Austin Energy	Yes	
Kansas City Power & Light	Yes	
San Diego Gas and Electric Co.	Yes	

9. The CSO706 SDT proposes the following for the **Effective Date**:

   The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

   Do you agree with the proposed Effective Date? If not, please explain and provide an alternative to the proposed effective date that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 9 Comment
Detroit Edison Company	No	Does this mean that the current quarter must end, and then you start counting to the first day of the following 3 quarters, or do you include the current quarter in counting? Why not simplify things and use a number of days, such as: "120 calendar days after applicable regulatory approvals have been received . . . . . ."
Response: **The NERC Compliance program has requested the implementation date start on a calendar quarter (January 1, April, 1, July 1, October1). The proposed effective date for the Version 2 standards is the first day of the third calendar quarter (i.e., a minimum of two full calendar quarters, and not more than three calendar quarters). Calendar quarters are January-March, April-June, July-September, and October-December. For example, if regulatory approval is granted in June, the standards would become effective January 1 of the following year. If regulatory approval is granted in July, the standards would become effective April 1 of the following year.**		
PacifiCorp	No	This effective date as written could move the compliance date for our GO functions up 6 months from the previously published compliance schedule found in Table 3. PacifiCorp has been working toward compliance with the standards under the premise that the generation owner has until December 31, 2009, to become compliant with Version 1 standards. For significant changes proposed in Version 2, the generation owner will need time to address and comply.
Response: **The drafting team anticipates that the Phase 1 revisions to the standards will not be approved by the NERC Board of Trustees until the end of May 2009. Accordingly, the earliest possible effective date would be January 1, 2010. Regulatory agency approval processes could push this date out even further for Responsible Entities within those jurisdictions.**		

Organization	Yes or No	Question 9 Comment
FirstEnergy Corp	Yes	
MidAmerican Energy Company	No	Comment: This effective date as written could move the compliance date for our GO functions up 6 months from the previously published compliance schedule. MidAmerican Energy Company has been working toward compliance with the standards under the premise that the generation owner has till December 31, 2009, to become compliant with version 1 standards. For significant changes proposed in version 2, the generation owner will need time to address and comply. For applicable regulatory approvals received between January 1 and March 31, revised standards will be effective the following January 1.MEC proposes the following language: Effective Date: The first day of the calendar quarter after at least nine months following the applicable regulatory approvals have been received, as illustrated in the following table. Applicable regulatory approval received - Effective the following Jan. 1- Mar. 31 Jan. 1Apr. 1- June 30 Apr.1July 1- Sept. 30 July 1Oct. 1- Dec. 31 Oct. 1
Response: **The drafting team anticipates that the Phase I revisions to the standards will not be approved by the NERC Board of Trustees until the end of May 2009. Accordingly, the earliest possible effective date would be January 1, 2010. Regulatory agency approval processes could push this date out even further for Responsible Entities within those jurisdictions. The drafting team believes the six to nine month implementation plan is reasonable.**		
Northeast Power Coordinating Council	No	1) - Existing words are confusing. We recommend changing from "The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)" to "The first day after two full consecutive quarters after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day after two full consecutive quarters after NERC Board Of Trustees adoption in those jurisdictions where regulatory approval is not required)". In addition, Canadian members of NPCC have concerns regarding the standards becoming effective at different dates in different jurisdictions. Coordination is required among government authorities to ensure that standards become effective at the same time in all jurisdictions. 2) - Request confirmation that these Effective Dates apply to these updates (Version 2). 3) - We request an addition to the Effective Date clause in CIP-002 - CIP-009 - "Compliance cannot require supporting documentation prior to the Standard's effective date." 4) - We request clarification on Compliance 1.1.1. Wording is confusing. 5) - While Regional Reliability Organization and Compliance Monitor are in the NERC Glossary, the

Organization	Yes or No	Question 9 Comment
		new terms are not (Regional Entity and Compliance Enforcement Authority). 6) - When will we have an opportunity to comment on the Violation Severity Levels (VSLs)? 7) - Clarification required for "the last audit records" and "subsequent audit records" in Data Retention 1.4.2. This comment applies to CIP-002 - CIP-009.

Response:

1) The NERC Compliance program has requested the implementation date start on a calendar quarter (January 1, April, 1, July 1, October1). The proposed effective date for the Version 2 standards is the first day of the third calendar quarter (i.e., a minimum of two full calendar quarters, and not more than three calendar quarters). Calendar quarters are January-March, April-June, July-September, and October-December. For example, if regulatory approval is granted in June, the standards would become effective January 1 of the following year. If regulatory approval is granted in July, the standards would become effective April 1 of the following year.

For some standards, such as standards that require entities in different organizations to work cooperatively with one another using a common set of rules or procedures to support reliability, we agree that there are benefits to having new or revised standards become effective at the same time in all jurisdictions. In situations where there is no coordination between entities in different regions or within an interconnection, then there is no apparent reliability benefit of delaying implementation until all governmental or regulatory authorities have approved the standard. We believe that the CIP standards fall into the second category – they primarily include requirements for entities to take in their own organizations.

2. The proposed effective dates on each standard (CIP-002-2 through CIP-009-2) are for these standards (Version 2) – not for the previous version that was already approved.

3. The requirements in the proposed standards would replace similar requirements in existing standards. If an entity were already expected to be compliant with a requirement in one of the "Version 1" CIP standards, then when the same requirement is replaced with its Version 2 equivalent, the expectation is that the entity has the evidence that was required under the Version 1 standard. Where entities need additional time to become compliant, this is noted in the implementation plan for the Version 2 standards.

4. 1.1.1 - The Regional Entity will serve as the Compliance Enforcement Authority for most entities. In situations where the Regional Entity is responsible for a requirement, the Regional Entity may not assess its own performance as part of an audit as this would serve as a conflict of interest. If the Regional Entity is responsible for a requirement, then the ERO will serve as the Compliance Enforcement Authority in auditing the Regional Entity.

5. The term, "Compliance Enforcement Authority" is used extensively in the ERO Rules of Procedure and replaced the term, "Compliance Monitor." This term has been used in standards under development since November of 2007 to more closely match the language used in the ERO Rules of Procedure – Appendix 4C – Uniform Compliance Monitoring and Enforcement Procedures.

Regional Entity is defined in NERC's corporate documents including, but not limited to, the Certificate of Incorporation and

Organization	Yes or No	Question 9 Comment
ByLaws. **6. The Violation Severity Levels (VSLs) are being developed by another Standards Drafting Team, and their schedule is outside the scope of the cyber security drafting team.** 7. **The "last audit record" would be the records from the last formal audit – if an entity were found noncompliant and there was a mitigation plan with milestones, then the subsequent audit records would include the mitigation plan and associated documentation.**		
WECC Reliability Coordination	Yes	
Southern Company	Yes	
Luminant Power	Yes	
Encari	No	This effective date is still open-ended as the process is not complete. Once additional comment periods have completed and the revisions have been refined we will provide comment as to the acceptability of this timeframe and the continued assurances of the reliability of the Bulk Electric System. We recommend that the standards become agreed upon and complete and then an effective implementation date be identified. This will provide proper assurances from asset owners that they can indeed meet the timeframe identified while continuing to assure the reliability of the BES. We also are confused regarding the term "calendar quarter" versus a concept of "fiscal quarter". Please provide a clarification.
Response: **The drafting team does not anticipate additional comment periods for the Phase 1 revisions to the CIP standards. The NERC Compliance program has requested the implementation date start on a calendar quarter (January 1, April, 1, July 1, October1). The proposed effective date for the Version 2 standards is the first day of the third calendar quarter (i.e., a minimum of two full calendar quarters, and not more than three calendar quarters). Calendar quarters are January-March, April-June, July-September, and October-December. For example, if regulatory approval is granted in June, the standards would become effective January 1 of the following year. If regulatory approval is granted in July, the standards would become effective April 1 of the following year.**

10. The CSO706 SDT is proposing a separate **CIP implementation plan** to address newly identified Critical Cyber Assets. In this plan, three specific classes of categories for newly identified Critical Cyber Assets are described. The plan provides an implementation schedule with "Compliant" milestones for each requirement in each category. All timelines are specified as an offset from the date when the Critical Cyber Asset has been newly identified.

    Do you agree with the approach proposed by the SDT for handling newly identified Critical Cyber Assets? If not, please explain and provide an alternative to the proposed milestones that would eliminate or minimize your disagreement.

Summary Consideration:

Organization	Yes or No	Question 10 Comment
Detroit Edison Company	Yes	
PacifiCorp	Yes	
FirstEnergy Corp	No	While we do agree with the overall objective the team is trying to achieve, we do not agree as presently written and offer the following comments: a) The description of Category 1 seems to imply that a Responsible Entity who has a CIP CA and CCA methodology, but did not identify any CCA assets may be given additional time to comply with the CIP standards when they have identified any CCAs on subsequent annual reviews. However, what is not clear is what triggered the new CCA being identified? The Category 1 description should be clear that it does not apply simply based on "error and ommission" if the Responsible Entity's methodologies for CA and CCA identification have not changed and the Responsible Entity simply overlooked an asset that should have been previously identified and protected. If these newly identified assets were in service during their initial CIP asset determination, then the entity was not compliant with their initial asset identification and it should be expected that the entity would file a Self Report and Mitigation Plan to obtain compliance. b) FE believes our above comment on Category 1 also applies to the Category 2 description as it indicates in the second paragraph that it refers to newly identified CCA assets but they are not associated with an addition or modification through construction, upgrade or replacement. Again, if the methodologies have not changed, if there was no merger or acquisition, then what triggered the newly identified existing asset? It should be clear that "error and ommission" do not apply. c) We agree with the provisions described for newly acquired assets through mergers and acquisitions when companies may have had differing methodologies.

