard A~~cti~~uthorization Request SAR) for developing revisions to Critical Infrastructure Protection Cyber Security Standards (revisions to CIP-002 through CIP-009). A Standards Drafting Team (SDT) was appointed by the Standards Committee on August 7, 2008 to develop these revisions. The overall drafting project requires reviewing each of the standards to ensure that it conforms to the latest version of the ERO Rules of Procedure, including the Reliability Standards Development Procedure as outlined in the Standard Review Guidelines. The revisions will also address all of the directed modifications identified in the FERC Final Order 706.

In addition, the SDT will consider the inclusion of clarifications from Requests for Interpretation to the CIP-002-1 – CIP-009-1 cyber security standards.
~~In addition, the SDT will consider the inclusion of clarifications from Requests for Interpretation to the CIP-002-1 – CIP-009-2 cyber security standards.~~

Comment [JL1]: Corrected typo from -2 to -1

Comment [t2]: SE: John, is it CIP009-2?

The SDT will also consider other Cyber-related standards, guidelines and activities:

- The NIST Security Risk Management Framework (includes GAO, OMB and FIPS)
- Other cyber security related documents such as NIST, ISO 27000 Family, CIPC Risk Assessment Guideline, MITRE corporation technical report, DHS, National Laboratories papers, DOE 417, IEC, ISA, etc.
- Coordination work between FERC, NEI and NRC in regard to the nuclear facility exemption issue with respect to regulatory gaps and modify, as necessary, the standards to reflect current determinations.

Formatted: Bulleted + Level: 1 + Aligned at: 0.25" + Indent at: 0.5"

Revisions will consider the additional issues identified by stakeholders in the SAR comment process:

Industry Education

- Consider what to do with the existing FAQ document e.g., modify, replace.
- Consider how to provide additional guidance in support of these standards, e.g., Technical Reference documents, guidelines, white papers.
- Consider development of a guideline document to address extended LANs over multiple geographically dispersed locations.

Formatted: Bulleted + Level: 1 + Aligned at: 0.25" + Indent at: 0.5"

Balloting and Implementation

- Determine the timing and grouping of revisions to be submitted to industry for comment and ballot, e.g., multi-phase or other approach.
- Determine the optimum implementation plan for revised CIP standards in this project.
- Address when newly identified critical assets or critical cyber assets, newly acquired equipment or assets, etc. must come into compliance with CIP standards.
- Address compliance issue where internal requirements exceed NERC requirements.
- Clarify in view of language contained in FERC Order 706 paragraph 377.

Formatted: Bulleted + Level: 1 + Aligned at: 0.25" + Indent at: 0.5"

Clarify Existing Requirements

- Consider the need for different requirements for different environments e.g., control center, substation and generation plant.
- Clarify how serial and wireless devices are subject to these standards. Refer to pp 278 and 285 of FERC Order 706.

Formatted: Bulleted + Level: 1 + Aligned at: 0.25" + Indent at: 0.5"

Other Issues

- Consider issues surrounding protection of data in motion.
- Consider the issue of hybrid devices that use both serial and routable protocols.
- Consider the issue of data versus information (electronic and/or hardcopy lists, drawings, etc.) protection including transport and transmittal of such information.
- Consider a clearly defined set of risks which can result in a more focused and effective set of compliance expectations.
- With regard to third-party vendors and contractors, provide clarification and additional guidance as to how much a responsible entity may rely on the processes and procedures of contractors and vendors that support the critical infrastructure of that responsible entity under the CIP standards and still be compliant with the standard.

Formatted: Bulleted + Level: 1 + Aligned at: 0.25" + Indent at: 0.5"

Because of the extensive scope and varying complexity of the issues and work in these revisions, the SDT, at its meeting on October 6th-8th, 2008, decided on a multiphase

approach in the development of the revisions. This comment form addresses Phase ~~1~~I of the project. A description of the scope, and criteria and rationale for inclusion in Phase ~~1~~I follow.

Comment [JDB3]: Use SAR description

Summary of Phase I Revisions

Formatted: Not Highlight

Phase I includes necessary modifications to CIP 002 – CIP 009 in order to comply with near term specific directives included in FERC Order 706. Certain modifications directed in Order 706, such as the removal of the term "reasonable business judgment," must be completed before compliance audits begin in 2009. In addition, each of the CIP standards has been modified to ensure that it conforms to the latest version of the ERO Rules of Procedure including applicability to Regional Entities. Additional directives included in FERC Order 706, which apply to specific standards are also addressed in Phase I modifications. More contentious issues listed in the Background Section above will be addressed in a later SDT phase.

Comment [JL4]: I believe this is appropriate, as this document accompanies the output of pase 1.

Phase I of the SDT proposes the following modifications to CIP 002 - CIP 009:

Formatted: Not Highlight

~~**Summary of Phase I Revisions**~~

A. For EACH CIP 002 – 009 Standard the following modifications apply:

Comment [t5]: SE: Each of these changes is based on the published red lined versions discussed at the meeting in Maryland. These changes must be reviewed to assure they are in accordance with the final version that will be sent to NERC for posting.

- As directed in Order 706
  - Purpose Section : Removed 'reasonable business judgment"
- To comply with ERO Rules of Procedure
  - Applicability Section : Added Regional Entity, in addition to Regional Reliability Organization
- Versioning
  - Phase I modifications to the existing version will be reflected as CIP 002-009 – 2
- Dates
  - New version dates will reflect Effective Date of new version and Date Adopted by Board of Trustees

Formatted: Bullets and Numbering

B. In addition to the changes noted above, the following modifications apply to specific CIP Standards:

- **CIP 002 Modifications**
  - As directed in Order 706
    - R4 Annual Approvals: Senior manager shall annually review and approve the risk-based assessment methodology in addition to the list of Critical Assets and Critical Cyber Assets

Formatted: Bullets and Numbering

- **CIP 003 Modifications**
  - As directed in Order 706
    - R2 Leadership: Require the designation of a single manager, who has direct and comprehensive responsibility and accountability for implementation and ongoing compliance with the CIP Reliability Standards. Eliminate the need for business phone and business address designation.

Formatted: Bullets and Numbering

- **CIP 004 Modifications**
  - As directed in Order 706

Formatted: Bullets and Numbering

- R2.1 Training: Personnel having access to Critical Cyber Assets must be trained prior to their being granted such access, rather than allowing 90 days to accomplish the training. Added reference to CIP 003 R1.1. for emergency provisions.
- R3 Personnel Risk Assessment: Personnel risk assessment shall be conducted prior to granting personnel access to Critical Cyber Assets rather than within 30 days of such access. Added reference to CIP 003 R1.1. for emergency provisions.

Comment [t6]: SE: Question: do we want to just list what the requirement was changed to? OR, do we want to indicate both what it is changed to and what it used to be?

- **CIP 005 Modifications**
  - Clarification to assure that requirement must be implemented
    - R2.3 Electronic Access Controls: Responsible Entities must both maintain and implement a procedure for securing dial up access, instead of just maintaining the procedure as stated in the prior CIP version.

Formatted: Bullets and Numbering

- **CIP 006 Modifications**
  - Clarifications to assure that solutions related to requirements must be implemented
    - R1 Physical Security Plan: Responsible entities must create, maintain and implement a physical security plan rather than simply creating and maintaining the plan as stated in prior CIP version.
    - R1.2 Measures to control access to entry points must be implemented as well as identified as stated in the prior CIP version.
    - R1.6 Escorted Access: Added the word implementation to assure that escorted access procedures are both created and implemented.
    - R1.7 Updates to the Physical Security Plan: Added the word implementation to assure that changes to the physical plan occur within thirty calendar days of the implementation of the perimeter change.

Formatted: Bullets and Numbering

Comment [t7]: SE: These were the tweaks related to 'implementation' which were discussed at the meeting. Double check to assure these match the final modifications.

- **CIP 007 Systems Security Management Modifications**
  - As directed in Order 706
    - R2.3 Ports and Services: Removal of the term "or an acceptance of risk."
    - R3.2 Security Patch Management: Removal of the term "or an acceptance of risk."
    - R4.1 Malicious Software Prevention: Removal of the term "or an acceptance of risk."
    - R9 Documentation Review and Maintenance: Modified to assure that changes to systems or controls are documented within thirty calendar days rather than within ninety days as prescribed in the prior CIP version.
  - Clarifications to assure that solutions related to requirements must be implemented
    - R7 Disposal and Redeployment: Added the word "implement" in R7 to assure that formal methods are both established and implemented.
    -

Formatted: Bullets and Numbering

- **CIP 008 Incident Response & Reporting Modifications**
  - As directed in Order 706
    - R1.6 Testing of the Incident Response Plan: Added language to clarify that testing need not require a responsible entity to remove any systems from service.
    - R1.4 Updating the Cyber security Incident Response Plan: Require updates within thirty calendar day so f any changes instead of within 90 days as required in the prior CIP version.
  - Clarifications to assure that solutions related to requirements must be implemented
    - R1 Incident Response Plan: Added the word "implement".

Formatted: Bullets and Numbering

CIP 009 Recovery Plan Modifications

- As directed in Order 706
  - R3 Change Control: Require updates to be communicated within thirty calendar days of the change, instead of within 90 days as required in the prior CIP version.

Formatted: Bullets and Numbering

.

Implementation Plan Changes

- New Critical Assets
  - New Implementation Plan is proposed for newly identified Critical Assets
- Changes in CIP Requirements as a result of Phase I SDT work
  - Modification to CIP Implementation Plan is proposed to address changes noted in Phase I of SDT work

Formatted: Bullets and Numbering

~~To the last point, the SDT adopted the multi-phase approach at its inaugural meeting at NIST headquarters in Gaithersburg, MD. At this meeting, the SDT set out to complete in Phase I, the date certain item to eliminate the phrase "reasonable business judgment" and any other scope items that could be completed within the same Phase I timeframe.~~

~~PUT DESCRIPTIONS OF PHASE I MODIFICATIONS TO CIP-002 TO CIP-009 HERE…~~
~~[list each CIP; summarize changes and rationale]~~

Comment Form

The following questions will assist the SDT in finalizing the Phase I work for CIP-002-2 through CIP-009-2 concerning changes to requirements. ~~For questions where you agree with the SDT, please state that you agree with any explanatory comments and if available, please provide supporting documentation.~~Please indicate whether or not you agree with the change. If you disagree with the SDT, please explain why you disagree and provide ~~data to support your position~~suggestions for improvement. The SDT would appreciate responses to as many of these questions as you can answer.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. The CSO706 SDT ~~modified~~added management approval of the risk-based assessment methodology[1] in CIP-002-1 ~~to remove the phrase "reasonable business judgment", added the Regional Entity as subject to the Standard and _____~~.Requirement R4.

   Do you agree with the change? If not, please explain and ~~explain~~provide specific suggestions for improvement.

   ☐ Yes

   ☐ No

   Comments:

2. The CSO706 SDT ~~modified~~ clarified the intent of the CIP-003-1 Requirement R2 on Leadership ~~to remove the phrase "reasonable business judgment", added the Regional Entity as subject to the Standard and _____~~.that a senior manager be assigned with the overall responsibility and authority for cyber security matters[2]. Requirement R2.3 was added to address senior manager delegation of authority for specific actions to a named delegate. The original R2.3 was renumbered to R2.4.

   Do you agree with the changes? If not, please explain and provide specific suggestions for improvement.

   ☐ Yes

   ☐ No

   Comments:

3. The CSO706 SDT modified CIP-004-1 Requirements R1 and R2 to ~~remove the phrase "reasonable business judgment", added the Regional Entity as subject to the Standard~~

In person at SMUD (Sacramento, Kevin Sherlin)	October 21-22 Full/Full	
Webex/Conf call for FULL Team	October 29, 2008 1PM to 5PM Eastern Please send completed documents to Harry by COB Monday October 27, 2008.	1. Implementation plan (new CCA) sub team (minus Dave Norton) takes commentary from full team and revises the categories for approval by full team. 2. Comment Form final for approval by full team. 3. Implementation plan (CIP version 2) sub team final for approval by full team. MAPPING document? 4. CIP-004 and CIP-006 final for approval by full team. Submit package to MEL for review and comment.

WebEx/Conference call	November 3, 2008	Develop concept document - TFE sub team (Scott Mix, Keith Stouffer, John Varnell, Jerry Freese, Tom Hofstetter, Compliance staffer). Deliver to full team by Nov. 7 or 10.
WebEx/Conference call	November 5, 2008 - NERC staff feedback	Review and conform drafts per feedback from MEL
In person at Little Rock, Arkansas (confirmed with AECC)	Nov 12-14 Half/Full/Half	1. Finalize Phase I documents. 2. Review and finalize "technical feasibility exception" proposal. 3. One pager "big picture" straw proposal and enumerate some guiding principles.
WebEx/conf call	Nov 18 Webex/Conf call	
In person meeting at FERC offices	December 4-5 Full/Full	
In person at APS (Phoenix, AZ)	January 7-9 Half/Full/Half	Consider Comments to Phase I

Implementation Plan for Cyber Security Standards
CIP-002-2 through CIP-009-2

Effective Date[i]

The proposed effective date for these standards is the greater of 1) 180 days following approval by the Federal Energy Regulatory Commission, or 2) the number of days following approval by the Federal Energy Regulatory Commission before a Responsible Entity must become Compliant with a requirement according to the associated Compliance Schedule.

Comment [p1]: This section captures the intent of the version 2 implementation schedule. See Implementation Schedule notes at the bottom of this document.

Comment [p2]: Consider Canadian regulatory bodies?

Summary of Modifications

A red line version of each of these standards showing the proposed changes has been posted at the following site:

[Insert URL for Red-Line version]

Modified Part	Modification Description
Purpose statement for all Standards	Removes the allowance of reasonable business judgment for Responsible Entities when applying Standards CIP-002 through CIP-009.
Applicability section for all Standards	Includes Regional Entities in the definition of Responsible Entity.
CIP-002-2 R4	Requires the senior manager or delegate(s) to approve the risk-based assessment methodology in addition to the Critical Asset and Critical Cyber Asset lists.
CIP-003-2 R2	Adds the requirement for the senior manager to have both responsibility and authority for leading and managing the implementation of, and adherence to, the Cyber Security Standards.
CIP-003-2 R2.1	Removes the requirement to identify the senior manager's business phone and address.
CIP-003-2 R2.3	Explicitly permits the assigned senior manager to delegate authority in writing for specified actions, where allowed, throughout the Cyber Security Standards.
CIP-004-2 R1	Explicitly requires the implementation of the documented security awareness program and clarifies that authorized cyber or authorized unescorted physical access is to Critical Cyber Assets.
CIP-004-2 R2	Explicitly requires the implementation of the documented cyber security training program.
CIP-004-2 R2.1	Requires the training of personnel prior to being granted access to Critical Cyber Assets.
CIP-004-2 R3	Requires Responsible Entities to perform a personnel risk assessment prior to such personnel being granted access to Critical Cyber Assets.
CIP-005-2 R1.5	Clarifies the scope of this requirement to include Cyber Assets used in either access control or monitoring of the Electronic Security Perimeter.
CIP-005-2 R2.3	Explicitly requires the implementation of the procedure to secure dial-up access to the Electronic Security Perimeter.
CIP-006-2 R1	Explicitly requires the implementation of a physical security plan. Modifications also include changing "a" senior manager to "the" senior manager.
CIP-006-2	Explicitly requires the implementation of measures to control entry to the Physical

Comment [p3]: We chose not to mention the FERC mandate here since the Implementation Plan is part of the standards. However, we believe the FERC mandate should appear in the comment form.

Comment [p4]: Need to update the FAQ to indicate the reasoning behind some of these changes.

Comment [p5]: MODIFICATION TO REDLINE – Change "a" to "the".

Comment [p6]: MODIFICATION TO REDLINE - Consider changing delegate to plural.

Comment [p7]: Pending review of SDT sub-team

R1.2	Security Perimeter.
CIP-006-2 R1.4	Explicitly requires the implementation of procedures for the appropriate use of physical access controls.
CIP-006-2 R1.6	Explicitly requires the implementation of procedures for escorted access to the Physical Security Perimeter.
CIP-006-2 R1.7	Shortens the timeframe to update the physical security plan from ninety to thirty calendar days upon implementation of a security system redesign or reconfiguration.
CIP-006-2 R1.8	Clarifies the scope of this requirement to include Cyber Assets used in either access control or monitoring of the Physical Security Perimeter.
CIP-007-2 R2	Explicitly requires the implementation of the process to ensure only required ports and services are enabled.
CIP-007-2 R3	Explicitly requires the implementation of a security patch management program.
CIP-007-2 R4.1	Removes the Responsible Entity's option to accept the risk of not implementing malware prevention tools without compensating measure(s) to mitigate risk exposure.
CIP-007-2 R7	Explicitly requires the implementation of Cyber Asset disposal and redeployment procedures.
CIP-007-2 R9	Shortens the timeframe to update CIP-007 documentation in response to a system or control change from ninety to thirty calendar days and further clarifies this timeframe begins after such changes are completed.
CIP-008-2 R1	Explicitly requires the implementation of a Cyber Security Incident response plan.
CIP-008-2 R1.4	Shortens the timeframe to update the Cyber Security Incident response plan from ninety to thirty calendar days.
CIP-008-2 R1.6	Clarifies the testing of Cyber Security Incident response plans does not require the removal of components or systems from service.
CIP-009-2 R3	Shortens the timeframe for communicating updates to Critical Cyber Asset recovery plans from within ninety to thirty calendar days of the change being completed.

Comment [p8]: MODIFICATIONS TO REDLINE – Capitalize physical security perimeter (R1.6 & 1.7)

Comment [p9]: Pending review of SDT sub-team

Comment [p10]: REDLINE NOTE – confusion around the term Cyber Asset and non-critical Cyber Asset globally.

Comment [p11]: REDLINE NOTE - Check for consistency of implementation after changes (e.g. CIP-006 R1.7, CIP-008 R1.4, CIP-009 R3)

Comment [p12]: MODIFICATION TO REDLINE – ensure consistency when capitalizing "Incident" and "Response".

Comment [p13]: REDLINE NOTE – This requirement does not actually require a test to be performed.

[i] **Implementation Schedule Issues**

- Are we 1) modifying, 2) referencing, or 3) completely developing a new Implementation Schedule in revision 2?
- There are issues with the Auditably Compliant phase. If an entity is required to become compliant with phase 2 180 days after approval, they may not have a year's worth of documentation.
- For those in the Substantially Compliant phase upon approval, should we allow additional time before they are required to become Compliant?
- Do the complications of the implementation schedule indicate the need to push all but the "reasonable business judgment" modifications out to Phase 2? Furthermore, is there some phrase we can substitute for "reasonable business judgment" to satisfy FERC in Phase 1?

Implementation Plan Amendment
for Cyber Security Standards
CIP-003 through CIP-009

Implementation Plan for Newly Identified Critical Cyber Assets

This Implementation Plan identifies the schedule for becoming compliant with the requirements of NERC Standards CIP-003 through CIP-009 (current version) for assets determined to be Critical Cyber Assets once the "Compliant" milestone date listed in the existing Implementation Plan has passed.

This Implementation Plan specifies only a Compliant milestone. The Compliant milestone is expressed in this Implementation Plan table as the number of months following the designation of the newly identified asset as a Critical Cyber Asset, following the requirements of NERC Standard CIP-002.

For some requirements, the Responsible Entity is expected to be Compliant immediately upon the designation of the newly identified Critical Cyber Asset. These instances are annotated as "0" herein. For other requirements, the designation of a newly identified Critical Cyber Asset has no bearing on the Compliant date. These are annotated as "—" (a dash).

In all cases where a milestone for compliance is specified (i.e., not annotated as "—"), the Responsible Entity is expected to have all audit records required to demonstrate compliance (i.e., to be Auditably Compliant) one year following the milestone listed in this Implementation Plan. Where the milestone assumes prior compliance (i.e., is annotated as "—"), the Responsible Entity is expected to have all documentation and records showing compliance (i.e., Auditably Compliant) based on other previously defined Implementation Plan milestones.

There are no Implementation Plan milestones specified herein for compliance with NERC Standard CIP-002. All Responsible Entities are required to be compliant with NERC Standard CIP-002 based on the existing Implementation Plan.

Implementation Schedule

There are three milestone categories described in this Implementation Plan. They are briefly:

1. First identified Critical Cyber Asset
2. Reclassification or change-in-status of an ~~E~~existing ~~Critical~~ Cyber Asset to be a Critical Cyber Asset associated with a newly identified Critical Asset~~at a newly identified Critical Asset~~
3. Associated with an existing Critical Asset, any r~~Modification~~ eplacement, reconfiguration, upgrade or addition of a relevant Cyber Asset~~at an existing Critical Asset~~

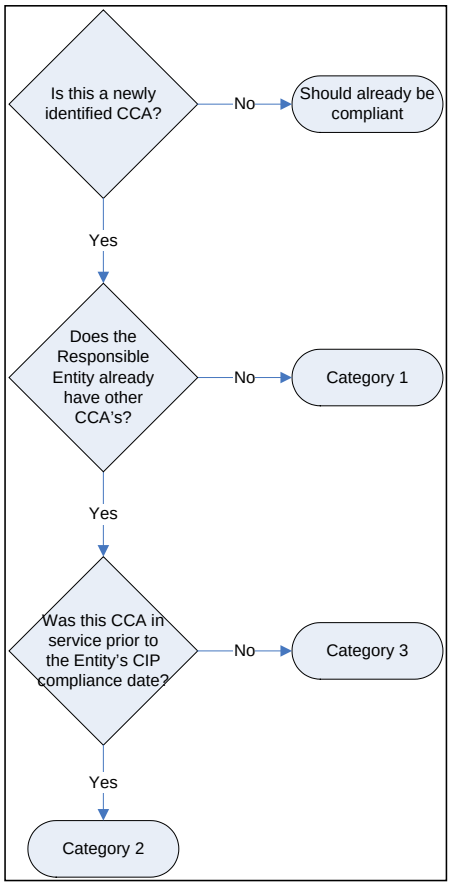

Figure 1

Figure 1 shows an overall process flow for determining which milestone category a Critical Cyber Asset identification scenario must follow. Following the figure is a more detailed description of each category.

The individual categories are distinguished as follows:

1. Category 1: A Responsible Entity that previously has undergone the CIP-002 Critical Asset identification process for at least one annual review and approval period without ever having identified any Critical Cyber Assets at Critical Assets,

but has now identified one or more Critical Asset(s) with associated Critical Cyber Assets. The Compliant milestone specified for this Category shall be the same as Table 4 of the original Implementation Plan for Standards CIP-003 through CIP-009. As such, it is presumed that the Responsible Entity has no previously established cyber security program in force. Table 4 of the original CIP Implementation Plan also shall apply in the event of a Responsible Entity business and system merger or acquisition where previously no Critical Assets had been identified by any of the Entities involved.

2. Category 2: A Responsible Entity has an established CIP Compliance program as required by an existing Implementation Schedule, and now has further identified one or more additional existing Critical Assets with existing associated Critical Cyber Assets. The existing Critical Cyber Assets may remain in service while the relevant requirements of the CIP Standards are implemented. Since the Responsible Entity had previously identified Critical Cyber Assets and had implemented the CIP Standards appropriately for them, it needs only to implement the CIP standards for the newly identified Critical Cyber Asset(s).

   This category applies only when new Critical Cyber Assets or applicable other Cyber Assets are *identified*, not when they are added or modified through construction, upgrade or replacement.

   In the case of business and system merger or asset acquisition, if any of the Responsible Entities involved had previously identified Critical Assets with associated Critical Cyber Assets (and, as appropriate, relevant other Cyber Assets), implementation of the CIP Standards for newly identified Critical Assets and Critical Cyber Assets must be completed per Compliant milestones established herein under Category 2.

   In the case of a merger where all parties already have previously identified Critical Cyber Assets and have existing but different CIP Compliance programs in place, the merged company has one calendar year from the effective date of the merger or acquisition to continue to operate the separate programs and to determine how to create a combined uniform CIP Compliance program. At the conclusion of the one calendar year period, the Category 2 milestones will be used to consolidate the separate CIP Compliance programs into a single uniform CIP Compliance program.

3. Category 3: A Responsible Entity has an established CIP Compliance program as required by an existing Implementation Schedule and implements a new or replacement Critical Cyber Asset associated with a previously identified or newly constructed Critical Asset. This Category shall apply for the following scenarios:

   a. "Greenfield" construction of an asset that will be declared a Critical Asset upon its commissioning or activation (e.g., based on planning or impact studies).

b. Replacement or upgrade of an existing Critical Cyber Asset (and/or other Cyber Asset within an Electronic Security perimeter) associated with a previously identified Critical Asset.
c. Addition of:
    i. a Critical Cyber Asset, or,
    ii. an other Cyber Asset within an established Electronic Security Perimeter.

This Category applies in any case where a Critical Cyber Asset or applicable other Cyber Assets is being added to or modified at an existing or new Critical Asset where that Entity has an established CIP Compliance Program as required by an existing Implementation Schedule.

Category 3 Compliant milestones shall apply for any of the above scenarios where relevant in the event of business and system merger and/or acquisition.

Note that there are no milestones specified for a Responsible Entity that has newly designated a Critical Asset, but no newly designated Critical Cyber Assets. This is because no action is required by the Responsible Entity upon designation of a Critical Asset without associated Critical Cyber Assets. Only upon designation of Critical Cyber Assets does a Responsible Entity need to become compliant with these standards.

Table 1: Implementation milestones for Newly Identified Critical Cyber Assets

Comment [th1]: Consider adding column to give idea what the requirement pertains to...

CIP Standard Requirement	Milestone Category 1	Milestone Category 2	Milestone Category 3
Standard CIP-002-2 – Critical Cyber Asset Identification			
R1	N/A	N/A	N/A

R5	24	2	~~2~~3

Strawman to address technical feasibility

The Responsible Entity may invoke a technical feasibility exception to a Requirement based on the Responsible Entity's determination that any of the following conditions apply:

- The Requirement poses a risk to the reliability of the Bulk-Power System
- The Requirement creates a significant adverse operational and/or safety impact
- The Requirement specifies mechanisms or functions that are not technically possible for a Cyber Asset to support

The Responsible Entity shall document all technical feasibility exceptions in an Exception Plan provided to the ERO and Regional Entity containing:

- A justification why the technical feasibility exception is necessary
- Compensating controls or mitigation steps to meet the intent of and provide a comparable level of security to the Requirement
- A plan of action, milestones, and schedule for implementing the compensating controls or mitigation steps

The Exception Plan must be approved annually by the Responsibility Entity senior manager.

The Exception Plan must be approved annually by the Regional Entity or the ERO if there is no applicable Regional Entity.

The ERO must annually audit compliance with the Exception Plan and provide FERC with an annual high-level, wide-area analysis regarding the effects of all exceptions on the reliability of the Bulk-Power System.

Possible placement of the language is within the A. Introduction section of each standard – possibly a new 5. Effective Date would then be 6.

Appendices

Meeting Facilitation and Draft Report By: Stuart Langton & Hal Beardall
FCRC Consensus Solutions — Florida Conflict Resolution Consortium**, Florida State University**
Thanks to Team members Sharon Edwards and Kevin Perry, and NERC Staff Harry Tom for their meeting notes.
http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html

EXECUTIVE SUMMARY

A. Introductions, Agenda Review, and Welcoming Remarks

The Chair, and Vice Chair welcomed the members and reviewed with the team and participants the proposed meeting agenda *(See appendix #1*). NERC staff Harry Tom conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). They then and thanked Kevin Sherlin for hosting the meeting at the Sacramento Municipal Utility District offices.

B. Review of NERC Antitrust Compliance Guidelines

Harry Tom reviewed with the team the need to comply with NERC's Antitrust Guidelines (See, Appendix #3). He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers.

C. Acceptance of Organizational Meeting Minutes

Stu Langton and Hal Beardall, with the FCRC Consensus Solutions facilitation team, reviewed the minutes from the first meeting noting corrections. The group agreed to accept the minutes as they were distributed to the group with the minor corrections noted; however the minutes will be open to additions as necessary.

D. Planning Challenges, Purpose Statement, and Consensus Guidelines

Stu Langton provided an overview of organizational issues and planning challenges the drafting team will need to keep in mind such as organization, process, issue identification, progression strategy and schedule.

Mr. Langton suggested some key principles for the group such as the capacity to tolerate ambiguity and patience. This will be an iterative process that will build on previous discussions while flexible enough for the group to revisit earlier issues if needed as a result of subsequent discussions.

Following the challenges and principles, Mr. Langton offered for the group's consideration the following draft purpose statement as a starting point for review and discussion:

> "The overall purpose of the Cyber Security of Order 706 SDT is to work together to build consensus on a package of recommended draft cyber security standards and implementation plan that is responsive to and consistent with the scope of the SAR and the FERC Order 706.
>
> The team's products will seek *to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system* and will be submitted for consideration by the registered ballot body. *(Italics from the SAR "purpose" statement)"*

Following discussion and suggestions for improvement, the group asked the facilitators work with the chair and staff to reframe the scope based on this discussion and bring a new draft back to the full group for review next time

Mr. Langton provided an overview of how consensus could be defined and used by the drafting team *(See Appendix #6).* He noted that consensus could be understood as having three meanings in a group process: it is an attitude, an outcome or decision rule, and a structured problem solving process. He suggested that the team has some flexibility to define what a 'consensus' decision should mean for the team's process. He suggested that the team review this again at the next meeting with an eye towards adopting a procedure going forward.

Mr. Beardall reviewed a set of ground rules *(See, Appendix #6)* for the meeting including additional items added at the first meeting for phone protocols.

E. Reviewing Sub-team Draft of NERC CIP Standard

Mr. Langton reviewed the drafting sub team assignments (*Appendix #4*). Sub team leader Jackie Collett described the revisions offered for consideration by the CIP 004 sub team. *(See appendix #5 for link to red-line/underline revisions)*

Sub team changes included:

- Improved the wording
- Took out reasonable business judgment
- Training to be completed prior to granting access
- Personnel risk assessment to be completed prior to granting access
- Added provision that emergency provisions should be handled in accordance with CIP 003.R.1.1.

Following team comments regarding proposed changes to CIP 004 the group voted on the following three options for references to emergencies concerning Training and Background Screening Pre-Requisites:

A. A personnel risk assessment shall be conducted pursuant to the program prior to such personnel being granted such access. (No reference to emergency provisions.)
B. A personnel risk assessment shall be conducted pursuant to the program prior to such personnel being granted such access except in specified circumstances such as an emergency. (Note: This option includes language included in FERC 706 language specifically.)
C. A personnel risk assessment shall be conducted pursuant to the program prior to such personnel being granted such access except in specified circumstances such as an emergency. Emergency provisions should be handled in accordance with CIP 003.R1.1. (Note: This option includes reference back to CIP 003 Policy within CIP 004 R.2&3 to deal with Emergency situations.)

Vote on accepting the proposed CIP 004 language

Preferences	Option A Above	Option B Above	Option C Above
Voting Members	0	22	2

The facilitators suggested an initial acceptability rating (using the 4-3-2-1 scale) of the preferred option to guide additional discussion and refinement.

Acceptance of CIP 004 Proposed Changes	4	3	2	1
Voting Members and Observers	16	8	2	0

Following team discussion and suggestions the group came to the following conclusions concerning CIP 004:

- CIP 004 was accepted with the changes to require the Cyber Security training and background screening prior to access and with the inclusion of language concerning emergency provisions in accordance with FERC Order 706 (Option B above).
- CIP 003 Policy language will be reviewed/modified by a work group in Phase II, not Phase I.

F. Technical Feasibility Exception proposal

Michael Assante, NERC Chief Security Officer, addressed the group by phone and asked the team to consider addressing the technical feasibility exception as a priority and possibly as part of Phase I. Mr. Assante pointed to the request from FERC to address this issue and reviewed several of the related issues to be considered.

Following team discussion of the request the Chair offered a motion to table the issue of the Technical Feasibility Exception until after the team agenda is completed. Members voted unanimously in favor of the motion with one abstention.

G. Reviewing Sub team draft of NERC CIP Standard 006

Kevin Perry, as CIP 006 sub team leader, provided an overview of the revisions offered by the sub team in CIP 006 for consideration by the full team: *(See appendix #5 for link to red-line/underline revisions)*

- Removed Reasonable Business judgment;
- Changed dates as appropriate;
- Minor wording changes which did not alter the substance of the requirement
- R1.6 added that procedures for the active monitoring of escorted persons at all times are required;
- R1.8 added that the Physical Security Plan must be reviewed annually;
- R2. (Note: The prior 1.8 requirement becomes R2 in this proposal. The original suggested language follows:

- R2. Protection of Physical Access Control Systems — Cyber Assets authorizing and logging access to the Physical Security Perimeter(s) shall:
    - R2.1. Exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall reside within an identified Physical Security Perimeter or be physically monitored 24x7 by personnel authorized unescorted access.
    - R2.2. Be afforded the protective measures specified in Standard CIP-003-1; Standard CIP-004-1 Requirement R3; Standard CIP-005-1 Requirements R2 and R3; Standard CIP-006-2 Requirements R4 and R5; Standard CIP-007-1; Standard CIP-008-1; and Standard CIP-009-1.

After an initial team discussion and questions for clarification, the team offered the following initial acceptability rating:

Acceptance of CIP 006 Proposed Changes	4	3	2	1
Voting Members	10	7	2	0

As a result of team discussion of the initial acceptability ratings the following revised CIP 006 language was proposed and tested for acceptability:

- R2. Protection of Physical Access Control systems – Cyber Assets that authorize and/or log access to the Physical Security Perimeters(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic mechanisms and badge readers, shall:
- R2.1 be protected from unauthorized physical access
- R2.2 be afforded the protective measures specified in Standard CIP 003-1; Standard CIP 004-1 Requirement 3; Standard CIP 005-1 Requirements R2 and R3; standard CIP 006-2 Requirement R4 and R5; Standard CIP 007-1; standard CIP 008-1; and Standard CIP 009-1.

Acceptability Rating for CIP 006 with Revised Proposed Language:

Acceptance of CIP 006 Proposed Changes	4	3	2	1
Voting Members	15	8	0	0

H. Review of Sub Team Report on Measures & VRFs

Jerry Freese, leader for the sub team on measures, reported that their team performed a review of the measures, but based on changes prior to today's meeting; they believe there are no changes to the measures in response to proposed changes in CIP requirements.

Todd Thompson reported on behalf of the sub team reviewing VRFs that they believe no changes need to be made at this time.

I. New Implementation Plan for Changes to the Existing Requirements after Phase I Changes

Phillip Huff reported on the progress with the Implementation plan for new or changed Phase I requirements and the accompanying table including the following proposed language: *(See appendix #5 for link to red-line/underline revisions)*

- Proposed language: the original proposed effective date discussed for the modifications contained in these standards is the greater of (1) 180 days following approval by the FERC or (2) the number of days following approval by FERC before a Responsible Entity must become Compliant with a requirement according to the associated Compliance Schedule.

Based on team discussion, the sub team will make additional edits for consistency with changes made in the body of the document and make conforming changes to the standards as identified in review for creating the table.

J. COMMENT FORM REVIEW

Chairman Jeri Domingo-Brewer reviewed the sub team progress on the comment form: *(See appendix #5 for link to red-line/underline revisions)*

- Background information Section uses language out of the SAR to explain what the team had agreed to
- Summary of Phase I Revisions Section summarizes each of the changes
- Requests for Comments/Questions Section requests feedback from commenters

During discussion the team noted that CIP-004, CIP-006 and the Implementation Plan changes need to be updated in the Comment Form. The team also noted the need for education to the industry through a robust communication plan. The team accepted that this draft as a good start on the Comment form.

Members agreed to adjourn for the day.

A. Day Two — Welcome and Agenda Review

Chairperson Jeri Domingo-Brewer thanked the members of the sub teams for their hard work and reviewed the progress made by the group yesterday. She stated that today the team would:

- Review work from the remaining sub teams that were not reviewed yesterday;
- Hanging issue that the group needs to consider pertaining to CIP 006;
- Consider the issue of Technical Feasibility based on the request yesterday from Mike Assante of NERC asking the group to add this issue to the agenda for this meeting.

Stu Langton, with the FCRC Consensus Solutions facilitation team, noted the broad range of expertise members brought to the table and the need to build a common understanding of issues. He asked individuals who raise questions or concerns to also offer a proposed solution or alternatives to help the group move forward.

B. Implementation Plan Amendments

Scott Mix, sub team lead, reviewed the work that has been done so far concerning implementation plans for new assets and other situations that will be covered under CIP standards in the future. The work included a summary, a narrative explanation of each category, and a timetable. *(See appendix #5 for link to red-line/underline revisions)*

He reviewed who and when an entity would need to be compliant. He noted three milestone categories:

- **Category 1** entities starting from scratch. Existing Table 4 will be used.
  - ***The first identified Critical cyber Asset for a Registered Entity***
  - 24 months to become compliant and 36 months to become auditable compliant.
- **Category 2** is for an entity that already has a schedule and is doing things but they have identified a newly identified Critical Asset.
  - ***Reclassification or change in status of an existing Critical Asset to a Critical Cyber asset.***
  - Questions were raised concerning how the proposed tables would work when/if the CIP standards apply to nuclear. There was no answer provided at this time, as there are many variables which still need to be resolved.
  - Mergers
    - For mergers and acquisitions there is a one-year period to bring the two programs of the different companies into harmony.
    - After that one year and after completing the original CIP compliance tables, they would need to comply with the proposed category 2 timetable.

- **Category 3** deals with new assets within an existing Critical Asset. The assumption is that because you are doing something active and that you do not turn on the asset until you have completed the compliance needs within the construction.
    - ***An existing Critical Asset Replacement, reconfiguration, upgrade, or addition of a relevant cyber Asset associated with an existing Critical Asset.***
    - Construction of an asset (substation, etc.) that will be declared Critical upon activation
    - Replacement or upgrade of a Critical Asset
    - Addition of a Critical Cyber Asset at an existing Critical Asset

Scott Mix reviewed the various time thresholds which the sub team is proposing for compliance with the various situations described in the above categories.

As part of the team discussion the Vice Chair offered 6 different scenarios and how each type of scenario could be gamed by entities to gain time for compliance. The Chair asked team members to submit suggested treatments of example scenarios that summarize the categories. The suggestions should ask 3 questions and categorize appropriate events. The sub team will review suggestion during the WebEx on October 29. The Chair also asked that the team to review the comment form and provide related input to the Comment Form Sub Team.

C. CIP 006 Un-resolved Issue

An additional proposed modification to CIP 006 R1.6 language was discussed and accepted by the group as follows:

- Continuous escorted access within the Physical Security Perimeter of personnel not authorized for unescorted access.

D. CIP 003 Changes and Discussion

Proposed changes were offered to CIP 003 as follows: *(See appendix #5 for link to red-line/underline revisions)*

CIP 003 R2: Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.

a. NERC audit compliance staff clarified that the Responsible Entity may be either the Corporation as a whole or may be the Registered Entity functions (GO, TO, BA, etc.).
b. **CIP 003 R3.2.** Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures. ~~taken or a statement accepting risk. and/or any residual risk~~

After reviewing several suggested changes, members were asked to rate the language as revised above striking "or acceptance of risk":

The SDT's first initial rating on acceptance of the proposal:

Scale	4 — Acceptable as it	3 — Acceptable with minor concerns	2 — Not acceptable unless major concerns are addressed	1 — Not acceptable
Voting on the above by SDT	11	7	1	0

Following additional discussion, members were asked to rate the proposal again without the word "any" before "compensating measures":

The SDT's second vote on acceptance of proposed language change:

Scale	4 — Acceptable as it	3 — Acceptable with minor concerns	2 — Not acceptable unless major concerns are addressed	1 — Not acceptable
Voting on the above by SDT	12	6	4	0

Following additional discussion, members agreed to retain the word "any".

There was general agreement around the room that in CIP 007 wherever the phrase "acceptance of risk" appears, it will be removed even though each such instance where the phase appears may not have been discussed at length.

E. Proposal to Substitute "Prudent Judgment" for "Reasonable Business Judgment"

Member John Varnell requested the group consider substituting the term "prudent judgment" in place of the term "reasonable business judgment." Due to a lack of support, the group decided not to move forward with the replacement of the term "reasonable business judgment" with 'prudent judgment."

F. Proposed a Definition of Access Control System

As requested by the drafting team, Scott Mix offered a draft definition of Access Control System as follows:

> A system which provides for Authorization, Authentication, and frequently Accounting of access through either a Physical Security Perimeter or an Electric Security Perimeter. An Access Control System may be a single computer system

which performs all three functions or may be a combination of two or more computer sub systems which work together to accomplish all three functions.

i. Authentication is the process of verifying a users or object's identify.
ii. Authorization is process for granting an authenticated user or object's the authority to perform a certain operation.
iii. Accounting provides an audit trail of access, and includes logging of access by identification and time.

The SDT was asked to submit their comments for the resolution of preferences concerning the definition to Vice Chair, Kevin Perry.

G. Technical Feasibility

The Chair noted that there were two potential proposals (one from Scott Mix and one from Keith Stouffer) for addressing "technical feasibility" exception in Phase 1. She asked the team to listen to each of the proposals, consider the proposals, and decides if one of the alternatives offered could be included within the Phase I work of this team.

Scott Mix reviewed material directed in the FERC Order 706. He noted that FERC wants a framework includes mitigation steps, regular review, justification, internal approval by the senior manager, wide area approval through the ERO audit process, and cooperation with the ERO to provide the Commission with high level impact of the technical feasibility on the reliability of the grid.

Keith Stouffer of NIST provided an alternative proposal on Technical Feasibility noting it is addressed within the NIST framework for risk management and describing what a responsible entity shall document for all Technical Feasibility exceptions in an Exception Plan.

Scott Mix also reviewed the current Self Reporting Process. Based on the similarities between FERC directives and the items required by a self-reporting of non-compliance, Scott suggested that this same process be used for Technical Feasibility Exceptions.

Scott Mix reviewed similarities between the proposals:

Keith Proposal	Scott Proposal
A justification why the Technical Feasibility exception is necessary	Document non compliance to a specific requirement c. Provide explanation d. Describe reliability impact e. Describe any external or extraneous factors
Compensating controls or mitigation steps that provide a comparable level of security	
A plan of action, milestones, and schedule for	Provide mitigation schedule

implementing the compensating controls.	Provide mitigation plan
Obtain approval by the senior manager	Obtain Senior Officer signature
	Catalog and approval by Regional Entity
ERO must annually audit compliance with the Exception plan	Catalog and approval by ERO May trigger accelerated audit schedule Annual review and re-approval by Responsible Entity and ERO
ERO to provide FERC with a high level assessment of the exceptions on reliability of the Bulk Power System	ERO to develop separate annual report to FERC Analyze the combined impact of all Technical Feasibility exemptions
	Report will contain sensitive information — must be CEI protected
	Submit to FERC (US Entities)

As a result of team discussion the following proposal was suggested and tested:

Proposal Prepare a 'conceptual' document to seek stakeholder consideration and feedback that describes a Technical Feasibility Exception process that parallels existing compliance self report process.

Scale	4 — Acceptable as it	3 — Acceptable with minor concerns	2 — Not acceptable unless major concerns are addressed	1 — Not acceptable
1st Poll — Voting SDT	20	2	0	0

As a next step for it was agreed that a sub team of Tom Hofstetter, John Varnell, Keith Stouffer, Scott Mix, Jerry Freese and possibly someone from NERC compliance, would draft a document described above for presentation at the next full team meeting.

H. Assignments and Next Steps for the Next Meeting

The team and staff reviewed the deadlines for revised drafts for review at the WebEx, October 29. In addition the team reviewed the schedule of meetings and possible topics over the next three months as follows:

- WebEx, November 3 — develop concept document for Technical Feasibility. Deliver to full team by November 7 or 10.
- WebEx, November 5 — following NERC Staff feedback, review and conform drafts per feedback.
- November 12–14 — full team meeting in Little Rock, Arkansas to finalize Phase I documents as needed and review proposed roadmap
- December 4 or 5 — In person meeting at FERC Offices in Washington, DC
- January 7–9 — In person meeting at APS in Phoenix, AZ

The Chair suggested that in December the group may begin to hash out the large issues still to be addressed. The Vice Chair offered two alternatives to the "Roadmap" going forward, a multiple phase or single phase approach and proposed the SDT use an incremental approach.

The FCRC Consensus Solutions facilitation team were asked to develop a one page proposal (big picture straw proposal and guiding principles) for addressing the remaining issues following Phase I for review and discussion by the full group at the next meeting in Little Rock, Arkansas. Member discussion today has included several key principles that could guide development and discussion of remaining issues.

The team quickly reviewed the remaining list of "Parking Lot" issues identified at the first SDT 706 meeting in Gaithersburg and not already addressed today.

I. What Did and Did Not Work Well

At the conclusion of the meeting, the facilitators asked the team to offer an evaluation of the process including what worked well during the meeting and what could be improved. Members appreciated the hard work of the sub teams and staff in completing assignment in time for this meeting and the ability of the full team to work toward agreement and respect each other's opinions.

Members suggested an improved phone or speaker system was needed for those who have to call in to participate effectively and that members need to continue to offer suggestions for improvement and avoid getting bogged down in details

Members agreed to adjourn until the next meeting on November 12–14, 2008 in Little Rock, Arkansas.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team
Draft Second Meeting Summary

A. INTRODUCTIONS, AGENDA REVIEW AND WELCOMING REMARKS

The Chair, and Vice Chair welcomed the members and asked NERC staff Harry Tom to conduct a roll call of members and participants in the room and on the conference call *(See appendix #2*). They then reviewed with the Team and participants the proposed meeting agenda *(See appendix #1*). They also thanked Kevin Sherlin for hosting the meeting at the Sacramento Municipal Utility District offices and for making all of the necessary logistical arrangements.

B. REVIEW OF ANTITRUST GUIDELINES

Harry Tom reviewed with the Team the need to comply with NERC's Antitrust Guidelines (See, Appendix #3). He urged the Team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

C. ACCEPTANCE OF ORGANIZATIONAL MEETING MINUTES

Stu Langton and Hal Beardall, with the FCRC Consensus Solutions facilitation team, reviewed the minutes from the first meeting noting several minor corrections for pagination. It was also noted that Bill Winters should be listed as representing Arizona. The group agreed to accept the minutes as they were distributed to the group with the minor corrections noted; however the minutes will be open to additions as necessary. Harry Tom explained that an announcement will go out that the minutes have been posted to the NERC website. It is the responsibility of the members to download the minutes and review them.

D. Planning challenges, Purpose statement & consensus guidelines

Stu Langton provided an overview of organizational issues including the following planning challenges the drafting team will need to keep in mind:

- Organization — a new team testing how best to work together
- Process — using a consensus building approach or process
- Issue Identification — a huge number of issues to identify and organize effectively
- Progression Strategy — important how you organize and address the issues
- Schedule — what is a realistic pace? In what order do we take up issues?

Mr. Langton suggested there are key principles the group should keep in mind to meet the challenges. He noted the group will need the capacity to tolerate ambiguity and patience since the group cannot do everything well all at once and may at times need to wait for more information. The group's progress may be circular as well as linear due to the practical and political variables that must be considered. This will be an iterative process that will build on previous discussions while flexible enough for the group to revisit earlier issues if needed as a result of subsequent discussions.

Following the challenges and principles, Mr. Langton offered for the group's consideration the following draft purpose statement as a starting point for review and discussion:

> "The overall purpose of the Cyber Security of Order 706 SDT is to work together to build consensus on a package of recommended draft cyber security standards and implementation plan that is responsive to and consistent with the scope of the SAR and the FERC Order 706.
>
> The Team's products will seek *to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system* and will be submitted for consideration by the registered ballot body. *(Italics from the SAR "purpose" statement)"*

Team Comments and Questions on the Draft Purpose Statement:

- Is this where we look at changing to "bulk power system" from "bulk electric system"? That is the language in the SAR
- "Critical Cyber Assets"? Using that term limits us to that subject. Do we want to limit ourselves to the critical assets?
- Yes, we do want to limit to those issues
- Also concerned about limiting us to those issues
- Critical Cyber Assets – definition includes assets essential to bulk electric system – can strike the word "critical" here
- In the first paragraph consider replacing with "package of recommended modifications to the cyber security standards"
- Remind group that this is part of the SDT process. The SAR sets the scope of this group to look at revising all of the CIP standards based on the order. You have to look at the standards top to bottom. Be careful, this scope can not limit you
- We need to be on the same page but the SAR already sets the scope of this group. We need to cross reference the purpose back to the scope as set by the SAR. We do not want to redefine the SAR
- Who are we serving? NERC, our companies, the public at large? Who are we doing this for? We could be serving more than one, but we are not serving the balloting body
- Expected to serve the public and the industry not the aspirations of our individual companies. Put that into the draft purpose statement.

The group agreed to the suggestion that the facilitators work with the chair and staff to reframe the scope based on this discussion and bring a new draft back to the full group for review next time

Mr. Langton provided an overview of how consensus could be defined and used by the drafting team *(See Appendix #6)*. He noted that consensus could be understood as having three meanings in a group process: it is an attitude of each of the team members, it is an outcome or decision rule for the team and it is a structured problem solving process. He suggested that the team has some

flexibility to define what a 'consensus' decision should mean for the team's process. He noted that among the ballot body, a standard requires at least a 2/3 majority of all of the industry segments to be adopted. The team may want to establish a higher supermajority for agreement (perhaps +75%) to assure 2/3 acceptance of the ballot body. He suggested that this could serve as a default standard and that the process would be designed to seek 100 percent acceptance of the team. He suggested that the team review this again at the next meeting with an eye towards adopting a procedure going forward.

Team Comments on Consensus Guidelines

- Agreement may not be at the same level to all
- These guidelines call for a 75% favorable vote but the standards committee set rules for 2/3's favorable vote – need to make consistent – quorum requires 2/3's present too
- "Dissenting opinion" not in the standards committee rules – how do we document?
- Not a problem to document as a minority report or opinion
- Even if we have consensus of this group, our companies may turn around and say "no" – we are working as a team for the public and the industry
- Know what your CEO wants
- Who in a company provides comments? Depends on the company, usually a lead person responsible for reliability who may get a corporate view, or you can get multiple comments form one company and can be contradictory
- Clarify that members on the phone are counted in any voting or polling
- Members agree to represent and consult their stakeholder interest groups – represent company, sector and self at the table
- What do you mean "seated at the table"? Staff and facilitators are in an advisory role, members are the voting members
- Only team members may participate in discussion? Everyone is invited to participate in discussion, only the votes are limited to members with a caveat to let chair limit discussion if needed
- Clarify that the polling/rating is limited to members and intended to guide discussion but comments are open to observers too
- Want a gentleman's agreement by observers to limit comments to the media
- At the discretion of the Chair or Vice Chair, the straw man polls can be extended to all participants in the meeting and not just be limited to the team members. Need to make sure to gauge the broader consensus by extending the straw poll to all at the discretion of the chair
- Cannot prevent anyone from talking to anyone else – refer to media relations at NERC as needed
- Cannot prohibit you from speaking – give factual updates on what we are doing, but must note personal opinions of the individual and not representing the group
- Group can become very comfortable with what we are doing so knowledgeable of the issues may lose tract of the broader interpretation
- Add phone participants: mute button, indicate name of speaker, use webex button to indicate you want to comment

Mr. Beardall reviewed a set of ground rules *(See, Appendix #6)* for the meeting including additional items added at the first meeting as follows:

- Additional phone protocols include using the mute button when not speaking on the phone. Do Not use the hold button.
- Say your name at the start if you are on the phone — "comment on the phone" with name to get in the queue to speak on an issue or use the feature on the WebEx that indicates you want to speak
- Ask team members on the phone to use the same WebEx feature to "raise their hands" for their acceptability ranking as needed

E. Reviewing Sub team Draft of NERC CIP Standard

Mr. Langton reviewed the drafting sub team assignments (*see Appendix 4*) and asked sub team leader Jackie Collett to describe the revisions offered for consideration by the CIP 004 sub team. *(See appendix #5 for link to red-line/underline revisions)*

Sub team changes included:

- Improved the wording
- Took out reasonable business judgment
- Training to be completed prior to granting access
- Personnel risk assessment to be completed prior to granting access
- Added provision that emergency provisions should be handled in accordance with CIP 003.R.1.1.

Team comments regarding proposed changes to CIP 004

- Some members did not like the reference back to a different standard within CIP 004.
- There were questions as to the intent of CIP 003.R1.1. and the reference to the meaning of 'emergency' as it is used in CIP 003.
- One member suggested that the Responsible Entity should have a mitigation strategy if the pre-requisites for access (Training and Personnel Risk Assessment) will not be enforced in an emergency.
- Vice Chair suggested that the modified language should be changed to: "…granted such access, subject to the emergency provisions of CIP 003-2."

Group voted on the following three options for references to emergencies concerning Training and Background Screening Pre-Requisites:

A. A personnel risk assessment shall be conducted pursuant to the program prior to such personnel being granted such access. (No reference to emergency provisions.)
B. A personnel risk assessment shall be conducted pursuant to the program prior to such personnel being granted such access except in specified circumstances such as an emergency. (Note: This option includes language included in FERC 706 language specifically.)

C. A personnel risk assessment shall be conducted pursuant to the program prior to such personnel being granted such access except in specified circumstances such as an emergency. Emergency provisions should be handled in accordance with CIP 003.R1.1. (Note: This option includes reference back to CIP 003 Policy within CIP 004 R.2&3 to deal with Emergency situations.)

Vote on accepting the proposed CIP 004 language

Preferences	Option A Above	Option B Above	Option C Above
Voting Members	0	22	2

The facilitators suggested an initial acceptability rating (using the 4-3-2-1 scale) of the preferred option to guide additional discussion and refinement.

Acceptance of CIP 004 Proposed Changes	4	3	2	1
Voting Members and Observers	16	8	2	0

Team comments and suggestions:

- 3: Footnote the language to reference CIP-003
- 3: Industry will not know what to document (addressed in CIP-003, R1.1)
- 3: Needs modifications to CIP-003 for completeness – that will be done in Phase 2
- 3: Needs to reference CIP-003 someplace, not necessarily as a footnote. Could be in the FAQ, a Guideline, a NERC definition, or as specific language in the standards themselves.

- There is a definition of "Emergency" or "BES Emergency" that can be used in CIP-003. Need to add some language regarding life and safety issues. Concern that limiting to this combination might be too limiting.
- The term "emergency" is an issue. Perhaps change the language to contingency, exigent, or exceptional.

- **Conclusions concerning CIP 004**
  - CIP 004 was accepted with the changes to require the Cyber Security training and background screening prior to access and with the inclusion of language concerning emergency provisions in accordance with FERC Order 706 (Option B above).
  - **CIP 003** Policy language will be reviewed/modified by a work group in Phase II, not Phase I.

F. Technical Feasibility Exception proposal

Michael Assante, NERC Chief Security Officer, addressed the group by phone and asked the team to consider addressing the technical feasibility exception as a priority and

possibly as part of Phase I. Mr. Assante pointed to the request from FERC to address this issue and reviewed issues to be considered:

- Develop a set of conditions or criteria for invoking technical feasibility exception
- Oversight of its use
- Want operational and safety considerations and not business judgment.
- Want to see a mitigation plan that achieves the same degree of security
- Wants time limitation on the use of the exception
- Senior manager approval of the exception, mitigation, and remediation time line
- Include audits and appeals of the exceptions
- Need to address confidentiality of the exception documentation
- ERO monitoring of the exception
- Accountability

Team discussion:

- Appreciate the importance of the issue but it will take quite a bit of discussion – adding it to the immediate scope may derail the ability to get the phase I products done and the removal of the business judgment language
- This exception should be a priority issue but after we complete the agenda today on the drafting materials for phase I
- Motion:
  - Motion was made by Chairperson to table the issue of the Technical Feasibility Exception until after the team agenda is completed.
  - In favor = 22 members; Against = 0; Abstain = 1; Not present = 1
  - The issue of Technical Feasibility was tabled until completion of the pre-defined agenda

G. Reviewing Sub team draft of NERC CIP Standard 006

Kevin Perry, as CIP 006 sub team leader, provided an overview of the revisions offered by the sub team in CIP 006 for consideration by the full team: *(See appendix #5 for link to red-line/underline revisions)*

- Removed Reasonable Business judgment
- Changed dates as appropriate
- Minor wording changes which did not alter the substance of the requirement
- R1.6 added that procedures for the active monitoring of escorted persons at all times are required.
- R1.8 added that the Physical Security Plan must be reviewed annually.
- R2. (Note: The prior 1.8 requirement becomes R2 in this proposal. The original suggested language follows:
  - R2. Protection of Physical Access Control Systems — Cyber Assets authorizing and logging access to the Physical Security Perimeter(s) shall:
  - R2.1. Exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall reside

within an identified Physical Security Perimeter or be physically monitored 24x7 by personnel authorized unescorted access.

- R2.2. Be afforded the protective measures specified in Standard CIP-003-1; Standard CIP-004-1 Requirement R3; Standard CIP-005-1 Requirements R2 and R3; Standard CIP-006-2 Requirements R4 and R5; Standard CIP-007-1; Standard CIP-008-1; and Standard CIP-009-1.

Initial Team Discussion and Questions:

- R1.6. How does an entity prove that escorts actively monitored persons at all times?
- Do we need evidence? Or Proof? You want evidence such as a manual sign-in book with the name of the escort associated with the visitor. Auditors need to understand that.
- Training and awareness is an essential part of the process. Make sure the escorts know their responsibilities.
- Order 706, Para 432 discusses the need for qualified escorts.
- Up to the auditor to prove that you did not comply. Needs a way to test the control.
- May need a NERC defined term on what escorted is.
- R2.1: what happens with a situation where the system is in use 8x5 and locked up otherwise. Unattended systems need to be within the PSP, HMI systems need to be secured when not in use.
- Does the system need to be in a PSP when not in use?

Initial Acceptability Rating

Acceptance of CIP 006 Proposed Changes	**4**	**3**	**2**	**1**
Voting Members	**10**	**7**	**2**	**0**

Team Discussion following Initial Acceptability Rating:

- Gave it a 2: R2.1, primarily around the issue surrounding the HMIs. Are we locking people into the card reader systems? One system may control everywhere.
- Gave it a 2: R3 is a new requirement that entities cannot comply with by July 1, 2009. Resolved by inclusion of a requirement-specific implementation plan.
- Whether the word 'remote' belongs in the physical access standard
- Define the Access Control System in the glossary. Address multiple systems that integrate together. [Credentialing, identification, authorization, authentication, accounting]

Revised Proposed CIP 006 language:

- R2. Protection of Physical Access Control systems – Cyber Assets that authorize and/or log access to the Physical Security Perimeters(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic mechanisms and badge readers, shall:
- R2.1 be protected from unauthorized physical access
- R2.2 be afforded the protective measures specified in Standard CIP 003-1; Standard CIP 004-1 Requirement 3; Standard CIP 005-1 Requirements R2 and R3; standard CIP 006-2 Requirement R4 and R5; Standard CIP 007-1; standard CIP 008-1; and Standard CIP 009-1.

Acceptability Rating for CIP 006 with Revised Proposed Language:

Acceptance of CIP 006 Proposed Changes	**4**	**3**	**2**	**1**
Voting Members	**15**	**8**	**0**	**0**

H. Review of Sub Team Report on Measures & VRFs

Jerry Freese, leader for the sub team on measures, reported that their team performed a review of the measures, but based on changes prior to today's meeting, they believe there are no changes to the measures in response to proposed changes in CIP requirements.

Todd Thompson reported on behalf of the sub team reviewing VRFs that they believe no changes need to be made at this time.

I. New Implementation Plan for Changes to the Existing Requirements after Phase I Changes

Phillip Huff reported on the progress with the Implementation plan for new or changed Phase I requirements. *(See appendix #5 for link to red-line/underline revisions)* The original proposal was that the additional implementation plan would be expanded by 180 days to allow participants to comply with changed requirements.

- Proposed language: the original proposed effective date discussed for the modifications contained in these standards is the greater of (1) 180 days following approval by the FERC or (2) the number of days following approval by FERC before a Responsible Entity must become Compliant with a requirement according to the associated Compliance Schedule.

Team comments and suggestions:

- 180 days after regulatory approval unless the initial compliance table is already a later date.
- Comment made that all requirements of the eight standards are affected and thus the revised implementation date affects all requirements. Does not necessarily make sense.
- Does the entity still need to march toward compliance with Version 1 once the Version 2 standards have been approved by FERC?
- We have added the RE – what table applies? Table 4? Do they also get an additional 180 days beyond that?

- Side Note: CIP-003, R2 needs to be required for all entities in the same manner as CIP-002.

Based on team discussion, the sub team will make additional edits for consistency with changes made in the body of the document and make conforming changes to the standards as identified in review for creating the table.

J. COMMENT FORM REVIEW

Chairman Jeri Domingo-Brewer reviewed the sub team progress on the comment form: *(See appendix #5 for link to red-line/underline revisions)*

- Background information Section uses language out of the SAR to explain what the team had agreed to
- Summary of Phase I Revisions Section summarizes each of the changes
- Requests for Comments/Questions Section requests feedback from commenters

Team comments and suggestions:

- CIP-004, CIP-006, and Implementation Plan changes need to be updated in the Comment Form.
- How do we handle an industry response that says they do not care what FERC requires, they will not approve the changes?
- May need an educational WebEx prior to comment and ballot.
- Really need a robust communications plan.
- Need to reach out to the CIPC and possibly the Regional Compliance Managers.
- Group accepted that this is a good start on the Comment form

K. TECHNICAL FEASABILITY QUESTIONS

Having tabled the technical feasibility exemption question until the end of the day, the Chair asked members how and when they wanted to address the issue.

Team comments and suggestions:

- Is it reasonable to try to do this in Phase I?
- It will touch most, if not all standards. That will require us to at least revisit the implementation plan.
- It was agreed to table this discussion until the next day and the end of the review of Phase I items.

Members agreed to adjourn for the day.

A. DAY TWO – WELCOME AND AGENDA REVIEW

Chairperson Jeri Domingo-Brewer thanked the members of the sub teams for their hard work and reviewed the progress made by the group yesterday. She stated that today the team would:

- Review work from the remaining sub teams that were not reviewed yesterday
- Hanging issue that the group needs to consider pertaining to CIP 006
- Consider the issue of Technical Feasibility based on the request yesterday from Mike Assante of NERC asking the group to add this issue to the agenda for this meeting.

Stu Langton, with the FCRC Consensus Solutions facilitation team, recognized the many details the group was trying to address, the broad range of expertise they brought to the table and the need to build a common understanding of issues and how to address those issues. He discussed the need for individuals who raise questions or concerns to also offer a proposed solution or alternatives to help the group move forward.

B. Implementation Plan Amendments

Scott Mix, sub team lead, reviewed the work that has been done so far concerning implementation plans for new assets and other situations that will be covered under CIP standards in the future. The work included a summary, a narrative explanation of each category, and a timetable. *(See appendix #5 for link to red-line/underline revisions)*

He reviewed who and when an entity would need to be compliant. He noted three milestone categories:

- **Category 1** entities starting from scratch. Existing Table 4 will be used.
  - ***The first identified Critical cyber Asset for a Registered Entity***
  - 24 months to become compliant and 36 months to become auditable compliant.
- **Category 2** is for an entity that already has a schedule and is doing things but they have identified a newly identified Critical Asset.
  - ***Reclassification or change in status of an existing Critical Asset to a Critical Cyber asset.***
  - Questions were raised concerning how the proposed tables would work when/if the CIP standards apply to nuclear. There was no answer provided at this time as there are many variables which still need to be resolved.
  - Mergers
    - For mergers and acquisitions there is a one-year period to bring the two programs of the different companies into harmony.
    - After that one year and after completing the original CIP compliance tables, they would need to comply with the proposed category 2 timetable.

- **Category 3** deals with new assets within an existing Critical Asset. The assumption is that because you are doing something active and that you do not turn on the asset until you have completed the compliance needs within the construction.
  - ***An existing Critical Asset Replacement, reconfiguration, upgrade, or addition of a relevant cyber Asset associated with an existing Critical Asset.***
  - Construction of an asset (substation, etc.) that will be declared Critical upon activation
  - Replacement or upgrade of a Critical Asset
  - Addition of a Critical Cyber Asset at an existing Critical Asset

Scott Mix Sub reviewed the various time thresholds which the sub team is proposing for compliance with the various situations described in the above categories.

Team comments and suggestions:

- One SDT member suggested that NERC maintain consistency in the implementation plans across all the NERC standards.
- The assumption is that if an entity is planning and constructing a new Critical Asset, CIP security compliance should be part of the construction. If a cyber asset exists but through a change such as load flow analysis becomes critical, the entity is provided time to come into compliance with the CIP standards.
- Evergreen plan – affects entities already expected to be Compliant under their original implementation table.
- Assumes everyone is fully in compliance with CIP-002. New entities registering for the first time will come under Table 4 in the original plan.
- Table is applicable to each registered entity. If a merged company retains the original registrations, then a merging of the CIP compliance programs might not be necessary.
- What about a purchase of an asset as opposed to a company merger. Falls into Category 2. Section describing this scenario needs some clarification since the remainder of the paragraph speaks to a merger scenario.
- Need to grandfather assets already in construction under Category 2.
- Merging of companies – harmonization of compliance programs spans all reliability standards, not just CIP.
- Upgrades and modifications to existing Cyber Assets that cause them to become Critical Cyber Assets needs to include the necessary compliance steps as part of the upgrade.
- SDT is asked to evaluate the new table against some business cases to determine if there are gaps or inconsistencies.
- Should require the entity to perform the Risk Assessment prior to placing a new asset or Cyber Asset into service.
- Need to address business cases in the implementation plan

- **Implementation Plan Discussion**
  - Dave Norton volunteered to write a white paper explaining scenarios and he asked for written and constructive input from team members.
  - Vice Chairman explained 6 different scenarios and how each type of scenario could be gamed by entities.
  - A SDT member asked if the implementation time frames should distinguish between field assets (substations, etc.) vs. control center assets. Some team members did not believe the implementation plan was the place to deal with the differences. Further team thought this may need to be considered in Phase II.
- **Homework Assignment Concerning Implementation Plan + Proposed Comment Form:**
  - Team members are asked for a treatment of example scenarios that summarize the categories
  - The goal is to ask yourself 3 questions and categorize appropriate events
  - Suggestions from the team should be send to the Sub Team before October 29.
  - Staff will email the team the Implementation Plan for their review.
  - Comments should be sent to Scott.Mix@NERC.net
  - The Chair asked that the SDT also review the Comment form and provide input to the Comment Form Sub Team.

C. CIP 006 Un-resolved Issue

An additional proposed modification to CIP 006 R1.6 language was discussed and accepted by the group as follows:

- Continuous escorted access within the Physical Security Perimeter of personnel not authorized for unescorted access.

D. CIP 003 Changes and Discussion

Proposed changes were offered to CIP 003 as follows: *(See appendix #5 for link to red-line/underline revisions)*

> **CIP 003 R2:** Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.

f. NERC audit compliance staff clarified that the Responsible Entity may be either the Corporation as a whole or may be the Registered Entity functions (GO, TO, BA, etc.).

~~g.~~ **CIP 003 R3.2.** Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures. ~~taken or a statement accepting risk. and/or any residual risk~~

Team comments and suggestions:

Senior Manger:

- Designated by the Registered Entity (registered function)
- Can be the same for multiple registrations (multiple functions)

Exceptions:

- Note that an entity cannot take exception to the regulatory standard, and so the exception would be taken to the entity's own policy. Believe that the flexibility for compensating measures and residual risk was appropriate.
- The NIST technical feasibility material may have language that would be of assistance with the concerns.
- The FERC comment referred more to regulatory compliance rather than compliance with the entity's own policy.
- The reference to acceptance of risk needs to be removed as directed by FERC.
- The issue of removing acceptance of risk is so difficult that it should be moved to Phase II.
- Or the language that provides for acceptance of risk should be removed from the CIP standard.

After reviewing several suggested changes, members were asked to rate the language as revised above striking "or acceptance of risk":

The SDT 1st initial rating on acceptance of the proposal.

Scale	4 – Acceptable as it	3 – Acceptable with minor concerns	2 – Not acceptable unless major concerns are addressed	1 – Not acceptable
Voting on the above by SDT	11	7	1	0

Following additional discussion, members were asked to rate the proposal again without the word "any" before "compensating measures:

The SDT 2nd vote on acceptance of proposed language change.

Scale	4 – Acceptable as it	3 – Acceptable with minor concerns	2 – Not acceptable unless major concerns are addressed	1 – Not acceptable
Voting on the above by SDT	12	6	4	0

Following additional discussion, members agreed to retain the word "any"

There was general agreement around the room that in CIP 007 wherever the phrase "acceptance of risk" appears, it will be removed even though each such instance where the phase appears may not have been discussed at length.

E. Proposal to Substitute "Prudent Judgment" for "Reasonable Business Judgment"

Member John Varnell requested the group consider substituting the term "prudent judgment" in place of the term "reasonable business judgment."

Team comments and suggestions:

- The concern is that the cost to remediate the last few percentages of risk could be cost prohibitive.
- FERC believes, in the order, that "reasonable business judgment" is not required to address that issue
- It was pointed out that Paragraph 132 of FERC order states that there is no recourse needed to substitute another term concerning judgment.

Due to a lack of support, the group decided not to move forward with the replacement of the term "reasonable business judgment" with 'prudent judgment."

F. Proposed a Definition of Access Control System

As requested by the drafting team, Scott Mix offered a draft definition of Access Control System as follows:

> A system which provides for Authorization, Authentication, and frequently Accounting of access through either a Physical Security Perimeter or an Electric Security Perimeter. An Access Control System may be a single computer system which performs all three functions or may be a combination of two or more computer sub systems which work together to accomplish all three functions.
>
> - Authentication is the process of verifying a users or object's identify.
> - Authorization is process for granting an authenticated user or object's the authority to perform a certain operation.
> - Accounting provides an audit trail of access, and includes logging of access by identification and time.

Team comments and suggestions:

- Needed to provide clarity to CIP-005 and CIP-006
- Will help industry understand the concept.
- Does not include a credentialing system.
- Should be a requirement around the credentialing system.
- The SDT was asked to submit their comments for the resolution of preferences concerning the definition to Vice Chair, Kevin Perry.

G. Technical Feasibility

The Chair that there were two potential proposals (one from Scott Mix and one from Keith Stouffer) for addressing "technical feasibility" exception in Phase 1. She asked the team to listen to each of the proposals, consider the proposals, and decide if one of the alternatives offered could be included within the Phase I work of this team.

- **Scott Mix reviewed material directed in the FERC Order 706**
  - All requirements in a NERC standard must be adhered to
    - Implies no exception
  - Self report a non-compliance (exception) with Mitigation Plan is allowed
  - Commission views the term 'acceptance of risk' as an uncontrolled exception
  - Alternative language that deals with such issues in terms of technical feasibility is preferable.
  - Flexibility along with control is the goal.
  - FERC does not support the long established practice of risk acceptance by sr. management
  - FERC wants specific framework for invoking the technical feasibility provisions
  - FERC narrows the application by stating that there are acknowledged concerns (device will not support) compliance with the requirement
  - For future installations the technical feasibility would not carry forward. New equipment should be compliant.
  - FERC steps
    - Comparable level of security to the requirement
    - A remediation plan although a date certain is not required for replacement
  - Exemptions should be reports, justified, and approved by the ERO or relevant Regional Entity
  - Regional entities should catalog notices of technical feasibility
  - Actual evaluation and approval of technical feasibility exceptions should be performed
  - Technical feasibility should be audited
  - NERC must protect such information
  - FERC wants a framework includes mitigation steps, regular review, justification, internal approval by the senior manager, wide area approval through the ERO audit process, and cooperation with the ERO to provide the Commission with high level impact of the technical feasibility on the reliability of the grid.

- **Keith Stouffer of NIST provided an alternative proposal on Technical Feasibility**
  - This is addressed within the NIST framework for risk management
  - The Responsible entity may invoke a technical feasibility exception to a requirement is any of the following conditions apply:
    - The requirement poses a risk to the reliability of the Bulk Power System

- The requirement creates a significant adverse effect on operations and/or safety impact
- The requirement specifies mechanisms or functions that are not technically possible for a cyber asset to support

- The responsible entity shall document all Technical Feasibility exceptions in an Exception Plan containing:
  - A justification why the Technical Feasibility exception is necessary
  - Compensating controls or mitigation steps that provide a comparable level of security
  - A plan of action, milestones, and schedule for implementing the compensating controls.
  - Obtain approval by the senior manager
  - Approval by the Regional Entity or the ERO
  - ERO must annually audit compliance with the Exception plan
  - ERO to provide FERC with a high level assessment of the exceptions on reliability of the Bulk Power System
  - Keith proposed that this section may be included before the effective date

- Scott Mix also reviewed the current Self Reporting Process. Based on the similarities between FERC directives and the items required by a self reporting of non-compliance, Scott suggests that this same process be used for Technical Feasibility Exceptions:
  - Document non compliance to a specific requirement
  - Provide explanation
  - Describe reliability impact
  - Describe any external or extraneous factors
  - Provide mitigation plan
  - Provide mitigation schedule
  - Obtain Senior Officer signature
  - Catalog and approval by ERO
  - Catalog and approval by Regional Entity
  - Submit to FERC (US Entities)

Scott Mix reviewed similarities between the proposals:

Keith Proposal	Scott Proposal
A justification why the Technical Feasibility exception is necessary	Document non compliance to a specific requirement h. Provide explanation i. Describe reliability impact j. Describe any external or extraneous factors

Compensating controls or mitigation steps that provide a comparable level of security	
A plan of action, milestones, and schedule for implementing the compensating controls.	Provide mitigation schedule Provide mitigation plan
Obtain approval by the senior manager	Obtain Senior Officer signature
	Catalog and approval by Regional Entity
ERO must annually audit compliance with the Exception plan	Catalog and approval by ERO May trigger accelerated audit schedule Annual review and re-approval by Responsible Entity and ERO
ERO to provide FERC with a high level assessment of the exceptions on reliability of the Bulk Power System	ERO to develop separate annual report to FERC Analyze the combined impact of all Technical Feasibility exemptions
	Report will contain sensitive information – must be CEI protected
	Submit to FERC (US Entities)

Team comments and suggestions:

- **Information Protection Concerns**
  - Concern was voiced about the controls over protection of the information that would be supplied
  - The specific detail regarding the exception should stay with the asset owner.
  - NERC has not yet addressed the confidentiality issue to any great extent
- **Proposed Whitepaper on Technical Feasibility**: draft and submit to the industry a high level concept document on Technical Feasibility simultaneously, but not as part of a revision to the standard in Phase I. Offer the industry a comment period to react to this as a concept to be folded into a standard later.
  - Allows the regions to review and respond to the proposal.
  - Allows time for NERC to assure protection of the information to be provided.
  - Questions arose concerning whether the technical feasibility exception applied to all requirements or to only certain of the requirements.

- **Proposal** Prepare a 'conceptual' document to seek stakeholder consideration and feedback that describes a Technical Feasibility Exception process that parallels existing compliance self report process.

Scale	4 — Acceptable as it	3 — Acceptable with minor concerns	2 — Not acceptable unless major concerns are addressed	1 — Not acceptable

1st Poll — Voting SDT	20	2	0	0

Additional Team comments and suggestions:

- Need to address issue of information protection in the proposal
- Who will be involved?

Next Steps for Technical Feasibility "White Paper":

- Proposal Sub Team: Tom Hofstetter, John Varnell, Keith Stouffer, Scott Mix, Jerry Freese and possibly someone from NERC compliance.
- Due for the next full team meeting

H. Assignments and Next Steps for the Next Meeting

1. For the next WebEx, October 29:

- NERC staff needs final products by cob Monday, 27th to distribute on Tuesday
- NERC staff will provide progress report on Draft proposal concerning technical feasibility
- Implementation Plan for new CA/CCA — should be done and distributed prior to October 27
- Implementation plan (CIP Version 2)
- Final Comment Form on the 28th
- Final versions of CIP 004 & CIP 006 language

2. Notes on Future Meetings and Proposed Topics

- Webex, November 3 — develop concept document for Technical Feasibility. Deliver to full team by November 7 or 10.
- Webex, November 5 – following NERC Staff feedback, review and conform drafts per feedback.
- November 12–14 — full team meeting in Little Rock, Arkansas to Finalize Phase I documents as needed and review proposed roadmap
- December 4 or 5 — In person meeting at FERC Offices in Washington DC
- January 7–9 — In person meeting at APS in Phoenix, AZ

3. Roadmap Proposals and Discussion

The Chair suggested that in December the group may begin to hash out the large issues still to be addressed. She cautioned members to think outside the box when it comes to all of the work to be done in the future.

The Vice Chair offered two alternatives to the "Roadmap" going forward, a multiple phase or single phase approach.

Multiple Phases:

- Phase I — Issues defined

- Phase II — Technical Feasibility Exception
- Phase III — Risk Assessment framework (18-24 months from end of Phase I). Overhaul CIP-002. Review future phases at that point for CIP-003 through CIP-009. Consider breaking apart the standards into Generation, Transmission, Control Centers, and Special Protection Controls.

Single Phase II:

- Phase II is everything not in Phase I
- Would be continuously communicating with the industry during the development time
- Can choose to post work once majority is completed in the event there are a couple of really difficult issues still on the table.
- Expect to have everything nailed down within 18 months of Phase I.

The Vice Chair made a proposal that the SDT should use an incremental approach.

Team comments and suggestions:

- Nothing sacred about 8 standards.
- If we are going to fundamentally change the standards, we do not want to dribble them out.
- Really intriguing concept to break out the standards functionally rather than one size fits all.
- At some future date we need to have the strategy planning session to determine how we approach the task at hand.
- Does there need to be a training of the industry as part of the strategy?
- Everything is an iterative process – determine next step as you finish up the current step.
- We are concerned with control systems, not information systems. Need to bear that concept in mind as we move forward.
- If we are going to make a revolutionary change, we need to start chewing on that now.
- We are starting to look more and more like traditional IT systems (Off The Shelf solutions are now proliferating).
- The integrated nature of systems is a real issue. We have to figure out how to deal with distribution and home network systems since they interconnect with the transmission-level systems. Also need to consider and handle interdependencies of critical infrastructures.
- Do we have enough representation on the team regarding distributive control systems? Need someone with ISA experience or expertise.
- Probably going to need a couple of days to hash out the strategy. Focus on work plan now and the strategy in January.
- Should address early on the requirement to address the FERC issue of compromised systems (used for malicious control).

- Need to resolve the information protection issues for the required external review of Critical Assets.
- When are we going to address Physical Security of the Critical Assets?
- One of the 17 control families in NIST is physical security controls.
- Pending legislation that will bring distribution systems into the critical infrastructures.
- Do we need a CIP-010 to address emergency actions?
- What are the implications for when the standards apply to the nuclear side of the house?

The FCRC Consensus Solutions facilitation team were asked to develop a one page proposal (big picture straw proposal and guiding principles) for addressing the remaining issues following Phase I for review and discussion by the full group at the next meeting in Little Rock, Arkansas. Member discussion today has included several key principles that could guide development and discussion of remaining issues.

4. Review of Remaining "Parking Lot" Issues Identified at the First SDT 706 Meeting

"Parking Lot" Issue:	
Emergency	Phase II item
Define Cyber Security Incident	Phase II item
006 SCG&E interpretation	Phase II item
Audit against policy question Industry concern regarding CIP 003 language that says the Responsible entity shall document & implement a cyber security. If the policy or sub documents exceed the CIP standards in depth or in scope, there is a desire within the industry for NERC to clarify that if they are in conformance with the CIP standards but fall short of their policy implementation, they should not be held in non-compliance. Auditors are asking the industry to demonstrate that they are in compliance.	NERC compliance staff have stated that they will audit to the standards
Communications Plan	In the future regular updates to regulators, and industry stakeholders will be necessary.

I. What Worked and Did not work

At the conclusion of the meeting, the facilitators asked the Team to offer an evaluation of the process including what worked well during the meeting and what could be improved.

What Worked Well:

- Prep work of the sub teams
- Need to improve the sound on the Web ex's for those who are not attending in person
- Talking about issues in a general way instead of the individuals' corporation perspective
- NERC staff offered feedback that they are pleased with the progress that is being made by the SDT
- Detailed agenda
- Assignments were completed prior to the meeting
- No picking holes – offered improvements
- People left their company hats at the door more often
- Refrained from violent agreement
- Many thanks to Kevin Sherlin and SMUD for hosting the meeting
- While we may have issues, this group has made excellent strides reaching consensus on our issues. Much more productive than most other teams.
- Scott and Harry have done a lot of pre-work and evening work to keep the team making progress.
- We all respect each other and agree to disagree
- External facilitation is essential
- Phase I is NOT a toothless tiger as had been feared.

What Could Be Improved Work

- Phone system is difficult. Hard to hear and follow the meeting
- Need to identify speaker when starting to speak
- Seemed bureaucratic at times
- When offering feedback, speakers should offer improvements not just pick on proposals
- On a couple of occasions the SDT got bogged down in details
- Need to facilitate toward resolution rather than getting bogged down in details.