Organization	Yes or No	Question 10 Comment
		d) We agree with item 3 regarding "Compliant upon Commissioning" for newly planned upgrades that result in new CA and CCA items. e) In general we found the information to be overly wordy and confusing to understand. We suggest the team attempt to greatly consolidate the information. f) Tables 2 should be adjusted such that it can be read and viewed stand alone to the extent possible from the remaining supporting text. For example, Table 2 has no indication that the numbers refer to "months".
Response: **a) The Implementation Plan does not evaluate why an asset becomes a newly identified Critical Asset. Changes in system conditions could result in the identification of an existing asset as a Critical Asset without modification to the Risk Assessment Methodology. An entity that misapplies its Risk Assessment Methodology could be in potential violation.** **b) The Implementation Plan does not evaluate why an asset becomes a newly identified Critical Asset. Changes in system conditions could result in the identification of an existing asset as a Critical Asset without modification to the Risk Assessment Methodology. An entity that misapplies its Risk Assessment Methodology could be in potential violation.** **c) Thank you for your comment.** **d) Thank you for your comment.** **e) The posted version is simplified from early drafts and must address the complexity of the problem.** **f) The tables will be updated to reflect the time period as being in months.**		
MidAmerican Energy Company	Yes	
Northeast Power Coordinating Council	No	1 - On the single page Implementation Plan, CIP-003 R2 is mandatory for all Entities. We suggested in answers to #1 and #2 that this Requirement move to CIP-002, which is already mandatory for these Entities. We agree that the CIP-003 R2 Requirement (wherever it is) should be 12 months. 2 - We request a clearer message that this new Implementation Plan applies to Version 1 and beyond Standards. It is too easy to believe this Plan applies to Version 2 because some refer to Version 2 (Table 2), and the Requirements do not match CIP-006-2. 3 - We recommend that the Implementation Plan consistently use Category 3 instead of interchanging with "Compliant upon commissioning." 4 - We request clarification on historical records for Category 3 (Compliant upon Commissioning) Critical

Organization	Yes or No	Question 10 Comment
		Cyber Assets. 5 - Second sentence of Category 2 (on page 3) is "The existing Critical Cyber Assets may remain in service while the relevant requirements of the CIP Standards are implemented." By their nature, CCAs must remain in service or have a detrimental effect on the grid. We recommend removal of this sentence. 6 - Category 2's second paragraph states "This category applies only when additional in-service Critical Cyber Assets or applicable other Cyber Assets are identified, not when they are added or modified through construction, upgrade or replacement." We recommend that emergency replacements be Category 2. This paragraph is different than the preceding flow chart. 7 - We recommend an additional scenario where a failed Cyber Asset in an emergency must be replaced with a Critical Cyber Asset, for example the original Asset used serial communications and the new Asset uses IP communications. We suggest this is Category 2. 8 - We recommend changing Category 3 (page 4) from "c) Addition of: "to "c) Planned addition of:" 9 - There is a discrepancy between the document's title and preamble (referring to CIP-003 and CIP-009) while Table 3 includes CIP-002. Please update or clarify.

Response:

1) All Entities must comply with all standards, and Entities that have no identified Critical Cyber Assets comply by invoking the exemption found in A.4.2.3 in each standard. Table 2 (Category 1) of the New Critical Cyber Asset Implementation Plan was in error and should have been N/A. Table 3 of the New Critical Cyber Asset Implementation Plan is invoked for a new Registered Entity, giving that Entity 12 months to comply.

2) The title of the document commonly referred to as the New Critical Cyber Asset Implementation Plan will be corrected to read "Implementation Plan for Cyber Security Standards CIP-002-2 through CIP-009-2 or Their Successor Standards." All references to Version 1 of the standards within the document will be similarly modified.

3) "Category 3" does not appear in the New Critical Cyber Asset Implementation Plan or the Version 2 Implementation Plan.

4) The New Critical Cyber Asset Implementation Plan describes only the Compliance Date, and no audit records are required for the Compliance Date.

5) The SDT agrees that the CCAs should remain in service to avoid a "detrimental effect on the grid." The inclusion of this sentence reinforces that belief. The SDT is concerned that if the sentence is removed, entities may remove the assets from service in order to not be found in non-compliance of the standard, resulting in a "detrimental effect on the grid." Similarly, changing the sentence to require that the assets must remain in service would not allow a brief maintenance outage to allow entities to implement changes associated with bringing the assets into compliance.

Organization	Yes or No	Question 10 Comment
6) Emergency provisions are described in Table 1 "Example Scenarios". The Figure 1 flowchart is a high-level process flow and does not contain the same level of detail. A special case of restoration as part of a disaster recovery situation (such as storm restoration) follows the emergency provisions of the Responsible Entity's policy required by CIP-003 R1.1. The SDT will modify the implementation plan to make it clear that the emergency provision is applicable to Category 2 as well as Compliant upon Commissioning. **7) The SDT will modify the implementation plan to make it clear that the emergency provision is applicable to Category 2 as well as Compliant upon Commissioning.** **8) The SDT agrees with the recommendation.** **9) The SDT agrees with the comment and will change the title of the document accordingly.**		
WECC Reliability Coordination	Yes	
Southern Company	Yes	
Luminant Power	Yes	
Encari	No	Due to the massiveness of the CCA process, we recommend that this approach needs to be partitioned in to its own comment period.

CenterPoint Energy		
Manitoba Hydro	No	The new implementation plan needs to clearly state that the categorization is only applied to newly

Organization	Yes or No	Question 10 Comment
		identified Critical Cyber Assets, and not to all Critical Cyber Assets. The new implementation plan should also state that the categorization of a Critical Cyber Asset expires and is no longer required when that Critical Cyber Asset becomes compliant. Table 2 needs to indicate that the milestones listed are in months. The title for Table 3 needs to be revised to indicate that the table is to be used for Registered Entities which have identified their first Critical Cyber Asset (Category 1), and for newly Registered Entities.
Response: **The New Critical Cyber Asset Implementation Plan repeatedly refers to "newly identified" Critical Cyber Assets. "Compliant Upon Commissioning" also includes Cyber Assets replacing existing Critical Cyber Assets. The categorization is only used to determine the applicable compliance schedule and has no meaning once the Critical Cyber Asset is compliant. The tables will be updated to reflect the time period as being in months.** **Table 2 is applicable to all Registered Entities that have now identified their first Critical Cyber Asset (Category 1) after registration.** **Table 3 is only applicable to newly Registered Entities whether or not they have identified a Critical Asset.**		
Alberta Electric System Operator		
Dynegy	No	Under the Category 2 heading, the proposed method for handling the case of a business merger or acquisition when any of the Responsible Entities involved had previously identified Critical Cyber Assets is inequitable and inconsistent with the proposed handling of the case when all Registered Entities have identified Critical Cyber Assets. Under the Category 2 heading, in the case of a business merger or acquisition when any of the Responsible Entities involved had previously identified Critical Cyber Assets, it really only matters if the acquiring or controlling Responsible Entity had previously identified Critical Cyber Assets. If the acquiring or controlling entity had not previously identified any Critical Cyber Assets it will have no CIP Compliance Program and it should be required to meet the same Category 1 (instead of Category 2) milestones established for the case where neither Registered Entity involved in merger had previously identified any critical Cyber Assets. In addition, in the case when all Registered Entities involved in a merger have identified Critical Cyber Assets the merged Responsible Entity is required to meet Category 2 milestones after one calendar year from the merger date. This provision in effect grants the Merged Responsibility Entity in this case the approximate equivalent of having to meet Category 1 milestones. This approach further justifies the revised approach suggested above for the former case.

Organization	Yes or No	Question 10 Comment
Response: **In the event of a merger or acquisition of a company resulting in a single registered entity, when both entities have existing programs, the Implementation Plan allows one year for the programs to be harmonized. When only one of the entities has an existing program, that program is expected to continue after the merger. In the case of acquisitions of assets resulting in a change in registered entity, if the acquiring company has a program and the acquired asset is already identified as critical, there is one year to harmonize the programs. If the acquiring company does not have a program and the acquired asset is already identified as critical, continuation of the program at the acquired asset is expected to be provided for in the acquisition process, assuming the asset continues to be critical.**		
Northern Indiana Public Service Company	No	Moving through the existing phases, I do not believe the steps provide for a situation in which a utility wishes to improve or strengthen the risk-based methodology. If a utility has an existing CCA and strengthens the methodology process which in turn produces a new CA and in turn new CCA's, the utility would find itself in immediate non-compliance. Based on this situation and using the flow chart contained within the proposed implementation schedule document, the responsible entity would already have an existing CCA, the Cyber assets of the new resulting CA would already be in service, and it would be a planned change as the utility chose to strengthen the existing methodology. The flow chart result would be compliant upon commissioning, and the cyber asset is already in service, therefore the real world result is immediate non-compliance. I believe this is counter productive as NERC and FERC would encourage an entity to strengthen the risk-based methodology. The current proposed implementation schedule would encourage a utility to not strengthen the risk-based methodology over time in order to remain in compliance. I believe additional provisions need to be made.
Response: **The described scenario is defined in Table 1 "Example Scenarios". The Figure 1 flowchart is a high-level process flow and does not contain the same level of detail.**		
CoreTrace		
Oncor Electric Delivery LLC	No	The timeframes in Table 2 are reasonable. However, CIP-002-1 currently specifies that an asset is not designated as a Critical Asset until the annual application of the Risk-Based Methodology. A cyber asset is not a Critical Cyber Asset unless it is essential to the operation of the Critical Asset. Category 3 "Compliant upon Commissioning" is not a current requirement of CIP-002-1 and represents a significant change to the current standard. This seems to imply that the Risk-Based Methodology must be applied continuously, not just annually. "Compliant upon Commissioning" should only apply to replacing existing Critical Cyber Assets. New Critical Cyber Assets identified by CIP-002-1 Requirement R3 should utilize the timeframes in Category 2

Organization	Yes or No	Question 10 Comment
Response: **CIP-002-2, Requirements R2 (Critical Asset identification) and R3 (Critical Cyber Asset identification) state "the Responsible Entity shall review this list at least annually, and update it as necessary." These requirements expect the entity to assess the new asset or Cyber Asset as part of the planning process.**		
Illinois Municipal Electric Agency		
Ontario Power Generation	No	We note that the implementation plan for newly identified Critical Cyber Assets specifies that it applies to "CIP-002-1 through CIP-009-1 and their successor standards". We further notice that in Milestone Category 2 an number of requirements have a six (6) month timeframe specified for compliance. In effect, the identification of a new CCA at an Entity today would be required to be fully compliant with respect to that new newly identified CCA before December 31, 2009 - the Compliant deadline for all other CCAs.
Response: **The drafting team anticipates that the Phase I revisions to the standards will not be approved by the NERC Board of Trustees until the end of May 2009. Accordingly, the earliest possible effective date would be January 1, 2010. Regulatory agency approval processes could push this date out even further for Responsible Entities within those jurisdictions.**		
American Electric Power	Yes	
Ontario IESO	Yes	We believe the proposed implementation plan is reasonable and appropriate.
Response: **Thank you for your comment.**		
Ameren	Yes	Would like to see a clarification on what is intended by phrase "planned change".
Response: **A "planned change" is any anticipated and planned for change to an asset or Cyber Asset.**

Austin Energy	Yes	
Kansas City Power & Light	Yes	
San Diego Gas and Electric Co.	Yes	

11. Do you agree with the **compliance milestones** included in the proposed implementation plan for handling newly identified Critical Cyber Assets? If not, please explain and provide an alternative to the proposed milestones that would eliminate or minimize your disagreement..

Summary Consideration:

Organization	Yes or No	Question 11 Comment
Detroit Edison Company	No	Table 2 does not address CIP-006-2 R7 and R8. They should both be 24 for category 1 and 12 for category 2. Table 2 CIP-008-2 R2 category 2 should be changed from 0 to 6 which matches the timetable associated with R1. The 0 implies that a Responsible Entity needs to retain documents relating to requirement, R1.1, which that entity is not yet required to be compliant. Table 2 CIP-009-2 R2 and R3 category 2 should be changed from 0 to 12. Similarly to the comment around CIP-008-2 R2, a Responsible Entity cannot be compliant with exercising a plan that is not required to exist. Changing the timetable to 12 ensures the recovery plan is initially executed in the annual time frame required by R2.
Response: **Table 2 does not reflect the addition of two new requirements in CIP-006-2. The SDT will update the tables appropriately.** **The formal title and references to the CIP standards will be modified to refer to the Version 2 standards and their successors.** **The SDT will update Table 2 CIP-008-2 R2 category 2 to 6 months as recommended.** **The SDT will update Table 2 CIP-009-2 R2 and R3 category 2 to 12 months as recommended.**		
PacifiCorp	Yes	
FirstEnergy Corp	Yes	We agree with the Implementation Plan times described for Category 1 and Category 2, however, we believe clarification is need as to when these provisions apply. See our comments in Question 10.

Organization	Yes or No	Question 11 Comment
Response: **The Implementation Plan does not evaluate why an asset becomes a newly identified Critical Asset. Changes in system conditions could result in the identification of an existing asset as a Critical Asset without modification to the Risk Assessment Methodology. An entity that misapplies its Risk Assessment Methodology could be in potential violation.**		
MidAmerican Energy Company	Yes	
Northeast Power Coordinating Council	No	1 - We recommend that Table 2 clarify the units as months, per page 1. 2 - Table 2 CIP-008 R2 Category 2's value is 0. Since R2 depends on R1 which is 6 months, this appears to need work. We recommend R2 change to 6. 3 – Table 2 CIP-009 R2 and R3 Category 2's value is 0. Since R2 and R3 depend on R1 which is 6 months, this appears to need work. We recommend R2 and R3 change to 6.
Response: **1) The tables will be updated to reflect the time period as being in months.** **2) The SDT will update Table 2 CIP-008-2 R2 Category 2 to 6 months as recommended.** **3) The SDT will update Table 2 CIP-009-2 R2 and R3 Category 2 to 12 months.**		
WECC Reliability Coordination	Yes	
Southern Company	Yes	
Luminant Power	Yes	
Encari	No	Due to the massiveness of the CCA process, we recommend that this approach needs to be partitioned in to its own comment period. For instance, the current document details "existing" within CIP-003-2; however - newly identified CCAs may not immediately be able to compliant at zero day with CIP-003-2 requirements. For example R4 requires the information associated with the CCA to be protected. This information may still reside in a non-protected format prior to becoming a CCA - however the

Organization	Yes or No	Question 11 Comment
		implementation timeframe is "existing".
Response: **The drafting team does not anticipate additional comment periods for the Phase I revisions to the CIP standards.** **The SDT agrees with the example cited and will modify the Category 2 compliance time frame for CIP-003-2 Requirements R4, R5, and R6 to be 6 months.**		
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	Yes	
Consolidated Edison Company of New York, Inc.	No	1 - We recommend that Table 2 clarifies the units as months, per page 12 - Table 2 CIP-008 R2 Category 2's value is 0. Since R2 depends on R1 which is 6 months, this appears to need work. We recommend R2 change to 6.3 - Table 2 CIP-009 R2 and R3 Category 2's value is 0. Since R2 and R3 depend on R1 which is 6 months, this appears to need work. We recommend R2 and R3 change to 6.
Response: **1) The tables will be updated to reflect the time period as being in months.** **2) The SDT will update Table 2 CIP-008-2 R2 Category 2 to 6 months as recommended.** **3) The SDT will update Table 2 CIP-009-2 R2 and R3 Category 2 to 12 months.**		
Southern California Edison Company	Yes	
Tampa Electric Company	Yes	
Electric Market Policy	Yes	On page 6, Table 2 Milestone Categories should indicate "months."

Organization	Yes or No	Question 11 Comment
Response: **The tables will be updated to reflect the time period as being in months.**		
PPL Corporation	No	PPL has concerns with the existing implementation schedule. Table 2 identifies some standard requirements as existing for Category 2 milestones. Having an Information Protection program does not mean that all information associated with a newly identified Critical Cyber Asset is immediately protected. For example, if an RE identifies an asset as critical with critical cyber assets, not all drawings and documentation will exist immediately marked as such. Even existing programs need to be applied to newly identified assets requiring an implementation schedule. The second concern is dependent on the outcome of the FERC Order for Clarification of CIP standards applicability to nuclear generating facilities. If the FERC Order results in nuclear facilities being included in the CIP applicability, this implementation plan should be noted to not include nuclear facilities affected by the pending FERC Order. The FERC Clarification Order needs to address the schedule for including nuclear facilities in the CIP applicability.
Response: **The SDT agrees with the example cited and will modify the Category 2 compliance time frame for CIP-003-2 Requirements R4, R5, and R6 to be 6 months.** **The issue of nuclear facilities is out of scope for this drafting team.**		
MRO NERC Standards Review Subcommittee	Yes	
Pepco Holdings, Inc - Affiliates		
United Illuminating Company	Yes	
Deloitte& Touche, LLP	Yes	
Exelon	No	The 6 month implementation milestones listed for CIP-004-2 Category 2 should instead reflect 6 months from when the new security boundaries and systems get implemented instead of 6 months from the

Organization	Yes or No	Question 11 Comment
		identification of the newly identified Critical Cyber Asset. Entities will not be able to know all the affected personnel until the new physical and electronic security perimeters are defined and implemented.
Response: **The SDT agrees with the comment and will modify the timeframe to 18 months after the new CCA is identified for Category 2 for CIP-004 Requirements R2, R3 and R4.**		
Old Dominion Electric Cooperative	Yes	
City of Tallahassee (TAL)	Yes	
BC Transmission Corporation	Yes	
Applied Control Solutions, LLC	Yes	
US Bureau of Reclamation	No	The agreement would be based on the response to the CIP-004 background check requirement timeframe. The milestones would require adjustment for more exhaustive background checks.
Response: **Personnel can be granted unescorted access as long as a personnel risk assessment has been conducted according to the requirements in CIP-004 R3.** **A more exhaustive background check is not required; therefore an adjustment to the implementation plan is not necessary..**		
Orange and Rockland Utilities Inc.	No	1 - We recommend that Table 2 clarifies the units as months, per page 1 2 - Table 2 CIP-008 R2 Category 2's value is 0. Since R2 depends on R1 which is 6 months, this appears to need work. We recommend R2 change to 6. 3 - Table 2 CIP-009 R2 and R3 Category 2's value is 0. Since R2 and R3 depend on R1 which is 6 months, this appears to need work. We recommend R2 and R3 change to 6.

Organization	Yes or No	Question 11 Comment
Response: **1) The tables will be updated to reflect the time period as being in months.** **2) The SDT will update Table 2 CIP-008-2 R2 Category 2 to 6 months as recommended.** **3) The SDT will update Table 2 CIP-009-2 R2 and R3 Category 2 to 12 months.**		
CenterPoint Energy		
Manitoba Hydro	No	CIP-003-2 R3, R4, and R5: The milestones should be changed to 6 months. Although the information protection, access control and change control and configuration management programs exist, the requirements also include implementation, which will require some time to meet compliance. CIP-008-2 R2: The milestone should be changed to 6 months, the same as R1. The documentation required in R2 is dependent upon the elements in the Cyber Security Incident Response Plan developed in R1. CIP-009-2 R2 and R3: The milestones should be changed to 6 months, the same as R1. The exercises and change control in R2 and R3 are dependent upon the elements in the Recovery Plan developed in R1.
Response: **The SDT interprets the comments to refer to Milestone Category 2.** **CIP-003, Requirement R3 has no implementation requirements, and thus the current timeframe is reasonable.** **The SDT will modify the Category 2 compliance timeframe for CIP-003-2 Requirements R4, R5, and R6 to be 6 months.** **The SDT will update Table 2 CIP-008-2 R2 Category 2 to 6 months as recommended.** **The SDT will update Table 2 CIP-009-2 R2 and R3 Category 2 to 12 months.**		
Alberta Electric System Operator		
Dynegy	Yes	

Organization	Yes or No	Question 11 Comment
Northern Indiana Public Service Company	No	I do not believe CIP-003-2 R3-R6 should be assumed to exist under Category 2 assets. An entity may need to identify exceptions, information, provide access control to that information and implement change control procedures on the newly identified asset. I also do not believe that it should be assumed that an entity can obtain the necessary financial capital to implement systems for compliance in any immediate fashion.
Response: **The SDT will modify the Category 2 compliance timeframe for CIP-003-2 Requirements R4, R5, and R6 to be 6 months.** **An entity that cannot comply within the implementation plan will be expected to submit a self-report of non-compliance with a mitigation plan that provides sufficient time to obtain funding.**		
CoreTrace		
Oncor Electric Delivery LLC	Yes	
Illinois Municipal Electric Agency		
Ontario Power Generation	No	We interpret that the plan seems to collapse together the Compliant and Auditably Compliant milestones. We note that it is not possible to identify a new CCA, bring it into a state or Compliant (as defined in the currently applicable standard) and have one year of data and records as required to be Auditably Compliant. We believe clarification is required in this area.
Response: **The New Critical Cyber Asset Implementation Plan states that "the Responsible Entity is expected to have all audit records required to demonstrate compliance (i.e., to be 'Auditably Compliant') one year following the [compliant] milestone listed in this Implementation Plan."**		
American Electric Power	Yes	
Ontario IESO	Yes	We believe the proposed implementation plan is reasonable and appropriate.

12. The CSO706 SDT seeks input on whether to include the information contained in this **stand-alone implementation plan within the body of each standard.** This would likely entail a new requirement in CIP-002 to classify newly identified Critical Cyber Assets, and changes to the remaining standards to insert the milestone timeframes.

    Do you agree with including the information about newly identified Critical Cyber Assets and newly registered entity information within the body of the standards which would eliminate the stand-alone documents? If not, please explain.