Members agreed to adjourn until the next meeting on November 12-14, 2008 in Little Rock, Arkansas.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix # 1

Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

October 21, 2008 | 8 a.m.–5 p.m.
October 22, 2008 | 8 a.m.–5 p.m.
Sacramento Municipal Utility District
6301 S Street
Sacramento, California

Day 1 Agenda

1. **8 a.m. — Opening Remarks — Jeri Domingo-Brewer, Chair and Kevin Perry, Vice Chair**
   a. SMUD Welcome — announcements, logistics
   b. NERC Antitrust Compliance Guideline
   c. FSU/CRC review of last meeting and adoption of meeting summary
2. **8:15 a.m. — SDT Organizational Issues: Purpose Statement and Adopt Rules of the Road**
3. **9 a.m. — Presentation and Review of Phase I Drafting Group Products**
   a. (Requirements, Measures, Implementation Plan, Comment Form, VRFs)
4. **10:15 a.m. — BREAK**
5. **10:30 a.m. — Phase I presentations and review — continued**
6. **noon Lunch — working (return to meeting at 12:45 p.m. ET)**
7. **12:30 p.m. — Phase I presentations and review — continued**
8. **3 p.m. — BREAK**
9. **3:15 p.m. — Review of Assignments to Finalize Phase I Redline Versions**
10. **4:45 p.m. — Review of Progress and Adjustments, as needed, Day 2 Agenda**
11. **5:00 p.m. — Recess**

Day 2 Agenda

12. **8 a.m. — Opening, Review of Day One Results and Day Two Agenda — Jeri Domingo-Brewer, Chair and Kevin Perry, Vice Chair**
13. **8:15 a.m. — SDT Organizational Issues (TBD)**
14. **8:30 a.m. — Post Phase I (Phase II) Project Roadmap — discussion**
    - Review of CIP 002-009 — Identify Approach, Key Issues from FERC Directive including NIST comparison, etc.
15. **10:30 — BREAK**
16. **10:45 — Continue Review of CIP 002-009 — Approach, Issues from FERC Directive including NIST comparison**
17. **noon — Lunch — working (return to meeting at 12:45 p.m. ET)**
18. **12:45 p.m. — Review of CIP 002-009 — Approach, Issues from FERC Order including NIST comparison.**
19. **2:45 p.m. — BREAK**
20. **3 p.m. — Post Phase I Project Roadmap — discussion, continued**
    - Disposition of RFI from SCE&G and U.S. Army Corps of Engineers
    - Review of Parking lot items from Gaithersburg meeting or Day 1
    - Initial Phase 2 Schedule Structure
21. **4:15 p.m. — Review of short term meeting schedule and Post Phase I drafting assignments**
22. **4:45 p.m. — Next Steps and Evaluation**
23. **5 p.m. Adjourn**

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix # 2

Cyber Security for Order 706 SDT Attendees List
Project 2008-06 — CS 706 SDT
SMUD — Sacramento, CA
October 21, 2008

Attending in Person — Team Members

1. D. Jack Bernhardsen	President/Manager Pacific Northwest Security Coordinator, Inc.
2. Jeri Domingo-Brewer, Chair	U.S. Bureau of Reclamation
3. Sharon Edwards	Project Manager, Duke Energy
4. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp.
5. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
6. Tom Hoffstetter	Midwest ISO, Inc
7. Philip Huff	Arkansas Electric Cooperative Corporation
8. Richard Kinas	Orlando Utilities Commission
9. John Lim	CISSP, Department Manager, Consolidated Edison Co. of New York
10. David Norton	Policy Consultant, CIPEnergy Coporation
11. Kevin B. Perry, Vice Chair	Director, IT-Infrastructure, Southwest Power Pool
12. Christopher A. Peters	ICF International
13. David S. Revill	Georgia Transmission Corporation
14. Kevin Sherlin	Sacramento Municipal Utility District
15. Jonathan Stanford	Bonneville Power Administration
16. Keith Stouffer	National Institute of Standards & Technology
17. Michael Winters	Arizona Public Service Co.
18. William Winters	Hydro One Networks, Inc.
19. David Taylor	NERC
20. Harry Tom	NERC
21. Roger Lampila	NERC
22. Scott R. Mix	NERC
23. Todd Thompson	NERC
24. Hal Beardall	FSU/FCRC Consensus Center
25. Stuart Langton	FSU/FCRC Consensus Center

SDT Team Members Attending via WebEx

1. Jay S. Cribb	Information Security Analyst, Principal, Southern Company Services, Inc.
2. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co.
3. Jackie Collett	Manitoba Hydro
4. Scott Rosenberger	Luminant Energy
5. John D. Varnell	Technology Director, Tenaska Power Services Co.

SDT Team Members Unable to Attend or Participate by WebEx

1. Bryan L. Singer	Kenexis

Attending in Person — Participants

1. James Brenton	ERCOT
2. Michael Toecker	Burns & McDonnell Engineering

Attending via WebEx — Participants

1. James Bassett	IPC
2. Marcus Braendle	ABB
3. Steve Brezina	WAPA
4. Jerome Farquharson	Burns & McDonnell Engineering
5. Mike Mertz	Southern California Edison
6. Matt Schnell	Nebraska Public Power District
7. Karen Yoder	First Energy

List of Attendees — Cyber Security Order 706
Standard Drafting Team Meeting
SMUD — Sacramento, CA
October 22, 2008

Attending in Person — Team Members

1. D. Jack Bernhardsen	President/Manager Pacific Northwest Security Coordinator, Inc.
2. Jeri Domingo-Brewer, Chair	U.S. Bureau of Reclamation
3. Sharon Edwards	Project Manager, Duke Energy
4. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp.
5. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
6. Tom Hoffstetter	Midwest ISO, Inc
7. Philip Huff	Arkansas Electric Cooperative Corporation
8. Richard Kinas	Orlando Utilities Commission
9. John Lim	CISSP, Department Manager, Consolidated Edison Co. of New York
10. David Norton	Policy Consultant, CIPEnergy Coporation
11. Kevin B. Perry, Vice Chair	Director, IT-Infrastructure, Southwest Power Pool
12. Christopher A. Peters	ICF International
13. David S. Revill	Georgia Transmission Corporation
14. Kevin Sherlin	Sacramento Municipal Utility District
15. Jonathan Stanford	Bonneville Power Administration
16. Keith Stouffer	National Institute of Standards & Technology
17. Michael Winters	Arizona Public Service Co.
18. William Winters	Hydro One Networks, Inc.
19. David Taylor	NERC
20. Harry Tom	NERC
21. Roger Lampila	NERC
22. Scott R. Mix	NERC
23. Todd Thompson	NERC
24. Hal Beardall	FSU/FCRC Consensus Center
25. Stuart Langton	FSU/FCRC Consensus Center

SDT Team Members Attending via WebEx

1. Jay S. Cribb	Information Security Analyst, Principal, Southern Company Services, Inc.
2. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co.
3. Jackie Collett	Manitoba Hydro
4. John D. Varnell	Technology Director, Tenaska Power Services Co.

SDT Team Members Unable to Attend or Participate by WebEx

1. Bryan L. Singer	Kenexis
2. Scott Rosenberger	Luminant Energy

Attending in Person — Participants

1. James Brenton	ERCOT
2. Michael Toecker	Burns & McDonnell Engineering

Attending via Webex — Participants

1. Haung Ngo	Reliant
2. Karen Yoder	First Energy

Appendix # 3

NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate

purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
  employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 4

Assignments from First SDT 706 meeting (Gaithersburg, MD)

	Task	Leader	Sub team	Due Date
1	CIP-004 R2 and R3	Jackie Collett	Chris Peters, John Varnell, Sharon Edwards	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
2	CIP-006 R1	Kevin Perry	Joe Doetzl, Scott Fixmer, Thomas Hofstetter	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
3	Review Measures associated with changes in CIP-002 to CIP-009	Jerry Freese	Keith Stouffer, Roger Lampila, Todd Thompson	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
4	Implementation Plan – update to address newly identified CA	Scott Mix	Michael Winters, Dave Norton, Kevin Perry	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
5	Implementation Plan update to address revised Requirements from Phase I and Mapping document – matrix that compares current version of standard with revised version with a comment that explains what changed.	Phil Huff	Kevin Sherlin, Scott Rosenberger, Jon Stanford, Scott Mix	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
6	Comment Form – including an extensive write-up of the background, rationale for revisions, explanatory text.	Jeri Domingo-Brewer	Steve Vandenberg, Harry Tom, Sharon Edwards, John Lim	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15
7	Review VRFs associated with changes in CIP-002 to CIP-009	Todd Thompson	Roger Lampila	Straw Proposal due to sub team leader on October 14 in advance of sub team WebEx on October 15

Appendix # 5

Appendix #6

Standard Drafting Team Draft Consensus Guidelines

October 21–22, 2008

CONSENSUS DEFINED

Consensus is a **process**, **an attitude and an outcome**. Consensus processes can produce better quality more informed products.

A. Consensus is a problem solving process in which all members:

1. Jointly distinguish their concerns
2. Educate each other
3. Jointly develop alternatives and then
4. Adopt recommendations everyone can embrace or at least live with.

In a consensus process, members can honestly say:

- I believe that other members understand my point of view
- I believe I understand other members' points of view
- Whether or not I prefer this decision, I support it because it was arrived at openly and fairly and because it is the best solution for us at this time

B. Consensus as an attitude provides that each member commits to work toward agreements that meet their own and other member needs and that all can support the outcome.

C. Consensus as an outcome means that agreement is reached by all members or by a significant majority of members. The level of enthusiasm for the agreement may not be the same among all members on any issue, but on balance all should be able to live with the overall package. **Levels of consensus** can include:

- Participants strongly support the solution
- Participants can "live with" the solution
- Some participants do not support the solution but agree not to veto it.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Draft Consensus Guidelines

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards including assessment of the reliability and market interface impacts.

General consensus is a participatory process whereby, on matters of substance, the members strive for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for the final package of recommended revisions, and the Team finds that 100% acceptance or support is not achievable, final consensus recommendations will require at least 75% favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing consensus throughout the process on substantive issues with the participation of all members. In instances where the Team finds that even 80% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team.

The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Team members, NERC staff and facilitators will be the only participants seated at the table. Only Team members may participate in discussions and vote on proposals and recommendations. The Chair and Vice Chair may request specific clarification from observers in order to assist the Team in understanding an issue. Observers/members of the public are welcome to speak during a public comment period that will be provided at each meeting, and all written comments submitted on the comment forms will be included in the Team and facilitators' summary reports.

To enhance the possibility of constructive discussions as members educate themselves on the issues and engage in consensus-building, members agree to refrain from public statements that may prejudge the outcome of the Team's consensus process. In discussing the Team process with the media, members agree to be careful to present only their own views and not the views or statements of other participants and/or may direct such inquiries to the Team Chair and Vice Chair. In addition, in order to provide balance to the Team process, members agree to represent and consult with their stakeholder interest group.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Guidelines for Participants

Participants' Role in Meetings:

- Explore possibilities
- Listen to understand (Respect) (limit sidebar conversations)
- Be focused and concise. (Avoid repetition. No need to offer comments in "strong agreement.")
- Focus on issues, not personalities.
- Offer options to address others' concerns.
- No sidebars.
- If participating by phone, indicate who is speaking.
- If participating by phone, please use the mute button. **Do not** put the phone on hold.

Facilitators/Staff Role in Meetings:

- Assist the Chair and Vice Chair in helping the Team stay on task
- Help the group follow agreed upon ground rules
- Design the meeting and problem solving process in consultation with the Chair and Vice Chair
- Facilitate discussion participation of the Team and other participants
- Prepare agenda packets and reports

Consensus Building Techniques

- **Brainstorming** (green light thinking – not judgmental) At certain points, the facilitator may ask the group to suspend judgment and get ideas onto the table before debating.

- **Name Stacking in Team Discussions**
  - Members in the room should use name tents to be recognized to speak
  - Telephone participants should give their name and indicate desire to speak on the topic

- **Acceptability Consensus Ranking Scale**
  - Use a consensus acceptability scale to help focus discussion and test support in reviewing substantive issues.
  - Use to guide and focus discussion, not used as a voting mechanism. Rather it is a poll to see where folks are.
  - Must be prepared to offer refinements and suggestions to address serious concerns.

  4 = Proposal is acceptable as it is
  3 = Proposal is acceptable; I can live with it but there are minor concerns to address

2 = Proposal is not acceptable. Proposal may be acceptable if the major concerns are addressed

1 = Proposal is not acceptable

Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

October 21, 2008 | 8 a.m.–5 p.m.
October 22, 2008 | 8 a.m.–5 p.m.
Sacramento Municipal Utility District
6301 S Street
Sacramento, California

Cyber Security Order 706 SDT — Day 1 Agenda

1. 8:00 Opening Remarks — Jeri Domingo-Brewer, Chair and Kevin Perry, Vice Chair
   a. SMUD Welcome — announcements, logistics
   b. NERC Antitrust Compliance Guideline
   c. FSU/CRC review of last meeting and adoption of meeting summary
2. 8:15 SDT Organizational Issues: Purpose Statement and Adopt Rules of the Road
3. 9:00 Presentation and Review of Phase I Drafting Group Products
   (Requirements, Measures, Implementation Plan, Comment Form, VRFs)
4. 10:15 BREAK
5. 10:30 Phase I presentations and review — continued
6. 12:00 Lunch — working (return to meeting at 12:45 p.m. ET)
7. 12:30 Phase I presentations and review — *continued*
8. 3:00 BREAK
9. 3:15 Review of Assignments to Finalize Phase I Redline Versions
10. 4:45 Review of Progress and Adjustments, as needed, Day 2 Agenda
11. 5:00 Recess

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 SDT — Day 2 Agenda

12. 8:00 Opening, Review of Day One Results and Day Two Agenda — Jeri Domingo-Brewer, Chair and Kevin Perry, Vice Chair
13. 815 SDT Organizational Issues *(TBD)*
14. 8:30 Post Phase I (*Phase II*) Project Roadmap — discussion
    - Review of CIP 002-009 — Identify Approach, Key Issues from FERC Directive including NIST comparison, etc.
15. 10:30 BREAK
16. 10:45 Continue Review of CIP 002-009 — Approach, Issues from FERC Directive including NIST comparison
17. 12:00 Lunch — working (return to meeting at 12:45 p.m. ET)
18. 12:45 Review of CIP 002-009 — Approach, Issues from FERC Order including NIST comparison.
19. 2:45 BREAK
20. 3:00 Post Phase I Project Roadmap — discussion, continued
    - Disposition of RFI from SCE&G and U.S. Army Corps of Engineers
    - Review of Parking lot items from Gaithersburg meeting or Day 1
    - Initial Phase 2 Schedule Structure
21. 4:15 Review of short term meeting schedule and Post Phase I drafting assignments
22. 4:45 Next Steps and Evaluation
23. 5:00 Adjourn

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

MEETING SUMMARY CONTENTS

EXECUTIVE SUMMARY

The Chair, and Vice Chair welcomed the members reviewed with the team and participants the proposed meeting agenda and thanked Phil Huff for hosting the meeting at the Arkansas Coop offices. Harry Tom reviewed with the team the need to comply with NERC's Antitrust Guidelines. The team accepted the October draft meeting summary but agreed that it will be open to editorial corrections as necessary.

The team reviewed and unanimously adopted the consensus guidelines which had been revised since the Sacramento meeting to address consistency with the NERC Reliability Standards Development Procedure.

Following discussion, the team unanimously adopted the following SDT purpose statement:

> The team is serving the public interest throughout North America to protect the critical cyber assets that include hardware, software, data, and communications networks essential to the reliable operations of the bulk power system.
>
> The team's outcomes will be achieved by working together to build consensus on a technically sound and complete package of recommended draft cyber security standards and realistic implementation plan that is responsive to and consistent with the scope of the SAR, the FERC Order 706 and the ANSI process.

Following an overview and extensive discussion of how to address the proposed edits by the NERC Standards Process Manager, and a review of specific edits in CIP 00 and 003, the SDT decided to accept agreed upon "global changes" discussed in CIP 002-003 review and reject all other changes reverting back to the final Sacramento language version. Team member Jackie Collett presented CIP 002-009 global revisions, including CIP 006 revisions made by Kevin Perry, for consideration by the team. The team also accepted the Implementation section language as revised on November 13 by the sub-team.

In the review of the Newly Identified Assets Implementation plan the team unanimously agreed to go back to the Sacramento agreed-on approach and have the "newly identified asset" CCA implementation plan as a separate document with no changes in the existing CIP standards documents to be posted for industry comment with Phase 1 documents. Based on comments from Phase I industry review and experience in the field, the SDT will consider incorporation into the standards documents in Phase II. The SDT will ask the industry whether they think it should be incorporated into the CIP standards documents as part of the Phase I submission for vote. Following the poll, Scott Mix made conforming changes in the draft language and the SDT then unanimously agreed to move forward this as a separate paper in Phase 1.

Jeri Domingo Brewer reviewed the SDT sub team's revisions to the comment form based on the revisions to the standards adopted by the team and the SDT unanimously agreed to adopt the Comment Form at part of the Phase 1 documents.

On Friday morning, the SDT Phase I package of documents was moved for adoption and submission to the industry for comment (Mover: Kevin Perry, second: Sharon Edwards). The Phase 1 Package was adopted unanimously without discussion.

The SDT reviewed the Phase II options paper drafted by the facilitators with input from the Chair, Vice Chair and some SDT members. The facilitators presented some initial draft assessment criteria and invited the SDT to clarify, revise or add additional criteria. The facilitators suggested the criteria could help provide a frame for each member to assess the acceptability of the various options for how to proceed. Below is the second draft of the assessment criteria:

SECOND DRAFT PHASE 2 OPTIONS ASSESSMENT CRITERIA
(Not Weighted nor Prioritized)

Initial Draft Criteria as Revised by SDT in November 14 Discussions

A. The option is consistent with the SDT purpose statement and is responsive to the FERC 706 directives and the SAR.
B. The option is achievable given the SDT schedule and work plan.
C. The option does most to advance and enhance cyber security.
D. The option helps the SDT address the foundational issues with the current standards.
E. The option is capable of implementation.
F. The option is capable of improving compliance.

New Criteria Identified by SDT in November 14 Review

G. The option helps protect the current investments and wherever possible builds on what has already been done.
H. The option helps to identify and mitigate risk on an ongoing basis.
I. The option balances a systems orientation with a facilities orientation to asset protection approach. The option is capable of being extended into related interests by others (distribution, AMI, Smart Grid, etc.).
J. The option enables the industry provide the appropriate level of security (not over securing nor under securing the cyber assets).
K. The option allows for discrimination among the various types of infrastructure that supports the BES.

The SDT then discussed, refined and reduced the number of optional approaches to four for consideration. The team ranked the acceptability of four identified options for going forward and then directed the Chair, Vice Chair and facilitators to design the December agenda around the approach receiving the greatest support from team members. Below are the results of that exercise:

PHASE II WORK PLAN OPTIONS IN RANK ORDER
(As identified and ranked by SDT November 14, 2008)

1. Address Risk management first then proceed with the rest

Acceptability Ranking Scale	**4** = acceptable, I agree	**3** = acceptable, I agree with minor reservations	**2** = not acceptable unless major reservations addressed	**1** = not acceptable	**Avg.**
11-14 rank	**9**	**5**	**4**	**0**	**3.27 of 4**

2. Adopt/adapt NIST into CIP or Merge NIST into CIP

Acceptability Ranking Scale	**4** = acceptable, I agree	**3** = acceptable, I agree with minor reservations	**2** = not acceptable unless major reservations addressed	**1** = not acceptable	**Avg.**
11-14 rank	**3**	**9**	**4**	**0**	**2.93 of 4**

3. Revise CIP as directed — leave as is and add in only items identified by FERC order

Acceptability Ranking Scale	**4** = acceptable, I agree	**3** = acceptable, I agree with minor reservations	**2** = not acceptable unless major reservations addressed	**1** = not acceptable	**Avg.**
11-14 rank	**5**	**7**	**7**	**0**	**2.89 of 4**

4. Start Over — in terms of a starting point

Acceptability Ranking Scale	**4** = acceptable, I agree	**3** = acceptable, I agree with minor reservations	**2** = not acceptable unless major reservations addressed	**1** = not acceptable	**Avg.**
11-14 rank	**2**	**5**	**7**	**5**	**2.21 of 4**

Scott Mix reviewed the "Technical Feasibility eight page document with two pages included of questions which were reviewed at the Sacramento meeting. This was modeled after self-reporting mechanism to fit into the existing compliance program. He noted that he would go through a red line version for one more round to send to the SDT for review prior to December. He noted the goal would be to post a paper approved by the team for comment soon after the December meeting. The comment period would overlap with the Phase I period but would last longer.

In reviewing next steps, the SDT reviewed the status of the NERC Phase I communication plan and asked for a presentation at the December meeting. They also reviewed the Phase I schedule and evaluated what worked in Little Rock and what could be improved going forward. The proposed December agenda items included:

- Review elements of communication plan for Phase I
- Technical Feasibility review
- Background on NIST and its application
- Continue discussion of Phase II approach

Members agreed to adjourn at 11:30 a.m. on Friday until the next meeting on December 4–5, 2008 in Washington D.C.

Cyber Security Order 706 Standard Drafting Team
Draft Third Meeting Summary

I. Introductions, Agenda Review and Welcoming Remarks

The Chair, and Vice Chair welcomed the members and asked NERC staff Harry Tom to conduct a roll call of members and participants in the room and on the conference call *(See appendix #2*). They then reviewed with the team and participants the proposed meeting agenda *(See appendix #1*). They also thanked Phil Huff for hosting the meeting at the Arkansas Coop. offices and for making all of the necessary logistical arrangements.

II. Review of Antitrust Guidelines

Harry Tom reviewed with the team the need to comply with NERC's Antitrust Guidelines *(See, Appendix #3)*. He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

III. Acceptance of Second SDT Meeting Summary

On Wednesday the Chair asked members to review the October draft meeting summary and the team would seek to adopt it on Friday. On Friday the Chair reviewed the minutes from the second meeting. The Chair suggested and the team agreed to accept the minutes as they were distributed, however the minutes will be open to editorial corrections as necessary. The Chair noted that an announcement that the minutes have been posted to the NERC Web site will be sent to members and other participants. It is then the responsibility of the members to download the minutes and review them in advance of meetings.

IV. SDT Consensus Guidelines

The team reviewed the consensus guidelines *(Appendix #5)* which had been revised since the Sacramento meeting to address consistency with the NERC Reliability Standards Development Procedure. The facilitator noted that the consensus process and techniques were designed to produce as close to 100 percent support of the team's final products as possible. The team discussed what level of agreement it should establish for making final decisions on substantive proposals. They agreed that it will be essential to seek as much consensus support among the team of its proposals since the products will be scrutinized and tested by the industry, many of whom may not be cyber security subject matter experts. Some noted that the initial adoption of the voluntary CIP standards was a controversial and challenging process and that the passage of mandatory cyber security standards will be at least as challenging. The team agreed to set its threshold for team decision making at least a supermajority of 75 percent of the SDT members. The Chair pointed out this exceeds the two-thirds vote needed to approve a standard by the ballot body.

The team also agreed to adopt a quorum rule of two-thirds of the team's members present in order to make decisions. This is consistent with the quorum set forth in the NERC rules for the ballot body process. Finally the team agreed to provide a statement consistent with the NERC

procedures that voting may take place in the context of formal SDT meetings or may take place through electronic means. The team unanimously adopted the consensus procedures as revised.

V. SDT Purpose Statement

Mr. Langton noted that the Chair and Vice Chair worked with the facilitators to respond to the range of team comments on the first draft purpose statement reviewed at the Sacramento meeting. The following revised purpose statement was offered for the team's consideration:

> **The team is serving the public interest throughout North America to protect the critical cyber assets that include hardware, software, data, and communications networks essential to the reliable operations of the bulk power system.**
>
> **The team's outcomes will be achieved by working together to build consensus on a technically sound and complete package of recommended draft cyber security standards and realistic implementation plan that is responsive to and consistent with the scope of the SAR, the FERC Order 706 and the ANSI process.**

In the discussion that followed, the team acknowledged the issue of communications networks as part of the range of critical cyber assets that need protection. Some emphasized that the team's focus should be on the data that moves over the system and not just on the facilities in the bulk power system. Following the discussion, the team unanimously adopted the SDT purpose statement.

VI. Review and Adoption of Phase One Products

A. Introduction and Overview of NERC Edits

David Taylor reviewed with the team the process for reviewing the team's draft products. He noted that the Standards Process Manager who works on behalf of the Standards Committee. This review as not intended to be a substantive review of the requirements but a fresh review "from the outside looking in" of the proposed SDT language for the standard requirements and other Phase 1 documents, with an eye towards compliance issues. For example, the term "risk based assessment methodology" may need some clarification and perhaps there is an alternative choice of word, better accepted and understood by all who would be reading this. Team members also felt strongly that the SDT's language: "This standard, in conjunction with the other standards in the set CIP-002 through CIP-009, comprise a cyber security framework for the protection of Critical Cyber Assets supporting the reliable operation of the Bulk Electric System," was critical to the draft and should not be removed as suggested by the NERC Standards Process Manager.

B. Team Review of Procedural Approaches to Reviewing Edits

The team discussed how to address NERC's Standards Process Manager proposed edits of the Phase 1 draft documents the team unanimously adopted at the conclusion of its October 21–22 meeting in Sacramento. Due to tight timeframes, an interim WebEx call scheduled to review the proposed NERC editorial changes was canceled. Many of the team members and sub teams did not have a chance to review the proposed edits in

advance of the meeting. After extensive discussion, the team identified and conducted a poll on the preferred approach to finalizing Phase 1 products.

Proposed Approaches	SDT Preference Poll
1. Review 002-009 spending ten minutes on a section. If not resolved, default to final draft as proposed by SDT. If six or more members reject the proposed edit, we reject the proposed edits go and go on to the next requirements.	**11**
2. Reject NERC Standards Process Manager's Changes	**8**
3. Table the discussion of NERC Standards Process Manager's changes. Focus on Requirements first, then Data Retention. We will not be concerned with boiler-plate standards changes made by NIDR.	**1**
4. Leave Alone - Deal with Implementation Plan and other substantive issues. After we do that we consider NERC Standards Process Manager's changes.	**0**
5. Accept NERC Standards Process Manager's changes	**0**
Total	**20**

The team agreed to utilize the approach to go through CIP-002 and touch each change briefly to determine whether to accept or reject, but then to check on its efficacy in moving through the proposed edits and reviewing new language for other products.

C. Initial Review of CIP 002-003

The team's efforts for the rest of the afternoon addressed whether to accept the range of proposed edits by the NERC Standards Process Manager. A chart reflecting the team's day one decisions is displayed in *Appendix #6.*

D. Agreement on Global Edits and Retention of the SDT Requirements and Measures

Following the Team's review of proposed edits to CIP 002, 003 and part of 006, it decided to conduct a ranking of options in going forward with their review. They tested the support for the two proposals noted below.

Proposal	Initial Straw Poll	
1. Accept agreed upon "global changes" discussed in CIP 002 and 003 review — Reject all other changes. Other than global changes, this reverts all standard language back to Sacramento version	20 Y	4 N

2. Accept global changes plus what was already done on CIP 002 and CIP 003. Reject everything else.	Not passed

Team Comments after Poll

- Concern that we are rejecting the changes we made in 002 and 003; which says something about our process?
- Understand the comment but 2 and 3 are really overall governance standards and we are not comfortable accepting the proposed edits without reviewing and reflecting on all the changes to each section.
- Concerned that some changes in 2 and 3 may impact the others without further review.
- This process was not a waste of time; the team had a good and necessary discussion that sets the stage for future work.
- We went through a necessary exercise and valuable team exercise, we then reflected and adjusted based on the experience.

	2nd Poll	
1. Accept all agreed upon global changes — Reject all other changes and edits proposed by NERC Standards Process Manager. Other than the global changes, this reverts all standard language back to the version adopted at the conclusion of the Sacramento meeting.	23	2
2. Accept global changes plus what was already done on CIP 002& CIP 003. Reject everything else.	*Failed to get enough support*	

Review of Global Edits

Team member Jackie Collett presented CIP 002 through CIP-009 global revisions, including CIP-006 revisions made by Kevin Perry, for consideration by the team.

E. Implementation Plan

Phillip Huff reviewed the SDT sub team's suggested revisions and agreed following comments to meet with the Sub team to address suggestions for revisions.

Comments:

- Did compliant date get changed? The "Introduction" makes clear that compliant date is not important.
- If use effective date in the standards then need to include here for consistency.
- Do we need to spell out the "versions" to avoid confusion?
- Also capitalize "Implementation Plan".
- Version 1 is the original 706 standard use "version one" in () to shorten subsequent references, similar description and use of version two.

- The second paragraph was offered by the sub-team for explanation but can dropped if the language is considered too informal.
- What does "Auditable compliant" mean?
- If compliant with standard on day one then do not need years worth of documentation — semantics — agree with having one date and that it does not mean that you will have one years worth of documents on that date.

Following a sub-team meeting over lunch, Mr. Huff reviewed the change proposed for the effective date.

Comments

- Is this to be inserted in place of specific item or as a global item in all the standards? As a global item in all the standards.
- Place it in the effective date for each standard.
- Both options to be included to offer option — not offered here as to which one to include in the standards.
- Why not say 180 days? NERC wants the compliance dates to line up with quarters to make auditing easier.
- The SDT discussed moving the parenthetical but left in as boilerplate already given to the drafting team. The parenthetical is meant as a clarifier not an alternative — remove the "or" in the parenthetical to clarify?
- Change to capital "Compliant Date"? That means it needs to be in the glossary — leave in lower case.
- Is this the effective date that appears in the footer of the document (XXXX)? No that footer addresses when FERC ultimately approves.
- It would have to be read multiple times to understand.
- The later of: i); or, ii) ….
- Remove "applicable"? Leave in to cover different Canadian jurisdictions.

	Poll of SDT Members	
Accept the Implementation section language as revised on Nov. 13	19	1

Comments following the Poll

- Still confused as to when this could become effective to investor owned utility in the U.S.?
- Possibly the end of next year.
- Note this is not the newly identified asset "implementation" plan.

F. Newly Identified Assets — Implementation Plan

Scott Mix reviewed the suggested revisions noting the new requirement R3.1.

Comments on Proposal

- Is this something we need to move here — identify senior manager — We agreed in Sacramento to include senior manager?
- Should say first calendar "day" of the first quarter.
- If categorization of an asset is now required is it subject to audits? As a requirement the answer is yes but how? Need to give compliance a chance to review.
- Should we be wrapping into the standards as a requirement in Phase 1 as opposed to a white paper for comment? We discussed in Sacramento and agreed to the white paper approach.
- Categorizing the equipment support reliable operation? This is about compliance first, not operations.
- CIP-002 has a new requirement CIP-003 through 009 do not
- Are we asking for a world of hurt by adding additional verbiage? This would add a lot of text to the standards here. Yes, but this is really salient concern in the industry asking us to fix this.
- Suggestion is not to not include it but address it as a separate document rather than embed in the standards
- Give ourselves a waiver under the applicability standard; avoids complications under implementing, and it is still auditable, but allows equipment to avoid compliance for longer period of time.
- How does it get implemented without embedding it? It gets a two-year test run as a separate document and in phase 2 we use the comments and practice and adjust as needed into the standards.
- Separate document makes it clearer what the concept is that is being presented to the industry.
- Give a 180-day waiver to critical and 30-day waiver for non-critical? Time could be adjusted, but it gives industry time to adjust to the concept before implementation.
- Simplicity is appealing but could be wrong — this is a complex issue that needs a complex answer to address multiple permutations — industry will tell us which ones are wrong.

The SDT used a straw proposal acceptability ranking to test support on how to proceed:

Consensus Ranking on options for how to present the "Newly Identified Assets" Implementation plan	**Acceptability Rank**			
A Go back to the Sacramento agreed on approach and have the "newly identified asset" CCA implementation plan as a separate document with no changes in the existing CIP standards documents to be posted for industry comment with Phase 1 documents. Based on comments from Phase I industry review and experience in the field, the SDT considers	**4**	**3**	**2**	**1**

incorporation into the standards documents in Phase II. Ask the industry whether they think it should be incorporated into the CIP standards documents as part of the Phase I submission for vote.	**19**	**2**	**0**	**0**
B. Instead of option A above, address the new assets within the applicability section	**3**	**9**	**8**	**1**
Poll on Support for Proposal A	**Poll**			
Who accepts Proposal A?	21-0			

Comments after the Poll:

- Need to strive for consistency where ever possible; have to look at different parts of the document to understand how to comply.
- We are talking about a phased in implementation.
- Putting into applicability section will lock into format and be more confusing.
- Elegance in simplicity but separate document will offer clearer path to receive and interpret comments.
- Do not think we can boil this issue down to key bullets and be comprehensive enough.
- This is too complex to put into the applicability section; compliance and other issues that do not fit in the applicability section. Review as one document now and then disperse into the standards as needed in Phase II; premature to place it in one place or another until we get comments back.
- Believe it is consistent to put in a separate document for implementation.

Following the poll, Scott Mix made some conforming changes in the draft language for "newly identified assets" white paper and presented to the SDT:

- Reviewed the three categories
- Category 3 is not called out directly in the flow chart
- Category 3 is covered by "compliant upon commissioning"
- Auditable Compliant always follows one-year after compliance
- Added storm restoration to the table — unplanned to get service back up for customers
- The dates are linked to quarters

Comments:

- Do we need to add verbiage to explain intent of this section and its applicability?
- The last sentence in adopted proposal frames the question to be asked in the comment form.
- Might include explanation for the time frames used in the table.

- Concerned about how we deal with constructive ambiguity in a large company formed from multiple former companies — each still operates parts of their grid separately.
- If separate delegated authority then should not have to combine and you may not have a single program but need a common governance program
- Three month time frames may not be enough for a large corporation realistically — change all of the 3's to 6's? Or wait for industry comments? Wait for industry comments.
- Can we use "senior management" for consistency?

The SDT then unanimously agreed to move forward this as a separate paper in phase 1.

G. Comment Form

Jeri Domingo Brewer reviewed the SDT sub team's revisions to the comment form based on the revisions to the standards adopted by the team.

SDT Comments on the Comment Form

- No changes have been made by the sub team — following a review comments from NERC.
- Include list of standards and titles in background to be sure industry understands what is being reviewed.
- Editorial changes included deletion of material from the SAR — trying not to confuse industry on what we are doing in phase I, so the sub team is suggesting deleting material that appears to be related to phase II
- Suggest removing the Requirements section that was added by the sub team
- Under Implementation Plan — make clear what the two different implementation plans are trying to do.
- Added to question about what they do not like the request for suggestions to address the concern — may adopt in other standards comment forms too.
- Keep language about intent to educate the industry on what we mean now and in future phases
- Clarify whether the implementation plan only in play during the transition from version 1 to version 2?
- Since we got rid of the second implementation plan, then related language here is no longer needed.
- Footnotes here are helpful in explaining the intent. Check whether the Footnotes work in the new "checkbox" software? May have to use (parenthetical) form.
- Ask Scott Mix and Phillip Huff to come up with questions for the critical asset identification and the effective date respectfully.

The sub-team agreed to review and present a proposal a revised version of the Comment Form before the vote on the Phase 1 package and products. On Friday, Jeri reviewed with the SDT the minor corrections to clarify language on the comment form that included key questions from the Implementation Plan document and from the "newly

identified assets document." The SDT unanimously agreed to adopt the Comment Form at part of the Phase 1 documents.

H. Adoption of Phase 1 Package

On Friday morning, the SDT Phase I package of documents was moved for adoption and submission to the industry for comment (Mover: Kevin Perry, second: Sharon Edwards). The Phase 1 Package was adopted unanimously without discussion.

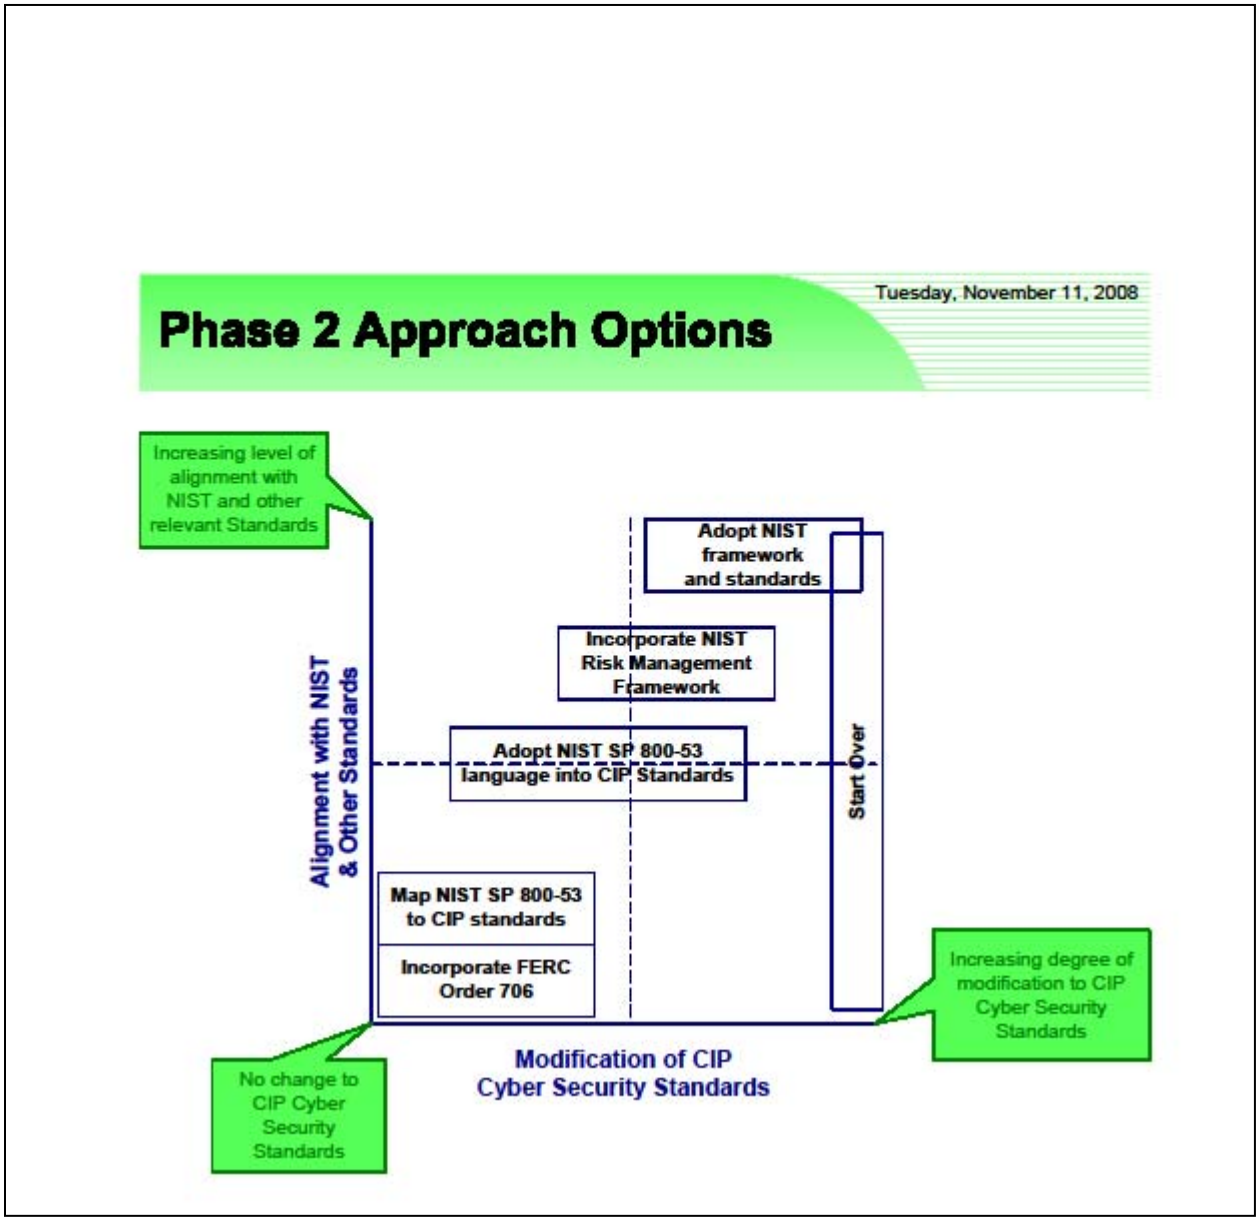
Phase 1 Package of Documents	Adoption Vote	
Phase I Document Motion to Adopt *(Mover, Kevin Perry, Second, Sharon Edwards)*.	21	0

VII. INITIAL REVIEW OF PHASE II APPROACH

A. Review of the Facilitators' Phase II Options Paper

The SDT at its first two meetings discussed how to develop a clear roadmap for how it would engage on the issues and products in Phase II. At the conclusion of the Sacramento meeting, the Chair asked the facilitator to develop an options paper for review at the Little Rock meeting following the adoption of the Phase I package. During an interim WebEx call, the Chair invited any member to send any thoughts on the options to the facilitators. The facilitators received comments and suggestions on approaches and options from John Varnell, Bryan Singer and William Winters and worked closely with the Chair and the Vice Chair in producing the options white paper *(See Appendix # 7)*.

The paper suggested there is a foundational issue concerning the relative merits of the CIP and NIST (and other) cyber security standards that should be addressed for several reasons. One reason is the attention that FERC Order 706 gives to this issue (*See Appendix # 9)*; second it raises questions about the basic paradigm that NERC uses in standards development and oversight; and third, how this matter is addressed by the SDT will influence how it may address many other issues raised in FERC Order 706. For these reasons, the paper suggested the next item on the SDT agenda at the conclusion of submitting the Phase I document will be a review of the CIP cyber security standards in relation to relevant standards developed by NIST and others. A diagram was offered to graphically describe a way to chart the options presented for Phase II.



SDT Initial Comments on the Phase II Options Paper:

- Option E is probably not acceptable under the NERC standards development process.
- We are on risky ground adopting a NIST risk management framework because it allows the entity to accept risk. FERC has stated that is not acceptable.
- NIST has a process for identifying risks that are very difficult to contain and a process to gradually work your way out of that situation. We need to have that discussion with FERC.

- Problem with current standards is that the acceptance of risk was decoupled from risk assessment.
- The FERC order is regulatory law and we cannot decide to ignore and go another direction.
- Missing link: FERC said to look at FISMA/NIST. FIPS 199/200 looks at risk profile. Things are different between the datacenter and the field sites. What is missing is "how much do I really need to worry about this?"
- We have got to do something about the cherry-pick approach to security found in the current standards.
- Need to group of all the issues to best determine the best approach for tackling them. Perhaps putting together multiple spreadsheets and sources of those issues.
- Note there are many suggestions in the SAR for process development aimed at NERC rather than the drafting team.
- For the SDT Scope, are we relying here only SAR 706? Are we only focusing on the FERC 706 order for our decision?
- Our charge is to consider all of the options from doing nothing to complete adoption of the NIST framework — the strawman is to test multiple options for responding to FERC
- The last two options (E and F) mention discarding — that is probably too harsh
- Also not adopting but will be adapting NIST into CIP?
- SAR notes the SDT can and perhaps should reassess everything
- E — Adopting NIST framework — does not meet the NERC process and is not allowed — adapting it may be a severe form of option C.
- F may be where FERC directive asks us to go but keep in mind that the original 15799 was the framework for the 1200 standard the industry started with and long since moved past.
- Has FERC told us the direction but also indicated that the direction is not acceptable — need to manage expectations based on risk assessment directions in the SAR
- Last two options have problems for adopting them in terms of responding to FERC.
- Acceptance of Risk — 706 language developed by lawyers and substance people may not be happy — we have to make it happen practically — process for easing our way out of the problem — FERC may be trying to "have their cake and eat it too"
- This would require a massive funding of a new system — need to practically work toward a more acceptable method of getting out of the problem developed over the past 100 years — FERC can not have it both ways
- Do not assume FERC is adverse to risk acceptance if we can show a practical way of addressing the issue.
- We have no choice to follow what is in the order regarding the CIP standards unless a contravening order is issued — it is the current law.

- Can comment within the law — just setting foundation for addressing additional issues beyond phase I
- Several of the options presented seem to overlap and say some of the same things — need not to bog down in discussing this and need to move on to meatier matters of substance.
- Look to NIST to see if there is anything we can approve — one issue is the residual risk — figure out your risk profile or impact — need levels of gradation of risk as a target — same goes for facilities, some more vulnerable or have a bigger impact — NIST framework helps address these two sets of gradation
- Commend facilitators for capturing the essence of the issue in the options to get us through the discussion to set the framework for dealing with the issues
- Today we "cherry pick" the issues in cyber security with a focus on what should not be covered — we have to figure out how to deal with this under any of the options offered.
- Not identifying new standards but to look at cyber security as it relates to bulk power production, not try to do everything
- We may not have a good concurrence on the scope of what we are being asked to do — the criteria help us focus on what needs to be considered — is there any support for throwing out the system and starting over?

B. Review of Draft Assessment Criteria

The facilitators presented some initial draft assessment criteria (*See Appendix #8)* and invited the SDT to clarify, revise or add additional criteria. The facilitators suggested the criteria could help provide a frame for each member to assess the acceptability of the various options for how to proceed. The criteria also offer an initial opportunity for the SDT to discuss key issues related to how to proceed. The facilitators noted that the mechanics of the proposed review process will include looking at each option to identify the pros/cons of each on its merit *(see Appendix # 8),* then ranking each option for acceptability and ending up with list ranked from top to bottom in terms of acceptability. The SDT could look at lower ranked options and see if anything is worth retaining or incorporating into the most acceptable framework option.

SDT Comments on Draft Criteria

- Suggest decoupling E between implementation and compliance and making this two criteria.
- Are these weighted for relative importance between the criteria? No. Enhancing cyber security should be given a higher weighting
- Goes to how we use these criteria — intended for guiding discussion not a formal formula for scoring each option
- Corollary to D — does the option do the most for advancing the reliability of the bulk power system? That is the object of ensuring cyber security
- Does it protect the investment we have already made in adhering to the CIP standards? — dollars or economic question — builds on what we have already done

- Which option best addresses the foundational issues? Foundational issues includes risk assessment is never done in the current system; also everything such as people and facilities are seen from a box — brainstorm a list of the key foundational issues — something is either critical or not, no gradation
- How does the option identify and mitigate the risk? Option that does the most to identify and mitigates risk.
- Which approach allows to extend into related issues — smart grid with new standards, distribution automation, etc. — from electronic systems view, being able to hack into system versus physical access to a facility — we are the most central system, other systems are looking to us for a model
- Possible criteria: "Does not drive industry to overly secure"
- This is not a one size fits all approach to assessing and securing risk, E.g. the impact on rural farm areas is different than impact on key urban facilities. This requires different assessments and levels of attention.
- Trying to protect bulk power system not the distribution (if not with in the production system)
- Will help if we move FAQs out as guidance to get them the attention they need for clarifying issues.
- Different types of bulk system production requires different levels of protection — vary in types of risk to be addressed
- C in CIP is not "cyber" but "critical" infrastructure protection. Need to stick with cyber security — it is in the Team's title.
- We are looking at the strategy for addressing issues in phase II, not the scope — that was developed by the SAR team, with flexibility for how to address the issues
- Drop off options that are not designed to significantly address issues identified in SAR
- F — double weights other criteria — "If expensive then it would not be supported by ballot,."
- Need to use a risk analysis process — that would help us to focus.
- "Support at ballot" is not a good criteria — no changes at all would be the most supportable at the ballot — need to keep in mind that we are protecting the bulk electric system and the focus is on cyber security
- To move forward there may be too many options and criteria for weighing and judging among them — also some of the answers to the criteria questions may be too subjective.

SECOND DRAFT PHASE II OPTIONS ASSESSMENT CRITERIA
(Not Weighted nor Prioritized)

Initial Draft Criteria as Revised by SDT in November 14 Discussion

D. The option is consistent with the SDT purpose statement and is responsive to the FERC 706 directives and the SAR.
E. The option is achievable given the SDT schedule and work plan.

F. The option does most to advance and enhance cyber security.
L. The option helps the SDT address the foundational issues with the current standards.
M. The option is capable of implementation.
N. The option is capable of improving compliance.

New Criteria Identified by SDT in November 14 Review

O. The option helps protect the current investments and wherever possible builds on what has already been done.
P. The option helps to identify and mitigate risk on an ongoing basis
Q. The option balances a systems orientation with a facilities orientation to asset protection approach. The option is capable of being extended into related interests by others (distribution, AMI, Smart Grid, etc.).
R. The option enables the industry provide the appropriate level of security (not over securing nor under securing the cyber assets).
S. The option allows for discrimination among the various types of infrastructure that supports the BES

C. Review and Ranking of Optional Phase II Approaches

The SDT then discussed refining and reducing the number of optional approaches to consider and rank:

SDT Comments on Approaches

- We need to tackle risk assessment first — everything else follows CIP 002 — that will drive the rest of the options — CIP 2 is not cyber security but is risk assessment
- Options: A is a must do, FERC will use as a check list and if not addressed then will shot us down and say start over; but other options may follow question on CIP 2 — look at NIST to see what it says about each issue, NIST stuff is not copyrighted and we can steal as needed
- A, B, C and some of D — the right approach is an amalgam of the options with A as the lead or preliminary discussion
- How much alignment do we have to start with? The groupings can be realigned — are we to fill the worksheet out for the next meeting? Group into three options and see where we fall as group — are we aligned or not — where on the graphic do we fall as a team?
- The question is where to start? The industry is about producing electricity — we are different — is it a facilities oriented framework or a systems oriented framework? - is it a physical asset protection or information system protection? Do we start with NIST framework and ask what is the right thing to do, checking with the 706 spreadsheet of issues? Or do we continue to cherry pick with current standards? Start with NIST mindset or CIP mindset?
- CIP has a huge acceptability in the industry to start with. What percentage of the CIP standards are acceptable to FERC? Offers a head start over the NIST standards.

- Do we need a broader discussion of risk assessment before discussing the framework?
- Is everyone familiar enough with NIST to assess its value as a starting framework?
- Concerned with setting to narrow a solution for guiding the discussion — need to look at the overall risk to be addressed first — previously we found a solution and fit the problem to it
- We need to look at the FERC order — want us to fix the standards, not replace them or start over — identified the things we need to fix — can look to NIST to see if it fixes particular problems
- Question on process — living with CIP standards and only read NIST standards in one day — need to take a deeper dive into NIST before deciding — utilize experience at the table as to how both are applied

The Chair suggested and SDT agreed to "test the team's pulse" by ranking the acceptability of four identified options for going forward and then to design the December agenda around the approach receiving the greatest support from team members. Below are the results of that exercise:

PHASE II WORK PLAN OPTIONS IN RANK ORDER
(As identified and ranked by SDT November 14, 2008)

1. Address Risk management first then proceed with the rest

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
11-14 rank	**9**	**5**	**4**	**0**	**3.27 of 4**

2. Adopt/adapt NIST into CIP or Merge NIST into CIP

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
11-14 rank	**3**	**9**	**4**	**0**	**2.93 of 4**

3. Revise CIP as directed — leave as is and add in only items identified by FERC order

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
11-14 rank	**5**	**7**	**7**	**0**	**2.89 of 4**

4. Start Over — in terms of a starting point

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
11-14 rank	**2**	**5**	**7**	**5**	**2.21 of 4**

The Chair agreed to plan for the December agenda with this in mind.

VIII. TECHNICAL FEASIBILITY

Scott Mix reviewed the "Technical Feasibility" eight page document with two pages included of questions which were reviewed at the Sacramento meeting. This was modeled after self-reporting mechanism to fit into the existing compliance program. He noted that he would go through a red line version for one more round to send to the SDT for review prior to December. He noted the goal would be to post a paper approved by the team for comment soon after the December meeting. The comment period would overlap with the Phase I period but would last longer.

SDT Comments on Technical Feasibility

- Purpose is because "reasonable business" not stricken yet and this is set for audits after June 1

IX. NEXT STEPS AND EVALUATION

A. NERC Phase One Communication Plan

The Chair asked whether NERC was developing a communication strategy for supporting this project. Dave Taylor noted he was still working with Gerry Adamski to develop the strategy and that they hope to have something ready to present at the December meeting. The Chair noted she prefers to have a session with the industry as soon after posting the package as possible to ensure they have the information they need before commenting. Mr. Taylor agreed to have a NERC presentation on the plan at the December SDT meeting.

B. Review of Phase I Schedule

Dave Taylor reviewed the potential schedule to complete the Phase I process by the end of June 2009. He noted the concerns that times are tight but noted the schedule provides very limited flexibility to extend the comment time — if we do so it extends the end of the time line into the middle of July.

SDT Comments:

- Changing the time frame will not help much — extending the time will not change how people vote.
- Important from a perception point to get this in on time to FERC — getting in after date may show too little concern for their directives— NERC and industry are under the gun.
- To do a realistic quality job and seriously respond to comments the schedule proposed gives us a defensible position that this is complicated and needs more than eighteen months — The Phase I experience will show FERC why it takes more time.
- Is this the fast track process promised by NERC CEO or is this the same process trying to go faster? No, this is not the fast track process.
- Holidays leaves people the first weeks of December to comment and we will offer WebEx explanation after first week? The comment period ends in early January just before the scheduled Phoenix SDT meeting.
- Credibility with FERC is important — need to meet the deadline is important
- Need to do the best we can to get the message out and input back but within the time deadline — set a conference call to discuss the communication plan
- Schedule offered, with three comment periods, Phase II ends April 2011 — draft subject to discussion to follow on proposals for concept approach to Phase II

C. December Meeting Agenda Review

NERC announced that the next meeting will take place in law office in downtown Washington, D.C. downtown and will be a two day format from 8 a.m.–5 p.m. on day one and from 8 a.m.–3 p.m. on day two to allow for travel out on a Friday.

The proposed agenda items include:

- Review elements of communication plan for Phase I,
- Technical Feasibility review,
- Background on NIST and its application, and

- Continue discussion of Phase II approach.

D. SDT Meeting Evaluation — What Worked and What Could Be Improved?
At the conclusion of the meeting, the facilitators asked the team to offer an evaluation of the process including what worked well during the meeting and what could be improved.

What worked?

- AECC is a GREAT meeting facility (Thanks to Phillip)
- Quick polls
- Attitude of the group as a whole very good and productive
- Like idea of breaking into sub-teams for editing documents
- Best meeting so far to participate in by WebEx
- Learned from SDT mis-direction and bounced back
- Came up with an edit rejection method for use while editing text
- Building arsenal of processes and when to use them
- Several team members stepped up and did a lot of extra effort
- Rich distinguished between "its" and "the" — the devil is in the detail and haste makes waste
- Everyone is not bashful about speaking up
- Devil is in the details — got to get it right — avoided temptation to rush to quickly past the details that make a huge impact.

What could be improved?

- Need a UBS for meeting rooms in the future
- Take opportunity to take straw polls sooner to keep us moving
- Bogged down
- Veered from time table
- Confusion over consensus procedures and use of parliamentary procedures and Robert's Rules
- Need tighter oversight from the facilitators. Facilitators could help us more avoid unintended discussions and detours
- Did not get a draft of the Communications Plan from NERC in advance as promised
- Need to have drafts available before meetings
- WebEx master needs to have all documents ahead of time

Other Comments

- Assumed NERC review would be tech-writing format only
- Need pre-review opportunity for NERC edited documents
- Frustration over the process but it is a good thing to realize decisions are hard but need to deal with issue
- Did not get a draft of communications plan as promised
- Making sure long edits are available prior to the meeting
- Help if WebEx has documents ahead of time

- Pre agreement for the process to deal with documents is helpful
- Gap in process — assumed NERC review would be a limited review — turned out to be much more extensive — would have been helpful to have an opportunity to review ahead of time — lack of opportunity to see and address ahead of time
- Appreciate the efforts of Scott and Jackie and others who committed extra time to help us move forward
- Sub teams stepped up and efforts were appreciated
- Important for everyone to speak up and we need to stop and pay attention when needed
- What matters are the words that make it onto the paper not just what we think they mean — others outside the room will read without the underlying discussion — need words to accurately communicate what we mean
- Thank you to Phillip again for hosting

Members agreed to adjourn at 11:30 a.m. on Friday until the next meeting on December 4–5, 2008 in Washington D.C.

Appendix # 1
Meeting Agenda
Cyber Security Order 706 SDT — Project 2008-06

November 12, 2008 — 1–5 p.m. EST
November 13, 2008 — 8 a.m.–5 p.m. EST
November 14, 2008 — 8 a.m.–noon EST
Little Rock, AK

Wednesday	**November 12, 2008**
1:00 p.m.	Welcome and Opening Remarks- Jeri Domingo-Brewer and Kevin Perry
1:05	Roll Call — Harry Tom
1:10	Review NERC Antitrust Compliance Guidelines — Harry Tom
1:15	Adopt October 22 Meeting Summary and Review of Meeting Objectives — Bob Jones
1:20	Organizational Issues — Stuart Langton ▪ Review of Work-plan ▪ Adopting the SRT Consensus Guidelines ▪ SRT Purpose Statement
2:00	Phase I Products Review and Refinement
3:00	Break
3:15	Phase I Products- Review and Refinement
5:00	Observer Comments and Suggestions
5:15	Summary of Day One Outcomes and Review of Day Two Agenda
5:30	Recess
Thursday November 13, 2008	
8:00	Welcome and Agenda Review
8:10	Phase I Products — Refinements and Straw Polls
10:00	Break
10:15	Phase I Produces — Refinements and Straw Polls
12:00	Working Lunch
1:00	Phase I Products — Refinements and Straw Polls
3:00	Break
3:15	Phase I Products Refinements and Straw Polls
5:00	Adoption of Phase I Products
5:15	Summary of Day Two Outcomes and Review of Day Three Agenda
5:30	Recess
Friday November 14, 2008	
8:00	Welcome and Agenda Review
8:10	Phase II Work-plan Review and Discussion — Review of Concept(s) Submitted and Straw-man
9:00	Phase II Discussion of Foundational Assumptions, Approach and Expectations
10:00	Break
10:15	Phase II Ranking and Discussion of Optional Approaches
11:30	Assignments, Next Steps, and Review of Work plan
12:00	Adjourn

Appendix # 2

Cyber Security for Order 706 Standard Drafting Team and Attendees List
Project 2008-06 — CS 706 SDT

Little Rock, Arkansas
November 12–14, 2008

Attending in Person — Team Members

1 **Jeri Domingo-Brewer, Chair**	U.S. Bureau of Reclamation
2. Jackie Collett	Manitoba Hydro
3. Jay S. Cribb	Information Security Analyst, Principal, Southern Company Services, Inc.
4. Sharon Edwards	Project Manager, Duke Energy
5. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp.
6. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
7. Philip Huff	Arkansas Electric Cooperative Corporation
8. Richard Kinas	Orlando Utilities Commission
9. John Lim	CISSP, Department Manager, Consolidated Edison Co. of New York
10. David Norton	Policy Consultant, CIPEnergy Corporation
11. **Kevin B. Perry, Vice Chair**	Director, IT-Infrastructure, Southwest Power Pool
12. David S. Revill	Georgia Transmission Corporation
13. Scott Rosenberger	Luminant Energy
14. Kevin Sherlin	Sacramento Municipal Utility District
15. Michael Winters	Arizona Public Service Co.
1. David Taylor	NERC
2. Harry Tom	NERC
4. Scott R. Mix	NERC
5. Todd Thompson	NERC
6. Hal Beardall	FSU/FCRC Consensus Center (November 13 & 14)
7. Robert Jones	
8. Stuart Langton	FSU/FCRC Consensus Center

SDT Team Members Attending via WebEx/Phone

1. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co.
2. Tom Hoffstetter	Midwest ISO, Inc *(November 13 and 14 only)*
3. Christopher A. Peters	ICF International *(November 12 and 14 only)*
4. Jonathan Stanford	Bonneville Power Administration
5. John D. Varnell	Technology Director, Tenaska Power Services Co.
6. William Winters	Hydro One Networks, Inc.

SDT Team Members Unable to Attend or Participate by WebEx

1. Bryan L. Singer	Kenexis
2. Keith Stouffer	National Institute of Standards & Technology

Attending in Person — Participants

1. John McGlynn	PJM
2.	Arkansas?

Attending via WebEx — Participants

6. Matt Schnell	Nebraska Public Power District
7. Karen Yoder	First Energy

Appendix # 3
NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC

meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 4 Phase I Products

Below is a link to all of the documents reviewed by the SDT including final Phase I products with both clean and red-lined versions agreed to during the full Team discussions in Little Rock:

Appendix # 5 SDT Consensus Guidelines

Adopted Unanimously, November 13, 2008

Cyber Security for Order 706 Standard Drafting Team

Draft Consensus Guidelines

CONSENSUS DEFINED

Consensus is a **process**, **an attitude and an outcome**. Consensus processes can produce better quality more informed products.

A. Consensus is a problem solving process in which all members:

1. Jointly distinguish their concerns
2. Educate each other
3. Jointly develop alternatives and then
4. Adopt recommendations everyone can embrace or at least live with.

In a consensus process, members can honestly say:

- I believe that other members understand my point of view
- I believe I understand other members' points of view
- Whether or not I prefer this decision, I support it because it was arrived at openly and fairly and because it is the best solution for us at this time

B. Consensus as an attitude provides that each member commits to work toward agreements that meet their own and other member needs and that all can support the outcome.

C. Consensus as an outcome means that agreement is reached by all members or by a significant majority of members. The level of enthusiasm for the agreement may not be the same among all members on any issue, but on balance all should be able to live with the overall package. **Levels of consensus** can include:

- Participants strongly support the solution
- Participants can "live with" the solution
- Some participants do not support the solution but agree not to veto it.

DRAFT CONSENSUS GUIDELINES

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

General consensus is a participatory process whereby, on matters of substance, the members strive for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for the final package of recommended revisions, and the Team finds that 100% acceptance or support of the members present is not achievable, final consensus recommendations will require at least 75% favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing consensus throughout the process on substantive issues with the participation of all members. In instances where the Team finds that even 75% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team.

The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Team members, NERC staff and facilitators will be the only participants seated at the table. Only Team members may participate in consensus ranking or vote on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Facilitator and all written comments submitted on the comment forms will be included in the Team and facilitators' summary reports.

The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 51% of the appointed members being present (simple majority). The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure),* as modified by the Team's adopted procedural guidelines, to make and approve motions; however, the 75% supermajority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision making on substantive motions and amendments to motions. In addition, the Council will utilize their adopted meeting guidelines for conduct during meetings. The Council will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

The presiding chair and/or Facilitator of the SDT, in general, should use parliamentary procedures set forth in Robert's Rules of Order, as modified by Council's adopted procedural guidelines.

To enhance the possibility of constructive discussions as members educate themselves on the issues and engage in consensus-building, members agree to refrain from public statements that may prejudge the outcome of the Team's consensus process. In discussing the Team process with the media, members agree to be careful to present only their own views and not the views or statements of other participants and/or may direct such inquiries to the Team Chair and Vice Chair. In addition, in order to provide balance to the Team process, members agree to represent and consult with their stakeholder interest group.

MEETING GUIDELINES FOR PARTICIPANTS

Participants' role in meetings:

- Explore possibilities
- Listen to understand (Respect) (limit sidebar conversations)
- Be focused and concise. (Avoid repetition. No need to offer comments in "strong agreement.")
- Focus on issues, not personalities.
- Offer options to address others' concerns.
- No sidebars.
- If participating by phone, indicate who is speaking.
- If participating by phone, please use the mute button. **Do not** put the phone on hold.

Facilitators and Staff role in meetings:

- Assist the Chair and Vice Chair in helping the Team stay on task
- Help the group follow agreed upon ground rules
- Design the meeting and problem solving process in consultation with the Chair and Vice Chair
- Facilitate discussion participation of the Team and other participants
- Prepare agenda packets and reports

CONSENSUS BUILDING TECHNIQUES

- **Brainstorming** (green light thinking — not judgmental) At certain points, the facilitator may ask the group to suspend judgment and get ideas onto the table before debating.

- **Name Stacking in Team Discussions** (use of name tents to seek attention)

- **Acceptability Consensus Ranking Scale**
  - Use a consensus acceptability scale to help focus discussion and test support in reviewing substantive issues.
  - Use to guide and focus discussion and as a poll to see where the Team stands, not used as a voting mechanism.
  - Must be prepared to offer refinements and suggestions to address serious concerns.

  4 = Proposal is acceptable as it is
  3 = Proposal is acceptable; I can live with it but there are minor concerns to address
  2 = Proposal is not acceptable. Proposal may be acceptable if the major concerns are addressed
  1 = Proposal is not acceptable

- **Consensus Ranking Scale**
  4. Comfortable — I support proposal as is ♥♥♥♥
  3. Minor Reservations — I can live with this; but would like to see changes as follows♥♥♥ Be prepared to offer specific refinements or changes to address your

concerns.

2. Major Reservations — I can't support this unless following changes are addressed to meet my serious concerns ♥♥ Be prepared to offer specific refinements or changes to address your concerns.
1. Fatal Flaws — I can't support this ♥ Be prepared to offer alternatives and options that would address your own as well as other's concerns.

- **Robert's Rules of Order and Facilitated Consensus Building Procedures**
  The Council will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

TABLED, November 13

Appendix #7
Options Paper—Phase II

OPTIONS FOR REVISING THE CIP CYBER SECURITY STANDARD(S)

As the SDT completes its phase I work, it needs to determine what issues it will next address and in what order. However, prior to so doing, there is a foundational issue concerning the relative merits of the CIP and NIST (and other) cyber security standards that should be addressed for several reasons. One reason is the attention that FERC Order 706 gives to this issue; second it raises questions about the basic paradigm that NERC uses in standards development and oversight; and third, how this matter is addressed by the SDT will influence how it may address many other issues raised in FERC Order 706. For these reasons, it is proposed that the next item on the SDT agenda at the conclusion of submitting the Phase I document will be a review of the CIP cyber security standards in relation to relevant standards developed by NIST and others.

Among the points that FERC makes regarding the NERC Cyber Security Standards and those developed by NIST and others, the following seem particularly relevant for the SDT to consider:

1. FERC "believes" that NIST standards "may" provide valuable guidance in developing "future" iterations of CIP standards (sec. 25).
2. FERC "directs" NERC to review revisions in the CIP standards "considering applicable features of the NIST framework." (sec. 25).
3. FERC states it will not delay the "effectiveness" of CIP standards by "directing replacement" of the CIP standards "with others based on the NIST framework." (sec. 25)
4. FERC says it, "will not at this time direct NERC to incorporate specific provisions of the NIST standards," and adds, "that immediate adoption of the NIST standards would result in unacceptable delays (sec.232).
5. FERC says it "believes" NERC "should monitor" the development of NIST standards to see if they contain provisions that may be better than the CIP standards (sec.233).
6. FERC "directs" NERC to "consult with federal agencies" that use both CIP and NIST standards regarding effectiveness and implementation issues concerning NIST and to, "report these findings to the Commission.," (sec. 233).
7. FERC says it "may" revisit this issue in future proceedings as part of their evaluation and assessment of NERC (sec. 233).

Given the above comments, and others from FERC, the NERC Standards Committee has included the following in its directions to the SDT.

"Revisions should consider other Cyber-related standards, guidelines and activities:

- Consider adopting the NIST Security Risk Management Framework (includes GAO, OMB and FIPS)
- Consider other cyber security related documents such as NIST, ISO 27000 Family,
- CIPC WG Risk Assessment Guideline, MITRE Corporation technical report, DHS,

- National Laboratoires papers, DOE 417, IEC, ISA, etc.
- Stay apprised of coordination work between FERC, NEI and NRC in regard to the nuclear facility exemption issue with respect to regulatory gaps. As necessary modify the standards to reflect current determinations."

FERC Order 706 and the directions provided by the NERC Standards Committee suggest a degree of latitude for the SDT in what they may conclude regarding consideration of the NIST Security Risk Management Framework, applicable features, or elements of other security related documents. In regard to the challenge this presents to the SDT, several members have offered suggestions. John Varnell, for example, points out the compatibility of CIP and NIST standards and suggests, "each CIP requirement can be mapped to a NIST 800-53 requirement." This is consistent with the NIST briefings the SDT was given at its first meeting. John goes on to suggest that the SDT develop a guide that will show how NIST requirements can comply with each CIP requirement. Bryan Singer supports this and suggests other relevant standards need to be considered and that attention needs to be given to whether any optional standards meet the intent of a compliance requirement. William Winters suggests that the SDT should first identify its foundational assumptions, of which he offers some examples and alternatives such as: "…adopt the NIST framework and proceed with a roadmap on that basis," "The team should dump the whole standard and start over," and ,"read each FERC concern and adjust current standard as little as necessary to address the concerns."

In keeping with the above suggestions, it is proposed that the SDT consider six options, which, as Phase II Approach Options graphic and the list below illustrate, range from more modest to more sweeping alternatives:

A. Incorporate FERC Order 706. Modify the CIP standards to incorporate the requirements of FERC Order 706. Modify the CIP standards as necessary to address the other requirements of the SAR. Evaluate splitting industrial control systems (ICS) into own set of standards.

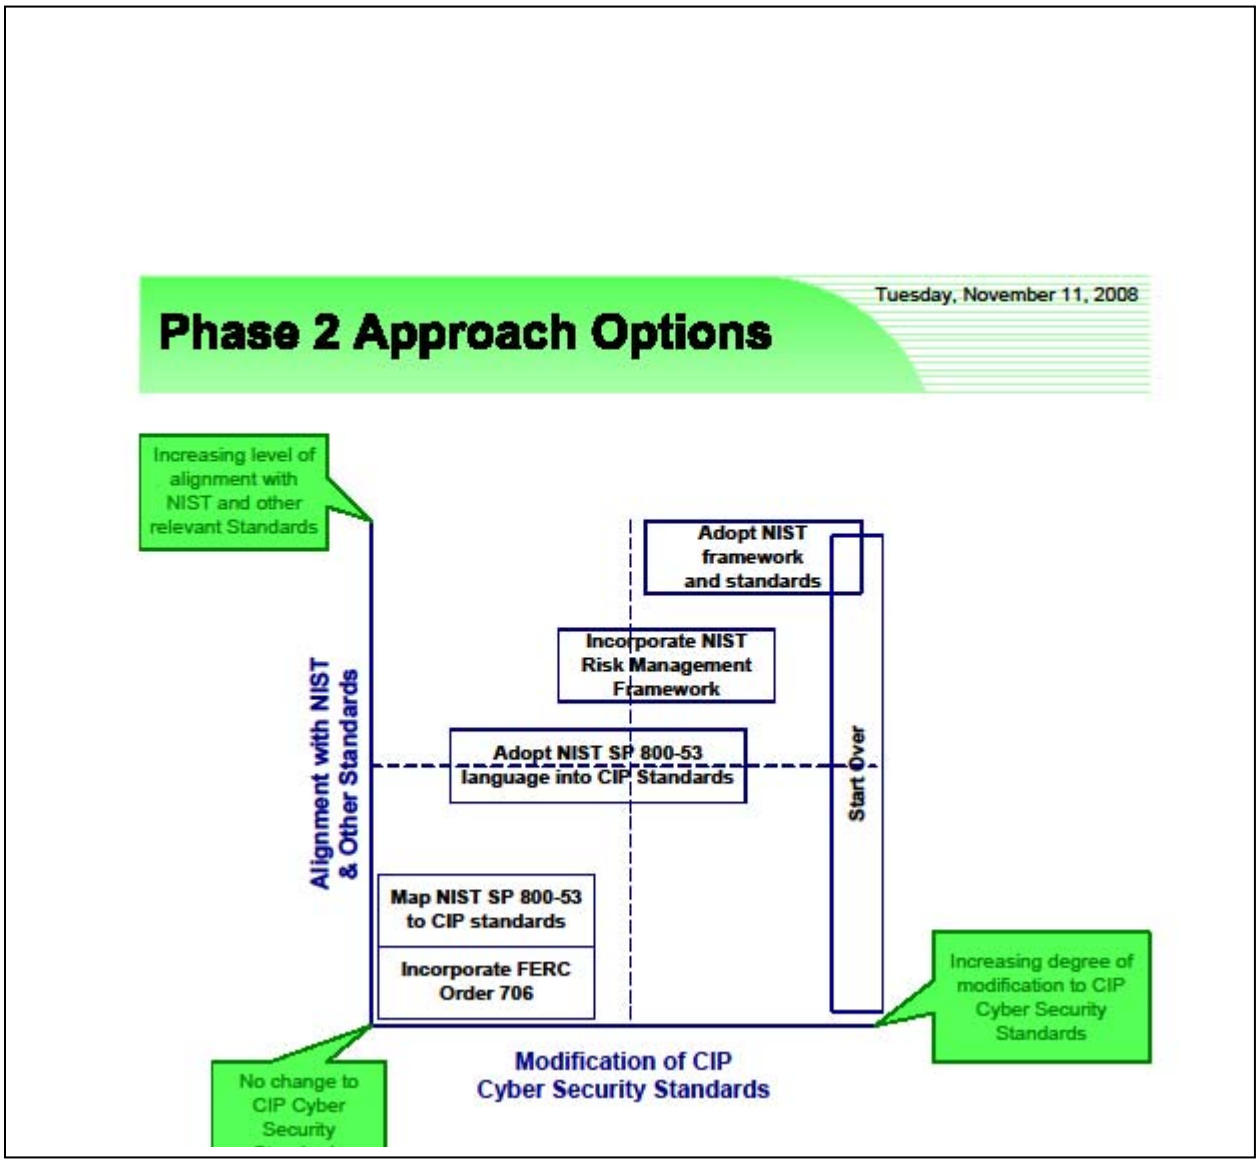
B. Map NIST SP 800-53 to CIP standards: Map similarities and differences between the CIP standards and NIST 800-53 requirements, and provide guidance as to how they can be managed separately but in concert with each other.

C. Adopt NIST SP 800-53 language into CIP standards. In addition to incorporating Option A, provide specific mapping between the CIP standards and the requirements of NIST SP 800-53. Evaluate and modify the language of CIP standards requirements and measures in light of NIST SP 800-53.

D. Incorporate NIST Risk Management Framework. In addition to incorporating options A and C, evaluate and incorporate the NIST Risk Management Framework into the CIP standards. This would predominately impact Critical Cyber Asset identification and technical feasibility/risk mitigation.

E. Adopt NIST framework and standards: Replace CIP Standards with NIST Risk Management Framework and SP 800-53/SP 800-82. This approach represents the wholesale adoption of the NIST framework and discards the existing CIP standards.

F. Start over. Evaluate all available security/risk management frameworks, including ISO



17799/27001, ISA 99, and NIST/FISMA. Select a framework and adopt it fully in place of the existing CIP standards.

It is proposed that the SDT assess these options, identify others that may be as appropriate, and consider modifications or combinations of them. To do this, it may be helpful for the SDT to select assessment criteria, identify the pros and cons of each option, and to rate the various options in regard to levels of acceptability.

Appendix #8 — Phase II Options Review Worksheet

This worksheet was developed by the Facilitators for use on November 14 to guide the STD discussion on approaches and options to Phase II on November 14

SDT PURPOSE STATEMENT

CYBER SECURITY FOR ORDER 706 STANARD DRAFTING TEAM
(adopted unanimously by the SDT, November 13)

The Cyber Security Order 706 Standards Drafting Team (SDT) is serving in the public interest throughout North America to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system.

The overall purpose of the SDT is to work together to build consensus on a technically sound and complete package of recommended cyber security standards and a realistic implementation plan that is responsive to and consistent with the scope of the Standard Authorization Request (SAR), the FERC Order 706 and the ANSI process.

DRAFT STRAWMAN OPTIONS ASSESSMENT CRITERIA

Review the draft strawman assessment criteria below. If you have an additional criterion you would like to propose, we will solicit those. We will rank, discuss and refine all proposed criteria. Members can utilize these criteria in the evaluation and assessment of each of the Phase II Options:

A. **The option most parallels the SDT purpose statement**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial rank				

B. **The option is responsive to the FERC 706 directives and the SAR.**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial rank				

C. **The option is achievable in time-- in terms of the SDT developing the proposed standards.**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial rank				

D. **The option does most to advance and enhance cyber security**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor*	***2** = not acceptable unless major*	***1** = not acceptable*

		reservations	*reservations addressed*	
11-14 initial rank				

E. **Most capable of implementation.**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial rank				

F. **Most capable of compliance.**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial rank				

G. **Is most supportable by ballot**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial rank				

DRAFT STRAWMAN OPTIONS

INSTRUCTIONS: Take a minute to list pros and cons for each of the 6 options. We will review and discuss these. Then we will ask you to rank each on its own keeping in mind the assessment criteria. We will then present these in order of rank (highest average ranking score) and see if there are ways to include pros of other options not selected.

A. Incorporate FERC Order 706.

Modify the CIP standards to incorporate the requirements of FERC Order 706. Modify the CIP standards as necessary to address the other requirements of the SAR. Evaluate splitting industrial control systems (ICS) into own set of standards.

+++++ Pros- Strengths +++++	**------- Cons- Weaknesses --------**
•	•
•	•
•	•

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial rank				

B. Map NIST SP 800-53 to CIP standards:

Map similarities and differences between the CIP standards and NIST 800-53 requirements, and provide guidance as to how they can be managed separately but in concert with each other.

+++++ Pros- Strengths +++++			------- Cons- Weaknesses --------	
• • •			• • •	
Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial rank				

C. Adopt NIST SP 800-53 language into CIP standards.

In addition to incorporating Option A, provide specific mapping between the CIP standards and the requirements of NIST SP 800-53. Evaluate and modify the language of CIP standards requirements and measures in light of NIST SP 800-53.

+++++ Pros- Strengths +++++			------- Cons- Weaknesses --------	
• • •			• • •	
Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial rank				

D. Incorporate NIST Risk Management Framework.

In addition to incorporating options A and C, evaluate and incorporate the NIST Risk Management Framework into the CIP standards. This would predominately impact Critical Cyber Asset identification and technical feasibility/risk mitigation.

+++++ Pros- Strengths +++++			------- Cons- Weaknesses --------	
• • •			• • •	
Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
11-14 initial				

rank				

E. Adopt IST framework and standards:
Replace CIP Standards with NIST Risk Management Framework and SP 800-53/SP 800-82. This approach represents the wholesale adoption of the NIST framework and discards the existing CIP standards.

+++++ Pros- Strengths +++++			**------- Cons- Weaknesses --------**

11-14 initial rank				

Appendix # 9 — FERC 706 Background References

Regarding NIST:

25. The Commission believes that the NIST standards may provide valuable guidance when NERC develops future iterations of the CIP Reliability Standards. Thus, as discussed below, we direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of the NIST framework. However, in response to Applied Control Solutions, we will not delay the effectiveness of the CIP Reliability Standards by directing the replacement of the current CIP Reliability Standards with others based on the NIST framework.

232. As proposed in the CIP NOPR, the Commission will not at this time direct NERC to incorporate specific provisions of the NIST standards into the CIP Reliability Standards. While commenters provide compelling information that suggests that the NIST standards may provide superior measures for cyber security protection, the Commission is concerned that the immediate adoption of the NIST standards would result in unacceptable delays in having any mandatory and enforceable Reliability Standards that relate to cyber security.

233. The Commission continues to believe — and is further persuaded by the comments — that NERC should monitor the development and implementation of the NIST standards to determine if they contain provisions that will protect the Bulk-Power System better than the CIP Reliability Standards. Moreover, we direct the ERO to consult with federal entities that are required to comply with both CIP Reliability Standards and NIST standards on the effectiveness of the NIST standards and on implementation issues and report these findings to the Commission. Consistent with the CIP NOPR, any provisions that will better protect the Bulk-Power System should be addressed in NERC's Reliability Standards development process. The Commission may revisit this issue in future proceedings as part of an evaluation of existing Reliability Standards or the need for new CIP Reliability Standards, or as part of an assessment of NERC's performance of its responsibilities as the ERO.

Regarding an additional guidance/reference document

61. The Commission received comments on both sides of the issue of specificity. Some commenters caution against the CIP Reliability Standards being too specific, while others request more guidance to help them comply. In general, the Commission believes it is appropriate to provide sufficient guidance to explain Requirements so that responsible entities have a high degree of certainty that they understand what is necessary to comply with a Requirement. More guidance will allow responsible entities to implement measures adapted to their specific situations more consistently and effectively. Additional guidance need not be included in a specific Requirement, but could be in the form of examples. The Commission is not directing that the ERO establish a specific end result. Our concern is simply that responsible entities have guidance on how to achieve an appropriate result in individual cases, which can vary on a case-by-case basis. Therefore, in several instances throughout this Final Rule, the Commission gives the ERO direction to provide additional guidance. In some cases, we require

that the guidance be placed in modifications to the CIP Reliability Standards. In other cases, we note that some or all of the additional guidance could be placed in a reference document separate from the CIP Reliability Standards.

253. The Commission believes that the comments affirm that responsible entities need additional guidance on the development of a risk-based assessment methodology to identify critical assets. While we adopt our CIP NOPR proposal, we recognize that the ERO has already initiated a process to develop such guidance. The CIP NOPR proposed to direct that NERC modify CIP-002-1 to incorporate the guidance. However, we are persuaded by commenters that stress the need for flexibility and the need to take account of the individual circumstances of a responsible entity. Thus, we modify our original proposal and in this Final Order leave to the ERO's discretion whether to incorporate such guidance into the CIP Reliability Standard, develop it as a separate guidance document, or some combination of the two. A responsible entity, however, remains responsible to identify the critical assets on its system.

355. The Commission believes that responsible entities would benefit from additional guidance regarding the topics and processes to address in the cyber security policy required pursuant to CIP-003-1. While commenters support the need for guidance, many are concerned about providing such guidance through a modification of the Reliability Standard. We are persuaded by these commenters. Accordingly, the Commission directs the ERO to provide additional guidance for the topics and processes that the required cyber security policy should address. However, we will not dictate the form of such guidance. For example, the ERO could develop a guidance document or white paper that would be referenced in the Reliability Standard. On the other hand, if it is determined in the course of the Reliability Standards development process that specific guidance is important enough to be incorporated directly into a Requirement, this option is not foreclosed. The entities remain responsible, however, to comply with the cyber security policy pursuant to CIP-003-1.

356. In response to ISO/RTO Council, Ontario Power and other commenters, the Commission's intent in the CIP NOPR — as well as the Final Rule — is not to expand the scope of the CIP Reliability Standards. Requirement R1 of CIP-003-1 requires a responsible entity to document and implement a cyber security policy "that represents management's commitment and ability to secure its Critical Cyber Assets." The Requirement then states that the policy, "at a minimum," must address the Requirements in CIP-002-1 through CIP-009-1. The Commission believes that there are other topics, besides those addressed in the Requirements of the CIP reliability Standards, which are relevant to securing critical cyber assets. The Commission identified examples of such topics in the CIP NOPR. Thus, the Commission, in directing the ERO to develop guidance on additional topics relevant to securing critical cyber assets, is not expanding the scope of the CIP Reliability Standards.

408. The Commission agrees with FirstEnergy on the importance of flexibility in developing a mutual distrust posture, but does not see a conflict between the need for flexibility and what it is proposing, which is simply more guidance. More guidance will allow responsible entities to implement measures adapted to their specific situations more consistently and

effectively. Additional guidance need not be included in a specific Requirement, but could be in the form of examples. We will leave it to the Reliability Standards development process and the ERO to decide whether some or all of the guidance can be contained in separate guidance documents referenced in the Reliability Standard. In response to Entergy, the Commission is not directing that the ERO establish a specific end result. Our concern is simply that responsible entities have guidance on how to achieve an appropriate result in individual cases, which can vary on a case-by case basis. We disagree that providing useful guidance affects the scope of the Reliability Standards.

502. In response to APPA/LPPC, the Commission clarifies that it does not intend to create an inflexible rule calling for redundant electronic security in all cases. While the Commission directs that a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process. This would include whether or not the second security measure must be "on par" with the first. The Commission also directs the ERO to consider, based on the content of the modified CIP-005-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.