Summary Consideration:

Organization	Yes or No	Question 12 Comment
Detroit Edison Company	Yes	
PacifiCorp	Yes	
FirstEnergy Corp	No	The stand alone document is sufficient and could be easily added as a reference document to each standard.
Response: **Thank you for your comment. The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
MidAmerican Energy Company	Yes	
Northeast Power Coordinating Council	Yes	
WECC Reliability Coordination	Yes	
Southern Company	Yes	
Luminant Power	Yes	

Organization	Yes or No	Question 12 Comment
Encari	No	We agree that the requirement to identify new CCA should be included; however, we believe that a continued need to guide Responsible Entities in the selection of CAs and CCAs is still necessary as separate documents.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase 1 of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision. Guidelines for the identification of Critical Assets and Critical Cyber Assets are currently being developed.**		
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	No	Including the implementation plan information in the individual CIP standards would greatly increase the size and complexity of each standard. All NERC Reliability Standards, including CIP, must be interpreted using various stand-alone documents (e.g., NERC Glossary of Terms Used in the Reliability Standards, NERC Reliability Functional Model, Compliance Monitoring and Enforcement Program, etc.). It's not a problem having the Implementation Plan available as a separate link or as a companion document to the CIP Reliability Standards.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
Consolidated Edison Company of New York, Inc.	Yes	
Southern California Edison Company	Yes	
Tampa Electric Company	Yes	
Electric Market Policy	Yes	

Organization	Yes or No	Question 12 Comment
PPL Corporation	Yes	
MRO NERC Standards Review Subcommittee	Yes	
Pepco Holdings, Inc - Affiliates	Yes	In response to the CSO706 SDT question, we agree that the implementation plan for newly identified Critical Cyber Assets should be incorporated into the cyber security standard and believe that it should be included as part of CIP-002-1.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
United Illuminating Company	Yes	
Deloitte& Touche, LLP	Yes	
Exelon	Yes	
Old Dominion Electric Cooperative	Yes	I agree with including this information in the standards so everyone, user and Region, understands what is required. Leaving it in a stand alone document might allow for FERC to unilaterally change the implementation timeframe without stakeholder input. I hate to have to revise the CIP standards again, but this is important.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
City of Tallahassee (TAL)	Yes	I am for eliminating stand alone documents, although this incorporation can be made in Version 3, since you have stated one will be done for the more contentious issues.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will**		

Organization	Yes or No	Question 12 Comment
consider incorporating the implementation plan into the standards in a subsequent revision.		
BC Transmission Corporation	Yes	
Applied Control Solutions, LLC	Yes	
US Bureau of Reclamation	No	Inserting the information and time lines for newly identified Critical Cyber Assets and newly registered entity information into the body of the standards will cause unnecessary confusion regarding the implementation of the standards. By retaining the current stand-alone implementation plan it provides a ready reference and single point of information for all new Critical Cyber Assets and newly registered entities.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
Orange and Rockland Utilities Inc.	Yes	
CenterPoint Energy		
Manitoba Hydro	Yes	Implementation plans which expire should be stand-alone documents from the standards. On-going implementation plans should be incorporated into the standards to create self-contained standards.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
Alberta Electric System Operator		
Dynegy	Yes	

Organization	Yes or No	Question 12 Comment
Northern Indiana Public Service Company	Yes	
CoreTrace	No	To include the distinct procedures for newly identified Critical Cyber Assets would introduce a level of complexity and confusion into the current standard. As they stand today the CIP requirements are easy to understand and useful. A reference to the standalone implementation plan in the CIP body would be useful and sufficient and ensure that the information in the implementation plan was not overlooked.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
Oncor Electric Delivery LLC	Yes	
Illinois Municipal Electric Agency		
Ontario Power Generation		
American Electric Power	Yes	AEP believes that there should be a statement in the standard providing a reference to the implementation plan and that the implementation plan be included in an appendix of the standard.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
Ontario IESO	No	We believe that an implementation plan managed as a separate document is a more logical choice. Information is less likely to be repetitive and other standards can reference it as necessary. However, where an issue pertains to a single standard, it would be appropriate to include the pertinent implementation information within that standard.

Organization	Yes or No	Question 12 Comment
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
Ameren	Yes	
Consumers Energy Company	Yes

ISO New England Inc	Yes	
American Transmission Company	Yes	
TVA	Yes	
Duke Energy	Yes	
Brazos Electric Power Cooperative, Inc.		
Progress Energy	No	PE recommends referring to the implementation plan but not including it in the standard.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
Standards Review Committee of ISO/RTO Council	No	We believe an implementation plan managed as a separate document is a more logical choice. Information is less likely to be repetitive and other standards can reference it as necessary. However, where an issue pertains to a single standard, it would be appropriate to include the pertinent implementation information within that standard.

Organization	Yes or No	Question 12 Comment
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
KEMA	No	Any change to the Standards is a long a laborious effort, so a change in implementation plan will have to go through the process. A separate document with the plan facilitites changes to the plan and not the Standard.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase 1 of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
Austin Energy	No	I have a question as to why any newly installed asset would be anything but critical. Certainly existing assets can degrade to a point where they no longer fulfill a critical role, but why would a new asset be installed if there was not a need?
Response: **There may be multiple reasons for building a Bulk Electric System (BES) asset, including reliability or economic. Other reasons might include transmission to connect a new merchant generator (which may have economic benefit to the GO, but not necessarily the TO), or BES assets supporting increased retail or wholesale load. Alternatively, a parallel implementation to "modernize" a non-critical asset would still be non-critical. It is left up to the Responsible Entity to determine if the newly built asset is a Critical Asset based on its impact to the reliability of the BES. Similarly, a Cyber Asset might be installed within an Electronic Security Perimeter that is not determined to be a Critical Cyber Asset.**		
Kansas City Power & Light	Yes	This seems like the most logical place to put those requirements. Otherwise we'll end up with Standards that have to be cross-referenced against multiple sets of documents.
Response: **The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.**		
San Diego Gas and Electric Co.	No	For clarity, SDG&E prefers the stand-alone Implementation Plan documents as presented rather than integrating the information for newly identified CCAs and newly registered entities into the existing CIP standards. This will help eliminate confusion and keep the existing Standard requirements and new

Organization	Yes or No	Question 12 Comment
		CCAs/Registered Entity information separate.

Response:

The SDT will maintain the New Critical Cyber Asset Implementation Plan as a separate document for Phase I of the revisions and will consider incorporating the implementation plan into the standards in a subsequent revision.

13. Do you agree that the Phase I improvements addresses the **time-sensitive FERC Order directives**? If not, please explain.

Summary Consideration:

Organization	Yes or No	Question 13 Comment
Detroit Edison Company	Yes	
PacifiCorp	No	The new effective date goes above the requirements listed in Order 706 and adds undue burden on the industry that will create the need for multiple technical exceptions and mitigation plans.
Response: **The requirements in the proposed standards would replace similar requirements in existing standards. If an entity were already expected to be compliant with a requirement in one of the "Version 1" CIP standards, then when the same requirement is replaced with its Version 2 equivalent, the expectation is that the entity has the evidence that was required under the Version 1 standard. Where entities need additional time to become compliant, this is noted in the implementation plan for the Version 2 standards.** **The Standards Drafting Team believes that the six to nine month implementation plan is reasonable.**		
FirstEnergy Corp	Yes	For the most part we agree with the improvements except for our previous comments in questions 3, 10 and 11.Also, we offer the following additional suggested improvements:CIP-002-2 R3 - The phrase "automatic generation control" should be capitalized since it is a NERC defined term.CIP-003 M1 - The SDT should consider removing the second sentence "Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2" since the language in the first sentence already covers the necessary measure.CIP-005 R2.4 - The word "strong" should be removed since it is not clearly defined and measurable.CIP-007 - R2,R3,R5 - The word "establish" should be removed consistant with the other CIP standards. All that should be required is to "implement and document".- R5.1.2 - Replace "establish" with "have".- R7 - Replace "establish" with "document.CIP-009 - The first sentence in "Sec. B Requirements" which states "The Responsible Entity shall comply with the following requirements of Standard CIP-009-2:" is not necessary and should be removed consistant with the other CIP revisions. FAQ Document - Is the SDT considering changes to the FAQ document to align with these proposed changed to the standards? Or is the FAQ document not a "living" document and was only to be used for the version 1 standards development? Regarding measures in CIP-002 through CIP-009, the drafting team should consider revising the measures to

Organization	Yes or No	Question 13 Comment
		include some guidance on the types of evidence or documentation that a responsible entity should and/or could have to demonstrate compliance. Throughout the standards the phrases "at least" and "at a minimum" are used and we fee that they are unnecessary. It is already understood that the standard requirements are the minimum expectations. Throughout the standards we suggest the SDT add the VRFs for each main requirement. Lastly, it would be appreciated if the SDT would use underlining in addition to the blue colored text to reflect inserted text for readability of black-n-white printed/copied material.
Response: **These types of issues will be addressed in Phase 2 of the CIP Standards; please use the Phase 2 comment period if you feel that your concerns have not been addressed.**		
MidAmerican Energy Company	No	The new effective date goes above the requirements listed in Order 706 and adds undue burden on the industry that will create the need for multiple technical exceptions and mitigation plans.
Response: **The requirements in the proposed standards would replace similar requirements in existing standards. If an entity were already expected to be compliant with a requirement in one of the "Version 1" CIP standards, then when the same requirement is replaced with its Version 2 equivalent, the expectation is that the entity has the evidence that was required under the Version 1 standard. Where entities need additional time to become compliant, this is noted in the implementation plan for the Version 2 standards.** **The Standards Drafting Team believes that the six to nine month implementation plan is reasonable.**		
Northeast Power Coordinating Council	Yes	We agree with the removal of "reasonable business judgment" and "acceptance of risk".
Response: **Thank you for your comment.**		
WECC Reliability Coordination	Yes	
Southern Company	Yes	

Organization	Yes or No	Question 13 Comment
Luminant Power	No	Luminant thanks the Standards Drafting Team for their work addressing improvements to the NERC CIP Standards CIP-002 through CIP-009. As indicated by our "yes" responses to the comment form, in general Luminant agrees with the drafting team regarding the phased approach, implementation plan and the changes to address the time-sensitive issues from the FERC Order. However, on each standard the drafting team changed the language under the Data Retention sections 1.4.1 and 1.4.2. Luminant agrees with the intent of the changes but does not believe the language provides sufficient clarity. Luminant respectfully submits the following suggested language for the aforementioned data retention sections on each standard. 1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-002-2 for the current calendar year and the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation. The Responsible Entity shall keep documentation required by the Compliance Enforcement Authority for an investigation for one year after Compliance Enforcement Authority notice to the Responsible Entity that the investigation is completed.1.4.2 The Compliance Enforcement Authority and the Responsible Entity shall each retain all requested and submitted audit records from the most recent audit.
Response: **The language of 1.4.2 indicates that the Compliance Enforcement Authority "in conjunction with" the Registered Entity will retain all the audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities and supports the need to retain the confidentiality of some data. The audit data retention period is determined by the audit period for each Registered Entity.**		
Encari	No	FERC provided directives on nearly all of the current requirements and guidance to include further requirements. The identification of what to modify in a time-sensitive manner was not open for public comment. We recognize the need to act swiftly to protect the assets; however, assurances also need to be made to protect system reliability. As an example, we feel that further clarifications around how to select critical assets and critical cyber assets would have provided a greater impact on the process and recommend that a public comment period be opened for the current draft guidelines. Therefore we recommend providing public comment periods to help the selection process of which FERC directives to introduce in the next phase of changes.
Response: **The Standards Drafting Team agrees that there are a variety of pressing needs such that a proritization process would be helpful. Once the time sensitive issues have been identified, the next step includes a discussion about the phased implementation approach**		

Organization	Yes or No	Question 13 Comment
to all of the FERC recommendations, while also considering industry needs.		
TransAlta Centralia Generation, LLC	Yes	
Bonneville Power Administration	Yes	
Consolidated Edison Company of New York, Inc.	Yes	We agree that Phase I addresses the time-sensitive FERC Order directives to remove "reasonable business judgment" and "acceptance of risk".
Response: **Thank you for your comment.**		
Southern California Edison Company	Yes	SCE hereby submits these additional general comments and questions (not related to or in response to Question 13): 1. What is the approval process for Violation Severity Levels? Will they be part of the standards? Will they be circulated for comment as part of the approval process? 2. In the Data Retention section of each Standard, a retention period is not specified for audit records. What is the retention period?
Response: **1) The Violation Severity Levels (VSLs) for Version 1 of the CIP Standards (CIP-002-1 through CIP-009-1) are being developed by another Standards Drafting Team, and their schedule is outside the scope of the cyber security drafting team. The VSLs for Version 2 of the CIP Standards (CIP-002-2 through CIP-009-2) associated with the changes being proposed by the Standards Drafting Team for this project are currently being coordinated with the other Standards Drafting Team and will be posted for Industry Comment. The schedule for doing so is currently unknown.** **2) The data retention periods for the standard requirements are specified in the standards. The language of 1.4.2 indicates that the Compliance Enforcement Authority "in conjuncgtion with" the Registered Entity will retain all the audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities. The audit data retention period is determined by the audit period for each Registered Entity.**		

Organization	Yes or No	Question 13 Comment
Tampa Electric Company	Yes	
Electric Market Policy	Yes	
PPL Corporation	Yes	
MRO NERC Standards Review Subcommittee	No	The new effective date goes above the requirements listed in Order 706 and adds undue burden on the industry that will create the need for multiple technical exceptions and mitigation plans.
Response: **The requirements in the proposed standards would replace similar requirements in existing standards. If an entity were already expected to be compliant with a requirement in one of the "Version 1" CIP standards, then when the same requirement is replaced with its Version 2 equivalent, the expectation is that the entity has the evidence that was required under the Version 1 standard. Where entities need additional time to become compliant, this is noted in the implementation plan for the Version 2 standards.** **The Standards Drafting Team believes that the six to nine month implementation plan is reasonable.**		
Pepco Holdings, Inc - Affiliates	No	1. We understand that the SDT is proposing that Technical Feasibility Exceptions (TFE) Process (i.e. exception approval process) be modeled after the existing Self-Report and Mitigation Plan processes in the Compliance Monitoring and Enforcement Program (CMEP) which would require TFE review by the Regional Entity and NERC to assess the impact to the BES and then approve or not approve the exception. We also understand that as part of the NERC TFE approval process a mitigation plan would need to be submitted to the Regional Entity/NERC and completed for compliance. We understand that the Standards Drafting Team (SDT) is proposing that the TFE process be done through the NERC Rules of Procedure update process rather than through the standards process. Is it the intent of the SDT is to keep the TFE process outside of the compliance process (i.e., TFE requirement as part of the NERC Rules of Procedures)? 2. The existing Self-Report and Mitigation Plan process is for self-reporting and remedying a potential non-compliance. Is the intent of modeling the existing Self-Report and Mitigation Plan for the TFE process because the SDT considers Technical Feasibility Exceptions as non-compliance to the CIP standards? It was our understanding that TFEs are not a compliance issue. The existing FAQs state: Technical feasibility refers only to engineering possibility and is expected to be a "can/cannot" determination in every circumstance. It is also intended to be determined in light of the equipment and

Organization	Yes or No	Question 13 Comment
		facilities already owned by the Responsible Entity. The Responsible Entity is not required to replace any equipment in order to achieve compliance with the Cyber Security Standards. http://www.nerc.com/docs/standards/sar/Revised_CIP-002-009_FAQs_06Mar06.pdf 3. We believe that the TFE process needs to be included in the standards as well (e.g. CIP-003-2 R3). If the TFE is not coupled to the Standards (e.g. requirement to submit to RE and NERC for approval) we have concerns that there may be unintended gaps or conflicts. **(i)** For example what happens if a Registered Entity in following CIP-003-2 R3 (Exceptions) has a technical exception approved by the Sr. Manager but by a de-coupled TFE process NERC does not approve the exception? The Registered Entity is in compliance with the Standard but not with the TFE approval process. Would failure of a TFE procedure be considered non-compliance and therefore subject to fines? **(ii)** Another example of a potential gap or conflict is there could be conflicting effective dates of the standards and the TFE process (i.e. the requirement to submit to NERC for approval) if these are not linked together. **(iii)** Timing of the approvals by NERC could also create a gap or conflict. **(iv)** We encourage the SDT drafting team to consider including the requirement of RE/NERC review in the standards. The detailed process and procedures could be separate. **(v)** Finally we believe that the SDT needs to identify how the RE and/or NERC will perform the assessment of a TFE request on the impact to the BES (e.g. engineering judgement, load flow studies, stability studies,...) and identify the parameters that would be considered an approved exception versus an unapproved exception. 4. We understand and agree that NERC has the right to review TFE information and evidence of compliance but providing this information/data offsite may be considered a violation to the CIP requirement(s) and at the very least is a potential risk because if this information is compromised could show vulnerabilities to Critical Cyber Assets at a given Registered Entity. The confidentiality and security of the data/information needs to be considered. Potential options could include: • NERC could review information over a secure communication channel without NERC keeping the sensitive information

Organization	Yes or No	Question 13 Comment
Response: **1. The removal of "reasonable business judgment" was done in accordance with FERC Order 706. The revisions made to the standards in Phase 1 are intended to be responsive to specific FERC directives relevant to the onset of compliance audits in July 2009. The expansion of the Technical Feasibility Exception Process should address the concerns regarding the removal of reasonable business judgment and acceptance of risk.** **2. Situations where the standards requirements cannot be met will be handled through the Technical Feasibility Exception process under the NERC Rules of Procedure. The technical feasibility exception process will address the requirements for documenting, approving, and remediating the exception. Any sanction decisions will arise from the TFE process. It is not appropriate to assert that "duly authorized exceptions will not result in non-compliance" within Section D-1.5 of the standard.** **3. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.** **4. Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. United Illuminating Company	Yes	
Deloitte& Touche, LLP	Yes	
Exelon	Yes	
Old Dominion Electric Cooperative	Yes	
City of Tallahassee (TAL)	Yes	I may not agree with all changes but they do address the FERC Order directives, even though by making these directives, they violate the ANSI approved process that they have stated NERC is required to follow.

Organization	Yes or No	Question 13 Comment
Response: **Comments regarding the ANSI process are outside the scope of the SDT to address.**		
BC Transmission Corporation	Yes	
Applied Control Solutions, LLC	No	NIST Framework needs to be addressed NOW!
Response: **The Standards Drafting Team will consider the NIST risk management framework in future revisions of the standards.**		
US Bureau of Reclamation	No	The revisions are moving these standards away from "Critical Infrastructure Protection" towards "Cyber Infrastructure Protection." We believe this move strays from the original intent of Critical Infrastructure Protection as defined by the initial requirements. By focusing solely on the Cyber aspect, many important aspects of critical infrastructure protection will be lost. We reject any efforts to modify CIP from Critical Infrastructure Protection to Cyber Infrastructure Protection.
Response: **The Standard Drafting Team is focused on the cyber security aspects of critical infrastructure protection, a priority reflected in the SDT 706 SAR and driven by national security concerns about the adequacy of the industry's cyber security efforts as stated by Congressional Committees, FERC, and the new Obama Administration.** **Nonetheless, the SDT agrees that there is a critical need to address non-cyber critical infrastructure issues. If the commenter believes such an effort is warranted, we would recommend the submission of a SAR to specify the applicable issues.**		
Orange and Rockland Utilities Inc.	Yes	
CenterPoint Energy	No	See responses above to Q5, Q7, and Q8. In addition, the SDT changed the data retention wording in CIP-002 through CIP-009 such that "the Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records." CenterPoint Energy believes the retention time should be more defined and proposes adding

Organization	Yes or No	Question 13 Comment
		"until the next scheduled audit" to make it clear that data retention is on a rolling basis.
Response: **The data retention periods for the standard requirements are specified in the standards. The language of 1.4.2 indicates that the Compliance Enforcement Authority in conjunction with the Registered Entity will retain all the audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities. The audit data retention period is determined by the audit period for each Registered Entity.**		
Manitoba Hydro	Yes	
Alberta Electric System Operator		
Dynegy	Yes	
Northern Indiana Public Service Company	Yes	Not sure if the question pertains to the CIP draft modifications or the proposed implementation schedule.
Response: **The Question pertains to both items.**		
CoreTrace		
Oncor Electric Delivery LLC	Yes	
Illinois Municipal Electric Agency		
Ontario Power Generation		
American Electric	Yes	As described above and following, AEP believes that there are a number of concepts that need to be

Organization	Yes or No	Question 13 Comment
Power		discussed and clarified in the standards. 1) AEP requests clarication be added about changes to Data Retention item 1.4.2. NERC reference materials suggest that the Compliance Enforcement Authority is solely responsible for keeping the last audit records. AEP does not believe that expanding the role of the Registered Entity, beyond that in any other standard, to include keeping audit documents is necessary or appropriate. However, there may be circumstances where confidential underlying data concerning critical infrastructure should only be retained only by the Registered Entity, but, even in such circumstances, auditing records should solely be retained under requirement by the Compliance Inforcement Authority. 2) Technical consideration should be given to determining the response to the "Compliance Monitoring Period and Reset Time Frame" section. The drafting team reference guide has suggested time periods aligning with audits cycles and less than monthly reset time frames. The response that it is not applicable does not appear consistent. 3) Lastly, item M1 under Measures has inadvertently dropped the "The" while the remaining M2 - M4 do contain "The" at the beginning of each sentence. In some of the following CIP standards, it is presented correctly, and, in others, it is not aligned within the M1 item.