511. The Commission adopts the CIP NOPR's proposal to direct the ERO to identify examples of specific verification technologies that would satisfy Requirement R2.4, while also allowing compliance pursuant to other technically equivalent measures or technologies. In response to commenters, in discussing digital certificates and two-factor authentication, the Commission was providing examples of strong authentication, not limiting authentication to those options. The Commission is not prescribing the specific methods as an exclusive solution pursuant to Requirement R2.4. The ERO can propose an alternative solution that it believes is equally effective and efficient. If the ERO believes it would be helpful to responsible entities, additional guidance beyond the examples that are eventually included in Requirement R2 can be given in a separate reference document. Since we are directing the ERO to provide guidance on what constitutes strong authentication, it is not necessary for the Commission to respond to ISO-NE's request that digital certifications or two-factor authentication are acceptable methods of authentication. In identifying examples or categories of specific verification technologies that would satisfy Requirement R2.4, the ERO should take into account the specific comments raised in this proceeding. Similarly, while encryption is one method to accomplish two-factor authentication, and is an effective process for ensuring authenticity of the accessing party, for some facilities, we leave it to the ERO in the Reliability Standards development process to evaluate whether and how to address the use of encryption. In the alternative, the ERO may identify verification technologies or categories of verification technologies in a reference document.

547. In sum, we direct the ERO to modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years. The ERO should develop the details of how to determine what constitutes a representative system and what modifications require an active vulnerability

assessment in the Reliability Standards development process. The revised Reliability Standard should contain the essential requirement that an active assessment must be performed at least once every three years. Based on the amount of guidance contained in the modified Reliability Standard, the ERO should consider at that time whether additional guidance should be provided in a reference document.

575. In response to commenters' questions regarding specific physical access controls, the Commission clarifies that it does not intend to create an inflexible rule calling for redundant physical security. While the Commission continues to believe that a responsible entity must implement two or more distinct and complimentary physical access controls at a physical access point of the perimeter, the specific requirements should be developed in the Reliability Standards development process when the ERO develops its modifications in response to this Final Rule. The Commission also directs the ERO to consider, based on the content of the modified CIP-006-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.

609 . The Commission has discussed issues related to testing environments in CIP-005-1. In that context, the Commission clarifies the CIP NOPR proposal to require differences between the test environment and the production system to be documented. As stated with respect to CIP-005-1, the Commission understands that test systems do not need to exactly match or mirror the production system in order to provide useful test results. However, to perform active testing, the responsible entities should be required at a minimum to create a "representative system" — one that includes the essential equipment and adequately represents the functioning of the production system. We therefore direct the ERO to develop requirements addressing what constitutes a "representative system" and to modify CIP-007-1 accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document.

621. While we agree that no safeguard will protect against all malicious or unintentional acts, this does not mean that systems should not be protected against such acts. In response to MidAmerican, the Commission believes that details regarding how to safeguard systems against personnel introducing, maliciously or unintentionally, viruses or malicious software to a cyber asset are best developed in the Reliability Standards development process. The revised Reliability Standard does not need to prescribe a single method for protecting against the introduction of viruses or malicious software to a cyber asset by personnel. However, how a responsible entity does this should be detailed in its cyber security policy so that it can be audited for compliance with the Reliability Standard. The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes how an entity should protect against personnel introducing viruses or malicious software to a cyber asset. The ERO could also provide additional guidance in a reference document.

629. For the reasons discussed in CIP-005-1, in directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the Commission will allow a manual review of a sampling of log entries or sorted or filtered logs. The

Commission recognizes that how a responsible entity determines what sample to review may not be the same for all locations. Therefore, the revised Reliability Standard does not need to prescribe a single method for producing the log sampling. However, how a responsible entity performs this sample review should be detailed in its cyber security policy so that it can be audited to determine compliance with the Reliability Standards. The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document. The final review process, however, must be rigorous enough to enable the entity to detect intrusions by attackers.

644. For the reasons discussed in CIP-005-1, in directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the Commission will allow a manual review of a sampling of log entries or sorted or filtered logs. The Commission recognizes that how a responsible entity determines what sample to review may not be the same for all locations. Therefore, the revised Reliability Standard does not need to prescribe a single method for producing the log sampling. However, how a responsible entity performs this sample review should be detailed in its cyber security policy so that it can be audited to determine compliance with the Reliability Standards. The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document. The final review process, however, must be rigorous enough to enable the entity to detect intrusions by attackers.

660. The Commission adopts the CIP NOPR proposal to direct the ERO to provide guidance regarding what should be included in the term reportable incident. In developing the guidance, the ERO should consider the specific examples provided by commenters, described above. However, we direct the ERO to develop and provide guidance on the term reportable incident. The Commission is not opposed to the suggestion that the ERO create a reference document containing the reporting criteria and thresholds and requiring responsible entities to comply with the reference document in the revised Reliability Standard CIP-008-1, but will allow the ERO to determine the best method to accomplish the goal of better defining reportable incident.

725. The Commission adopts, with modifications, the CIP NOPR proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years. Consistent with our goals and discussion of CIP-005-1, the Commission will not at this time require responsible entities to perform full operational exercises. Instead, the Reliability Standard should require the demonstrated recovery of critical cyber assets in a test environment, with the requirements for representative test environments and for addressing differences between the test environment and the production environment, similar to the conditions discussed for live testing in CIP-005-1. Given the range of views presented in comments regarding live testing, as the Reliability Standard development process forms the details of this “demonstrated recovery”

concept, it should consider offering guidance beyond the actual Requirements of the Reliability Standard in separate reference documents. The Commission believes this alleviates commenters' concerns about the risks associated with such testing

Cyber Security Order 706 Standard Drafting Team

DRAFT CONSENSUS GUIDELINES

CONSENSUS DEFINED

Consensus is a **process**, **an attitude and an outcome**. Consensus processes can produce better quality more informed products.

A. Consensus is a problem solving process in which all members:

1. Jointly distinguish their concerns
2. Educate each other
3. Jointly develop alternatives and then
4. Adopt recommendations everyone can embrace or at least live with.

In a consensus process, members can honestly say:

- I believe that other members understand my point of view
- I believe I understand other members' points of view
- Whether or not I prefer this decision, I support it because it was arrived at openly and fairly and because it is the best solution for us at this time

B. Consensus as an attitude provides that each member commits to work toward agreements that meet their own and other member needs and that all can support the outcome.

C. Consensus as an outcome means that agreement is reached by all members or by a significant majority of members. The level of enthusiasm for the agreement may not be the same among all members on any issue, but on balance all should be able to live with the overall package. **Levels of consensus** can include:

- Participants strongly support the solution
- Participants can "live with" the solution
- Some participants do not support the solution but agree not to veto it.

DRAFT CONSENSUS GUIDELINES

The Cyber Security Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

General consensus is a participatory process whereby, on matters of substance, the members strive for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for the final package of recommended revisions, and the team finds that 100 percent acceptance or support of the members present is not achievable, final consensus recommendations will require at least 75 percent favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing consensus throughout the process on substantive issues with the participation of all members. In instances where the team finds that even 75 percent acceptance or support is not achievable, the team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50 percent support from the team.

The team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The team's consensus process will be conducted as a facilitated consensus-building process. Team members, NERC staff, and facilitators will be the only participants seated at the table. Only team members may participate in consensus ranking or vote on proposals and recommendations. Observers and members of the public are welcome to speak when recognized by the Facilitator and all written comments submitted on the comment forms will be included in the team and facilitators' summary reports.

The team will make decisions only when a quorum is present. A quorum shall be constituted by at least 51 percent of the appointed members being present (simple majority). The team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure)*, as modified by the team's adopted procedural guidelines, to make and approve motions; however, the 75 percent supermajority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision making on substantive motions and amendments to motions. In addition, the team will utilize their adopted meeting guidelines for conduct during meetings. The team will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

Either the presiding chair or Facilitator of the SDT, in general, should use parliamentary procedures set forth in Robert's Rules of Order, as modified by the team's adopted procedural guidelines.

To enhance the possibility of constructive discussions as members educate themselves on the issues and engage in consensus-building, members agree to refrain from public statements that may prejudge the outcome of the team's consensus process. In discussing the team process with the media, members agree to be careful to present only their own views and not the views or statements of other participants and/or may direct such inquiries to the team Chair and Vice Chair. In addition, in order to provide balance to the team process, members agree to represent and consult with their stakeholder interest group.

MEETING GUIDELINES FOR PARTICIPANTS

Participants' Role in Meetings:

- Explore possibilities.
- Listen to understand (Respect) (limit sidebar conversations).
- Be focused and concise. (Avoid repetition. No need to offer comments in "strong agreement.")
- Focus on issues, not personalities.
- Offer options to address others' concerns.
- No sidebars.

Facilitators and Staff role in Meetings:

- Assist the Chair and Vice Chair in helping the team stay on task.
- Help the group follow agreed upon ground rules.

- Design the meeting and problem solving process in consultation with the Chair and Vice Chair.
- Facilitate discussion participation of the team and other participants.
- Prepare agenda packets and reports.

CONSENSUS BUILDING TECHNIQUES

- **Brainstorming (green light thinking — not judgmental).** At certain points, the facilitator may ask the group to suspend judgment and get ideas onto the table before debating.

- **Name Stacking in Team Discussions** (use of name tents to seek attention)

- **Acceptability Consensus Ranking Scale**
  - Use a consensus acceptability scale to help focus discussion and test support in reviewing substantive issues.
  - Use to guide and focus discussion and as a poll to see where the team stands, not used as a voting mechanism.
  - Must be prepared to offer refinements and suggestions to address serious concerns.

  4 = Proposal is acceptable as it is
  3 = Proposal is acceptable; I can live with it but there are minor concerns to address
  2 = Proposal is not acceptable. Proposal may be acceptable if the major concerns are addressed
  1 = Proposal is not acceptable

- **Consensus Ranking Scale**
  4. Comfortable — I support proposal as is ♥♥♥♥
  3. Minor Reservations — I can live with this; but would like to see changes as follows♥♥♥ Be prepared to offer specific refinements or changes to address your concerns.
  2. Major Reservations — I can't support this unless following changes are addressed to meet my serious concerns ♥♥ Be prepared to offer specific refinements or changes to address your concerns.
  1. Fatal Flaws — I can't support this ♥ Be prepared to offer alternatives and options that would address your own as well as other's concerns.

- **Robert's Rules of Order and Facilitated Consensus Building Procedures**
  The Council will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

  - Any voting member may make a motion when a quorum is present.
  - A second is required to discuss the motion.

- If a motion is seconded, the Chair or Facilitator opens the floor for discussion.
- The Chair or Facilitator will recognize members wishing to speak on the motion.
- The Chair or Facilitator will, if time permits, recognize other participants wishing to speak on the motion.
- The Chair or Facilitator may elect or be requested by the member making the motion to take a "straw poll" on the motion.
- The member making the motion may accept friendly amendments to the motion.
- After completing discussion, the Chair or Facilitator will call the discussion to a close and restate the motion, with any friendly amendments, and call for a vote.
- If the motion receives a 75 percent favorable vote of the members present and voting it will be approved.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CYBER SECURITY ORDER 706 STANDARD DRAFTING TEAM DRAFT PURPOSE STATEMENT

The team is serving in the public interest throughout North America *to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system.*

The overall purpose of the Cyber Security Order 706 Standards Development Team is to work together to build consensus on a technically sound and complete package of revised draft cyber security standards and realistic implementation plan that is responsive to and consistent with the scope of the Standard Authorization Request (SAR), the FERC Order 706 and the ANSI process.

(Italics from the SAR "purpose" statement)

	4=acceptable	***3= minor reservations***	***2=major reservations***	***1= not acceptable***
Initial Ranking				
Revised/Amend				

Comments

TITLE: REVISIONS TO CRITICAL INFRASTRUCTURE PROTECTION STANDARDS (REVISIONS TO CIP-002 THROUGH CIP-009)

Request Date: March 1, 2008, Revision Date: June 9, 2008
Approved by Standards Committee for standard development on July 10, 2008

July 15 Announcement for Nominations to SAR (excerpt):
"For this drafting team, the Standards Committee is looking for a variety of expertise, with the possibility of having the team subdivide itself into smaller teams based on expertise."

Team Purpose: To protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system.

Industry Need:
Implement Changes to the following Cyber Security Standards as indicated in FERC Order 706:

CIP-002-1 — Critical Cyber Asset Identification
CIP-003-1 — Security Management Controls
CIP-004-1 — Personnel & Training
CIP-005-1 — Electronic Security Perimeter(s)
CIP-006-1 — Physical Security of Critical Cyber Assets
CIP-007-1 — Systems Security Management
CIP-008-1 — Incident Reporting and Response Planning
CIP-009-1 — Recovery Plans for Critical Cyber Assets

Brief Description:

This set of revisions in this project includes:

- Modifying the standards so they conform to the latest approved versions of the ERO
- Rules of Procedure as outlined in the Standard Review Guidelines identified in Attachment 1.
- Addressing the directives issued by FERC, in Order 706 relative to the approved Cyber Security Standards CIP-002-1 through CIP-009-1. Refer to http://www.ferc.gov/whats-new/comm-meet/2008/011708/E-2.pdf for the complete text of the final order. Specific requirements from the Order are identified in Attachment 2.
- Emphasis on Order 706 directive for NERC to address revisions to the CIP standards considering applicable feature of the NIST Security Risk
- Management Framework among other resources.
- Incorporating clarifications from the Interpretation of CIP-006-1 Requirement 1.1.

Cyber Security Order 706 Standard Drafting Team
Draft December 4–5 Meeting Summary
Washington D.C.

EXECUTIVE SUMMARY

The Chair, and Vice Chair welcomed the members and a roll call of members and participants in the room and on the conference call was conducted. Following review of the proposed meeting agenda, Michael J. Assante, NERC Chief Security Officer who offered some comments and perspectives for the Team's consideration urging them to adopt an "outcome oriented" standards development approach with a goal of regulatory stability while focusing resources on protecting what is most important. Jake Olcott, Staff Director and Counsel, House Subcommittee on Emerging Threats, Cyber Security, Science & Technology chaired by Rep. James R. Langevin (D-RI) under the Committee on Homeland Security, offered comments on the Team's effort thus far and noted that this was an area to great and continuing interest to Congress, as witnessed by their formal comments submitted by the Committee and Subcommittee on the FERC Notice of Proposed Rulemaking for Mandatory Reliability Standards for Critical Infrastructure Protection in October, 2007.

David Taylor reviewed with the Team the need to comply with NERC's Antitrust Guidelines.
The SDT unanimously adopted the November 12-14, 2008 meeting summary with a correction in the text changing the quorum rule from 51% to 2/3's. The facilitators reviewed with the Team the consensus guidelines adopted at the Little Rock meeting.

Kelly Ziegler, NERC Manager of Communication presented a proposed Phase I Communications Plan. She outlined for the team three plan objectives: provide adequate information for voting**;** improve visibility of the SDT process**;** and drive positive media coverage**.** She then described the Webinar procedure and NERC's experience with them.

Scott Mix reviewed the "Technical Feasibility eight page document which was first reviewed at the Sacramento meeting and then again at the Little Rock meeting. The paper sections include:

- Objective/Purpose/Executive Summary/Background
- Definition of Technical Feasibility Exception:
- Application:
- Overview of Essential Elements:
- Detailed TFE Process:
- Good Faith efforts
- Sensitive Information:
- Post Approval Processes required by FERC Order:
- Appeals Process:

This was modeled after self-reporting mechanism to fit into the existing compliance program. He noted the plan was to post a white paper for Industry review after the Team reviewed and agreed on the draft. Todd Thompson, NERC Compliance, noted a process has been developed for protecting sensitive audit-

related information so it remains on site at the Responsible Entity, providing evidence if it's tampered with. Roger Lampila noted that training is being provided to regions for their CIP auditors; during recent session, there was general agreement from those present that more knowledgeable auditors will be needed. Entities need to verify with their respective regions that the individuals performing the audits are qualified.

Areas of the Paper the SDT commented on included: Documenting Mitigation; Remediation Steps and Wide Area Approval- ERO's audit process--Regional Entity and ERO Steps

Scott Mix sent out the TF Exception Paper for review by the drafting team on Thursday evening. Comments were received from several drafting team members and Mr. Mix responded on Friday with refinements to the draft. Mr. Mix agreed to determine how the paper would be presented to the industry- i.e. as a NERC or SDT product. The Team agreed to provide Scott with comments by December 12, 2008 and the SDT would review the revised white paper at the January meeting seeking to adopt it for posting thereafter for industry comments.

The balance of the meeting focused on reviewing and discussing the approach to the SDT's Phase II which had been reviewed at each of its first three SDT meetings including an options paper presented and discussed at the Little Rock meeting.

A presentation on the implementation of the NIST framework from a user's perspective was offered by SDT members Jeri Brewer, John Stamford and Keith Stouffer. They provided some perspectives on implementation and identified issues. Following the briefing, The SDT members discussed current approaches to identification of Critical Assets, risk management and the following topics:

- New Technology and Risk Management
- Threats and Risk
- NIST Guidelines and CIP Standards- Both/And?
- Risk Assessment and Resource Implications
- Component-based System Approach
- IT and Control Systems
- Levels of Risk- "One Size Fits All"? NIST and CIP
- Compliance and Audit Concerns

Following the Little Rock meeting, the facilitators asked the Vice Chair, Kevin Perry to draft some strawman draft statements and questions to serve as a starting point for the SDT's consideration of risk assessment. He introduced the statements noting they provide a statement on the industry's current methodology, a problem statement on this methodology, and 8 critical questions regarding risk management. The SDT reviewed and discussed risk management and tested the support through a 4-point acceptability ranking for the following statements:

> **The Current "Consequence-based" Assessment Methodology Draft Statement:**
> The industry focuses on the facility (asset), employing a "consequences-based" assessment methodology to determine if the facility is essential to the reliable operation of the bulk electric system:
>
> - Those that are essential are declared to be Critical Assets.

- We then determine the Cyber Assets essential to the operation of the identified Critical Asset and those become subject to the CIP standards to the exclusion of pretty much all else.

(Average Acceptability Ranking-3.9 of 4)

A Draft Problem Statement with the "Consequences-Based" Assessment Methodology:
The problem presented with this approach is that:

(a) Given the dynamic nature of the transmission system, assets that are critical today might not be tomorrow, and vice versa. *(Average Acceptability Ranking-3.8 of 4)*

(b) The industry may be "cherry-picking" the Cyber Assets to be protected, along with any collateral Cyber Assets that happen to be connected to the same network segment. *(Average Acceptability Ranking-3.1 of 4)*

- *2nd Draft* (b) Some in the industry may be selecting the Cyber Assets to be protected, along with any collateral Cyber Assets that happen to be connected to the same network segment based on economic vs. security considerations.

(c) The approach excludes all other Cyber Assets, including Cyber Assets that may provide essential data to the Critical Cyber Assets or may have a trusted relationship (communications path) that could be exploited as an attack vector. *(Average Acceptability Ranking-3.1 of 4)*

(d) Once a Cyber Asset is identified as either a Critical Cyber Asset or collateral Cyber Asset within the Electronic Security Perimeter, all of the requirements of the CIP Cyber Security Standards apply, regardless of the specific Cyber Asset's importance to the reliable operation of the Bulk Electric System. *(Average Acceptability Ranking-3.8 of 4)*

The discussion regarding risk management led to the testing of the goal of CIP 002. The following statement was offered for acceptability ranking:

> The goal/intended outcome of CIP 002 to identify the Cyber Assets (i.e. Programmable electronic devices and communication networks including hardware, software, and data, NERC Glossary) that need to be protected and to identify the level of protection. *(Average Acceptability Ranking-3.8 of 4)*

The SDT then discussed what kind of framework made sense for inventorying cyber assets which covering the following topics:

- Overall Approach
- Inside-Out Approach
- Systems View
- Protection Model
- Scope
- What Assets Included?
- Real World Examples
- Inventory and Compliance

Following the discussion, one member proposed testing support for the following inventory statement:

Inventory your cyber assets directly related to the operation of your registered NERC functionality:

- Apply a risk methodology to assign a level.
- Apply distinct controls according to the level.
- Inventory for each cyber asset should be: device + o's + function + firmware level.
- These attachments will be critical for patch management and CIP 007R1 testing.

(Average Acceptability Ranking-2.3 of 4)

Another member then proposed testing support for the following inventory statement:

> Identify the applications and computer systems within the Industry Controls Systems or information systems as well as the networks within and interfacing with the ICS. The focus should be on systems rather than devices, and should include PLCs, DCS, SCADA, and instrument bases systems that use a monitoring device such as an HMI.
> *(Average Acceptability Ranking-2.2 of 4)*

Following the lunch break on Day 2, the chair announced that Jackie Collett and William Winters had agreed to draft two "straw" documents, reviewing the SDT discussions to date, to help move the Team forward on the development of a Phase 2 roadmap:

- SDT member Jackie Collett will draft a white paper starting from an attempt to protect the best of what exists with the current CIP and incorporating NIST concepts/features.
- SDT member William Winters will draft a 2nd white paper starting with the NIST framework and incorporate the best of the CIP into it.

NERC staff presented some information and sought SDT input on the industry "Webinar" December 16 from 11:30 until 1 p.m. on the Phase I SDT products. The SDT reviewed the proposed meeting schedule to complete the Phase I process by the end of June, 2009. The next meeting will take place at the Arizona Public Services Corporation facilities in Phoenix. The Chair suggested the following agenda items:

- Organizing and initiating the review of industry comments that have been received on the posting of Revised CIP standards from Phase I;
- Finalize the SDT input to the NERC Technical Feasibility Exceptions white paper; and
- Time permitting, continue discussion of the CIP 002 approach to assets in scope for Phase II including review of the papers from SDT members Jackie Collett and William Winters.

At the conclusion of the meeting, the facilitators asked the Team to offer an evaluation of the process including what worked well during the meeting and what could be improved. There was appreciation of the meeting site in the Capital and facility, of the sound system, of the tagging on from the NERC CIPC meeting and the debate and breadth of knowledge on the team. On improvements, SDT members suggested the facilitators should try to close off open-ended discussions where we are repeating our points (i.e. "violent agreement"). The meeting adjourned at 2:15 p.m. Friday afternoon.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Draft Fourth Meeting Summary
December 4–5, 2008
Washington D. C.

I. INTRODUCTIONS, AGENDA REVIEW, PROCEDURES AND OPENING REMARKS

The Chair, and Vice Chair welcomed the members and asked NERC staff David Taylor to conduct a roll call of members and participants in the room and on the conference call *(See appendix #2*). They then reviewed with the Team and participants the proposed meeting agenda *(See appendix #1*).

The Chair introduced Michael J. Assante, NERC Chief Security Officer who offered some comments and perspectives for the Team's consideration. He thanked the Team for their commitment and work to date and urged them to adopt an "outcome oriented" standards development approach which will require rigor and discipline to follow through. He suggested the key goal should be regulatory stability – i.e. seek to establish an enduring outcome with a set of standards that will last for long time – only needing tweaking as conditions change. This will require a very sharp focus by the Team on each requirement to define the outcome you are trying to achieve and then work backwards to ensure all of the requirements achieve the desired outcome objective. To illustrate the offered two examples:

- CIP-002: approach understood, objective well intended, trying to take sensible approach to defend what is most important. But if you do work backwards, you will find gaps that need to be filled. Guard against assumptions that if you do it right you will fill the gaps. How dangerous are the assumptions? TO/TOP understands assets and can make determination of relative importance. Not true of GO/GOP that do not have planning resources.
- CIP-004: Personnel Risk Assessment/Training – plan is good, subject matter of training will change. If outcome is to assure that risky personnel cannot have unescorted access to cyber assets, then working backwards you find gaps. A missing gap is an entity must have a list of disqualifying factors. A starting point may be the Federal standards (Transportation Worked Identification Credential) a federal mandate for any entity needing access to port facilities. Then need to bring in bargaining agreements, etc.

The Team should focus resources on protecting what is most important. The CIP standards requirements may not have that focus and there may be some gaps. He challenged the Team to look at each assumption with this in mind and suggested their Phase 2 work is the right time to deliver this message.

The Chair also welcomed Jake Olcott, Staff Director and Counsel, House Subcommittee on Emerging Threats, Cyber security, Science & Technology chaired by Rep. James R. Langevin (D-RI) under the Committee on Homeland Security, and invited him to provide the Team with any comments. Mr. Olcott acknowledged the Team's effort thus far and

noted that this was an area to great interest to Congress as witnessed by their formal comments submitted by the Committee and Subcommittee on the FERC Notice of Proposed Rulemaking for Mandatory Reliability Standards for Critical Infrastructure Protection in October, 2007 *(See Appendix #9).* He noted that membership is not yet resolved for the new congress but predicted that there will be continuing interest in this topic. He noted that the Energy and Commerce Committee in the House and Senate are also very interested in this issue. He noted that he will be following the Team's work and provided his contact information for anyone wanting to follow up with him *(See, Appendix #9).*

David Taylor reviewed with the Team the need to comply with NERC's Antitrust Guidelines *(See, Appendix #3).* He urged the Team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The Chair noted the November 12-14, 2008 meeting summary had been circulated to members in advance of the meeting. She noted a correction in the text changing the quorum rule from 51% to 2/3's. David Norton moved and Sharon Edwards seconded the motion to accept the summary as revised. The Team unanimously accepted the meeting summary.

The facilitators reviewed with the Team the consensus guidelines (Appendix #5) adopted at the Little Rock meeting.

II. NERC PHASE 1 COMMUNICATIONS PLAN

Kelly Ziegler, NERC Manager of Communication presented a proposed Phase I Communications Plan. She outlined for the team three plan objectives: provide adequate information for voting**;** improve visibility of the SDT process**;** driving positive media coverage**.** She then described the Webinar procedure and NERC's experience with them. They will provide a press release in advance which will note the multi-phased approach and a high level summary on the web of the Phase 1 products.

Initial Questions/Comments on the Communication Plan Approach

- Reference to 3 phases? Should be referenced as a multi-phase approach.
- It would be ideal to capture the audio webinar in a-podcast form so industry could listen to it at other times.
- Press release: timing? Plan to released next week followed up with the Webinar.

III. TECHNICAL FEASIBILITY EXCEPTION- REVIEW AND REFINEMENT

Scott Mix reviewed the "Technical Feasibility eight page document which was initially reviewed at the Sacramento meeting and then again at the Little Rock meeting. The paper sections include:

- Objective/Purpose/Executive Summary/Background
- Definition of Technical Feasibility Exception:

- Application:
- Overview of Essential Elements:
- Detailed TFE Process:
- Good Faith efforts
- Sensitive Information:
- Post Approval Processes required by FERC Order:
- Appeals Process:

This approach was modeled after self-reporting mechanism to fit into the existing compliance program. He noted that he would go through a red line version for one more round. He reviewed the requirements within the filing including the date that the TF exception is no longer necessary. After the individual filings are made, FERC has charged the ERO with the task of taking a regional and national impact of all TF exceptions. At this time, NERC does not have a consistent process for self-reporting across the regions. The TFE language may show up in 005 & 006 & 007. There were many questions concerning the right approach to presenting the straw man to the industry.
He noted the goal would be to post a paper approved by the Team for comment soon after the December or January meeting.

Todd Thompson, NERC Compliance, noted a process has been developed for protecting sensitive audit-related information so it remains on site at the Responsible Entity, providing evidence if it's tampered with. Roger Lampila noted that training is being provided to regions for their CIP auditors; during recent session, there was general agreement from those present that more knowledgeable auditors will be needed. Entities need to verify with their respective regions that the individuals performing the audits are qualified.

SDT Comments

- If we do our job right we will look at outcome-based standards. The issue is that the standard does not drive technology and that the proposed process needs to consider requirements that apply to PLCs, for example, where there is no solution in response to the requirement such as anti virus.
- Order 706 may leave room to consider replacing equipment that does not comply with the requirements with a similar vintage of equipment if necessary.
- NERC might start an effort to work with the vendors to supply solutions to security as directed in Order 706. This would be something that the ERO could do to improve and drive technology.
- Where ever possible take care of this in Phase 2. But will need a process to deal with really new problems.
- Could be a self-reported non-compliance?
- Some technical requirements may mean someone may need a TFE. Indicate in general language a requirement that you think the TFEs showing up will be reviewed on a case-by-case basis analysis.

- What about an instance of, for example, a plane crash with all staff? Self report of non-compliance. Not a technical issue but an emergency issue.
- You may need an "exception" to the exception process- "outcome basis"? Let the ERO deal with it. If denied then on the non-compliance path. If accept, look back at whether standards need adjustment.
- Each utility for each requirement, e.g. CIP 007- file an exception per requirement, per utility? Could be a deluge? Checks and balances will require paperwork associated with it. Consider the compliance process- self reported
- This may be the reason to stop thinking about generation, transmission and think about types of equipment. All bought at same time, with same problem. E.g. 10,000 of a brand of relays that can't support a password. Single filing vs. 10,000 filings. Will have to work through details
- TFE- problem with piece of equipment- probably would result in one filing.
- The required timeframe for documentation may present problems.
- Consider a paperwork avoidance procedure—while we annotate where TFEs can be taken.
- Develop a list where we know where exceptions can't be taken. When does the inconvenience/cost factor cross over into a security issue. "Infeasibility"- can't be just inconvenience.
- "Burning the strawman" in the debate- put this in a guideline. Cut down on lots of needless actions.
- Clarification- TFE procedure – same as CIP 003 R3 exception process? No. Difference. R3 is taking exception to own internal policies and not a compliance issue vs. a compliance issue taking exception to the standard.
- If built policy to mirror CIP standards, would they be interpreted as one and the same? You may do that but the ERO won't be tracking all internal policies at a company.
- If we do our job right and focus on outcome based standards this will be addressed.
- Today no consideration in current standards as to whether their application makes sense in a particular setting. Concept deserves continued debate and discussion.
- Standards do not drive technology- can't expect that sometime in future engineers will design a way to comply with standard. Also can't assume technology won't change.
- Opportunity for NERC to document the current exceptions taken to date to inform the SDT review of this? Probably right thing to do. List sounds like a roadmap to the past. How to communicate all info to all who need to take action and yet protect everyone else. Difficult problem. Devil in the details.
- Operating systems- software and purpose written software do not have the same vulnerability.
- "Improperly comply with requirement"? Literal interpretation reducing reliability. E.g. passwords not working well in a setting.
- Maybe this is literally complying vs. "improperly"
- Revision in Phase 2 should be more obvious where to apply
- Virus scanning- putting on windows platform becomes a detriment to the operation.

- Clear as to what we are asking for. E.g. list what not complying with and provide mitigation steps. Need to understand- dealing with the remaining risk or risk of not doing it at all.
- Can't anticipate everything. Probably can be clear on somewhere you can't take a TFEs.

Documenting Mitigation- *Scott Fix, NERC*

- Documenting mitigation. E.g. protect device from attack from viruses by doing something that isn't in the standard but works.
- Document a remediation plan- will be long term plans. May be open-ended plans. "when it breaks I will fix it". Need provision for these kind of plans. Tough to do with annual approval process.

Remediation Steps

SDT Comments on Remediation Steps

- Envision a technical exception to equipment password. Still purchasing equipment. So taking a TFE of where they are going, not just where they been.
- E.g. 100,000 relays in environment. 1 breaks do I replace with one everyone knows how to work with or the new one requiring new training, assessment, major purchases. Different from a new substation investment. Everything should meet standards.
- Everything done is very date-related in terms of compliance looking backwards.
- 706 position may not be right on remediation by date certain necessary in all cases.
- Para 181- new equipment- left some wiggle room for valid considerations
- NERC compiling exceptions? Can't write standards that drive the vendor community? Need to ask for a bridge that is not too far.
- What NERC might do, start working with vendors in a vendor management forum to educate and help the market respond better. Feed into this concepts like forensics?

Wide Area Approval — ERO's audit process — Regional Entity and ERO Steps

SDT Comments

- Front line for the process. Notice to the Region on TFE.
- Region apply catalogue i.d. to track- analysis and approval
- ERO needs to provide enough info for Regional entity to do job
- If not enough detail provided, claim rejected.
- Analysis of impact to reliability of TFE. Might require coordination with other entities and regions.
- Milestone slippage- grounds for non-compliance. In best interest to be upfront and forth coming.
- Sensitive info concerns. E.g. Fed agencies for FOIA requests etc.
- Post approval process- annual report to FERC. Canadians have a similar view in their systems. ERO high level view across America. "ARSAWS" (check with todd) completed for all requirements.

- Didn't invent a new appeals process. Compliance and enforcement monitoring appeals process.
- Safe harbor/good faith while request is being processed? CMEP is public document. Is this legal? FERC safe harbor wasn't thrilled. May open up self to "gaming"- have to structure it carefully.
- Cryptographic mechanisms? E.g. Disaster recovery evidence go with it. Including this for electronic documentation. Incorporated way to take encrypted data on better cds. Maintain it at responsible entity.
- Summary info to Canadian entities. Responsible entity has some sort approval? Utilities need some input on what goes forward. Regional entity, ERO and utility should be comfortable. Work towards getting something that meets all needs before reporting.
- If you go to ERO and they say no to TFE? Use the appeals process at the ERO.
- Has to be added to each regional entities CMEP for this to work. This is part of the next steps. Sooner we do this, better we will all be.
- Guidance from current compliance self report process?
- Better definition of "validity"? Fair question. Need to clarify that for industry.
- Part will be how well you write justification and how you demonstrate that you are seeking to achieve the spirit of the requirement.
- Do the RE's have the technical expertise to evaluation the appropriateness of the TFE? Typically don't know various systems. How will we expect that can do this consistently across.
- Reason why approvals are multi-step. ERO could reject even when the RE accepts.
- May become part of the formal delegation agreement?
- How good is good enough? Adequacy metrics. Regional auditors- ARSAW run through to see how vanilla IT look at cyber security environment.
- FISMA experience- Keith. SP 800 series is a lot of guidelines- best professional advice.
- SDT can't do this. Is there an encyclopedia can go to in order to help with the process.
- Federal agency- Auditor General- take a manual- (Jeri). Reports to congress annually on how effective Federal agency security program. Effectiveness of your implementation against the 853 standards. How well that is achieving the goal. FISCAM- Audit Manual
- 800 series documents have lots of best practices. Most are guidelines. GAO looks at them, says you can't blow off, must consider. Some weight.
- Unfortunately for this area are IT specific vs. cyber. 800-82 is one guidance doc. ISA 99 good material as well.
- Don't overplay how "unique" our environment increasingly is.
- Field assets are a different animal.
- This is bigger than just TF, also auditing requirements of regions. Problem recognized within the compliance structure- regions told need to solve the problem. ERO is serious as well with Mike and Todd brought on.
- First CIP auditor training recently in Princeton. Just getting underway. By the end of day 1, regions realized they needed more talented staff. Only a few with the right background. Really thinking of how to function as a audit team member.
- NERC- virtual auditor- support structure to get assistance and reach back.

- What assurances do we have this will be done before audits are happening? Auditing bodies should show how their training. This is a major concern of industry. This is a resource and knowledge issue.
- Federal- auditing with key focuses- programmatically how applied the standards and guidance. Did we id the risks and select the right controls. Test the controls to determine level of veracity and then produce a report (GAO, IG) give equal weight to IT and the cyber community. Have to do risk assessment.

Next steps — Day One

- Scott Mix will clean up and email to the team.
- SDT members will provide comments and suggestions.
- NERC internal working document and doesn't have to go through a ballot process.

SDT Comments

- Are we sure the requirements won't change. TFE for other than technical issues. Invoked where it allows. How to handle this? Hold off until we hit the version 3 standards.
- "Field test" the process.
- If this guideline is to be treated as a non binding guideline then no voting necessary. If this is the expectation that auditors will use and will become binding, industry will have to vote on it.
- This document needs to fit into and follow the current ERO auditing process.
- NERC – Roger's process for input on the audit process. Went to NERC BOT for approval. CIPSE guidelines don't go to BOT because they are not binding. Some way these will be sanctioned.
- Need to make this when implemented. Need to say where this TFE cannot be used.
- FERC- identify where positively can't be used. "Willing to be reasonable" TFE process will be out quickly and implemented quickly.
- Note, when we revisit the requirements- its only where it is currently in the standard.
- Possible at beginning of Jan meeting to agree to post.
- Do we apply only where we have it in the standards?
- Back out "only where specifically allowed" language. Note we may do this in Phase 2.
- Deleted "reasonable business judgment and acceptance of risk"
- Team appreciated.

Day Two — SDT Review and Next Steps

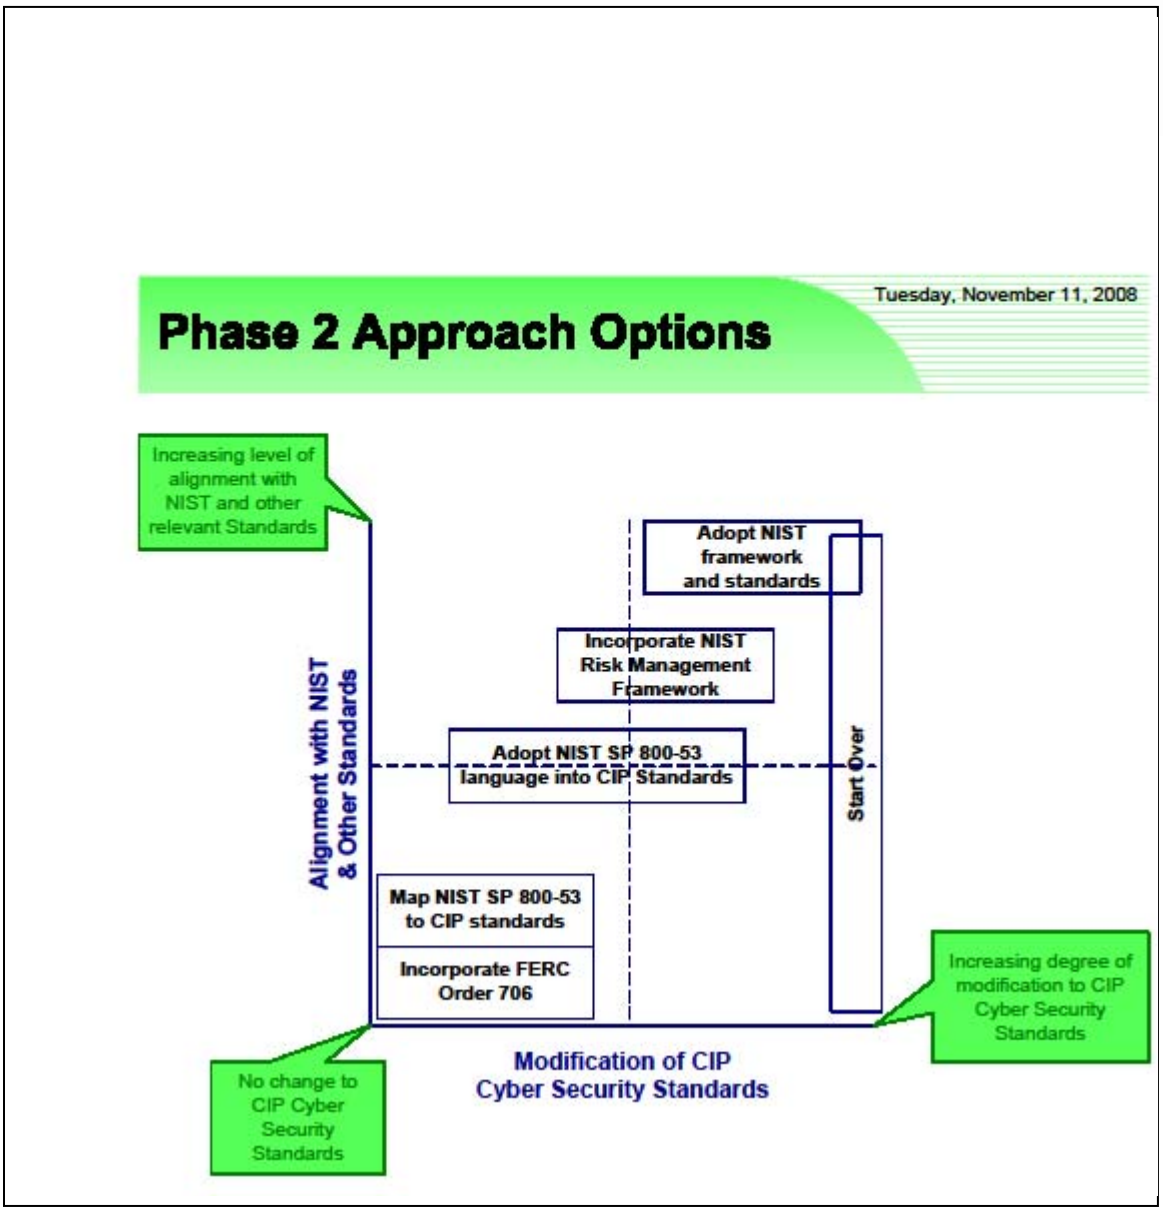
- Scott Mix had sent out the TF Exception Process for review and sent it out to the drafting team on Thursday evening. Comments were received from several drafting team members.
- There was a concern expressed around sensitive information. Scott stated that NERC staff will review the procedure with audit staff. Scott said he would like a couple more days for the rest of the drafting team to review and make comments. After that the draft will be sent out to the drafting team PLUS list.

- Scott also wants the legal staff to review. After all those steps are done, the information will be posted as a white paper for public comment.
- Scott does not expect the public posting to happen until 1st half of January. Scott raised the issue of whose name should be on the white paper when it is posted?
- When the team provides comment, Scott asked that the group provide questions that should be asked of the industry at the public posting.
- The Chairman suggested Friday, December 12, as the due date for comments. The Facilitator asked that comments be submitted to the entire drafting team.
- The technical feasibility exception is in the standard today. What NERC is creating is the procedure that utilities must follow so the change that is being proposed is a change in the rules of procedure. Therefore, this is not a new standard; the TF exception is a new NERC process. There was discussion as to whether NERC needs to post the document for public review. It was generally agreed that the new TF exception process is only a NERC procedure not a standard, and does not need to be balloted by the industry.
- This process provides approval, oversight and appeal. Order 705 Paragraph 184 - exemption is a release from a requirement; an exception is a way to deal with a requirement. There was discussion of the meaning of "exception" vs. "exemption."
- Jeri cautioned the group to get their comments in on the TF exception process. Finalizing the SDT review of the Technical Feasibility Exceptions white paper will be placed on the SDT agenda at the January meeting.

IV. REVIEW OF PHASE II APPROACH

A. Background on SDT Development of Phase II Roadmap

The SDT at its first three meetings discussed how to develop a clear roadmap for how it would engage on the issues and products in Phase II. At the conclusion of the Sacramento meeting, the Chair asked the facilitator to develop an options paper for review at the Little Rock meeting following the adoption of the Phase I package. The facilitators received comments and suggestions on approaches and options from John Varnell, Bryan Singer and William Winters and worked closely with the Chair and the Vice Chair in producing the options white paper that was initially reviewed at the Little Rock meeting. *(See Appendix #7).*



The paper suggested there is a foundational issue concerning the relative merits of the CIP and NIST (and other) cyber security standards that should be addressed for several reasons. One reason is the attention that FERC Order 706 gives to this issue (*See Appendix # 9)*; second it raises questions about the basic paradigm that NERC uses in standards development and oversight; and third, how this matter is addressed by the SDT will influence how it may address many other issues raised in FERC Order 706. For these reasons, the paper suggested the next item on the SDT agenda at the conclusion of submitting the Phase I document will be a review of the CIP cyber security standards in relation to relevant standards developed by NIST and others. A diagram (*See previous page)* was offered to graphically describe a way to chart the options presented for Phase II.

B. Perspectives on Implementing the NIST in the Context of the CIP

SDT members Jeri Brewer, John Stamford and Keith Stouffer provided some comments on implementing the NIST framework from a user's perspective

1. Briefing Issues Identified

- NIST was established around human relations and finance style systems. It was not based on the operational perspective of a control system that needs to keep the operations functional 24/7 minimizing disruptions when they happen (nature, troublemakers etc.). The NIST risk management framework gives tools from IT to apply to control sectors that give protections. 882 helped to address some of the gaps between the IT and control system perspectives.
- The basic concept calls for identifying assets and the risk these assets will have on your mission and tailoring the protections to fit your mission needs.
- Focus on is on control systems, so production impact is a greater concern than in IT. NIST Framework is tool designed for IT environment and applied to control system environment. Elements missing from 800-53 have been addressed by 800-82.
- So NIST represents a process for identifying assets and the associated risks, with protection tailored to fit systems and environment is based on impact, what is needed to address it.
- The NIST framework provides a way for the utilities to adopt the methodology tailored to the utility's specific needs.
- On the positive side, the NIST framework is technology neutral. It is “technology agnostic and risk agnostic.”
- The NIST risk management framework is also flexible for tailoring. However this can also be a negative in that it requires more work and expertise of the end user and in the control center environment to figure out how to align the system. This also extends to the auditor in determining how to assess your system. In a compliance environment the CIP standards tend to lend themselves to more prescriptive requirements--more check-the-box than risk management.
- It functions like an IT network environment with common platforms. NIST framework adapted well to the control system environment. Started in 2004 in first NIST draft.
- The NIST framework has adapted well to the control system environment, however they have not been as successful in adapting the framework for field devices which are not similar to normal IT systems on which NIST was based initially.
- This framework is superior to other methods which are available.
- In a compliance environment, more prescriptive directions for the NIST framework may be needed to facilitate auditing.
- Investing resources to give the biggest bang for you buck. Not 100% protection. Focus on minimize disruption on critical operations, get them back into production as quickly as possible
- Framework to structure and invest in those resources so you can be resilient and recover quickly.

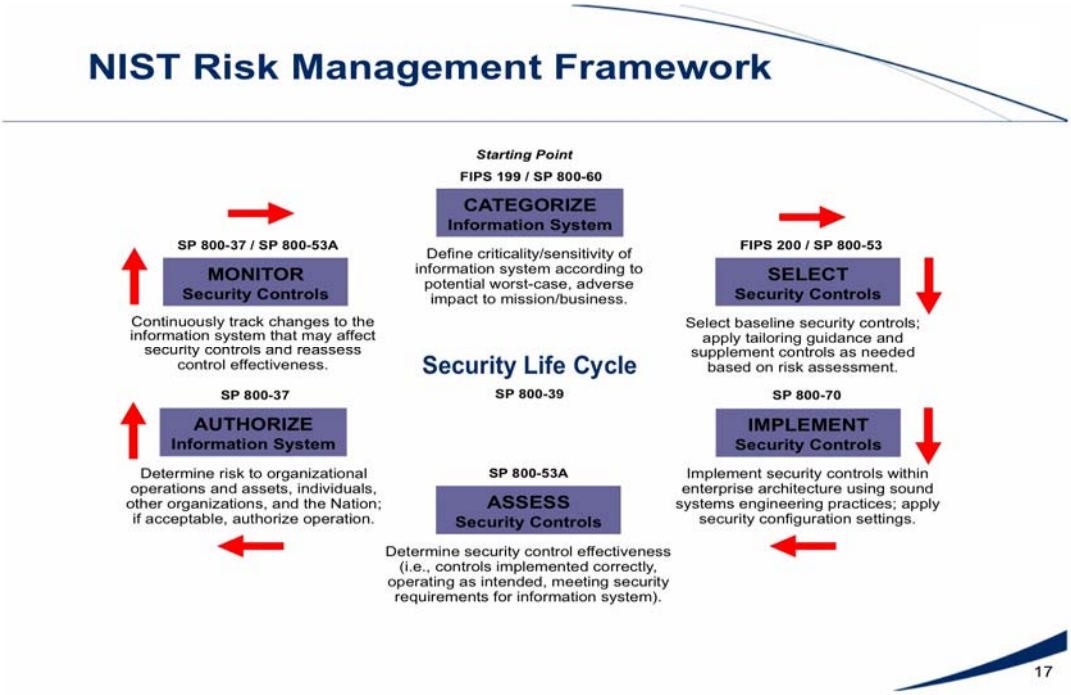
- Standardized way to establish protections with flexibility to adapt to requirements and assets to meet mission.

SDT Comments on NIST and CIP

- The SDT members discussed current approaches to identification of Critical Assets, the role of threats, and associated matters.

2. New Technology and Risk Management

- New risks are constantly being introduced as a result of bringing on new technology. This trend will continue.
- In the field this is a much bigger challenge. Smart grid and substation automation is happening and easier to consider in this light.
- Increasing use of intelligent electronic devices.
- A fundamental issue: mindset in the industry that doesn't take interconnectivity of systems into account.



3. Threats and Risk Management

- Congressional perspectives frame the issue in terms of how the model addresses threats and vulnerability. Congressional staff are looking for feedback from the SDT on how that fits into the NIST or other risk management models used by the industry.

- In the federal NIST implementation framework, most threat information comes in from DHS.
- Frankly in the federal sector from a substation control center perspective, Congress needs to sit down with people who do this every day. Homeland security data is largely worthless, as it is very generalized threats. Doesn't apply specifically to the grid and electric system.
- In recent Audit- DOE was criticized for not having good external threat information, even though it is reliant on DHS for this data.
- If you know your vulnerabilities, considering "risk" isn't viable because true risk is impossible to ascertain. Instead, the focus should be on the vulnerability & the impact if it occurs. Whatever has the greatest potential impact is the area that needs the greatest effort to protect.
- FERC suggested that threat should be taken off the table when it comes to a risk assessment. Instead look to take the best of CIP and NIST in order to provide better protection for control systems. Field devices are going to need minimal amount of protection. But there is a basic level of protection regardless.
- Internal threat profiles are frequently overlooked in many risk assessment discussions.
- We should use a consequence-based assessment- what is the consequence of comprising and taking over the system vs. just knocking the system down.
- Threat- many people believe government has good threat information. But it really isn't there or if it is, it is only available for short term (vs. longer term).
- In the risk equation, throw threat out otherwise it drives the risk lower. Never will get the granularity you want.
- For the industry the threat/risk is sanctions. Our vulnerability is unclear. Potential to separate the critical asset assessment from the standard itself.
- What is the vulnerability of BES from any asset we control. Drive down to risk assessment- do we employ a graded-mitigation model? With a high risk, there will be a higher level of mitigation. Not a proponent of low-level mitigation.
- Missing vulnerability information related to our assets. No model in place for determining the effect of the loss of a given asset. E.g. that component has the following vulnerability.
- Have to take the vendor's assessment of that.
- Concern about the quality of the vendor companies for the assessment. National labs available to do this. Get additional funding not just from the industry.
- Develop a national security assessment model?
- Is exclusion of vendors from the standards development a problem?

- Threat and vulnerability- last posted draft of the CIPC- "threat and vulnerabilities" are going to exist. Becomes an impact analysis for the reliability or operability of the BES. Risk based assessment method- does an asset if destroyed impact the reliability of the BES.
- Threat and vulnerability should be irrelevant. Impact analysis is what matters and it is what we do best.

4. NIST Guidelines and CIP Standards — Both/And?

- Is there a key difference between guidelines vs. a standard? CIP is already using a lot of the framework. When the industry re-did the CIP standards, it took a risk-based approach. Sees a lot of good points from NIST that could be added to the CIP standards.
- Most valuable aspect of FISMA framework is doing the risk-based approach to whatever asset you are dealing with.
- While it is not easy to implement, it is superior to others e.g. ISA 99.
- Based on the CIP and NIST experience evidence suggested it may be possible to use both standards and controls to help strengthen the CIP.
- NIST is proscriptive to systems applied to. Hardware, software, people and processes.
- Can do things in field you can't do in CIP. Look at like assets. Mitigate risks to assets in a repeatable way.
- CIP is all or nothing. Black or white. CIP standards are more requirements. Put you in a path you may not be able to get out of.
- NERC assessment- Bonneville is self-funded not subject to appropriations. When NERC a non-compliance finding happens, it is taken very seriously. The SDT job is to marry the two approaches together so we are not wasting time, effort and resources.
- The SDT should use the concepts of the framework and not the specifics—that's what the SDT needs to focus on. Industry needs reasonable and achievable controls, giving them options where appropriate.
- Ideally, adopt the best of CIP & NIST. CIP's biggest problem: identification of critical assets. If protection is focused on those items alone, the other assets related to control systems are left potentially vulnerable. A minimal level of protection would be identified if an organization used NIST process. Everything needs some protection; the most essential assets need more protection.
- The NIST standards & FISMA are not focusing efforts from a national perspective; that's a core problem for this industry to look at issues from this viewpoint.
- This approach is valuable because the oversight responsibilities of NERC & the Regions will offer a different perspective than government utilizes for addressing issues of national concern that extend beyond the boundaries of a specific agency/organization.

Day Two SDT Comments

- Every federal system has to meet baseline controls at a minimum
- Concern that CIP didn't meet even minimum baselines compared to NIST

- Determining scope is an application specific issue; preliminary activities are needed regardless of approach. CIP takes more piecemeal approach and then applies all rules to what's been identified.
- NIST is more systems oriented; looks at identify boundaries around important things, then all aspects of each identified information system are managed—things over which you do have control. A risk based decision needs to be made about what will (or should) come across interfaces from outside that environment. Since every component is not equally able to apply controls, there is a more comprehensive approach.
- NIST may not be readily auditable so it will be a challenge to modify that approach for our purposes.
- CIP vs. NIST. Better adapting the best of each to come up something better.
- Flaw of the "critical asset" — cyber is a different animal can get to all assets at the same time (#274 control stations/centers). N-1 method of id critical assets is not good enough.
- NIST- what is electrically important to the grid- armor those assets. But need to provide basic protection for the rest.
- Resources using the NIST framework are ultimately aligned in most effective manner and threats are not (and cannot be) eliminated, but resources can be structured to address the greatest risks.
- NIST only identify information systems not control systems. Need to merge the two. CIP missing some of the NIST components.
- Conformance and compliance works well when you have check box spec system.
- Risk management may be what is needed to be done- but as a standard for compliance. Will be difficult to map up the two.
- Is there another tool to promote risk management other than a compliance approach?

5. Risk Assessment and Resource Implications

- Risk assessment done in federal sector by independent organizations. E.g. Iowa labs. It is an iterative process, like maintenance on car. Annual basis sometimes quarterly. Constant tweaks. Continuous improvement.
- The primary goal of the assessment process is impact analysis.
- We know the assets we need to protect. Are we mitigating the right risk for the right asset. Most valuable threat info (comes best from locally).
- It might be useful for INL or similar group to develop a risk assessment model for the industry, specifying what requirements actually are mandatory.
- In Florida, came up with "Risk = Impact divided by level of effort to accomplish the bad deed." From there they graded the risk levels of different deeds. A ratio (picked 1.0 threshold below which standard protection). Kept applying assets and compensation measures until risks went low. Critical assets review- risk assessment methodology.
- Risk assessment- grading security to the assets we have to take care of. Not sure how it has to work, but there is got to be a way to do it.

- Risk management and conformance – if outcome based standards with a risk management approach you can build a conformance model around that. Not always mutually exclusive.
- If the risk assessment framework were adopted, would it be a significant resource burden on the industry? Yes, it does take lots of resources to go through the FISMA exercise. CIP is narrower applying only to critical asset and cyber asset.

6. Component-Based Systems Approach

- Does a systems based approach vs. a component-based approach make any difference? More risks with certain components. Not adding or getting out of anything by using the NIST standards. Could probably modify the framework to deal with critical components.
- The SDT can modify anything in the NIST if it accurately assesses the risk of each component across and within the system.
- Component based vs. system based? Take the framework concepts and not the literal framework, we might have the opportunity to focus on what really needs protection. Give the industry appropriate, reasonable and achievable control and where they are given the options. This may present a challenge for auditors and the auditing process, but this may be the right step to take for the industry.
- The control system mechanism requires protection. Limiting the focus to "critical assets" necessarily overlooks areas of the control system that are essential but miss the target for receiving protection.

7. IT and Control Systems

- The overall issue is conventional IT vs. control systems. Before interconnection, no problems
- Opportunity: continue treating control systems as special, and build accordingly
- Alternative: emphasize reliability & resiliency, w/ chance to lead industry:
- The conventional IT environment has been geared to accept occasional outages as a cost of doing business, but that approach is not acceptable for control systems
- There is a "corporate IT" and "power system IT"; effective management and change control

8. Levels of Risk- “One Size Fits All”? NIST and CIP

- The fundamental problem with CIP that the SDT should address is the one size fits all in terms of critical cyber asset. There isn’t the high, medium low judgment made in the NIST framework. It will be important for the industry to invest money and staff into focusing in on most important (i.e. high).
- Don’t throw the CIP standards out and plug NIST in wouldn’t work. Because it comes from a IT background not from a power plant control systems and control centers. What constitutes a cyber threat pushed out to specific equipment. Gap needs to be addressed in NIST and one size fits all in CIP needs to be addressed.
- The CIP standards effort tried to make it work otherwise. Don’t need to throw all out the CIPs to address levels of compliance or types of equipment.

- We need lots of works on levels, controls. Try to preserve the industry investment made while making our existing framework better.
- Auditors may need to consider "appropriateness", perhaps. The current approach of CIP standards w/ all or none/one size fits all is not working.

9. Compliance and Audit Concerns

- In a compliance environment, more prescriptive directions for the NIST framework may be needed to facilitate auditing.
- FISMA and NERC amount of penalty associated with NERC standard. Doesn't exist in NIST framework. Compliance environment with flexibility-
- SDT members offered to continue to lend the Federal lessons learned from implementing NIST and surviving numerous audits to the SDT. It has been an eye opening experience.
- Some federal entities are not subject to NERC sanctions, but there are implicit sanctions for them—appropriations lacking, or rate payers who are subject to the penalties for entities that are self supporting.
- Auditing community needs re-educated; they're typically in a checklist mentality because of other NERC Standards. Without the technical knowledge, they can't adequately determine whether efforts adequately address potential vulnerabilities in the cyber area.
- Conformance & compliance work well w/ a specific standard (pass/fail checklist); for cyber security. If risk management is the approach, another tool is needed besides conformance to compliance.
- What's needed isn't a "culture of compliance"; what's needed is a "culture of security."
- NIST standards are not unlike others and audits are possible.
- FERC is concerned about the quality of what an entity does; it's not just checking off an item on a list.
- On audit issue, whichever route we take, the biggest culture change will be in the auditor community. Checklist mentality. Cyber requires analysis of what have you done. If they don't have technical knowledge or working with that mindset.
- "Defense in depth"- filtering wall, firewall have BS. Can have those all and not have a secure architecture.

C. Risk Management- Key Concepts and Questions

The facilitators asked Kevin Perry to draft some strawman statements and questions to serve as a strawman for the SDT's consideration. He introduced the statements noting it provides an overview of the statement of the current methodology a problem statement for the SDT's consideration followed by 8 critical questions regarding risk management.

1. The Current "Consequence-based" Assessment Methodology Draft Statement:

The industry focuses on the facility (asset), employing a "consequences-based" assessment methodology to determine if the facility is essential to the reliable operation of the bulk electric system:

- Those that are essential are declared to be Critical Assets.
- We then determine the Cyber Assets essential to the operation of the identified Critical Asset and those become subject to the CIP standards to the exclusion of pretty much all else.

Acceptability Ranking Scale	***4 =** acceptable, I agree*	***3 =** acceptable, I agree with minor reservations*	***2 =** not acceptable unless major reservations addressed*	***1 =** not acceptable*	***Avg.***
12-5 rank	**16** (13 + 3)	**0**	**2**	**0**	**3.9 of 4**

Comments before ranking

- Review of current process for assessing critical assets & corresponding CCAs.
- Focus on critical facilities/assets begs the issue of dynamic systems (e.g., flowgates)
- Industry could easily be "cherry picking" what they want to protect—the systems, related cyber systems. As a result, quality of review may vary
- An ESP doesn't address trusted path that crosses it (e.g., VPNs). A potentially vulnerable/out-of-scope system then has unrestricted access inside the perimeter.
- "All or nothing": there are no gray areas; a system either has to follow all CIP requirement or none.
- The "as is" statement describing the current methodology isn't accurate; by saying that non-critical assets are exempt from CIP Standards in the current scenario overlooks processes and activities that some have used to address situations such as those used in the example.
- The statement is accurately describing the situation that currently exists.
- The team needs to develop standards that can be audited against; there are various ways to accomplish that. The CIPC effort to develop guidelines for identifying critical assets has generated a lot of comments & won't be finalized for several months. However, whatever we create needs to align with the guidelines or vice versa.

Comments after ranking

- **2=** Don't agree with statement. CIP standards isn't a system approach. However don't see that CIP excludes a systems approach. Took an assets.
- 2= concern about the phrase "to the exclusion of pretty much everything else."
- Reason focus is on the critical assets is because NERC charge to deal with BES. Make sure all critical assets protected. This statement can't be right if we really think about what NERC's charge is.
- Standards say we can exclude. Drawing the line not in CIP. We exclude them from the CIP standards. Only requirement for maintenance. Logging at access point.

2. A Draft Problem Statement with the "Consequences-Based" Assessment Methodology

Kevin Perry presented the following problem statement as a strawman for the SDT's review and consideration.

The problem presented with this approach is that:

(a) Given the dynamic nature of the transmission system, assets that are critical today might not be tomorrow, and vice versa.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
12-5 SDT rank	**16** *(14 + 2)*	**5** *(2 + 3)*	**0**	**0**	**3.8 of 4**

SDT Comments

- None

(b) The industry may be "cherry-picking" the Cyber Assets to be protected, along with any collateral Cyber Assets that happen to be connected to the same network segment.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
12-5 SDT rank	**9** *(6 + 3)*	**5** *(3 + 2)*	**5** *(5 + 0)*	**1**	**3.1 of 4**

SDT Comments

- Not related to this approach- accept gaming is part of the deal and move on.
- Not a problem statement for standards. This is part of implementation statement for the solutions.
- This implies industry is dishonest in "cherry picking." Not necessarily the case.
- Should delete or reword this as a part of the problem statement.
- The "cherry picking" issue isn't primarily driven by a desire to not protect systems, but to make them exempt from CIP because of sanction issues

- **2nd Draft E.g. (b) Some in the industry may be ~~"cherry-picking"~~ selecting the Cyber Assets to be protected, along with any collateral Cyber Assets that happen to be connected to the same network segment based on economic vs. security considerations.**

(c) The approach excludes all other Cyber Assets, including Cyber Assets that may provide essential data to the Critical Cyber Assets or may have a trusted relationship (communications path) that could be exploited as an attack vector.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
12-5 SDT rank	**5 + 1**	**6 + 2**	**2 + 1**	**1**	

SDT Comments

- Doesn't necessarily exclude. This is matter of interpretation.

(d) Once a Cyber Asset is identified as either a Critical Cyber Asset or collateral Cyber Asset within the Electronic Security Perimeter, all of the requirements of the CIP Cyber Security Standards apply, regardless of the specific Cyber Asset's importance to the reliable operation of the Bulk Electric System.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
12-5 SDT rank	**17 *(13+4)***	**1**	**0**	**1**	**3.8 of 4**

SDT Comments

- When ever you have a perimeter, it is protecting your assets.
- Is this a problem
- Other issues to consider: are we addressing facilities? What are "systems"?
- Focus perhaps should be on functions vs. assets.
- The current approach focuses too much on "how we affect the national grid"; instead, entities should be looking at their own mission—what do they need to do to protect themselves? The result of that effort would lead to protection of the BES, in a manner more inclusive than the current approach. Using the national grid as the criteria allows too many loopholes to applying the standards.
- The definition of "critical assets" needs to be limited to physical assets. By bringing in the logical components would increase the complexity of identifying critical assets in another context (e.g., physical protection standards that might be developed in the future).
- These standards shouldn't be focused on Critical Assets; the cyber issues ought to be the priority.
- The SDT shouldn't overlook the interest shown by Congress, and the promise to take action if industry doesn't respond in a timely or adequate manner. The input to the NOPR by a couple members of the committee was historic and unprecedented. The SDT needs to take that issue seriously.
- The focus is cyber security engineering, not electrical engineering.
- Is the current definition of "cyber asset" in the Glossary accurate & acceptable?
- Kevin Perry sent this to members over night: Definition of Computer System and Control System
- Definition of Computer System (http://www.webopedia.com/TERM/C/computer_system.html):
- "A complete, working computer. The computer system includes not only the computer, but also any software and peripheral devices that are necessary to make the computer function. Every computer system, for example, requires an operating system.
- Definition of Control System (DHS Catalog of Control Systems Security: Recommendations for Standards Developers): 'A set of hardware and software acting in concert that manage the behavior of other devices."

- Maybe can be added to the glossary and added to the definition of Cyber Asset. For example: Cyber assets include Computer Systems, Control Systems, programmable electronic devices, and communication networks including hardware, software, and data.
- Current NERC Glossary definition of Cyber Asset: "Programmable electronic devices and communication networks including hardware, software, and data.") His concern: the focus is on "the box", and an integrated system may not adequately be addressed.
- The existing taxonomy resulted from the historic focus on power engineering & bulk electric system reliability. Otherwise, a bottom-up approach would result in application of the standards to areas outside FERC's jurisdiction: market systems, etc.
- Be clear about "cyber asset" definition (e.g., data?).
- Don't overlook who our audience is.

D. Risk Management and CIP 002

1. CIP 002 Goal

The discussion regarding risk management led to a discussion and testing of a goal statement for CIP 002.

SDT Comments before Ranking

- What are we trying to accomplish w/ CIP-002? What is it's intent/end goal? The intended outcome?
- One possible answer: It's to identify cyber assets that need to be protected (& to what level—Mike Winters)
- What is the best way to identify those cyber assets/the best way to get there? [e.g. FDIC approach]
- By focusing on these two questions, we address the real needs and also satisfy the outcome focus that Mike Assante described this morning.
- The existing taxonomy resulted from the historic focus on power engineering & bulk electric system reliability. Otherwise, a bottom-up approach would result in application of the standards to areas outside FERC's jurisdiction: market systems, etc.
- Be clear about "cyber asset" definition (e.g., data?).
- Also critical to be considered is compromise of assets vs. loss of assets. An instance of malicious compromise of assets might be more damaging than its loss.
- The SDT shouldn't overlook who our audience is.
- Disparity between use of terms "bulk power" and "bulk electric?" The definition in FERC Order 693 clarifies that.
- "Dueling risk assessments." Id critical assets, then cyber. Risk of compliance second. Avoid that. Need is protection of system not just compliance.
- Understandable enough to see real goal is protection and compliance is a side effect not a goal.

The following CIP 002 goal statement was offered for ranking:

The goal/intended outcome of CIP 002 to identify the Cyber Assets (i.e. Programmable electronic devices and communication networks including hardware, software, and data, NERC Glossary) that need to be protected and to identify the level of protection.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
12-5 rank	**16** *(15 +1)*	**4** *(3 +1)*	**0**	**0**	**3.8 of 4**

SDT Comments after Ranking

- Minor Concerns: Some felt that CIP 003 should only identify the CCAs but not go into the level of production.
- The SDT's key task is to identify what is the best way to get there.

2. What Should be the Framework for an Inventory of Cyber Assets?

SDT Discussion Points

a. Overall

- Key questions:
  - Are we getting to the inventory level we need to do under CIP's?
  - How do we set up a process that removes as much as possible that are not essential or critical?
  - How do we conduct the inventory?
  - What is the scope necessary for considering the protection of the infrastructure? To what level do we have to protect our "lifestyle"? (goes to SDT)
- Perhaps have entity initially catalog the cyber assets they use to support environment, then look at those assets from the perspective of how their loss, compromise, etc. would impact the BES
- Mindset problem in industry- interconnectivity and solve problem by changing. This go beyond communication and education.
- CIP 002 how do we apply the inventory framework. How well does it apply in that setting?
- Support the need for inventorying your assets. When you are identifying cyber asset using to control your generation, transmission, coordination centers. "Need to look at who is talking to me."
- Got to do inventory. How you do it is another issue. From a system point. Put arms around the outer limits. There was a clear concept with the first drafting team. We have to acknowledge that you have to know what you have in order to know what and how to protect. In future more routable protocols will produce more attack vectors.

- This is an engineering problem- critical asset facilities, applying engineering principles. Cyber security is not a physics problem. Can't apply the same principles. Developed a risk assessment methodology for 2 control centers. I.d. the 7 filtering criteria for determining the critical cyber asset. Easier today CMBB/ ITELL allow you to do the inventory.
- Will that approach address FERC's concerns?
- Concerns about "cherry picking" that removes things in the purview of CIP. Don't want in there simply because the sanctions threat. Whether this is the purview of NERC or not with the logging process. We do this now at a very high level. If someone can conclude that you can leave off your control system, that is just plain wrong.
- President Sergel's testimony: Characterized CCA as a priority-setting process. However it appears that entities in the industry are using it to identify what is in scope.
- Agreement that there needs to be a risk framework from a control system perspective.

b. Inside-Out Approach

- Good idea to use "inside out" approach
- Identify assets according to the areas they impact
- Go from the inside view inventory and get up. Then how to get auditable compliance. Not lots of confidence there are other options to test.
- Initial focus on cyber systems is logical and valuable. However law on BES vs. BPS differ; BPS is more expansive
- Would this approach lead to very few individual assets that actually would be covered by standard?

c. Systems View

- Needs to be viewed from aggregated view of systems
- What should the system look like- what is the vision?
- Need to know what's there; i.e., inventory
- There are systems that seem obviously critical from a common sense perspective, but fail to appear on lists; the risk assessment process is broken. An electrical engineering point of view is not working
- Mis-configuration is a major problem- systems management on configuration. Problem may be in the field organizations not in the data centers. Supports the idea of taking inventory. Find where it is. What is the outer limit of the system we are operating.
- There are many systems that are used for non-BES processes that would muddy the
- Critical to consider cyber systems and impact on other systems.
- Should market systems be covered by CIP? Taking information and sending instructions.

d. Protection Model

- If we were to devise an approach of a "protection model" that fit with the engineers' mindset, it might be a better way to reach them, teach them and satisfy the needs.
- Industry at large- understand operations thoroughly. Down to an art. Others know how to plan things, same tools with different models. What we don't have, is a protection model. We can use the same tools with a different set of models to figure out what we need to protect.

e. Scope

- If we start inventorying cyber assets- everything in north American grid with a chip in it? If you do at that level, you will have few cyber assets. We have to bump this up to a system level vs. a cyber assets level. Define and do it at that level. Need to look at aggregated points of control.
- Critical asset- 2 things. Protection critical to electric sector and then cyber security.
- Why should we inventory everything initially? Lot of systems that don't and won't have an impact on the BES.
- At what level do we assess what is on our inventory? Individual asset level or a system.
- Clarify what is the scale of inventory- not implying we don't need to do. Not ESO but ERO, write reliability standards.
- Not every cyber system is under the tent. Need to define the filtering what is important/not importance (FERC wide span of control etc.)

f. What Assets Included?

- Not necessarily everything in data center would be included
- Pure, raw, means of production are the key assets to be managed (also the approach original drafting team followed)
- IP-based assets are going to increase
- Problem is not data centers, but field organizations
- Need to protect the control system mechanisms.
- "Criticality of equipment"-- prioritizing how we go after the issue.
- Take an inventory; find where things are, what's the outer limits of systems that are operating
- One device in the substation that can't talk to anyone else will still need protection.
- Even if it's painful, it needs to be done
- Can't do anything unless you have an inventory- boxes and connections.
- Problem with going out and finding all assets- shouldn't be dealing with things outside those critical to the BES. To what level is it required. Identify a second tier level.
- Identifying negative potential impacts of software. The more subtle the error implemented, is a higher impact than a blue screen. Methodology to protect against.

g. Real World Examples

- Real world examples demonstrate the need for inventorying assets, better controlling systems & understanding dependencies. Better defined guidance for priorities is essential
- Similar approach for guidance for the AMI security task force. Domain based analysis. Attacker may go for something trivial vs. valuable and then hop-over. Draw domain around things. Use tools to define domain.
- Three legs of security- "availability" is the third leg. E.g. Southern-- Nuclear plant had an incident. Software on a business network. Communication. Engineer installing update on business system, didn't know it would affect the other system. Fixed.
- Look at incidents at Duke a few years ago. In the Florida incident, can't get a clear line of whether distribution or generation as the source of the threat.

h. Inventory and Compliance

- CIP 1- came up with an auditable framework. Creative way to make this a system to be auditably compliant. Can't model malicious control. PSSC tool leads to gross underestimating of cyber assets. Will have to go to a large set.
- CIP wasn't designed to preclude NIST framework to do your procedures. CIP is the auditable part. That's how the can be utilized and pulled together.
- Manage to compliance vs. cyber assets. N-1 is a part of the problem. Need to tie to something bigger than that. Come up a way to model more than N-1.
- Some of NIST is mandatory. Consider 800 standards. Issue of compliance was dealt with FISMA
- Current auditing in this sector is focused on checklist- dialogue needed- what are you trying to do, what means you have used, how effective. Talked about "quality" of what you did in terms of audit.

3. Draft SDT Inventory Statements

Following the inventory discussion, one member proposed testing SDT support for the following inventory statement:

a. Draft Inventory Statement

Inventory your cyber assets directly related to the operation of your registered NERC functionality:

- Apply a risk methodology to assign a level.
- Apply distinct controls according to the level.
- Inventory for each cyber asset should be: device + o's + function + firmware level.
- These attachments will be critical for patch management and CIP 007R1 testing.

Acceptability	*4 = acceptable, I*	*3 = acceptable, I agree with*	*2 = not acceptable unless major*	*1 = not*	*Avg.*

Ranking Scale	*agree*	*minor reservations*	*reservations addressed*	*acceptable*	
12-6 rank	**2** *(1 + 1)*	**6** *(3 + 3)*	**8** *(7 + 1)*	**4** *(4 + 0)*	**2.3 of 4**

Comments from SDT members finding the statement unacceptable or with major reservations:

- SDT member suggested that the above does not take into consideration of the reliability of the BES sufficiently.
- Need to start with Critical Assets, not devices.
- The starting point of the inventory was too broad; there may be a way of identifying the functions of the devices and including only some, but not all.
- Another member believed that the only important considerations should be only identification of the devices and the function of the devices;
- Add a new bullet that addresses the interconnection of the devices.
- FERC staff stated that the above approach moved in the right direction along with a way to identify other systems such as market systems where appropriate.

b. Draft Inventory Systems Statement

Following the first statement discussion, another SDT member proposed testing support for the following inventory statement:

> **Identify the applications and computer systems within the Industry Controls Systems or information systems as well as the networks within and interfacing with the ICS. The focus should be on systems rather than devices, and should include PLCs, DCS, SCADA, and instrument bases systems that use a monitoring device such as an HMI.**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
12-6 rank	**0**	**9**	**6**	**5**	**2.2 of 4**

Comments from SDT members finding the statement unacceptable or with major reservations:

- One SDT member believes that lack of specifying impact on the BES or BPS made the above unacceptable.
- the bottom up approach is not an acceptable approach.
- Another member believed that the impact profile of the entity should be considered in order for any proposal to be thorough.
- In response to an SDT member question, FERC staff stated that they have no limiting agenda. FERC through its order indicated it wants all of the systems protected to some degree and they like the framework that allows the entities to properly protect the systems as opposed to the CIP systems which are black and white. Under CIP if an asset is not designated as 'Critical' under the current regulations, no security or protection is required. FERC finds this approach lacking. However, FERC staff agreed that not everything should be protected to

the highest level. The assets that really are important should be protected at the highest level; however, nothing should be ignored.

SDT Discussion Points

- Start with a more inclusive view of all these devices. 002-R3 called out now some devices. Attack vectors.
- General concept of inventory of the devices- what are the appropriate filters.
- If we are called to testify- can we respond that our standards process is ensuring we are protecting the BES.
- Why are we here? Because there is inadequate IT life cycle management and power system IT--fragmented within. Are we good stewards of our company's assets and devices used?
- Everything should be inventoried- in corporate IT or power system IT. Reluctant to use IT but call it power system IT. Inadequate change management and loss of control
- Do it by design and explicit management decision. Doing a little bit of "greenfield design" here. Look at all cyber assets. Now with your full inventory.
- "It is all" IT 101- need to know what you are managing in your Skada.

E. Phase II Going Forward Proposal

Following the lunch break, the chair announced that Jackie Collett and William Winters had agreed to draft two "straw" documents to help move the Team forward on the Phase 2:

- Jackie Collett will start from an attempt to protect the best of what exists with the current CIP and incorporate NIST concepts/features.
- William Winters will start with the NIST framework and incorporate the best of the CIP into it.

SDT Advice to the Team Authors

- Authors agree to post to the SDT list
- Produce a workflow chart- business process management flow. Inputs/ outputs.
- Be as visual as possible
- All should read the House Committee's comments on FERC NOPR for CIP standards *(See Appendix #10)*

V. NEXT STEPS AND EVALUATION

A. SDT/NERC Phase 1 Webinar — December 16, 2008

NERC staff presented some information and the SDT discussed the industry "Webinar" on the Phase I SDT products.

- Time/Date: December 16 from 11:30 until 1 p.m. will be the Webinar on the topic of Phase I version of revised CIP.

- There will be a Standards Committee meeting that date.
- Dave Taylor will ask that the Committee listen to the SDT Phase I Webinar.
- SDT members should mark this date on the calendar.
- NERC will be putting out an press announcement on this next week.

The SDT then discussed the presentations for the Webinar:

- The emphasis should be on why we're doing what we're doing, give presentation and allow questions.
- Provide & explain information from the Phase 1 Comment Form.
- New asset implementation plan needs thorough explanation for industry.
- Mention why Phase I being done to begin with, draw attention to government scrutiny that we're receiving.
- Mention the new Congressional Cybersecurity Caucus that's beginning, point to FERC order requirements. Note why a phased approach was taken by the SDT and why we are proposing to take action now.
- Michael Peters agreed to prepare and provide background information.
- The Chair, Vice Chair and Scott Mix will present.
  - Jeri Brewer- 10 minutes on the Background reasons
  - Scott Mix - Actual Changes
  - Kevin Perry - Technical Feasibility Exception
  - Scott Mix - Schedule (near the end)
  - NIST - framework and how it applies in this scenario
- Note that there will be some Canadian government interest in issue. Need to follow-up needed to determine extent and whether it should be addressed.

B. Review of Phase I Schedule

Dave Taylor reviewed the proposed schedule to complete the Phase I process by the end of June, 2009. He noted the concerns that times are tight but noted the schedule provides very limited flexibility to extend the comment time – if we do so it extends the end of the time line into the middle of July

- *December 16 — 11:30 a.m.–1 p.m., NERC Webinar on Phase 1*
- **January 7–9 SDT Meeting, Phoenix, AZ** ½ / 1/½ day format. Wednesday through Friday
- January 15 WebEx meeting
- January 21 WebEx meeting
- **February 2–4, 2009 Meeting in Phoenix, AZ,** ½ / 1/½ day format. Monday through Wednesday
- **February 18–19, 2009 Meeting in Boulder City, NV**
- February 25, 2009 WebEx meeting
- **March 10–11, 2009 Meeting in Tampa, FL,** 2–day format
- March 18, 2009 WebEx meeting

- **April 14–16, 2009 Meeting in Charlotte NC,** ½ / 1/½ day format. Wednesday through Friday
- March 18, 2009 WebEx meeting
- **May 13–14, 2009 Meeting in Dallas TX,** 2–day format
- June, WebEx meeting
- **June 17–18, SDT Meeting, Location TBD,** 2–day format
- June, WebEx meeting

C. January Meeting Agenda Review

NERC announce that the next meeting will take place in Phoenix at an Arizona Public Service Corporation conference facilities and will be a ½ day/1 day/ ½ day format. The proposed agenda items will include:

- Organizing to review and answer industry comments that have been received on the posting of Revised CIP standards from Phase I
- Finalize the SDT input to the NERC Technical Feasibility Exceptions white paper
- Time permitting, continued discussion of the CIP 002 approach to assets in scope for Phase II reviewing papers from Jackie Collett and William Winters.

D. SDT Meeting Evaluation — *What Worked and What Could Be Improved* ?

At the conclusion of the meeting, the facilitators asked the Team to offer an evaluation of the process including what worked well during the meeting and what could be improved.

What worked?

- Meeting in Washington, DC and exposure to Congressional perspective
- Appreciated being tagged onto the NERC CIPC meeting to allow others to participate as well as participation by NIST, Congressional committee member, etc.
- Good sound system.
- Appreciated the debate and the breadth of wisdom knowledge on the team.

What could be improved?

- Appreciate everyone have a chance to voice decisions. However sometimes we are saying the same things and repeating thoughts. Facilitators should try to close off open-ended discussion more quickly and move forward towards resolution.
- Place flip charts higher.

Meeting adjourned at 2:15 p.m. on Friday afternoon.