Response:

1) The ERO Rules of Procedure include sections on dealing with confidential data associated with the Cyber Security standards, and recognize that there may be some evidence retained by the Responsible Entity. The data retention section of these standards was written to support this concept.

The language of 1.4.2 indicates that the Compliance Enforcement Authority "in conjunction with" the Registered Entity will retain all audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities and supports the need to retain the confidentiality of some data.

The audit data retention period is determined by the audit period for each Registered Entity. The Reliability Coordinator, Transmission Operator and Balancing Authority are audited for each requirement once every three years – and all others are audited once every six years. The intent is to assure that, if there was an event and the performance of an entity was in question, there would be, at a minimum, at least one record showing the past performance of that entity.

2) The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. Until the Reliability Standards Development Procedure is updated, we cannot remove this heading from the standard template; until then all drafting teams are placing the phrase, "not applicable" under the heading, "Compliance Monitoring Period and Reset Time Frame" in the standard.

Organization	Yes or No	Question 13 Comment
3) The compliance staff assisted in developing a set of guidelines for developing measures and compliance elements in standards – and these guidelines do allow various data retention periods. **Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
Ontario IESO	Yes	
Ameren	Yes	Would like to see a clarification on what is intended by phrase "shall make available" that is included in measures for each standard and whom an entity is supposed to make documents available to. The change from a three year retention for documents to a non-specific period will provide additional burden to the compliance process, since the region will have an arbitrary time length assigned per specific incident.
Response: **The phrase, "shall make available" means that the responsible entity must allow the Compliance Enforcement Authority to see the evidence. The evidence is made available to the Compliance Enforcement Authority** **The data retention periods for the standard requirements are specified in the standards. The language of 1.4.2 indicates that the Compliance Enforcement Authority in conjunction with the Registered Entity will retain all the audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities. The audit data retention period is determined by the audit period for each Registered Entity.** **The audit data retention period is determined by the audit period for each Registered Entity. The Reliability Coordinator, Transmission Operator and Balancing Authority are audited for each requirement once every three years – and all others are audited once every six years. The intent is to assure that, if there was an event and the performance of an entity was in question, there would be, at a minimum, at least one record showing the past performance of that entity.**		
Consumers Energy Company	Yes	
Xcel Energy		
ISO New England Inc	Yes	1) - We agree with the removal of "reasonable business judgment" and "acceptance of risk."

Organization	Yes or No	Question 13 Comment
		2) - GENERAL COMMENT: As a general matter, NERC needs to explain how it plans on enforcing these standards. This is critical, because NERC is not defining what cyber-security practices are, in fact, acceptable. Therefore, if a company establishes a "high bar for its internal programs (e.g., training employees), and does not meet its own business practices, it can be fined by NERC. By contrast (and depending on how the standards are enforced) companies that set "low bars" for its internal programs will escape penalty. NERC could inadvertently, through its compliance and enforcement policy, incent companies to establish "lowest common denominator" practices.
Response: **1) The removal of "reasonable business judgment" was done in accordance with FERC Order 706. The revisions made to the standards in Phase 1 are intended to be responsive to specific FERC directives relevant to the onset of compliance audits in July 2009. The expansion of the Technical Feasibility Exception Process should address the concerns regarding the removal of reasonable business judgment and acceptance of risk.** **2) Phase 1 of this project includes necessary modifications to CIP-002-1 through CIP-009-1 to comply with the near term specific directives included in FERC Order 706. The issue identified in your comment is an issue better suited for a later phase of this project. The SDT suggests that you review the changes proposed in the later phases of the project and resubmit your comments as appropriate if they have not been addressed.**		
American Transmission Company	Yes	
TVA	Yes	
Duke Energy	Yes	
Brazos Electric Power Cooperative, Inc.	Yes	
Progress Energy	Yes	1) Overall comment - PE recommends the removal of "Reasonable business judgment" be replaced with the use of "good utility practice" as defined by FERC. 2) Overall comment - Section D – Data Retention – It is not practical to leave data retention period totally open ended at the sole discretion of the Compliance Enforcement Authority, there should at least be a capped limit, PE recommends a maximum of 3-years to allow time between audits.

Organization	Yes or No	Question 13 Comment
Response: **1) The removal of "reasonable business judgment" was done in accordance with FERC Order 706. The revisions made to the standards in Phase 1 are intended to be responsive to specific FERC directives relevant to the onset of compliance audits in July 2009. The expansion of the Technical Feasibility Exception Process should address the concerns regarding the removal of reasonable business judgment and acceptance of risk.** **2) The data retention periods for the standard requirements are specified in the standards. The language of 1.4.2 indicates that the Compliance Enforcement Authority in conjunction with the Registered Entity will retain all the audit records from the previous audit and all audit records submitted since the previous audit, until completion of the next audit. This supports the audit intervals for all entities. The audit data retention period is determined by the audit period for each Registered Entity.**		
Standards Review Committee of ISO/RTO Council	Yes	
KEMA	Yes	
Austin Energy	Yes	
Kansas City Power & Light	Yes	
San Diego Gas and Electric Co.	No	While the Standards Drafting Team has done a great job overall incorporating many of the issues raised in FERC Order 706 FERC, there appears to be two issues identified by FERC in Order 706 that have not been addressed by the Standards re-write team in these first revisions. FERC Order 706 directed in Paragraph 88 that features such as enhanced conditions on technical feasibility exceptions and oversight of critical asset determinations for CIP-002 are too important to the protection of the Bulk-Power System to wait until the 2009-2010 time period for the process to start. But no substantial modifications for CIP-002 in these areas are included from the SDT. In addition, FERC Order 706, in Paragraph 90, also directed the ERO, in its development of a work plan, to consider developing modifications to CIP-002-1 and the provisions regarding technical feasibility exceptions as a first priority, before developing other modifications required by the Final Rule. This doesn't appear to have been completed by the SDT as a first priority.

Organization	Yes or No	Question 13 Comment
Response: **In Paragraph 88, the Commission ordered revisions to the CIP standards not be delayed until completion of the Version 1 standards Implementation Plan, and specifically cited the CIP-002-1 and Technical Feasibility Exceptions (TFE) as priority revisions.** **The Commission at Paragraph 253 adopted the NOPR proposal requiring the ERO to provide additional guidance as to the features and functionality of an adequate risk-based assessment methodology, while leaving to the ERO's discretion whether to incorporate such guidance into the CIP Reliability Standard, develop it as a separate guidance document, or some combination of the two. The NERC Critical Infrastructure Protection Committee is in the process of developing specific Guidelines to address this requirement. The SDT believes the development of the Critical Asset and Critical Cyber Asset Identification Guidelines currently underway address the immediate concerns of the Commission. In addition, the SDT will be examining the entire risk management framework. Due to the complexity of this issue, the SDT decided to address risk management and its impact on CIP-002 early in Phase 2 in order to not delay the time-critical modifications directed elsewhere in the Final Order.** **The Commission at Paragraph 178 directed the ERO to develop a set of conditions or criteria that a responsible entity must follow when relying on the technical feasibility exception contained in specific Requirements of the CIP Reliability Standards. NERC Staff, with consultation with the SDT, has begun to develop a process for handling Technical Feasibility Exceptions (TFE) that is modeled after the existing self-report of non-compliance with mitigation plan process, as described in the NERC Rules of Procedure (ROP) Appendix 4C. The TFE process is not a "requirement" of a "standard" - it is a process for meeting requirements in standards. The TFE process is considered to be a compliance issue, although it is anticipated to be a way of being "compliant" with a standard in the event that an entity cannot meet the specific requirements of the standard. Because the TFE process is a compliance process, not development of requirements, it is outside the charter of the SDT. Therefore, the TFE process development and approval will be moving away from a direct SDT effort, to follow the established process for modifying the NERC ROP. As such, the SDT will not have a formal role in continued development of the process. The established ROP update process includes public comment and stakeholder input (including continued input from the SDT).**		

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for Version 2 of Cyber Security Standards CIP-002-2 through CIP-009-2

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

The following standards have been modified:
CIP–002–2 — Cyber Security — Critical Cyber Asset Identification
CIP–003–2 — Cyber Security — Security Management Controls
CIP–004–2 — Cyber Security — Personnel and Training
CIP–005–2 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–2 — Cyber Security — Physical Security
CIP–007–2 — Cyber Security — Systems Security Management
CIP–008–2 — Cyber Security — Incident Reporting and Response Planning
CIP–009–2 — Cyber Security — Recovery Plans for Critical Cyber Assets

Red-line versions of the above standards are posted with this Implementation Plan. When these modified standards become effective, the prior versions of these standards and their Implementation Plan are retired.

Compliance with Standards

Once these standards become effective, the responsible entities identified in the Applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinator
- Balancing Authority
- Interchange Authority
- Transmission Service Provider
- Transmission Owner
- Transmission Operator
- Generator Owner
- Generator Operator
- Load Serving Entity
- NERC
- Regional Entity

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

Newly registered entities must comply with the requirements of CIP-002-2 through CIP-009-2 within 24 months of registration. The sole exception is CIP-003-2 R2 where the newly registered entity must comply within 12 months of registration.

Proposed Effective Date

The proposed effective date for these modified standards is the first day of the third calendar quarter (i.e., a minimum of two full calendar quarters, and not more than three calendar quarters) after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

For example, if regulatory approval is granted in June, the standards would become effective January 1 of the following year. If regulatory approval is granted in July, the standards would become effective April 1 of the following year.

Implementation Plan for Cyber Security Standards CIP-003-1~~2~~-2 through CIP-009-1~~2~~ or Their Successor Standards

Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

This Implementation Plan identifies the schedule for becoming compliant with the requirements of NERC Standards CIP-003-1~~2~~ through CIP-009-1~~2~~ and their successor standards, for assets determined to be Critical Cyber Assets once an Entity's applicable 'Compliant' milestone date listed in the existing Implementation Plan has passed.

This Implementation Plan specifies only a 'Compliant' milestone. The Compliant milestone is expressed in this Implementation Plan table (Table 2) as the number of months following the designation of the newly identified asset as a Critical Cyber Asset, following the requirements of NERC Standard CIP-002-1~~2~~ or its successor standard.

For some requirements, the Responsible Entity is expected to be Compliant immediately upon the designation of the newly identified Critical Cyber Asset. These instances are annotated as '0' herein. For other requirements, the designation of a newly identified Critical Cyber Asset has no bearing on the Compliant date. These are annotated as *existing*.