Appendix # 1 — Meeting Agenda
Washington, D.C. 20005

Thursday, December 4, Day One Agenda

1. 8:00 Opening Remarks - Jeri Domingo-Brewer, Chair & Kevin Perry, Vice Chair
   a. Welcome — announcements, logistics
   b. NERC Antitrust Compliance Guideline
   c. FSU/CRC review of last meeting and adoption of November 12–14 meeting summary
2. 8:15 SDT Organizational Issues: Review of Adopted Consensus Procedures
3. 8:30 NERC Presentation and Discussion of Phase I Communications Plan
4. 9:00 Technical Feasibility Strawman, Review and Refinement
5. 10:00 Break
6. 10:15 Technical Feasibility Strawman, Review and Refinement
7. 12:00 Lunch — working (return to meeting at 12:45PM ET)
8. 12:45 Summary of Phase II Concept- Next Steps
9. 1:15 Potential Application of NIST to CIP-Background Briefing and Discussion
10. 3:00 Stretch Break
11. 3:15 Risk Management — Conceptual Approach
12. 5:00 Recess

Friday, December 5, Day Two Agenda

13. 8:00 Opening, Review of Day One Results and Day Two Agenda — Jeri Domingo-Brewer, Chair & Kevin Perry, Vice Chair
14. 815 SDT Organizational Issues *(TBD)*
15. 8:30 Review and Further Refinement of Technical Feasibility Draft
16. 10:30 BREAK
17. 10:45 Final Review and Adoption of Technical Feasibility Draft
18. 11:15 Continue Review of Risk Management Approach, NIST and CIP 002-009 — Approach
19. 12:00 Lunch — working (return to meeting at 12:45 p.m. ET)
20. 12:45 Implications from Risk Management Discussion for CIP 002
21. 2:30 Review of meeting schedule and drafting assignments
22. 2:45 Next Steps and Evaluation
23. 3:00 Adjourn

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix # 2

Project 2008-06 Cyber Security for Order 706 SDT Attendees List

Washington D.C.
December 4–5, 2008

Attending in Person — SDT Members

1 **Jeri Domingo-Brewer, Chair**	U.S. Bureau of Reclamation
2. Jackie Collett	Manitoba Hydro
3. Jay S. Cribb	Information Security Analyst, Principal, Southern Company Services, Inc.
4. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co. *(Dec 4, in room, Dec 5 on phone)*
5. Sharon Edwards	Project Manager, Duke Energy
6. Tom Hoffstetter	Midwest ISO, Inc
5. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp. *(in room Dec 4, by phone Dec 5)*
6. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
7. Richard Kinas	Orlando Utilities Commission
8. John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
9. David Norton	Policy Consultant, CIPEnergy Corporation
10. **Kevin B. Perry, Vice Chair**	Director, IT-Infrastructure, Southwest Power Pool
11. Christopher A. Peters	ICF International
12. David S. Revill	Georgia Transmission Corporation
13. Scott Rosenberger	Luminant Energy
14. Keith Stouffer	National Institute of Standards & Technology
15. John D. Varnell	Technology Director, Tenaska Power Services Co.
16. William Winters	Hydro One Networks, Inc.
1. Roger Lampilla	NERC
2. David Taylor	NERC
3. Scott R. Mix	NERC
4. Todd Thompson	NERC
5. Kelly Ziegler	NERC, *Dec 4*
6. Mike Assante	NERC, *Dec 4*
7. Robert Jones	FSU/FCRC Consensus Center
8. Stuart Langton	FSU/FCRC Consensus Center
9. Joe Bucciero	Bucciero Consulting LLC

SDT Members Attending via WebEx and Phone

1.Phillip Huff	Arkansas Electric Coop Corporation
2.Kevin Sherlin	Sacramento Municipal Utility District *(Day 2)*
3. Bryan Singer	Kenexis Consulting Corp.
4.Jonathan Stanford	Bonneville Power Administration
5.Michael Winters	Hydro One

Attending — Participants *(in person and by phone and WebEx)*

Chuck Abell	Ameren *(in room Dec 4, on phone Dec 5)*

Joseph Baxter	Associated Electrical *(by phone Dec 5)*
Jim Brenton	ERCOT *(in room Dec 4 and Dec 5)*
Markus Braewole	ABB *(by phone Dec 4)*
Steve Breziwa	WAPA *(by phone Dec 4 and Dec 5)*
Mike Fischette	Lansing Board of Water and Light *(by phone Dec 4)*
Jerome Farqumarson	Burns and McDowell Engineering *(in room Dec 4 and Dec 5)*
Brian Harrel,	SERC Reliability *(by phone Dec 4 and Dec 5)*
Darren Highfill	EnerNex Corporation *(in room Dec 4, on phone Dec 5)*
Steve McElwee	PJM *(In room Dec 4, by phone Dec 5)*
William McEvoy	Northern Utilities, *(In room Dec 4)*
Austin Montgomery	Salisbury Institute, CMU *(in room Dec 4, on phone Dec 5)*
Mike Peters	FERC (*in room Dec 4 and Dec 5)*
Matt Schnell	Nebraska Public Power District *(Dec 5 on phone)*
Mark Simon	Encari, *(by phone Dec 4)*
Michael Toeaker	Burns and McDowell Engineering *(by phone Dec 4 and Dec 5)*
Karen Yoder	First Energy *(by phone Dec 4 and Dec 5)*

Appendix # 3
NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that
violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely
impact competition. Decisions and actions by NERC (including its committees and

subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 4

Below is a link to all of the documents reviewed by the SDT 706 Team during the full Team discussions in Washington D.C. as well as Phase 1 SDT Products:

http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security-RF.html

Appendix # 5 — SDT Consensus Guidelines

Adopted Unanimously, November 13, 2008

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

General consensus is a participatory process whereby, on matters of substance, the members strive for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for the final package of recommended revisions, and the Team finds that 100% acceptance or support of the members present is not achievable, final consensus recommendations will require at least 75% favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing consensus throughout the process on substantive issues with the participation of all members. In instances where the Team finds that even 75% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team.

The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Team members, NERC staff and facilitators will be the only participants seated at the table. Only Team members may participate in consensus ranking or vote on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Facilitator and all written comments submitted on the comment forms will be included in the Team and facilitators' summary reports.

The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 51% of the appointed members being present (simple majority). The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure),* as modified by the Team's adopted procedural guidelines, to make and approve motions; however, the 75% supermajority voting requirement will supercede the normal voting requirements used in Robert's Rules of Order for decision making on substantive motions and amendments to motions. In addition, the Council will utilize their adopted meeting guidelines for conduct during meetings. The Council will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

The presiding chair and/or Facilitator of the SDT, in general, should use parliamentary procedures set forth in Robert's Rules of Order, as modified by Council's adopted procedural guidelines.

To enhance the possibility of constructive discussions as members educate themselves on the issues and engage in consensus-building, members agree to refrain from public statements that may prejudge the outcome of the Team's consensus process. In discussing the Team process with the media, members agree to be careful to present only their own views and not the views or statements of other participants and/or may direct such inquiries to the Team Chair and Vice Chair. In addition, in order to provide balance to the Team process, members agree to represent and consult with their stakeholder interest group.

Meeting Guidelines for Participants

Participants' role in meetings:

- Explore possibilities
- Listen to understand (Respect) (limit sidebar conversations)
- Be focused and concise. (Avoid repetition. No need to offer comments in "strong agreement.")
- Focus on issues, not personalities.
- Offer options to address others' concerns.
- No sidebars.
- If participating by phone, indicate who is speaking.
- If participating by phone, please use the mute button. **Do not** put the phone on hold.

Facilitators/Staff role in meetings:

- Assist the Chair and Vice Chair in helping the Team stay on task
- Help the group follow agreed upon ground rules
- Design the meeting and problem solving process in consultation with the Chair and Vice Chair
- Facilitate discussion participation of the Team and other participants
- Prepare agenda packets and reports

Consensus Building Techniques

- **Brainstorming** (green light thinking – not judgmental) At certain points, the facilitator may ask the group to suspend judgment and get ideas onto the table before debating.

- **Name Stacking in Team Discussions** (use of name tents to seek attention)

- **Acceptability Consensus Ranking Scale**
  - Use a consensus acceptability scale to help focus discussion and test support in reviewing substantive issues.

- Use to guide and focus discussion and as a poll to see where the Team stands, not used as a voting mechanism.
- Must be prepared to offer refinements and suggestions to address serious concerns.

4 = Proposal is acceptable as it is
3 = Proposal is acceptable; I can live with it but there are minor concerns to address
2 = Proposal is not acceptable. Proposal may be acceptable if the major concerns are addressed
1 = Proposal is not acceptable

- **Consensus Ranking Scale**
  4. Comfortable—I support proposal as is ♥♥♥♥
  3. Minor Reservations— I can live with this; but would like to see changes as follows♥♥♥ Be prepared to offer specific refinements or changes to address your concerns.
  2. Major Reservations—I can't support this unless following changes are addressed to meet my serious concerns ♥♥ Be prepared to offer specific refinements or changes to address your concerns.
  1. Fatal Flaws—I can't support this ♥ Be prepared to offer alternatives and options that would address your own as well as other's concerns.

- **Robert's Rules of Order and Facilitated Consensus Building Procedures**

The Council will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

Appendix #6
Technical Feasibility Framework White Paper, Scott Mix, NERC
December 5, 2008
Objective, Purpose, Executive Summary, and Background

The purpose of this whitepaper is to describe a proposed framework to address the Technical Feasibility exception provisions introduced in the cyber security standards (CIP-002-1 through CIP-009-1).

The proposed Technical Feasibility Exception process is modeled after the existing Self-report of Non-Compliance with Mitigation Plan process. These similarities are beneficial because it is anticipated that this Technical Feasibility process will be administered by the same staff at both the Regional Entity and ERO.

Definition of Technical Feasibility Exception:
A Technical Feasibility Exception (TFE) may arise when compliance with a requirement or sub-requirement under a CIP Reliability Standard is not technically possible, technically safe or operationally reasonable given the responsible entity's environment. A TFE may be invoked by a Responsible Entity only on a case-by-case basis within the Technical Feasibility Framework.

Application:
A Responsible Entity may invoke a Technical Feasibility Exception (TFE) to a NERC Reliability Standard requirement only where explicitly allowed by the language of a specific standard requirement or sub-requirement. Entities may file a Self-Report of Non-Compliance in cases (1) where they cannot meet the requirements specified in the Reliability Standard and no allowance for a TFE is requested or (2) where the TFE process requirements cannot be met (see FERC Order 706 paragraph 160).

Overview of Essential Elements:
Each TFE request must contain the following essential elements, as described in FERC Order 706, paragraph 222:

- Document mitigation steps.
- Document a remediation plan.
- Document a timeline for eliminating the use of the TFE unless appropriate justification otherwise is provided.
- Provide regular review of whether it continues to be necessary to invoke the exception.
- Document internal approval by the Senior Manager.
- **Document wide-area approval through the ERO's audit process.**

Additionally, the TFE process requires cooperation with the ERO to provide FERC with high-level, wide-area analysis regarding the effects of the TFE on the reliability of the Bulk Electric System. In other words, where a TFE is requested, the impact on interconnected assets must be considered in the development of a remediation plan. This may require coordination with one or more Responsible Entities prior to submission for approval.

In addition to the FERC-directed elements, the following steps are proposed:

- The request must reference the NERC standard and requirement for which the TFE is being requested.
- The "regular" review will be an annual review by the Responsible Entity, Regional Entity, and ERO.
- To facilitate cataloging and tracking, each TFE will be assigned a unique identifier by the Regional Entity that initially receives the TFE, during its review process.

Detailed TFE Process:
The TFE process described herein is based on the existing NERC Compliance Self-Report of Non-Compliance to a Reliability Standard. Each of the essential elements of a TFE report is described below.

The following elements are the responsibility of the Responsible Entity requesting the TFE:

- **Document the exception**
  Each TFE request must reference the specific NERC Reliability Standard requirements or sub-requirements for which the TFE is being requested[1].

  Each TFE request must include a description of the equipment, process, or procedure that prevents the entity from meeting the requirement and explain the reason for the inability to meet the requirement. The justification should focus on the impact to reliability that will result if the requirement cannot be met. Also included in this explanation may be a discussion of the impact of not complying with the requirement, or the impact of improperly literally complying with the requirement. This explanation may also discuss how other factors impact the TFE

[1] It is anticipated that future limitations on where TFEs may be implemented. These limitations will be implemented through modifications to the language of the standards. However, the immediate need for the TFE process requires that the process be developed in advance of these modifications. This proposed process can be implemented in a "field test" environment to allow the future specification of where TFEs may be requested, leading to modifications of the standards language during the next review and approval cycle. The determination as to whether specific requirements should be allowed or disallowed will be deferred until that point. These changes must include a discussion of operational and safety concerns, as discussed in FERC Order 706, paragraphs 178 and 182.

request, such as scarce technical resources, funding availability, equipment availability, etc.

A single TFE request may be associated with multiple equipment instances that share a common issue with regard to the request for the TFE. The issues, situations, mitigations and timelines associated with the TFE are assumed to be similar, and the approval process and impact analysis is expected to be the same.

- **Document and implement mitigating and/or compensating steps**
  Each TFE request must include a description of what actions the Responsible Entity has taken to mitigate, compensate, or lessen the impact of the vulnerability resulting from not being able to comply with the requirement(s) of the Reliability Standard.

  The Responsible Entity must demonstrate the implementation of the mitigating and/or compensating steps to the Regional Entity or the ERO upon request.

  For example, in standard CIP-005 R2.4, if a TFE is being requested for the lack of "strong procedural or technical controls at the access points to ensure authenticity of the accessing party," a mitigation measure might be to implement additional procedures to log all access attempts, more aggressively monitor those logs for unauthorized access, and provide a rapid response when an unauthorized access attempt is detected. In the same example, a compensating measure might be to install an extra in-line communications device to provide the strong authentication component, and force all access to go through the extra device. For purposes of meeting the intent of the requirement, either (or both) could be acceptable, but the chosen method would need to be documented as a mitigating or compensating measure on the TFE request.

- **Document and implement a remediation plan**
  Each TFE request must include a plan for resolving the issue being requested. The remediation plan may provide an extended (e.g., multi-year) plan, for example, to upgrade equipment to versions that are compliant with the Standards requirement, to allow for contract renegotiations, or to allow for regulatory amendment. Alternatively, the remediation plan may be to implement mitigating and/or compensating measures sufficient to protect the component until the equipment for which the TFE is requested reaches its natural end of life and is replaced with a compliant version of the equipment if such equipment exists at that time.

  The Responsible Entity must demonstrate the implementation of the remediation plan to the Regional Entity or the ERO upon request.

- **Document a timeline for eliminating the use of the TFE unless appropriate justification is provided**

Each TFE request must include, as part of its remediation plan, a timeline for the elimination of the need for the TFE. There are no specific requirements for the timeline: it may be short or multi year; it may be detailed or general. It must, however, effectively communicate the Responsible Entity's commitment to resolving the TFE in a manner consistent with maintaining appropriate cyber security and Bulk Electric System reliability.

In some cases, there is no possibility for eliminating the TFE. For example, providing a completely enclosed boundary around a circuit breaker containing an embedded controller that may be classified as a Critical Cyber Asset is not possible. Also, completing personnel risk assessments prior to providing access to Critical Cyber Assets may not be possible during restoration activities after a natural disaster. In such cases, the timeline cannot include a definite end date; therefore, the timeline discussion must include a justification for not having an end date, in addition to specifying that there is no end date. Note that absent a compelling argument for maintaining the TFE request, the Responsible Entity is expected to become compliant with the Reliability Standard requirement upon replacement of the equipment necessitating the TFE request (see FERC Order 706 paragraph 181).

In cases where there are milestones associated with a timeline, the Responsible Entity must show progress meeting the identified milestones to the Regional Entity or the ERO upon request.

- **Provide regular (annual) internal review of whether it continues to be necessary to maintain the exception**
  Each Responsible Entity requesting a TFE must at least annually provide documentation, subject to an audit, that (1) the TFE remains necessary, (2) all remediation plan steps requested by the TFE remain in place and are effective, and (3) any timeline milestones for the elimination of the TFE are on schedule for successful completion of the remediation plan. The documentation must be provided upon request to the Regional Entity and ERO, subject to audit (see also "Sensitive Information" section below).

- **Document internal approval by the Senior Manager**
  The TFE request must be signed and dated by the Senior Manager[2] appointed per Requirement R2 of *CIP-003-1 – Security Management Controls* (no delegation allowed). The request must indicate that the Senior Manager has read and understands all of the components requested by the TFE. The TFE must be reviewed and approved by the Senior Manager at least annually based on the date of the initial TFE request. The Senior Manager must also review and document the progress the Responsible Entity is making toward completing the remediation plan timeline. All missed milestones must be approved by the Senior Manager and reported through the wide-area approval process described below.

- **Submit TFE to Regional Entity (and subsequently to the ERO)**
  Notice of each TFE, when complete and approved by the Responsible Entity's Senior Manager, must be submitted to the compliance office of the appropriate Regional Entity to catalog.

  In each instance, the Responsible Entity must make available for review the details of the TFE, including background and justification for requesting the TFE. Failure to make the TFE details available upon request to authorized representatives of the Regional Entity or ERO, subject to the protection requirements described below, will result in automatic disapproval of the TFE.

  Note that 'submitted' does not necessarily mean that the full TFE documentation is physically or electronically transmitted to the Regional Entity or ERO; it may mean that only a notice of TFE is transmitted to the Regional Entity and ERO.

  The annual re-approval by the Responsible Entity shall re-submitted to the Regional Entity.

The following elements are the responsibility of Regional Entity and ERO:

- **Receive TFE submissions from Responsible Entities**
  Upon submission of the TFE to the Regional Entity, the Regional Entity shall assign a unique catalog identifier to the TFE for further reference. The Regional Entity will ensure that the TFE submissions are complete, and that sufficient information is included to allow the required approvals and analysis.

[2] The Compliance Monitoring and Enforcement Program (CMEP) refers to the approval entity as a Senior Officer. Since the CIP Standards use the term Senior Manager, it is used here. These individuals may be the same person for a specific Responsible Entity.

- **Annual review of TFE**
  The Regional Entity shall review the resubmitted TFE requests to verify that the re-submitted TFE remains valid. Any resubmitted TFE must be analyzed to determine if the TFE must be reapproved.

- **Document wide-area approval through the ERO's audit process**
  Each TFE will be individually analyzed and evaluated prior to approval by the Regional Entity. This analysis and evaluation will take into account all documented particular circumstances and justifications to ensure that the TFE request is valid, that the mitigating and/or compensating measures are appropriate for the TFE and the mitigating and/or compensating measures address the associated impact to the reliable operations of the Bulk Electric System. Only information included in the TFE request will be analyzed; if additional information is required, the TFE request may be updated by the Responsible Entity during the approval analysis and evaluation process.

  Upon receipt of the notice of TFE, the Regional Entity may need to visit the Responsible Entity to review the details of the TFE request in order to analyze and approve the TFE request.

  Included in the Regional Entity approval process is an analysis of the impact to Bulk Electric System reliability for the TFE request. This may require coordination with one or more Responsible Entities prior to submission for approval in addition to any analysis performed by the Regional Entity.

  Updates to the TFE, specifically including updates to the Responsible Entity's completion of milestones in the remediation plan, must also be submitted to the Regional Entity for wide-area approval through the ERO's audit process. Significant unreported and unapproved deviation from meeting the established remediation plan milestone dates may result in a finding of non-compliance with the requirements of the Reliability Standard (see FERC Order 706 paragraph 160).

  Following approval by the Regional Entity, notice of the TFE must be submitted to the ERO for its cataloging and for input into the wide-area analysis, following a similar process.

  Note that separate approval analyses and evaluations will be conducted by the Regional Entity and the ERO; therefore, the TFE request may need to be updated during each review.

Good Faith efforts
Responsible Entities may assume TFEs submitted in good faith are valid and accepted until rejected during the review process, provided the submitted TFE is technically sound, complete and addresses the exemption. Any preliminary rejection determinations should be investigated to determine if the Responsible Entity could modify and resubmit its TFE request to satisfy the reason for the rejections.

Sensitive Information:
It is recognized that many TFE requests will contain sensitive information that must be protected against disclosure, including information that must be protected from Freedom of Information Act (FOIA) release for certain U.S. Government agencies. The Regional Entities and the ERO will work with the Responsible Entity to minimize the possibility of release, but must have access upon request to the TFE requests in order to carry out their regulatory oversight responsibilities. Similarly, the Regional Entity and the ERO will work with the Responsible Entity to ensure that personnel with proper clearances are assigned to the review. Note that inability to review the TFE request, regardless of reason, may result in the disapproval of the request. Information used in the TFE approval and analysis process shall be protected pursuant to NERC's Rules of Procedure section 1500.

As discussed above, review of the TFE by the Regional Entity and ERO does not require that the Regional Entity or ERO take physical possession of the TFE documentation; an on-site review of the TFE documentation will, in many cases, suffice. Actions taken during the review will be mutually agreed to by the Responsible Entity and the reviewing party, and depend on specific legal requirements.

Post Approval Processes required by FERC Order:
Additionally, the TFE process requires cooperation with the ERO to provide the FERC with high-level, wide-area analysis regarding the effects of the TFE on the reliability of the Bulk Electric System.

The ERO, in conjunction with the Regional Entities, must provide a summary report to the FERC providing a high-level, wide-area analysis of the combined effects of all current TFE requests. In order to produce this report, the ERO and the Regional Entities must have appropriate access to the TFE requests from each Responsible Entity. In some cases, it may be necessary to conduct interviews of the individual Responsible Entities to determine the individual and combined impact of the TFE requests within that Responsible Entity, and to determine what wide-area impact, if any, the TFE requests represent in aggregate (see FERC Order 706 paragraph 221). Failure to cooperate with the ERO or the Regional Entity to provide such information upon formal request may result in the rejection of the TFE, and subsequent possibility of non-compliance with the Reliability Standard (see FERC Order 706 paragraph 160).

This wide-area impact analysis shall be re-conducted annually using the most recently submitted TFEs.

Appeals Process:
The appeals process for any TFE request that is rejected by either the Regional Entity or the ERO shall follow the existing Compliance Monitoring and Enforcement program appeals process.

Sample TFE Request Form Fields:
(A form will need to be developed)

Responsible Entity:

Entity Name:

NERC Compliance Registry ID Number:

Compliance Contact Name and Title:

Compliance contact Phone

Compliance Contact email

Technical Contact Name and Title:

Technical Contact Phone:

Technical Contact email:

Date of Technical Feasibility Request submission:

NERC Standard:

Requirement in Standard:

Justification for requesting a Technical Feasibility Exception:

Mitigation and/or Compensation taken:

Remediation Plan steps, milestones and timeline:
If no timeline is given, provide justification for not providing a timeline

Initial Internal Approval by Senior Manager or compliance Senior Officer
Name, title, Date of Approval:

Internal Annual Re-approval by Senior Manager if timeline is longer than one year or no timeline is given

Justification for continued re-approval:

Regional Entity Approval:

Regional Entity:

Technical Feasibility Exception Number (assigned by Regional Entity)

Regional Entity Approval Name

Regional Entity Approval Date

Regional Assessment of impact of Technical Feasibility Exception:

ERO Approval:

ERO Approval Name

ERO Approval Date

ERO Assessment of impact of Technical Feasibility Exception:

Appendix #7 — Phase II Assessment Criteria and Workplan Options

2nd DRAFT PHASE 2 OPTIONS ASSESSMENT CRITERIA

(Presented, Revised and Added to by SDT in its review on November 14, 2008)

1. The option is consistent with the SDT purpose statement and is responsive to the FERC 706 directives and the SAR.
2. C. The option is achievable given the SDT schedule and workplan.
3. The option does most to advance and enhance cyber security
4. The option helps the SDT address the foundational issues with the current standards.
5. The option is capable of implementation.
6. The option is capable of improving compliance.
7. The option helps protect the current investments and wherever possible builds on what has already been done.
8. The option helps to identify and mitigate risk on an ongoing basis
9. The option balances a systems orientation with a facilities orientation to asset protection approach.
10. The option is capable of being extended into related interests by others (distribution, AMI, Smart Grid, etc.).
11. The option enables the industry provide the appropriate level of security (not over securing nor under securing the cyber assets).
12. The option allows for discrimination among the various types of infrastructure that supports the BES

Phase II Work plan Options in Rank Order

(Identified and ranked by SDT November 14, 2008)

1. Address Risk management first then proceed with the rest

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
11-14 rank	9	5	4	0	3.27 of 4

2. Adopt/adapt NIST into CIP or Merge NIST into CIP

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
11-14 rank	3	9	4	0	2.93 of 4

3. Revise CIP as directed — leave as is and add in only items identified by FERC order

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
11-14 rank	5	7	7	0	2.89 of 4

4. Start Over — in terms of a starting point

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
11-14 rank	2	5	7	5	2.21 of 4

Appendix #8 Risk Management Worksheet

The SDT Conceptual Approach Risk Management

NOTE: The following points and questions were developed by Kevin Perry to help focus the SDT discussion on risk management. The purpose of this discussion is to provide an initial consideration of important information, options and arguments regarding risk management.

The Current "Consequence-based" Assessment Methodology:

We focus on the facility (asset), employing a "consequences-based" assessment methodology to determine if the facility is essential to the reliable operation of the bulk electric system:

1) Those that are essential are declared to be Critical Assets.
2) We then determine the Cyber Assets essential to the operation of the identified Critical Asset and those become subject to the CIP standards to the exclusion of pretty much all else.

Acceptability Ranking Scale	***4 =*** *acceptable, I agree*	***3 =*** *acceptable, I agree with minor reservations*	***2 =*** *not acceptable unless major reservations addressed*	***1 =*** *not acceptable*	***Avg.***
12-5 rank					

A Draft Problem Statement with the "Consequences-Based" Assessment methodology

The problem presented with this approach is that:

(a) Given the dynamic nature of the transmission system, assets that are critical today might not be tomorrow, and vice versa.
(b) The industry may be "cherry-picking" the Cyber Assets to be protected, along with any collateral Cyber Assets that happen to be connected to the same network segment.
(c) The approach excludes all other Cyber Assets, including Cyber Assets that may provide essential data to the Critical Cyber Assets or may have a trusted relationship (communications path) that could be exploited as an attack vector. And
(d) Once a Cyber Asset is identified as either a Critical Cyber Asset or a collateral Cyber Asset within the Electronic Security Perimeter, all of the requirements of the CIP Cyber Security Standards apply, regardless of the specific Cyber Asset's importance to the reliable operation of the Bulk Electric System.

Acceptability Ranking Scale	***4 =*** *acceptable, I agree*	***3 =*** *acceptable, I agree with minor reservations*	***2 =*** *not acceptable unless major reservations addressed*	***1 =*** *not acceptable*	***Avg.***
12-5 rank					

Overview of Considerations and Key Discussion Questions

1. Should the current Critical Cyber Asset identification process continue without modification?
2. Should the concepts of the NIST Risk Management Framework be adopted in some form, allowing for degrees of importance and corresponding protection controls?
3. Should the same risk management approach be used for field assets (e.g. generation plants, substations) as are used for traditional datacenter environments (e.g. control centers)?
4. Should there be a distinction between Critical Assets and non-Critical Assets (facilities) or should Cyber Assets in all facilities be protected to some degree?
5. Should the Critical Cyber Asset identification process consider the interaction of connected Cyber Assets and the vulnerabilities therein?
6. Should all Cyber Assets at a Critical Asset (facility) be subject to at least a minimal set of basic cyber security standards?
7. How does the NIST framework concept of risk acceptance compare/conflict with the FERC Order 706 and could it work given the FERC's current position on the subject?
8. Should there be some consideration of the importance and potential impact to a Critical Cyber Asset/Bulk Electric System reliability when assessing compliance penalties? For example, if all Cyber Assets at a facility require compliance with at least a minimal set of security standards, should a compliance failure charged against an office PC be subject to the same penalty structure as a Critical Cyber Asset?

Should any of these questions be deleted, reworded or changed in regard to the order?

Are there any additional questions to be considered?

For each question:

- *What are the issues at play in answering this question?*
- *Any guidance or directives from FERC Order 706 that the SDT should consider?*
- *Any additional information needed to answer this question?*
- *Following the discussion of the questions above, are there any draft statements that should be ranked for acceptability? (4,3,2,1 scale)*

FERC 706 Background References

Regarding NIST:

25. The Commission believes that the NIST standards may provide valuable guidance when NERC develops future iterations of the CIP Reliability Standards. Thus, as discussed below, we direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of the NIST framework. However, in response to Applied Control Solutions, we will not delay the effectiveness of the CIP Reliability Standards by directing the replacement of the current CIP Reliability Standards with others based on the NIST framework.

232. As proposed in the CIP NOPR, the Commission will not at this time direct NERC to incorporate specific provisions of the NIST standards into the CIP Reliability Standards. While commenters provide compelling information that suggests that the NIST standards may provide superior measures for cyber security protection, the Commission is concerned that the immediate adoption of the NIST standards would result in unacceptable delays in having any mandatory and enforceable Reliability Standards that relate to cyber security.

233. The Commission continues to believe – and is further persuaded by the comments – that NERC should monitor the development and implementation of the NIST standards to determine if they contain provisions that will protect the Bulk-Power System better than the CIP Reliability Standards. Moreover, we direct the ERO to consult with federal entities that are required to comply with both CIP Reliability Standards and NIST standards on the effectiveness of the NIST standards and on implementation issues and report these findings to the Commission. Consistent with the CIP NOPR, any provisions that will better protect the Bulk-Power System should be addressed in NERC's Reliability Standards development process. The Commission may revisit this issue in future proceedings as part of an evaluation of existing Reliability Standards or the need for new CIP Reliability Standards, or as part of an assessment of NERC's performance of its responsibilities as the ERO.

Reliability Standards. In other cases, we note that some or all of the additional guidance could be placed in a reference document separate from the CIP Reliability Standards.

Regarding Risk Management

253. The Commission believes that the comments affirm that responsible entities need additional guidance on the development of a risk-based assessment methodology to identify critical assets. While we adopt our CIP NOPR proposal, we recognize that the ERO has already initiated a process to develop such guidance. The CIP NOPR proposedDocket No. RM06-22-000 - 71 -to direct that NERC modify CIP-002-1 to incorporate the guidance. However, we are persuaded by commenters that stress the need for flexibility and the need to take account of the individual circumstances of a responsible entity. Thus, we modify our original proposal and in this Final Order leave to the ERO's discretion whether to incorporate such guidance into the CIP

Reliability Standard, develop it as a separate guidance document, or some combination of the two. A responsible entity, however, remains responsible to identify the critical assets on its system.

254. Commenters raise a number of topics that they believe should be addressed in the NERC guidance, such as how to assess whether a generator or a blackstart unit is "critical" to Bulk-Power System reliability, the proper quantification of risk and frequency, facilities that are relied on to operate or shut down nuclear generating stations, and the consequences of asset failure and asset misuse by an adversary. We believe these are all appropriate topics to be addressed and direct the ERO to consider these commenter concerns when developing the guidance.

255. The Commission proposed in the CIP NOPR that the ERO and Regional Entities provide reasonable technical support to relatively smaller entities that may have difficulty determining whether a particular asset is critical because, for example, the impact of the facility may be dependent on their connection with a transmission owner or operator. While we believe that there is a need to assist entities that lack a wide-area view, we are mindful of the ERO's concern that it would place an undue burden on it and the Regional Entities. If the ERO believes that it and the Regional Entities do not have sufficient resources to take on this responsibility, it should designate another type of entity with a wide-area view, such as a reliability coordinator, to provide needed assistance. This approach is consistent with our determination (discussed later in this Final Rule) regarding the external review of critical asset lists. Accordingly, we direct either the ERO or its designees to provide reasonable technical support to assist entities in determining whether their assets are critical to the Bulk-Power System.

256. Regarding MidAmerican's comments on use of the N minus 1 criterion when applying a risk-based assessment methodology to the identification of critical assets, we agree with MidAmerican that an N minus 1 criterion is not an appropriate risk-based assessment methodology for identifying critical assets. While the N minus 1 criterion may be appropriate in transmission planning, use of an N minus 1 criterion for the risk based assessment in CIP-002-1 would result in the nonsensical result that no substations or generating plants need to be protected from cyber events. A cyber attack can strike multiple assets simultaneously, and a cyber attack can cause damage to an asset for such a time period that other asset outages may occur before the damaged asset can be returned to service. Thus, the fact that the system was developed to withstand the loss of any single asset should not be the basis for not protecting that asset. Also, we note that the definition of "critical assets" is focused on the criticality of the asset, not the Docket No. RM06-22-000 - 72 - likelihood of an outage. Based on this reasoning, in response to US Power, we clarify that a generator should not assume that none of its individual generating assets would be regarded "critical" to the Bulk-Power System.**84**

257. With regard to Xcel's request for clarification regarding the meaning of the phrase "used for initial system restoration," in CIP-002-1, Requirement R1.2.4, we direct the ERO to consider this clarification in its Reliability Standards development process.

258. As to Entergy's suggestion that the ERO provide a DBT profile of potential adversaries, the

ERO should consider this issue in the Reliability Standards development process. Likewise, the ERO should consider Northern California's suggestion that the ERO establish a formal "feedback loop" to assist the industry in developing policies and procedures.**85**

FN84 Further, Requirement R.1.2.3 provides that the risk-based assessment must consider "generation resources that support the reliable operation" of the Bulk-Power System. This language indicates that certain generation facilities, and presumably some facilities within a region identified as critical, must be considered in an assessment. Beyond this, we leave it to the ERO to provide sufficient guidelines to inform generation owners and operators on how to determine whether it should identify a facility as a critical asset. As discussed later in the Final Rule, the Commission will monitor and evaluate the outcome of this endeavor – the list of critical assets.

FN85 Consistent with our approach in Order No. 693, the ERO should address NOPR comments suggesting specific new improvements to the CIP Reliability Standards. The Commission, however, does not direct any outcome other than that the comments receive consideration. See Order No. 693 at P 188.

272. Based on the range of comments received on this topic, the Commission is convinced that the consideration and designation of various types of data as a critical asset or critical cyber asset pursuant to CIP-002-1 is an area that could benefit from Docket No. RM06-22-000 - 76 -greater clarity and guidance from the ERO. Accordingly, the Commission directs the ERO, in developing the guidance discussed above regarding the identification of critical assets, to consider the designation of various types of data as a critical asset or critical cyber asset. In doing so, the ERO should consider Juniper's comments. Further, the Commission directs the ERO to develop guidance on the steps that would be required to apply the CIP Reliability Standards to such data and to consider whether this also covers the computer systems that produce the data.
273. The Commission also agrees with ISO-NE that experience in the implementation of the CIP Reliability Standards may indicate a need to further address this topic in a future proceeding.

Regarding an additional guidance or reference document

61. The Commission received comments on both sides of the issue of specificity. Some commenters caution against the CIP Reliability Standards being too specific, while others request more guidance to help them comply. In general, the Commission believes it is appropriate to provide sufficient guidance to explain Requirements so that responsible entities have a high degree of certainty that they understand what is necessary to comply with a Requirement. More guidance will allow responsible entities to implement measures adapted to their specific situations more consistently and effectively. Additional guidance need not be included in a specific Requirement, but could be in the form of examples. The Commission is not directing that the ERO establish a specific end result. Our concern is simply that responsible entities have guidance on how to achieve an appropriate result in individual cases, which can vary on a case-by-case basis. Therefore, in several instances throughout this Final Rule, the Commission gives the ERO direction to provide additional guidance. In some cases, we require that the guidance be placed in modifications to the CIP

355. The Commission believes that responsible entities would benefit from additional guidance regarding the topics and processes to address in the cyber security policy required pursuant to CIP-003-1. While commenters support the need for guidance, many are concerned about providing such guidance through a modification of the Reliability Standard. We are persuaded by these commenters. Accordingly, the Commission directs the ERO to provide additional guidance for the topics and processes that the required cyber security policy should address. However, we will not dictate the form of such guidance. For example, the ERO could develop a guidance document or white paper that would be referenced in the Reliability Standard. On the other hand, if it is determined in the course of the Reliability Standards development process that specific guidance is important enough to be incorporated directly into a Requirement, this option is not foreclosed. The entities remain responsible, however, to comply with the cyber security policy pursuant to CIP-003-1.

356. In response to ISO/RTO Council, Ontario Power and other commenters, the Commission's intent in the CIP NOPR – as well as the Final Rule – is not to expand the scope of the CIP Reliability Standards. Requirement R1 of CIP-003-1 requires a responsible entity to document and implement a cyber security policy "that represents management's commitment and ability to secure its Critical Cyber Assets." The Requirement then states that the policy, "at a minimum," must address the Requirements in CIP-002-1 through CIP-009-1. The Commission believes that there are other topics, besides those addressed in the Requirements of the CIP reliability Standards, which are relevant to securing critical cyber assets. The Commission identified examples of such topics in the CIP NOPR. Thus, the Commission, in directing the ERO to develop guidance on additional topics relevant to securing critical cyber assets, is not expanding the scope of the CIP Reliability Standards.

408. The Commission agrees with FirstEnergy on the importance of flexibility in developing a mutual distrust posture, but does not see a conflict between the need for flexibility and what it is proposing, which is simply more guidance. More guidance will allow responsible entities to implement measures adapted to their specific situations more consistently and effectively. Additional guidance need not be included in a specific Requirement, but could be in the form of examples. We will leave it to the Reliability Standards development process and the ERO to decide whether some or all of the guidance can be contained in separate guidance documents referenced in the Reliability Standard. In response to Entergy, the Commission is not directing that the ERO establish a specific end result. Our concern is simply that responsible entities have guidance on how to achieve an appropriate result in individual cases, which can vary on a case-by case basis. We disagree that providing useful guidance affects the scope of the Reliability Standards.

502. In response to APPA/LPPC, the Commission clarifies that it does not intend to create an inflexible rule calling for redundant electronic security in all cases. While the Commission directs that a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process. This would include whether or not

the second security measure must be "on par" with the first. The Commission also directs the ERO to consider, based on the content of the modified CIP-005-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.

511. The Commission adopts the CIP NOPR's proposal to direct the ERO to identify examples of specific verification technologies that would satisfy Requirement R2.4, while also allowing compliance pursuant to other technically equivalent measures or technologies. In response to commenters, in discussing digital certificates and two-factor authentication, the Commission was providing examples of strong authentication, not limiting authentication to those options. The Commission is not prescribing the specific methods as an exclusive solution pursuant to Requirement R2.4. The ERO can propose an alternative solution that it believes is equally effective and efficient. If the ERO believes it would be helpful to responsible entities, additional guidance beyond the examples that are eventually included in Requirement R2 can be given in a separate reference document. Since we are directing the ERO to provide guidance on what constitutes strong authentication, it is not necessary for the Commission to respond to ISO-NE's request that digital certifications or two-factor authentication are acceptable methods of authentication. In identifying examples or categories of specific verification technologies that would satisfy Requirement R2.4, the ERO should take into account the specific comments raised in this proceeding. Similarly, while encryption is one method to accomplish two-factor authentication, and is an effective process for ensuring authenticity of the accessing party, for some facilities, we leave it to the ERO in the Reliability Standards development process to evaluate whether and how to address the use of encryption. In the alternative, the ERO may identify verification technologies or categories of verification technologies in a reference document.

547. In sum, we direct the ERO to modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years. The ERO should develop the details of how to determine what constitutes a representative system and what modifications require an active vulnerability assessment in the Reliability Standards development process. The revised Reliability Standard should contain the essential requirement that an active assessment must be performed at least once every three years. Based on the amount of guidance contained in the modified Reliability Standard, the ERO should consider at that time whether additional guidance should be provided in a reference document.

575. In response to commenters' questions regarding specific physical access controls, the Commission clarifies that it does not intend to create an inflexible rule calling for redundant physical security. While the Commission continues to believe that a responsible entity must implement two or more distinct and complimentary physical access controls at a physical access point of the perimeter, the specific requirements should be developed in the Reliability Standards development process when the ERO develops its modifications in response to this Final Rule. The Commission also directs the ERO to consider, based on the content of the modified CIP-

006-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.

609 . The Commission has discussed issues related to testing environments in CIP-005-1. In that context, the Commission clarifies the CIP NOPR proposal to require differences between the test environment and the production system to be documented. As stated with respect to CIP-005-1, the Commission understands that test systems do not need to exactly match or mirror the production system in order to provide useful test results. However, to perform active testing, the responsible entities should be required at a minimum to create a "representative system" – one that includes the essential equipment and adequately represents the functioning of the production system. We therefore direct the ERO to develop requirements addressing what constitutes a "representative system" and to modify CIP-007-1 accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document.

621. While we agree that no safeguard will protect against all malicious or unintentional acts, this does not mean that systems should not be protected against such acts. In response to MidAmerican, the Commission believes that details regarding how to safeguard systems against personnel introducing, maliciously or unintentionally, viruses or malicious software to a cyber asset are best developed in the Reliability Standards development process. The revised Reliability Standard does not need to prescribe a single method for protecting against the introduction of viruses or malicious software to a cyber asset by personnel. However, how a responsible entity does this should be detailed in its cyber security policy so that it can be audited for compliance with the Reliability Standard. The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes how an entity should protect against personnel introducing viruses or malicious software to a cyber asset. The ERO could also provide additional guidance in a reference document.

629. For the reasons discussed in CIP-005-1, in directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the Commission will allow a manual review of a sampling of log entries or sorted or filtered logs. The Commission recognizes that how a responsible entity determines what sample to review may not be the same for all locations. Therefore, the revised Reliability Standard does not need to prescribe a single method for producing the log sampling. However, how a responsible entity performs this sample review should be detailed in its cyber security policy so that it can be audited to determine compliance with the Reliability Standards. The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document. The final review process, however, must be rigorous enough to enable the entity to detect intrusions by attackers.

644. For the reasons discussed in CIP-005-1, in directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the Commission will allow a manual review of a sampling of log entries or sorted or filtered logs. The

Commission recognizes that how a responsible entity determines what sample to review may not be the same for all locations. Therefore, the revised Reliability Standard does not need to prescribe a single method for producing the log sampling. However, how a responsible entity performs this sample review should be detailed in its cyber security policy so that it can be audited to determine compliance with the Reliability Standards. The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document. The final review process, however, must be rigorous enough to enable the entity to detect intrusions by attackers.

660. The Commission adopts the CIP NOPR proposal to direct the ERO to provide guidance regarding what should be included in the term reportable incident. In developing the guidance, the ERO should consider the specific examples provided by commenters, described above. However, we direct the ERO to develop and provide guidance on the term reportable incident. The Commission is not opposed to the suggestion that the ERO create a reference document containing the reporting criteria and thresholds and requiring responsible entities to comply with the reference document in the revised Reliability Standard CIP-008-1, but will allow the ERO to determine the best method to accomplish the goal of better defining reportable incident.

725. The Commission adopts, with modifications, the CIP NOPR proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years. Consistent with our goals and discussion of CIP-005-1, the Commission will not at this time require responsible entities to perform full operational exercises. Instead, the Reliability Standard should require the demonstrated recovery of critical cyber assets in a test environment, with the requirements for representative test environments and for addressing differences between the test environment and the production environment, similar to the conditions discussed for live testing in CIP-005-1. Given the range of views presented in comments regarding live testing, as the Reliability Standard development process forms the details of this “demonstrated recovery” concept, it should consider offering guidance beyond the actual Requirements of the Reliability Standard in separate reference documents. The Commission believes this alleviates commenters’ concerns about the risks associated with such testing

STANDARDS FOR CRITICAL INFRASTRUCTURE PROTECTION**

I. INTRODUCTION

As Members of Congress, we are pleased to provide these comments in response to the Notice of Proposed Rulemaking ("NOPR") issued in the above-captioned docket.[3] We support the efforts of the Federal Energy Regulatory Commission ("FERC") to require the North American Electric Reliability Corporation ("NERC") to develop modifications to the Critical Infrastructure Protection ("CIP") Reliability Standards. However, we believe that the reliability of the nation's bulk-power system ("BPS") will be better protected by a cyber security standard that incorporates the additional security measures of National Institute of Standards and Technology ("NIST") Special Publication ("SP") 800-53 as applied to industrial control systems.

II. NOTICES AND COMMUNICATIONS

III. BACKGROUND

The BPS of the United States and Canada has more than $1 trillion in asset value, more than 200,000 miles of transmission lines, and more than 800,000 megawatts of generating capability serving over 300 million people.[4] The effective functioning of this infrastructure is highly dependent on control systems, computer-based systems that are used to monitor and control sensitive processes and physical functions. Once largely proprietary, closed-systems, control systems are becoming increasingly connected to open networks, such as corporate intranets and the Internet. According to the United States Computer Emergency Readiness Team ("US-CERT"), "this transition towards widely used technologies and open connectivity exposes control systems to the ever- present cyber risks that exist in the information technology world in addition to control system specific risks."[5]

The cyber risk to these systems is becoming increasingly dangerous. Ten years ago, the President's Commission on Critical Infrastructure Protection ("PCCIP") released a report on the risks associated with interconnected computer systems on the BPS, stating that "the widespread and increasing use of supervisory control and data acquisition systems for control of energy systems provides increasing ability to cause serious damage and disruption by cyber means."[6] Since the release of that study, numerous unintentional cyber incidents – from the Davis-Besse power plant incident in 2003, to the Northeast blackout, to the Browns Ferry nuclear power plant failure in 2006 – suggest that the concerns raised by the PCCIP were warranted.

But nothing quantified the intentional threat to the BPS quite like the experiment performed by the Idaho National Laboratory for the Department of Homeland Security. In September 2007, the Department disclosed that its researchers successfully destroyed a generator while conducting an experimental cyber attack. According to news reports, the attack involved a controlled hack of a replicated control system commonly found throughout the BPS.[7] The

results of this experiment suggest that malicious actors could use the same attack vector against larger generators and other critical rotating equipment that could cause widespread and long-term damage to the electric infrastructure.

Clearly, intentional and unintentional control system failures on the BPS can have a significant and potentially devastating impact on the economy, public health, and national security of the U.S. For a society that runs on power, the discontinuity of electricity to chemical plants, banks, refineries, hospitals, water systems, and military installations presents a terrifying scenario. Economists recently suggested that the loss of power to a third of the country for three months would result in losses of over $700 billion.[8] This figure does not consider the negative societal or health ramifications that such an event would have on the American people.

The FERC proposes to approve a set of reliability standards to help safeguard the nation's BPS against potential disruptions from cyber attacks. The proposed standards require certain users, owners and operators of the grid to establish plans, protocols and controls to safeguard physical and electronic access to systems, to train personnel on security matters, to report security incidents, and to be prepared to recover information. The FERC recently created an Office of Electric Reliability ("OER") designed to focus on the development and implementation of these standards for the users, owners, and operators of the grid.

Unfortunately, we believe the standards proposed by the NERC for adoption by the FERC do not sufficiently ensure the production or delivery of power in the event of intentional or unintentional cyber incidents involving critical infrastructures. We are primarily concerned with five issues: 1) the limitations of CIP-002-1 which exclude critical assets from the risk methodology; 2) the failure of the NOPR to consider the dependencies of critical infrastructures on the BPS; 3) the absence of clearly defined characteristics that will comprise a risk methodology; 4) the interconnectivity of industrial control system data networks; and 5) the vulnerabilities created by using a separate standard for publicly- and privately-owned infrastructures. The fact that our comments are primarily related to the first of the proposed eight standards should not be construed as support of the remaining standards, but demonstrate our deep concern with the implementation of CIP-002-1. We believe that the reliability of the nation's BPS would be better protected by a cyber security standard that incorporates the additional security measures of NIST Special Publication 800-53 as applied to industrial control systems.

IV. DISCUSSIONS OF MAJOR ISSUES OUTLINED IN THE NOPR

Though we applaud FERC's efforts and support many of its modifications to the NERC CIP Reliability Standards, we are primarily concerned with five issues: 1) the limitations of CIP-

---

from http://www.cnn.com/2007/US/09/27/power.at.risk/index.html.

[8] (2007, Sept. 27). "Mouse click could plunge city into darkness, experts say," Retrieved Sept. 28, 2007, from http://www.cnn.com/2007/US/09/27/power.at.risk/index.html.

002-1 which exclude critical assets from the risk methodology; 2) the failure of the NOPR to consider the dependencies of critical infrastructures on the BPS; 3) the absence of clearly defined characteristics that will comprise a risk methodology; 4) the interconnectivity of industrial control system data networks; and 5) the vulnerabilities created by using a separate standard for publicly- and privately-owned infrastructures.

NERC's proposed CIP-002-1 requires an entity to identify its "critical assets" and "critical cyber assets" using a risk-based methodology. Identifying assets is arguably the most important step in the entire assessment process. With control systems becoming increasingly interconnected to each other, and also interconnected with corporate data networks and the Internet, many assets that were once thought to be isolated are now vulnerable.[9] As noted in the FERC Staff Preliminary Assessment, "because CIP-002-1 addresses the assessment methodology and process for identifying critical assets and critical cyber assets, it represents the critical first step that can fundamentally affect the chances for successful implementation of the remaining CIP Reliability Standards."[10] However, if implemented in its present form, CIP-002-1 would not require responsible entities to comprehensively secure "critical assets" that could in fact have a significant impact on the safety and security of the United States.

The problem lies with the NERC definitions of "critical assets." NERC defines "critical cyber assets" as "cyber assets essential to the reliable operation of critical assets."[11] "Critical assets" are defined as "facilities, systems, and equipment that would affect the reliability or operability of the BPS."[12] This is a conceptual mistake that fails to understand the importance of the reliability and operability of individual elements of the grid, which are essential to the delivery of power to the nation's critical infrastructure.

The BPS is an enormous, interconnected network that is both redundant and resilient, making the sole focus on "reliability" and "operability" of the grid as a whole inappropriate. Practically, there are several assets that would fall outside the scope of NERC's definition of "critical" which should not. For instance, although generation units serving communities locally regularly trip offline due to both unexpected events and routine maintenance alike, service to customers generally remains constant. This is a credit to the design of the greater grid, which is engineered to withstand these kinds of singular events.[13] Critical to providing power for

[9] Today, the existing "NERCnet" employed for inter-control center coordination arguably provides a direct link for hacker access to most utility control centers in North America.

[13] North American Electric Reliability Corporation, Transmission Planning Series Standards (TPL).

citizens, businesses, and other critical infrastructures, these units would not be defined as such because they would not affect the reliability or operability of the BPS itself. Similarly, individual substations may experience reliability problems, but unless the load shed exceeds a certain level of megawatts, it is unlikely that a single substation would be recognized as a critical asset under the NERC definition. Telecommunications equipment would also be excluded from the "critical cyber assets" list even though there are documented cases of computer worms denying service from control systems to substations.[14]

Finally, though it is impossible to argue that they are not critical to the safety and security of the U.S., distribution assets would be excluded because they are not essential to reliability of the BPS. Again, real world examples expose problems with this logic. Though the BPS was restored within days to the primary areas affected by Hurricane Katrina, it took some municipal water department pumps over a year to get back up and running because the distribution systems remained off-line. In a June 2007 incident, an outage in Tempe, Arizona, caused by the unexplained activation of the distribution load shedding program in the energy management system affected nearly 100,000 customers.[15]

It is easy to see that an intentional or unintentional cyber incident on the BPS resulting in the disability of any connected asset – from distribution control systems to telecommunications equipment – can have a significant impact on the nation's security. Every critical infrastructure in the country is dependent on the BPS: chemical plants, banks, refineries, hospitals, water systems, and military installations all rely on the effective operation in their region. Focusing on assets relative to the functioning of the grid as a whole misses the importance of each individual asset to the functioning of our society. Unfortunately, recognition of the major infrastructure dependencies on the BPS is entirely absent from the FERC NOPR. Though the NOPR suggests that FERC "will revisit this matter through future proceedings and with other agencies," it is difficult to understand why cross-sector dependencies on the BPS are not the main focus of this standards process.[16] To address this shortcoming, we suggest that every electronically connected asset be considered "critical," as failures on those systems could potentially cause cascading outages of the BPS that could affect every critical infrastructure associated with it.

We strongly support FERC's efforts to provide guidance on the content to be applied in the

---

[14] On June 20, 2003, NERC issued a lessons learned advisory about the "SQL Slammer Worm," a computer worm that caused a denial of service on some Internet hosts and dramatically slowed down general Internet traffic in early 2003. However, CIP-002-1 excludes telecommunications equipment because it is not a "critical asset."

[16] Notice of Proposed Rulemaking: Mandatory Reliability Standards for Critical Infrastructure Protection (Docket No. RM06-22-000), issued July 20, 2007.

risk-based assessment methodology and require that a senior manager annually review and approve the methodology. We do hope, however, that FERC will create a meaningful deadline for the issuance of such guidance so that it can be effectively promoted across the system. It is true that one singular methodology is probably not appropriate for all situations or entities, but FERC should define the acceptable characteristics of a methodology. While flexibility is important, allowing each responsible entity to craft its own methodology may lead to difficulties in assessing risk across the system. Explicit requirements will avoid a situation where neighboring utilities with the same equipment can have completely different critical cyber assets by virtue of their interpretation of the definitions. Ultimately, however, as long as a responsible entity uses a risk-based methodology focusing on the reliability of the BPS rather than the critical infrastructure end user, safety and security concerns remain paramount. We expect FERC will establish an expedited timeline for responsible entities to complete their assessments and mitigation efforts.

V. CONCLUSIONS AND ACTIONS REQUESTED

The Energy Policy Act of 2005 created a statutory impediment on federal regulators seeking to enact higher standards of security on responsible entities operating within the BPS. We are concerned that the regulatory framework may lead to delays in the implementation of security standards that would better protect the BPS infrastructure and the critical infrastructures that depend on its operation. We endorse the FERC's interpretation of the Section 215 provision requiring "due weight" to be given to the technical expertise of the Electric Reliability Organization with respect to the content of a proposed standard without complete deference.[17] We believe that the FERC staff's technical expertise in control systems and cyber security and the proposals that they set forward in this rulemaking provide a valuable security perspective for the responsible entities charged with implementing these regulations.

A painful lesson from the September 11th attacks on our country is that a system is only as strong as its weakest link. On that day, several terrorists entered the U.S. transportation system through a small airport in Portland, Maine. Once inside the system, they were able to carry out their plans unimpeded. The Federal government must remain vigilant in eliminating weak links that can be exploited by those who wish to do us harm. In that vein, because of the interconnections between publicly- and privately-owned infrastructures that comprise the BPS, we believe that every responsible entity should be held to the same standards for securing their critical assets.

NIST is responsible for developing standards and guidelines, including minimum requirements, for providing adequate information security for all Federal agency non- national security operations and assets. In 2005, NIST released Special Publication (SP) 800-53, "Recommended Security Controls for Federal Information Systems." This publication was originally developed for use with traditional information technology systems. Recently, however, NIST established the Industrial Control System Security Project to improve the security of publicly- and privately-owned industrial control systems. The major focus of the

[17] Energy Policy Act of 2005, Pub. L. No. 109-58, Title XII, Subtitle A, 119 Stat. 594, Section 215(d)(5) (2005).

project is to clarify and rectify problems experienced in applying SP 800-53 to industrial control systems and develop new requirements in those areas. In December 2006, NIST published SP 800-53 Revision-1 that provides interim guidance on the application of the security controls to industrial control systems. These specifications are binding on federal government agencies.

NIST research also focused on comparing the proposed NERC Reliability Standards for cybersecurity with SP 800-53. According to a NIST-sponsored review published in March 2007, an organization conforming to the baseline set of security controls in SP 800-53 will also comply with the management, operational and technical security requirements of the NERC Reliability Standards, though the converse may not be true. For instance, in the Tempe outage and SQL Slammer Worm incidents, the NERC Reliability Standards allow for the exclusions of telecommunications and distribution equipment from the "critical assets" list. Under the SP 800-53 requirements, however, there is no similar exclusion, and it is reasonable to conclude that a responsible entity could identify and mitigate vulnerabilities in these assets prior to an incident. The technical report concluded that the NERC Reliability Standards are both "inadequate for protecting critical national infrastructure," and "inadequate for all electric energy systems when the impact of regional and national power outages is considered."[18] In its February 2007 comments on the FERC Preliminary Staff Assessment, NIST researchers concurred, stating that the NERC standards "do not provide levels of protection commensurate with the mandatory minimum federal standards (FIPS) prescribed by NIST."[19]

Because of the interconnectivity between Federally- and privately-owned elements of the BPS, inconsistent regulatory structures create weak links and potential vulnerabilities in the entire system. A responsible entity in the private sector may fully implement the NERC Reliability Standards but will fall short of the security measures implemented by a public entity. According to a report by MITRE sponsored by NIST, "to date, there has been no serious effort to ensure that the cyber security standards and best practices emerging from the electric power industry are consistent with the federal standards and guidelines being developed by NIST in response to the FISMA."[20] We believe that this is a significant problem that must be addressed immediately. Though the NOPR specifically declines to propose that NERC incorporate any provisions of the NIST guidelines in the CIP Reliability Standards, in light of the security concerns at issue in this rulemaking, we urge the FERC to modify the standard so that it incorporates aspects of SP 800-53 and the related NIST standards.

In closing, we applaud FERC for proposing these regulations. We are hopeful that both FERC and NERC will find these comments helpful and incorporate them when finalizing their

Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

December 4, 2008 | 8 a.m.–5 p.m.
December 5, 2008 | 8 a.m.–3 p.m.
Dewey & LeBoeuf, LLP
1101 New York Avenue, N.W — First Floor Conference Room
Washington, D.C. 20005

Proposed Meeting Objectives

- To receive and discuss a NERC presentation on a Phase I communications plan.
- To review, refine, and adopt a Technical Feasibility Paper for Industry review and comment.
- To continue the review of a Phase II work plan.
- To review and discuss the conceptual approach to risk management in Phase II.
- To receive a presentation on NIST and its application to CIP.
- To review assignments and the January 7–8 meeting objectives.

Thursday, December 4, Day One Agenda

1. **8:00 a.m.** Opening Remarks — Jeri Domingo-Brewer, Chair and Kevin Perry, Vice Chair
    a. Welcome — Announcements and Logistics
    b. NERC Antitrust Compliance Guidelines
    c. FSU/CRC review of last meeting and adoption of November 12–14 meeting summary
2. **8:15** SDT Organizational Issues: Review of Adopted Consensus Procedures
3. **8:30** NERC Presentation and Discussion of Phase I Communications Plan
4. **9:00** Technical Feasibility Strawman, Review and Refinement
5. **10:00** Break
6. **10:15** Technical Feasibility Strawman, Review and Refinement
7. **noon** Lunch — Working (return to meeting at 12:45 p.m. ET)
8. **12:45 p.m.** Presentation and Discussion of 2nd Draft Phase II Work plan including

		Applicable FERC Directives
9.	**1:45**	NIST Application to CIP-Background Presentation and Discussion
10.	**3:00**	Stretch Break
11.	**3:15**	Risk Management — Conceptual Approach (Strawman?)
12.	**5:00**	Adjourn

Friday, December 5, Day Two Agenda

13.	**8:00 a.m.**	Opening, Review of Day One Results and Day Two Agenda — Jeri Domingo-Brewer, Chair and Kevin Perry, Vice Chair
14.	**815**	SDT Organizational Issues (TBD)
15.	**8:30**	Review and Further Refinement of Technical Feasibility Draft
16.	**10:30**	BREAK
17.	**10:45**	Final Review and Adoption of Technical Feasibility Draft
18.	**11:15**	Continue Review of Risk Management Approach, NIST and CIP 002-009-Approach
19.	**noon**	Lunch — working (return to meeting at 12:45 p.m. ET)
20.	**12:45 p.m.**	Review of CIP 002 — Issues from FERC Order including NIST comparison
21.	**2:30**	Review of meeting schedule and drafting assignments
22.	**2:45**	Next Steps and Evaluation
23.	**3:00**	Adjourn

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Revised Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

January 7, 2009 | 1–5 p.m. PST
January 8, 2009 | 8 a.m.–5 p.m. PST
January 9, 2009 | 8 a.m.–noon PST
Arizona Public Service Deer Valley Campus
Black Canyon 3 Building (BC-3)
2133 W. Peoria Ave.
Phoenix, AZ (609-250-1117)

Wednesday January 7, 2009

1:00 p.m. **Welcome and Opening Remarks — Jeri Domingo-Brewer and Kevin Perry**

a. Roll Call
b. NERC Antitrust Compliance Guidelines
c. FSU/FCRC Review of December meeting and adoption of December 4–5 Meeting Summary

1:15 **Review of Meeting Objectives and Agenda — Jeri Domingo and Bob Jones**

1:20 **Organizational Issues and Review of Phase 1 and early Phase II Schedule — Stuart Langton**

- Review of Phase 1 — Work-plan, January — May 2009 including small group proposal
- Review of Phase 2 — January—June, 2009 — including CIP-002 conceptual approach and industry input and feedback.

2:00 **Overview of Phase I Industry Responses — Number and Issues and Procedure Going Forward — Kevin Perry**

2:30 **Technical Feasibility Exception (TFE) — Briefing on NERC Review and Proposal Going Forward — Scott Mix**

3:00 **Break**

3:15 **TFE White Paper — Review of Changes and Additional Suggestions**

4:00	**Phase I Comment Review and Refinement — Full SDT Discussion of Cross Cutting Issues**
4:50	**Summary of Day One Outcomes and Review of Day Two Agenda**
5:00	**Recess**

Thursday January 8, 2009

8:00	**Welcome — Agenda Review and Review of Day One Results**
8:10	**Phase I Comment Review and Refinement- Plenary Discussion of Overall and Cross Cutting Issues**
9:00	**Break**
9:10	**Possible Small Group Breakouts — Review and Draft Responses**
noon	**Working Lunch *(Return to plenary meeting at 12:45)***
12:45	**Initial Small Group Reports on Draft Responses and Full SDT Discussion**
2:45	**Break**
3:00	**Initial Small Group Reports on Draft Responses and Full SDT Discussion**
4:20	**Next Steps for Drafting Group WebEx Meetings in preparation for February 2–3, 2009 Meeting**
4:50	**Summary of Day Two Outcomes and Review of Day Three Agenda**
5:00	**Recess**

Friday January 9, 2009

8:00	**Welcome and Agenda Review**
8:10	**Learning from Other Initiatives — John Sykes, NERC System Protection and Control Task Force**
9:00	**SDT Discussion of Implications for Phase II 002 Critical Asset Identification**
10:00	**Break**

10:15	**Phase II White Paper Development — Early Thoughts and Preview and Questions of the SDT to aid in the drafting- Jackie Collette and William Winters**
11:30	**Assignments — Next Steps and Review of Work-plan**
noon	**Adjourn**

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 SDT — Project 2008-06
JANUARY — JUNE 2009 DRAFT SDT SCHEDULE

NOTE: Below are draft considerations developed by the facilitators in consultation with the Chair, Vice Chair and NERC staff and following the December SDT NERC Communication Plan briefing and Phase 1 Webinar on December 16. The facilitators also reviewed the SDT criteria for a "roadmap approach" to revising the CIP standards discussed and refined in Little Rock at its November, 2008 meeting (See pp 4 below for a list of the criteria) These considerations were used to construct a draft schedule for the SDT for the first half of 2009.

Short Term 2009 Schedule Draft Considerations

1. Follow the ANSI standard development process but use creative ways to efficiently secure input from the industry on emerging concepts and approaches to the CIP standards.
2. Seek creative ways to get advice and input to the SDT from experts in cyber security.
3. Seek creative ways to get focused input from industry stakeholders.
4. Take advantage of input opportunities from related NERC committees that will be meeting in the first half of 2009 (e.g. working with the NERC Members Representative Committee, CIPC, BOT, and industry committees such as the Electricity Sector Coordinating Council, etc.)
5. Seek, as soon as possible but no later than late Spring, 2009, to establish a consensus on the way forward for the SDT in its efforts to revise the CIP standards.
6. Track any follow up to the "Securing Cyberspace for the 44th Presidency" report of the Commission on Cybersecurity for the 44th President.

SDT Draft Schedule — January–June 2009

Overview

- 7 SDT Face-to-Face Meetings
- Multiple SDT subgroup and subcommitees WebEx Meetings
- 1 Cyber Expert Workshop (March 10 or 11, 2009)
- 1 NERC CIPC presentation? (Feb. 9, 2009)
- Industry Comments on CIP 002 White Paper (April 17–June 3)
- 1 NERC Members Representative Committee, May 1, 2009

- OTHER MEETINGS?

SDT Draft Schedule — January–June, 2009

1. January 7–9 SDT Meeting — Phoenix, AZ ½–1/½ day format — Wednesday–Friday

- Review of Technical Feasibility Exceptions white paper
- Review of Industry Comments on Phase 1 products- Establish and convene small groups
- Initial Review of Phase 2 White papers

January 15 — WebEx meeting(s)

- Small group draft responses to industry.

January 21 — WebEx meeting(s)

- Small group draft responses to industry.

2. February 2–4, 2009 SDT Meeting — Phoenix, AZ, ½–1/½ day format — Monday–Wednesday

- Review of Small Group responses and recommendations on Industry comments and adopt draft of Phase 1 products, as revised, for review by NERC/Maureen.
- Review of Phase 2 White papers and Testing of a Phase 2 CIP 002 concept going forward

February 9, 2009 — CIPC Meeting — Update on SDT Progress and Input?
February 11 — WebEx meeting

- Phase 2 drafting concept group?

3. February 18–19, 2009 SDT Meeting — Boulder City, NV

- Review of Maureen's comments and adoption of Phase 1 products for balloting.
- Further discussion and adoption of a draft Phase 2 CIP 002 Concept for review by experts and stakeholders in March and beyond.

February 25 — WebEx meeting(s)

- Phase 2 drafting concept group?
- Development of Phase 2 CIP 002 Workshop for review by experts and stakeholders

4. March 10–11, 2009 SDT Meeting — Tampa, FL, 2-day format

- Invited Cyber Security Experts join SDT in a workshop to provide expert feedback to draft CIP 002 concept.
- Further SDT refinement of the CIP 002 proposed concept

March NERC Balloting on Phase 1 Products

March 18 **—** WebEx meeting(s)

- Phase 2 drafting concept group?

5. April 14–16, SDT Meeting, Charlotte NC — ½–1/½ day format. Wednesday-Friday

- Continue review and refinement of 002 concept and adopt White Paper on CIP 002 concept for Industry Comment

Industry Comment Period on White Paper **—** 45-days (April 17–June 3)

*May 1, **NERC Member Representative Committee**, Presentation of the Phase 2 CIP 002 Approach for MRC input. (Agenda item, Possible Workshop?)*

6. May 13–14 — SDT Meeting — Dallas, TX, 2-day format

- Review and respond to MRC input and further SDT refinement of the CIP 002 proposed concept and SDT CIP roadmap.
- Organize SDT in subcommittees to begin effort to draft revisions to CIP 003-008 or to address key issue areas.

June **—** following June 3 — WebEx meeting(s)

- SDT subcommittee meetings to review and draft responses to Industry comments on the CIP 002 concept.

7. June 17–18, SDT Meeting — Location TBD —2-day format

- Review Subcommittee responses to Industry comments on 002 approach
- Charge subcommittees and conduct organizational meetings
- Subcommittees meet to draft revisions to CIP 003-008

June **—** WebEx meeting

- SDT Subcommittee meetings

July–December, 2009 — SDT and subcommittees meet and continue CIP drafting

2nd DRAFT PHASE 2 ROADMAP APPROACH ASSESSMENT CRITERIA

(Presented, Revised, and Added to by SDT in its review on November 14, 2008)

1. The approach is consistent with the SDT purpose statement and is responsive to the FERC 706 directives and the SAR.

2. The approach is achievable given the SDT schedule and workplan.
3. The approach does most to advance and enhance cyber security in the BES.
4. The approach helps the SDT address the foundational issues with the current standards.
5. The approach is capable of implementation.
6. The approach is capable of improving compliance.
7. The approach helps protect the current investments and wherever possible builds on what has already been done.
8. The approach helps to identify and mitigate risk on an ongoing basis.
9. The approach balances a “systems” orientation with a “facilities” orientation to asset protection.
10. The approach is capable of being extended into related interests by others (distribution, AMI, Smart Grid, etc.).
11. The approach enables the industry to provide the appropriate level of security (i.e. not over securing nor under securing the BES cyber assets).
12. The approach allows for discrimination among and targeting the various types of infrastructure that support the BES

Cyber Security Order 706 Standard Drafting Team
5th Meeting Summary
Phoenix AZ

Meeting Summary Contents

EXECUTIVE SUMMARY

The Chair and Vice Chair welcomed the members and a roll call of members and participants in the room and on the conference call was conducted, following review of the proposed meeting agenda. David Taylor reviewed with the team the need to comply with NERC's Antitrust Guidelines. The SDT agreed to review, and unanimously adopted, the December 4–5, 2008 SDT meeting summary on Friday.

Scott Mix provided an update on the Technical Feasibility Exception process since the SDT December meeting. The Technical Feasibility Exception (TFE) process is based on discussion with utility management. The process is not about the technical requirements and standards that the SDT is addressing, but it is more about whether compliance has been met; compliance is more than just the audit process. Technical feasibility exception was intended to address the issues where compliance could not be met quickly, thereby allowing for good reason to be technically out of compliance while significant issues can be addressed.

The TFE White Paper is being reviewed by NERC management. Compliance and Legal counsel were sought concerning how the white paper should be positioned and what it would mean to enforcement. It needs its own vetting process within NERC, and it may require modification to the Compliance Monitoring and Evaluation Program (CMEP). Changes to the CMEP are applicable across all of NERC's standards, so the TFE needs to well thought through and vetted within NERC. Mike Assante, Chief Security Officer at NERC, has agreed to sponsor the TFE through the compliance process at NERC. Scott Mix will work with NERC Management to determine the best approach for getting this done.

For the Phase I industry comments, Kevin Perry provided a preliminary overview of the 119 pages of comments received from the 46 industry respondents. The comments were organized by NERC staff, and the latest set of comments was released to the SDT on January 7th.

The SDT reviewed several approaches to responding to the Phase I Comments on the cyber security standards. The preferred approach was to break up into small working groups to review an assigned grouping of standards in parallel. There was agreement to begin the Phase II discussion with the full SDT following the development and agreement on responses to Phase I comments. Following the small group breakouts, the full group would meet to discuss the findings and responses from each of the small working groups. Any cross-references or duplicative responses would be addressed and made consistent during this group review session.

Six small working groups were formed to review the industry comments and to develop the SDT's responses. The six groups were created to craft the SDT's responses and to make appropriate edits to the text of the CIP Standards. The six groups and the SDT members participating included:

Working Group Assignments

CIP Standard No.	Questions Nos.	Assignments/Volunteers
002 & 003	Q1 & Q2	Jeri Brewer, Gerald Freese, Dave Norton, Dave Revill
004 & 007	Q3 & Q6	Chris Peters, Keith Stouffer, Mike Winters, William Winters
005 & 006	Q4 & Q5	John Varnell, John Lim, Rich Kinas, Scott Fixmer, Scott Rosenberger
008 & 009	Q7 & Q8	Tom Hofstetter, Joe Doetzel, Kevin Sherlin
Compliance	ALL Qs	Roger Lampila, Todd Thompson, Jackie Collett
Implementation	Q9, Q10, Q11, Q12	Kevin Perry, Scott Mix, Phil Huff
Q13	Q13	Tom Hofstetter and various small groups

The SDT agreed that whatever was not completed by the end of this meeting (January 7–9, 2009) could be taken up in the WebEx calls scheduled for January 15th and January 21st.

The members of each small working group considered the following in presenting their findings to the full group:

- Present substantive issues and responses from most to least contentious (10–15 total minutes for each small group report);
- The full SDT will focus on most contentious issues to confirm response(s); and
- Small groups may reconvene to refine responses.

The SDT reviewed all 13 questions and draft responses to industry comments and addressed compliance issues raised across all of the comments.

On the third day the small groups met again to review and refine their comments further in light of the SDT review on day two.

Scott Mix introduced John Sykes, Vice Chair of the NERC System Protection and Control Subcommittee, which is looking at redundancy in control and protection systems, as an aspect of critical asset protection. They are early in their process of review. The NERC SPCS has written a technical white paper, a proposed working paper for a standard, and has prepared the

presentation. It took two an a half years to get to this point, and the SPCS need lots of industry input because of the high potential cost to the industry. The major topic of discussion was on the methods for determining risk. Do we write a prescriptive standard or a performance-based standard? Key initial question, helped decide on the performance based approach.

Stu Langton introduced a review of the Phase II White Paper process. He reviewed discussion from the previous SDT meeting in Washington where we came away with proposal to prepare and review two straw proposals, one starting from the CIP standards perspective and looking to incorporate applicable NIST concepts and the other starting from the NIST standards perspective and looking to incorporate CIP concepts.

Jackie Collett took a look at the NIST 800-53 standard and sees promise, but she also sees aspects of the standard that may cause concern for electric power systems. Jackie reviewed her take on the original intent of the NERC CIP-002 standard. William Winters offered initial thoughts on his approach from NIST, and how he might address some of the gaps in the standards but recognizing the concerns the industry may have with the NIST risk assessment approach, particularly cost. Bill will look at what NIST does regarding asset identification, focusing on CIP-002, not CIP-003.

This discussion provided guidance to Jackie and William to develop their approaches for review in February. Jackie noted she would be working with other members in developing the paper. William will look at how NIST can be tailored to fit with the CIP standards, while Jackie will look at how the CIP standards can be adopted into the NIST framework. Both will be brought together to see if and how a hybrid might work effectively. Both products will be circulated before the next face-to-face meeting in early February.

The SDT must sign off on the edits by the end of the next meeting in Phoenix to meet the proposed schedule for Phase I. The facilitators reviewed the schedule for the meetings through June 2009.

The meeting was adjourned at 11 a.m. on January 9, 2009.

Fifth Meeting Summary,
January 7–9, 2009
Phoenix, Arizona

I. INTRODUCTIONS, AGENDA REVIEW, PROCEDURES AND OPENING REMARKS

The Chair and Vice Chair welcomed the members and asked NERC staff David Taylor to conduct a roll call of members and participants in the room and on the conference call *(See appendix #2*). They then reviewed with the team and participants the proposed meeting agenda *(See appendix #1*).

David Taylor reviewed with the team the need to comply with NERC's Antitrust Guidelines *(See, appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The Chair noted the December 4–5, 2008 meeting summary had been circulated to members in advance of the meeting. The team unanimously accepted the meeting summary.

II. TECHNICAL FEASIBILITY EXCEPTION- UPDATE, REVIEW AND REFINEMENT

Scott Mix provided an update on the Technical Feasibility Exception process since
The Technical Feasibility Exception (TFE) process is based on discussion with utility management. The process is not about the technical requirements and standards that the SDT is addressing, but it is more about whether compliance has been met; compliance is more than just the audit process. TFE was intended to address the issues where compliance could not be met quickly, thereby allowing for good reason to be technically out of compliance while significant issues can be addressed.

The TFE White Paper is being reviewed by NERC management. Compliance and Legal counsel were sought concerning how the white paper should be positioned and what it would mean to enforcement. It needs its own vetting process within NERC, and it may require modification to the Compliance Monitoring and Evaluation Program (CMEP). Changes to the CMEP are applicable across all of NERC's standards, so the TFE needs to well thought through and vetted within NERC.

Mike Assante, Chief Security Officer at NERC, has agreed to sponsor the TFE through the compliance process at NERC. Scott Mix will work with NERC Management to determine the best approach for getting this done.

Member Comments

- Is there a schedule for getting something to NERC's Mike Assante? Still missing legal information on how it can be done.
- This is an important issue linked to the removal of reasonable business judgment language in Phase I draft changes.

III. PHASE I INDUSTRY COMMENT and SDT RESPONSES

A. Overview of and Response to Phase I Comments on the SDT Standards

Kevin Perry provided a preliminary overview of the 119 pages of comments received from the 46 industry respondents. The comments were organized by NERC staff, and the latest set of comments was released to the SDT on January 7th. In summary, there were:

- No show stoppers
- Lots of duplication in the comments received
- Some comments cross multiple standards with common concerns such as:
  - Compliance Enforcement Authority
  - "a" vs. "the" senior manager and the delegation of authority
- New compliance language received lots of comments and maybe confusing to industry
- Confusion regarding data retention requirements warrants further discussion

Mr. Perry recommended that the Compliance team pay close attention to the new compliance wording so as to avoid the possibility of impact on all of the cyber security standards.

B. SDT Approach for Reviewing Phase I Comments

The SDT reviewed several approaches to responding to the Phase I comments on the cyber security standards. The preferred approach was to break up into small working groups to review an assigned grouping of standards in parallel. There was agreement to begin the Phase II discussion with the full SDT following the development and agreement on responses to Phase I comments. Following the small group breakouts, the full group would meet to discuss the findings and responses from each of the small working groups. Any cross-references or duplicative responses would be addressed and made consistent during this group review session.

The SDT agreed the Industry Comments need to be addressed in January 2009 through the face-to-face meeting and WebEx that were scheduled. The plan was to have the responses ready for review by NERC by the February 2–4, 2009 meeting for group adoption and eventual posting. Some of the SDT member overview comments included:

1. Many comments could be contentious and caution should be taken such that we answer comments at face value and not be drawn into the arguments.
2. Avoid getting drawn into discussing the Aurora incident; it is out of scope for the SDT.

3. A lot of the issues will be considered in Phase II; our response needs to indicate that the commenter should review their concern when Phase II documents are published for industry review and comment. An appropriate response may be "we will consider the comment in Phase II".
4. We will receive comments during the ballot period that we will need to respond to — hopefully the highly contentious issues are identified now before sending out the Phase I standards for ballot.
5. A "significant" change to a standard versus a "minor" change is a judgment call initially made by SDT and reviewed by the NERC Standards Manager (Maureen Long).
6. If we make a significant change to what's already been published, we'll have to seek comments again.
7. If we do not change the requirement but move it to a different standard, is that a significant change? Some clarification may be needed.
8. The plan is to issue the responses to the industry comments without requiring another round of industry comments.
9. If we receive a particularly contentious comment, consider removing the item for further consideration in Phase II.
10. Compliance comments and issues should be addressed by the Compliance small group which will have one SDT member participating.
11. Keep responses short and concise; don't water it down or get involved in long explanations; take the issue on in the appropriate language.
12. Point to reference documents, where appropriate, to address confusion about what some requirements mean.
13. Put the background material into the responses and refer to it, if needed.
14. A suggestion was made to include an introduction to the standards comments response document that describes the approach and what is being accomplished in Phase I and that the major issues will be addressed in Phase II.

C. Small Working Groups

Six small working groups were formed to review the industry comments and to develop the SDT's responses. The six groups were created to craft the SDT's responses and to make appropriate edits to the text of the CIP standards. The six groups and the SDT members participating included:

Working Group Assignments

CIP Standard No.	Questions Nos.	Assignments/Volunteers
002 & 003	Q1 & Q2	Jeri Brewer/Gerald Freese/Dave Norton/Dave Revill
004 & 007	Q3 & Q6	Chris Peters/Keith Stouffer/Mike

		Winters/William Winters
005 & 006	Q4 & Q5	John Varnell/ John Lim/ Rich Kinas/Scott Fixmer/Scott Rosenberger
008 & 009	Q7 & Q8	Tom Hofstetter/Joe Doetzel/Kevin Sherlin
Compliance	ALL Qs	Roger Lampila/Todd Thompson/Jackie Collett
Implementation	Q9, Q10, Q11, Q12	Kevin Perry/Scott Mix/Phil Huff
Q13	Q13	Tom Hofstetter and various small groups

The SDT agreed that whatever was not completed by the end of this meeting (January 7–9, 2009) could be taken up in the WebEx calls scheduled for January 15th and January 21st.

The members of each small working group were asked to consider the following in presenting their findings to the full group:

- Present substantive issues and responses from most to least contentious (10-15 total minutes for each small group report);
- The full SDT will focus on most contentious issues to confirm response(s); and
- Small groups may reconvene to refine responses.

The WebEx was re-initiated after lunch. The facilitator reviewed the expectations for the group reports with a focus on the most contentious or substantive issues that will need full group input for possible additional refinement. The small group reports were brief with an opportunity for groups to revise their work.

1. **Questions 1 and 2 (CIP 002 & 003)**
   Three sets of substantive issues were presented by the small group:

   1. Concern about assigning a senior manager in CIP-003 rather than in CIP-002.
   2. Clarify delegation of senior manger responsibilities
   3. Industry concern about the responsibility of a senior manager vs. a responsible entity (accountability issue?)

   SDT members noted there was some confusion over how to delegate responsibilities. For example, does the Senior Manager have the authority to: assign specific actions; identify which responsibilities will be delegated; document only those delegations assigned to each delegate; delegate authority for specific actions (added) “assigned to the senior manager” to a named delegate or delegates.

Other items the small group proposed for changes included:

- Delete "business phone" information. Yes
- Use "calendar days" throughout CIP-002 to 009.
- Add: "assigned to the senior manager" to a named delegate or delegates.

An SDT straw poll was taken to test support for adding/deleting this language to the requirement: *(Result: 7 for; 10 against, falling short of 75% support).* As a result of poll, the small group would draft responses consistent with this direction back to those offering the language in their comments.

2. **Questions 3 and 6 (CIP-004 and CIP-007)**
Substantive issues raised by the small group and discussed by the SDT included the following:

- How should the SDT respond to comments on addressing ambiguity in "specified circumstances"? SDT should answer that the language was included as directed in FERC Order 706.
- The SDT agreed they need to be specific in responses, not necessarily clarifying, but more explicit about what the drafting team will do with the issue raised.
- Don't change any language, but specify where the wording came from.
- Phase II will not change the language either.
- We should be careful about what we are promising to do in Phase II.
- Leave first sentence of the response as is and refine second sentence into a shorter version without promising future action
- SDT needs to avoid creating any linkages between guidance and standards.

The small group highlighted the following key items for discussion:

1. For R3 — need to specify critical assets. Added access "to critical cyber assets" - much the same reference in R2 — consistency issue
2. Added "all" in front of "other" cyber assets to remove any potential ambiguity. Need to be consistent across the different standards — use the same terminology

A SDT straw poll was taken to test adding securing "all" Cyber Assets within an ESP: (*10 yes; 8 no falling short of 75 percent support).* As a result of the poll, the guidance for the small group was to respond that these changes will be addressed in Phase II.

The SDT agreed not to take out "acceptance of risk" which did not make a substantive change but review of the response for group support. Recommendation is to consider language modification, residual risk analysis would demonstrate that an entity has

exercised due diligence when compensation measures have been applied. The SDT agreed that the response should be that the analysis will be considered in development of the technical feasibility (TFE) process.

Within the measures the team initially agreed with changing M2 to make it consistent with other measures, but suggest alternative language to add "and records" to M2 — (make available documentation "and records of its ports and services process" as specified in Requirement R2). SDT agreed to remove "and records" in order to limit the "heartburn". The SDT could revisit this in Phase 2?

A SDT straw poll taken to test if there support for adding the language. (*7 yes; 11 no falling short of 75 percent support)*. As a result of the poll, the guidance for the small group was to respond that these changes will be addressed in Phase II

The team may need to re-explain in the responses the need for the Phase I changes to meet the June audit deadline set by FERC Order when the response document is sent out for comment.

3. **Questions 4 and 5 (CIP-005 and CIP-006)**
Substantive Issues:

   a. Substitute "subsequent" phases for Phase II; "subsequent" phases anticipate significant changes

   b. Intent is to include only devices that perform access control or monitoring, not those devices that are receiving alerts

   c. Only a few real changes suggested and agreed to:

      - Change "maintain and implement" to "implement and maintain"
      - "Continuous" is a clarification of active escort and SDT agreed not to remove it from the requirement.
      - Agree that R1.4 should reference R4 and not R3
      - Competing authorities is outside the scope of the SDT – offer to refer it to appropriate entity (NERC)
      - Reliability standards only prescribe what and not how

   d. Is there a more positive way of asking commenters to resubmit during the next phase?

   e. In Phase II, the SDT will need to address differences between logging and monitoring/

   f. Use of "documents" versus "documentation" – need to be consistent in use

4. **Questions 7 and 8 (CIP-008 and CIP-009)**
    a. Concern with the addition of the word "dated" into the measures
    b. CIP 009-02 R3 missed the mark
    c. CIP 008-02 confusing wording

Actions:

a. "Dated": Remove the word "dated" from the measures.

b. CIP-009-02 R3:
- Rewrite to meet intent of FERC Order 706 (P731)
- Change control — updates shall be completed within 30 days and communicated within 90 calendar days (What is meant by "completed"?)
- Subsequent discussions led to the decision to wait to make any changes until Phase II development of the CIP Standards.

c. CIP-008-02 R1.3 to R1.6:
- Remove "process for" from each requirement
- R1.5 and R1.6 add annual testing of the response plan
- *Comments:*
    - Add to the compliance section as additional guidance?
    - Is this a major change requiring submittal for further comments?
    - Putting it in as additional compliance guidance - is it a major or minor modification to the standard?
    - This comment is not related to a change made in the last revision to the standards, but rather is a new additional item. These changes should be addressed as part of Phase II
    - Do we need to weigh the number of commenters making the comment that this section is confusing?
- Subsequent discussion to accept these comments or pull them for consideration in Phase II led to the conclusion to wait until Phase II. A good strawman will be needed to start the process at that time.

5. **Questions 9 to 12 (Implementation)**
    Actions to be taken:
    1. Update Implementation Tables
    2. Modify the SDT implementation plan to clarify emergency provision
    3. Change category 3
    4. Change #3 to add "cyber"
    5. Reference "other" CA rather than "non-critical" CA
    6. Modify timeframe to 18 months after the new CCA is identified
    7. Update Table 2 to reflect the addition of two new requirements

8. Any further updates to Table 2

Decisions:

a. Implementation plan as a separate document — consider incorporating in subsequent revisions

b. Guidelines for identifying CA and CCA are being developed

c. Six months is reasonable — the SDT agreed to leave it and not change it as requested to nine months

d. Nuclear facilities are out of the scope of this SDT group

Explanations:

- "In the event of a merger or acquisition of a company, … allow one year for the programs to be harmonized." If one party has a program then continue it while merging, if they have competing programs, then take a year to sort it out – this is a response to a comment, not making any changes to standard.
- Concern about how this applies when a holding company owns separately registered entities — will address by revising language here
- Reviewed items "tossed over the wall" to the Compliance small group

Proposed effective date in implementation plan — add "compliant" to clarify from "auditably compliant". There was no opposition. There was a test to leave without "compliant" which concluded with no objection. Why does title include "proposed"? Not adopted yet and consistent with other implementation plans

6. Compliance Issues (All CIPs)

- The wording in Compliance Section 1.1.1 does not specify who is responsible for the enforcement – not changing it at this time but probably will need to – have sent it to NERC (Maureen) for possible clarification
- Do the terms ERO and Compliance Enforcement Authority need to be defined in the glossary? They are already defined in the Rules of Procedure of NERC, which is hierarchically higher in terms of precedence of documentation, and therefore governs the definition - is not needed in the standards glossary
- Can we just add the same definition to the glossary? Keep response simple here that definition is already covered in the Rules of Procedure.
- "Dated" – do we revise the measures for all standards to include "dated"?
  - (Comment: - In phase I, leave it like it is – revisit in Phase II)
- Reinstate "duly authorized exceptions will not result in non-compliance"?
  - Referring back to NERC for follow up
- "In conjunction" leaves open possible interpretation – referred back to NERC

Jackie will review the rest of the compliance issues, but expects most new comments will be repeats from responses covered above. Jackie will flag any additional issues that the group may need to address.

7. **Question 13 (All CIPs)**
   Tom Hofstetter described how he assigned many of the comments to the appropriate small group. The small groups will need to tag or segregate their responses to Question 13 items so they can be pulled out to include as a set of responses under Question 13.

   Tom reviewed a few basic responses that he proposes to comments that are not related to other questions or small groups.

IV. NERC System Protection and Control Presentation (Jon Sykes)

Scott Mix introduced John Sykes, Vice Chair of the NERC System Protection and Control Subcommittee, which is looking at redundancy in control and protection systems, as an aspect of critical asset protection. They are early in their process of review.

The NERC SPCS has written a technical white paper, a proposed working paper for a standard, and has prepared the presentation. It took two an a half years to get to this point, and the SPCS need lots of industry input because of the high potential cost to the industry.

The major topic of discussion was on the methods for determining risk. Do we write a prescriptive standard or a performance-based standard? Key initial question, helped decide on the performance based approach.

Defined "redundancy", and reviewed protection system performance requirements Methodology to determine adequate redundancy of a Protection System:

- Determine redundancy of the PS
- Ascertain the performance of the PS
- Compare protection systems performance with electric system performance requirements in the TPL standards
- Mitigate all performance shortfalls

V. White Paper Discussions for Phase II

Stu Langton introduced a review of the Phase II White Paper process. He reviewed discussion from the previous SDT meeting in Washington where we came away with proposal to prepare and review two straw proposals, one starting from the CIP standards perspective and looking to incorporate applicable NIST concepts and the other starting from the NIST standards perspective and looking to incorporate CIP concepts.

Jackie Collett took a look at the NIST 800-53 standard and sees promise, but she also sees aspects of the standard that may cause concern for electric power systems. Jackie reviewed her take on the original intent of the NERC CIP 002 Standard.

William Winters offered initial thoughts on his approach from NIST, and how he might address some of the gaps in the standards but recognizing the concerns the industry may have with the NIST risk assessment approach, particularly cost. Bill will look at what NIST does regarding asset identification, focusing on CIP-002, not CIP-003. Some of the items addressed were:

- Concerns expressed by members about the disincentive for including critical assets, particularly for purposes of audits
- NIST may allow for gradations of identification, but that can complicate compliance – will the NIST approach work in the end?
- Energy Act 2005 and FERC announcements have come subsequent to the drafting of the standards which were written for data centers - industry concern about the cost and need for the identification of the critical assets
- Understand where and why we are where we are today to help figure out how to avoid potential industry refection – if industry does not accept, then FERC will do something because they now have clear Congressional support to do something
- Change in administration attitude about the need for industry regulation – we need to do a better job of educating the industry on the cyber risk in order to get their support for changes and limit the gaming – people want to do the right thing, if they understand why
- NERC SDT is focused on critical assets for the bulk power system, but the NIST framework covers the whole spectrum of systems used by the federal system.
- Generation aspect does not necessarily include transmission – we need to understand the different needs but be sure to include both – one size will not fit all for different systems
- Homeland Security list exists – need to resolve how industry list supports this other broader list
- ISA 99 takes a multi-level approach to security
- Identify the cyber assets that do x, y and z – then if it fails what bad happens – that identifies critical cyber assets system wide – is the information flow essential, follow out to find boundary, even where it crosses company boundaries – need to get away from applying physical engineering to the flow of information
- How do we reorganize what we consider critical?

This discussion provided guidance to Jackie and William to develop their approaches for review in February. Jackie noted she would be working with other members in developing the paper.

Should the approaches be combined now for review next time? Or parallel approaches to be merged later? Jackie envisioned parallel approaches to then be compared, and William agreed. Also they agreed that the items/issues identified are the starting points to be addressed. William will look at how NIST can be tailored to fit with the CIP standards, while Jackie will look at how the CIP Standards can be adopted into the NIST framework. Both will be brought together to see if and how a hybrid might work effectively.

Both products will be circulated before the next face-to-face meeting in early February. Some manner of blending will occur — just a matter of how much, however no one is saying start over from scratch. They will review and discuss the balance and trade-offs especially from an audit perspective. Five issue areas will be used by Jackie as part of the problem statement.

VI. Wrap-Up and Next Steps

The SDT must sign off on the edits by the end of the next meeting to meet the proposed schedule for Phase I. The next meeting is scheduled at the downtown Phoenix Hyatt Regency, please plan on staying the full meeting time, and especially try to stick around for the afternoon of the third day.

Beyond the February 2–4, 2009 meeting in Phoenix:

- February 18–19, 2009 in Fairfax, VA (ICFI Offices)
- March 10, 2009 Workshop
  - Progress at the next few meeting will help move us toward preparations for that workshop. Need to work in February to prepare for the workshop, which is preliminarily scheduled in conjunction with the March 10–12, 2009 SDT Meeting in the Orlando or Tampa area.
  - Purpose of the Workshop is to broaden our outreach and enlist review and input from cyber security experts in other industries as well as the electric industry.
  - The workshop will lead to a presentation to the NERC MRC on or about May 1, 2009.
- April 14–16, 2009 in Charlotte (Duke Energy)
- May 14–15, 2009 in Boulder City, NV (Bureau of Reclamation)
- June 17–18, 2009 in Manitoba (Manitoba Hydro)

Web meetings are scheduled approximately one week following each SDT meeting. Industry Webinar meetings are also planned to keep the industry informed on the progress of the Cyber Standards development.

The meeting was adjourned at 11 a.m. on January 9, 2009.

Appendix #1

Revised Meeting Agenda

Arizona Public Service Deer Valley Campus

Wednesday January 7, 2009

1:00 p.m. **Welcome and Opening Remarks — Jeri Domingo-Brewer and Kevin Perry**

a. Roll Call
b. NERC Antitrust Compliance Guidelines
c. FSU/FCRC Review of December meeting and adoption of December 4–5 Meeting Summary

1:15 **Review of Meeting Objectives and Agenda — Jeri Domingo and Bob Jones**

1:20 **Organizational Issues and Review of Phase 1 and early Phase II Schedule — Stuart Langton**

- Review of Phase 1 — Work-plan, January — May 2009 including small group proposal
- Review of Phase 2 — January–June, 2009 — including CIP-002 conceptual approach and industry input and feedback.

2:00 **Overview of Phase I Industry Responses — Number and Issues and Procedure Going Forward — Kevin Perry**

2:30 **Technical Feasibility Exception (TFE) — Briefing on NERC Review and Proposal Going Forward — Scott Mix**

3:00 **Break**

3:15 **TFE White Paper — Review of Changes and Additional Suggestions**

4:00 **Phase I Comment Review and Refinement — Full SDT Discussion of Cross Cutting Issues**

4:50 **Summary of Day One Outcomes and Review of Day Two Agenda**

5:00 **Recess**

Thursday January 8, 2009

8:00 **Welcome — Agenda Review and Review of Day One Results**

8:10 **Phase I Comment Review and Refinement- Plenary Discussion of Overall and Cross Cutting Issues**

9:00 **Break**

9:10 **Possible Small Group Breakouts — Review and Draft Responses**

12:00 **Working Lunch *(Return to plenary meeting at 12:45)***

12:45 **Initial Small Group Reports on Draft Responses and Full SDT Discussion**

2:45 **Break**

3:00	**Initial Small Group Reports on Draft Responses and Full SDT Discussion**
4:20	**Next Steps for Drafting Group WebEx Meetings in preparation for February 2–3, 2009 Meeting**
4:50	**Summary of Day Two Outcomes and Review of Day Three Agenda**
5:00	**Recess**

Friday January 9, 2009

8:00	**Welcome and Agenda Review**
8:10	**Learning from Other Initiatives — John Sykes, NERC System Protection and Control Task Force**
9:00	**SDT Discussion of Implications for Phase II 002 Critical Asset Identification**
10:00	**Break**
10:15	**Phase II White Paper Development — Early Thoughts and Preview and Questions of the SDT to aid in the drafting- Jackie Collette and William Winters**
11:30	**Assignments — Next Steps and Review of Work-plan**
12:00	**Adjourn**

Appendix # 2

Attendees List
January 7–9, 2009

Attending in Person — SDT Members

1 **Jeri Domingo-Brewer, Chair**	U.S. Bureau of Reclamation
2. Jackie Collett	Manitoba Hydro
3. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co. (Dec 4, in room, Dec 5 on phone)
4. Tom Hoffstetter	Midwest ISO, Inc
5. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp. (in room Dec 4, by phone Dec 5)
6. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
7. Phillip Huff	Arkansas Electric Coop Corporation
8. Richard Kinas	Orlando Utilities Commission
9. John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
10. David Norton	Policy Consultant, CIPEnergy Corporation
11. **Kevin B. Perry, Vice Chair**	Director, IT-Infrastructure, Southwest Power Pool
12. Christopher A. Peters	ICF International
13. David S. Revill	Georgia Transmission Corporation
14. Scott Rosenberger	Luminant Energy
15.Kevin Sherlin	Sacramento Municipal Utility District (Day 2)
16. Keith Stouffer	National Institute of Standards & Technology
17. John D. Varnell	Technology Director, Tenaska Power Services Co.
18.Michael Winters	Hydro One
19. William Winters	Arizona Public Service.
1. Roger Lampilla	NERC
2. David Taylor	NERC
3. Scott R. Mix	NERC
4. Todd Thompson	NERC
7. Robert Jones	FSU/FCRC Consensus Center Feb 3-4
8. Hal Beardall	FSU/FCRC Consensus Center Feb 2-4
9. Stuart Langton	FSU/FCRC Consensus Center
10. Joe Bucciero	Bucciero Consulting LLC

SDT Members Attending via WebEx and Phone

20. Jay S. Cribb	Southern Company Services, Inc.
21. Sharon Edwards	Project Manager, Duke Energy *Jan. 7.*
22.Jonathan Stanford	Bonneville Power Administration

SDT Members Not Attending

Bryan Singer	Kenexis Consulting Corp.

Appendix # 3

JANUARY — JUNE 2009 DRAFT SDT SCHEDULE

NOTE: Below are draft considerations developed by the facilitators in consultation with the Chair, Vice Chair and NERC staff and following the December SDT NERC Communication Plan briefing and Phase 1 Webinar on December 16. The facilitators also reviewed the SDT criteria for a "roadmap approach" to revising the CIP standards discussed and refined in Little Rock at its November, 2008 meeting (See pp 4 below for a list of the criteria) These considerations were used to construct a draft schedule for the SDT for the first half of 2009.

Short Term 2009 Schedule Draft Considerations

1. Follow the ANSI standard development process but use creative ways to efficiently secure input from the industry on emerging concepts and approaches to the CIP standards.
2. Seek creative ways to get advice and input to the SDT from experts in cyber security.
3. Seek creative ways to get focused input from industry stakeholders.
4. Take advantage of input opportunities from related NERC committees that will be meeting in the first half of 2009 (e.g. working with the NERC Members Representative Committee, CIPC, BOT, and industry committees such as the Electricity Sector Coordinating Council, etc.)
5. Seek, as soon as possible but no later than late Spring, 2009, to establish a consensus on the way forward for the SDT in its efforts to revise the CIP standards.
6. Track any follow up to the "Securing Cyberspace for the 44th Presidency" report of the Commission on Cyber security for the 44th President.

SDT Draft Schedule — January–June 2009

Overview

- 7 SDT Face-to-Face Meetings
- Multiple SDT subgroup and subcommittees WebEx Meetings
- 1 Cyber Expert Workshop (March 10 or 11, 2009)
- 1 NERC CIPC presentation? (Feb. 9, 2009)
- Industry Comments on CIP 002 White Paper (April 17–June 3)
- 1 NERC Members Representative Committee, May 1, 2009
- Other Meetings?

SDT Draft Schedule — January–June, 2009

1. January 7–9 SDT Meeting — Phoenix, AZ ½–1/½ day format — Wednesday–Friday

- Review of Technical Feasibility Exceptions white paper
- Review of Industry Comments on Phase 1 products- Establish and convene small groups
- Initial Review of Phase 2 White papers

January 15 — WebEx meeting(s)

- Small group draft responses to industry.

January 21 — WebEx meeting(s)

- Small group draft responses to industry.

2. February 2–4, 2009 SDT Meeting — Phoenix, AZ, ½–1/½ day format — Monday–Wednesday

- Review of Small Group responses and recommendations on Industry comments and adopt draft of Phase 1 products, as revised, for review by NERC/Maureen.
- Review of Phase 2 White papers and Testing of a Phase 2 CIP 002 concept going forward

February 9, 2009 — CIPC Meeting — Update on SDT Progress and Input?

February 11 — WebEx meeting?

- Phase 2 drafting concept group?

3. February 18–19, 2009 SDT Meeting — Boulder City, NV

- Review of Maureen's comments and adoption of Phase 1 products for balloting.
- Further discussion and adoption of a draft Phase 2 CIP 002 Concept for review by experts and stakeholders in March and beyond.

February 25 — WebEx meeting(s)

- Phase 2 drafting concept group?
- Development of Phase 2 CIP 002 Workshop for review by experts and stakeholders

4. March 10–11, 2009 SDT Meeting — Tampa, FL, 2-day format

- Invited Cyber Security Experts join SDT in a workshop to provide expert feedback to draft CIP 002 concept.
- Further SDT refinement of the CIP 002 proposed concept

March NERC Balloting on Phase 1 Products

March 18 — WebEx meeting(s)

- Phase 2 drafting concept group?

5. April 14–16, SDT Meeting, Charlotte NC — ½–1/½ day format. Wednesday-Friday

- Continue review and refinement of 002 concept and adopt White Paper on CIP 002 concept for Industry Comment

Industry Comment Period on White Paper — 45-days (April 17–June 3)

*May 1, **NERC Member Representative Committee**, Presentation of the Phase 2 CIP 002 Approach for MRC input. (Agenda item, Possible Workshop?)*

6. May 13–14 — SDT Meeting — Dallas, TX, 2-day format

- Review and respond to MRC input and further SDT refinement of the CIP 002 proposed concept and SDT CIP roadmap.
- Organize SDT in subcommittees to begin effort to draft revisions to CIP 003-008 or to address key issue areas.

June — following June 3 — WebEx meeting(s)

- SDT subcommittee meetings to review and draft responses to Industry comments on the CIP 002 concept.

7. June 17–18, SDT Meeting — Location TBD —2-day format

- Review Subcommittee responses to Industry comments on 002 approach
- Charge subcommittees and conduct organizational meetings
- Subcommittees meet to draft revisions to CIP 003-008

June — WebEx meeting

- SDT Subcommittee meetings

July–December, 2009 — SDT and subcommittees meet and continue CIP drafting

2nd DRAFT PHASE 2 ROADMAP APPROACH ASSESSMENT CRITERIA

(Presented, Revised, and Added to by SDT in its review on November 14, 2008)

1. The approach is consistent with the SDT purpose statement and is responsive to the FERC 706 directives and the SAR.
2. The approach is achievable given the SDT schedule and work plan.
3. The approach does most to advance and enhance cyber security in the BES.
4. The approach helps the SDT address the foundational issues with the current standards.
5. The approach is capable of implementation.
6. The approach is capable of improving compliance.
7. The approach helps protect the current investments and wherever possible builds on what has already been done.
8. The approach helps to identify and mitigate risk on an ongoing basis.
9. The approach balances a “systems” orientation with a “facilities” orientation to asset protection.
10. The approach is capable of being extended into related interests by others (distribution, AMI, Smart Grid, etc.).
11. The approach enables the industry to provide the appropriate level of security (i.e. not over securing nor under securing the BES cyber assets).

12. The approach allows for discrimination among and targeting the various types of infrastructure that support the BES

Appendix # 4

NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups)

should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 5

Below is a link to all of the documents reviewed by the SDT during the full team discussions in Washington D.C. as well as Phase 1 SDT Products:

Adopted Unanimously, November 13, 2008

Cyber Security for Order 706 Standard Drafting Team

Consensus Guidelines

The Cyber Security for Order 706 Standard Drafting Team (team) will seek consensus on its recommendations for any revisions to the CIP standards.

General consensus is a participatory process whereby, on matters of substance, the members strive for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for the final package of recommended revisions, and the team finds that 100 percent acceptance or support of the members present is not achievable, final consensus recommendations will require at least 75 percent favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing consensus throughout the process on substantive issues with the participation of all members. In instances where the team finds that even 75 percent acceptance or support is not achievable, the team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50 percent support from the team.

The team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The team's consensus process will be conducted as a facilitated consensus-building process. Team members, NERC staff and facilitators will be the only participants seated at the table. Only team members may participate in consensus ranking or vote on proposals and recommendations. Observers or members of the public are welcome to speak when recognized by the Facilitator and all written comments submitted on the comment forms will be included in the Team and facilitators' summary reports.

The team will make decisions only when a quorum is present. A quorum shall be constituted by at least 51 percent of the appointed members being present (simple majority). The ream will utilize Robert's Rules of Order (as per the NERC Reliability Standards Development Procedure), as modified by the Team's adopted procedural guidelines, to make and approve motions;

however, the 75 percent supermajority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision making on substantive motions and amendments to motions. In addition, the Council will utilize their adopted meeting guidelines for conduct during meetings. The Council will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

The presiding chair and/or Facilitator of the SDT, in general, should use parliamentary procedures set forth in Robert's Rules of Order, as modified by Council's adopted procedural guidelines.

To enhance the possibility of constructive discussions as members educate themselves on the issues and engage in consensus-building, members agree to refrain from public statements that may prejudge the outcome of the team's consensus process. In discussing the team process with the media, members agree to be careful to present only their own views and not the views or statements of other participants and/or may direct such inquiries to the team Chair and Vice Chair. In addition, in order to provide balance to the team process, members agree to represent and consult with their stakeholder interest group.

Meeting Guidelines for Participants

Participants' role in meetings:

- Explore possibilities
- Listen to understand (Respect) (limit sidebar conversations)
- Be focused and concise. (Avoid repetition. No need to offer comments in "strong agreement.")
- Focus on issues, not personalities.
- Offer options to address others' concerns.
- No sidebars.
- If participating by phone, indicate who is speaking.
- If participating by phone, please use the mute button. Do not put the phone on hold.

Facilitators/Staff role in meetings:

- Assist the Chair and Vice Chair in helping the Team stay on task
- Help the group follow agreed upon ground rules
- Design the meeting and problem solving process in consultation with the Chair and Vice Chair
- Facilitate discussion participation of the Team and other participants
- Prepare agenda packets and reports

Consensus Building Techniques

- Brainstorming (green light thinking – not judgmental) At certain points, the facilitator may ask the group to suspend judgment and get ideas onto the table before debating.

- Name Stacking in Team Discussions (use of name tents to seek attention)

- Acceptability Consensus Ranking Scale
  - Use a consensus acceptability scale to help focus discussion and test support in reviewing substantive issues.
  - Use to guide and focus discussion and as a poll to see where the Team stands, not used as a voting mechanism.
  - Must be prepared to offer refinements and suggestions to address serious concerns.

  4 = Proposal is acceptable as it is
  3 = Proposal is acceptable; I can live with it but there are minor concerns to address
  2 = Proposal is not acceptable. Proposal may be acceptable if the major concerns are addressed
  1 = Proposal is not acceptable

- Consensus Ranking Scale

  4. Comfortable—I support proposal as is ♥♥♥♥
  3. Minor Reservations— I can live with this; but would like to see changes as follows♥♥♥ Be prepared to offer specific refinements or changes to address your concerns.
  2. Major Reservations—I can't support this unless following changes are addressed to meet my serious concerns ♥♥ Be prepared to offer specific refinements or changes to address your concerns.
  1. Fatal Flaws—I can't support this ♥ Be prepared to offer alternatives and options that would address your own as well as other's concerns.

- Robert's Rules of Order and Facilitated Consensus Building Procedures

The Council will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

Appendix # 6

FERC 706 Background References

Regarding NIST:

25. The Commission believes that the NIST standards may provide valuable guidance when NERC develops future iterations of the CIP Reliability Standards. Thus, as discussed below, we direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of the NIST framework. However, in response to Applied Control Solutions, we will not delay the effectiveness of the CIP Reliability Standards by directing the replacement of the current CIP Reliability Standards with others based on the NIST framework.

232. As proposed in the CIP NOPR, the Commission will not at this time direct NERC to incorporate specific provisions of the NIST standards into the CIP Reliability Standards. While commenters provide compelling information that suggests that the NIST standards may provide superior measures for cyber security protection, the Commission is concerned that the immediate adoption of the NIST standards would result in unacceptable delays in having any mandatory and enforceable Reliability Standards that relate to cyber security.

233. The Commission continues to believe – and is further persuaded by the comments – that NERC should monitor the development and implementation of the NIST standards to determine if they contain provisions that will protect the Bulk-Power System better than the CIP Reliability Standards. Moreover, we direct the ERO to consult with federal entities that are required to comply with both CIP Reliability Standards and NIST standards on the effectiveness of the NIST standards and on implementation issues and report these findings to the Commission. Consistent with the CIP NOPR, any provisions that will better protect the Bulk-Power System should be addressed in NERC's Reliability Standards development process. The Commission may revisit this issue in future proceedings as part of an evaluation of existing Reliability Standards or the need for new CIP Reliability Standards, or as part of an assessment of NERC's performance of its responsibilities as the ERO.

Reliability Standards. In other cases, we note that some or all of the additional guidance could be placed in a reference document separate from the CIP Reliability Standards.

Regarding Risk Management

253. The Commission believes that the comments affirm that responsible entities need additional guidance on the development of a risk-based assessment methodology to identify critical assets. While we adopt our CIP NOPR proposal, we recognize that the ERO has already initiated a process to develop such guidance. The CIP NOPR proposed Docket No. RM06-22-000 - 71 -to direct that NERC modify CIP-002-1 to incorporate the guidance. However, we are persuaded by commenters that stress the need for flexibility and the need to take account of the individual

circumstances of a responsible entity. Thus, we modify our original proposal and in this Final Order leave to the ERO's discretion whether to incorporate such guidance into the CIP Reliability Standard, develop it as a separate guidance document, or some combination of the two. A responsible entity, however, remains responsible to identify the critical assets on its system.

254. Commenters raise a number of topics that they believe should be addressed in the NERC guidance, such as how to assess whether a generator or a blackstart unit is "critical" to Bulk-Power System reliability, the proper quantification of risk and frequency, facilities that are relied on to operate or shut down nuclear generating stations, and the consequences of asset failure and asset misuse by an adversary. We believe these are all appropriate topics to be addressed and direct the ERO to consider these commenter concerns when developing the guidance.

255. The Commission proposed in the CIP NOPR that the ERO and Regional Entities provide reasonable technical support to relatively smaller entities that may have difficulty determining whether a particular asset is critical because, for example, the impact of the facility may be dependent on their connection with a transmission owner or operator. While we believe that there is a need to assist entities that lack a wide-area view, we are mindful of the ERO's concern that it would place an undue burden on it and the Regional Entities. If the ERO believes that it and the Regional Entities do not have sufficient resources to take on this responsibility, it should designate another type of entity with a wide-area view, such as a reliability coordinator, to provide needed assistance. This approach is consistent with our determination (discussed later in this Final Rule) regarding the external review of critical asset lists. Accordingly, we direct either the ERO or its designees to provide reasonable technical support to assist entities in determining whether their assets are critical to the Bulk-Power System.

256. Regarding MidAmerican's comments on use of the N minus 1 criterion when applying a risk-based assessment methodology to the identification of critical assets, we agree with MidAmerican that an N minus 1 criterion is not an appropriate risk-based assessment methodology for identifying critical assets. While the N minus 1 criterion may be appropriate in transmission planning, use of an N minus 1 criterion for the risk based assessment in CIP-002-1 would result in the nonsensical result that no substations or generating plants need to be protected from cyber events. A cyber attack can strike multiple assets simultaneously, and a cyber attack can cause damage to an asset for such a time period that other asset outages may occur before the damaged asset can be returned to service. Thus, the fact that the system was developed to withstand the loss of any single asset should not be the basis for not protecting that asset. Also, we note that the definition of "critical assets" is focused on the criticality of the asset, not the Docket No. RM06-22-000 - 72 - likelihood of an outage. Based on this reasoning, in response to US Power, we clarify that a generator should not assume that none of its individual generating assets would be regarded "critical" to the Bulk-Power System.**84**

257. With regard to Xcel's request for clarification regarding the meaning of the phrase "used for initial system restoration," in CIP-002-1, Requirement R1.2.4, we direct the ERO to consider this clarification in its Reliability Standards development process.

258. As to Entergy's suggestion that the ERO provide a DBT profile of potential adversaries, the ERO should consider this issue in the Reliability Standards development process. Likewise, the ERO should consider Northern California's suggestion that the ERO establish a formal "feedback loop" to assist the industry in developing policies and procedures.**85**

FN84 Further, Requirement R.1.2.3 provides that the risk-based assessment must consider "generation resources that support the reliable operation" of the Bulk-Power System. This language indicates that certain generation facilities, and presumably some facilities within a region identified as critical, must be considered in an assessment. Beyond this, we leave it to the ERO to provide sufficient guidelines to inform generation owners and operators on how to determine whether it should identify a facility as a critical asset. As discussed later in the Final Rule, the Commission will monitor and evaluate the outcome of this endeavor – the list of critical assets.

FN85 Consistent with our approach in Order No. 693, the ERO should address NOPR comments suggesting specific new improvements to the CIP Reliability Standards. The Commission, however, does not direct any outcome other than that the comments receive consideration. See Order No. 693 at P 188.

272. Based on the range of comments received on this topic, the Commission is convinced that the consideration and designation of various types of data as a critical asset or critical cyber asset pursuant to CIP-002-1 is an area that could benefit from Docket No. RM06-22-000 - 76 -greater clarity and guidance from the ERO. Accordingly, the Commission directs the ERO, in developing the guidance discussed above regarding the identification of critical assets, to consider the designation of various types of data as a critical asset or critical cyber asset. In doing so, the ERO should consider Juniper's comments. Further, the Commission directs the ERO to develop guidance on the steps that would be required to apply the CIP Reliability Standards to such data and to consider whether this also covers the computer systems that produce the data.
273. The Commission also agrees with ISO-NE that experience in the implementation of the CIP Reliability Standards may indicate a need to further address this topic in a future proceeding.

Regarding an additional guidance/reference document

61. The Commission received comments on both sides of the issue of specificity. Some commenters caution against the CIP Reliability Standards being too specific, while others request more guidance to help them comply. In general, the Commission believes it is

appropriate to provide sufficient guidance to explain Requirements so that responsible entities have a high degree of certainty that they understand what is necessary to comply with a Requirement. More guidance will allow responsible entities to implement measures adapted to their specific situations more consistently and effectively. Additional guidance need not be included in a specific Requirement, but could be in the form of examples. The Commission is not directing that the ERO establish a specific end result. Our concern is simply that responsible entities have guidance on how to achieve an appropriate result in individual cases, which can vary on a case-by-case basis. Therefore, in several instances throughout this Final Rule, the Commission gives the ERO direction to provide additional guidance. In some cases, we require that the guidance be placed in modifications to the CIP

355. The Commission believes that responsible entities would benefit from additional guidance regarding the topics and processes to address in the cyber security policy required pursuant to CIP-003-1. While commenters support the need for guidance, many are concerned about providing such guidance through a modification of the Reliability Standard. We are persuaded by these commenters. Accordingly, the Commission directs the ERO to provide additional guidance for the topics and processes that the required cyber security policy should address. However, we will not dictate the form of such guidance. For example, the ERO could develop a guidance document or white paper that would be referenced in the Reliability Standard. On the other hand, if it is determined in the course of the Reliability Standards development process that specific guidance is important enough to be incorporated directly into a Requirement, this option is not foreclosed. The entities remain responsible, however, to comply with the cyber security policy pursuant to CIP-003-1.

356. In response to ISO/RTO Council, Ontario Power and other commenters, the Commission's intent in the CIP NOPR – as well as the Final Rule – is not to expand the scope of the CIP Reliability Standards. Requirement R1 of CIP-003-1 requires a responsible entity to document and implement a cyber security policy "that represents management's commitment and ability to secure its Critical Cyber Assets." The Requirement then states that the policy, "at a minimum," must address the Requirements in CIP-002-1 through CIP-009-1. The Commission believes that there are other topics, besides those addressed in the Requirements of the CIP reliability Standards, which are relevant to securing critical cyber assets. The Commission identified examples of such topics in the CIP NOPR. Thus, the Commission, in directing the ERO to develop guidance on additional topics relevant to securing critical cyber assets, is not expanding the scope of the CIP Reliability Standards.

408. The Commission agrees with FirstEnergy on the importance of flexibility in developing a mutual distrust posture, but does not see a conflict between the need for flexibility and what it is proposing, which is simply more guidance. More guidance will allow responsible entities to implement measures adapted to their specific situations more consistently and effectively. Additional guidance need not be included in a specific Requirement, but could be in

the form of examples. We will leave it to the Reliability Standards development process and the ERO to decide whether some or all of the guidance can be contained in separate guidance documents referenced in the Reliability Standard. In response to Entergy, the Commission is not directing that the ERO establish a specific end result. Our concern is simply that responsible entities have guidance on how to achieve an appropriate result in individual cases, which can vary on a case-by case basis. We disagree that providing useful guidance affects the scope of the Reliability Standards.

502. In response to APPA/LPPC, the Commission clarifies that it does not intend to create an inflexible rule calling for redundant electronic security in all cases. While the Commission directs that a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process. This would include whether or not the second security measure must be "on par" with the first. The Commission also directs the ERO to consider, based on the content of the modified CIP-005-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.

511. The Commission adopts the CIP NOPR's proposal to direct the ERO to identify examples of specific verification technologies that would satisfy Requirement R2.4, while also allowing compliance pursuant to other technically equivalent measures or technologies. In response to commenters, in discussing digital certificates and two-factor authentication, the Commission was providing examples of strong authentication, not limiting authentication to those options. The Commission is not prescribing the specific methods as an exclusive solution pursuant to Requirement R2.4. The ERO can propose an alternative solution that it believes is equally effective and efficient. If the ERO believes it would be helpful to responsible entities, additional guidance beyond the examples that are eventually included in Requirement R2 can be given in a separate reference document. Since we are directing the ERO to provide guidance on what constitutes strong authentication, it is not necessary for the Commission to respond to ISO-NE's request that digital certifications or two-factor authentication are acceptable methods of authentication. In identifying examples or categories of specific verification technologies that would satisfy Requirement R2.4, the ERO should take into account the specific comments raised in this proceeding. Similarly, while encryption is one method to accomplish two-factor authentication, and is an effective process for ensuring authenticity of the accessing party, for some facilities, we leave it to the ERO in the Reliability Standards development process to evaluate whether and how to address the use of encryption. In the alternative, the ERO may identify verification technologies or categories of verification technologies in a reference document.

547. In sum, we direct the ERO to modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper

assessments in the intervening years. The ERO should develop the details of how to determine what constitutes a representative system and what modifications require an active vulnerability assessment in the Reliability Standards development process. The revised Reliability Standard should contain the essential requirement that an active assessment must be performed at least once every three years. Based on the amount of guidance contained in the modified Reliability Standard, the ERO should consider at that time whether additional guidance should be provided in a reference document.

575. In response to commenters' questions regarding specific physical access controls, the Commission clarifies that it does not intend to create an inflexible rule calling for redundant physical security. While the Commission continues to believe that a responsible entity must implement two or more distinct and complimentary physical access controls at a physical access point of the perimeter, the specific requirements should be developed in the Reliability Standards development process when the ERO develops its modifications in response to this Final Rule. The Commission also directs the ERO to consider, based on the content of the modified CIP-006-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.

609 . The Commission has discussed issues related to testing environments in CIP-005-1. In that context, the Commission clarifies the CIP NOPR proposal to require differences between the test environment and the production system to be documented. As stated with respect to CIP-005-1, the Commission understands that test systems do not need to exactly match or mirror the production system in order to provide useful test results. However, to perform active testing, the responsible entities should be required at a minimum to create a "representative system" – one that includes the essential equipment and adequately represents the functioning of the production system. We therefore direct the ERO to develop requirements addressing what constitutes a "representative system" and to modify CIP-007-1 accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document.

621. While we agree that no safeguard will protect against all malicious or unintentional acts, this does not mean that systems should not be protected against such acts. In response to MidAmerican, the Commission believes that details regarding how to safeguard systems against personnel introducing, maliciously or unintentionally, viruses or malicious software to a cyber asset are best developed in the Reliability Standards development process. The revised Reliability Standard does not need to prescribe a single method for protecting against the introduction of viruses or malicious software to a cyber asset by personnel. However, how a responsible entity does this should be detailed in its cyber security policy so that it can be audited for compliance with the Reliability Standard. The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes how an entity should protect

against personnel introducing viruses or malicious software to a cyber asset. The ERO could also provide additional guidance in a reference document.

629. For the reasons discussed in CIP-005-1, in directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the Commission will allow a manual review of a sampling of log entries or sorted or filtered logs. The Commission recognizes that how a responsible entity determines what sample to review may not be the same for all locations. Therefore, the revised Reliability Standard does not need to prescribe a single method for producing the log sampling. However, how a responsible entity performs this sample review should be detailed in its cyber security policy so that it can be audited to determine compliance with the Reliability Standards. The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document. The final review process, however, must be rigorous enough to enable the entity to detect intrusions by attackers.

644. For the reasons discussed in CIP-005-1, in directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the Commission will allow a manual review of a sampling of log entries or sorted or filtered logs. The Commission recognizes that how a responsible entity determines what sample to review may not be the same for all locations. Therefore, the revised Reliability Standard does not need to prescribe a single method for producing the log sampling. However, how a responsible entity performs this sample review should be detailed in its cyber security policy so that it can be audited to determine compliance with the Reliability Standards. The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document. The final review process, however, must be rigorous enough to enable the entity to detect intrusions by attackers.

660. The Commission adopts the CIP NOPR proposal to direct the ERO to provide guidance regarding what should be included in the term reportable incident. In developing the guidance, the ERO should consider the specific examples provided by commenters, described above. However, we direct the ERO to develop and provide guidance on the term reportable incident. The Commission is not opposed to the suggestion that the ERO create a reference document containing the reporting criteria and thresholds and requiring responsible entities to comply with the reference document in the revised Reliability Standard CIP-008-1, but will allow the ERO to determine the best method to accomplish the goal of better defining reportable incident.

725. The Commission adopts, with modifications, the CIP NOPR proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an

operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years. Consistent with our goals and discussion of CIP-005-1, the Commission will not at this time require responsible entities to perform full operational exercises. Instead, the Reliability Standard should require the demonstrated recovery of critical cyber assets in a test environment, with the requirements for representative test environments and for addressing differences between the test environment and the production environment, similar to the conditions discussed for live testing in CIP-005-1. Given the range of views presented in comments regarding live testing, as the Reliability Standard development process forms the details of this "demonstrated recovery" concept, it should consider offering guidance beyond the actual Requirements of the Reliability Standard in separate reference documents. The Commission believes this alleviates commenters' concerns about the risks associated with such testing.

Revised Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

January 7, 2009 | 1–5 p.m. PST
January 8, 2009 | 8 a.m.–5 p.m. PST
January 9, 2009 | 8 a.m.–noon PST
Arizona Public Service Deer Valley Campus
Black Canyon 3 Building (BC-3)
2133 W. Peoria Ave.
Phoenix, AZ (609-250-1117)

Wednesday January 7, 2009

1:00 p.m. **Welcome and Opening Remarks — Jeri Domingo-Brewer and Kevin Perry**

a. Roll Call
b. NERC Antitrust Compliance Guidelines
c. FSU/FCRC Review of December meeting and adoption of December 4–5 Meeting Summary

1:15 **Review of Meeting Objectives and Agenda — Jeri Domingo and Bob Jones**

1:20 **Organizational Issues and Review of Phase 1 and early Phase II Schedule — Stuart Langton**

- Review of Phase 1 — Work-plan, January — May 2009 including small group proposal
- Review of Phase 2 — January—June, 2009 — including CIP-002 conceptual approach and industry input and feedback.

2:00 **Overview of Phase I Industry Responses — Number and Issues and Procedure Going Forward — Kevin Perry**

2:30 **Technical Feasibility Exception (TFE) — Briefing on NERC Review and Proposal Going Forward — Scott Mix**

3:00 **Break**

3:15 **TFE White Paper — Review of Changes and Additional Suggestions**

4:00	**Phase I Comment Review and Refinement — Full SDT Discussion of Cross Cutting Issues**
4:50	**Summary of Day One Outcomes and Review of Day Two Agenda**
5:00	**Recess**

Thursday January 8, 2009

8:00	**Welcome — Agenda Review and Review of Day One Results**
8:10	**Phase I Comment Review and Refinement- Plenary Discussion of Overall and Cross Cutting Issues**
9:00	**Break**
9:10	**Possible Small Group Breakouts — Review and Draft Responses**
noon	**Working Lunch *(Return to plenary meeting at 12:45)***
12:45	**Initial Small Group Reports on Draft Responses and Full SDT Discussion**
2:45	**Break**
3:00	**Initial Small Group Reports on Draft Responses and Full SDT Discussion**
4:20	**Next Steps for Drafting Group WebEx Meetings in preparation for February 2–3, 2009 Meeting**
4:50	**Summary of Day Two Outcomes and Review of Day Three Agenda**
5:00	**Recess**

Friday January 9, 2009

8:00	**Welcome and Agenda Review**
8:10	**Learning from Other Initiatives — John Sykes, NERC System Protection and Control Task Force**
9:00	**SDT Discussion of Implications for Phase II 002 Critical Asset Identification**
10:00	**Break**

10:15	**Phase II White Paper Development — Early Thoughts and Preview and Questions of the SDT to aid in the drafting- Jackie Collette and William Winters**
11:30	**Assignments — Next Steps and Review of Work-plan**
noon	**Adjourn**

Cyber Security Order 706 SDT — Project 2008-06
JANUARY — JUNE 2009 DRAFT SDT SCHEDULE

NOTE: Below are draft considerations developed by the facilitators in consultation with the Chair, Vice Chair and NERC staff and following the December SDT NERC Communication Plan briefing and Phase 1 Webinar on December 16. The facilitators also reviewed the SDT criteria for a "roadmap approach" to revising the CIP standards discussed and refined in Little Rock at its November, 2008 meeting (See pp 4 below for a list of the criteria) These considerations were used to construct a draft schedule for the SDT for the first half of 2009.

Short Term 2009 Schedule Draft Considerations

1. Follow the ANSI standard development process but use creative ways to efficiently secure input from the industry on emerging concepts and approaches to the CIP standards.
2. Seek creative ways to get advice and input to the SDT from experts in cyber security.
3. Seek creative ways to get focused input from industry stakeholders.
4. Take advantage of input opportunities from related NERC committees that will be meeting in the first half of 2009 (e.g. working with the NERC Members Representative Committee, CIPC, BOT, and industry committees such as the Electricity Sector Coordinating Council, etc.)
5. Seek, as soon as possible but no later than late Spring, 2009, to establish a consensus on the way forward for the SDT in its efforts to revise the CIP standards.
6. Track any follow up to the "Securing Cyberspace for the 44th Presidency" report of the Commission on Cybersecurity for the 44th President.

SDT Draft Schedule — January–June 2009

Overview

- 7 SDT Face-to-Face Meetings
- Multiple SDT subgroup and subcommitees WebEx Meetings
- 1 Cyber Expert Workshop (March 10 or 11, 2009)
- 1 NERC CIPC presentation? (Feb. 9, 2009)
- Industry Comments on CIP 002 White Paper (April 17–June 3)
- 1 NERC Members Representative Committee, May 1, 2009

- OTHER MEETINGS?

SDT Draft Schedule — January–June, 2009

1. January 7–9 SDT Meeting — Phoenix, AZ ½–1/½ day format — Wednesday–Friday

- Review of Technical Feasibility Exceptions white paper
- Review of Industry Comments on Phase 1 products- Establish and convene small groups
- Initial Review of Phase 2 White papers

January 15 — WebEx meeting(s)

- Small group draft responses to industry.

January 21 — WebEx meeting(s)

- Small group draft responses to industry.

2. February 2–4, 2009 SDT Meeting — Phoenix, AZ, ½–1/½ day format — Monday–Wednesday

- Review of Small Group responses and recommendations on Industry comments and adopt draft of Phase 1 products, as revised, for review by NERC/Maureen.
- Review of Phase 2 White papers and Testing of a Phase 2 CIP 002 concept going forward

February 9, 2009 — CIPC Meeting — Update on SDT Progress and Input?
February 11 — WebEx meeting

- Phase 2 drafting concept group?

3. February 18–19, 2009 SDT Meeting — Boulder City, NV

- Review of Maureen's comments and adoption of Phase 1 products for balloting.
- Further discussion and adoption of a draft Phase 2 CIP 002 Concept for review by experts and stakeholders in March and beyond.

February 25 — WebEx meeting(s)

- Phase 2 drafting concept group?
- Development of Phase 2 CIP 002 Workshop for review by experts and stakeholders

4. March 10–11, 2009 SDT Meeting — Tampa, FL, 2-day format

- Invited Cyber Security Experts join SDT in a workshop to provide expert feedback to draft CIP 002 concept.
- Further SDT refinement of the CIP 002 proposed concept

March NERC Balloting on Phase 1 Products

March 18 **—** WebEx meeting(s)

- Phase 2 drafting concept group?

5. April 14–16, SDT Meeting, Charlotte NC — ½–1/½ day format. Wednesday-Friday

- Continue review and refinement of 002 concept and adopt White Paper on CIP 002 concept for Industry Comment

Industry Comment Period on White Paper **—** 45-days (April 17–June 3)

*May 1, **NERC Member Representative Committee**, Presentation of the Phase 2 CIP 002 Approach for MRC input. (Agenda item, Possible Workshop?)*

6. May 13–14 — SDT Meeting — Dallas, TX, 2-day format

- Review and respond to MRC input and further SDT refinement of the CIP 002 proposed concept and SDT CIP roadmap.
- Organize SDT in subcommittees to begin effort to draft revisions to CIP 003-008 or to address key issue areas.

June **—** following June 3 — WebEx meeting(s)

- SDT subcommittee meetings to review and draft responses to Industry comments on the CIP 002 concept.

7. June 17–18, SDT Meeting — Location TBD —2-day format

- Review Subcommittee responses to Industry comments on 002 approach
- Charge subcommittees and conduct organizational meetings
- Subcommittees meet to draft revisions to CIP 003-008

June **—** WebEx meeting

- SDT Subcommittee meetings

July–December, 2009 — SDT and subcommittees meet and continue CIP drafting

2nd DRAFT PHASE 2 ROADMAP APPROACH ASSESSMENT CRITERIA

(Presented, Revised, and Added to by SDT in its review on November 14, 2008)

1. The approach is consistent with the SDT purpose statement and is responsive to the FERC 706 directives and the SAR.

2. The approach is achievable given the SDT schedule and workplan.
3. The approach does most to advance and enhance cyber security in the BES.
4. The approach helps the SDT address the foundational issues with the current standards.
5. The approach is capable of implementation.
6. The approach is capable of improving compliance.
7. The approach helps protect the current investments and wherever possible builds on what has already been done.
8. The approach helps to identify and mitigate risk on an ongoing basis.
9. The approach balances a “systems” orientation with a “facilities” orientation to asset protection.
10. The approach is capable of being extended into related interests by others (distribution, AMI, Smart Grid, etc.).
11. The approach enables the industry to provide the appropriate level of security (i.e. not over securing nor under securing the BES cyber assets).
12. The approach allows for discrimination among and targeting the various types of infrastructure that support the BES

Working Group Assignments

CIP Standard No.	Questions Nos.	Assignments/Volunteers
002 & 003	Q1 & Q2	Jeri Brewer/Gerald Freese/Dave Norton/Dave Revill
004 & 007	Q3 & Q6	Chris Peters/Keith Stouffer/Mike Winters/William Winters
005 & 006	Q4 & Q5	John Varnell/ John Lim/ Rich Kinas/Scott Fixmer/Scott Rosenberger
008 & 009	Q7 & Q8	Tom Hofstetter/Joe Doetzel/Kevin Sherlin
Compliance	ALL Qs	Roger Lampila/Todd Thompson/Jackie Collett
Implementation	Q9, Q10, Q11, Q12	Kevin Perry/Scott Mix/Phil Huff
Q13	Q13	

Phase I Schedule of Activities

Jan 7-9, 2009 Meeting (Phoenix): General Consensus

Jan 15 WebEx I: Harry will run this WebEx (Joe will attend)

Move toward specific comments responses to the questions and comments from industry

Jan 21 Webex II: Joe will run the WebEx

Move toward producing final responses to industry comments and other ballotting documents

Prepare for ballotting: Comments and Summaries; Clean and revised versions of the CIP Standards, Implementation Plan (redline and new clean copy), Implementation Plan for Newly Identified Cyber Assets

Seek input from Maureen to finalize responses

February 2-4, 2009 (Phoenix): Meeting to **approve** comments back to the industry

Meeting is likely to be a 2 ½ day meeting (Half-day; Full-day; Full-day)

February 5, 2009 Target: Post document for pre-ballot review

February 18-19, 2009 (ICFI-Fairfax, VA): Meeting to finalize and approve comments back to industry including any changes or comments from Maureen

February 25 WebEx: Follow up with action items from February 18-19 meeting.

March 9-19, 2009: Initial Ballot

March 10-11, 2009 Meeting (Orlando): Deliver the Industry Workshop (Day 1); Discuss outcome of Workshop and Phase 2 (Day 2)

March 20 - April 3: Respond to Comments

March 25 WebEx: Respond to comments received during Initial Ballot

April 14-16, 2009 Meeting (Charlotte): Hold first day for possible Industry Workshop (Alternate to March 10); Prepare MRC Presentation for May MRC Meeting

April 29 WebEx: Finalize the MRC Presentation (Mike Assante participation)

May 13-14, 2009 Meeting (Boulder City, NV): TBD

May 21 WebEx:

June 17-18, 2009 Meeting (Manitoba): TBD

June 25 WebEx:

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Summary
Cyber Security Order 706 SDT — Project 2008-06

January 7–9, 2009
Arizona Public Service
Phoenix, AZ

1. **Attendance and Roll Call**
   See attached attendance sheet, plus 12 participants on the WebEx and conference call.

2. **Antitrust Compliance**
   NERC Antitrust Compliance statement was read

3. **Meeting Agenda and Objectives**
   The agenda and objectives for this meeting were reviewed and no changes were made (see attached document).

   Stu introduced the revised process schedule for Phase I as it reflects adjustments to original schedule and includes flexibility leading up to June 2009, when we can pause and assess the best way to move forward from there with Phase II taking into account the ANSI process (see Assessment Criteria listed at the end of the schedule).

   Jonathan Sykes from SRP was invited to provide the SDT with a briefing from the NERC System Protection and Control Subcommittee describing Protection System Redundancy on Friday, January 9th. The Subcommittee's engineering approach to equipment redundancy and protection may be useful in helping the SDT to identify criteria for determining critical electric system assets.

   The upcoming Phase I SDT Meeting schedule from January to June 2009 was also reviewed. (See the attached schedule "SDT Draft Schedule – January—June 2009")

   Preparations for the upcoming NERC Member Representative Committee (MRC) meeting scheduled for May 1, 2009 were also discussed.

   A Cyber Security SDT workshop was also discussed and is planned for March 2009. The idea of this workshop is to bring in cyber experts from the electricity industry

and a variety of other industries and companies to obtain additional input that can be used to augment and/or validate the SDT's approaches.

Some preliminary thoughts and discussion on the preparation of white papers by Jackie Collett and William Winters concerning Phase II SDT Standards Development approach will be explored on Friday, January 9th.

4. Review of Phase I Comments on the SDT Standards

Kevin Perry provided a preliminary overview of the 119 pages of comments received from the 46 industry respondents. The comments were organized by NERC staff, and the latest set of comments was released to the SDT on January 7th. In summary, there were:

- No show stoppers
- Lots of duplication in the comments received
- Some comments cross multiple standards with common concerns such as :
  - Compliance Enforcement Authority
  - "a" vs. "the" senior manager and the delegation of authority
- New compliance language received lots of comments and maybe confusing to industry
- Confusion regarding data retention requirements warrants further discussion

Kevin recommended that the Compliance Team pay close attention to the new compliance wording so as to avoid the possibility of impact on all of the cyber security standards.

a. Approaches for Reviewing Phase I Comments

A couple of approaches to reviewing the Phase I Comments on the cyber security standards were discussed:

- *Option 1*: Form various small groups to review and respond to subsets of the comments received. Possibly begin Phase II work in parallel.
- *Option 2*: All comments would be reviewed by all SDT members and those present at the meeting.

The preferred approach was to break up into small working groups to review an assigned grouping of standards in parallel, but not to begin Phase II activities. Following the review period, the full group would meet to discuss the findings and responses from each of the small working groups. Any cross references or duplicative responses should be found during this group review session. The

small working groups and their assignments are identified in the attachment labeled *"Working Group Assignments"*.

b. Schedule for Reviewing Phase I Comments

The Industry Comments need to be addressed and responses prepared in January 2009. The plan is to have the responses ready by the February 2–4, 2009 meeting for group adoption and eventual posting.

c. Response Strategy and Process

a. Many comments could be contentious and caution should be taken such that we answer comments at face value and not be drawn into the arguments.
b. Avoid getting drawn into discussing the Aurora incident; it is out of scope for the SDT.
c. A lot of the issues will be considered in Phase II; our response needs to indicate that the commenter should review their concern when Phase II documents are published for industry review and comment. An appropriate response may be "we will consider the comment in Phase II".
d. We will receive comments during the ballot period that we will need to respond to — hopefully the highly contentious issues are identified now before sending out the Phase I standards for ballot.
e. A "significant" change to a standard versus a "minor" change is a judgment call made by the NERC standards manager (Maureen Long).
f. If we make a significant change to what's already been published, we'll have to seek comments again. If we do not change the requirement but move it to a different standard, is that a significant change? Some clarification is needed.
g. The plan is to issue the responses to the industry comments without requiring another round of comments. If we receive a particularly contentious comment, consider removing the item for further consideration in Phase II.
h. Compliance comments and issues should be addressed by the NERC compliance folks, not the SDT.
i. Keep responses short and concise; don't water it down or get involved in long explanations; take the issue on in the appropriate language.
j. Point to reference documents, where appropriate, to address confusion about what some requirements mean.
k. Put the background material into the responses and refer to it, if needed.
l. A suggestion was made to include an introduction to the standards comments response document that describes the approach and what is being accomplished in Phase I and that the major issues will be addressed in Phase II.

d. Small Working Group Logistics

Some of the logistical items that were discussed included:

a. Logistically how and where will we meet? Should groups go off on their own? Should we meet at individual group tables so we can address cross-cutting issues as needed?
b. Can WebEx participants be included in the discussions?
c. CIP-002 and CIP-003 should be considered together.
d. Compliance requirements should be carved out of each standard for review and comment.
e. Each working group needs a scribe to document the responses. The industry comments are simply arranged by the thirteen questions that were asked and in the ordered they were received.
f. If a "yes" response is received and no comment is provided, then no response is needed. If a comment is provided, then an appropriate response is needed.
g. Address the most contentious issues first.
h. Work with the Word version of the comment document.

5. Technical Feasibility Exception Discussion

The Technical Feasibility Exception (TFE) process is based on discussion with utility management. The process is not about the technical requirements and standards that the SDT tends to address, but it is more about whether compliance has been met; compliance is more than just the audit process.

Technical feasibility was meant to address the issues where compliance could not be met quickly, thereby allowing for good reason to be technically out of compliance while significant issues can be addressed.

The TFE White Paper is being reviewed by NERC management. Compliance and Legal counsel were sought concerning how the white paper should be positioned and what it would mean to enforcement. It needs its own vetting process within NERC, and it may require modification to the Compliance Monitoring and Evaluation Program (CMEP). Changes to the CMEP are applicable across all of NERC's standards, so the TFE needs to well thought through and vetted within NERC.

Mike Assante, Chief Security Officer at NERC, has agreed to sponsor the TFE through the compliance process at NERC. Scott Mix will work with NERC Management to determine the best approach for getting this done.

6. Small Working Groups

Six small working groups were formed to review the industry comments and to develop the SDT's responses. The six groups were created to craft the SDT's responses and to make appropriate edits to the text of the CIP Standards. The six groups were:

1. CIP 2 and 3 (Questions 1 & 2)
2. CIP 4 and 7 (Questions 3 & 6)
3. CIP 5 and 6 (Questions 4 & 5)
4. CIP 8 and 9 (Questions 7 & 8)
5. Implementation (Questions 9, 10, 11, and 12)
6. Compliance Issues (all questions)

Question 13 was reviewed by the entire group.

WebEx and teleconference participants were advised that members would be breaking into small groups for the afternoon; they were welcome to join again when the full group reconvened to review the responses and edits prepared by the working groups.

The plan was to begin the review of the formal responses to the comments on a WebEx to be held on January 15th, and complete the initial reviews during a WebEx scheduled for Wednesday, January 21st.

a. Small Working Groups — Initial Report Out

The members of each small working group were asked to consider the following in presenting their findings to the full group:

- Present substantive issues/responses from most to least contentious (10-15 total minutes for each small group report)
- The full SDT will focus on most contentious issues to confirm response
- Small groups may reconvene to refine responses

At 1:00, the WebEx was re-initiated. Bob Jones reviewed the expectations for the group reports with a focus on the most contentious or substantive issues that will need full group input for possible additional refinement. The reports were brief with an opportunity for groups to revise their work.

b. Questions 1 and 2 (CIP 002 & 003)

Three sets of substantive issues

1. Concern about assigning a senior manager in CIP-003 rather than in CIP-002
2. Clarify delegation of senior manger responsibilities
3. Industry concern about the responsibility of a senior manager vs. a responsible entity (accountability issue?)

Confusion over how to delegate responsibilities. Does the Senior Manager have the authority to:

a. Assign specific actions
b. Identify which responsibilities will be delegated
c. Document only those delegations assigned to each delegate
d. Delegate authority for specific actions (added) "assigned to the senior manager" to a named delegate or delegates.

Other items to change include:

i. Delete "business phone" information
ii. Use "calendar days" throughout CIP 002 to 009

Poll was taken to test support for adding the above language: (Result: 7 for; 10 against)
Respond back to those offering the language in the comments?

c. Questions 3 & 6 (CIP 004 & 007)

Substantive issues were the following:

a. Addressing ambiguity in "specified circumstances" – answer that the language was included as directed in FERC Order 706
(Comment: we need to be specific in our responses, not necessarily clarifying, but more explicit about what the drafting team will do with this)
b. Don't change any language, but specify where the wording came from – Phase II will not change the language either
c. Careful what you are promising to do in Phase II
d. Leave first sentence as is and refine second sentence into a shorter version without promising future action
e. Need to avoid any linkages between guidance and standards

Highlighted key items for discussion:

i. For R3 – need to specify critical assets
ii. Added access "to critical cyber assets" - much the same reference in R2 – consistency issue
iii. Added "all" in front of "other" to remove any potential ambiguity
iv. Need to be consistent across the different standards – use the same terminology

Poll to test securing "all" Cyber Assets within an ESP: (10 yes; 8 no)
Rather make the necessary changes in Phase II

Exception to taking out "acceptance of risk" – did not make a substantive change – but review response for group support

Recommendation is to consider language modification – residual risk analysis would demonstrate that an entity has exercised due diligence when compensation measures have been applied.
Response should be that the analysis will be considered in development of the technical feasibility (TFE) process.

Within the measures – initially agreed with changing M2 to make it consistent with other measures, but suggest alternative language to add "and records" to M2 – (make available documentation "and records of its ports and services process" as specified in Requirement R2)
Conclusion was to remove "and records" to limit the heartburn
The SDT could revisit in Phase 2?
Are we changing more than we should?

Poll taken to test if there is any problem in adding the language? (7 – Yes - that's enough to remove it)

Need to re-explain the need for Phase I to meet the June deadline set by FERC when the response document is sent out for comment.

d. Questions 4 & 5 (CIP 005 & 006)

Substantive Issues:

a. Substitute "subsequent" phases for Phase II; "subsequent" phases anticipate significant changes
b. Intent is to include only devices that perform access control or monitioring, not those devices that are receiving alerts
c. Only a few real changes suggested:
    i. Change "maintain and implement" to "implement and maintain"
    ii. Agree that R1.4 should reference R4 and not R3
    iii. Competing authorities is outside the scope of the SDT – offer to refer it to appropriate entity (NERC)
    iv. Reliability standards only prescribe what and not how
    v. "Continuous" is a clarification of active escort – SDT is not agreeing to remove it
d. Is there a more positive way of asking commenters to resubmit during the next phase?
e. Apologize for not clearly red-lining the changes; it added to the confusion

f. In Phase II, the SDT will need to address differences between logging and monitoring
g. Use of "documents" versus "documentation" – need to be consistent in use

e. Questions 7 & 8 (CIP 008 & 009)

Substanfive issues:

a. Concern with the addition of the word "dated" into the measures
b. CIP 009-02 R3 missed the mark
c. CIP 008-02 confusing wording

Actions:

a. "Dated": Remove the word dated from the measures.

b. CIP-009-02 R3:
- Rewrite to meet intent of FERC Order 706 (P731)
- Change control — updates shall be completed within 30 days and communicated within 90 calendar days (What is meant by "completed"?)
- *Subsequent discussions led to the decision to wait to make any changes until Phase II development of the CIP Standards.*

c. CIP-008-02 R1.3 to R1.6:
- Remove "process for" from each requirement
- R1.5 and R1.6 add annual testing of the response plan
- *Comments:*
  - Add to the compliance section as additional guidance?
  - Is this a major change requiring submittal for further comments?
  - Putting it in as additional compliance guidance - is it a major or minor modification to the standard?
  - This comment is not related to a change made in the last revision to the standards, but rather is a new additional item. These changes should be addressed as part of Phase II
  - Do we need to weigh the number of commenters making the comment that this section is confusing?
- *Subsequent discussion to accept these comments or pull them for consideration in Phase II led to the conclusion to wait until Phase II. A good strawman will be needed to start the process at that time.*

f. Questions 9 to 12 (Implementation)

Actions to be taken:

1. Update Implementation Tables
2. Modify the SDT implementation plan to clarify emergency provision

3. Change category 3
4. Change #3 to add "cyber"
5. Reference "other" CA rather than "non-critical" CA
6. Modify timeframe to 18 months after the new CCA is identified
7. Update Table 2 to reflect the addition of two new requirements
8. Any further updates to Table 2

Decisions:

a. Implementation plan as a separate document – consider incorporating in subsequent revisions
b. Guidelines for identifying CA and CCA are being developed
c. Six months is reasonable – not changing to nine months
d. Nuclear facilities are out of the scope of this SDT group

Explanations:

- "In the event of a merger or acquisition of a company, … allow one year for the programs to be harmonized." If one party has a program then continue it while merging, if they have competing programs, then take a year to sort it out – this is a response to a comment, not making any changes to standard.
- Concern about how this applies when a holding company owns separately registered entities – will address by revising language here
- Reviewed items "tossed over the wall" to Compliance small group

Proposed effective date in implementation plan– add "compliant" to clarify from "auditably compliant" – Poll to test for opposition: Any opposed? None
Test to leave without "compliant" – no objection. Why does title include "proposed"? Not adopted yet and consistent with other implementation plans

g. Compliance Issues (All CIPs)

Substantive Compliance issues identified were:

1. The wording in Compliance Section 1.1.1 does not specify who is responsible for the enforcement – not changing it at this time but probably will need to – have sent it to NERC (Maureen) for possible clarification
2. Do the terms ERO and Compliance Enforcement Authority need to be defined in the glossary? They are already defined in the Rules of Procedure of NERC, which is hierarchically higher in terms of precedence of documentation, and therefore governs the definition - is not needed in the standards glossary
3. Can we just add the same definition to the glossary? Keep response simple here that definition is already covered in the Rules of Procedure.

4. "Dated" – do we revise the measures for all standards to include "dated"? (Comment: - In phase I, leave it like it is – revisit in Phase II)
5. Reinstate "duly authorized exceptions will not result in non-compliance"? Referring back to NERC for follow up
6. "In conjunction" leaves open possible interpretation – referred back to NERC

Jackie will review the rest of the compliance issues, but expects most new comments will be repeats from responses covered above. Jackie will flag any additional issues that the group may need to address.

h. Question 13 (All CIPs)

Tom Hofstetter described how he assigned many of the comments to the appropriate small group. The small groups will need to tag or segregate their responses to Question 13 items so they can be pulled out to include as a set of responses under Question 13.

Tom reviewed a few basic responses that he proposes to comments that are not related to other questions or small groups.

7. NERC System Protection and Control Presentation (Jon Sykes)

Scott Mix introduced John Sykes – Vice Chair of the NERC System Protection and Control Subcommittee, which is looking at redundancy in control and protection systems, as an aspect of critical asset protection. They are early in their process of review.

The NERC SPCS has written a technical white paper, a proposed working paper for a standard, and has prepared the presentation. It took two an a half years to get to this point, and the SPCS need lots of industry input because of the high potential cost to the industry.

The major topic of discussion was on the methods for determining risk. Do we write a prescriptive standard or a performance based standard? Key initial question, helped decide on the performance based approach.

Defined "redundancy", and reviewed protection system performance requirements Methodology to determine adequate redundancy of a Protection System

- Determine redundancy of the PS
- Ascertain the performance of the PS
- Compare protection systems performance with electric system performance requirements in the TPL standards

- Mitigate all performance shortfalls

8. White Paper Discussions for Phase II

Stu introduced a review of the Phase II White Paper process. He reviewed discussion from the previous SDT meeting in Washington where we came away with proposal to prepare and review two straw proposals, one starting from the CIP standards perspective and the other starting from the NIST standards perspective

Jackie Collett took a look at the NIST 800-53 standard and sees promise, but she also sees aspects of the standard that may cause concern for electric power systems. Jackie reviewed her take on the original intent of the NERC CIP 002 Standard.

William Winters offered initial thoughts on his approach from NIST, and how he might address some of the gaps in the standards but recognizing the concerns the industry may have with the NIST risk assessment approach, particularly cost.

William will look at what NIST does regarding asset identification, focusing on CIP 002, not CIP 003. Some of the items addressed were:

- Concerns expressed by members about the disincentive for including critical assets, particularly for purposes of audits
- NIST may allow for gradations of identification, but that can complicate compliance – will the NIST approach work in the end?
- Energy Act 2005 and FERC announcements have come subsequent to the drafting of the standards which were written for data centers - industry concern about the cost and need for the identification of the critical assets
- Understand where and why we are where we are today to help figure out how to avoid potential industry refection – if industry does not accept, then FERC will do something because they now have clear Congressional support to do something
- Change in administration attitude about the need for industry regulation – we need to do a better job of educating the industry on the cyber risk in order to get their support for changes and limit the gaming – people want to do the right thing, if they understand why
- NERC SDT is focused on critical assets for the bulk power system, but the NIST framework covers the whole spectrum of systems used by the federal system.
- Generation aspect does not necessarily include transmission – we need to understand the different needs but be sure to include both – one size will not fit all for different systems
- Homeland Security list exists – need to resolve how industry list supports this other broader list –

- ISA 99 takes a multi-level approach to security
- Identify the cyber assets that do x, y and z – then if it fails what bad happens – that identifies critical cyber assets system wide – is the information flow essential, follow out to find boundary, even where it crosses company boundaries – need to get away from applying physical engineering to the flow of information
- How do we reorganize what we consider critical?

This discussion provided guidance to Jackie and William to develop their approaches for review in February. Should the approaches be combined now for review next time? Or parallel approaches to be merged later?

Jackie envisioned parallel approaches to then be compared, and William agreed. Also they agreed that the items/issues identified are the starting points to be addressed. William will look at how NIST can be tailored to fit with the CIP standards, while Jackie will look at how the CIP Standards can be adopted into the NIST framework. Both will be brought together to see if and how a hybrid might work effectively.

Both products will be circulated before the next face-to-face meeting in February. Some manner of blending will occur — just a matter of how much — no one is saying start over from scratch. They will review and discuss the balance and trade-offs especially from an audit perspective. Five issue areas will be used by Jackie and William as part of the problem statement. Are there possibly other areas that need to be added to the list of five?

9. Wrap-Up

The SDT must sign off on the edits by the end of the next meeting to meet the proposed schedule for Phase I.

Next Meeting is scheduled at the downtown Phoenix Hyatt Regency — please plan on staying the full meeting time, especially try to stick around for the afternoon of the third day.

Beyond the February 2–4, 2009 meeting in Phoenix:

- February 14–15, 2009 meeting is in Fairfax, VA (ICFI Offices)
- March workshop
    - Progress at the next few meeting will help move us toward preparations for that workshop. Need to work in February to prepare for the workshop, which is preliminarily scheduled in conjunction with the March 10–12, 2009 SDT Meeting in the Orlando or Tampa area.

  - Purpose of the Workshop is to broaden our outreach and enlist review and input from cyber security experts in other industries as well as the electric industry.
  - The workshop will lead to a presentation to the NERC MRC on or about May 1, 2009.
- April 14–16, 2009 meeting in Charlotte (Duke Energy)
- May 14–15, 2009 meeting in Boulder City, NV (Bureau of Reclamation)
- June 17–18, 2009 meeting in Manitoba (Manitoba Hydro)

Web meetings are scheduled approximately one week following each SDT meeting. Industry Webinar Meetings are also planned to keep the industry informed on the progress of the Cyber Standards development.

Meeting Adjourned at 11 a.m. on January 9, 2009.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Summary
Cyber Security Order 706 SDT — Project 2008–06

February 2, 2008 | 1–5 p.m. MST
February 3, 2008 | 8 a.m.–5 p.m. MST
February 4, 2008 | 1–5 p.m. MST

Adopted Unanimously February 19, 2009

Robert Jones and Stuart Langton, Facilitation and Meeting Design

FCRC Consensus Center, Florida State University

Thanks to team members Sharon Edwards, Tom Hofstedler and Kevin Perry for sharing their meeting notes.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team
Sixth Meeting Summary,
February 2–4, 2009
Phoenix, AZ

EXECUTIVE SUMMARY

The Chair and Vice Chair welcomed the members and welcomed Rob Antonishen, Ontario Power Generation as the team's newest member. NERC staff David Taylor conducted a roll call of members and participants in the room and on the conference call. They then reviewed with the team and participants the proposed meeting agenda. David Taylor reviewed with the team the need to comply with NERC's Antitrust Guidelines**.** The facilitators reviewed with the team the consensus guidelines adopted at the SDT November 2008 Little Rock meeting.

Scott Mix, NERC staff provided the team with an update on the status of the Technical Feasibility Exception white paper and the effort to convert it into a compliance document under NERC Rules of Procedure. On Wednesday, Scott Mix provided an additional update on the TFE process noting he had received an e–mail from the NERC Assistant General Counsel that outside counsel started to review the white paper and that nothing had been identified as a show stopper e.g. "good faith efforts".

In introducing the Phase II presentations and discussions, the facilitator reviewed related FERC 706 provisions noting they direct the SDT to consider "applicable features" of the NIST framework (Paragraph 25, 232, 233).

Bill Winters presented his paper, "Independent assessment of FISMA and related NIST documents for adoption for Electric Sector Critical Infrastructure Protection," and an additional section, "Thoughts for Discussion of NIST/CIP Opportunities" noting his assignment was to review the NIST/FISMA framework and suggest CIP features that represented strengths that might be incorporated into NIST/FISMA. His approach was to ask and try to answer the question: could my company apply the NIST/FISMA security framework approach? He suggested two approaches going forward: Heavy alignment vs. Integration Light:

1. *Heavy alignment* — replace/expand CIP 002 require assessment of: systems used in control and monitoring BES/BPS; systems directly connected and/or exchange data with; and systems which transport data used in control and monitoring.
2. *Light alignment* — develop a set of controls using NIST controls as starting points.

Members discussed topics that included: Address gaps in both NIST and CIP; Common Controls and Auditing; Outcomes Based Framework; Other Approaches; How prescriptive should controls be; Standards vs. Frameworks; and Certification Methodology.

John Lim presented the team's paper on Phase II approach from a CIP perspective on behalf of Jackie Collett, Scott Rosenberger and John Varnell. He noted that CIP standards are intended to be a baseline for cyber security for bulk power assets with a focus on assets with the highest impact. One of the issues with the current NERC standards which the team discussed the most was the "all or nothing" approach of the current CIP standards, i.e. if an asset is not defined as "critical" under CIP, there are no controls required. Perhaps additional systems and/or functions need to be identified to address this gap.

The team identified the following five issues with CIP 002 and for each offered comments on shortcomings, gaps, challenges and options: Piecemeal Approach; Not protecting assets needing protection; Gaming; All or Nothing Approach; and Loss of Asset Integrity and Misuse. John Lim noted that a multi–level protection scheme will have to identify high, medium and low. It will be necessary to study which assets are most critical. Look at the function of system and the connection to the BES.

Following the presentation there was a discussion about whether vulnerabilities in common systems should be addressed in the next version of standards. There was also discussion concerning the protection of defined Critical Assets versus protection of all SCADA systems. Several members stated that priority should be given to CIP 002 and the all or nothing view of defining Critical Infrastructure which is in scope as a result of CIP 002 current logic. Several members expressed that at least a minimum level of protection must be prescribed for additional assets.

Scott Mix took on the task of trying to conceptualize what would a NERC FISMA process look like to apply while maintaining the status quo in terms of the scope of the current CIP standards. He created a "straw man" which was presented in a power point format. He noted that he started with a mission focus on the bulk electric system (BES) vs. the bulk power system (BPS). The law and FERC say BPS whereas NERC has historically used the BES. He then noted that extending the scope into the distribution system will take an act of Congress because the bulk power system does not include distribution. The bulk power system consists of the 8 regional bulk electric systems. Characteristics are identified for 3 categories: confidentiality; integrity and availability. Then a high water mark is applied to the highest ranking of the 3 aspects. The electric system is bisected into Transmission and Distribution. Distribution is off the table by law. The portion of Transmission dealing with Marketing is also off the table. Transmission is then divided into High, Medium and low impact to the BES. If we applied that methodology to the standards this would classify all transmission assets by impact (high, medium, low, none). Then the SDT could go through CIP-003 through CIP-009 and determine what the implications are from a reliability standpoint. 800–53 is a good catalog that can be used for an approach excluding the sections that deal with financial, etc, which are not applicable. There are significant implications for the workload for SDT, the workload for education, and the workload for industry implementation. Scott suggested the SDT could have a healthy debate as to whether or not this approach is what the Team agrees is the right approach.

SDT member Michael Winter drafted these overarching principles for consideration by the SDT based on the team's previous review and discussion. He introduced them making the following points: these principles are intended to be complementary and not mutually exclusive; the SDT should modify in order

get the best of both worlds; CIP and NIST. The concept is to offer protection for all but to different degrees based on the risk.

The top 3 most acceptable principles based on the SDT's initial ranking are:

1. Create clear standards and employ a technical exception/compensating controls reporting and guidance process that accommodates deviations (3.6 of 4)
2. A mapping similar to NIST 800–53 Appendix G to CIPs will help quantify and assess the gap, if any. (3.6 of 4)
3. Use a consistent risk–based model to classify all assets (i.e. facilities, sites, physical perimeters) (i.e. not cyber assets at this point) as critical/high impact, moderate impact, low impact.

The following draft principles are in order of acceptability:

4. An entity's Asset classification would be open to scrutiny by regional entities and ERO. The extent of scrutiny to be defined and tightly controlled. (3.1 of 4)
5. Use the minimum security controls for high, moderate, low within NIST 800–53 to help model the CIP controls for each level. Address any gaps at the same time but keep the same CIP-002 to CIP-0XX general format. Industry knows this format, is building policies and programs around it, has commented on it and has voted on it. (3.0 of 4)
6. Any IT devices beyond the perimeter, including telecom, are not part of the CIPs — the CIPs remain perimeter–based where devices on and within the perimeter are protected and everything beyond is considered untrusted. (2.9 of 4)
7. As part of a power system (non–corporate IT) inventory of cyber assets, add an attribute to each device that associates the high, moderate, or low classification of the physical perimeter, facility, or site within which it resides. Apply security controls based on the classification. (2,8 of 4)
8. Protect all cyber assets related to power system; not just the Critical Cyber Assets but to different degrees of protection/controls depending on their classification. (2.8 of 4)

The facilitators noted that the authors of the draft papers and principles would be asked to refine them and be prepared to present them at the February 18–19 SDT meeting.

For the Phase I review, the SDT reviewed all of the responses drafted to date for consistency and content. The team also looked at each of the additional industry comments that were not available at the January 7–9, 2009 Phoenix meeting. They then broke into the small groups that had been formed and worked together at the January meeting to complete the task of refining the responses. The SDT then reconvened and reviewed and agreed on the final responses.

On Wednesday, the SDT reviewed all of the proposed changes to the Phase I documents posted for industry review in light of the SDT responses and discussion. The SDT unanimously agreed to:

- Adopt the SDT Response Document (reflecting Tuesday's agreed on changes)
- Adopt the Proposed Changes to the Phase I Documents (reflecting Wednesday's review)
- Agree to post the documents for the 30–day pre-ballot period.
- However, the Phase I balloting will only commence after the NERC TFE proposal has been posted for industry comment for at least 14 days.

The SDT reviewed a draft set of Violation Severity Levels for the current CIP 003 through CIP-009 that a separate team (Project 2008–14) has developed. The SDT members expressed concerns with the likely confusion with the VSL team and in the industry posting both of these VSL changes (i.e. current CIP and Phase I proposed changes). Mr. Taylor noted that the draft SAR that directed the VSL SDT to only review the current CIP standard was open for comment until February 10, 2009. Members again expressed concerns that two SDTs revising the same documents is sure to cause confusion in the industry. Following straw polls, (the SDT to take on drafting VSLs for current CIP, Phase I, and Phase II standards 0–18; for the SDT to take on VSLs for Phase I and II, 7–11 in support; and for SDT addressing only Phase 2 VSLs, 16–2 in support, the SDT adopted the following approach:

The following statement will be forwarded to the SAR Committee as an SDT comment for its consideration with only the names of those SDT members voting in support of the motion:

> "The Phase I changes ("Version 2") to the CIP standards are expected to be balloted coincident with the development of the VSLs for "Version 1" of the CIP standards. The Project 2008–06 drafting team will not be in a position to include the VSLs with the revised standards due to the timing of the two projects. The VSL drafting team is best positioned to recommend VSLs in support of the Version 2 standards."

The motion was approved by more than 75 percent of the SDT members present and voting. The facilitators reviewed adjustments to the schedule including:

- A SDT comment on the VSL SAR by the deadline (February 10, 2009)
- February 18–19 in Fairfax, Virginia — advance the Phase II review and discussion
- March 10–12 in Orlando, Florida — seek a Phase II framework going forward.
- April 14–16 in Charlotte, NC — test the Phase II framework in a workshop with cyber experts and refine the framework for presentation at the MRC on May 1.
- May 1 — Members Representative Committee presentation of Phase II framework
- May 18–19 — Refinement to Phase II framework based on MRC comments and determination of whether to issue a white paper for industry comment. Review proposed SDT sub–committee and drafting group structure
- June–December, 2009 — SDT meetings along with SDT drafting groups.

The team then evaluated the meeting in terms of what worked and what could be improved. The meeting adjourned at 11:30 a.m.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team

Sixth Meeting Summary,
February 2–4, 2009
Phoenix, AZ

I. INTRODUCTIONS, AGENDA REVIEW, PROCEDURES AND OPENING REMARKS

The Chair and Vice Chair welcomed the members and welcomed Rob Antonishen, Ontario Power Generation as the team's newest member. NERC staff David Taylor conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). They then reviewed with the team and participants the proposed meeting agenda *(See appendix #1*).

David Taylor reviewed with the team the need to comply with NERC's Antitrust Guidelines *(See, appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti–competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The facilitators reviewed with the team the consensus guidelines (Appendix #5) adopted at the SDT November, 2008 Little Rock meeting.

II. TECHNICAL FEASIBILITY EXCEPTION UPDATE

Scott Mix, NERC staff provided the team with an update on the status of the Technical Feasibility Exception white paper and the effort to convert it into a compliance document under NERC Rules of Procedure. He offered the following points:

- NERC's outside legal counsel is reviewing and helping to convert the whitepaper into a formal compliance document under NERC Rules of Procedure.
- The SDT needs to take into account all of the FERC rules regarding the NERC Rules of Procedure.
- Expect to see a short formal version in the ROP (400 series) and an appendix with greater detail.
- Being prioritized with all other filings. Unlikely to hear more by Wednesday, February 4, 2009. There is a large compliance filing in queue ahead of this tasking and we do not know if other work is ahead of the TFE document.
- Once the proposed procedure is ready, it will have a 45–day posting period for industry comments. Similarity to standards review, comment, and vote process is not yet clear. It must be adopted by the NERC BOT.
- NERC and the SDT understand that the Industry needs something now. Need to be able to process TFE by the end of the second quarter of 2009.

- Need to circle around on Wednesday to see if there is more information for the SDT prior to its approval to post the Phase I revisions for review and balloting.
- Dave Taylor noted that in Sacramento the SDT decided TFE was a separate process from Phase 1. He noted the Rules of Procedure process is likely to happen more quickly than the Phase 1 Standards process

SDT Member Comments

- TFE is a big gap that may impact the Phase 1 posting schedule.
- The schedule was to post the responses to comments and revisions to standards on February 5, 2009.
- The Standards Committee meets next week and would be expected to approve for pre–ballot posting.
- A lot of utilities will need to use TFE beginning July 1; they're asking members often what's going to be needed. As soon as possible, they need to know something for them to begin the process.
- Scott Mix added that he is not sure exactly what it will look like, but the SDT can assume the fields that appear in the white paper (standard referenced, etc.) that the SDT reviewed in December won't get stripped out. Some other entries may or may not be acceptable from a legal perspective. The key information that is likely to stay is the information that will take the longest time to develop.
- Entities are counting on the availability of technical feasibility.
- Once posted, can balloting be delayed?
- Are we going to let the clock drive us or are we going to do what is right?
- When will there be industry notice of what is happening?
- Large NERC and FERC compliance filing ahead of this.
- The industry has to be understanding of generation and substation devices. Implementing during the last half of this year.
- Industry needs to understand how this fits with standards development.
- Starts July 1 — need the TFE. Impact on response to industry of Phase 1 products?
- Need to get information, even if it is not in final form.
- Need process in place on July 1. Normally compliance processes take several months.
- If remove reasonable business judgment, must have TFE piece.
- We separated TFE from the standards and handled through compliance and rules of procedure. Industry hasn’t separated this in their understanding. Without clarity and certainty about how this is going to be handled, industry may reject phase 1 changes.
- The SDT is ready to help and also not advisable to post Phase 1 standards for balloting until something is out on the TFE process as well so the industry has what it needs.
- SDT shouldn’t authorize until TFE process is out in some form.

- The Chair and Vice Chair sent a memo to Mike Assante at NERC and copied Dave Cook, NERC General Counsel and Dave Taylor last week and he is aware of the SDT concerns about the importance of moving quickly so that the Phase 1 changes and the TFE process is known.
- Whenever it occurs, the industry wants to know what the TFE process will be and what it will need it by the end of the year. There may be a compliance issue and the industry needs to know how TFE fits into compliance, especially with CIP–007.
- If we get thru the comment response during this meeting, we may want to follow up on Wednesday.
- The Chair and Vice Chair suggested that perhaps a few of us can come up with an interim solution that we can review on Wednesday and will allow us to move forward.

On Wednesday, Scott Mix provided an update on the TFE process noting he had received an e-mail from the NERC Assistant General Counsel that outside counsel started to review the white paper and that nothing had been identified as a show stopper e.g. "good faith efforts". In the SDT discussion the following points were made:

- One new point that they raised concerned "What can you claim a TF for?" Is it only what is called out in the standard, or is the subject broader that defined in the standard?
- Scott cautioned that we will have to wait for the outside counsel to complete their review.
- The majority of comments on such rules of procedure typically come from legal and upper management. The good news is that the process seems to be proceeding more quickly. He expects approval around the middle of the first round of ballots on standard changes. It is possible that the ballot should be delayed in order to ensure the opportunity of review if the SDT believes it is warranted.