In all cases where a milestone for compliance is specified (i.e., not annotated as *existing*), the Responsible Entity is expected to have all audit records required to demonstrate compliance (i.e., to be 'Auditably Compliant') one year following the milestone listed in this Implementation Plan. Where the milestone assumes prior compliance (i.e., is annotated as *existing*), the Responsible Entity is expected to have all documentation and records showing compliance (i.e., 'Auditably Compliant') based on other previously defined Implementation Plan milestones.

There are no Implementation Plan milestones specified herein for compliance with NERC Standard CIP-002. All Responsible Entities are required to be compliant with NERC Standard CIP-002 based on the existing Implementation Plan.

Implementation Schedule

There are three categories described in this Implementation Plan, two of which have associated milestones. They are briefly:

1. A Cyber Asset becomes the *first identified* Critical Cyber Asset at a responsible Entity. No existing CIP compliance program for CIP-003 through CIP-009 is assumed to exist at the Responsible Entity.
2. An existing Cyber Asset becomes subject to CIP standards, *not due to planned change*. A CIP compliance program already exists at the Responsible Entity.
3. A new or existing Cyber Asset becomes subject to CIP standards *due to planned change*. A CIP compliance program already exists at the Responsible Entity.

Note that the term 'Cyber Asset becomes subject to the CIP standards' applies to all Critical Cyber Assets, as well as ~~non-critical~~other (non-critical) Cyber Assets within an Electronic Security Perimeter.

Figure 1 shows an overall process flow for determining which milestone category a Critical Cyber Asset identification scenario must follow. Following the figure is a more detailed description of each category.

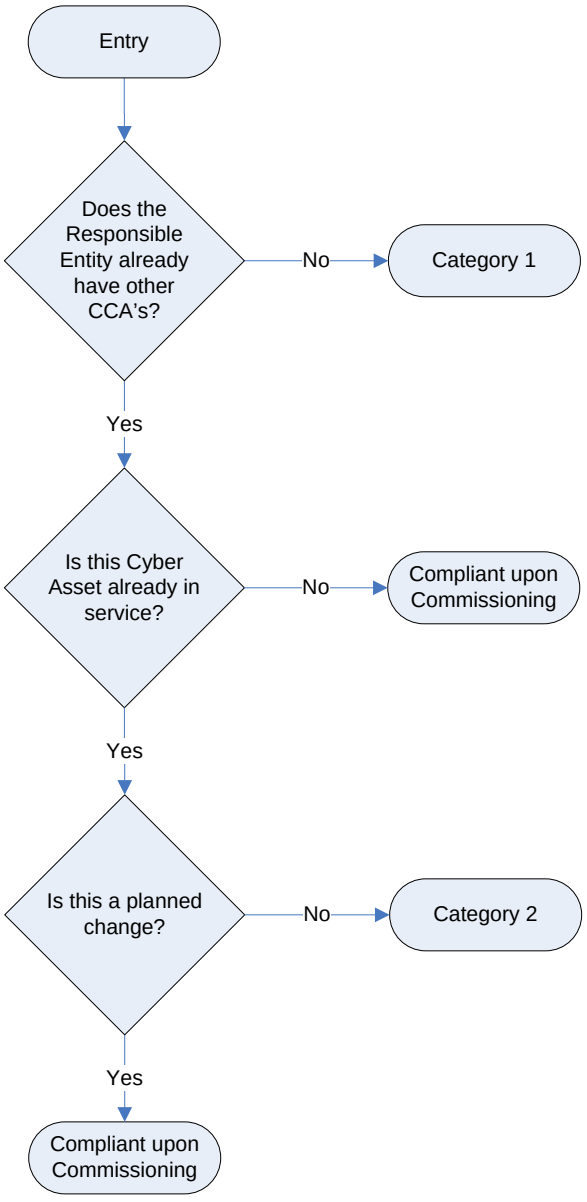

Figure 1: Category Selection Process Flow

The individual categories are distinguished as follows:

1. **Category 1**: A Responsible Entity that previously has undergone the CIP-002 Critical Asset identification process for at least one annual review and approval period without ever having identified any Critical Cyber Assets associated with Critical Assets, but has now identified one or more Critical Cyber Assets. The Compliant milestone specified for this Category shall be the same as Table 3 of this New Asset Implementation Plan. (Note that Table 3 of this New Asset Implementation Plan provides the same schedule as was provided in Table 4 of the original Implementation Plan for Standards CIP-003~~-1~~-2 through CIP-009~~-1~~-2.) As such, it is presumed that the Responsible Entity has no previously established cyber security program in force. Table 3 also shall apply in the event of a Responsible Entity business merger or asset acquisition where previously no Critical Cyber Assets had been identified by any of the Entities involved.

2. **Category 2**: A Responsible Entity has an established CIP Compliance program as required by an existing Implementation Schedule, and now has added additional items to its Critical Cyber Asset list. The existing Critical Cyber Assets may remain in service while the relevant requirements of the CIP Standards are implemented. Since the Responsible Entity already has a CIP compliance program, it needs only to implement the CIP standards for the newly identified Critical Cyber Asset(s).

   This category applies only when additional in-service Critical Cyber Assets or applicable other Cyber Assets are *identified*, not when they are added or modified through construction, upgrade or replacement.

   In the case of business merger or asset acquisition, if any of the Responsible Entities involved had previously identified Critical Cyber Assets, implementation of the CIP Standards for newly identified Critical Cyber Assets must be completed per Compliant milestones established herein under Category 2. In the case of an asset acquisition, where the asset had been declared as a Critical Asset by the selling company, the acquiring company must determine whether the asset remains a Critical Asset as part of the acquisition planning process.

   In the case of a business merger where all parties already have previously identified Critical Cyber Assets and have existing but different CIP Compliance programs in place, the merged Responsible Entity has one calendar year from the effective date of the business merger to continue to operate the separate programs and to determine how to either combine the programs, or at a minimum, combine the separate programs under a common Senior Manager and governance structure. At the conclusion of the one calendar year period, the Category 2 milestones will be used by the Responsible Entity to consolidate the separate CIP Compliance programs.

   A special case of restoration as part of a disaster recovery situation (such as storm restoration) shall follow the emergency provisions of the Responsible Entity's policy required by CIP-003 R1.1.

3. **Compliant upon Commissioning**: When a Responsible Entity has an established CIP Compliance program as required by an existing Implementation Schedule and implements a new or replacement Critical Cyber Asset associated with a previously identified or newly constructed Critical Asset, the Critical Cyber Asset shall be compliant when it is commissioned or activated. This scenario shall apply for the following scenarios:

    a) 'Greenfield' construction of an asset that will be declared a Critical Asset upon its commissioning or activation (e.g., based on planning or impact studies).
    b) Replacement or upgrade of an existing Critical Cyber Asset (or other Cyber Asset within an Electronic Security ~~perimeter~~Perimeter) associated with a previously identified Critical Asset.
    c) Planned a~~A~~ddition of:
        i. a Critical Cyber Asset, or,
        ii. an other (i.e., non-critical) Cyber Asset within an established Electronic Security Perimeter.

    In summary, this scenario applies in any case where a Critical Cyber Asset or applicable other Cyber Asset is being added or modified associated with an existing or new Critical Asset where that Entity has an established CIP Compliance Program as required by an existing Implementation Schedule.

    This scenario shall also apply for any of the above scenarios where relevant in the event of business merger and/or asset acquisition.

    A special case of a 'greenfield' construction exists where the asset under construction was planned and construction started under the assumption that the asset would not be a Critical Asset. During construction, conditions changed, and the asset will now be a Critical Asset upon its commissioning. In this case, the responsible Entity must follow the Category 2 milestones from the date of the determination that the asset is a Critical Asset.

    A special case of restoration as part of a disaster recovery situation (such as storm restoration) shall follow the emergency provisions of the Responsible Entity's policy required by CIP-003 R1.1.

    Since the assets must be compliant upon commissioning, no milestones are provided herein.

Note that there are no milestones specified for a Responsible Entity that has newly designated a Critical Asset, but no newly designated Critical Cyber Assets. This is because no action is required by the Responsible Entity upon designation of a Critical Asset without associated Critical Cyber Assets. Only upon designation of Critical Cyber Assets does a Responsible Entity need to become compliant with these standards.

As an example, Table 1 provides some sample situations, and provides the milestone category for each of the described situations.

Table 1: Example Scenarios

Scenarios	CIP Compliance Program:	
	No CIP Program (note 1)	Existing CIP Program
Existing Cyber Asset reclassified as Critical Cyber Asset due to change in assessment methodology	Category 1	Category 2
Existing asset becomes Critical Asset; associated Cyber Assets become Critical Cyber Assets	Category 1	Category 2
New asset comes online as a Critical Asset; associated Cyber Assets become Critical Cyber Asset	Category 1	Compliant upon Commissioning
Existing Cyber Asset moves into the Electronic Security Perimeter due to network reconfiguration	N/A	Compliant upon Commissioning
New Cyber Asset - never before in service and not a replacement for an existing Cyber Asset - added into a new or existing Electronic Security Perimeter	Category 1	Compliant upon Commissioning
New Cyber Asset replacing an existing Cyber Asset within the Electronic Security Perimeter	N/A	Compliant upon Commissioning
Planned modification or upgrade to existing Cyber Asset that causes it to be reclassified as a Critical Cyber Asset	Category 1	Compliant upon Commissioning
Asset under construction as an other (non-critical) ~~non-critical~~ asset becomes declared as a Critical Asset during construction	Category 1	Category 2
Unplanned modification such as emergency restoration invoked under a disaster recovery situation or storm restoration	N/A	Per emergency provisions as required by CIP-003 R1.1

Note: 1) assumes the entity is already compliant with CIP-002

Table 2 provides the compliance milestones for each of the two identified milestone categories.

Meeting Summary Contents

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

EXECUTIVE SUMMARY

The Chair, Jeri Domingo-Brewer, welcomed Frank Kim, Power System IT oversight — Ontario Hydro as a new member of the SDT replacing Michael Winters. She also noted that this meeting will be Tom Hoffsetter's last meeting on the SDT as he will be taking a position with NERC in their compliance group. She also noted that Bryan Singer had resigned as he is unable to fully participate in the SDT. Finally, Kevin Perry, Vice Chair, noted that he would be taking up a new position as SPP director of Critical Infrastructure Protection.

Joe Bucciero conducted a roll call of members and participants, the Chair reviewed the meeting objectives and the facilitator, reviewed with the team and participants the proposed meeting agenda.