III. SDT 706 PHASE II FRAMEWORK REVIEW AND DISCUSSION

A. FERC 706 Order Provisions

The facilitator reviewed related FERC 706 provisions noting they direct the SDT to consider "applicable features" of the NIST framework that might be applied to the CIP:

- "…we direct NERC to address revisions to the CIP Reliability Standards CIP–002–1 through CIP–009–1 considering **applicable features** of the NIST framework. However, in response to Applied Control Solutions, we will not delay the effectiveness of the CIP Reliability Standards by directing the replacement of the current CIP Reliability Standards with others based on the NIST framework." *FERC Order 706, Paragraph 25*

- "…As proposed in the CIP NOPR, the Commission will not at this time direct NERC to incorporate specific provisions of the NIST standards into the CIP Reliability Standards." *FERC Order 706, Paragraph 232*
- "…NERC should monitor the development and implementation of the NIST standards to determine if they contain provisions that will protect the Bulk–Power System better than the CIP Reliability Standards. Moreover, we direct the ERO to consult with federal entities that are required to comply with both CIP Reliability Standards and NIST standards on the effectiveness of the NIST standards and on implementation issues and report these findings to the Commission." *FERC Order 706, Paragraph 233*

B. White Paper Presentation — NIST/FISMA and CIP, Bill Winters

Bill presented his paper, "Independent assessment of FISMA and related NIST documents for adoption for Electric Sector Critical Infrastructure Protection," and an additional section, "Thoughts for Discussion of NIST/ CIP Opportunities" and noted his assignment was to review the NIST/FISMA framework and suggest CIP features that represented strengths that might be incorporated into NIST/FISMA. His approach was to ask and try to answer the question: could my company apply the NIST/FISMA security framework approach? Below are points he made in his presentation:

1. One of the CIP problems is that it is a one size fits all approach. It doesn't distinguish between different big and small facilities and their relative security risks. NIST/FISMA with its focus on life cycle methodology, risk assessment methodology and matching the "controls." It offers more in bringing the electric industry forward in information and system security knowledge and application.
2. "Controls" are most common set of information to provide to industry as a common basis for implementation and protection and 853 represent a "hell of a body of controls." 853A is an assessment process for those controls.
3. The NIST/FISMA approach offers a good educational potential as its series of documents could easily be put together for a curriculum that could be offered industry wide to teach and get everyone up to an equivalent level of understanding of the NIST/FISMA framework which provides capability.
4. The NIST/FISMA framework is not currently targeted towards our kind of control systems (CIP based). But the industry can bridge that gap to meet our needs. You may not have to use only the controls presented in 853 as these could be augmented.
5. All gaps in CIP are largely covered in NIST/FISMA regarding controls regarding any entity type. Even where technical feasibility is limited.
6. The closer and sooner we can get to NIST framework, the faster we will get to a common set of controls across various entities; a framework then that vendors, and industry, will produce an infrastructure grounded in a common set of expectations.

SDT Member Comments

- "Frequently asked questions" may answer some of the NIST questions. Did the FAQ with the standards make it on the NERC Web site yet? The Standards Committee asked for more information on that and its posting is pending the SCs review.
- Most SDT members indicated they have seen questions.
- What was Bill's "plan of attack" in his review and drafting? He indicated he started with 853, FIPS 199 and 200, looked at the FISMA site, with all other documents (about 12 in number). They are voluminous but practical for drafting team to use this process. Bill's second paper addresses this. Is the SDT doing it or is it guidance to industry to do it?
- 853 caveat for control systems — Appendix J. NIST published white paper on control systems speaking to general architecture. How much is 853 applicable to control systems?
- SDT would have to tailor controls to fit our systems. The largest gap in the NIST/FISMA is that they don't address reliability.
- Review the FISMA appendix that addresses how to tailor the controls.
- NIST Draft 2 of 82 goes to next step and addresses control systems. Similarity between process control systems and BES control systems.
- CIP standards may need to be broken apart into: commercial computing environment; different standards in generation plants, etc.
- A plus is that the NIST/FISMA framework is developed and already paid for with tax payer dollars. We can leverage that expertise and apply and tailor it to our industry.
- He thought he would find a disjointed set of documents but was surprised to see the logic and connection of the framework. The SDT could get behind or alongside NIST/FSMA to further documents for the BES.

Thoughts for Discussion of CIP/NIST Opportunities

Bill Winters offered the following thoughts for the CIP/NIST/FISMA SDT discussion that were contained in a second paper he handed out to members:

1. He noted there are some controls in CIP but they are not related together.
2. A possible transition approach could be to walk through CIP standards and tie to NIST guidelines (e.g. analyze system, risk assessment process, etc). The SDT could do this relatively easily. The question would be how much detail we should go to.
3. The SDT could put together controls and break into small working groups to align controls to CIP standards.
4. SDT might recommend letting federal agencies subject to FISMA be able to use it to satisfy CIP requirements.
5. It may be better to create separate set of documents that serve as parallels for control systems vs. creating appendices for things like control systems.

6. Offers two approaches going forward: Heavy alignment vs. Integration Light.
7. *Heavy alignment* — replace/expand CIP-002 requires assessment of: systems used in control and monitoring BES/BPS; systems directly connected and/or exchange data with; and systems which transport data used in control and monitoring.
8. *Light alignment* — develop a set of controls using NIST controls as starting points.
9. Common controls would serve as the basis for certification. How proscriptive they are written will be debated.
10. The industry should be trying to get to a common set of protections and the controls are the fastest route there. Hard work up front, but down the road, there will be less work under a new NIST/FISMA system.
11. The NIST/FISMA framework will enable a more open discussion across the industry of the controls unlike today's CIP discussion.
12. Options in developing and implementing/phasing in over time: e.g. on vendor–by–vendor, system by system etc.

Member Comments

- **Address gaps in both NIST and CIP.** There are gaps for control systems that still need to be addressed in NIST. CIP has benefits for addressing these gaps.
- NIST needs an overarching document that provides step by step. "A read me first" document with an FAQ. There is a 36 pp Guide to NIST information security docs that serves as a roadmap for all docs on the NIST/FISMA website.
- Replace all CIP standards with one requirement? Implement a NIST based protection program to protect critical cyber assets. Would that be close to what the current CIPs provide? May not be close at all. Moving NIST into CIP — care has to be taken; we may end up with more holes
- Moving to be more strongly associated with NIST/FISMA might be better than sticking with where we are with CIP.
- Nothing precludes you from using NIST as basis for building standards. There is a small percent within the industry have to use NIST. A much larger percent can use CIP standards and come up with their own methodology and document in procedures how to do that.
- **Common Controls and Auditing.** You can do it however if you want to in CIP; some struggle with this. When it comes to auditing, what is the outcome? Most prevalent feature in NIST is that you can audit across the entities through the existence of common controls.
- How much reworking would be required to convert to a NIST/FISMA compliant program? There are many ways to meet requirements.
- The SDT's work and output will be roundly criticized if we adopt a narrow scope and basically leave the CIP as is it is now.
- **Outcomes Based Framework.** The SDT should remember the challenge Mr. Assante made to seek to develop an "outcomes based approach and standards". Standards that are

more prescriptive are presumably easier for auditors, but harder for industry to protect assets.

- Let the industry use tools out there as long as the end goal of protecting critical infrastructure is achieved. We are caught between multiple masters. NERC Compliance wants black and white standards requirements audited with a Yes or No.
- **Other Approaches?** In DC all we heard was NIST/FISMA. Are there other standards? Look across all to determine how to build guidelines to have protection. What would be entry to these? 199 document. E.g. all cyber assets in CIP-002 fit in high category. How we categorize systems?
- What would an outcome based standard look like? A "senior manager" outcome entity will put into place a governance program to ensure that an appropriate program is in place to maintain a good security program. Why should CIP mandate a single senior manager. Will FERC buy off? Outcomes may be hard to measure.
- Guideline about the types of people and roles for good practice. Let them figure out who will do. Somebody is responsible for all (1 or 10 different).
- SDT should be trying to move people in direction of NIST framework over the long term. This is "a" methodology.
- **How prescriptive should controls be?** What is the body of controls? Should we be prescriptive and identify a minimum set of protections for each type of system? CIP-002 through CIP-009 does it here and there but leaves a lot for interpretation.
- Trying to be as non–prescriptive in order to preserve choices in implementing security as long as certain goals are met.
- Standards should be telling you "what" to do not "how" to do. CIP may have stepped over the line on the "how" end. In order to make it auditable we may be forced to cross the line again with the "how". 199 and 200 are the standards and 853 a guide.
- If we put anything in a standard it becomes mandatory and enforceable; specifically if we put controls as to what we tell industry they must be doing. E.g. look at kinds of industry comments on the proposal to find a single person who will have to take responsibility. This will be nothing compared to 200–400 pp we will receive on this path.
- **Standards vs. Frameworks.** We need to be clear of difference between standards vs. framework. NIST is a framework that was not intended nor designed to be standards to be certified.
- **Certification Methodology.** We should focus on a framework and then what is the certification methodology we will use. How do we get to that so we are able to have a consistent set of protections?
- Current CIP based on 1200, which was based on ISO 17799. The SDT should pick a framework and develop the adaptation as they can all work. Then consistently implement that framework. All frameworks have provisions for certification.
- Should the SDT propose continuing down the ISO 17799 path? Or go to some other framework?

C. Phase II — CIP and NIST/FISMA — CIP–002–1 Discussion Document, 1–29–09

John Lim presented the team's paper on behalf of Jackie Collett, Scott Rosenberger and John Varnell. He presented a discussion paper for the Phase 2 approach. He noted that the CIP standards are intended to be a baseline for cyber security for bulk power assets with a focus on assets with the highest impact. One of the issues with the current NERC standards which the team discussed the most was the "all or nothing" approach of the current CIP standards, i.e. if an asset is not defined as "critical" under CIP, there are no controls required. Perhaps additional systems and/or functions need to be identified to address this gap.

The team identified the following five issues with CIP-002 and for each offered comments on shortcomings, gaps, challenges and options:

1. Piecemeal Approach.
2. Not protecting assets needing protection. Description, comments, and options.
3. Gaming
4. All or Nothing
5. Loss of Asset Integrity and Misuse

John Lim noted that a multi–level protection scheme will have to identify high, medium, and low. It will be necessary to study which assets are most critical. Look at the function of system and the connection to the BES.

Following the presentation there was a discussion about whether vulnerabilities in common systems should be addressed in the next version of standards. There was also discussion concerning the protection of defined Critical Assets versus protection of all SCADA systems. Several members stated that priority should be given to CIP-002 and the all or nothing view of defining Critical Infrastructure which is in scope as a result of CIP-002 current logic. Several members expressed that at least a minimum level of protection must be prescribed for additional assets.

Member Discussion Points

- All or nothing. Definition of a cyber asset. "Something that is programmable." It is in the NERC glossary. What about network connectivity? Formal definition from NERC. How is programmable being defined?
- What about analogue?
- Programmable or programmed?
- Include anything with firmware. What about subclasses in security environment. Very few of those are left.

- **Focus on High Impact Assets.** Commonality of vulnerabilities — perhaps looking at functionality will address issue. Will focusing on high impact assets address common vulnerability?
- Should this be addressed in standards or in the vulnerability assessment and response system? E.g. "Zero day exploits" problem — the risk of acts that take systems down before we realize vulnerability. Apply good basic security standards and you can deal with this. But if we only look at high impact systems, we may not be addressing this.
- **System Approach.** Industry can/may use a system approach. However, won't do this voluntary. Whatever is not critical asset. This approach doesn't conform with information security. Can we redefine some of these things in standards? No just programmable devices. CIP standards may not be sufficient.
- Many in industry are protecting others even though standard doesn't require. Put critical asset in because that is what they are going to get fined for. You can keep off the CA books but still protect.
- Already addressed/protected in CIP-005
- If this involved anything except critical infrastructure I would trust that people will do the right thing. Don't call cyber security call them reliability.
- System perspective approach — today people only admit to 30 percent of what they have. However, FERC's jurisdiction to BES is tied to interstate commerce moving of power. Bulk power assets is a limited portion of what falls under FERC's jurisdiction. Critical asset list. N– 1, 2, 3 and extreme contingencies. Cyber event — could be in an N–4, 5, 6. From a system perspective, this increases which assets are 'critical"
- Dump CIP-002 and start over again?
- From a NERC standpoint we need to focus on potential attack vectors and will increase in the future.
- Have to study the criticality of the systems we are doing.
- Look at NERC charter — BES doesn't cover every device — agree, but we need to be looking far enough forward to be able to protect that. The end goal is to protect BES, but extent to which the distribution affects BES, we need to be considering whether or not distribution can impact BES and if so, what to do at that level what needs to happen.

D. Strawman — NERC/FISMA Asset Selection Process — Scott Mix

Scott Mix took on the task of trying to conceptualize what would a NERC/FISMA process look like to apply while maintaining the status quo in terms of the scope of the current CIP standards. He created a "strawman" which was presented in a PowerPoint format. He noted that he started with a mission focus on the bulk electric system (BES) vs. the bulk power system (BPS). The law and FERC say BPS whereas NERC has historically used the BES. He noted that some standards have drawn line at various levels and the CIP standards focus only on high impact systems. Most of NIST framework deals with technical protections once assets have been identified.

Scott noted that the FISMA approach requires that all computer assets be included in scope. Using FIPS–199, systems are in scope if needed to accomplish the assigned mission.

He then noted that extending the scope into the distribution system will actually take an act of Congress because the bulk power system does not include distribution. The bulk power system consists of the eight regional bulk electric systems. Characteristics are identified for 3 categories: confidentiality; integrity and availability. Then a high water mark is applied to the highest ranking of the 3 aspects.

Electric system is bisected into Transmission and Distribution. Distribution is off the table by law.

The portion of Transmission dealing with Marketing is also off the table. Transmission is then divided into High, Medium, and Low impact to the BES. Perhaps there needs to be a fourth category that is "ignore" or no impact to reliability. If we applied that methodology to the standards this would classify all transmission assets by impact (high, medium, low, or none). Then the SDT could go through CIP-003 through CIP-009 and determine what the implications are from a reliability standpoint. 800–53 is a good catalog that can be used for an approach excluding the sections that deal with financial, etc, which are not applicable. A key question is would this meet all mandated changes for FERC 706? There are significant implications for the workload for SDT, the workload for education, and the workload for industry implementation. Scott suggested the SDT could have a healthy debate as to whether or not this approach is what the team agrees is the right approach.

SDT Member discussion

- Mainly affect CIP 5, 6 7? Yes but also others.

E. Overarching Principles Presentation and Review — Mike Winters

SDT member Michael Winters drafted these principles for consideration by the SDT. He introduced them making the following points:

- Hoping principles are complementary
- Modify existing standards and get the best of both worlds– CIP and NIST.
- Risk of scrapping and starting over.
- Consider the amount of IT introduced to distribution systems.
- These principles are not mutually exclusive.
- #1, 3 and 5 are consistent with Scott Mix's strawman.
- The concept is to offer protection for all cyber assets associated to operating the interconnected power system but to different degrees based on the risk.

SDT Member Comments before Ranking

- Why not use guideline by Risk Development Working Group?
- Pick a framework. Apply it consistently. 800–53 catalogue – 003–009.
- All cyber assets "Power system". There is not a nice line around generation systems. [Note to Draft: Generation is a critical component to power systems]
- The term Power System IT is simply intended to differentiate from corporate IT.
- Potential for causing someone to make a decision to shut down a plant?
- E.g. continuous emissions monitoring. Fuel supply and multiple infrastructure interdependencies. This is a big issue. SDT can't get to this point for a long time.
- Approach for #1 — catalogue your SCADA, (EMS systems, etc.) and then look at those systems essential to operation of inner circle.
- What is the list of critical assets minimum to perform our mission? Why protect anything else? Or the reverse — identify which assets are critical in order to meet mission. Determine which assets, if turned off, would prove to be critical to meet mission.

Phase II Overarching Principles (Michael Winters)
February 2 SDT Initial Rankings

The Overarching Principles have been re–ordered to reflect the ranking of each principle and their average acceptability from higher to lower. The Strikethrough #s reflect the initial numbering.

1. **(2) Create clear standards and employ a technical exception and compensating controls reporting and guidance process that accommodates deviations.**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank	**11** (10/1)	**5**	**1**	**0**	**3.6 of 4**

Author's clarifying comments before SDT initial ranking

- #2 outcome based, not too prescriptive — Exception based standards. Need a clear process with clear standards and TFE process and guidance to accommodate deviations.

2. **(8) A mapping similar to NIST 800–53 Appendix G to CIPs will help quantify and assess the gap, if any.**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank	**11**(10/1)	**2**	**2**	**0**	**3.6 of 4**

Author's clarifying comments before SDT initial ranking

- #8 Mapping — refers to NIST 800–53 Appendix G.

3. **(3)Use a consistent risk–based model to classify all assets (i.e. facilities, sites, physical perimeters) (i.e. not cyber assets at this point) as critical/high impact, moderate impact, low impact.**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank	**9 (**8/1 ph)	**6**	**2**	**0**	**3.4 of 4**

Author's clarifying comments before SDT initial ranking

- Principle #3 strike/delete from principle reference to going below 100kV. This should be considered "evolution" vs. "revolution."

4. **(4)An entity's Asset classification would be open to scrutiny by regional entities and ERO. The extent of scrutiny to be defined and tightly controlled.**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank	**4** (3/1)	**11**	**2**	**0**	**3.1 of 4**

Author's clarifying comments before SDT initial ranking

- #4 allows for scrutiny — "open up the kimono" and have peer reviews or have asset classifications scrutinized by RRO and ERO. Will need and effective arbitration/mediation mechanism.

5. **(7)Use the minimum security controls for high, moderate, low within NIST 800–53 to help model the CIP controls for each level. Address any gaps at the same time but keep the same CIP002 to CIP0XX general format. Industry knows this format, is building policies and programs around it, has commented on it and has voted on it.**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank	**5** (4/1)	**8**	**4**	**0**	**3.0 of 4**

Author's clarifying comments before SDT initial ranking

- #7 Use guideline to figure out the controls at different levels. Some customization, reference NIST, Use as starting point.

6. **(6) Any IT devices beyond the perimeter, including telecom, are not part of the CIPs – the CIPs remain perimeter–based where devices on and within the perimeter are protected and everything beyond is considered untrusted.**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank	**4** (3/1)	**6**	**6**	**0**	**2.9 of 4**

Author's clarifying comments before SDT initial ranking

- #6 — logistics — interfacing devices and perimeters. Keep perimeter based or trusted zones, still accomplish.

7. **(5) As part of a power system (non–corporate IT) inventory of cyber assets, add an attribute to each device that associates the high/moderate/low classification of the physical**

perimeter/facility/site within which it resides. Apply security controls based on the classification.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank	**4** (3/1)	**6**	**7**	**0**	**2.8 of 4**

Author's clarifying comments before SDT initial ranking

- #5. This is logistical and is related to principles #1 (8) and #3 (3)

8. (1)Protect all cyber assets related to power system – not just the Critical Cyber Assets – but to different degrees of protection/controls depending on their classification.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank	**3** (2/1)	**8**	**6**	**0**	**2.8 of 4**

The facilitators noted that the authors of the draft papers and principles would be asked to refine them and be prepared to present them at the February 18–19 SDT meeting. That meeting would be devoted to making progress on the SDT's development of a Phase II framework around which the team could organize its work and begin more detailed review of the CIP and the applicability of the NIST.

IV. PHASE I INDUSTRY COMMENT/ SDT RESPONSES

The Chair proposed that the SDT review all of the responses and then, as needed, break into the small groups that had been formed and worked together at the January meeting to complete the task of drafting the responses. The SDT then would reconvene and review and agree on the final response. Following that the SDT would review any changes made in the Phase 1 documents that were out for comment based on the SDT's responses.

Joe Bucciero presented the draft Response Text noting where there were additional responses needed. (See, Appendix #4 for link to a power point presentation). The team looked at each of the additional industry comments that were not available at the January 7–9, 2009 Phoenix meeting. The SDT reviewed and made suggestions related to consistency and content for the small working groups to consider keeping in mind the goal of "good enough to post" the responses. The six small working groups were re-formed to review the industry comments and to refine the SDT's responses. The six groups were created to craft the SDT's responses and to make appropriate edits to the text of the CIP standards.

The small groups reported the results of their drafting later in the afternoon to the full SDT which approved them pending the development of the complete text that was to be developed

overnight by Joe Bucciero along with a redline draft of the Phase I documents with changes made as a result of the industry comments.

On Wednesday, the SDT reviewed all of the proposed changes to the Phase I documents posted for industry review in light of the SDT responses and discussion. The final SDT response document reflecting all of the changes agreed to by the SDT on Tuesday was not ready in final form for the team's review. The Chair asked Mr. Bucciero to distribute the final Response document to the SDT as soon as it was ready.

Kevin Perry made a motion which was seconded by Tom Hofstedder that the SDT will:

- Adopt the SDT Response Document (reflecting Tuesday's agreed on changes)
- Adopt the Proposed Changes to the Phase I Documents (reflecting Wednesday's review)
- Agree to post the documents for the 30 day pre-ballot period.
- However, the Phase I balloting will only commence after the NERC TFE proposal has been posted for industry comment for at least 14 days.

The motion was unanimously adopted by all SDT members present and voting.

V. VSL PROCESS AND DISCUSSION

Dave Taylor, NERC staff reminded SDT members that under the FERC Order 706 the Violation Severity Levels needed to be applied to the CIP 002 through CIP-009. The Standards Committee made a decision to have a separate team assign VSLs to the standards rather than incorporating into the 706 SDT. Project 2008–14 is creating the VSLs. An initial draft of the VSLs is complete, but still needs to be posted for comment. These draft VSLs will ultimately need to be compatible with CIP Phase I efforts of the SDT.

There were questions concerning the relationship of measures vs. VSLs. Mr. Taylor reminded the group that the only thing which is required is the requirements and not the measures.

The SDT discussed the fact that a separate team created the VSL. Mr. Taylor suggested that the original VSLs be posted and then revisions related to this SDT Phase I work could also be posted for comment. The SDT members expressed concerns with the likely confusion with the VSL team and in the industry posting both of these VSL changes (i.e. current CIP and Phase I proposed changes). Mr. Taylor noted that the draft SAR that directed the VSL SDT to only review the current CIP standards was open for comment until February 10, 2009. Members again expressed concerns that two SDTs revising the same documents is sure to cause confusion in the industry. There was discussion regarding whose responsibility it is to create VSLs for the CIP original and Phase I revisions to CIP. There was also discussion concerning the changes and timing or Phase I changes.

The facilitators suggested straw polling to determine the SDT's views on several options going forward.

- **Poll 1**: This team should take on both the CIP current VSLs (Version 1) and Phase 1 (Version 2) and Phase 2 (Version 3) CIP VSLs — **0–18 members supported** this approach.
- **Poll 2**: The VSL team should do both current CIP VSLs (Version 1) and the Phase I VSLs (Version 2) — **16–2 in support of this approach.**

Member Comments following Poll 2

- One member expressed concern about the amount of time it will take for this SDT to agree on comments to be sent on the other team's SAR. That member suggested that individual utilities should comment on the SAR, but consensus is not needed.
- **Poll 3:** The SDT should be responsible for VSL's for both Version 2 (Phase I) and Version 3 (Phase II) of VSL's — **7–11 in support** of proposal.

Following the polls and further discussion, a motion was made by Kevin Perry and seconded by Sharon Edwards as follows:

The following statement, if approved by the SDT, will be forwarded to the SAR Committee as an SDT comment for its consideration with only the names of those SDT members voting in support of the motion:

> **"The Phase I changes ("Version 2") to the CIP standards are expected to be balloted coincident with the development of the VSLs for "Version 1" of the CIP standards. The Project 2008–06 drafting team will not be in a position to include the VSLs with the revised standards due to the timing of the two projects. The VSL drafting team is best positioned to recommend VSLs in support of the Version 2 standards."**

The motion was approved by more than 75 percent of the SDT members present and voting.

The following SDT members voted in favor of sending the following SDT comment to the VSL SAR Committee with their names appended: Jeri Domingo Brewer; Kevin Perry; Jon Stanford; Rob Antonishen; Sharon Edwards; Jay Cribb; Joe Doetzl; Scott Fixmer; David Revill; Phil Huff; Tom Hofstetter; Chris Peters; Keith Stoffer; and Gerry Freeze

The following SDT members voted against the motion: Rich Kinas; John Lim; John Varnell; and Kevin Sherlin.

VI. NEXT STEPS

The facilitators reviewed adjustments to the schedule including:

- A SDT comment on the VLS SAR by the deadline (February 10, 2009)
- February 18–19 in Fairfax, Virginia — advance the Phase II review and discussion
- March 10–12 in Orlando, Florida — seek a Phase II framework going forward.
- April 14–16 in Charlotte, NC — test the Phase II framework in a workshop with cyber experts and refine the framework for presentation at the MRC on May 1.
- May 1 — Members Representative Committee presentation of Phase II framework
- May 18–19 — Refinement to Phase II framework based on MRC comments and determination of whether to issue a white paper for industry comment. Review proposed SDT sub–committee/drafting group structure
- June–December, 2009 — SDT meetings along with SDT drafting groups.

The team then evaluated the meeting

- **What worked?**
  - Small group breakout
  - Papers for Monday's presentation available for advanced review
  - Rapid parking lot

- **What could be improved?**
  - Meeting announcement/agenda versus actual schedule — try to clarify and establish starting and ending times so people can book appropriate travel.
  - 4–3–2–1 vote language needs to be a bit tighter and clearer. Need to allow sufficient time in the session to understand proposals that will be ranked.
  - Underestimation of level of effort to get updated documents available on the last day.
  - Hard to keep track of where we were in the comments list. Needed unique identifier for reference purposes when we do this again.

- **Suggestions for next meeting**
  - Earlier agenda posting (with caveat that there are only two weeks separating meeting on February 18–19).
  - Possible pre–meeting SDT agenda review for future meetings?
  - Consider ways to survey experts

The SDT adjourned at 11:30 a.m.

Appendix # 1

Meeting Agenda — February 2–4, 2009

Draft Meeting Objectives:

- To receive an update on the NERC Technical Feasibility Exception process;
- To complete and adopt the SDT's responses to comments and any changes to the Phase I documents for posting;
- To initiate a SDT review of Phase II principles and potential approaches to integrating CIP and NIST/FISMA; and
- To agree on next steps and the work plan going forward.

Monday	**February 2, 2009**
1:00 p.m.	Welcome and Opening Remarks — Jeri Domingo–Brewer and Kevin Perry • Roll Call • NERC Antitrust Compliance Guidelines • Facilitator Review of January meeting and adoption of January 7–9, 2009 Meeting Summary
1:15	Review of Meeting Objectives and Agenda — Jeri Domingo and Bob Jones
1:20	Organizational Issues and Review of Phase I and early Phase II Schedule — Stuart Langton • Overview of Phase I Work–plan, January– May 2009 • Overview of Phase II Work plan– January–June, 2009– including CIP 002 conceptual approach and workshop and industry input and feedback.
1:40	Update on Phase I SDT Responses to Comments and Procedure Going Forward for Day Two — Jeri Domingo–Brewer
1:50	Update on Technical Feasibility Exception (TFE) Process — Scott Mix
2:00	Introduction to Phase II Review Process — Stuart Langton
2:10	Initial Review of Phase II Principles — Michael Winters
3:00	Break
3:15	Initial Presentation and Discussion of the Phase II White Papers — John Lim (Jackie Collett, Scott Rosenberg, and John Varnell) Bill Winters
4:55	Summary of Day One Outcomes and Review of Day Two Agenda
5:00	Recess
Tuesday	**February 3, 2009**
8:00	Welcome, Agenda Review and Review of Day One Results

8:05	Review of Proposed Procedure/Guidelines for Phase I Comment Review
8:10	Phase I Comment Review and Refinement — Plenary Discussion of Comments
10:15	Phase I Comment Review and Refinement — Plenary Discussion of Comments
12:00	Working Lunch (Return to plenary meeting at 2:00) Small Group Breakouts — Review and Draft Final Responses (As needed)
2:00	Small Group Reports on Draft Responses and Plenary SDT Discussion and Decisions
3:30	Break
3:15	Small Group Reports on Draft Responses and Full SDT Discussion and Decisions
4:50	Summary of Day Two Outcomes and Review of Day Three Agenda
5:00	Recess

Wednesday February 4, 2009

8:00	Welcome and Agenda Review
8:10	Review and Adoption of Phase I Responses and Proposed Changes to Phase I Products
10:00	Review of Work plan for Phase I and Phase II
10:30	(If time permits) Continue Review and Discussion of the Phase II Approach to Integrating CIP and NIST/FISMA.
11:15	Next Steps on Phase II Approach Development
11:30	Technical Feasibility Exception Process Going Forward — Scott Mix
11:45	Meeting Evaluation — What Worked and What Could be Improved?
11:55	Assignments, Next Steps and Review of February and March SDT Agendas
12:00	Adjourn
12:15	Working Lunch and Opportunity for SDT Small Groups to Continue Development of Phase II Products
3:00	Conclude

Appendix # 2

Cyber Security for Order 706 SDT Attendees List
Phoenix AZ
February 2–4, 2009

Attending in Person — SDT Members

1.Rob Antonishen,	Ontario Power Generation
2. **Jeri Domingo–Brewer, Chair**	U.S. Bureau of Reclamation
3. Jay S. Cribb	Information Security Analyst, Principal, Southern Company Services, Inc.
4. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co.
5. Sharon Edwards	Project Manager, Duke Energy
6. Tom Hoffstetter	Midwest ISO, Inc
7. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp.
8. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
9. Richard Kinas	Orlando Utilities Commission
10. John Lim	CISSP, Department Manager, Consolidated Edison Co.NY
11. **Kevin B. Perry, Vice Chair**	Director, IT–Infrastructure, Southwest Power Pool
12. Christopher A. Peters	ICF International
13. David S. Revill	Georgia Transmission Corporation
14. Kevin Sherlin	Sacramento Municipal Utility District
15. Keith Stouffer	National Institute of Standards & Technology
16. John D. Varnell	Technology Director, Tenaska Power Services Co.
17. William Winters	Hydro One Networks, Inc. *(Monday only)*
1. Roger Lampilla	*NERC*
2. David Taylor	*NERC*
3. Scott R. Mix	*NERC*
4. Joe Bucciero	*NERC/Bucciero Assoc.*
7. Robert Jones	*FSU/FCRC Consensus Center*
8. Stuart Langton	*FSU/FCRC Consensus Center*

SDT Members Attending via WebEx and Phone

18.Phillip Huff	Arkansas Electric Coop Corporation
19.Jonathan Stanford	Bonneville Power Administration
20.Michael Winters	Hydro One

SDT Members Unable to Attend

1. Jackie Collett	Manitoba Hydro
2. David Norton	Policy Consultant, CIPEnergy Corporation
3. Scott Rosenberger	Luminant Energy
4. Bryan Singer	Kenexis Consulting Corp.

Appendix # 3

NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups)

should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC–related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC–related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti–competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 4

Below is a link to all of the Phase I documents and the Draft SDT Response Document and PowerPoint presentations by Joe Bucciero (Phase I review), Scott Mix (Phase II Strawman) and David Taylor (Phase I VSLs) reviewed by the SDT during the small group and full team discussions in Phoenix, AZ:

Appendix #5

Background, Principles, and White Paper and Strawman Documents

FERC 706 Background References

Regarding NIST:

25. The Commission believes that the NIST standards may provide valuable guidance when NERC develops future iterations of the CIP Reliability Standards. Thus, as discussed below, we direct NERC to address revisions to the CIP Reliability Standards CIP–002–1 through CIP–009–1 considering applicable features of the NIST framework. However, in response to Applied Control Solutions, we will not delay the effectiveness of the CIP Reliability Standards by directing the replacement of the current CIP Reliability Standards with others based on the NIST framework.

232. As proposed in the CIP NOPR, the Commission will not at this time direct NERC to incorporate specific provisions of the NIST standards into the CIP Reliability Standards. While commenters provide compelling information that suggests that the NIST standards may provide superior measures for cyber security protection, the Commission is concerned that the immediate adoption of the NIST standards would result in unacceptable delays in having any mandatory and enforceable Reliability Standards that relate to cyber security.

233. The Commission continues to believe – and is further persuaded by the comments – that NERC should monitor the development and implementation of the NIST standards to determine if they contain provisions that will protect the Bulk–Power System better than the CIP Reliability Standards. Moreover, we direct the ERO to consult with federal entities that are required to comply with both CIP Reliability Standards and NIST standards on the effectiveness of the NIST standards and on implementation issues and report these findings to the Commission. Consistent with the CIP NOPR, any provisions that will better protect the Bulk–Power System should be addressed in NERC's Reliability Standards development process. The Commission may revisit this issue in future proceedings as part of an evaluation of existing Reliability Standards or the need for new CIP Reliability Standards, or as part of an assessment of NERC's performance of its responsibilities as the ERO.

Phase II Overarching Principles (*Michael Winters)*

***NOTE**: The principles below were drafted and submitted by SDT member Michael Winters. He notes they are applicable to both the 'NIST approach' and the 'CIPs modification' approach and suggests that the approaches may be one and the same. He requests that SDT members "Don't get hung up on any specific term as this is a concept. Terms and definitions can be refined."*

***Note from Michael Winters**: The approach suggested uses an example of facilities/sites being Critical Assets. Consider this a case study where we could then make the 'CA=System' model also work. These principles represent a collection of ideas voiced by several members at previous SDT meetings. It focuses on building upon existing CIPs for improvement rather then starting at the beginning. The foundation for the principles consists of: existing CIPs; NIST 800–53/82; SDT discussion and debate to–date. We have all observed that the SDT has made a few different attempts at finding the starting point for the next phase of changes and the overarching principles to be applied to those changes. It may be time to attempt an approach and then assess its effectiveness at an interim checkpoint. Even if we end up abandoning a main concept, some of the learning's will prove useful for future iterations. Leveraging the existing CIPs instead of a wholesale re–write will still accomplish an incorporation of NIST 800–53/82 where applicable without losing all the good work that has already gone into the CIPs or it being perceived by Industry that their investments in becoming CIP compliant to–date will be stranded.*

1. Protect all cyber assets related to power system — not just the Critical Cyber Assets — but to different degrees of protection/controls depending on their classification.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank					

2. Resist creating exception–based standards to accommodate every possible business and operations scenario. Instead, create clear standards and employ a technical exception/compensating controls reporting and guidance process that accommodates deviations.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank					

3. Use a consistent risk–based model to classify all assets (i.e. facilities, sites, physical perimeters) (i.e. not cyber assets at this point) as critical/high impact, moderate impact, low impact. Risk Assessment Working Group may be providing a good start and perhaps concepts from FIPS 199 impact analysis can also be

incorporated. This will allow for expansion of standards beyond Critical and to Distribution networks (i.e. below 100 kV – accommodates AMI, Dx automation, etc). Classifying at the physical perimeter level would allow different classifications to exist within a building or at a site (e.g. control room, computer rooms, dev and testing rooms, and back–office at a control centre).

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank					

4. An entity's Asset classification would be open to scrutiny by regional entities and ERO. The extent of scrutiny to be defined and tightly controlled.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank					

5. As part of a power system (non–corporate IT) inventory of cyber assets, add an attribute to each device that associates the high/moderate/low classification of the physical perimeter/facility/site within which it resides. Apply security controls based on the classification.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank					**of 4**

6. Interfaces between ESPs/PSPs of two different classifications will take on the controls of the higher classification. Any routers, switches, firewalls, secure FTP, ICCP, DMZ that connects corporate admin networks or external entities to your power system IT (cyber) devices/perimeters get included as a CIP protected device. Any IT devices beyond the perimeter, including telecom, are not part of the CIPs – the CIPs remain perimeter–based where devices on and within the perimeter are protected and everything beyond is considered untrusted.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank					**of 4**

7. Use the minimum security controls for high, moderate, low within NIST 800–53 to help model the CIP

controls for each level. Address any gaps at the same time but keep the same CIP002 to CIP0XX general format. Industry knows this format, is building policies and programs around it, has commented on it and has voted on it.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank					**of 4**

8. A mapping similar to NIST 800–53 Appendix G to CIPs will help quantify and assess the gap, if any.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2–2–09 rank					

DRAFT **01/29/09**

Independent assessment of FISMA and related NIST documents for adoption for Electric Sector Critical Infrastructure Protection.

William Winters, Arizona Public Service
*(Distributed before the Meeting)_*

What

First, I have to commend the NIST staff responsible for the development of the guidelines and standards documents that form the FISMA framework. This body of work provides an incredibly comprehensive background and framework for information security.

To a limited degree, the current version of CIP standards at least attempted to capture the essence of fundamental cyber security implementation and management however, as is evidenced by the creation of the SDT, the full extent of what is required was missed. In the years since the CIP standards were conceived, NIST expanded and refined the cyber security framework and standards documents required for FISMA. These documents embody the essence and the detail required for Information Security Management. In fact, the NIST FISMA documents go beyond a framework by providing the narrative background at a fundamental level necessary to develop a clear understanding of the framework, intent and method of implementation to non–cyber security professionals. A clarity that is largely lacking in the CIP standards.

To date the SDT 706 Phase II discussions have largely centered on NIST 800–53 and integration with the CIP standards. To a lesser degree, FIPS–199, NIST 800–53A and FISMA have been discussed.

I feel at this time expanding the discussion to FISMA and the full body of associated NIST standards and guidelines is warranted. Not simply should or how NIST 800–53 can be integrated but to what degree should or can CIP integrate or parallel FISMA.

After review of FISMA as documented and the supporting NIST documents, I count myself an advocate of integration and, to a significant degree, adoption of the FISMA/NIST approach to Information Security Management for electric sector CIP standard.

Why

The FISMA/NIST framework provides a consistent methodology to install a set of security protections appropriate to the criticality of an information system and the associated information.

It is well thought out, documented and based on the fundamentals of cyber security and SDLC. The guidelines provide the fundamental security background as well as the guidance for application.

It is a body of work that is easily accessible by all industries and sectors and all sizes of entities, service providers, vendors, auditors, etc. It is a requirement for federal agencies including those in the electric sector. As such, it represents a common framework. Ambiguity is minimized. Knowledge sharing is maximized.

The use of a common framework will provide the greatest opportunity for uniform application of cyber security controls to protect our Critical Infrastructure. Fundamentally, it provides a common basis for assessment, implementation and audit regardless of sector or service entity.

As much as the existing CIP standards may get most entities to the point of implementing appropriate cyber security controls, it will not have been done in a consistent manner with clear mutual understanding of the objectives.

Though the body of NIST documents is of significant volume, the effort required to understand and apply is in no way more difficult than the effort that has been expended to understand and apply the CIP standards. The most significant difference is that after the NIST process is assimilated, security controls may be implemented consistently, monitored consistently, changed consistently and, assessed consistently.

Protecting our cyber managed supply of electricity in a consistent manner across all entities is the best thing to do.

It's paid for.

How

Integration approaches can range from drawing on individual elements in the NIST documents to fill in the CIP gaps requirement by requirement to wholesale adoption of FISMA.

My recommendation is that we take an approach that establishes a strong parallel to FISMA, utilizing the NIST standards and guidelines as much as possible.

In its most pervasive manifestation, this would entail a combination of adopting the FISMA/NIST documents directly and/or creating parallel documents/supplements tailored to the electric sector. This would likely result in an overhaul of the current CIP requirement layout and require transition education.

At a minimum, this would entail developing a set of controls (800–53), related assessment procedures (800–53A) and FIPS 200 Minimum Security Requirements equivalent specific to BES entities, creation of FIPS 199 Security Categorization equivalent that integrates to CIP 002 and other CIP requirements to relevant NIST documents.

The degree to which the FISMA/NIST framework should be adopted will need to be discussed and debated.

A couple of fundamental questions:

- Does FERC feel that adoption of FISMA/NIST framework will meet all the concerns in Order 706?
- What were the concerns with adopting the FISMA/NIST framework as the basis for the existing CIP standards and do those concerns still exist?

W Winters 02/02/09
Thoughts for discussion of CIP/NIST opportunities
(Handed out at the meeting)

- Develop set of controls for each area/entity which could be done regionally
- Entities can create control extensions. This is currently allowed in the NIST method
- Allow option for federal entities currently subject to FISMA and CIP to use FISMA/NIST to satisfy CIP
- Encourage use of FISMA/NIST today. Entities have the option today to use FISMA/NIST as a basis for meeting CIP requirements.

- Develop a process for application of FISMA/NIST (e.g. Develop as an overlay of CIP or Develop as standalone)

Controls Development Approach

- SDT sub–team(s) could develop initial minimum controls (they could be entity tailored controls and/or "exception" based controls)
- Create clearinghouse for sharing of controls amongst entities as different organizations develop control extensions
- Develop controls using working group model at the regional level. This could be extended to development of educational framework and more effective open information sharing.
- Lifecycle management of controls for improvement/refinement and adoption
- Regional controls could feed to national and periodic update with regional, national and NIST representation.
- NIST and/or SDT team create initial draft of documents for "CIP" (e.g. appendices to existing or separate set of docs,)
- Build transition education program based on mapping of CIP to NIST.
- As body of controls are refined and standardized, auditors, developers of compliance programs (internal, consultant/vendor), developers of applications, support personnel, etc. have common reference and interpretation of the standards

Heavy alignment:

1. Expand/replace CIP 002 to require assessment of:

   a) Systems used in control and monitoring of BES/BPS
   b) Systems directly connected and/or exchange data with
   c) Systems which transport data used in control and monitoring

2. Develop equivalent FIPS 199, FIPS 200
3. Develop Risk Assessment process (800–37 equivalent/appendix) tailored to industry.

Integration light (in the beginning):

1. Develop set of controls (can use existing NIST controls as starting point) for each of the CIP requirements. Some of these exist within the CIP standards today but not consistently.
2. Systems that are determined in CIP 002 to be CCA are classified as high, as are all systems within the same ESP and form the ESP. Monitoring systems get medium?
3. 3Map CIP requirements to NIST docs as guidelines particularly for Risk Assessment

CIP–002–1 Discussion Document, 1–29–09

Jackie Collett, John Lim, Scott Rosenberger, and John Varnell

I. Original Intent of the CIP–002 Version 1 Standard

- **Starting Point**: A "reasonable" initial attempt to applying cyber security to the electric infrastructure.
  - Initial Baseline – starting from zero
- High Impact Focus: Reduces the scope of implementation to the transmission and generation assets which have the highest impact on the reliability and operability of the BES.
- Cyber Assets: directly linked to the BES elements *FAQ Q2*
- Cyber Asset Scope: limited to control centers, remote access and "jumping–off" points, which may not be evident in the standard *FAQ 2*
- What to Do: Not How to Do
- Non–prescriptive: Allows flexibility for a wide range of scenarios

- **Key Decisions**:
  - Create "trusted zones"
  - Exclude communications outside of "trusted zones": often external carriers and indeterminate paths

- **Assumptions**: Not explicit in the standard, but required for good security
  - **Redundancy**: Critical Asset / Cyber Asset redundancy does not eliminate the requirement for cyber protection. *FAQ Q5*
    - Need to protect common modes of failure.
    - Multiple attacks / compromises are possible electronically.
  - **"Systems approach"**: A systems approach to identifying Critical Assets / Critical Cyber Assets can and should be used. CIP–002 does not preclude a systems approach, but does not explicitly require it.
  - **"Consider"**: Consider means include if at all applicable.
  - **"Essential to operation":** Critical Assets and Critical Cyber Assets should be identified and protected to ensure sustainable and reliable operation indefinitely. Loss or compromise of the Control Centre or other critical functions is not sustainable.
  - **Critical Assets**: Critical Assets may include sites, elements and systems.
  - **CCA Compromise**: In addition to the BES impact due to loss of the Critical Asset or Critical Cyber Asset, compromise of the Critical Cyber Asset must be included in the risk assessment (Integrity).
- FERC conditionally approved the Version 1 standards, and directed changes for a "final" version

- The "gap" is what is currently under discussion

II. Important Aspects of CIP–002–1

1. **Relationship to BES**: There is a very clear relationship between the BES assets required for reliability and the cyber assets essential for their operation. The reliability and operations segments of the electric industry are structured upon BES assets. This includes processes, procedures, inventories and terminology.
2. **High Impact Focus**: CIP–002–1 focuses the efforts and resources for protection to the most important BES assets and associated cyber assets, recognizing that resources are not unlimited. Assets which do not affect the reliability and operability of the BES are not considered. As a result, the majority of the BES assets are not included for protection under the CIP standards.
3. **Industry Acceptance**: The electric industry has invested thousands of hours and millions of dollars to meet CIP–003–1 through CIP–009–1 based on CIP–002–1. The industry would not favor a significant or radical change to the asset identification method, and could reject it.

III. Issues identified with the current CIP–002 + Standards

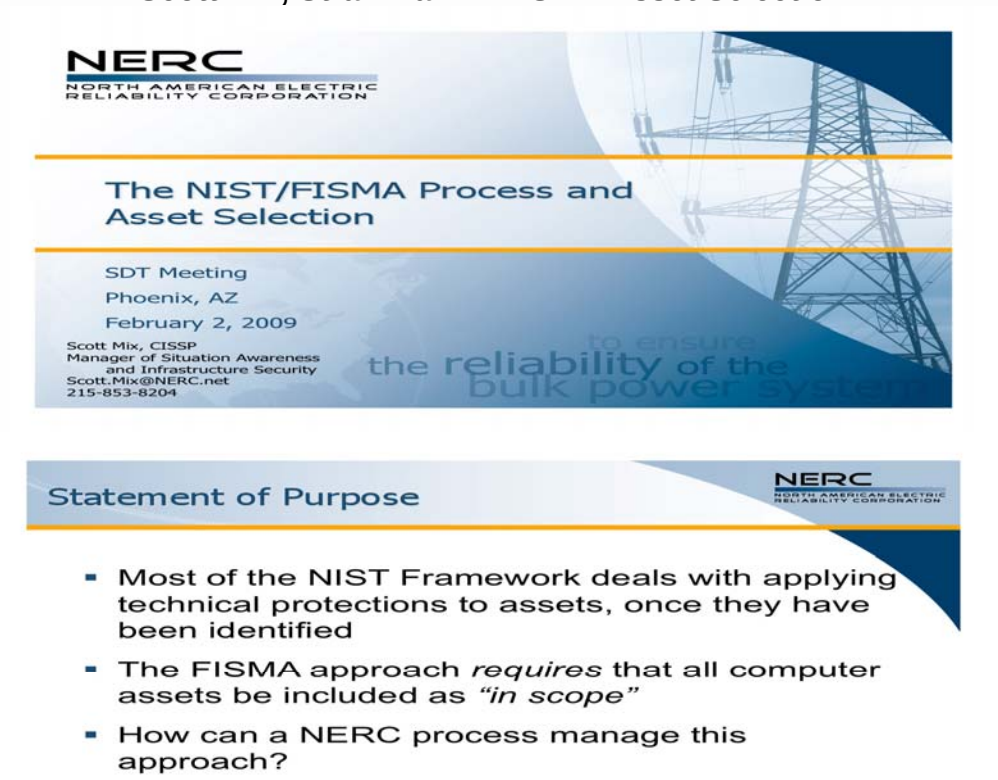
A		**Piecemeal Approach**
	Description	By identifying individual Critical Cyber Assets, security gaps exist when the CCAs operate in a system. (E.g. data integrity impact for a cyber asset outside of the ESP)
	Comment	• The identification of Critical Cyber Assets does not preclude a systems approach, but does not explicitly require it. • A Critical Cyber Asset may be part of a system or network, including other cyber assets, which is currently addressed somewhat by the ESP. • The standards do not address interdependent functions across ESP boundaries, which may be essential to the Critical Cyber Asset and/or the BES.
	Options	1. Need to include both Critical Cyber Assets and critical functions. 2. Need to include an impact assessment of the components required for the critical function. 3. Need to include consideration and protection for interfaces into the Critical Cyber Assets – may be at a different risk level. Protection may be required outside of the ESP.
B		**Not Protecting Assets Needing Protection**
	Description	Assets which may have an impact on the BES, either singly or in conjunction with other assets are not being identified under CIP–002.
	Comment	• Compliance with the NERC cyber security standards is onerous.

		• There are large penalties for non–compliance. • Criticality based on BES system planning models (e.g. PSSE) are not adequate. BES interconnectivity and interdependencies are very different from cyber connectivity and interdependencies. • Area requirements or impacts may not be available or considered in the identification of Critical Assets and Critical Cyber Assets (e.g. generation units' impact on the reliability and operability of the BES in a geographical area). • Perception of "missing Critical Assets" creates a lack of confidence in the industry to self–manage.
	Options	1. Include some responsibility for the BA in determining Critical Assets based on area impact (area overview). 2. Single largest contingency must be included in the impact / Critical Asset identification. 3. The Identifying Critical Assets Guideline1 provides detailed guidance for Critical Asset evaluation. 4. Targeting specific risks / impacts can help focus the protection requirements.
C	**Gaming**	
	Description	Entities are striving to create minimal or null Critical Asset Lists to avoid the effort and expense of complying with the standards.
	Comment	• Some entities are taking a very literal interpretation of the standards, and some oppose guidance that is not explicitly included in the standards. • Asset identification by some entities has been perceived as "unreasonable" and generated criticism of the industry. • All compliance avoidance (gaming) cannot be completely anticipated or eliminated. • Gaming will occur regardless of the methodology or framework applied. These issues can be addressed over time through the audit and compliance enforcement process. • "Zero tolerance" for non–compliance: self–report a violation and possibly be fined (compliance culture vs. good security practice)
	Options	1. Improve clarification of the intent of the standards and the requirements.
D	**All or Nothing**	
	Description	Assets or cyber assets are either critical and require protection, or not critical and do not require any protection.
	Comment	• Conducted diligently, including the interdependencies of systems required for essential functions, the asset identification can provide an adequate level of security for the BES. • NERC's mandate is to protect the BES. This does not include distribution and the related assets.

[1] The NERC Guideline "Identifying Critical Assets" is presently under development by the Critical Infrastructure Protection Committee Risk Assessment Working Group. The development of this guidance document was directed by FERC in its NOPR, and reconfirmed in FERC Order 706 p253.

		• There are no graduations or levels of assets, and no levels of protection for cyber assets. ***Options*** 1. The fundamental tenet of the NERC reliability standards is to protect the reliable operation of the BES; therefore the focus of cyber protection, for both BES assets and cyber assets, should be on their impact to the reliable operation of the BES. 2. The Identifying Critical Assets Guideline1 provides some criteria to help define impact to the BES. 3. There may be a need to define what systems beyond the current Critical Assets need protection. 4. Required protection of cyber assets may be related to some characteristics (contains an operating system / purpose–written software / no software). 5. Multiple levels of protection do exist in the standards: critical cyber asset vs. non–critical cyber asset in an ESP vs. cyber asset outside an ESP. May want to provide a different granularity. 6. Define the breadth and depth of protection.
5	**Loss of Asset – Integrity / Misuse**	
	Description	Determining the criticality of BES assets tends to focus on a loss (outage) of the asset. Loss of data integrity or misuse of the cyber assets may not be considered.
	Comment	– Loss of an asset is a traditional risk analysis approach which may be incomplete for cyber impacts. – Can be combined with other system or cyber events, increasing the impact – Need to include the analysis of intentional and unintentional misuse.
	Options	1. Consider magnitude of impact of loss of data integrity / misuse: o Generation or Transmission Control Centre – possible impact. o Transmission Substation or Generation Assets – little or no impact depending upon the size or function of the facility. May be related to the single largest contingency. o ISO – possible impact. 2. Need to educate industry to consider intentional and unintentional misuse

Scott Mix, Strawman — FISMA Asset Selection

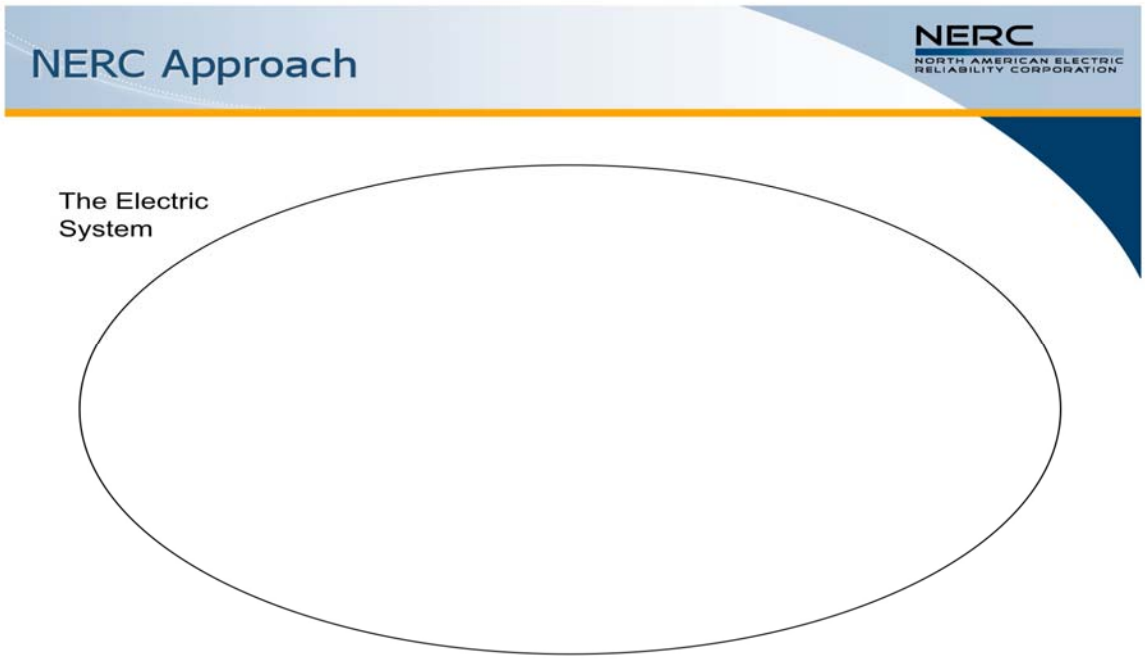


Categorization of Assets

- FIPS-199:
  - Mission Focus:
    - "The security categories are based on the potential impact on an organization should certain events occur which jeopardize the information and information systems needed by the organization to accomplish its assigned mission, protect its assets, fulfill its legal responsibilities, maintain its day-to-day functions, and protect individuals." (emphasis added)
    - "Security categories are to be used in conjunction with vulnerability and threat information in assessing the risk to an organization."

Categorization of Assets

- FIPS-199:
  - Characterize in 3 categories:
    - Confidentiality
    - Integrity
    - Availability
  - Assign level to each category:
    - Low
    - Medium
    - High
  - High Water Mark
  - Customize controls (later)



NERC Approach

NERC Approach

- This would require changes:
  - CIP-002 to classify ALL transmission assets by impact category
  - CIP-003 to CIP-009 – requirement-by-requirement specificity for obligations at each impact category level
    - SP800-53 Catalog as an example

NERC Approach

- Separate set of standards for:
  - Control Centers
  - Transmission Facilities
  - Generation Facilities
- Each with 3 levels of requirements
  - Not every requirement would expand – but most would
  - Essentially expanding current requirement set by practically a factor of 9 just to maintain *status quo* with requirement scope

NERC Approach

- Would this meet all the mandated (ordered) changes from FERC Order 706???
  - Probably not by itself
  - Would require significant additional work on top of what was just described.

Appendix # 6

SDT Consensus Guidelines
Adopted Unanimously, November 13, 2008

The Cyber Security for Order 706 Standard Drafting team (team) will seek consensus on its recommendations for any revisions to the CIP standards.

General consensus is a participatory process whereby, on matters of substance, the members strive for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for the final package of recommended revisions, and the team finds that 100 percent acceptance or support of the members present is not achievable, final consensus recommendations will require at least 75 percent favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing consensus throughout the process on substantive issues with the participation of all members. In instances where the team finds that even 75 percent acceptance or support is not achievable, the team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50 percent support from the team. The team will develop its recommendations using consensus–building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The team's consensus process will be conducted as a facilitated consensus–building process. team members, NERC staff and facilitators will be the only participants seated at the table. Only team members may participate in consensus ranking or vote on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Facilitator and all written comments submitted on the comment forms will be included in the team and facilitators' summary reports.

The team will make decisions only when a quorum is present. A quorum shall be constituted by at least 51 percent of the appointed members being present (simple majority). The team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure)*, as modified by the team's adopted procedural guidelines, to make and approve motions; however, the 75 percent supermajority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision making on substantive motions and amendments to motions. In addition, the Council will utilize their adopted meeting guidelines for conduct during meetings. The Council will make substantive recommendations using their adopted facilitated consensus–building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

The presiding chair and/or Facilitator of the SDT, in general, should use parliamentary procedures set forth in Robert's Rules of Order, as modified by Council's adopted procedural guidelines.

To enhance the possibility of constructive discussions as members educate themselves on the issues and engage in consensus–building, members agree to refrain from public statements that may prejudge the outcome of the team's consensus process. In discussing the team process with the media, members agree to be careful to present only their own views and not the views or statements of other participants and/or may direct such inquiries to the team Chair and Vice Chair. In addition, in order to provide balance to the team process, members agree to represent and consult with their stakeholder interest group.

Meeting Guidelines for Participants

Participants' role in meetings:

- Explore possibilities
- Listen to understand (Respect) (limit sidebar conversations)
- Be focused and concise. (Avoid repetition. No need to offer comments in "strong agreement.")
- Focus on issues, not personalities.
- Offer options to address others' concerns.
- No sidebars.
- If participating by phone, indicate who is speaking.
- If participating by phone, please use the mute button. **Do not** put the phone on hold.

Facilitators/Staff role in meetings:

- Assist the Chair and Vice Chair in helping the team stay on task
- Help the group follow agreed upon ground rules
- Design the meeting and problem solving process in consultation with the Chair and Vice Chair
- Facilitate discussion participation of the team and other participants
- Prepare agenda packets and reports

Consensus Building Techniques

- **Brainstorming** (green light thinking – not judgmental) At certain points, the facilitator may ask the group to suspend judgment and get ideas onto the table before debating.

- **Name Stacking in Team Discussions** (use of name tents to seek attention)

- **Acceptability Consensus Ranking Scale**
  - Use a consensus acceptability scale to help focus discussion and test support in reviewing substantive issues.

- Use to guide and focus discussion and as a poll to see where the team stands, not used as a voting mechanism.
- Must be prepared to offer refinements and suggestions to address serious concerns.

4 = Proposal is acceptable as it is
3 = Proposal is acceptable; I can live with it but there are minor concerns to address
2 = Proposal is not acceptable. Proposal may be acceptable if the major concerns are addressed
1 = Proposal is not acceptable

o **Consensus Ranking Scale**

4. Comfortable—I support proposal as is ♥♥♥♥
3. Minor Reservations— I can live with this; but would like to see changes as follows♥♥♥ Be prepared to offer specific refinements or changes to address your concerns.
2. Major Reservations—I can't support this unless following changes are addressed to meet my serious concerns ♥♥ Be prepared to offer specific refinements or changes to address your concerns.
1. Fatal Flaws—I can't support this ♥ Be prepared to offer alternatives and options that would address your own as well as other's concerns.

o **Robert's Rules of Order and Facilitated Consensus Building Procedures**

The Council will make substantive recommendations using their adopted facilitated consensus–building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee (SC) accepted the Standards Authorization Request (SAR) for Project 2008-06 Cyber Security Order 706 on March 10, 2008.
2. The SAR for Project 2008-06 Cyber Security Order 706 was posted for industry comment March 20–April 19, 2008.
3. Nominations for the SAR drafting team members were solicited March 20–April 4, 2008.
4. The Executive Committee of the SC appointed the SAR drafting team for Project 2008-06 Cyber Security Order 706 on April 25, 2008 and the full SC ratified the Executive Committee's action on May 8.
5. The SC accepted the SAR and approved moving forward with Project 2008-06 Cyber Security Order on July 10, 2008.
6. Nominations for the standard drafting team (SDT) for Project 2008-06 Cyber Security Order 706 were solicited July 15–28, 2008.
7. The Executive Committee of the SC appointed the SDT for Project 2008-06 Cyber Security Order 706 on August 7, 2008.

Proposed Action Plan and Description of Current Draft:

The standard drafting team for Project 2008-06 Cyber Security Order 706 (SDT CSO706) has been assigned the responsibility to review each of the following reliability standards to ensure that they conform to the latest version of the ERO Rules of Procedure, including the Reliability Standards Development Procedure, and also address all of the directed modifications identified in the FERC Order 706:

CIP–002–1 — Cyber Security — Critical Cyber Asset Identification
CIP–003–1 — Cyber Security — Security Management Controls
CIP–004–1 — Cyber Security — Personnel and Training
CIP–005–1 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–1 — Cyber Security — Physical Security
CIP–007–1 — Cyber Security — Systems Security Management
CIP–008–1 — Cyber Security — Incident Reporting and Response Planning
CIP–009–1 — Cyber Security — Recovery Plans for Critical Cyber Assets

Because of the extensive scope of Project 2008-06 Cyber Security Order 706 the SDT CSO706 is implementing a multiphase approach for revising this set of standards.

Phase I of the project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. In particular, the SDT addressed the directive in FERC Order 706 that the "... ERO modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin in 2009." In addition, a number of other directives included in FERC Order 706, which apply to specific standards are also addressed in Phase I. More contentious issues to be addressed by the SDT associated with the modification of this set of standards will be addressed in a later phase(s) of Project 2008-06 Cyber Security Order 706.

This posting of the cyber standards for industry comment only relates to Phase I of the project. Specifically, SDT CSO706 produced a revised version of Standard CIP–002–2 — Cyber Security — Critical Cyber Asset Identification and is posting the proposed modifications for a 45-day comment period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop and post reply comments to initial posting of standard for industry comment	January 7–February 17, 2009
2. Post for 30-day pre-ballot period.	February 18–March 31, 2009
3. Conduct initial ballot	April 2–11, 2009
4. Post response to comments on first ballot	April 20–May 12, 2009
5. Conduct recirculation ballot	May 13–22, 2009
6. Board adoption date.	To be determined.

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-2

3. Purpose: NERC Standards CIP-002-2 through CIP-009-2 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-2 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of a risk-based assessment.

4. Applicability:

4.1. Within the text of Standard CIP-002-2, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-2:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

B. Requirements

R1. Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.

R1.1. The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.

R1.2. The risk-based assessment shall consider the following assets:

R1.2.1. Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.

R1.2.2. Transmission substations that support the reliable operation of the Bulk Electric System.

R1.2.3. Generation resources that support the reliable operation of the Bulk Electric System.

R1.2.4. Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.

R1.2.5. Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

R1.2.6. Special Protection Systems that support the reliable operation of the Bulk Electric System.

R1.2.7. Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.

R2. Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology required in R1. The Responsible Entity shall review this list at least annually, and update it as necessary.

R3. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R2, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-2, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

R3.1. The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,

R3.2. The Cyber Asset uses a routable protocol within a control center; or,

R3.3. The Cyber Asset is dial-up accessible.

R4. Annual Approval — The senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

M1. The Responsible Entity shall make available its current risk-based assessment methodology documentation as specified in Requirement R1.

M2. The Responsible Entity shall make available its dated list of Critical Assets as specified in Requirement R2.

M3. The Responsible Entity shall make available its dated list of Critical Cyber Assets as specified in Requirement R3.

M4. The Responsible Entity shall make available its dated approval records of annual approvals as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-002-2 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None.

2. Violation Severity Levels (Under Development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	R3.2 — Change "Control Center" to "control center"	03/24/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee (SC) accepted the Standards Authorization Request (SAR) for Project 2008-06 Cyber Security Order 706 on March 10, 2008.
2. The SAR for Project 2008-06 Cyber Security Order 706 was posted for industry comment March 20–April 19, 2008.
3. Nominations for the SAR drafting team members were solicited March 20–April 4, 2008.
4. The Executive Committee of the SC appointed the SAR drafting team for Project 2008-06 Cyber Security Order 706 on April 25, 2008 and the full SC ratified the Executive Committee's action on May 8.
5. The SC accepted the SAR and approved moving forward with Project 2008-06 Cyber Security Order on July 10, 2008.
6. Nominations for the standard drafting team (SDT) for Project 2008-06 Cyber Security Order 706 were solicited July 15–28, 2008.
7. The Executive Committee of the SC appointed the SDT for Project 2008-06 Cyber Security Order 706 on August 7, 2008.

Proposed Action Plan and Description of Current Draft:

The standard drafting team for Project 2008-06 Cyber Security Order 706 (SDT CSO706) has been assigned the responsibility to review each of the following reliability standards to ensure that they conform to the latest version of the ERO Rules of Procedure, including the Reliability Standards Development Procedure, and also address all of the directed modifications identified in the FERC Order 706:

CIP–002–1 — Cyber Security — Critical Cyber Asset Identification
CIP–003–1 — Cyber Security — Security Management Controls
CIP–004–1 — Cyber Security — Personnel and Training
CIP–005–1 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–1 — Cyber Security — Physical Security
CIP–007–1 — Cyber Security — Systems Security Management
CIP–008–1 — Cyber Security — Incident Reporting and Response Planning
CIP–009–1 — Cyber Security — Recovery Plans for Critical Cyber Assets

Because of the extensive scope of Project 2008-06 Cyber Security Order 706 the SDT CSO706 is implementing a multiphase approach for revising this set of standards.

Phase I of the project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. In particular, the SDT addressed the directive in FERC Order 706 that the "... ERO modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin in 2009." In addition, a number of other directives included in FERC Order 706, which apply to specific standards are also addressed in Phase I. More contentious issues to be addressed

by the SDT associated with the modification of this set of standards will be addressed in a later phase(s) of Project 2008-06 Cyber Security Order 706.

This posting of the cyber standards for industry comment only relates to Phase I of the project. Specifically, SDT CSO706 produced a revised version of Standard CIP–003–2 — Cyber Security – Security Management Controls and is posting the proposed modifications for a 45-day comment period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop and post reply comments to initial posting of standard for industry comment	January 7–February 17, 2009
2. Post for 30-day pre-ballot period.	February 18–March 31, 2009
3. Conduct initial ballot	April 2–11, 2009
4. Post response to comments on first ballot	April 20–May 12, 2009
5. Conduct recirculation ballot	May 13–22, 2009
6. Board adoption date.	To be determined.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-2

3. Purpose: Standard CIP-003-2 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003-2 should be read as part of a group of standards numbered Standards CIP-002-2 through CIP-009-2.

4. Applicability:

4.1. Within the text of Standard CIP-003-2, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-003-2:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-2, identify that they have no Critical Cyber Assets shall only be required to comply with CIP-003-2 Requirement R2.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002-2 through CIP-009-2, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-2 through CIP-009-2.

R2.1. The senior manager shall be identified by name, title, and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002-2 through CIP-009-2, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

R2.4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-2, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

R5.1.1. Personnel shall be identified by name, title, ~~business phone~~ and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

M1. The Responsible Entity shall make available documentation of its cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2.

M2. The Responsible Entity shall make available documentation of the assignment of, and changes to, its leadership as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the exceptions, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its information protection program as specified in Requirement R4.

M5. The Responsible Entity shall make available its access control documentation as specified in Requirement R5.

M6. The Responsible Entity shall make available its change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None

2. Violation Severity Levels (Under Development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Requirement R2 applies to all Responsible Entities, including Responsible Entities which have no Critical Cyber Assets. Changed compliance monitor to Compliance Enforcement Authority.	
	04 Feb 2009	Modifications to clarify the requirements and to incorporate industry comments. Section 1.5: Additional Compliance Information, added “None” Modified the personnel identification information requirements in R5.1.1 to include name, title, and the information for which they are responsible for authorizing	

		access (removed the business phone information).	

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee (SC) accepted the Standards Authorization Request (SAR) for Project 2008-06 Cyber Security Order 706 on March 10, 2008.
2. The SAR for Project 2008-06 Cyber Security Order 706 was posted for industry comment March 20–April 19, 2008.
3. Nominations for the SAR drafting team members were solicited March 20–April 4, 2008.
4. The Executive Committee of the SC appointed the SAR drafting team for Project 2008-06 Cyber Security Order 706 on April 25, 2008 and the full SC ratified the Executive Committee's action on May 8.
5. The SC accepted the SAR and approved moving forward with Project 2008-06 Cyber Security Order on July 10, 2008.
6. Nominations for the standard drafting team (SDT) for Project 2008-06 Cyber Security Order 706 were solicited July 15–28, 2008.
7. The Executive Committee of the SC appointed the SDT for Project 2008-06 Cyber Security Order 706 on August 7, 2008.

Proposed Action Plan and Description of Current Draft:

The standard drafting team for Project 2008-06 Cyber Security Order 706 (SDT CSO706) has been assigned the responsibility to review each of the following reliability standards to ensure that they conform to the latest version of the ERO Rules of Procedure, including the Reliability Standards Development Procedure, and also address all of the directed modifications identified in the FERC Order 706:

CIP–002–1 — Cyber Security — Critical Cyber Asset Identification
CIP–003–1 — Cyber Security — Security Management Controls
CIP–004–1 — Cyber Security — Personnel and Training
CIP–005–1 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–1 — Cyber Security — Physical Security
CIP–007–1 — Cyber Security — Systems Security Management
CIP–008–1 — Cyber Security — Incident Reporting and Response Planning
CIP–009–1 — Cyber Security — Recovery Plans for Critical Cyber Assets

Because of the extensive scope of Project 2008-06 Cyber Security Order 706 the SDT CSO706 is implementing a multiphase approach for revising this set of standards.

Phase I of the project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. In particular, the SDT addressed the directive in FERC Order 706 that the "... ERO modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin in 2009." In addition, a number of other directives included in FERC Order 706, which apply to specific standards are also addressed in Phase I. More contentious issues to be addressed by the SDT associated with the modification of this set of standards will be addressed in a later phase(s) of Project 2008-06 Cyber Security Order 706.

This posting of the cyber standards for industry comment only relates to Phase I of the project. Specifically, SDT CSO706 produced a revised version of Standard CIP–002–4 — Cyber Security — Personnel and Training and is posting the proposed modifications for a 45-day comment period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop and post reply comments to initial posting of standard for industry comment	January 7–February 17, 2009
2. Post for 30-day pre-ballot period.	February 18–March 31, 2009
3. Conduct initial ballot	April 2–11, 2009
4. Post response to comments on first ballot	April 20–May 12, 2009
5. Conduct recirculation ballot	May 13–22, 2009
6. Board adoption date.	To be determined.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-2

3. **Purpose:** Standard CIP-004-2 requires that personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including contractors and service vendors, have an appropriate level of personnel risk assessment, training, and security awareness. Standard CIP-004-2 should be read as part of a group of standards numbered Standards CIP-002-2 through CIP-009-2.

4. **Applicability:**

   4.1. Within the text of Standard CIP-004-2, "Responsible Entity" shall mean:

   4.1.1 Reliability Coordinator.

   4.1.2 Balancing Authority.

   4.1.3 Interchange Authority.

   4.1.4 Transmission Service Provider.

   4.1.5 Transmission Owner.

   4.1.6 Transmission Operator.

   4.1.7 Generator Owner.

   4.1.8 Generator Operator.

   4.1.9 Load Serving Entity.

   4.1.10 NERC.

   4.1.11 Regional Entity.

   4.2. The following are exempt from Standard CIP-004-2:

   4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

   4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

   4.2.3 Responsible Entities that, in compliance with Standard CIP-002-2, identify that they have no Critical Cyber Assets.

5. **Effective Date:** The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Awareness — The Responsible Entity shall establish, document, implement, and ~~,~~ maintain, ~~document and implement~~ a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);

- Management support and reinforcement (e.g., presentations, meetings, etc.).

R2. Training — The Responsible Entity shall establish, document, implement, and maintain, ~~document and implement~~ an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. The cyber security training program shall be reviewed annually, at a minimum, ~~reviewed~~ and shall be updated ~~as~~ whenever necessary.

R2.1. This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access except in specified circumstances such as an emergency.

R2.2. Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004-2, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities:

R2.2.1. The proper use of Critical Cyber Assets;

R2.2.2. Physical and electronic access controls to Critical Cyber Assets;

R2.2.3. The proper handling of Critical Cyber Asset information; and,

R2.2.4. Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.

R2.3. The Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.

R3. Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. A personnel risk assessment shall be conducted pursuant to that program prior to such personnel being granted such access except in specified circumstances such as an emergency.

The personnel risk assessment program shall at a minimum include:

R3.1. The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.

R3.2. The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.

R3.3. The Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004-2.

R4. Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.

R4.1. The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.

R4.2. The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.

C. Measures

M1. The Responsible Entity shall make available documentation of its security awareness and reinforcement program as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation of its cyber security training program, review, and records as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the personnel risk assessment program and that personnel risk assessments have been applied to all personnel who have authorized cyber or authorized unescorted physical access to Critical Cyber Assets, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of the list(s), list review and update, and access revocation as needed as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep personnel risk assessment documents in accordance with federal, state, provincial, and local laws.

1.4.2 The Responsible Entity shall keep all other documentation required by Standard CIP-004-2 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (Under Development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.2.4 — Insert the phrase "for cause" as intended. "One instance of personnel termination for cause…"	03/24/06
1	06/01/06	D.2.1.4 — Change "access control rights" to "access rights."	06/05/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Reference to emergency situations. Removal of 90 day window to complete training and personnel risk assessments. Changed compliance monitor to Compliance Enforcement Authority.	
	4 Feb 2009	Modifications to clarify the requirements and to incorporate industry comments. Modification to R1 for the awareness and training program to establish, document, implement, and maintain**.** Modification to R2 stating the requirements for the cyber security training program. Modification to R3 Personnel Risk Assessment to clarify that it pertains to personnel having authorized cyber or authorized unescorted physical access to "Critical Cyber Assets".	

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee (SC) accepted the Standards Authorization Request (SAR) for Project 2008-06 Cyber Security Order 706 on March 10, 2008.
2. The SAR for Project 2008-06 Cyber Security Order 706 was posted for industry comment March 20–April 19, 2008.
3. Nominations for the SAR drafting team members were solicited March 20–April 4, 2008.
4. The Executive Committee of the SC appointed the SAR drafting team for Project 2008-06 Cyber Security Order 706 on April 25, 2008 and the full SC ratified the Executive Committee's action on May 8.
5. The SC accepted the SAR and approved moving forward with Project 2008-06 Cyber Security Order on July 10, 2008.
6. Nominations for the standard drafting team (SDT) for Project 2008-06 Cyber Security Order 706 were solicited July 15–28, 2008.
7. The Executive Committee of the SC appointed the SDT for Project 2008-06 Cyber Security Order 706 on August 7, 2008.

Proposed Action Plan and Description of Current Draft:

The standard drafting team for Project 2008-06 Cyber Security Order 706 (SDT CSO706) has been assigned the responsibility to review each of the following reliability standards to ensure that they conform to the latest version of the ERO Rules of Procedure, including the Reliability Standards Development Procedure, and also address all of the directed modifications identified in the FERC Order 706:

CIP–002–1 — Cyber Security — Critical Cyber Asset Identification
CIP–003–1 — Cyber Security — Security Management Controls
CIP–004–1 — Cyber Security — Personnel and Training
CIP–005–1 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–1 — Cyber Security — Physical Security
CIP–007–1 — Cyber Security — Systems Security Management
CIP–008–1 — Cyber Security — Incident Reporting and Response Planning
CIP–009–1 — Cyber Security — Recovery Plans for Critical Cyber Assets

Because of the extensive scope of Project 2008-06 Cyber Security Order 706 the SDT CSO706 is implementing a multiphase approach for revising this set of standards.

Phase I of the project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. In particular, the SDT addressed the directive in FERC Order 706 that the "... ERO modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin in 2009." In addition, a number of other directives included in FERC Order 706, which apply to specific standards are also addressed in Phase I. More contentious issues to be addressed by the SDT associated with the modification of this set of standards will be addressed in a later phase(s) of Project 2008-06 Cyber Security Order 706.

This posting of the cyber standards for industry comment only relates to Phase I of the project. Specifically, SDT CSO706 produced a revised version of Standard CIP–005–2 — Cyber Security — Electronic Security Perimeter(s) and is posting the proposed modifications for a 45-day comment period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop and post reply comments to initial posting of standard for industry comment	January 7–February 17, 2009
2. Post for 30-day pre-ballot period.	February 18–March 31, 2009
3. Conduct initial ballot	April 2–11, 2009
4. Post response to comments on first ballot	April 20–May 12, 2009
5. Conduct recirculation ballot	May 13–22, 2009
6. Board adoption date.	To be determined.

A. Introduction

1. Title: Cyber Security — Electronic Security Perimeter(s)

2. Number: CIP-005-2

3. Purpose: Standard CIP-005-2 requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005-2 should be read as part of a group of standards numbered Standards CIP-002-2 through CIP-009-2.

4. Applicability

4.1. Within the text of Standard CIP-005-2, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-005-2:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-2, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).

R1.1. Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).

R1.2. For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.

R1.3. Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).

R1.4. Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-2.

R1.5. Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-2; Standard CIP-004-2 Requirement R3; Standard CIP-005-2 Requirements R2 and R3; Standard CIP-006-2 Requirement R3; Standard CIP-007-2 Requirements R1 and R3 through R9; Standard CIP-008-2; and Standard CIP-009-2.

R1.6. The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.

R2. Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).

R2.1. These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.

R2.2. At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.

R2.3. The Responsible Entity shall implement and maintain ~~and implement~~ a procedure for securing dial-up access to the Electronic Security Perimeter(s).

R2.4. Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.

R2.5. The required documentation shall, at least, identify and describe:

R2.5.1. The processes for access request and authorization.

R2.5.2. The authentication methods.

R2.5.3. The review process for authorization rights, in accordance with Standard CIP-004-2 Requirement R4.

R2.5.4. The controls used to secure dial-up accessible connections.

R2.6. Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.

R3. Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.

R3.1. For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.

R3.2. Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.

R4. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:

R4.1. A document identifying the vulnerability assessment process;

R4.2. A review to verify that only ports and services required for operations at these access points are enabled;

R4.3. The discovery of all access points to the Electronic Security Perimeter;

R4.4. A review of controls for default accounts, passwords, and network management community strings;

R4.5. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R5. Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-2.

R5.1. The Responsible Entity shall ensure that all documentation required by Standard CIP-005-2 reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-2 at least annually.

R5.2. The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.

R5.3. The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-2.

C. Measures

M1. The Responsible Entity shall make available ~~dated documents~~ documentation about the Electronic Security Perimeter as specified in Requirement R1.

M2. The Responsible Entity shall make available ~~dated~~ documentation of the electronic access controls to the Electronic Security Perimeter(s), as specified in Requirement R2.

M3. The Responsible Entity shall make available ~~dated~~ documentation of controls implemented to log and monitor access to the Electronic Security Perimeter(s) as specified in Requirement R3.

M4. The Responsible Entity shall make available ~~dated~~ documentation of its annual vulnerability assessment as specified in Requirement R4.

M5. The Responsible Entity shall make available ~~dated~~ access logs and documentation of review, changes, and log retention as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep logs for a minimum of ninety calendar days, unless: a) longer retention is required pursuant to Standard CIP-008-2, Requirement R2; b) directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall keep other documents and records required by Standard CIP-005-2 from the previous full calendar year.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (Under Development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.3.1 — Change “Critical Assets,” to “Critical Cyber Assets” as intended.	03/24/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity.	

		Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
		Modifications to clarify the requirements and to incorporate industry comments. Revised the wording of the Electronic Access Controls requirement stated in R2.3 to clarify that the Responsible Entity shall "implement and maintain" a procedure for securing dial-up access to the Electronic Security Perimeter(s). Deleted the word "dated" from the Measures.	

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee (SC) accepted the Standards Authorization Request (SAR) for Project 2008-06 Cyber Security Order 706 on March 10, 2008.
2. The SAR for Project 2008-06 Cyber Security Order 706 was posted for industry comment March 20–April 19, 2008.
3. Nominations for the SAR drafting team members were solicited March 20–April 4, 2008.
4. The Executive Committee of the SC appointed the SAR drafting team for Project 2008-06 Cyber Security Order 706 on April 25, 2008 and the full SC ratified the Executive Committee's action on May 8.
5. The SC accepted the SAR and approved moving forward with Project 2008-06 Cyber Security Order on July 10, 2008.
6. Nominations for the standard drafting team (SDT) for Project 2008-06 Cyber Security Order 706 were solicited July 15–28, 2008.
7. The Executive Committee of the SC appointed the SDT for Project 2008-06 Cyber Security Order 706 on August 7, 2008.

Proposed Action Plan and Description of Current Draft:

The standard drafting team for Project 2008-06 Cyber Security Order 706 (SDT CSO706) has been assigned the responsibility to review each of the following reliability standards to ensure that they conform to the latest version of the ERO Rules of Procedure, including the Reliability Standards Development Procedure, and also address all of the directed modifications identified in the FERC Order 706:

CIP–002–1 — Cyber Security — Critical Cyber Asset Identification
CIP–003–1 — Cyber Security — Security Management Controls
CIP–004–1 — Cyber Security — Personnel and Training
CIP–005–1 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–1 — Cyber Security — Physical Security
CIP–007–1 — Cyber Security — Systems Security Management
CIP–008–1 — Cyber Security — Incident Reporting and Response Planning
CIP–009–1 — Cyber Security — Recovery Plans for Critical Cyber Assets

Because of the extensive scope of Project 2008-06 Cyber Security Order 706 the SDT CSO706 is implementing a multiphase approach for revising this set of standards.

Phase I of the project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. In particular, the SDT addressed the directive in FERC Order 706 that the "... ERO modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin in 2009." In addition, a number of other directives included in FERC Order 706, which apply to specific standards are also addressed in Phase I. More contentious issues to be addressed by the SDT associated with the modification of this set of standards will be addressed in a later phase(s) of Project 2008-06 Cyber Security Order 706.

This posting of the cyber standards for industry comment only relates to Phase I of the project. Specifically, SDT CSO706 produced a revised version of Standard CIP–006–2 — Cyber Security — Physical Security and is posting the proposed modifications for a 45-day comment period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop and post reply comments to initial posting of standard for industry comment	January 7–February 17, 2009
2. Post for 30-day pre-ballot period.	February 18–March 31, 2009
3. Conduct initial ballot	April 2–11, 2009
4. Post response to comments on first ballot	April 20–May 12, 2009
5. Conduct recirculation ballot	May 13–22, 2009
6. Board adoption date.	To be determined.

A. Introduction

1. **Title:** Cyber Security — Physical Security of Critical Cyber Assets

2. **Number:** CIP-006-2

3. **Purpose:** Standard CIP-006-2 is intended to ensure the implementation of a physical security program for the protection of Critical Cyber Assets. Standard CIP-006-2 should be read as part of a group of standards numbered Standards CIP-002-2 through CIP-009-2.

4. **Applicability:**

   4.1. Within the text of Standard CIP-006-2, "Responsible Entity" shall mean:

   4.1.1 Reliability Coordinator.

   4.1.2 Balancing Authority.

   4.1.3 Interchange Authority.

   4.1.4 Transmission Service Provider.

   4.1.5 Transmission Owner.

   4.1.6 Transmission Operator.

   4.1.7 Generator Owner.

   4.1.8 Generator Operator.

   4.1.9 Load Serving Entity.

   4.1.10 NERC.

   4.1.11 Regional Entity.

   4.2. The following are exempt from Standard CIP-006-2:

   4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

   4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

   4.2.3 Responsible Entities that, in compliance with Standard CIP-002-2, identify that they have no Critical Cyber Assets.

5. **Effective Date:** The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Physical Security Plan — The Responsible Entity shall document, implement, and maintain~~, and implement~~ a physical security plan, approved by the senior manager or delegate(s) that shall address, at a minimum, the following:

R1.1. All Cyber Assets within an Electronic Security Perimeter shall reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to such Cyber Assets.

R1.2. Identification of all access points through each Physical Security Perimeter and measures to control entry at those access points.

R1.3. Processes, tools, and procedures to monitor physical access to the perimeter(s).

R1.4. Appropriate use of physical access controls as described in Requirement ~~R3~~ R4 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.

R1.5. Review of access authorization requests and revocation of access authorization, in accordance with CIP-004-2 Requirement R4.

R1.6. Continuous escorted access within the Physical Security Perimeter of personnel not authorized for unescorted access.

R1.7. Update of the physical security plan within thirty calendar days of the completion of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the Physical Security Perimeter, physical access controls, monitoring controls, or logging controls.

R1.8. Annual review of the physical security plan.

R2. Protection of Physical Access Control Systems — Cyber Assets that authorize and/or log access to the Physical Security Perimeter(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall:

R2.1. Be protected from unauthorized physical access.

R2.2. Be afforded the protective measures specified in Standard CIP-003-2; Standard CIP-004-2 Requirement R3; Standard CIP-005-2 Requirements R2 and R3; Standard CIP-006-2 Requirements R4 and R5; Standard CIP-007-2; Standard CIP-008-2; and Standard CIP-009-2.

R3. Protection of Electronic Access Control Systems — Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter.

R4. Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.
- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets.

R5. Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008-2. One or more of the following monitoring methods shall be used:

- Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R4.

R6. Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R4.

R7. Access Log Retention — The responsible entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-2.

R8. Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R4, R5, and R6 function properly. The program must include, at a minimum, the following:

R8.1. Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.

R8.2. Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement R8.1.

R8.3. Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.

C. Measures

M1. The Responsible Entity shall make available the physical security plan as specified in Requirement R1 and documentation of the implementation, review and updating of the plan.

M2. The Responsible Entity shall make available documentation that the physical access control systems are protected as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation that the electronic access control systems are located within an identified Physical Security Perimeter as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation identifying the methods for controlling physical access to each access point of a Physical Security Perimeter as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation identifying the methods for monitoring physical access as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation identifying the methods for logging physical access as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation to show retention of access logs as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation to show its implementation of a physical security system maintenance and testing program as specified in Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entities.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documents other than those specified in Requirements R7 and R8.2 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation..

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 The Responsible Entity may not make exceptions in its cyber security policy to the creation, documentation, or maintenance of a physical security plan.

1.5.2 For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006-2 for that single access point at the dial-up device.

2. Violation Severity Levels (Under development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to remove extraneous information from the requirements, improve readability, and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Replaced the RRO with RE as a responsible entity. Modified CIP-006-1 Requirement R1 to clarify that a physical security plan to protect Critical Cyber Assets must be documented, maintained, implemented and approved by the senior manager. Added Requirement R2 to CIP-006-2 to clarify the requirement to safeguard the Physical Access Control Systems and exclude hardware at the Physical Security Perimeter access point, such as electronic lock control mechanisms and badge readers from the requirement. Requirement R2.1 requires the Responsible Entity to protect the Physical Access Control Systems from unauthorized access. CIP-006-1 Requirement R1.8 was moved to become CIP-006-2 Requirement R2.2. Added Requirement R3 to CIP-006-2, clarifying the requirement for Electronic Access Control Systems to be safeguarded within an identified Physical Security Perimeter. The sub requirements of CIP-006-2 Requirements R4, R5, and R6 were changed from formal requirements to bulleted lists of options consistent with the intent of the requirements. Changed the Compliance Monitor to Compliance Enforcement Authority.	
		Modifications to clarify the requirements and to incorporate industry comments. Modify Physical Security Plan to document, implement, and maintain. Correct Requirement reference in R1.4 to R4	

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee (SC) accepted the Standards Authorization Request (SAR) for Project 2008-06 Cyber Security Order 706 on March 10, 2008.
2. The SAR for Project 2008-06 Cyber Security Order 706 was posted for industry comment March 20–April 19, 2008.
3. Nominations for the SAR drafting team members were solicited March 20–April 4, 2008.
4. The Executive Committee of the SC appointed the SAR drafting team for Project 2008-06 Cyber Security Order 706 on April 25, 2008 and the full SC ratified the Executive Committee's action on May 8.
5. The SC accepted the SAR and approved moving forward with Project 2008-06 Cyber Security Order on July 10, 2008.
6. Nominations for the standard drafting team (SDT) for Project 2008-06 Cyber Security Order 706 were solicited July 15–28, 2008.
7. The Executive Committee of the SC appointed the SDT for Project 2008-06 Cyber Security Order 706 on August 7, 2008.

Proposed Action Plan and Description of Current Draft:

The standard drafting team for Project 2008-06 Cyber Security Order 706 (SDT CSO706) has been assigned the responsibility to review each of the following reliability standards to ensure that they conform to the latest version of the ERO Rules of Procedure, including the Reliability Standards Development Procedure, and also address all of the directed modifications identified in the FERC Order 706:

CIP–002–1 — Cyber Security — Critical Cyber Asset Identification
CIP–003–1 — Cyber Security — Security Management Controls
CIP–004–1 — Cyber Security — Personnel and Training
CIP–005–1 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–1 — Cyber Security — Physical Security
CIP–007–1 — Cyber Security — Systems Security Management
CIP–008–1 — Cyber Security — Incident Reporting and Response Planning
CIP–009–1 — Cyber Security — Recovery Plans for Critical Cyber Assets

Because of the extensive scope of Project 2008-06 Cyber Security Order 706 the SDT CSO706 is implementing a multiphase approach for revising this set of standards.

Phase I of the project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. In particular, the SDT addressed the directive in FERC Order 706 that the "... ERO modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin in 2009." In addition, a number of other directives included in FERC Order 706, which apply to specific standards are also addressed in Phase I. More contentious issues to be addressed by the SDT associated with the modification of this set of standards will be addressed in a later phase(s) of Project 2008-06 Cyber Security Order 706.

This posting of the cyber standards for industry comment only relates to Phase I of the project. Specifically, SDT CSO706 produced a revised version of Standard CIP–007–2 — Cyber Security — Systems Security Management and is posting the proposed modifications for a 45-day comment period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop and post reply comments to initial posting of standard for industry comment	January 7–February 17, 2009
2. Post for 30-day pre-ballot period.	February 18–March 31, 2009
3. Conduct initial ballot	April 2–11, 2009
4. Post response to comments on first ballot	April 20–May 12, 2009
5. Conduct recirculation ballot	May 13–22, 2009
6. Board adoption date.	To be determined.

A. Introduction

1. Title: Cyber Security — Systems Security Management

2. Number: CIP-007-2

3. Purpose: Standard CIP-007-2 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the other (non-critical) Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007-2 should be read as part of a group of standards numbered Standards CIP-002-2 through CIP-009-2.

4. Applicability:

4.1. Within the text of Standard CIP-007-2, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-007-2:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-2, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-2, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

R1.1. The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.

R1.2. The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.

R1.3. The Responsible Entity shall document test results.

R2. Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.

R2.1. The Responsible Entity shall enable only those ports and services required for normal and emergency operations.

R2.2. The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).

R2.3. In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-2 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

R3.1. The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.

R3.2. The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4. Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).

R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4.2. The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.1. The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.

R5.1.1. The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-2 Requirement R5.

R5.1.2. The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.

R5.1.3. The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-2 Requirement R5 and Standard CIP-004-2 Requirement R4.

R5.2. The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.

R5.2.1. The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.

R5.2.2. The Responsible Entity shall identify those individuals with access to shared accounts.

R5.2.3. Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:

R5.3.1. Each password shall be a minimum of six characters.

R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters.

R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

R6. Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.

R6.1. The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2. The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.

R6.3. The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-2.

R6.4. The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.

R6.5. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.

R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-2.

R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.

R8. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:

R8.1. A document identifying the vulnerability assessment process;

R8.2. A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;

R8.3. A review of controls for default accounts; and,

R8.4. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-2 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.

C. Measures

M1. The Responsible Entity shall make available documentation of its security test procedures as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation and records of its security patch management program, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation and records of its malicious software prevention program as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation and records of its account management program as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation and records of its security status monitoring program as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation and records of its program for the disposal or redeployment of Cyber Assets as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation and records of its annual vulnerability assessment of all Cyber Assets within the Electronic Security Perimeters(s) as specified in Requirement R8.

M9. The Responsible Entity shall make available documentation and records demonstrating the review and update as specified in Requirement R9.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall retain security–related system event logs for ninety calendar days, unless longer retention is required pursuant to Standard CIP-008-2 Requirement R2.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information.

2. Violation Severity Levels (Under development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment and acceptance of risk. Replaced the RRO with the RE as a responsible	

		entity. Rewording of Effective Date. R9 changed ninety (90) days to thirty (30) days Changed compliance monitor to Compliance Enforcement Authority.	
		Modifications to clarify the requirements and to incorporate industry comments. Revise the Purpose of this standard to clarify that Standard CIP-007-2 requires Responsible Entities to define methods, processes, and procedures for securing Cyber Assets and other (non-Critical) Assets within an Electronic Security Perimeter.	

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee (SC) accepted the Standards Authorization Request (SAR) for Project 2008-06 Cyber Security Order 706 on March 10, 2008.
2. The SAR for Project 2008-06 Cyber Security Order 706 was posted for industry comment March 20–April 19, 2008.
3. Nominations for the SAR drafting team members were solicited March 20–April 4, 2008.
4. The Executive Committee of the SC appointed the SAR drafting team for Project 2008-06 Cyber Security Order 706 on April 25, 2008 and the full SC ratified the Executive Committee's action on May 8.
5. The SC accepted the SAR and approved moving forward with Project 2008-06 Cyber Security Order on July 10, 2008.
6. Nominations for the standard drafting team (SDT) for Project 2008-06 Cyber Security Order 706 were solicited July 15–28, 2008.
7. The Executive Committee of the SC appointed the SDT for Project 2008-06 Cyber Security Order 706 on August 7, 2008.

Proposed Action Plan and Description of Current Draft:

The standard drafting team for Project 2008-06 Cyber Security Order 706 (SDT CSO706) has been assigned the responsibility to review each of the following reliability standards to ensure that they conform to the latest version of the ERO Rules of Procedure, including the Reliability Standards Development Procedure, and also address all of the directed modifications identified in the FERC Order 706:

CIP–002–1 — Cyber Security — Critical Cyber Asset Identification
CIP–003–1 — Cyber Security — Security Management Controls
CIP–004–1 — Cyber Security — Personnel and Training
CIP–005–1 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–1 — Cyber Security — Physical Security
CIP–007–1 — Cyber Security — Systems Security Management
CIP–008–1 — Cyber Security — Incident Reporting and Response Planning
CIP–009–1 — Cyber Security — Recovery Plans for Critical Cyber Assets

Because of the extensive scope of Project 2008-06 Cyber Security Order 706 the SDT CSO706 is implementing a multiphase approach for revising this set of standards.

Phase I of the project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. In particular, the SDT addressed the directive in FERC Order 706 that the "... ERO modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin in 2009." In addition, a number of other directives included in FERC Order 706, which apply to specific standards are also addressed in Phase I. More contentious issues to be addressed

by the SDT associated with the modification of this set of standards will be addressed in a later phase(s) of Project 2008-06 Cyber Security Order 706.

This posting of the cyber standards for industry comment only relates to Phase I of the project. Specifically, SDT CSO706 produced a revised version of Standard CIP–008–2 — Cyber Security — Incident Reporting and Response Planning and is posting the proposed modifications for a 45-day comment period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop and post reply comments to initial posting of standard for industry comment	January 7–February 17, 2009
2. Post for 30-day pre-ballot period.	February 18–March 31, 2009
3. Conduct initial ballot	April 2–11, 2009
4. Post response to comments on first ballot	April 20–May 12, 2009
5. Conduct recirculation ballot	May 13–22, 2009
6. Board adoption date.	To be determined.

A. Introduction

1. Title: Cyber Security — Incident Reporting and Response Planning

2. Number: CIP-008-2

3. Purpose: Standard CIP-008-2 ensures the identification, classification, response, and reporting of Cyber Security Incidents related to Critical Cyber Assets. Standard CIP-008-2 should be read as part of a group of standards numbered Standards CIP-002-2 through CIP-009-2.

4. Applicability

4.1. Within the text of Standard CIP-008-2, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-008-2:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-2, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident response plan shall address, at a minimum, the following:

R1.1. Procedures to characterize and classify events as reportable Cyber Security Incidents.

R1.2. Response actions, including roles and responsibilities of Cyber Security Incident response teams, Cyber Security Incident handling procedures, and communication plans.

R1.3. Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.

R1.4. Process for updating the Cyber Security Incident response plan within thirty calendar days of any changes.

R1.5. Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.

R1.6. Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident. Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test.

R2. Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.

C. Measures

M1. The Responsible Entity shall make available its ~~dated~~ Cyber Security Incident response plan as indicated in Requirement R1 and documentation of the review, updating, and testing of the plan

M2. The Responsible Entity shall make available all documentation as specified in Requirement R2.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation other than that required for reportable Cyber Security Incidents as specified in Standard CIP-008-2 for the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 The Responsible Entity may not take exception in its cyber security policies to the creation of a Cyber Security Incident response plan.

1.5.2 The Responsible Entity may not take exception in its cyber security policies to reporting Cyber Security Incidents to the ES ISAC.

2. Violation Severity Levels (Under Development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
		Modifications to clarify the requirements and to incorporate industry comments. Removed “dated” from Measure M1.	

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee (SC) accepted the Standards Authorization Request (SAR) for Project 2008-06 Cyber Security Order 706 on March 10, 2008.
2. The SAR for Project 2008-06 Cyber Security Order 706 was posted for industry comment March 20–April 19, 2008.
3. Nominations for the SAR drafting team members were solicited March 20–April 4, 2008.
4. The Executive Committee of the SC appointed the SAR drafting team for Project 2008-06 Cyber Security Order 706 on April 25, 2008 and the full SC ratified the Executive Committee's action on May 8.
5. The SC accepted the SAR and approved moving forward with Project 2008-06 Cyber Security Order on July 10, 2008.
6. Nominations for the standard drafting team (SDT) for Project 2008-06 Cyber Security Order 706 were solicited July 15–28, 2008.
7. The Executive Committee of the SC appointed the SDT for Project 2008-06 Cyber Security Order 706 on August 7, 2008.

Proposed Action Plan and Description of Current Draft:

The standard drafting team for Project 2008-06 Cyber Security Order 706 (SDT CSO706) has been assigned the responsibility to review each of the following reliability standards to ensure that they conform to the latest version of the ERO Rules of Procedure, including the Reliability Standards Development Procedure, and also address all of the directed modifications identified in the FERC Order 706:

CIP–002–1 — Cyber Security — Critical Cyber Asset Identification
CIP–003–1 — Cyber Security — Security Management Controls
CIP–004–1 — Cyber Security — Personnel and Training
CIP–005–1 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–1 — Cyber Security — Physical Security
CIP–007–1 — Cyber Security — Systems Security Management
CIP–008–1 — Cyber Security — Incident Reporting and Response Planning
CIP–009–1 — Cyber Security — Recovery Plans for Critical Cyber Assets

Because of the extensive scope of Project 2008-06 Cyber Security Order 706 the SDT CSO706 is implementing a multiphase approach for revising this set of standards.

Phase I of the project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. In particular, the SDT addressed the directive in FERC Order 706 that the "... ERO modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin in 2009." In addition, a number of other directives included in FERC Order 706, which apply to specific standards are also addressed in Phase I. More contentious issues to be addressed by the SDT associated with the modification of this set of standards will be addressed in a later phase(s) of Project 2008-06 Cyber Security Order 706.

This posting of the cyber standards for industry comment only relates to Phase I of the project. Specifically, SDT CSO706 produced a revised version of Standard CIP–009–2 — Cyber Security — Recovery Plans for Critical Cyber Assets and is posting the proposed modifications for a 45-day comment period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop and post reply comments to initial posting of standard for industry comment	January 7–February 17, 2009
2. Post for 30-day pre-ballot period.	February 18–March 31, 2009
3. Conduct initial ballot	April 2–11, 2009
4. Post response to comments on first ballot	April 20–May 12, 2009
5. Conduct recirculation ballot	May 13–22, 2009
6. Board adoption date.	To be determined.

A. Introduction

1. **Title:** Cyber Security — Recovery Plans for Critical Cyber Assets

2. **Number:** CIP-009-2

3. **Purpose:** Standard CIP-009-2 ensures that recovery plan(s) are put in place for Critical Cyber Assets and that these plans follow established business continuity and disaster recovery techniques and practices. Standard CIP-009-2 should be read as part of a group of standards numbered Standards CIP-002-2 through CIP-009-2.

4. **Applicability:**

   4.1. Within the text of Standard CIP-009-2, "Responsible Entity" shall mean:

   4.1.1 Reliability Coordinator

   4.1.2 Balancing Authority

   4.1.3 Interchange Authority

   4.1.4 Transmission Service Provider

   4.1.5 Transmission Owner

   4.1.6 Transmission Operator

   4.1.7 Generator Owner

   4.1.8 Generator Operator

   4.1.9 Load Serving Entity

   4.1.10 NERC

   4.1.11 Regional Entity

   4.2. The following are exempt from Standard CIP-009-2:

   4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

   4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

   4.2.3 Responsible Entities that, in compliance with Standard CIP-002-2, identify that they have no Critical Cyber Assets.

5. **Effective Date:** The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

~~The Responsible Entity shall comply with the following requirements of Standard CIP-009-2:~~

R1. Recovery Plans — The Responsible Entity shall create and annually review recovery plan(s) for Critical Cyber Assets. The recovery plan(s) shall address at a minimum the following:

R1.1. Specify the required actions in response to events or conditions of varying duration and severity that would activate the recovery plan(s).

R1.2. Define the roles and responsibilities of responders.

R2. Exercises — The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident.

R3. Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change being completed.

R4. Backup and Restore — The recovery plan(s) shall include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.

R5. Testing Backup Media — Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.

C. Measures

M1. The Responsible Entity shall make available its ~~dated~~ recovery plan(s) as specified in Requirement R1.

M2. The Responsible Entity shall make available its ~~dated~~ records documenting required exercises as specified in Requirement R2.

M3. The Responsible Entity shall make available its ~~dated~~ documentation of changes to the recovery plan(s), and documentation of all communications, as specified in Requirement R3.

M4. The Responsible Entity shall make available its ~~dated~~ documentation regarding backup and storage of information as specified in Requirement R4.

M5. The Responsible Entity shall make available its ~~dated~~ documentation of testing of backup media as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entities.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-009-2 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (Under development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Communication of revisions to the recovery plan changed from 90 days to 30 days. Changed compliance monitor to Compliance Enforcement Authority.	
		Modifications to clarify the requirements and to incorporate industry comments. Revised the wording in Section B, Requirements, to be consistent with the other standards. Remove “dated” from the measures.	

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments on 1st Draft of CIP-002-2 through CIP-009-2 — Project 2008-06 — Cyber Security Order 706

The Cyber Security for Order 706 Standard Drafting Team thanks all commenters who submitted comments on the first draft of following CIP standards:

CIP–002–2 — Cyber Security — Critical Cyber Asset Identification
CIP–003–2 — Cyber Security — Security Management Controls
CIP–004–2 — Cyber Security — Personnel and Training
CIP–005–2 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–2 — Cyber Security — Physical Security
CIP–007–2 — Cyber Security — Systems Security Management
CIP–008–2 — Cyber Security — Incident Reporting and Response Planning
CIP–009–2 — Cyber Security — Recovery Plans for Critical Cyber Assets

These standards were posted for a 45-day public comment period from November 21, 2008 through January 5, 2009. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 52 sets of comments, including comments from more than 100 different people from over 55 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. The CSO706 SDT added management approval of the risk-based assessment methodology (per FERC Order 706, paragraph 236) to **CIP-002-1 Requirement R4**. Do you agree with the proposed modification? If not, please explain and provide an alternative to the proposed modification that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 1 Comment
Detroit Edison Company	Yes	
PacifiCorp	Yes	
FirstEnergy Corp	Yes	
MidAmerican Energy Company	Yes	
Northeast Power Coordinating Council	No	We recommend that CIP-002 be updated by moving CIP-003 R2 into CIP-002. By moving CIP-003 R2 into CIP-002 all the Requirements that all Entities must complete are in one Standard. The senior manager has not been identified in CIP-002. Moving CIP-003 R2 into the CIP-002 Standard clarifies who the senior manager is, and allows for only one Standard (CIP-002) that must be completed by everyone.
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
WECC Relibaility Coordination	Yes	
Southern Company	Yes	CIP-002 Section D - Compliance: 1.1.1 does not specify who is responsible for the enforcement authority.

Organization	Yes or No	Question 1 Comment
		CIP-002 Section D - Compliance: 1.4.1 - Indefinite retention is not feasible, overall cost of storage depending on scope could potentially be very large. Item should define an upper bound of the request (e.g. a maximum of 3 years) CIP-002 Section D - Compliance: 1.4.2- Should have a time limit to reduce the overall liability of confidential information.
Response: **1.1.1 - The Regional Entity will serve as the Compliance Enforcement Authority for most entities. As the Regional Entity may not audit itself, the ERO will serve as the Compliance Enforcement Authority in auditing the Regional Entity. A third-party monitor without a vested interest in the outcome will serve as the Compliance Enforcement Authority for NERC. (Refer to NERC's Rules of Procedure, Paragraphs 404 and 405).** **1.4.1 – With the exception of retaining evidence in support of an investigation, the standard defines a finite retention period. The language that indicates the Compliance Enforcement Authority may direct the responsible entity to retain evidence for a longer period of time as part of an investigation is a restatement of what is included in the ERO Rules of Procedure. Reference the ERO Rules of Procedure Appendix 4C – Uniform Compliance Monitoring and Enforcement Procedures – Section 3.4.1 Compliance Violation Investigation Process Steps. While the duration of an investigation cannot be predicted, further clarification of the retention timeframe is outside the scope of the SDT.** **1.4.2 – This language supports the regularly scheduled audit intervals for all entities and supports the need to retain the confidentiality of some data. The audit data retention period is determined by the audit period for each Registered Entity.**		
Luminant Power	Yes	
Encari	No	1. R4 should also include a direct reference to CIP-003-2 R2 to ensure that the Responsible Entities are aware are all applicable requirements. A Responsible Entity that identifies a null CA list must still perform CIP-003-1 R2. This would allow the exemption in CIP-003-2 (4.2.3) to be removed. General Comment Provided in All Submissions--Other modifications were also made to this standard that are not included as part of the question. 2. The wording of 1.1.1 is awkward and should be modified. 3. We also request further clarification regarding the Data Retention Requirement 1.4.2 as to which entity will be maintaining the last audit records and submitted subsequent audit records. As the statement is currently worded "in conjunction" leaves this open to interpretation.

Organization	Yes or No	Question 1 Comment
Response: **1. The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **2. The intent of the wording in 1.1.1 is to clarify which entity will serve as the Compliance Enforcement Authority. For most standards, the Regional Entity serves as the Compliance Enforcement Authority and audits the performance of the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, Generator Owner, etc. In this standard, the Regional Entity is responsible for some of the requirements – but an entity cannot audit its own performance. Where the Regional Entity is also the responsible entity, the ERO will audit the Regional Entity's performance. Where the ERO is the responsible entity, a third-party monitor without vested interest in the outcome will conduct the audit.** **3. The data retention periods for the standard requirements are specified in the standards. The language of 1.4.2 indicates that the Compliance Enforcement Authority and the Registered Entity will retain all the audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities. The audit data retention period is determined by the audit period for each Registered Entity.** **The phrase, "in conjunction with" was deliberately used to recognize that there may be some confidential records that fall into the category of "critical energy infrastructure information" as defined in the ERO Rules of Procedure – and the responsible entity has the right to retain control over these records. Most other records will be retained by the Compliance Enforcement Authority.**		
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	Yes	
Consolidated Edison Company of New York, Inc.	No	We agree with the proposed modification, but have suggestions which affect CIP-002 in one area of the Leadership requirement which would be more logical.CIP-002 requires the approval of the Senior Manager for many requirements, and is the standard that determines whether other CIP standards are applicable to the Entity. In order to streamline compliance filing in these cases, and also as a more logical place for the identification of a Senior Manager, we recommend that CIP-002 be updated by 1) moving CIP-003 R2 into CIP-002 or 2) CIP-002 R4 should reference CIP-003 R2. We prefer moving CIP-003 R2 into CIP-002 so that all the Requirements that all Entities must complete are in one Standard.1 - The senior manager has not been identified in CIP-002. Many requirements make

Organization	Yes or No	Question 1 Comment
		reference to the Senior Manager or delegate. Moving CIP-003 R2 into CIP-002 Standard clarifies who the senior manager is, and allows for only one Standard (CIP-002) that must be completed by everyone. This is the preferred option.Or2 - The senior manager or delegate(s) assigned per CIP-003 R2 and its sub-Requirements shall?
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Southern California Edison Company	Yes	
Tampa Electric Company	Yes	
Electric Market Policy	Yes	1) NERC (Step 4.1.10) and Regional Entity (Step 4.1.11) are not defined in the NERC Glossary of Terms or Functional Model. 2) Propose that section 4.2 for each standard (CIP-002-2 through CIP-009-2) be updated to state that law enforcement agencies and emergency services in the performance of their duties are exempt from the standards.
Response: **1) NERC and Regional Entity are defined in NERC's corporate documents including, but not limited to, the Certificate of Incorporation and ByLaws.** **2) Law enforcement agencies and emergency services are not users, owners, or operators of the Bulk Power System; therefore, it is not necessary to exempt them. Their access should be included in the emergency provisions of the cyber security policy as required by the Emergency Situations Provision in CIP-003-R1.1.**		
PPL Corporation	Yes	
MRO NERC Standards	No	The MRO NSRS believes that R4 is prescriptive in nature. The requirement tells how to accomplish, not

Organization	Yes or No	Question 1 Comment
Review Subcommittee		what to accomplish.
Response: **The SDT respectfully disagrees with the comment. CIP-002-2 R4 is a requirement for governance over the critical cyber asset identification standard. The SDT's intent was to define annual approval by the senior manager.**		
Pepco Holdings, Inc - Affiliates	No	We appreciate and support the CSO706 SDT efforts. We agree and support the following proposed changes in CIP-002-2 through CIP-009-2: 1. Nomenclature and clarification changes (e.g. changing RRO to Regional Entity, version references) 2. Clearly state that requirements not only need a program but need to be implemented (e.g. electronic access controls, awareness program, Security Patch Management program) 3. Removed the term "reasonable business judgment" 4. Where applicable, removed the phrase "acceptance of risk" 5. Added annual review and approval of risk-based assessment methodology 6. Background checks and training would be required prior to allowing unescorted physical access or cyber access to critical cyber assets (i.e. eliminates 90 days or 30 days after the fact but allows for emergencies) 7. Added protection of physical access control systems However we have the following questions about changes in CIP-002-2. (These questions also apply to CIP-003-2 through CIP-009-2 but will not be repeated below.): 1). The proposed change for D. Compliance, Section 1.1 appears to add a new term, "Compliance Enforcement Authority", (which we do not believe is in the Glossary of Terms or in any other standards as of 12/1/08). Does the CSO706 SDT plan to define this new term? If yes, how will it be different from the term "Compliance Monitor" (defined in the Glossary of Terms)? 2). In D. Compliance, Section 1.1.2 The proposed change is to replace NERC with ERO. We believe that this should be left as NERC as we do not believe ERO appears in the Glossary of Terms or in any other standards. If ERO remains, does ERO need to be added to the applicability list in A. Introduction, Section 4.1 and the Glossary of Terms?
Response: **1) The term, "Compliance Enforcement Authority" is used extensively in the ERO Rules of Procedure and replaced the term,**		

Organization	Yes or No	Question 1 Comment
"Compliance Monitor." This term has been used in standards under development since November of 2007 to more closely match the language used in the ERO Rules of Procedure – Appendix 4C – Uniform Compliance Monitoring and Enforcement Procedures. **2) Under the ERO Rules of Procedure, the ERO can be penalized but not NERC – therefore the use of the term, "Electric Reliability Organization" or "ERO" is technically correct. As a guideline, drafting teams are asked not to add terms to the glossary unless there is a chance that the term will be misunderstood. In this case, the entities who follow these standards should know what is meant by these terms, and we don't believe the terms need to be added to the glossary.**		
United Illuminating Company	Yes	
Deloitte& Touche, LLP	Yes	
Exelon	Yes	
Old Dominion Electric Cooperative	Yes	
City of Tallahassee (TAL)	Yes	While I agree with the R4 revision, I disagree with the removal of the "reasonable business judgement" in all the standards. While this was in response to FERC directive, it creates a one-size-fits-all approach. Every system is different, as is their Risk Assessment Procedure. This will be one of the more contentious issues. While it may be outside the perview of the SDT, the industry has not been given the information that is needed to specifically address the Auroura fiasco. All we know is someone set up a generator and "hacked" in to change the set frequency and damage ensued. We are not aware of what software was in place to protect this "asset" or what controlling software was. Can the specifics of who set up the test and the hardware/software/control systems being utilized be shared with the industry through a NERC Alert Industry Advisory? While I do not think I have my head buried in the sand about the potential for Cyber attack, I do have a problem with taking all-encompassing action with so little information on what caused the initial knee-jerk reaction. The cost of safeguarding a system against such unknown attacks, to a level that will be acceptable during an audit (a second unknown) will surely be a significant burden to many utilities. While entities have some latitude in our "methodology" in identifying Critical Assets, the fact will remain that you have to spend money on new tools and hardware to comply with the existing requirements outside of routine budget cycles at a significant impact to operations. According to the letter from Rick

Organization	Yes or No	Question 1 Comment
		Sergel to the BOT of July 7, 2008 even after we spend a ton of money, we are still susceptible to attack. Without the flexibility of determining cost vs. benefit, we will overachieve the goal of ".. .reasonably ensure the reliability of the BPS. . ."
Response: **The comments concerning Aurora are outside of the aegis of the SDT.** **The removal of "reasonable business judgment" was done in accordance with FERC Order 706. The revisions made to the standards in Phase 1 are intended to be responsive to specific FERC directives relevant to the onset of compliance audits in July 2009. The expansion of the Technical Feasibility Exception Process should address the concerns regarding the removal of reasonable business judgment and acceptance of risk.**		
BC Transmission Corporation	Yes	
Applied Control Solutions, LLC	No	Need to include the NIST Framework in addition to senior management approval
Response: **The SDT plans to consider the NIST Framework during future phases of standards review, as directed by FERC Order 706.**		
US Bureau of Reclamation	No	The modification of the standard to require that a specific individual approve the risk-assessment methodology appears to be overstepping the bounds of the authority of the regulatory agencies as it pertains to improved reliability. It is difficult to imagine or prove that having one individual within an agency approve a methodology (as opposed to making the entity responsible for having and using a methodology) improves system reliability. Such a requirement is also not consistent with most of the other BES reliability standards. For consistency, the standard should refer to "Responsible Entity" rather than specific individuals within the organization. That determination is the sole discretion of the Responsible Entity and was not required by FERC. FERC required, in paragraph 236, that "internal, management, approval of the riskbased assessment" is required. FERC further clarified: "A responsible entity, however, remains responsible to identify the critical assets on its system". To that end the standard should require that the 'Responsible Entity" ensure that management has approved the risk based assessment. The "Responsible Entity" is then responsible to demonstrate that the requirement has been met and who approved it.

Organization	Yes or No	Question 1 Comment
Response: **The intent of the standard is not to define an entity's organizational structure. The intent is to ensure that the appropriate governance structure is taken into consideration and that, as directed by FERC, there exists a single individual with overarching authority.**		
Orange and Rockland Utilities Inc.	No	We recommend that CIP-002 be updated by 1) moving CIP-003 R2 into CIP-002 or 2) CIP-002 R4 should reference CIP-003 R2. We prefer moving CIP-003 R2 into CIP-002 so that all the Requirements that all Entities must complete are in one Standard.1 – The senior manager has not been identified in CIP-002. Moving CIP-003 R2 into CIP-002 Standard clarifies who the senior manager is, and allows for only one Standard (CIP-002) that must be completed by everyone.2 - The senior manager or delegate(s) assigned per CIP-003 R2 and its sub-Requirements shall?
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
CenterPoint Energy		
Manitoba Hydro	Yes	
Alberta Electric System Operator	No	The functional entity (e.g. the Balancing Authority, etc) should be designated as the responsible entity for this requirement, not an individual. This would be consistent with other ERO standards. Also, R1 implies that the purpose of this standard is not only to identify the "Critical Cyber Assets" but also the "Critical Assets" (which must be done before you can identify the Critical Cyber Assets), and hence we suggest that either the identification of "critical Assets" be specified in its own and separate standard or the Title and Purpose of CIP-002 be clarified to state that there are 2 purposes to this standard. We suggest that R1 should be re-written to improve clarity. R1, as currently written, contains not only a single requirement, but with at least two, and possibly three or more requirements embedded in it. The accountabilities for these different requirements could be different within an organization, so assigning them to one person would be inappropriate.

Organization	Yes or No	Question 1 Comment
Response: **The change made in CIP-002 includes adding the management approval of the risk-based assessment methodology per directives in FERC Order 706. Given the limited scope and timeline for Phase 1, please readdress the additional concerns during the Phase 2 comment period.**		
Dynegy	No	Agree with requiring management approval of the risk-based assessment methodology. Also, suggest moving CIP-003, R2 into CIP-002 so that all the Requirements that all Entities must comply with are in one Standard.
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Northern Indiana Public Service Company	No	I do support the recommended change to require management approval of the risk-based assessment methodology per FERC Order 706, paragraph 236. I would like to recommend the addition of some language to CIP-002-2 Req 4. Currently the language in R4 directs the responsible entity to comply with CIP-002-2 R1-R3 and retain a record of the resulting CA and CCA asset list (even if that list is null). My concern is that if the list is null the entity may feel they have completed all necessary actions for compliance. There is however compliance actions for an entity with a null list contained within CIP-003-2. As it stands there is an oddly placed exemption in the applicability section of CIP-003 4.2.3. I would recommend the inclusion of language in CIP-002-2 Req. 4 to identify the need for compliance with CIP-003-2 R2 as well as the currently referenced CIP-002-2 R1-3; in order to contain all applicability for CIP-002-2 R4 in one location and in turn removing the exemption in CIP-003-2. As there is no other means through the use of this comment form I would also like to comment on changes made in CIP-002-2 that repeat throughout CIP-002-2 - CIP-009-2 In the purpose section of CIP-002-2, I would like to see as a component of this draft, an attempt to develop alternative language to replace reasonable business judgment as mentioned in Order 706 in paragraph 135. In the Data Retention section of CIP-002-2, I would like to request clarification on the language added to 1.4.2. As the language was there was a limit on data retention that matched the audit enforcement

Organization	Yes or No	Question 1 Comment
		period of three years. The language provided currently removes this limit and extends the retention into perpetuity as well as leaving it unclear which entity is responsible for retaining the data into perpetuity.

Response:

The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.

The removal of "reasonable business judgment" was done in accordance with FERC Order 706. The revisions made to the standards in Phase 1 are intended to be responsive to specific FERC directives relevant to the onset of compliance audits in July 2009. The expansion of the Technical Feasibility Exception Process should address the concerns regarding the removal of reasonable business judgment and acceptance of risk.

The data retention periods for the standard requirements are specified in the standards. The language of 1.4.2 indicates that the Compliance Enforcement Authority and the Registered Entity will retain all the audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities. The audit data retention period is determined by the audit period for each Registered Entity.

CoreTrace	Yes	
Oncor Electric Delivery LLC	Yes	
Illinois Municipal Electric Agency	Yes	
Ontario Power Generation	No	Measures M2 and M3 add a requirement by specifying the lists of Critical Assets and Critical Cyber Assets must be dated. M2 references Requirement R2 and M3 references Requirement R3. Neither R2 or R3 require a list to be dated.

Response: **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **The word "dated" will be removed at this time. The measures will be reviewed and considered in an upcoming drafting phase of these standards.**		
American Electric Power	Yes	Section R4 of the Requirements category does not clearly define what type of unit the senior manager represents. We would suggest a clarifying comment like "for each responsible entity" be added following the word "delegate(s)." This does not appear again in any of the following standards. However, throughout all of these standards, the drafting team has introduced a new term in its use of "Responsible Entity." If this term is to be used, it should probably be considered by the NERC organization with corresponding updates to lists of compliance term glossaries and/or definitions.
Response: **The SDT believes that this change could be too prescriptive and limits the flexibility allowed in delegation.** **"Responsible Entity" is defined within the Applicability section of each CIP standard.**		
Ontario IESO	No	Standards should hold a functional entity(ies) responsible for meeting the requirements, not a person or a position. Furthermore, delegation is an internal process which does not need to be explicitly mentioned/allowed in a standard. We propose R4 be revised to: "Annual Approval? The Responsible Entity shall appoint a senior manager with the authority to approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3, the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of its approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.) "If appointing a senior manager is required to ensure standards are complied with and implemented, we recommend that CIP-002 be updated by 1) moving CIP-003 R2 into CIP-002 or 2) CIP-002 R4 should explicitly reference CIP-003 R2. We prefer moving CIP-003 R2 into CIP-002 so that all the Requirements that all Entities must complete are in one Standard.

Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **The senior manager is held responsible to ensure that there is a clear line of authority and that cyber security functions are given the prominence they deserve. The SDT believes that delegation needs to be addressed in the CIP standards to ensure that the appropriate governance structure is considered by the Responsible Entity.**		
Ameren	Yes	None.
Response: **Thank you for your comment.**		
Consumers Energy Company	Yes	
Xcel Energy	Yes	
ISO New England Inc	No	1) - We recommend that CIP-002 be updated by: moving CIP-003 R2 into CIP-002 or CIP-002 R4 should explicitly reference CIP-003 R2. We prefer moving CIP-003 R2 into CIP-002 so that all the Requirements that all Entities must complete are in one Standard. Rational: 2) - The senior manager has not been identified in CIP-002. Moving CIP-003 R2 into CIP-002 Standard clarifies who the senior manager is, and allows for only one Standard (CIP-002) that must be completed by everyone. Allows for, "The senior manager or delegate(s) assigned per CIP-003 R2 and its sub-Requirements" shall" 3. In this Standard and throughout several other CIP Standards, "Dated" is used only in the Measures. Adding a requirement in the measures is inappropriate and cannot be applied.
Response: **1) The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in**		

the later phases of the project and resubmit your comments as appropriate if they have not been addressed. **2) The senior manager is held responsible in order to ensure that there is a clear line of authority and that cyber security functions are given the prominence they deserve. The SDT believes that delegation should be addressed in the CIP standards to ensure that the appropriate governance structure is considered by the Responsible Entity.** **3) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **The word "dated" will be removed at this time. The measures will be reviewed and considered in an upcoming drafting phase of these standards.**		
American Transmission Company	Yes	
TVA	No	There are three areas we feel need clarification: 1. Standards should hold a functional entity(ies), not a person or a position, responsible for meeting the requirements; 2. Delegation is an internal process which does not need to be explicitly mentioned/allowed in a standard; and 3. An appointment of a senior manager is a part of CIP-003 and for Responsible Entities without Critical Assets only CIP-002 is applicable. We propose the following: i) R4 be revised to: Annual Approval - The Responsible Entity shall appoint a senior manager with the authority to approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3, the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. ii) The Responsible Entity shall keep a signed and dated record of its approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.) iii. Move the senior manager appointment from CIP-003 R2 to CIP-002. Incorporate, by reference to CIP-003, for a senior manager appointment into CIP-002.
Response:		

i) The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed. (Reference FERC Order 706 Paragraph 381) **ii) The senior manager is held responsible in order to ensure that there is a clear line of authority and that cyber security functions are given the prominence they deserve. The SDT believes that delegation should be addressed in the CIP standards to ensure that the appropriate governance structure is considered by the Responsible Entity. (reference FERC Order 706, Paragraph 381)** **iii) As stated in CIP-003-2, all Responsible Entities regardless of a null Critical Cyber Asset list are required to perform CIP003-2 R2.**		
Duke Energy	Yes	
Brazos Electric Power Cooperative, Inc.	No	Suggest that the first sentence of R4 be re-written as follows: R4 The Responsible Entity shall assign a single senior manager with overall responsibility and authority for approving annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets.
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Progress Energy	Yes	
Standards Review Committee of ISO/RTO Council	No	(1) Standards should hold a functional entity(ies), not a person or a position, responsible for meeting the requirements. Further, delegation is an internal process which does not need to be explicitly mentioned/allowed in a standard. We propose R4 be revised to: "Annual Approval — The Responsible Entity shall appoint a senior manager with the authority to approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3, the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of its approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)" If appointing a senior mangager is required to ensure standards are complied with and implemented, we recommend that CIP-002 be updated by 1) moving CIP-003 R2 into CIP-002 or 2) CIP-002 R4 should

		explicitly reference CIP-003 R2. We prefer moving CIP-003 R2 into CIP-002 so that all the Requirements that all Entities must complete are in one Standard. (2) In this Standard and throughout several other CIP Standards, "Dated" is used only in the Measures. Adding a requirement in the measures is inappropriate and cannot be applied.
Response: **(1) The senior manager is held responsible in order to ensure that there is a clear line of authority and that cyber security functions are given the prominence they deserve. The SDT believes that delegation should be addressed in the CIP standards to ensure that the appropriate governance structure is considered by the Responsible Entity.** **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **(2) The word "dated" will be removed at this time. The measures will be reviewed and considered in an upcoming drafting phase of these standards.**		
KEMA	Yes	
Austin Energy	Yes	
Kansas City Power & Light	Yes	
San Diego Gas and Electric Co.	Yes	

2. The CSO706 SDT is proposing the following modifications to **CIP-003-1**:

   - Revise Applicability 4.2.3 to specify that compliance with Requirement R2 applies to Responsible Entities that have determined they have no Critical Cyber Assets (per FERC Order 706, paragraph 376)
   - Clarify the intent of the Requirement R2 on Leadership that a senior manager be assigned with the overall responsibility and authority for cyber security matters (per FERC Order 706, paragraph 381).
   - Add Requirement R2.3 to address senior manager delegation of authority for specific actions to a named delegate.
   - Renumber the original R2.3 to R2.4.
   - Delete the phrase "or a statement accepting risk" from Requirement R3.2.(per FERC Order 706, paragraph 376)

   Do you agree with the proposed modifications? If not, please explain and provide an alternative to the proposed modification that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 2 Comment
Detroit Edison Company	Yes	
PacifiCorp	No	Suggested modification to R2.3"Where allowed by Standards CIP-002-2 through CIP-009-2, the senior manager may delegate authority for specific actions assigned to the senior manager to a named delegate or delegates."
Response: **The SDT received a number of comments that suggested clarifications to the delegation in CIP-003-2 R2.3. The SDT discussed this specific language and did not agree that it provided clarity over the posted language in the delegation requirement.**		
FirstEnergy Corp	Yes	
MidAmerican Energy Company	No	Suggest an addition: The senior may delegate authority for actions assigned to the senior manager in Standards CIP-002-2 through CIP-009-2 to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

Organization	Yes or No	Question 2 Comment
Response: **The SDT believes that the senior manager should annually approve, without delegation, the Cyber Security Policy. As indicated in R2.3, delegation is only allowed where specifically stated in the requirement. Consequently, there is no delegation allowed in the approval of the Cyber Security Policy.**		
Northeast Power Coordinating Council	No	1 - We recommend moving CIP-003 R2 into the CIP-002 Standard. 2 - We request clarification of CIP-003 R2. 3 "the senior manager may delegate authority for specific actions to a named delegate or delegates." Please clarify a) the named delegate(s) and b) the delegation.
Response: **1.-2. The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **3, The SDT believes that the clarifications requested regarding who a delegate is and how a delegation is performed should be determined by the entity, and the SDT does not intend to prescribe a delegation process.**		
WECC Reliability Coordination	Yes	
Southern Company	Yes	CIP-003 Section D - Compliance: 1.1.1 does not specify who is responsible for the enforcement authority. CIP-003 Section D - Compliance: 1.4.1 - Indefinite retention is not feasible, overall cost of storage depending on scope could potentially be very large. Item should define an upper bound of the request (e.g. a maximum of 3 years) CIP-003 Section D - Compliance: 1.4.2 - Should have a time limit to reduce the overall liability of confidential information.

Organization	Yes or No	Question 2 Comment
Response: **1.1.1 - The Regional Entity will serve as the Compliance Enforcement Authority for most entities. As the Regional Entity may not audit itself, the ERO will serve as the Compliance Enforcement Authority in auditing the Regional Entity. A third-party monitor without a vested interest in the outcome will serve as the Compliance Enforcement Authority for NERC. (Refer to NERC's Rules of Procedure, Paragraphs 404 and 405).** **1.4.1 – With the exception of retaining evidence in support of an investigation, the standard defines a finite retention period. The language that indicates the Compliance Enforcement Authority may direct the responsible entity to retain evidence for a longer period of time as part of an investigation is a restatement of what is included in the ERO Rules of Procedure. Reference the ERO Rules of Procedure Appendix 4C – Uniform Compliance Monitoring and Enforcement Procedures – Section 3.4.1 Compliance Violation Investigation Process Steps. While the duration of an investigation cannot be predicted, further clarification of the retention timeframe is outside the scope of the SDT.** **1.4.2 – This language supports the regularly scheduled audit intervals for all entities and supports the need to retain the confidentiality of some data. The audit data retention period is determined by the audit period for each Registered Entity.**		
Luminant Power	Yes	
Encari	No	Also see comments on Question 1 pertaining to exemption 4.2.3--General Comments Provided in All Submissions--Other modifications were also made to this standard that are not included as part of the question. 1. The wording of 1.1.1 is awkward and should be modified. 2. We also request further clarification regarding the Data Retention Requirement 1.4.2 as to which entity will be maintaining the last audit records and submitted subsequent audit records. 3. As the statement is currently worded "in conjunction" leaves this open to interpretation.
Response: **1. The intent of the wording in 1.1.1 is to clarify which entity will serve as the Compliance Enforcement Authority. For most standards, the Regional Entity serves as the Compliance Enforcement Authority and audits the performance of the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, Generator Owner, etc. In this standard, the Regional Entity is responsible for some of the requirements – but an entity cannot audit its own performance. Where the Regional Entity is also the responsible entity, the ERO will audit the Regional Entity's performance. Where the ERO is the responsible entity, a third-party monitor without vested interest in the outcome will conduct the audit.** **2. The data retention periods for the standard requirements are specified in the standards. The language of 1.4.2 indicates that the**		

Organization	Yes or No	Question 2 Comment
Compliance Enforcement Authority and the Registered Entity will retain all the audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities. The audit data retention period is determined by the audit period for each Registered Entity. **3. The phrase, "in conjunction with" was deliberately used to recognize that there may be some confidential records that fall into the category of "critical energy infrastructure information" as defined in the ERO Rules of Procedure – and the responsible entity has the right to retain control over these records. Most other records will be retained by the Compliance Enforcement Authority.**		
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	Yes	
Consolidated Edison Company of New York, Inc.	No	1) - We recommend moving CIP-003 R2 into the CIP-002 Standard. (See comments to Question 1). 2) - We request clarification of CIP-003 R2. 3) -"the senior manager may delegate authority for specific actions to a named delegate or delegates." 4)- Please clarify a) the named delegate(s) (e.g. does he/she have to be a senior manager?) and b) the requirements for what the delegation must contain (i.e. does it have to explicitly reference the standard and requirement?)
Response: **1)-3) The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **4) The SDT believes that the clarifications requested regarding who a delegate is and how a delegation is performed should be determined by the entity, and the SDT does not intend to prescribe a delegation process.**		
Southern California Edison Company	No	R1.3 - Add language to indicate whether Senior Manager may or may not delegate annual review and approval of the policy.R3.2 - SCE believes that the removal of "acceptance of risk" limits SCE's ability to analyze risk and determine a proper response. For example, SCE could determine that the residual risk

Organization	Yes or No	Question 2 Comment
		posed by the state of maturity of a technology used to address CIP requirements is both low risk and low probability. Removing the acceptance of risk language would require SCE to continue to allocate time and resources to address the residual risk rather than deeming it acceptable within the CIP Standards. SCE recommends adding language to indicate that where unavoidable residual risk remains after remediation, it must be documented and authorized by the Senior Manager or delegate.
Response: **The SDT believes that the senior manager should annually approve, without delegation, the Cyber Security Policy. As indicated in R2.3, delegation is only allowed where specifically stated in the requirement. Consequently, there is no delegation allowed in the approval of the Cyber Security Policy.** **FERC has directed the ERO to have the technical feasibility exception process supersede all instances of acceptance of risk. Where requirements cannot be met due to technical, safety, or operational limitations, those limitations are to be treated and documented according to a technical feasibility exception process. [Please refer to FERC 706, Paragraph 151]**		
Tampa Electric Company	No	Regarding the removal of the language in Section 1.5 : Additional Compliance Information: It is not clear if removal of this language is implying that authorized exceptions result in non-compliance. There are situations where requirements of this standard cannot be met, particularly for legacy equipment and associated vendor supplied systems. The following language should be reinstated in the standard: "Duly authorized exceptions will not result in non-compliance."
Response: **Situations where the standards requirements cannot be met will be handled through the Technical Feasibility Exception process under the NERC Rules of Procedure. The technical feasibility exception process will address the requirements for documenting, approving, and remediating the exception. Any sanction decisions will arise from the TFE process. It is not appropriate to assert that "duly authorized exceptions will not result in non-compliance" within Section D-1.5 of the standard.**		
Electric Market Policy	Yes	1) NERC (Step 4.1.10) and Regional Entity (Step 4.1.11) are not defined in the NERC Glossary of Terms or Functional Model. 2) Suggest R3.1 read thirty calendar days.
Response: **1) NERC and Regional Entity are defined in NERC's corporate documents including, but not limited to, the Certificate of Incorporation and ByLaws.**		

Organization	Yes or No	Question 2 Comment
2) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.		
PPL Corporation	Yes	
MRO NERC Standards Review Subcommittee	No	The MRO NSRS believes the R2 should be moved to CIP-002. This would package all of the requirements in one standard the apply to every entitiy. The senior may delegate authority for actions assigned to the senior manager in Standards CIP-002-2 through CIP-009-2 to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **The SDT believes that the senior manager should annually approve, without delegation, the Cyber Security Policy. As indicated in R2.3, delegation is only allowed where specifically stated in the requirement. Consequently, there is no delegation allowed in the approval of the Cyber Security Policy.** **The SDT received a number of comments that suggested clarifications to the delegation in CIP-003-2 R2.3. The SDT discussed this specific language and did not agree that it provided clarity over the posted language in the delegation requirement.**		
Pepco Holdings, Inc - Affiliates	Yes	We support the proposed modifications including the removal of business phone and business address from B. Requirements, R2.1. Similary, should the business phone requirement be removed from B. Requirements, R5.1.1 - Similar to CIP-002-2, D. Compliance, Section 1.5, should CIP-003-2, D. Compliance, Section 1.5 say "None"?
Response: **Thank you for identifying the inconsistency. Section 1.5 should state, “None”, and “Business phone” in R5.1.1 will be removed.**		
United Illuminating	Yes	

Organization	Yes or No	Question 2 Comment
Company		
Deloitte& Touche, LLP	Yes	
Exelon	Yes	
Old Dominion Electric Cooperative	Yes	
City of Tallahassee (TAL)	Yes	Although the "acceptance of risk" ties in with the discusson above on business judgement.
Response: **The removal of "reasonable business judgment" was done in accordance with FERC Order 706. The revisions made to the standards in Phase 1 are intended to be responsive to specific FERC directives relevant to the onset of compliance audits in July 2009. The expansion of the Technical Feasibility Exception Process should address the concerns regarding the removal of reasonable business judgment and acceptance of risk.**		
BC Transmission Corporation	Yes	
Applied Control Solutions, LLC	Yes	
US Bureau of Reclamation	No	The reference to a senior manager in paragraph 381 was not intended be a requirement. FERC did allow registered entities some flexibility, to wit: "The Commission adopts its CIP NOPR interpretation that Requirement R2 of CIP-003-1 requires the designation of a single manager who has direct and comprehensive responsibility and accountability for implementation and ongoing compliance with the CIP Reliability Standards. The Commission's intent is to ensure that there is a clear line of authority and that cyber security functions are given the prominence they deserve". The modification by the SDT, which specifies delegation by the "senior manager", is intrusive upon the Responsible Entity's organizational structure. It is sufficient to require that the Responsible Entity must be able to produce documentation of who has responsibility for the CIP implementation. For geographically diverse organizations, that responsibility will change depending on the location of the affected systems. Each Responsible Entity generally has identified an individual who is authorized to submit documentation in response to a Regional Entity's requests or through the certification process. The specific requirement

Organization	Yes or No	Question 2 Comment
		that the senior manager have the authority of leading and managing CIP is not the same as requiring certification and may not fit with the organizational lines of the Responsible Entity. Organizational structures must not be legislated in industry standards, especially when the organizations have a vast array of responsibilities and authorities that govern their function. Reclamation has functional responsibilities delegated to Regional Directors in order to manage the vast array of legislated mandates. To require Reclamation to alter its organizational structure in no way improves the reliability of the BES and the requirement appears arbitratry. Each entity certifies that it complies with the integrity of its security through one individual who is authorized to speak for the agency. The requirements should focus on the desired performance outcome which is needed to maintain reliability of the power system, not how the performance is accomplished.
Response: **The SDT believes that R2.3 provides Responsible Entities the flexibility to meet the leadership requirements without prescribing organizational changes.**		
Orange and Rockland Utilities Inc.	No	1) We recommend moving CIP-003 R2 into the CIP-002 Standard. 2) We request clarification of CIP-003 R2. 3) “the senior manager may delegate authority for specific actions to a named delegate or delegates." Please clarify a) the named delegate(s) (e.g. does he/she have to be a senior manager?) and b) the delegation (i.e. does it have to explicitly reference the standard and requirement?)
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **The SDT believes that the clarifications requested regarding who a delegate is and how a delegation is performed should be determined by the entity, and the SDT does not intend to prescribe a delegation process.**		
CenterPoint Energy		
Manitoba Hydro	No	In CIP-003 R2.3 the assignment to delegate authority could be done specifically or by assignment through the entitities policies. It should not be necessary to perform specific delegation for all

Organization	Yes or No	Question 2 Comment
		circumstances which necessitates additional overhead for maintaining such documentation of delegation from the senior manager. The webinar on the revisions to the CIP Standards and other recent discussions mentioned the possible creation of a new process for instances when the phrase "where technically feasible" is applied. These instances might also be exceptions to a responsible entity's cyber security policies. Any new process dealing with "where technically feasible" must be supported by additional requirements(s) in the CIP Standards. Responsible Entities should be given direction in the CIPC Standards for identifying, documenting, managing and approving internally these instances. An additional requirement based on CIP-003-1 R3 Exceptions would provide the required direction for industry. Additional requirement(s) must included prior to further industry commenting or balloting on revised CIP Standards or before any new industry process is implemented for "where technically feasible".
Response: **The SDT believes that the clarifications requested regarding how a delegation is performed should be determined by the entity and does not intend to prescribe a delegation process. There is no requirement to delegate.** **The Technical Feasibility Exception process is under development by NERC staff. Please readdress this issue during the Phase 2 comment period.**		
Alberta Electric System Operator	Yes	However, we would like to comment that the responsibility for meeting requirements in standards must lie with the functional entity, not an individual within the entity. Also, we don't believe details on how delegation is done within an entity should be included in a standard. We propose R4 be revised to: "Annual Approval". The Responsible Entity shall appoint a senior manager with the authority to approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3, the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of its approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null).
Response: **The senior manager is held responsible in order to ensure that there is a clear line of authority and that cyber security functions are given the prominence they deserve. The intent of the SDT is to uphold the directive from Paragraph 381 of FERC Order 706 which clarifies that the senior manager is not a user, owner, or operator of the Bulk Power System who is personally subject to civil penalties pursuant to Section 215 of FPA. The SDT believes that delegation should be addressed in the CIP standards in order to ensure that the appropriate governance structure is considered by the Responsible Entity.** **We have received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002**		

Organization	Yes or No	Question 2 Comment
in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.		
Dynegy	No	Agree with proposed modifications except recommend moving CIP-003, R2 into the CIP-002 Standard (see comment on Item #1).
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Northern Indiana Public Service Company	No	As stated in question 1 I believe the revised applicability in CIP-003-2 section 4.2.3 is oddly placed as an entity could read CIP-002-2 in entirety and feel that the resulting null asset list excludes the entity from any other CIP standards. If a single requirement also applies to an entity that has a resulting null list, I believe it is better to call out the additional requirement within CIP-002-2 R4 rather than adding revised applicability language to CIP-003-2.
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
CoreTrace	Yes	
Oncor Electric Delivery LLC	Yes	
Illinois Municipal Electric Agency	No	IMEA agrees with the intent of the proposed modifications, but recommends they be incorporated into CIP-002-1 (instead of CIP-003-1) modifications for clarification of applicability regardless of Critical

Organization	Yes or No	Question 2 Comment
		Cyber Asset identification.
Response: **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Ontario Power Generation		
American Electric Power	Yes	Refer to comments provided in questions 1 and 13.
Response: **"Responsible Entity" is defined within the Applicability section of each CIP standard.** **The ERO Rules of Procedure include sections on dealing with confidential data associated with the Cyber Security standards, and recognize that there may be some evidence retained by the Responsible Entity. The data retention section of these standards was written to support this concept.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Ontario IESO	No	With respect to individual bullet points: (1) We find this question confusing. We interpret Applicability as written to mean that those Responsible Entities that have determined that they have no Critical Cyber Assets need only to meet R2 of CIP-003. The question as posted here seems to suggest that R2 of CIP-003 only applies to these Responsible Entities, but NOT to those other Responsible Entities that have identified that they have Critical Cyber Assets. Please clarify. Currently, only CIP-002 is applicable to entities without Critical Assets. Thus, the recommended modification to CIP-003 would be insufficient for accomplishing the intent of the change. One solution might be to move the Senior Manager appointment requirement from CIP-003 R2 to CIP-002 (as suggested under Q1), or incorporate the requirement for a Senior Manager appointment by

Organization	Yes or No	Question 2 Comment
		reference within CIP-002. (2) Agreed, and this is consistent with our comments on CIP-002, above. (3) Agreed (4) Agreed (5) Agreed
Response: **To clarify, the question refers to the addition of a requirement for entities with no Critical Cyber Assets, not the exclusive application of CIP-003-2 R2 to entities with no Critical Cyber Assets. All Responsible Entities, regardless of their ownership of critical assets, are required to meet CIP-003-2 R2.** **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Ameren	Yes	None.
Response: **Thank you for your comment.**		
Consumers Energy Company	Yes	
Xcel Energy	No	It appears as though R3.2 could be interpreted to require compensating measures, once the phrase "or a statement accepting risk" is eliminated. We would like clarification if this was the intent.
Response: **The phrase “any compensating measures” is not intended to require compensating measures. As an Entity is free to develop a Cyber Security Policy which exceeds the minimum requirements of CIP-002-2 through CIP-009-2, there exists the case where an Entity may take exception to its Cyber Security Policy, but still meet all of the CIP requirements. Consequently, the SDT concluded that it was overreaching to require compensating measures for all exceptions to the Cyber Security Policy at this time.**		

Organization	Yes or No	Question 2 Comment
ISO New England Inc	No	1) In R1, and throughout other Requirements in this and other CIP Standards, the inclusion of the word "Implement" is redundent and unnecessary. A Policy, Program, or Plan does not exist if it is not in fact put into practice. 2) We recommend moving CIP-003 R2 into the CIP-002 Standard. Therefore the change to APPLICABILITY 4.2.3 would not be necessary. 3) We take exceptiopn to the inclusion of the words "single" and "authority." These inclusions present a specific example where the CIP Standards are too prescriptive in that they seek to regulate company's internal management, as opposed to regulating performance. This modification is inappropriate and potentially outside NERC's legislative mandate. The drafting team must explain what it intends by adding the word "authority" to the word "responsibility." Second, if "authority" is given a meaning of having the power to ensure that capital resources are expended to achieve the objectives laid out in the Standard, we have questions about how NERC can propose regulating how companies manage their budgets. Some companies budgets must be approved by their Boards, and some companies' budgets must be approved by FERC. 4) We support the change to R2.1 5) We request clarification of CIP-003 R2.3. Would very short term delegations (less than 30 days) for vacation and out-of-office travel need same level of recording and Senior Manager approval. 6) In this Standard and throughout several other CIP Standards, the lead focus statement in the Measures is re-stated redundantly throughout each of the bulleted Measure statements. Please clean-up such text.

Response:

1) The addition of the "implement" language was in response to a determination in the FERC Order. [Please refer to FERC Order 706 Paragraph 75.]

2) The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.

3) The SDT believes that R2.3 provides Responsible Entities the flexibility to meet the leadership requirements without prescribing organizational changes.

Organization	Yes or No	Question 2 Comment
4) Thank you for your comment. **5) There is no adjustment of the requirement based upon longevity of absence.** **6) This modification was done in order to be in line with the structure of other ERO standards.**		
American Transmission Company	Yes	
TVA	Yes	
Duke Energy	No	We believe that R3.2 should be revised to require an analysis of risk, in order to provide understanding of what the compensating measures are achieving. Suggested language is as follows: "Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary, any compensating measures, and analysis of residual risk."
Response: **The SDT does not intend to prescribe an analysis of risk for all exceptions. Please readdress this issue during the phase 2 comment period.**		
Brazos Electric Power Cooperative, Inc.	No	Under the Applicability section it makes no sense for a Responsible Entity to have to comply with CIP003 R2 when there are no CCAs. This should be deleted.
Response: **The intent of the application of CIP-003-2 R2 to Responsible Entities with no Critical Cyber Assets is to ensure that the appropriate individual approves the null list of Critical Cyber Assets.**		
Progress Energy	Yes	
Standards Review Committee of ISO/RTO Council	Yes No	(1) We are confused by the question asked here. We interpret Applicability as written to mean that those Responsible Entities that have determined that they have no Critical Cyber Assets need only to meet R2 of CIP-003. The question as posted here seems to suggest that R2 of CIP-003 only applies to these Responsible Entities, but NOT to those other Responsible Entities that have identified that they have Critical Cyber Assets. Please clarify. Currently, only CIP-002 is applicable to entities without Critical Assets. Thus, the recommended modification to CIP-003 would be insufficient for accomplishing the intent of the change. One solution

Organization	Yes or No	Question 2 Comment
		might be to move the Senior Manager appointment requirement from CIP-003 R2 to CIP-002 (as suggested under Q1), or incorporate the requirement for a Senior Manager appointment by reference within CIP-002. Specific to R2, notwithstanding the above recommendation to move it to CIP-002, we have concerns with the inclusion of the words "single" and "authority." These inclusions present a specific example where the CIP Standards are overly prescriptive in that they seek to regulate company's internal management, as opposed to regulating performance. This modification is inappropriate, unnecessary and outside NERC's legislative mandate. The drafting team must explain what it intends by adding the word "authority" to the word "responsibility." Second, if "authority" is given a meaning of having the power to ensure that capital resources are expended to achieve the objectives laid out in the Standard, we have questions about how NERC can propose regulating how companies manage their budgets. Some companies budgets must be approved by their Boards, and some companies' budgets must be approved by FERC. (2) Agreed, and this is consistent with our comments on CIP-002, above. (3) Agreed (4) Agreed (5) Agreed
Response: **To clarify, the question refers to the addition of a requirement for entities with no Critical Cyber Assets, not the exclusive application of CIP-003-2 R2 to entities with no Critical Cyber Assets. All Responsible Entities, regardless of their ownership of critical assets, are required to meet CIP-003-2 R2.** **The SDT has received numerous comments related to either referencing CIP-003 R2 within CIP-002 R4 or moving CIP-003 R2 into CIP-002 in order to clarify the reference to the senior manager. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
KEMA	No	Agree with all modifications, but strongly suggest rather than deleting the phrase "or a statement accepting risk" rewording it instead. Any time compensating measures are used instead of complying with established policy or standards, some residual risk is always involved, which must be acknowledged and accepted by executive management. Use wording similar to: "...any compensating measures with executive management accepting any residual security risks." This will also force

Organization	Yes or No	Question 2 Comment
		individuals to develop compensating measures with adequate coverage.
Response: **The SDT will consider a Risk Management Framework as defined by NIST during future phases of modifications as directed by FERC Order 706. In addition, FERC has directed the ERO to have the technical feasibility exception process supersede all instances of acceptance of risk. Where requirements cannot be met due to technical, safety, or operational limitations, those limitations are to be treated and documented according to a technical feasibility exception process. [Please refer to FERC 706, Paragraph 151]**		
Austin Energy	Yes	
Kansas City Power & Light	No	In CIP-003 R2, internal political difficulties are created by requiring the designated senior manager to have the authority to implement the security program. Many medium to large utilities have IT departments separate from their operations or compliance departments. In order to find a manager of sufficient direct line authority, you have moved to a level within the organization where the manager will either not have the appropriate level of knowledge to review compliance actions or will not have sufficient time to dedicate to the task. Either way, all that will occur will be a perfunctory signature on the compliance documentation which defeats multiple goals of the program. I believe most utilities will want to comply with the spirit of this provision, but the proposed phrasing will make doing so more difficult.
Response: **The senior manager is held responsible to ensure that there is a clear line of authority and that cyber security functions are given the prominence they deserve. The SDT believes that delegation needs to be addressed in the CIP standards to ensure that the appropriate governance structure is considered by the Responsible Entity.** **The responsibilities of the senior manager may be delegated with the exception of approving (1) the Cyber Security Policy required by CIP-003, Requirement R1; (2) the Risk-based Assessment Methodology required by CIP-002, Requirement R1, and (3) the technical feasibility exceptions. For those instances where delegation is not permitted or not granted, the senior manager would reasonably be expected to seek the advice of technically qualified staff before giving approval.**		
San Diego Gas and Electric Co.	Yes	

3. The The CSO706 SDT is proposing the following modifications to **CIP-004-1**:
   - In R1 and R2, clarify the requirement to implement security awareness and annual cyber security training programs.
   - Revise R2.1 to train personnel prior to granting access (per FERC Order, paragraph 431).
   - Revise R3 to complete a personnel risk assessment prior to granting access (per FERC Order, paragraph 443).
   - In Requirements R2.1 and R3, the SDT adopted the FERC Order 706 language, "except in specified circumstances such as an emergency," to address unusual events that demand urgent action before the personnel risk assessment can be completed.

   Do you agree with the proposed modifications? If not, please explain and provide an alternative to the proposed modifications that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 3 Comment
Detroit Edison Company	No	The language "except in specified circumstances such as emergency." introduces ambiguity into this requirement. What would other circumstances be? Is each Responsible Entity allowed to define this on their own? Paragraph 443 of FERC order 706 directs the SDT to provide guidance on defining emergencies. "The Commission adopts with modifications the proposal to direct the ERO to modify Requirement R3 of CIP-004-1 to provide that newly-hired personnel and vendors should not have access to critical cyber assets prior to the satisfactory completion of a personnel risk assessment, except in specified circumstances such as an emergency. We also direct the ERO to identify the parameters of such exceptional circumstances through the Reliability Standards development process."
Response: **This language was included as specified in Paragraph 443 of FERC Order 706 which permits an entity to grant such access under specified circumstances. The responsible entity shall define and document its own specified circumstances**		
PacifiCorp	Yes	
FirstEnergy Corp	No	Regarding R2.1 and R3, we believe that the phrase "specified circumstances such as an emergency" is ambiguous. It is not clear what would constitute acceptable "specified circumstances" other than an emergency situation. This phrase should be replaced with simply "emergency situations", which would also be consistant with language in other CIP requirements such as in CIP-003 R1.1.

Organization	Yes or No	Question 3 Comment
Response: **This language was included as specified in Paragraph 443 of FERC Order 706 which permits an entity to grant such access under specified circumstances. The responsible entity shall define and document its own specified circumstances.**		
MidAmerican Energy Company	Yes	
Northeast Power Coordinating Council	Yes	
WECC Relibaility Coordination	No	do not agree with R1.2 that personnel need to be trained before they are granted access. Training in this area is extensive and we feel the 90 day window allows appropriate training to take place along with our employee orientation.
Response: **It has been identified in FERC Order 706 and the SDT agrees that the requisite training shall be completed prior to granting unescorted access. Providing escorted access is permitted prior to the requisite training being completed. Granting unescorted access is permitted for specified circumstances such as an emergency prior to the requisite training being completed. The responsible entity shall define their own specified circumstances and document them within their cyber security training program or cyber security policy.**		
Southern Company	Yes	CIP-004 Section D - Compliance: 1.1.1 does not specify who is responsible for the enforcement authority. CIP-004 Section D - Compliance: 1.4.2 - Indefinite retention is not feasible, overall cost of storage depending on scope could potentially be very large. Item should define an upper bound of the request (e.g. a maximum of 3 years) CIP-004 Section D - Compliance: 1.4.3 - Should have a time limit to reduce the overall liability of confidential information.
Response: **1.1.1 - The Regional Entity will serve as the Compliance Enforcement Authority for most entities. As the Regional Entity may not audit itself, the ERO will serve as the Compliance Enforcement Authority in auditing the Regional Entity. A third-party monitor without a vested interest in the outcome will serve as the Compliance Enforcement Authority for NERC. (Refer to NERC's Rules of Procedure.**		

Organization	Yes or No	Question 3 Comment
Paragraphs 404 and 405). **1.4.2 – With the exception of retaining evidence in support of an investigation, the standard defines a finite retention period. The language that indicates the Compliance Enforcement Authority may direct the responsible entity to retain evidence for a longer period of time as part of an investigation is a restatement of what is included in the ERO Rules of Procedure. Reference the ERO Rules of Procedure Appendix 4C – Uniform Compliance Monitoring and Enforcement Procedures – Section 3.4.1 Compliance Violation Investigation Process Steps. While the duration of an investigation cannot be predicted, further clarification of the retention timeframe is outside the scope of the SDT.** **1.4.3 – This language supports the regularly scheduled audit intervals for all entities and supports the need to retain the confidentiality of some data. The audit data retention period is determined by the audit period for each Registered Entity.**		
Luminant Power	Yes	
Encari	No	1. The new language within R2.1 allows for an exception in specific circumstances. What are specified circumstances? And, if these specific circumstances occur do the individuals ever have to take the training? - The prior requirement was within ninety calendar days. 2. An additional crossover requirement exists leading to confusion. CIP-006-2 R3 now states cyber assets residing in a PSP; however the language now in CIP-004-2 does not require access to Cyber Assets to undergo training, awareness and PRAs. We recommend providing further clarification around this requirement.— General Comments Pertaining to All Standards--Other modifications were also made to this standard that are not included as part of the question. 3. The wording of 1.1.1 is awkward and should be modified. We also request further clarification regarding the Data Retention Requirement 1.4.2 as to which entity will be maintaining the last audit records and submitted subsequent audit records. As the statement is currently worded "in conjunction" leaves this open to interpretation.
Response: **1. This language was included as specified in Paragraph 443 of FERC Order 706 which permits an entity to grant such access under specified circumstances. The responsible entity shall define and document its own specified circumstances.** **2. If personnel roles and responsibilities require access after the specified circumstance, then training must be completed**		

Organization	Yes or No	Question 3 Comment
according to CIP-004. Personnel can be granted such access as long as a personnel risk assessment has been conducted according to the requirements in R3, and the minimum training has been conducted according to personnel roles and responsibilities according to the requirements in R2. **3. The data retention periods for the standard requirements are specified in the standards. If a standard does not specify any data retention period, then there are default periods in the Compliance Monitoring and Enforcement Procedures –and in general, the default data retention periods are longer than the periods specified in the standards. The compliance staff worked to develop guidelines that drafting teams could use to determine reasonable data retention periods – trying to balance the needs of the compliance program to have sufficient evidence to review to determine compliance, with the burden to responsible entities of collecting and retaining that evidence.** **The language of 1.4.2 indicates that the Compliance Enforcement Authority "in conjunction with" the Registered Entity will retain all audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities and supports the need to retain the confidentiality of some data.** **The audit data retention period is determined by the audit period for each Registered Entity. The Reliability Coordinator, Transmission Operator and Balancing Authority are audited for each requirement once every three years – and all others are audited once every six years. The intent is to assure that, if there was an event and the performance of an entity was in question, there would be, at a minimum, at least one record showing the past performance of that entity.**		
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	Yes	
Consolidated Edison Company of New York, Inc.	No	CIP-003 requires "including provision for emergency situations" in the Entity's cyber security policy. This "emergency" is referenced in CIP-004 R2.1 and R3. Nowhere in the standards is any requirement or more specific guidance provided in what should be addressed in these provisions: e.g. description of what it is and who declares it, start and end conditions, documentation requirements: is it left to the entity to set its own parameters on how and what to declare as an emergency?
Response: **This language was included as specified in Paragraph 443 of FERC Order 706 which permits an entity to grant such access under specified circumstances. The responsible entity shall define and document its own specified circumstances.**		

Organization	Yes or No	Question 3 Comment
Southern California Edison Company	Yes	
Tampa Electric Company	No	Requirement R3 The proposed changes would result in the language: "....A personnel risk assessment shall be conducted pursuant to that program prior to such personnel being granted such access except in specified circumstances such as an emergency."(removing within 30 days of being granted access). This would leave the standard open to the interpretation that as long as an assessment is no older than 7 years old, then this risk assessment is "prior" to the personnel begin granted access. Tampa Electric is unsure if this is the intention of the language change. If this is not the intenct, then the wording should be clarified. Section 1.5 Regarding the removal of the language in Section 1.5: Additional Compliance Information: It is not clear if removal of this language is implying that authorized exceptions result in non-compliance. There are situations where requirements of this standard cannot be met, particularly for legacy equipment and associated vendor supplied systems. The following language should be reinstated in the standard: "Duly authorized exceptions will not result in non-compliance."
Response: **As stated in R3, personnel can be granted such access as long as the personnel risk assessment has been conducted within the last seven years. CIP-003-2 Requirement R3 includes the identification and approval of exceptions to the corporate Cyber Security Policy.Situations where the standards requirements cannot be met will be handled through the Technical Feasibility Exception process under the NERC Rules of Procedure. The technical feasibility exception process will address the requirements for documenting, approving, and remediating the exception. Any sanction decisions will arise from the TFE process. It is not appropriate to assert that "duly authorized exceptions will not result in non-compliance" within Section D-1.5 of the standard.**		
Electric Market Policy	Yes	1) NERC (Step 4.1.10) and Regional Entity (Step 4.1.11) are not defined in the NERC Glossary of Terms or Functional Model. 2) Suggest rewording Requirement R2.1 as follows: "This program will ensure that all personnel requiring access to Critical Cyber Assets," for clarity.
Response: **1) NERC and Regional Entity are defined in NERC's corporate documents including, but not limited to, the Certificate of Incorporation and ByLaws.** **2) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific**		

Organization	Yes or No	Question 3 Comment
directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.		
PPL Corporation	Yes	
MRO NERC Standards Review Subcommittee	Yes	
Pepco Holdings, Inc - Affiliates	Yes	We agree with the proposed modifications especially with the phrase "except in specified circumstances such as an emergency". Similar to CIP-002-2, D. Compliance, Section 1.5, should CIP-004-2, D. Compliance, Section 1.5 say "None"?
Response: **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
United Illuminating Company	Yes	
Deloitte & Touche, LLP	Yes	With the adoption of "implement", will the drafting team release a FAQ on what entities and auditors should consider for evidence of compliance of implementation (i.e. a documentation of a formal training and awareness program that has ownership, stakeholders, documented narratives & workflows, risk assessment and internal control testing).
Response: **Reliability standards are limited to specifying what to do, not how to do it.** **Please refer to NERC Rules of Procedure Appendix 4C Compliance Process.**		
Exelon	Yes	

Organization	Yes or No	Question 3 Comment
Old Dominion Electric Cooperative	Yes	
City of Tallahassee (TAL)	Yes	
BC Transmission Corporation		
Applied Control Solutions, LLC	No	Training needs to be specifically control system cyber security training
Response: **R2.2 defines minimum required items which are Critical Cyber Asset specific.**		
US Bureau of Reclamation	No	Requirement R2 needs to more specifically distinguish between access types and required training. Individuals with physical access may only need general security awareness training, whereas those with physical and logical access may require specific role-based training. The requirement, as written, addresses proper use of cyber assets, physical and logical access controls, proper handling of information, etc., in what appears to be an all-inclusive manner. Some of these training requirements would appear to be unnecessary for an individual who may only need limited physical access and the requirement should support this. The requirement does not recognize that Entities may have a more rigorous background check process which takes longer than the abbreviated process described in the standard. While describing the minimum helps to clarify what is needed, the standard should allow Entities that have more rigorous requirements longer time frames to implement the background checks. In most cases the background checks timeframes are not within the control of the Entity. In addition the standard would hamper the ability of existing experienced staff who have passed a more exhaustive check from operating thereby defeating the value to reliability. Can the requirement, R3, be structured in such a manner as to support access following initial screening in situations where full investigations may take a significant period of time? As an example, a national security check resulting in a clearance may take an extended period of time, limiting an organization's ability to utilize an employee - even in a decreased sensitivity role - while awaiting results. If the employee is allowed access - even limited - following a preliminary check (through local/national law enforcement agencies), would this meet the intent of the requirements while awaiting the results of a full and more comprehensive investigation? Further, is there a means, within the present requirements, to address the temporary "grandfathering" of

Organization	Yes or No	Question 3 Comment
		individuals who have access today while they are undergoing investigations? Without such an allowance, staff availability, during investigation activities, could be severely limited.
Response: **Personnel can be granted such access as long as a personnel risk assessment has been conducted according to the requirements in R3, and the minimum training has been conducted according to personnel roles and responsibilities according to the requirements in R2. A national security investigation contains elements beyond the scope of R3, which are not necessary to meet R3.As stated in R3, personnel can be granted access as long as the personnel risk assessment has been conducted within the last seven years. If a personnel risk assessment has not been conducted within the last seven years, it must be completed before the individual can be granted access.**		
Orange and Rockland Utilities Inc.	No	CIP-003 requires "including provision for emergency situations" in the Entity's cyber security policy. This "emergency" is referenced in CIP-004 R2.1 and R3. Nowhere in the standards is any requirement or more specific guidance provided in what should be addressed in these provisions: e.g. description of what it is and who declares it, start and end conditions, documentation requirements: is it left to the entity to set its own parameters on how and what to declare as an emergency?
Response: **This language was included as specified in Paragraph 443 of FERC Order 706 which permits an entity to grant such access under specified circumstances. The responsible entity shall define and document its own specified circumstances.**		
CenterPoint Energy		
Manitoba Hydro	Yes	
Alberta Electric System Operator	No	The term "specified circumstances" implies that a set of circumstances is specified somewhere. Where is this list and who will decide what comprises it? Suggest that this list be clarified.
Response: **This language was included as specified in Paragraph 443 of FERC Order 706 which permits an entity to grant such access under specified circumstances. The responsible entity shall define and document its own specified circumstances.**		
Dynegy	Yes	

Organization	Yes or No	Question 3 Comment
Northern Indiana Public Service Company	No	Clarification regarding the definition of specified circumstances and emergency conditions is needed. Additionally, language needs to be added to clarify what steps need to be taken if an emergency occurs and access is granted. As the draft reads, an entity could declare an emergency, grant access, and document the emergency condition. There is no language directing follow up action that would ever require the responsible entity to perform training or a PRA of the individual that was granted access under the emergency condition. Depending on the direction provided from the drafting team in regards to what would consist of an emergency, the removal of the 30-90 day after the fact language may create significant concern in regards to bargaining unit operations and service personnel. Secondly, I have a comment regarding the additional clarifying language that was added to CIP004-2 R1 to indicate applicability to critical cyber assets. I understand that this language was added to provide uniformity in scope between CIP-004-2 R1, R2, and all of the respective sub-requirements. I have a concern regarding the absence of the CCA language in CIP-004-2 R3. I feel R3 should be modified to include similar CCA language to provide uniformity with R1, R2 and the R3 sub-requirements.
Response: **This language was included as specified in Paragraph 443 of FERC Order 706 which permits an entity to grant such access under specified circumstances. The responsible entity shall define and document its own specified circumstances.** **If personnel roles and responsibilities require access after the specified circumstance, then training and a personnel risk assessment must be conducted according to CIP-004.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
CoreTrace	Yes	
Oncor Electric Delivery LLC	Yes	
Illinois Municipal Electric Agency		
Ontario Power Generation		

Organization	Yes or No	Question 3 Comment
American Electric Power	Yes	Refer to comments provided in questions 1 and 13.
Response: **"Responsible Entity" is defined within the Applicability section of each CIP standard.** **The ERO Rules of Procedure include sections on dealing with confidential data associated with the Cyber Security standards, and recognize that there may be some evidence retained by the Responsible Entity. The data retention section of these standards was written to support this concept.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Ontario IESO	Yes	
Ameren	No	The elimination of the 30 day temporary access time will have a significant "operational" impact to fill personnel positions in a timely manner within protected areas. Without the 30 day temporary access criteria, personnel will not be allowed "unescorted" access into a facility until the candidate has completed training and a background check is completed, reviewed and returned with a positive and acceptable response. Additionally, mandating that another employee watch or "escort" the new candidate all the time during their shift is both a nuisance and a possible safety hazard. It is important to note that this proposed change is a "180 degree conceptual change" from what was a noticeable and unwavering stance that most companies took when the original CIP standards were implemented. Not being able to shift personnel around from one area of the company to the protected-area assignments (when personnel are re-assigned) immediately, places an unnecessary burden on both areas of the company. When comparing the proposed change to the current process, the benefits gained by the elimination of the 30-day temporary access window clearly don't outweigh what is already a solid and workable solution.
Response: **It has been identified in FERC Order 706 and the SDT agrees that the personnel risk assessment and requisite training shall be completed prior to granting unescorted access. Providing escorted access is permitted prior to the personnel risk assessment and requisite training being completed. Granting unescorted access is permitted for specified circumstances such as an emergency prior to the personnel risk assessment and requisite training being completed. The responsible entity shall define their own specified circumstances and document them within their cyber security training program, personnel risk assessment program, or**

cyber security policy.		
Consumers Energy Company	Yes	
Xcel Energy	Yes	
ISO New England Inc	No	1 - In R1, and throughout other Requirements in this and other CIP Standards, the inclusion of the word "Implement" is redundent and unnecessary. A Policy, Program, or Plan does not exist if it is not in fact put into practice.
Response: **The word 'implement' was included per FERC Order 706 Paragraph 75 to remove any doubt that a particular process/procedure/program could be only designed, developed, documented but not implemented. This was a result of previous questions around implementation from Industry. It is added for clarity and completeness**		
American Transmission Company	Yes	
TVA	Yes	
Duke Energy	Yes	
Brazos Electric Power Cooperative, Inc.	Yes	
Progress Energy	Yes	CIP004R2 – The cyber security training program shall be annually reviewed and updated as necessary – Please provide clarification, does updated as necessary mean updates only need to occur annually during the annual review period?
Response: **The cyber security training program shall be reviewed annually, at a minimum, and shall be updated whenever necessary.**		

Organization	Yes or No	Question 3 Comment
Standards Review Committee of ISO/RTO Council	No	In R1, and throughout other Requirements in this and other CIP Standards, the inclusion of the word "Implement" is redundant and unnecessary. A Policy, Program, or Plan does not exist if it is not in fact put into practice.
Response: **The word 'implement' was included per FERC Order 706 Paragraph 75 to remove any doubt that a particular process/procedure/program could be only designed, developed, documented but not implemented. This was a result of previous questions around implementation from Industry. It is added for clarity and completeness.**		
KEMA	Yes	
Austin Energy	Yes	
Kansas City Power & Light	Yes	
San Diego Gas and Electric Co.	No	To help clarify training requirements for different users and access levels, SDG&E would like to see language added to CIP-004-1 R2.2 stating that training should be appropriate to user duties, functions, experience, and access level. Information concerning vulnerabilities should be revealed on a need to know basis and not universally.
Response: **Given the limited scope and timeline for Phase 1, please readdress this issue during the Phase 2 comment period.**		

4. The CSO706 SDT is proposing the following modifications to **CIP-005-1**:

   - In R1.5, clarify the requirement to safeguard Cyber Assets used in the control or monitoring of Electronic Security Perimeter.
   - The term "implement" was added to CIP-005-1 Requirement R2.3 to clarify that the procedure for securing dial-up access to the Electronic Security Perimeter must be both maintained and implemented.

   Do you agree with the proposed modifications? If not, please explain and provide an alternative to the proposed modifications that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 4 Comment
Detroit Edison Company	Yes	
PacifiCorp	No	Yes to the second bullet. No to the first bullet and other points.R1.1 - It is unclear what is meant by "externally connected". Does "connectivity" refer to logical or physical connectivity? Is "external" a reference to the ESP in question, or to the entity? Is it a reference to layer 3 (and above)? PacifiCorp recommends some clarifying language similar to the following: • Any device accessible via routable protocol (layer 3) from outside the ESP is an access point unless such traffic is already passing through and controlled (layer 3) by another CIP005 compliant access point. • Additionally, any device serving as an endpoint of an encrypted and/or encapsulated layer 3 (and above) tunnel (IPSEC, GRE, SSL-VPN, SSH, CIPE, etc..) which provides remote network connectivity to the ESP network and not merely application access to the host itself, and where the other endpoint is outside the ESP, is also an access point.? • Externally connected also includes devices accessible via modem or any form of wireless access point providing network connectivity to other devices within the ESP." • Externally connected does not include encrypted communication links where the end points are within the ESP.R1.3 - This should be eliminated. By definition,

Organization	Yes or No	Question 4 Comment
		communication links between discrete ESPs are “out of scope” (CIP-005-2 4.2.2) Additionally, where such links are using routable protocols, the termination point would be a “communication end point” and thus covered by R1.1. This section provides no additional value.R1.5 references to CIP005.R2 and CIP005.R3 should be removed as these are not applicable to the access control and monitoring equipment which are not "Access points". Additionally, the proper security practices for these devices are covered under CIP007 R2-R9.R1.5 (continued) - The access control and/or monitoring devices for the electronic security perimeter are not clearly identified in the standard, such as mobile devices. The proposed language may jeopardize the integrity of the bulk electric system by limiting the ability to quickly assess and respond to events and alarms from these access control and/or monitoring devices. PacifiCorp believes strengthening CIP-006 R3 with the language below achieves the intent of the standard by protecting mobile devices used for access control and/or monitoring. The proposed language parallels the requirements of language in CIP-005-2, R2.4.PAC proposes the following language: R3. Protection of Electronic Access Control Systems - Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter, except for mobile devices, for which the Responsible Entity shall implement strong procedural or technical controls to ensure authenticity of the accessing party.
Response: **These types of issues will be addressed in Phase 2. Please use the Phase 2 comment period if you feel that your concerns have not been addressed.**		
FirstEnergy Corp	Yes	
MidAmerican Energy Company	No	Comment: On CIP-005, R1.5, the access control and/or monitoring devices for the electronic security perimeter are not clearly identified in the standard, such as client-server applications. The proposed language may jeopardize the integrity of the bulk electric system by limiting the ability to quickly assess and respond to events and alarms from these access control and/or monitoring devices. For example, we cannot place laptops used by technicians inside a physical security perimeter. MidAmerican believes strengthening CIP-006 R3 with the language below achieves the intent of the standard by protecting client-server applications used for access control and/or monitoring. The proposed language parallels the requirements of language in CIP-005-2, R2.4.MEC proposes the following language: CIP-006 R3. Protection of Electronic Access Control Systems - Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter, except for the client of a client-server application. In a client-server application, the server will be located in a Physical Security Perimeter, and the Responsible Entity shall implement strong

Organization	Yes or No	Question 4 Comment
		procedural or technical controls to ensure authenticity of the accessing party.
Response: **The scope of the modification is only to include devices that perform access control and/or monitoring as identified in CIP-005 R2 and R3 and not those devices that are receiving alerts.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Northeast Power Coordinating Council	No	"Dated" is used only in the Measures (M1, M2, M3, M4, M5). Adding a requirement in the measures is inappropriate. R1 refers to documentation while M1 uses documents. Recommend using documentation consistently.
Response: **The word "dated" will be removed at this time. The measures will be reviewed and considered in an upcoming drafting phase of these standards.**		
WECC Reliability Coordination	Yes	
Southern Company	Yes	CIP-005 Section D - Compliance: 1.1.1 does not specify who is responsible for the enforcement authority. CIP-005 Section D - Compliance: 1.4.2- Indefinite retention is not feasible, overall cost of storage depending on scope could potentially be very large. Item should define an upper bound of the request (e.g. a maximum of 3 years) CIP-005 Section D - Compliance: 1.4.3 - Should have a time limit to reduce the overall liability of confidential information.
Response: **1.1.1 - The Regional Entity will serve as the Compliance Enforcement Authority for most entities. As the Regional Entity may not audit itself, the ERO will serve as the Compliance Enforcement Authority in auditing the Regional Entity. A third-party monitor without a**		

Organization	Yes or No	Question 4 Comment
vested interest in the outcome will serve as the Compliance Enforcement Authority for NERC. (Refer to NERC's Rules of Procedure, Paragraphs 404 and 405). **1.4.2 – With the exception of retaining evidence in support of an investigation, the standard defines a finite retention period. The language that indicates the Compliance Enforcement Authority may direct the responsible entity to retain evidence for a longer period of time as part of an investigation is a restatement of what is included in the ERO Rules of Procedure. Reference the ERO Rules of Procedure Appendix 4C – Uniform Compliance Monitoring and Enforcement Procedures – Section 3.4.1 Compliance Violation Investigation Process Steps. While the duration of an investigation cannot be predicted, further clarification of the retention timeframe is outside the scope of the SDT.** **1.4.3 – This language supports the regularly scheduled audit intervals for all entities and supports the need to retain the confidentiality of some data. The audit data retention period is determined by the audit period for each Registered Entity.**		
Luminant Power	Yes	
Encari	No	1. It is very important to define monitoring in the new context. Originally the cyber assets had to be used for the dual purpose of access control and monitoring. Now, simply a monitoring device is considered a cyber asset under this new language. We ask for an additional clarification around to what extent monitoring is covered, for example: a. The original monitoring cyber asset (device a) b. 2. The cyber asset receiving alerts from the original device (device b) c. 3. The cyber asset forwarding the alerts (device c) d. 4. The cyber asset receiving the alerts (device d)The current language could be interpreted in a way that a blackberry receiving alerts is "monitoring" the ESP. General Comments Pertaining to All Standards--Other modifications were also made to this standard that are not included as part of the question. 2. The wording of 1.1.1 is awkward and should be modified. 3. We also request further clarification regarding the Data Retention Requirement 1.4.2 as to which entity will be maintaining the last audit records and submitted subsequent audit records. As the statement is currently worded "in conjunction" leaves this open to interpretation.

Organization	Yes or No	Question 4 Comment
Response: **1) The scope of the modification is to only include devices that perform access control and/or monitoring as identified in CIP-005 R2 and R3 and not those devices that are receiving alerts. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **2) The intent of the wording in 1.1.1 is to clarify which entity will serve as the Compliance Enforcement Authority. For most standards, the Regional Entity serves as the Compliance Enforcement Authority and audits the performance of the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, Generator Owner, etc. In this standard, the Regional Entity is responsible for some of the requirements – but an entity cannot audit its own performance. Where the Regional Entity is also the responsible entity, the ERO will audit the Regional Entity's performance. Where the ERO is the responsible entity, a third-party monitor without vested interest in the outcome will conduct the audit.** **3) The data retention periods for the standard requirements are specified in the standards. If a standard does not specify any data retention period, then there are default periods in the Compliance Monitoring and Enforcement Procedures –and in general, the default data retention periods are longer than the periods specified in the standards. The compliance staff worked to develop guidelines that drafting teams could use to determine reasonable data retention periods – trying to balance the needs of the compliance program to have sufficient evidence to review to determine compliance, with the burden to responsible entities of collecting and retaining that evidence.** **The language of 1.4.2 indicates that the Compliance Enforcement Authority "in conjunction with" the Registered Entity will retain all audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities and supports the need to retain the confidentiality of some data.** **The audit data retention period is determined by the audit period for each Registered Entity. The Reliability Coordinator, Transmission Operator and Balancing Authority are audited for each requirement once every three years – and all others are audited once every six years. The intent is to assure that, if there was an event and the performance of an entity was in question, there would be, at a minimum, at least one record showing the past performance of that entity.**		
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	No	The revision to CIP-005-2 R1.5 referenced only CIP-006-2 R3. CIP-003 R3 requires that the organization identify the Physical Security Perimeter. In the original CIP-005-1 R1.5, the physical protections had to meet CIP-006-1 R2 and R3 which are now renumbered R4 and R5 in CIP-006-2. This represents a major revision and a much less robust security in the physical protection requirements

Organization	Yes or No	Question 4 Comment
		for cyber assets used for access control or monitoring of the Electronic Security Perimeter. To retain the original intent of CIP-005-1 R1.5, the requirement must include a reference to CIP-006-2 R3, R4, and R5.
Response: **CIP-006-R3 requires placing the devices of CIP-005-2 R1.5 within a Physical Security Perimeter. Once a device is within a Physical Security Perimeter, physical control is automatically established, making these inclusions redundant.**		
Consolidated Edison Company of New York, Inc.	No	"Dated" is used only in the Measures (M1, M2, M3, M4, M5). The corresponding requirements do not state a requirement for a date: adding a requirement in the measures is inappropriate. R1 refers to documentation while M1 uses documents. Recommend using documentation consistently
Response: **The word "dated" will be removed at this time. The measures will be reviewed and considered in an upcoming drafting phase of these standards.**		
Southern California Edison Company	Yes	Request clarification on the difference between "process" and "procedure."
Response: **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Tampa Electric Company	No	In R1.5, the change from "and" to "and/or" could bring unintended devices into scope of this standard. The change should be clarified to say "access control of and/or monitoring access to of the Electronic Security Perimeter(s)." Section 1.5 Regarding the removal of the language in Section 1.5: Additional Compliance Information: It is not clear if removal of this language is implying that authorized exceptions result in non-compliance. There are situations where requirements of this standard cannot be met, particularly for legacy equipment and associated vendor supplied systems. The following language should be reinstated in the standard: "Duly authorized exceptions will not result in non-compliance."

Organization	Yes or No	Question 4 Comment
Response: **The scope of the modification is to only include devices that perform access control and/or monitoring as identified in CIP-005 R2 and R3 and not those devices that are receiving alerts.** **Situations where standards requirements cannot be met will be handled through the Technical Feasibility Exception process under the NERC Rules of Procedure. The TFE process will address the requirements for documenting, approving, and remediating the exception.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Electric Market Policy	Yes	NERC (Step 4.1.10) and Regional Entity (Step 4.1.11) are not defined in the NERC Glossary of Terms or Functional Model.
Response: **NERC and Regional Entity are defined in NERC's corporate documents including, but not limited to, the Certificate of Incorporation and ByLaws.**		
PPL Corporation	Yes	
MRO NERC Standards Review Subcommittee	No	On CIP-005, R1.5, the access control and/or monitoring devices for the electronic security perimeter are not clearly identified in the standard, such as client-server applications. The proposed language may jeopardize the integrity of the bulk electric system by limiting the ability to quickly assess and respond to events and alarms from these access control and/or monitoring devices. For example, we cannot place laptops used by technicians inside a physical security perimeter. The MRO NSRS believes strengthening CIP-006 R3 with the language below achieves the intent of the standard by protecting client-server applications used for access control and/or monitoring. The proposed language parallels the requirements of language in CIP-005-2, R2.4.The MRO NSRS proposes the following language: CIP-006 R3. Protection of Electronic Access Control Systems? Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter, except for the client of a client-server application. In a client-server application, the server will be located in a Physical Security Perimeter, and the Responsible Entity shall implement strong procedural or technical controls to ensure authenticity of the accessing party.

Organization	Yes or No	Question 4 Comment
Response: **The scope of the modification is to only include devices that perform access control and/or monitoring as identified in CIP-005 R2 and R3 and not those devices that are receiving alerts.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Pepco Holdings, Inc - Affiliates	Yes	
United Illuminating Company	Yes	
Deloitte& Touche, LLP	Yes	With the adoption of "implement", will the drafting team release a FAQ on what entities and auditors should consider for evidence of compliance of implementation (i.e., a documentation of a formal dial-up security program and procedure that has ownership, stakeholders, documented narratives & workflows, risk assessment and internal control testing).
Response: **Reliability standards are limited to specifying what to do, not how to do it.** **Please refer to NERC Rules of Procedure Appendix 4C Compliance Process.**		
Exelon	Yes	We support all comments noted for CIP005 in this section with the recommendation to move the word implement before maintain in R2.3 so the sentence reads ?implement and maintain.? Reason for the recommendation is a control must be implemented before it can be maintained
Response: **The SDT will make the appropriate change in R2.3 from “maintain and implement” to “implement and maintain”.**		
Old Dominion Electric Cooperative		

Organization	Yes or No	Question 4 Comment
City of Tallahassee (TAL)	Yes	
BC Transmission Corporation	Yes	
Applied Control Solutions, LLC	Yes	
US Bureau of Reclamation	No	The standard should be worded to be applicable for existing dial-up access or if dial-up access is added.
Response: **The requirement applies to all dial-up access, both existing and future.**		
Orange and Rockland Utilities Inc.	No	"Dated" is used only in the Measures (M1, M2, M3, M4, M5). Adding a requirement in the measures is inappropriate. R1 refers to documentation while M1 uses documents. Recommend using documentation consistently

CenterPoint Energy		
Manitoba Hydro	Yes	
Alberta Electric System Operator	Yes	
Dynegy	Yes	
Northern Indiana Public	No	I would request a clarification on scope and depth of the devices to be included in the access control

Organization	Yes or No	Question 4 Comment
Service Company		and/or monitoring. The previous language would have limited the devices to those that performed access control and monitoring of the ESP (traditional Firewalls, routers with ACL's, any IPS devices, VPN endpoints, etc.). The new language provided in the draft under CIP-005-2 R1.5 modifies the scope to include cyber assets used in the access control and/or monitoring of the ESP. I am concerned with the depth of devices involved in the monitoring chain that have no relevance on access control, but are an active component in the monitoring of the ESP. Specifically: log correlation servers, SNMP trap servers, SMTP relay servers for notification, pagers, blackberry's, enterprise email servers, backup and recovery servers for these extended devices, etc.. In the current draft it is unclear whether the device performing the monitoring is the only device that is subject to the requirements specified in CIP-005-2 R1.5 or if all devices involved in monitoring are subject to those requirements specified in CIP-005-2 R1.5. I feel that additional language needs to be provided to clarify the scope and depth of the devices to be included under the classification of cyber assets used in the monitoring of the ESP.
Response: **The scope of the modification is to only include devices that perform access control and/or monitoring as identified in CIP-005 R2 and R3 and not those devices that are receiving alerts.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. 5. The CSO706 SDT is proposing the following modifications to **CIP-006-1**:

- Clarify Requirement R1 that a physical security plan to protect Critical Cyber Assets must be documented, maintained, implemented and approved by the senior manager. CIP-006-1 Requirements R1.1 through R1.7 and R1.9 were revised to clarify the elements that, at a minimum, must be addressed in the physical security plan.
- The SDT added Requirement R2 to CIP-006-2 to clarify the requirement to safeguard the Physical Access Control Systems and exclude hardware at the Physical Security Perimeter access point, such as electronic lock control mechanisms and badge readers from the requirement. Requirement R2.1 requires the Responsible Entity to protect the Physical Access Control Systems from unauthorized access. CIP-006-1 Requirement R1.8 was moved to become CIP-006-2 Requirement R2.2.
- The SDT added Requirement R3 to CIP-006-2, clarifying the requirement for Electronic Access Control Systems to be safeguarded within an identified Physical Security Perimeter.
- Subsequent Requirements were renumbered and references were appropriately revised. The sub requirements of CIP-006-2 Requirements R4, R5, and R6 were changed from formal requirements to lists of options consistent with the intent of the requirements.
- The SDT revised the Measures to add “implementation” to Measure M1 documentation elements for Requirement R1, added Measure M2 to document the protection of physical access control systems, added Measure M3 to document the protection of electronic access control systems, and renumbered subsequent Measures and references to Requirements. The SDT also added failure to implement the security plan as Level 4 non-compliance.

Do you agree with the proposed modifications? If not, please explain and provide an alternative to the proposed modifications that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 5 Comment
Detroit Edison Company	No	CIP-006-2 R1.4 references "physical access controls as described in Requirement R3". R1.4 should reference Requirement R4 since the requirements were renumbered and Physical Access Controls is now R4.CIP-006-2 Introduction, 3. Purpose, it should read something like, ?. . . . . to ensure the implementation and continued maintenance of a physical . . . . . ? This program is not only being implemented, but will also be maintained going forward. (i.e. ? does not make sense to implement a program and do nothing else)CIP-006-2 Introduction, 4.2 The following are exempt from Standard CIP-006-2, in addition to listing the exemptions to NERC Standard CIP-006, they may also want to comment

Organization	Yes or No	Question 5 Comment
		on potentially overlapping security requirements for facilities which are also regulated under the Maritime Transportation Security Act (33 CFR 101/105) and the Chemical Facility Anti-Terrorism Standards. (6 CFR 27)CIP-006-2 R2 Protection of Physical Access Control Systems, sub-requirements R2.1 & R2.2. R2.1 is ambiguous in that it states, "Be protected from unauthorized physical access," yet it does not explain how this is to be accomplished. R2.2 defines the protective measures to be utilized? R4 and R5, Physical Access Controls and Monitoring Physical Access. It appears they want to grant the responsible entity flexibility in R2.1, but then it is limited by R2.2. These two sub-requirements should be combined into one to avoid confusion.
Response: **The Drafting team agrees that R1.4 should reference R4 and not R3. This change will be implemented. With regard to inclusion of maintenance within the Purpose of the requirement, the drafting team agrees that this could add clarity however for consistency we would need to review how this would impact the purpose statements of the remaining CIP standards hence this will be addressed in Phase 2. The issue of conflicting regulatory authorities will be brought before NERC for discussion. Relating to protection of Physical Access Control Systems, reliability standards only prescribe "What" and not "How". These types of issues will be addressed in Phase 2. Please resubmit your comments during the Phase 2 comment period if you feel that your concerns have not been addressed.**		
PacifiCorp	No	No for the third bullet (R3) (See comment on CIP-005-2). Yes for remaining bullets.
Response: **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
FirstEnergy Corp	Yes	
MidAmerican Energy Company	No	See comment for question 5
Response: **The scope of the modification is only to include devices that perform access control and/or monitoring as identified in CIP-005 R2**		

Organization	Yes or No	Question 5 Comment
and R3 and not those devices that are receiving alerts. **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Northeast Power Coordinating Council	No	1) We recommend changing R1.2 from "Identification of all access points" to "Identification of all physical access points". 2) We request a correction to R1.4 which references R3. We believe this is now R4. 3) Regarding R1.6, we are concerned with the new word "continuous", and that it will be difficult to demonstrate compliance. Requirements need to be auditable, measurable and enforceable. We request removing "continuous." 4) We recommend changing R1.7 from "within thirty calendar days of the completion of any" to "within thirty calendar days of completion of the entity's change process for any".
Response: **1) Adding "physical" to access point in R1.2 - the drafting team feels that it is clear that the access points are "physical" since the requirement is directed at Physical Security Perimeters.** **2) The drafting team agrees and will implement this change.** **3) The drafting team feels that 'continuous' is a clarification of an active process of escorting as opposed to just being in the same room as an individual (i.e. escorted).** **4) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
WECC Reliability Coordination	Yes	
Southern Company	Yes	CIP-006 R1.1 - Change to the last sentence should be clarifed that it applies to Critical Cyber Assets and not Critical Assets.

Organization	Yes or No	Question 5 Comment
		R1.4 makes reference to "Requirement 3", but the correct reference in the new standard should now be "Requirement 5". CIP-006 Section D - Compliance: 1.1.1 does not specify who is responsible for the enforcement authority. CIP-006 Section D - Compliance: 1.4.1 - Indefinite retention is not feasible, overall cost of storage depending on scope could potentially be very large. Item should define an upper bound of the request (e.g. a maximum of 3 years) CIP-006 Section D - Compliance: 1.4.3 - Should have a time limit to reduce the overall liability of confidential information.
Response: **Within CIP-006 R1.1, the requirement now reads "to such Cyber Assets". The Drafting team agrees that the R1.4 reference is incorrect. The SDT points out that the correct reference is R4 and not R5.** **1.1.1 - The Regional Entity will serve as the Compliance Enforcement Authority for most entities. As the Regional Entity may not audit itself, the ERO will serve as the Compliance Enforcement Authority in auditing the Regional Entity. A third-party monitor without a vested interest in the outcome will serve as the Compliance Enforcement Authority for NERC. (Refer to NERC's Rules of Procedure, Paragraphs 404 and 405).** **1.4.1 – With the exception of retaining evidence in support of an investigation, the standard defines a finite retention period. The language that indicates the Compliance Enforcement Authority may direct the responsible entity to retain evidence for a longer period of time as part of an investigation is a restatement of what is included in the ERO Rules of Procedure. Reference the ERO Rules of Procedure Appendix 4C – Uniform Compliance Monitoring and Enforcement Procedures – Section 3.4.1 Compliance Violation Investigation Process Steps. While the duration of an investigation cannot be predicted, further clarification of the retention timeframe is outside the scope of the SDT.** **1.4.3 – This language supports the regularly scheduled audit intervals for all entities and supports the need to retain the confidentiality of some data. The audit data retention period is determined by the audit period for each Registered Entity.**		
Luminant Power	Yes	
Encari	No	1. The redlining appears to be inaccurate. For example R2 in CIP-006-1 is now R4 in CIP-006-2. This modification is very important to note as compliance monitoring systems may have been defined to key on the requirement field.2. CIP-006-2 R4/R5/R6 now use bullets instead of numbered identifiers for the individual physical access methods. A unique identifier should be selected to identify these bulleted

Organization	Yes or No	Question 5 Comment
		items.3. R3 requires cyber assets used in the access control and/or monitoring of the ESP to be in a PSP. Please see our comments in Question 4 (CIP-005-2) pertaining to the extent of what assets need to be in a PSP (device a / b / c / d). --General Comments Pertaining to All Standards--Other modifications were also made to this standard that are not included as part of the question. The wording of 1.1.1 is awkward and should be modified. We also request further clarification regarding the Data Retention Requirement 1.4.2 as to which entity will be maintaining the last audit records and submitted subsequent audit records. As the statement is currently worded "in conjunction" leaves this open to interpretation.

Response:

1) **The drafting team agrees that not all of the changes are clearly identified. The posted version (the one that was commented on) is the official version, and while the drafting team did renumber some of the requirements, these are consistent across the reliability standards.**

2) **The changes that made individual sub-requirements into bullets were made to correct an original error, since requirements cannot be levied upon an item that may not be implemented.**

3) **CIP-006-R3 requires placing the devices of CIP-005-2 R1.5 within a Physical Security Perimeter. Once a device is within a Physical Security Perimeter, physical control is automatically established, making these inclusions redundant. Relating to not including all of the changes within the questions, the questions were meant to only address substantive changes to the standards.**

General: The data retention periods for the standard requirements are specified in the standards. If a standard does not specify any data retention period, then there are default periods in the Compliance Monitoring and Enforcement Procedures –and in general, the default data retention periods are longer than the periods specified in the standards. The compliance staff worked to develop guidelines that drafting teams could use to determine reasonable data retention periods – trying to balance the needs of the compliance program to have sufficient evidence to review to determine compliance, with the burden to responsible entities of collecting and retaining that evidence.

The language of 1.4.2 indicates that the Compliance Enforcement Authority "in conjunction with" the Registered Entity will retain all audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities and supports the need to retain the confidentiality of some data.

The audit data retention period is determined by the audit period for each Registered Entity. The Reliability Coordinator, Transmission Operator and Balancing Authority are audited for each requirement once every three years – and all others are audited once every six years. The intent is to assure that, if there was an event and the performance of an entity was in question, there would be, at a minimum, at least one record showing the past performance of that entity.

Organization	Yes or No	Question 5 Comment
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	No	While the majority of the revisions to R1 do provide clarity, the revision to Requirement R1.1 is less clear than the previous version and represents a change to the requirement. In the previous version, R1.1 requires that the Physical Security Plan address "Processes to ensure and document that" all Cyber Assets within an Electronic Security Perimeter reside within an identified Physical Security Perimeter consisting of a six-wall border. With this new revision, the Physical Security Plan shall address all Cyber Assets within an Electronic Security Perimeter. Address cyber assets how? There is no longer any requirement to describe the process the organization uses to ensure that cyber assets reside within an identified Physical Security Perimeter. Is the intent of this revision to clarify that a Physical Security Plan must simply exist and address identified Physical Security Perimeters protecting Cyber Assets within an Electronic Security Perimeter? There is no requirement for Physical Security Plans for cyber assets used for access control and/or monitoring of Physical Security Perimeters or Electronic Security Perimeters. If the intent of Phase 1 changes to R1 are simply to provide clarity, then recommend retaining the original R1.1 text from the previous version and make changes to R1.1 in a later phase of Project 2008-06 - Cyber Security Order 706.
Response: **Requirement 1 identifies what must be within the Physical Security Plan, and Requirement 1.1 identifies that all cyber assets within an ESP must be within a Physical Security Perimeter, (i.e, the plan must address ensuring that all cyber assets within an ESP are within a PSP). Relating to exclusion of cyber assets used for access control and/or monitoring from the Physical Security Plan, the SDT refers you to Requirements 1.2 and 1.3.**		
Consolidated Edison Company of New York, Inc.	No	1) We recommend changing R1.2 from "Identification of all access points" to "Identification of all physical access points" 2) We request a correction to R1.4 which references R3. We believe this is now R4. 3) Regarding R1.6, we are concerned with the new word "continuous," it will be difficult to demonstrate compliance. Requirements need to be auditable, measurable and enforceable. We request removing "continuous." 4) We recommend changing R1.7 from "within thirty calendar days of the completion of any" to "within thirty calendar days of completion of the Entity's Change Process for any": a change generally includes more processes than just the change, e.g. acceptance period, required internal approvals,

Organization	Yes or No	Question 5 Comment
		"as built" regulatory approvals.
Response: **1) Adding "physical" to access point in R1.2 - the drafting team feels that it is clear that the access points are "physical" since the requirement is directed at Physical Security Perimeters.** **2) The drafting team agrees and will implement this change.** **3) The drafting team feels that 'continuous' is a clarification of an active process of escorting as opposed to just being in the same room as an individual (i.e. escorted).** **4) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Southern California Edison Company	No	For R1.8 Annual review and approval - we interpret it as the Senior Manager or delegate reviews and approves the physical security plan annually. For consistency with R2, suggest re-wording R3 to: "Protection of Electronic Access Control Systems - Cyber Assets that authorize and/or log access to the Electronic Security Perimeter (s) shall reside within an identified Physical Security Perimeter." Delete R2.1.
Response: **The drafting team feels that since Requirement 1.8 is a subrequirement of Requirement 1, it is appropriate to interpret that the annual review would be signed off by the senior manager or delegate as identified in Requirement 1.** **For your additional comments, these types of issues will be addressed in Phase 2. Please resubmit your comments during the Phase 2 comment period if you feel that your concerns have not been addressed.**		
Tampa Electric Company	No	Requirement 1.3: Remove "processes" from the wording to be consistent with the other changes in CIP006 Requirement 1 and eliminate the redundancy of having "processes" and "procedures" in same statement. Processes are included in the procedures. Section 1.5 Regarding the removal of the language in Section 1.5: Additional Compliance Information: It is not clear if removal of this language is implying that authorized exceptions result in non-compliance. There are situations where requirements of this standard cannot be met, particularly for legacy equipment and associated vendor supplied systems. The following language should be reinstated in the

Organization	Yes or No	Question 5 Comment
		standard: “Duly authorized exceptions will not result in non-compliance.”
Response: **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **Situations where the standards requirements cannot be met will be handled through the Technical Feasibility Exception process under the NERC Rules of Procedure. The technical feasibility exception process will address the requirements for documenting, approving, and remediating the exception. Any sanction decisions will arise from the TFE process. It is not appropriate to assert that “duly authorized exceptions will not result in non-compliance” within Section D-1.5 of the standard.**		
Electric Market Policy	Yes	1) NERC (Step 4.1.10) and Regional Entity (Step 4.1.11) are not defined in the NERC Glossary of Terms or Functional Model. 2) Requirement R1.4, it is not clear what is intended by the phrase "response to loss." . 3) Requirement R1.4 should reference R4 rather than R3. 4) Suggest standardizing the language used in R4, R5 and R6. (R4 refers to security personnel; R5, second bullet, to authorized personnel; R6, third bullet, to security or other authorized personnel.)
Response: **1) NERC and Regional Entity are defined in NERC’s corporate documents including, but not limited to, the Certificate of Incorporation and ByLaws.** **2) Due to the limited scope and timeline for Phase 1, issues such as “response to loss” will be addressed in Phase 2. Please use the Phase 2 comment period if you feel that your concerns have not been addressed.** **3) The drafting team agrees with the correction of Requirement 1.4, and will implement this.** **4) Standardizing language will additionally be addressed in Phase 2.**		
PPL Corporation	No	Recommend a correction to R1.4 which references R3. We believe this is now R4.

Organization	Yes or No	Question 5 Comment
Response: **The drafting team agrees with the correction of Requirement 1.4, and will implement this.**		
MRO NERC Standards Review Subcommittee	No	The MRO NSRS believes strengthening CIP-006 R3 with the language below achieves the intent of the standard by protecting client-server applications used for access control and/or monitoring. The proposed language parallels the requirements of language in CIP-005-2, R2.4.The MRO NSRS proposes the following language:CIP-006 R3. Protection of Electronic Access Control Systems ? Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter, except for the client of a client-server application. In a client-server application, the server will be located in a Physical Security Perimeter, and the Responsible Entity shall implement strong procedural or technical controls to ensure authenticity of the accessing party. The MRO NSRS agrees with the remaining changes in CIP-006-2.
Response: **You bring up a good point of clarification. The intent of the modification was to clarify that a device that performs either function must be included. However an unintended consequence of this change was to add ambiguity as to what constitutes a monitoring device. The intent is to only include devices that perform access control and/or monitoring as identified in CIP-005 R2 and R3 and not those devices that are receiving alerts.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Pepco Holdings, Inc - Affiliates		
United Illuminating Company	Yes	
Deloitte& Touche, LLP	Yes	With the adoption of "implement", will the drafting team release a FAQ on what entities and auditors should consider for evidence of compliance of implementation (i.e. a documentation of a formal physical security program that has ownership, stakeholders, documented narratives & workflows, risk assessment and internal control testing).

Organization	Yes or No	Question 5 Comment
Response: **Reliability standards are limited to specifying what to do, not how to do it.** **Please refer to NERC Rules of Procedure Appendix 4C Compliance Process.**		
Exelon	Yes	Recommendation to increase the timeframe in R1.7 to update the physical security plan to 60 days from 30 days. Reason for the recommendation is 30 days is not a sufficient time period to accomplish this level of change management on documentation. We support all the other comments noted for CIP006 in this section with the recommendation to move the word implement before maintain in R1 so the sentence reads “create, implement and maintain.” Reason for the recommendation is a control must be implemented before it can be maintained. .
Response: **Thank you for your comments. They will be considered in future phases of these standards.** **Revising the order of “create, implement, and maintain” is accepted.**		
Old Dominion Electric Cooperative		
City of Tallahassee (TAL)	Yes	
BC Transmission Corporation	Yes	
Applied Control Solutions, LLC	Yes	
US Bureau of Reclamation	No	The requirement that the Physical Security plan be approved by a single senior manager is not appropriate. It should be sufficient to require that the entity have a management approved plan. As stated before, submissions from the regional entities in geographically diverse entities pass through and are certified by the entity's compliance POC and represent an official entity position and commitment to action. To require more adds an unnecessary organizational and administrative burden.

Organization	Yes or No	Question 5 Comment
Response: **The requirement specifically provides for the Senior Manager or delegate(s) to approve the plan, thereby providing enough flexibility while maintaining a specific chain of authority.**		
Orange and Rockland Utilities Inc.	No	1) We recommend changing R1.2 from "Identification of all access points" to "Identification of all physical access points" 2) We request a correction to R1.4 which references R3. We believe this is now R4. 3) Regarding R1.6, we are concerned with the new word "continuous," it will be difficult to demonstrate compliance. Requirements need to be auditable, measurable and enforceable. We request removing "continuous." 4) We recommend changing R1.7 from "within thirty calendar days of the completion of any" to "within thirty calendar days of completion of the Entity's Change Process for any"
Response: **1) Adding "physical" to access point in R1.2 - the drafting team feels that it is clear that the access points are "physical" since the requirement is directed at Physical Security Perimeters.** **2) The drafting team agrees and will implement this change.** **3) The drafting team feels that 'continuous' is a clarification of an active process of escorting as opposed to just being in the same room as an individual (i.e. escorted).** **4) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
CenterPoint Energy	No	An additional modification that was proposed by the SDT in R1.7 reduced the amount of time allowed for making changes and updates to the physical security plan from 90 days to 30 days. CenterPoint Energy strongly disagrees with this change. Furthermore, the Commission did not direct this change in Order 706 or Order 706A. CenterPoint Energy believes 30 days is too constraining and unwarranted, and that 90 days should be retained. If the SDT moves forward with the proposed reduction in time, CenterPoint Energy proposes 60 days to allow for a complete review of any physical security plan changes.

Organization	Yes or No	Question 5 Comment
Response: **The drafting team understands your concerns, however for consistency across all CIP standards, short term implementations were reduced from 90 days to 30 days.**		
Manitoba Hydro	No	The wording in R2 should be: "Cyber Assets used in the access control and/or monitoring and/or logging access to the Physical Security Perimeter(s)", to reflect similar wording in R3, and to include other devices or systems used in access control, such as authentication systems.
Response: **Issues such as clarifying the difference between logging and monitoring will be addressed in Phase 2. Please use the Phase 2 comment period if you feel that your concerns were not addressed.**		
Alberta Electric System Operator	Yes	R1.1 is missing the word, "critical" for Cyber Assets. There is no need to have a requirement for assets that are not critical.
Response: **Requirement 1.1 specifically addresses Cyber Assets and not the subset of Critical Cyber Assets. Any device that is within the same Electronic Security Perimeter as a Critical Cyber Asset must be within a Physical Security Perimeter and hence must be addressed within the Physical Security plan.**		
Dynegy	No	1. Recommend changing R1.2 to require identification of all "physical" access points. 2. Correct R1.4 to reference R4 instead of R3. 3. Eliminate "continuous" from R1.6. This term is not auditable.
Response: **1. Adding "physical" to access point in R1.2 - the drafting team feels that it is clear that the access points are "physical" since the requirement is directed at Physical Security Perimeters.** **2. The drafting team agrees and will implement this change.** **3. The drafting team feels that 'continuous' is a clarification of an active process of escorting as opposed to just being in the same room as an individual (i.e. escorted).**		

Organization	Yes or No	Question 5 Comment
Northern Indiana Public Service Company	No	In future drafts I would encourage the drafting team to enable track changes on the modifications to the requirements numbers as well as the text. Modifications to requirement numbers, especially in CIP-006-2 were not consistently red-lined to display where the content was formerly referenced in the existing CIP-006-1. Regarding CIP-006-2 R2 I would request a clarification on scope and depth of the cyber assets that authorize and/or log access to the PSP. The previous language would have limited the devices to those that performed control and monitoring of the PSP (traditional physical access control security systems, and localized panels that communicate with the main system). The new language provided in the draft under CIP-006-2 R2 modifies the scope to include cyber assets that authorize and/or log access to the PSP. I am concerned with the depth of devices involved in the authorization or logging chain. Specifically: log correlation servers, backup and recovery servers, camera's, badge printing workstations, camera monitoring stations, log printers, etc.. In the current draft it is unclear whether the device performing the authorization and/or logging is the only cyber asset that is subject to the requirements specified in CIP-006-2 R2.1-R2.2 or if all devices involved in authorization or logging are subject to those requirements specified in CIP-006-2 R2.1-R2.2. I feel that additional language needs to be provided to clarify the scope and depth of the devices to be included under the classification of cyber assets that authorize and/or log access to the PSP. Regarding CIP-006-2 R3 I reiterate my request for a clarification on scope and depth of the devices to be included in the access control and/or monitoring of the ESP. The previous language would have limited the devices to those that performed access control and monitoring of the ESP (traditional Firewalls, routers with ACL's, any IPS devices, VPN endpoints, etc.). The new language provided in the draft under CIP-005-2 R1.5 modifies the scope to include cyber assets used in the access control and/or monitoring of the ESP. I am concerned with the depth of devices involved in the monitoring chain that have no relevance on access control, but are an active component in the monitoring of the ESP. Specifically: log correlation servers, SNMP trap servers, SMTP relay servers for notification, pagers, blackberry's, enterprise email servers, backup and recovery servers for these extended devices, etc.. In the current draft it is unclear whether the device performing the monitoring is the only device that is subject to the requirements specified in CIP-005-2 R1.5 or if all devices involved in monitoring are subject to those requirements specified in CIP-005-2 R1.5. I feel that additional language needs to be provided to clarify the scope and depth of the devices to be included under the classification of cyber assets used in the monitoring of the ESP. When providing the scope and depth clarification of these cyber assets, the drafting team needs to give consideration in regards to an entities ability to satisfy the new CIP-006-2 R3 requirements of containing all of the cyber assets used in the access control and/or monitoring within an identified PSP. In regards to CIP-006-2 R4-R6, I believe the sub requirement identifiers were removed as they are not specific requirements, but rather a means to satisfy the requirement. I believe the bullet items need some level of identifier for reference purpose. Potentially a B4.1, B4.2, etc. this would allow for an entity to

Organization	Yes or No	Question 5 Comment
		reference the manner in which they satisfy the requirement.
Response: **The drafting team agrees that not all of the changes were clearly identified. However, the posted version (the one that was commented on) is the official version, and while the drafting team did renumber some of the requirements, these are consistent across the reliability standards.** **In relation to your comments on CIP-006-2 R2 and R3, the intent of the modification was to clarify that a device that performs either function must be included. However an unintended consequence of this change was to add ambiguity as to what constitutes a monitoring device. The intent is to only include devices that perform access control and/or monitoring as identified in CIP-005 R2 and R3 and not those devices that are receiving alerts.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **With respect to your comments on CIP-006-2 R4-R6, while the drafting team did renumber some of the requirements, these are consistent across reliability standards. The changes from individual sub-requirements to bullets were made to correct an original error where requirements cannot be levied upon an item that may not be implemented.**		
CoreTrace		
Oncor Electric Delivery LLC	Yes	
Illinois Municipal Electric Agency		
Ontario Power Generation	No	Requirement R2.1 will limit the ability of entities to leverage existing personnel to perform such duties as allocating access cards to legitimate visitors. Such duties are frequently delegated to trained reception personnel. OPG believes that allowance must be made for workstations in reception areas and selected offices areas (e.g. Human Resources departments). Cyber controls such as dual authentication on the workstation would be sufficient to meet the protective needs of the system. As noted earlier with respect to CIP 005-2 R1.5, OPG believes that CIP-006-2 R3 creates issues where an entity may be using a third party to remotely monitor and administer Cyber Assets used in the control

Organization	Yes or No	Question 5 Comment
		or monitoring of the ESP. The new requirement will require the entity to police the physical security measures of any such third party to a degree not required for third parties who may support CCAs within the ESP. OPG suggests that the requirements for Cyber Assets used in the access control and / or monitoring of the ESP require protections to the same standards as those which are used to access CCAs. With respect to R1.6 there is concern that the addition of the new word "continuous" it will be difficult to demonstrate compliance. Requirements need to be enforceable. We recommend removing "continuous". We are concerned with the change in R1.7 reducing the time to update the Physical Security Plan from 90 to 30 calendar days. In a large organization this timeframe may not be achievable. Changes to CIP-006 R1.1 open up concerns about the protection of non- Critical Cyber Asset components such as cables. To eliminate this concern we request that the wording of the last sentence be returned to read "Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to the Critical Cyber Assets."
Response: **Any device that has the ability to authorize and or log access to Physical Security Perimeters must be physically protected per requirement CIP-006-2 R2.** **Relating to your comment on CIP-006-2 R3, the Requirements apply regardless of who performs the functions.** **The drafting team feels that 'continuous' is a clarification of an active process of escorting as opposed to just being in the same room as an individual (i.e., escorted).** **For consistency across all CIP standards, short term implementations were reduced from 90 days to 30 days.** **Requirement 1.1 specifically addresses Cyber Assets and not a subset of Critical Cyber Assets. Any device that is within the same Electronic Security Perimeter as a Critical Cyber Asset must be within a Physical Security Perimeter, and hence must be addressed within the Physical Security plan**		
American Electric Power	Yes	Refer to comments provided in questions 1 and 13.

Organization	Yes or No	Question 5 Comment
Response: **"Responsible Entity" is defined within the Applicability section of each CIP standard.** **The ERO Rules of Procedure include sections on dealing with confidential data associated with the Cyber Security standards, and recognize that there may be some evidence retained by the Responsible Entity. The data retention section of these standards was written to support this concept.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Ontario IESO	No	With respect to individual bullet points: (i) R1: The reference to the Senior Manager should also refer to CIP-003 R2 to clarify the requirement. (ii) CIP-006 R1.6 should not require "continuous" escorted access, since demonstrating compliance with such requirement would be impossible. As an alternative, wording might indicate that visitors are to be escorted in a manner that ensures their actions can be supervised and unauthorized disclosures prevented, and/or only authorized employees can be escorts. (iii) We recommend changing R1.2 from "Identification of all access points" to "Identification of all physical access points" (iv) R1.4, reference to R3 should read R4.
Response: **(i) The drafting team feels we made this distinction by the change from "a Senior Manager" to "the Senior Manager".** **(ii) The drafting team feels that 'continuous' is a clarification of an active process of escorting as opposed to just being in the same room as an individual (i.e., escorted).** **(iii) The drafting team feels the statement is clear that the access points are "physical" since the requirement is directed at Physical Security Perimeters.** **(iv) The drafting team agrees and will implement this change.**		

Organization	Yes or No	Question 5 Comment
Ameren	Yes	
Consumers Energy Company	Yes	
Xcel Energy	No	Xcel Energy feels strongly that 30 days is too short of a time frame to get drawings updated, Sr. Management approval,..etc. every time there is a change to the plan. We feel that 60 calendar days is more attainable industry-wide.
Response: **The drafting team understands your concerns, however for consistency across all CIP standards, short term implementations were reduced from 90 days to 30 days.**		
ISO New England Inc	No	1) We recommend changing R1.2 from "Identification of all access points" to "Identification of all physical access points" 2) We request a correction to R1.4 which references R3. We believe this is now R4. 3) Regarding R1.6, we are concerned with the new word "continuous." it is subjective and will be difficult to demonstrate compliance. Requirements need to be auditable, measurable and enforceable. We request removing "continuous." 4) We recommend changing R1.7 from "within thirty calendar daysof the completion of any" to "within thirty calendar days of completion of the Entity's Change Process for any"
Response: **1) Adding "physical" to access point in R1.2 - the drafting team feels that it is clear that the access points are "physical" since the requirement is directed at Physical Security Perimeters.** **2) The drafting team agrees and will implement this change.** **3) The drafting team feels that 'continuous' is a clarification of an active process of escorting as opposed to just being in the same room as an individual (i.e. escorted).** **4) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. Organization	Yes or No	Question 5 Comment
comments as appropriate if they have not been addressed.		
American Transmission Company	Yes	
TVA	No	We agree with all except, CIP-006 R1.6. CIP-006 R1.6 requires a "continuous" escort. We agree that performing escort duties in a manner that ensures visitors actions are supervised and malicious attempts are prevented is critical. However, being able to provide auditable proof of "continuous" escorting creates a condition that is impossible to meet. We propose the following: R1.6: Policy and procedures describing roles, responsibilities, and corrective action in regard to escorting personnel not authorized for unescorted access within the Physical Security Perimeter. We would also recommend that Responsible Entitie obtain a signature for record from individuals performing escort duties demonstrating that they acknowledge and accept their role and responsibilities and understand what corrective actions will be taken for any breach in procedure.
Response: **The drafting team feels that 'continuous' is a clarification of an active process of escorting as opposed to just being in the same room as an individual (i.e., escorted).**		
Duke Energy	No	The language introduced in R2 and R3 has created an inconsistency with the use of the phrases "authorize and/or log access" and " access control and/or monitoring". This creates confusion and opportunity for differing interpretations of the requirements.
Response: **Issues such as inconsistencies will be addressed in Phase 2. Please resubmit your comments during the Phase 2 comment period if you feel that your concerns have not been addressed.**		
Brazos Electric Power Cooperative, Inc.	No	In R1.3, replace "the perimeter(s)" with "the Physical Security Perimeter(s)". In R8.3, need to clarify what "outage records" are. In M2, replace "shall make available documentation that" with "shall make available documentation showing how " In M3, replace "shall make available documentation that" with "shall make available documentation

Organization	Yes or No	Question 5 Comment
		showing how".
Response: **The drafting team feels it is clear that the perimeters are "physical" since the requirement is directed at Physical Security Perimeters. Requirement 1.3 is a sub requirement of R1, "Physical Security Plan".** **With respect to your comments on R8.3, M2, and M3 issues, these will be addressed in Phase 2. Please use the Phase 2 comment period if you feel that your concerns have not been addressed.**		
Progress Energy	Yes	CIP006R1.7 – We believe the reduction of 90 to 30 days for updates to the Physical Security Plan is inadequate when you consider the number and levels of approvals required to complete the updates. PE recommends leaving the 90 day time period.
Response: **For consistency across all CIP standards, short term implementations were reduced from 90 days to 30 days.**		
Standards Review Committee of ISO/RTO Council	No	(i) R1: We recommend revising "the Senior manager" to "a senior manager" as the requirement should not be job title specific. Further, the reference to "a Senior Manager" also should be made to CIP-003 R2 to clarify the requirement. (ii) CIP-006 R1.6 should not require "continuous" escorted access, insofar as that would create a condition that is impossible to prove to auditors. As an alternative, wording might indicate that visitors are to be escorted in a manner to ensure their actions can be supervised and unauthorized disclosures prevented, and/or only authorized employees can be escorts. (iii) We recommend changing R1.2 from "Identification of all access points" to "Identification of all physical access points" (iv) R1.4, reference to R3 should read R4.
Response: **(i) The drafting team feels it made this distinction by the change from "a Senior Manager" to "the Senior Manager".** **(ii) The drafting team feels that 'continuous' is a clarification of an active process of escorting as opposed to just being in the same room as an individual (i.e., escorted).**		

Organization	Yes or No	Question 5 Comment
(iii) The drafting team feels the statement is clear that the access points are "physical" since the requirement is directed at Physical Security Perimeters. **(iv) The drafting team agrees and will implement this change.**		
KEMA	Yes	In R4 and R6, access control and logging should include in and out of the Critical Facility in accordance to NERC's Security Guidelines for the Electricity Sector: Physical Security--Substations Dated 10-2004. Responsible entities should control and log in and out access to Critical Facilities to maintain a high level of access security to Critical Cyber Assets.
Response: **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Austin Energy	No	The original stated intent of the Standards was to protect against 'cyber' attacks. Modifications to R2 would seem to overstep the intent in the case where a separate non-critical system was used the monitor assess to Critical Cyber Assets (CCA). Now if the CCA was itself incorporated into the physical assess monitoring then the modification to R2 is self evident. However, when a separate system is employed, it takes a coordinated effort by humans with a physical presence to pull off an attack. Although this may certainly qualify as espionage, there is nothing 'cyber' about it. It is proposed that an exception be made for cases where a separate system is used to monitor CCA.
Response: **The original standards were to protect the Cyber Assets from both cyber and physical attacks. While most of the standards deal with cyber protections, the easiest method to successfully attack a cyber asset is through physical means. The modifications in CIP-006 clarify cyber protections afforded to the systems that assist in the physical protection, including access and monitoring.** **The SDT will clarify that monitoring systems that do not authenticate and/or grant physical access are excluded from this requirement. An example would be a CCTV system that performs the monitoring role and also supports access logging, but does not control the Physical Security Perimeter access point.**		
Kansas City Power &	Yes	

Organization	Yes or No	Question 5 Comment
Light		
San Diego Gas and Electric Co.	No	SDG&E has the following comment to make about CIP-006-2 R2.1: This requirements states that cyber assets that authorize and/or log access to PSPs must be "protected from unauthorized physical access." In addition, R2.2 states that these cyber assets must be afforded the protective measures specified in, among others, CIP-006-2 R4, which addresses physical access control. Including both of these statements seems redundant. We recommend removing R2.1 and appending the text of R2.2 to R2 (thus allowing the deletion of R2.2)
Response: **The SDT respectfully disagrees with the comment. The Reference in R2.2 to CIP-006-2, R4, defines the procedural and operational control requirements for the Physical Security Perimeter access points (e.g., doors with card access readers or other access authentication processes). R2.1 refers specifically to protecting the authorization and logging systems, recognizing that in some cases it is not practical to require that the systems reside within a defined Physical Security Perimeter.**		

6. The CSO706 SDT is proposing the following modifications to **CIP 007-1:**

   - Add "implement" to CIP-007-1 Requirements R2, R3 and R7 to clarify that processes and procedures must be implemented as well as documented.
   - Remove the "acceptance of risk" language (per FERC Order 706, paragraph 622) in Requirements R2.3, R3.2 and R4.1.
   - Revise the timeframe for documenting changes to systems or controls to thirty days in Requirement R9.

   Do you agree with the proposed modifications? If not, please explain and provide an alternative to the proposed modification that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 6 Comment
Detroit Edison Company	Yes	
PacifiCorp	No	Other comment: R5.3 - Instead of prescribing specific password construction standards, it would be better to express desired outcomes in terms of measurable entropy. The standards should require a certain level of protection against password guessing and brute force "hash cracking" attacks, but leave specifics to the implementers. For example, the standard could simply require 24 bits min-entropy per NIST Special Publication 800-63.
Response: **R5.3 was not changed during this revision of the CIP standards. These types of issues will be addressed in Phase 2. Please resubmit your comments during the Phase 2 comment period if you feel that your concerns have not been addressed.**		
FirstEnergy Corp	Yes	
MidAmerican Energy Company	No	Comment: MidAmerican does not agree with the change within the Purpose section of the standard to change the term ?non-critical? to ?other.? MEC proposes the following language Purpose: Standard CIP-007-2 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the non-critical (delete other) cyber assets and cyber assets used in access control and/or monitoring within the Electronic Security Perimeter(s) . Standard CIP- 007-2 should be read as part of a group of standards numbered Standards CIP-002-2 through CIP-009-2.

Organization	Yes or No	Question 6 Comment
Response: **The word "non-critical" will be put back into the purpose statement within parentheses beside the word other [i.e "other (non-critical)"], which is similar to the structure in the implementation plan. The additional wording is meant to remove ambiguity.**		
Northeast Power Coordinating Council	No	We recommend changing R9 from "within thirty calendar days of the change being completed" to "within thirty calendar days of completion of the entity's change process."
Response: **Each entity's change process may be different and processes may include a number of steps to be performed after the actual change is completed over an extended period of time. The proposed wording would not drive a consistent approach to having documentation completed within thirty days of the actual modification to the systems or controls.**		
WECC Reliability Coordination	No	R2.3, R3.2 and R4.1 removes an organizations ability to accept minimal risk which cannot be compensated for.R9, we think 90 days is a reasonable time frame, 30 days is too restrictive.
Response: **FERC has directed the ERO to have the technical feasibility exception process supersede all instances of acceptance of risk. For example, Responsible Entities should implement the requirements for ports and services for all cyber assets within an electronic security perimeter or justify why it is not doing so pursuant to technical feasibility exceptions including reporting requirements and the implementation of compensating measures. The drafting team feels that one entity cannot accept risk for another entity in an interconnected power system. Where requirements cannot be met due to technical, safety, or operational limitations, those limitations are to be treated and documented according to a technical feasibility exception process (Please refer to FERC Order 706, Paragraph 151).** **(FERC Order 706 Paragraph 651) "… 30 days should provide sufficient time to update any necessary documentation with exceptions granted by the Regional Entity for extraordinary circumstances. The Commission believes that having correct documentation of methods, processes, and procedures for securing a responsible entity's system is necessary because if an event occurred before documentation was updated, an operator may not know of a change and could operate the system using out of date information. This puts reliability at risk by not informing operators of a method, process, or procedure to secure the system against a known risk." The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Southern Company	Yes	CIP-007 Section D - Compliance: 1.1.1 does not specify who is responsible for the enforcement authority.

Organization	Yes or No	Question 6 Comment
		CIP-007 Section D - Compliance: 1.4.1 - Indefinite retention is not feasible, overall cost of storage depending on scope could potentially be very large. Item should define an upper bound of the request (e.g. a maximum of 3 years) CIP-007 Section D - Compliance: 1.4.3 - Should have a time limit to reduce the overall liability of confidential information.
Response: **1.1.1 - The Regional Entity will serve as the Compliance Enforcement Authority for most entities. As the Regional Entity may not audit itself, the ERO will serve as the Compliance Enforcement Authority in auditing the Regional Entity. A third-party monitor without a vested interest in the outcome will serve as the Compliance Enforcement Authority for NERC. (Refer to NERC's Rules of Procedure, Paragraphs 404 and 405).** **1.4.1 – With the exception of retaining evidence in support of an investigation, the standard defines a finite retention period. The language that indicates the Compliance Enforcement Authority may direct the responsible entity to retain evidence for a longer period of time as part of an investigation is a restatement of what is included in the ERO Rules of Procedure. Reference the ERO Rules of Procedure Appendix 4C – Uniform Compliance Monitoring and Enforcement Procedures – Section 3.4.1 Compliance Violation Investigation Process Steps. While the duration of an investigation cannot be predicted, further clarification of the retention timeframe is outside the scope of the SDT.** **1.4.3 – This language supports the regularly scheduled audit intervals for all entities and supports the need to retain the confidentiality of some data. The audit data retention period is determined by the audit period for each Registered Entity.**		
Luminant Power	Yes	
Encari	No	1. We recommend striking the following language from the Purpose section - "those systems determined to be Critical Cyber Asset, as well as the other". – General Comments Pertaining to All Standards--Other modifications were also made to this standard that are not included as part of the question. 2. The wording of 1.1.1 is awkward and should be modified. 3. We also request further clarification regarding the Data Retention Requirement 1.4.2 as to which entity will be maintaining the last audit records and submitted subsequent audit records. As the statement is currently worded "in conjunction" leaves this open to interpretation.
Response: **1) The word non-critical will be added back into the purpose statement within parentheses beside the word other [i.e "other (non-**		

Organization	Yes or No	Question 6 Comment
		critical)"], which is similar to the structure in the implementation plan. The additional wording is meant to remove any ambiguity. 2) The intent of the wording in 1.1.1 is to clarify which entity will serve as the Compliance Enforcement Authority. For most standards, the Regional Entity serves as the Compliance Enforcement Authority and audits the performance of the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, Generator Owner, etc. In this standard, the Regional Entity is responsible for some of the requirements – but an entity cannot audit its own performance. Where the Regional Entity is also the responsible entity, the ERO will audit the Regional Entity's performance. Where the ERO is the responsible entity, a third-party monitor without vested interest in the outcome will conduct the audit. 3) The data retention periods for the standard requirements are specified in the standards. If a standard does not specify any data retention period, then there are default periods in the Compliance Monitoring and Enforcement Procedures –and in general, the default data retention periods are longer than the periods specified in the standards. The compliance staff worked to develop guidelines that drafting teams could use to determine reasonable data retention periods – trying to balance the needs of the compliance program to have sufficient evidence to review to determine compliance, with the burden to responsible entities of collecting and retaining that evidence. The language of 1.4.2 indicates that the Compliance Enforcement Authority "in conjunction with" the Registered Entity will retain all audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities and supports the need to retain the confidentiality of some data. The audit data retention period is determined by the audit period for each Registered Entity. The Reliability Coordinator, Transmission Operator and Balancing Authority are audited for each requirement once every three years – and all others are audited once every six years. The intent is to assure that, if there was an event and the performance of an entity was in question, there would be, at a minimum, at least one record showing the past performance of that entity.
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	Yes	
Consolidated Edison Company of New York, Inc.	No	We recommend changing R9 from "within thirty calendar days of the change being completed" to "within thirty calendar days of completion of the Entity's Change Process." See comments to question 5.
Response: Since each entity's change process may be different and since processes may include a number of steps to be performed after the actual change is completed over an extended period of time, the newly proposed wording will not drive consistency in having documentation completed within thirty days of the actual modification to the systems or controls.		

Organization	Yes or No	Question 6 Comment
Southern California Edison Company	No	The change from 90 days to 30 days is difficult to achieve. SCE suggests 60 days to provide ample time for internal due diligence.
Response: **(FERC Order 706 Paragraph 651) "… 30 days should provide sufficient time to update any necessary documentation with exceptions granted by the Regional Entity for extraordinary circumstances. The Commission believes that having correct documentation of methods, processes, and procedures for securing a responsible entity's system is necessary because if an event occurred before documentation was updated, an operator may not know of a change and could operate the system using out of date information. This puts reliability at risk by not informing operators of a method, process, or procedure to secure the system against a known risk." The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Tampa Electric Company	No	Section 1.5 Regarding the removal of the language in Section 1.5: Additional Compliance Information: It is not clear if removal of this language is implying that authorized exceptions result in non-compliance. There are situations where requirements of this standard cannot be met, particularly for legacy equipment and associated vendor supplied systems. The following language should be reinstated in the standard: "Duly authorized exceptions will not result in non-compliance."
Response: **Situations where the standards requirements cannot be met will be handled through the Technical Feasibility Exception process under the NERC Rules of Procedure. The technical feasibility exception process will address the requirements for documenting, approving, and remediating the exception. Any sanction decisions will arise from the TFE process. It is not appropriate to assert that "duly authorized exceptions will not result in non-compliance" within Section D-1.5 of the standard.**		
Electric Market Policy	Yes	NERC (Step 4.1.10) and Regional Entity (Step 4.1.11) are not defined in the NERC Glossary of Terms or Functional Model.
Response: **NERC and Regional Entity are defined in NERC's corporate documents including, but not limited to, the Certificate of Incorporation and ByLaws.**		
PPL Corporation	Yes	We fully support the revisions in section B, Requirements.

Organization	Yes or No	Question 6 Comment
Response: **Thank you for your comment.**		
MRO NERC Standards Review Subcommittee	No	The MRO NSRS do not agree with the change within the Purpose section of the standard to change the term “non-critical” to “other.” The term "other" is too vague. The MRO NSRS proposes the following language: Purpose: Standard CIP-007-2 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the non-critical (delete other) cyber assets and cyber assets used in access control and/or monitoring within the Electronic Security Perimeter(s) . Standard CIP- 007-2 should be read as part of a group of standards numbered Standards CIP-002-2 through CIP-009-2.
Response: **The word non-critical will be added back into the purpose statement within parentheses beside the word other [i.e “other (non-critical)”], which is similar to the structure in the implementation plan. The additional wording is meant to remove any ambiguity.**		
Pepco Holdings, Inc - Affiliates		
United Illuminating Company	Yes	
Deloitte& Touche, LLP	Yes	With the adoption of "implement", will the drafting team release a FAQ on what entities and auditors should consider for evidence of compliance of implementation (i.e., a documentation of a formal security management program that has ownership, stakeholders, documented narratives & workflows, risk assessment and internal control testing).
Response: **Reliability standards are limited to specifying what to do, not how to do it.** **Please refer to NERC Rules of Procedure Appendix 4C Compliance Process.**		
Exelon	No	Recommendation to increase the timeframe in R9 to document changes to systems or controls to 60 days from 30 days. Reason for the recommendation is 30 days is not a sufficient time period to accomplish this level of change management on documentation.

Organization	Yes or No	Question 6 Comment
Response: **(FERC Order 706 Paragraph 651) "… 30 days should provide sufficient time to update any necessary documentation with exceptions granted by the Regional Entity for extraordinary circumstances. The Commission believes that having correct documentation of methods, processes, and procedures for securing a responsible entity's system is necessary because if an event occurred before documentation was updated, an operator may not know of a change and could operate the system using out of date information. This puts reliability at risk by not informing operators of a method, process, or procedure to secure the system against a known risk." The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Old Dominion Electric Cooperative		
City of Tallahassee (TAL)	Yes	Although the "acceptance of risk" ties in with the discusson above on business judgement.
Response: **The removal of "reasonable business judgment" was done in accordance with FERC Order 706. The revisions made to the standards in Phase 1 are intended to be responsive to specific FERC directives relevant to the onset of compliance audits in July 2009. The expansion of the Technical Feasibility Exception Process should address the concerns regarding the removal of reasonable business judgment and acceptance of risk.**		
BC Transmission Corporation	Yes	
Applied Control Solutions, LLC	Yes	
US Bureau of Reclamation	No	More rational is needed to explain the decision to remove "acceptance of risk" and "reasonable business judgement" language from CIP requirements while leaving the ability to identify "exceptions" through cyber security policy (CIP-003-2, R3.) With this exception in place, entities will be able to establish "policy" that will allow for deviation from the requirements outlined in the Standards. If the intent of the changes was to limit implementation disparity across all entities by removing "risk based decisions", the potential remains that an entity will establish exceptions through relaxed "policy" and the disparity will remain. If the intent was to remove any avenue for not meeting or implementing the requirements, entities may continue to accept "risk based decisions" (although not formally identified as such) by

Organization	Yes or No	Question 6 Comment
		pursuing relaxed policy via exceptions (CIP-003-2 R3).Further, entities may have numerous "systems" of differing capabilities and generations. To require that exceptions be documented in "policy" does not acknowledge the diversity of systems that may be in service in an organization in as effective a manner as documenting exceptions as a function of the system, its environment, and its criticality. Such documentation would be better addressed through specific risk-acceptance decisions tied to specific systems, rather than to an all-encompassing "policy. "Finally, as CIP-003 is amended, entities may not implement or meet certain requirements, as long as, they are identified and documented as "policy exceptions." Was this the intent of the authors? We recommend that risk-managed approaches to cyber security requirements be reinstated into the requirements, recognizing that such a change will require FERC to reassess their order.
Response: **The recommendation of using a risk-managed approach to cyber-security requirements is well appreciated and will be a significant topic in the next revision phase of the CIP Standards.** **The removal of "reasonable business judgment" was done in accordance with FERC Order 706. The revisions made to the standards in Phase 1 are intended to be responsive to specific FERC directives relevant to the onset of compliance audits in July 2009. The expansion of the Technical Feasibility Exception Process should address the concerns regarding the removal of reasonable business judgment and acceptance of risk.**		
Orange and Rockland Utilities Inc.	No	We recommend changing R9 from "within thirty calendar days of the change being completed" to "within thirty calendar days of completion of the Entity's Change Process."
Response: **Since each entity's change process may be different and since processes may include a number of steps to be performed after the actual change is completed over an extended period of time, the newly proposed wording will not drive consistency in having documentation completed within thirty days of the actual modification to the systems or controls.**		
CenterPoint Energy		
Manitoba Hydro	Yes	
Alberta Electric System Operator	Yes	
Dynegy	Yes	

Organization	Yes or No	Question 6 Comment
Northern Indiana Public Service Company	No	Within the purpose section of CIP-007-2 I would recommend the removal of the following language "those systems determined to be Critical Cyber Assets, as well as the non critical" as this language is redundant.
Response: **The word non-critical will be added back into the purpose statement within parentheses beside the word other [i.e "other (non-critical)"], which is similar to the structure in the implementation plan. The additional wording is meant to remove any ambiguity.**		
CoreTrace	No	The modifications above are acceptable, however R4.2, as written, implies that all anti-virus and malware prevention tools have signatures, which is not true. Specifically whitelisting or behavioral approaches do not require signature updates. Whitelisting in particular provides greater antivirus/antimalware protection than traditional signature based antivirus, including zero day protection, yet does NOT require "signatures". Whitelisting relies on a positive security model that complements CIP 003 Configuration Control Requirements. By clarifying that traditional signature based antivirus is not required, NERC opens up the range of platforms and systems that can be protected greatly. For example, traditional antivirus does not exist for most Unix based systems, however whitelisting does. Propose revising R4.2 to read as follows: R4.2. If the Responsible Entity chooses to implement signature based antivirus or malware prevention tools the Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention ?signatures.? The process must address testing and installing the signatures. This requirement does not apply for non-signature based antivirus or malware prevention tools such as those based on whitelisting or behavioral analysis.
Response: **R4.2 was not changed during this revision of the CIP Standards. Please resubmit your comments during the Phase 2 comment period if you feel that your concerns have not been addressed.**		
Oncor Electric Delivery LLC	Yes	
Illinois Municipal Electric Agency		
Ontario Power Generation	No	Reducing the timeframe for documenting changes to systems or controls in R9 from 90 to 30 calendar days introduces a constraint that may not be achievable in a large organization.

Organization	Yes or No	Question 6 Comment
Response: **(FERC Order 706 Paragraph 651) "… 30 days should provide sufficient time to update any necessary documentation with exceptions granted by the Regional Entity for extraordinary circumstances. The Commission believes that having correct documentation of methods, processes, and procedures for securing a responsible entity's system is necessary because if an event occurred before documentation was updated, an operator may not know of a change and could operate the system using out of date information. This puts reliability at risk by not informing operators of a method, process or procedure to secure the system against a known risk." The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
American Electric Power	Yes	Refer to comments provided in questions 1 and 13.
Response: **"Responsible Entity" is defined within the Applicability section of each CIP standard.** **The ERO Rules of Procedure include sections on dealing with confidential data associated with the Cyber Security standards, and recognize that there may be some evidence retained by the Responsible Entity. The data retention section of these standards was written to support this concept.** **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Ontario IESO	Yes	
Ameren	No	Acceptance of risk for certain ports and services is within security best practices. Mitigating controls for certain ports and services could effect the reliable operation of the bulk electric system.
Response: **FERC directed the ERO to have a technical feasibility exception process supersede all instances of acceptance of risk. For example, Responsible Entities should implement the requirements for ports and services for all cyber assets within an electronic security perimeter or justify why it is not doing so pursuant to technical feasibility exceptions including reporting requirements and the implementation of compensating measures. The drafting team feels that one entity cannot accept risk for another entity in an interconnected power system. Where requirements cannot be met due to technical, safety, or operational limitations, those limitations are to be treated and documented according to a technical feasibility exception process (Please refer to FERC Order 706,**		

Organization	Yes or No	Question 6 Comment
Paragraph 151).		
Consumers Energy Company	Yes	
Xcel Energy	Yes	
ISO New England Inc	No	We recommend changing R9 from "within thirty calendar days of the change being completed" to "within thirty calendar days of completion of the Entity's Change Process."
Response: **Since each entity's change process may be different and since processes may include a number of steps to be performed after the actual change is completed over an extended period of time, the newly proposed wording will not drive consistency in having documentation completed within thirty days of the actual modification to the systems or controls.**		
American Transmission Company	Yes	
TVA	Yes	
Duke Energy	Yes	Regarding R2.3, R3.2 and R4.1, we understand that the Responsible Entity's action to document compensating measures is sufficient to achieve compliance with the requirements, and that the Responsible Entity does not need to also invoke the "Technical Feasibility" exception. Technical Feasibility is only applicable when the Responsible Entity cannot comply with a requirement. We also recommend that the Responsible Entity be required to perform an analysis of the residual risk after all compensating measures are applied. Add the words "and analysis of residual risk" to the end of R2.3, R3.2 and R4.1
Response: **FERC has directed the ERO to have the technical feasibility exception process supersede all instances of acceptance of risk. Where requirements cannot be met due to technical, safety, or operational limitations, those limitations are to be treated and documented according to a technical feasibility exception process. [Please refer to FERC 706, Paragraph 151]** **The Technical Feasibility Exception process is under development by NERC staff. Please readdress this issue during the Phase 2 comment period.**		

Organization	Yes or No	Question 6 Comment
Brazos Electric Power Cooperative, Inc.	No	1) In R5.1.1, replace "user accounts" with "user access privalges". 2) In R6.4, replace "all logs" with "all logs of system events related to cyber security". 3) In M2, replace "available documentation" with "available documentation of all ports and services".
Response: **1) All aspects of R5.1 are specific to individual and shared system accounts. User access privileges are covered in CIP-004.** **2) The requirement is to retain all logs from all applicable cyber assets for 90 days. Log retention of system events related to cyber security may be longer based on incident response and reporting plan as defined by CIP-008.** **3) The SDT reviewed and concluded that changing the wording as suggested would exclude the process documentation. It remains applicable to all documentation related to R2.**		
Progress Energy	Yes	CIP007R9 – The reduction from 90 to 30 days is inadequate. PE recommends leaving the 90 day time period (same justification as for CIP006-R1.7).
Response: **The FERC Order consistently requires a shortening of the update period and recommends 30 days. The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Standards Review Committee of ISO/RTO Council	Yes	
KEMA	Yes	
Austin Energy	Yes	
Kansas City Power & Light	Yes	
San Diego Gas and Electric Co.	Yes	

7. The CSO706 SDT modified **CIP-008-1** Requirement R1 to clarify the requirement to implement the plan in response to cyber security incidents, update the plan within thirty days of any changes, and clarify that tests of the plan do not require removing components or systems during the test.

   Do you agree with the proposed modifications? If not, please explain and provide an alternative to the proposed modification that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 7 Comment
Detroit Edison Company	No	The addition of "and implement the plan in response to Cyber Security Incidents." is awkward. This literally states that the plan will only be implemented upon a security incident, but the plan must be implemented in order to "characterize and classify" reportable Cyber Security Incidents. It might be clearer if written as " The Responsible Entity shall develop, implement and maintain a Cyber Security Incident Response Plan....and execute the plan in the event of a Cyber Security Incident." Remove the "Process for?." language in CIP-008-2 R1.4, R1.5, and R1.6 to be consistent with the language changes in CIP-006 R1.7 and R1.8. Suggested language is as follows: R1.4. Update of the Cyber Security Incident response plan within thirty calendar days of any changes.R1.5. Annual review of the Cyber Security Incident response plan.R1.6. Annual testing of the Cyber Security Incident response plan. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident. Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test.
Response: **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
PacifiCorp	Yes	
FirstEnergy Corp	Yes	
MidAmerican Energy Company	Yes	

Organization	Yes or No	Question 7 Comment
Northeast Power Coordinating Council	No	1) - We recommend changing R1 from "The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents." to "The Responsible Entity shall develop, maintain and implement a Cyber Security Incident response plan. The plan shall be activated in response to a Cyber Security Incident." 2) - We recommend changing R1.4 from "Process for updating the Cyber Security Incident response plan within thirty calendar days of any changes" to "Process for updating the Cyber Security Incident response plan within thirty calendar days of completion of the entity's change process". 3) - Measure M1 appears to one of the few measures that specifies "dated." Please clarify "dated." Also, R1 does not specify dating a Plan. Besides inconsistency, it appears this measurement adds a requirement incorrectly.
Response: **1)-2) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **3) The word "dated" will be removed at this time. The measures will be reviewed and considered in an upcoming drafting phase of these standards.**		
WECC Reliability Coordination	No	we feel that 90 days is a reasonable time frame.
Response: **The FERC Order consistently requires a shortening of the update period and recommends 30 days. The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**

		or Functional Model.
Response: **NERC and Regional Entity are defined in NERC's corporate documents including, but not limited to, the Certificate of Incorporation and ByLaws.**		
PPL Corporation	No	The sentence added to the end of R1.6 would be more appropriate in a FAQ, guideline, or interpretation rather than in the standard itself.
Response: **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
MRO NERC Standards Review Subcommittee	No	The MRO NSRS questions the change in timing requirements for R1.4 from 90 days to 30 days. What is the justification for change? Do you have specific examples of problems that resulted from the plan not being updated within 90 days.
Response: **The FERC Order consistently requires a shortening of the update period and recommends 30 days. The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Pepco Holdings, Inc - Affiliates		
United Illuminating Company	Yes	
Deloitte& Touche, LLP	Yes	With the adoption of "implement", will the drafting team release a FAQ on what entities and auditors should consider for evidence of compliance of implementation (i.e. a documentation of a formal incident management program that has ownership, stakeholders, documented narratives & workflows, risk assessment and internal control testing).

Organization	Yes or No	Question 7 Comment
Response: **Reliability standards are limited to specifying what to do, not how to do it.** **Please refer to NERC Rules of Procedure Appendix 4C Compliance Process.**		
Exelon	No	Recommendation to increase the timeframe in R1.4 to document changes to the cyber security incident response plan to 60 days from 30 days. Reason for the recommendation is 30 days is not a sufficient time period to accomplish this level of change management on documentation.
Response: **The FERC Order consistently requires a shortening of the update period and recommends 30 days. The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Old Dominion Electric Cooperative		
City of Tallahassee (TAL)	Yes	
BC Transmission Corporation	Yes	
Applied Control Solutions, LLC	Yes	
US Bureau of Reclamation	Yes	
Orange and Rockland Utilities Inc.	No	1) We recommend changing R1 from "The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents." to "The Responsible Entity shall develop, maintain, and implement a Cyber Security Incident response plan. The plan shall be activated in response to a Cyber Security Incident." 2) We recommend changing R1.4 from "Process for updating the Cyber Security Incident response plan within thirty calendar days of any changes" to "Process for updating the Cyber Security Incident response plan within within thirty calendar days of completion of the Entity's Change Process"

Organization	Yes or No	Question 7 Comment
		3) The new sentence in R1.6 adds no value and may confuse - "Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test." We recommend removing this new sentence 4) Measure M1 appears to one of the few measures that specifies "dated." Please clarify "dated." Also, R1 does not specify dating a Plan. Besides inconsistency, it appears this measurement adds a requirement incorrectly.
Response: **1)-3) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **4) The word "dated" will be removed at this time. The measures will be reviewed and considered in an upcoming drafting phase of these standards.**		
CenterPoint Energy	No	CenterPoint Energy strongly disagrees with the proposed modification in R1.4 reducing the amount of time allowed for making changes and updates to the Cyber Security Incident Response Plan from 90 days to 30 days. Furthermore, the Commission did not direct this change in Order 706 or Order 706A. CenterPoint Energy believes 30 days is too constraining and unwarranted, and that 90 days should be retained. If the SDT moves forward with the proposed reduction in time, CenterPoint Energy proposes 60 days to allow for a complete review of any changes.
Response: **The FERC Order consistently requires a shortening of the update period and recommends 30 days. The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Manitoba Hydro	Yes	
Alberta Electric System Operator	Yes

San Diego Gas and Electric Co.	Yes	

8. The CSO706 SDT revised the timeframe to thirty days for communicating updates of recovery plans to personnel responsible for activating or implementing the plan in **CIP-009-1** Requirement R3.

   Do you agree with the proposed modifications? If not, please explain and provide an alternative to the proposed modification that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 8 Comment
Detroit Edison Company	Yes	
PacifiCorp	Yes	
FirstEnergy Corp	Yes	
MidAmerican Energy Company	Yes	
Northeast Power Coordinating Council	No	1) We recommend changing R3 from "Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change being completed." to "Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of completion of the entity's change process." 2) "Dated" is used only in the Measures (M1, M2, M3, M4, M5). Adding a requirement in the measures is inappropriate.

Response:

1) The FERC Order consistently requires a shortening of the update period and communication of the updates to personnel responsible for the activation, and the Order recommends 30 days. The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.

2) **The word "dated" will be removed at this time. The measures will be reviewed and considered in an upcoming drafting phase of these standards.**

Organization	Yes or No	Question 8 Comment
WECC Relibaility Coordination	No	We feel 90 days is a reasonable time frame.
Response: **The FERC Order consistently requires a shortening of the update period and communication of the updates to personnel responsible for the activation, and the Order recommends 30 days. The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Southern Company	Yes	
Luminant Power	Yes	
Encari	No	General Comments Pertaining to All Standards--Other modifications were also made to this standard that are not included as part of the question. 1) The wording of 1.1.1 is awkward and should be modified. 2) We also request further clarification regarding the Data Retention Requirement 1.4.2 as to which entity will be maintaining the last audit records and submitted subsequent audit records. As the statement is currently worded "in conjunction" leaves this open to interpretation.
Response: **1) The intent of the wording in 1.1.1 is to clarify which entity will serve as the Compliance Enforcement Authority. For most standards, the Regional Entity serves as the Compliance Enforcement Authority and audits the performance of the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, Generator Owner, etc. In this standard, the Regional Entity is responsible for some of the requirements – but an entity cannot audit its own performance. Where the Regional Entity is also the responsible entity, the ERO will audit the Regional Entity's performance. Where the ERO is the responsible entity, a third-party monitor without vested interest in the outcome will conduct the audit.** **2) The data retention periods for the standard requirements are specified in the standards. The language of 1.4.2 indicates that the Compliance Enforcement Authority and the Registered Entity will retain all the audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities. The audit data retention period is determined by the audit period for each Registered Entity.** **The phrase, "in conjunction with" was deliberately used to recognize that there may be some confidential records that fall into the category of "critical energy infrastructure information" as defined in the ERO Rules of Procedure – and the responsible entity**		

Organization	Yes or No	Question 8 Comment
has the right to retain control over these records. Most other records will be retained by the Compliance Enforcement Authority.		
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	Yes	
Consolidated Edison Company of New York, Inc.	No	1) We recommend changing R3 from "Updates shall becommunicated to personnel responsible for the activation and implementation of the recoveryplan(s) within thirty calendar days of the change being completed." to "Updates shall becommunicated to personnel responsible for the activation and implementation of the recoveryplan(s) within thirty calendar days of completion of the Entity's change process." 2) "Dated" is used only in the Measures (M1, M2, M3, M4, M5). Adding a requirement in the measures is inappropriate
Response: **1) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **2) The word "dated" will be removed at this time. Southern California Edison Company	Yes	
Tampa Electric Company	No	Section 1.5 Regarding the removal of the language in Section 1.5 : Additional Compliance Information: It is not clear if removal of this language is implying that authorized exceptions result in non-compliance. There are situations where requirements of this standard cannot be met, particularly for legacy equipment and associated vendor supplied systems. The following language should be reinstated in the standard: "Duly authorized exceptions will not result in non-compliance."

Organization	Yes or No	Question 8 Comment
Response: **Situations where the standards requirements cannot be met will be handled through the Technical Feasibility Exception process under the NERC Rules of Procedure. The technical feasibility exception process will address the requirements for documenting, approving, and remediating the exception. Any sanction decisions will arise from the TFE process. It is not appropriate to assert that "duly authorized exceptions will not result in non-compliance" within Section D-1.5 of the standard.**		
Electric Market Policy	Yes	NERC (Step 4.1.10) and Regional Entity (Step 4.1.11) are not defined in the NERC Glossary of Terms or Functional Model.
Response: **NERC and Regional Entity are defined in NERC's corporate documents including, but not limited to, the Certificate of Incorporation and ByLaws.**		
PPL Corporation	Yes	
MRO NERC Standards Review Subcommittee	No	The MRO NSRS questions the change in timing requirements for R3 from 90 days to 30 days. What is the justification for change? Do you have specific examples of problems that resulted from the plan(s) not being updated within 90 days.
Response: **The FERC Order consistently requires a shortening of the update period and recommends 30 days. The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Pepco Holdings, Inc - Affiliates	No	It may not be possible to communicate updates of recovery plans to all personnel responsible for activating or implementing the plan within 30 days (e.g. family leave). Suggest adding exceptions.

The measures will be reviewed and considered in an upcoming drafting phase of these standards..**		
CenterPoint Energy	No	Regarding R3, CenterPoint Energy acknowledges that updates to a recovery plan and communication of those updates should be completed in a timely manner; however, CenterPoint Energy believes the SDT went too far in reducing the timeframe for communicating updates from 90 days to 30 days. CenterPoint Energy believes that 30 days is too constraining. Furthermore, in FERC Order 706, paragraph 731, the Commission separated the time allowed for updating recovery plans (30 days) and the time allowed for communicating those updates (90 days), and was willing to consider timeframes other than 30 days. CenterPoint Energy proposes a 60 day window for updating a recovery plan and retaining the 90 day window for communicating the updates to responsible personnel. This would allow adequate time for the appropriate documentation changes to be made and is still timely for communicating to personnel.
Response: **The FERC Order consistently requires a shortening of the update period and communication of the updates to personnel responsible for the activation, and the Order recommends 30 days. The SDT agrees with this position. Further, the 30 day period begins upon final implementation of the changes. At that point, much of the due diligence should already be completed related to the actual implementation with final documentation to follow within 30 days.**		
Manitoba Hydro	Yes