Mr. Bucciero reviewed with the team the need to comply with NERC's Antitrust Guidelines. The team reviewed and unanimously adopted on March 12 the SDT February 18–19, 2009 meeting summary. Stuart Langton, SDT facilitator, reviewed the current work plan and meeting schedule for both Phase 1 and Phase 2 development. At the conclusion of the meeting the SDT agreed on a schedule of meetings from July-December, 2009.

NERC staff indicated the Technical Feasibility Exception white paper is being prepared for posting for industry comment. If posted promptly, the TFE posting will occur within the 14 day window the SDT agreed to when it approved the Phase 1 products for industry review, and thereby permit industry balloting of the Phase 1 products to begin in early April 2009. Regional entities received an early preview and briefing of the TFE white paper for any compliance and resource implications associated with the TFEs. Michael Assante, CSO at NERC, met with FERC staff to brief them on the TFE and the SDT 706 Phase 1 products.

Dave Taylor set out the process for developing the Version 2 Violation Security Levels (VSLs) noting that NERC was seeking to post the VSLs by Monday, March 16 in coordination with the Version 1 VSLs. He noted the plan is to pre-ballot review for Version 2 (that applies to the SDT's Phase I products) by May 11, 2009 and provide a 30-day industry comment period. On day-three, David Taylor reviewed with the SDT the Violation Risk Factors (VRFs) associated with the Cyber Security standards, and these were unanimously adopted by the SDT.

Joe Bucciero reviewed the Phase 1 Response document that was circulated to the Team earlier in March and the SDT unanimously adopted the response document for posting.

The facilitators reviewed the Phase 2 concept development which was initiated in the fall of 2008 by the SDT. In November there were criteria suggested for the design of the process. In December there were presentations and discussions regarding risk management. In January and

February 2009 two concept papers were developed that looked at two approaches to Phase 2: one which worked within the current CIP and sought to integrate applicable NIST and other ideas; the other started with a review of the NIST approach and sought to bring some of the CIP elements into a NIST-like model. At the conclusion of the February 18-19, 2009 meeting, the SDT asked the two teams working on the concepts to produce an initial draft of a CIP-002 standard that would be consistent with their concepts. These CIP-002 concept papers were reviewed, compared, and considered for possibly merger.

Bill Winters and Phil Huff presented a CIP-002 strawman alternative (Strawman A) developed by one team since the February meeting. The concept suggested:

- Assign 'functions' to systems
- Identify BES cyber systems
- Engineering studies used to develop Impact Criteria
- Use criteria in calculation of impact (integrity, availability, confidentiality)
- Categorization process (hi, med, low, none)
- Categorized BES cyber systems.

The discussion that followed covered issues such as: Connectivity to Networks; Increase in the scope of the CIP; Role of RROs and REs; Focus on information security; Updates for the standards; Boundaries; and 3rd Party Review.

Jackie Collett presented a second CIP-002 strawman (Strawman B). She noted that the CIPC Risk Assessment Working Group's (RAWG) work and draft report were helpful in the preparation and thinking for the concept paper. The CIP-002 concept paper started with the connections to BES-which is an engineered system. Cyber assets support the reliability of the BES. She suggested the strawman approach builds on: industry work, experience and investments in compliance programs but noted that the identified risks will increase scope of compliance. The concept paper addresses facilities, equipment, and systems, but acknowledges a need to better define systems going forward. The approach is not a risk assessment, but an impact assessment of the reliability of the BES. The CIPC RAWG work focuses on "impacts." Cyber assets are one of many elements supporting the BES processes. The concept paper proposes that properly applying a top down approach will ensure the reliability of the BES. She suggested the SDT should consider including some concepts from the RAWG in the new CIP-002 standard where it makes sense. The approach included in the strawman avoids being prescriptive but considers categorization of the BES assets as critical or not. The approach also considers the impact of the associated cyber assets as (3) low, (2) moderate, (1) high, and possibly none. The oversight of critical asset lists remains an open question at this point. The approach suggests using and incorporating NIST controls as a good starting point.

The discussion that followed covered issues such as: degree of flexibility and prescription; engineering-based assessment; list of cyber assets; and implementation phase.

As a follow-up to the discussion, the SDT members were given a brief survey to evaluate the two proposed approaches. The SDT reviewed the results of the overnight member survey, which suggested that the strawman approaches were generally in alignment with the overriding principles and have more in common than they differ. The facilitators asked members to offer elements of the strawman approaches they felt were strengths: (1) the simplicity and the definitions of Strawman A; (2) the critical asset identification associated with the BES that addresses the interrelationships of engineering, electric, and cyber systems in Strawman B.

The SDT discussed and refined the following common propositions drawn from day one's discussion on the two CIP-002 strawman approaches:

1. Existing CIP language is insufficient for the future
2. Ground the approach in the context of NERC's 6 elements of reliability adding cyber security to each
3. Utilize the graduated levels (high, moderate, low, and "who cares") in the approach
4. Include systems, facilities, and equipment *(build on the CIPC Working Group Draft Guidelines)*
5. Provide for 3rd party oversight and accountability in the process
6. Address the external interfaces impacting on BES reliability
7. Build upon existing controls such as the NIST 800-53 suite of controls

The facilitators suggested several discussion questions following the presentations and discussion of the strawman options including:

- What is the best place for the CIP-002 approach to start? From facilities? From Systems? From either? From both?
- What is the best approach to 3rd party oversight and accountability?
- What is the best approach to addressing external interfaces?

After some discussion, the SDT members agreed to break into two small discussion groups on the morning of Day Two to explore and focus on the possible merger of the two strawman approaches and concepts. Following lunch, each group reported the results of their discussion and engaged in a full SDT discussion of the issues.

The proposed structure of the draft CIP-002 standard has the following six requirements:

R1 — Identification of BES Assets
R2 — Critical Asset Identification Method
R3 — Critical Asset Identification

R4 — Cyber Asset Identification
R5 — Categorization of Cyber Assets
R6 — Annual Approval

The small group looking at Requirement R1 explored the possibility of merging a "facilities vs. functional" approach. They agreed that the starting point should be to identify the functions necessary for the reliability of the BES. The group agreed that it would then be necessary to identify the systems or hardware used to perform those functions. It would then be necessary to incorporate the high, moderate, low impact threshold each into category.

The small group looking at Requirement R4 suggested that the "systems" references should be taken out of R1 and only the "functions" of the BES should be included in R1. Requirement R4 should then identify the systems that support and perform the R1 functions.

Scott Mix presented a strawman for an approach to CIP-002 Requirements R2 and R3 for consideration by the SDT. He suggested starting with the functions and mapping them to the physical equipment. Consider determining "Asset Impact" as high, moderate, low, and none and "Cyber impact" as high, moderate, low, and none for CIP 003-009. After discussion the SDT ranked the three proposals:

Proposal 1 Keep R2 + R3 with Scott's Language (Matrix) (Average 2.9 of 4)
Proposal 2 Move R2 & R3 into R5 (Vector Analysis) (Average 2.7 of 4)
Proposal 3 R2 + R3 Performed by External Entity (Average 1.8 of 4)

The SDT agreed these proposals needed further review and consideration in the context of a single, coordinated approach.

At the end of the second day, a small group agreed to work further to draft a common framework. The group included Phil Huff, John Lim, Scott Mix, Jackie Collett, Scott Rosenberg and John Varnell. Jackie Collett introduced a flow chart as a strawman designed to be flexible to allow for further development and refinements, and it focuses on cyber systems (not on assets) and does not offer a hierarchal model. The "vector" categorization- matrix offers some more granularity as to what we are meaning to accomplish. It offers a cyber impact analysis of the impacts on the functions.

Following the discussion, the SDT agreed to rank the acceptability of the following proposition:

The SDT should adopt this approach as a working conceptual model to develop and frame a concept white paper that includes a set of definitions/glossary, develops a list of functions, and uses lists of scenarios to test the concept.

Acceptability	*4 =*	*3 = acceptable, I*	*2 = not acceptable unless*	*1 = not*	*Avg.*

Ranking Scale	*acceptable, I agree*	*agree with minor reservations*	*major reservations addressed*	*acceptable*	
3-12 SDT rank	**15**	**3** *(1/2)*	**1**	**1**	**3.6 of 4**
Second Rank with D Norton's Concept	**15**	**3**	**2**	**0**	**3.65 of 4**

During the discussion of the approach going forward, concern was expressed about whether the SDT was the right group to develop the concepts for Requirements 1,2, and 3 (the left hand side). Planning and operations perspectives would be helpful. Dave Taylor volunteered and the SDT agreed that he should draft a white paper to present to the next meeting on a process for determining Requirements 1, 2, and 3.

CIP-002 Common Framework Concept

Identification of BES functions which support the reliability and operability of the BES

Need 1 layer of specificity below ALR

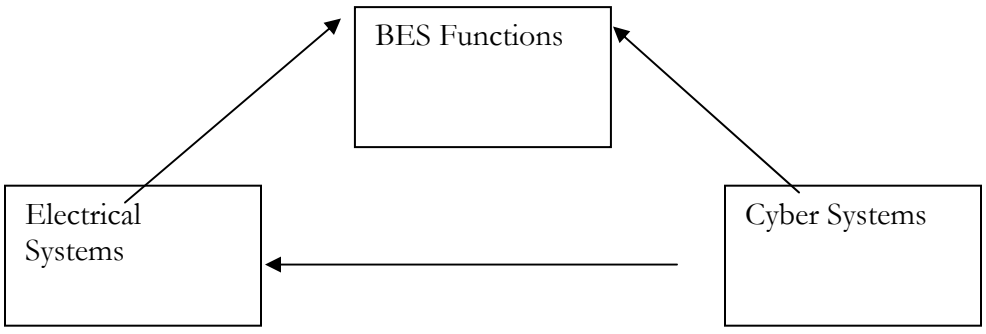
Cyber Impact — the local impact due to loss of CIA of the cyber asset for a BES element

System — a set of components which must work together

Electric System — a set of BES elements which must work together

Cyber System — a set of cyber components which must work together

Pre-Determined Functions			
R1	List of Electric Systems which support the BES functions	R4	List of Cyber Systems which support the Electric Systems and/or BES Functions
R2	Method of Categorization - impact to BES	R5	Method of Categorization - local impact to Electric System components
R3	List of Systems & Categories	R6	List of Systems & Categories
R7	Matrix: combines the 2 impact levels		
R8	Local Approval		
R9	Oversight		



Bill Winters requested the SDT rank the following proposition that if acceptable would be incorporated into the white paper going forward as the CIP-002 intent statement:

CIP-002 is intended to provide a discovery methodology that will lead to explicit identification and categorization of all cyber elements that perform or support BES functions. (3.9 of 4)

The SDT agreed that a helpful next step would be to refine the concept that was presented and tested on the third day to be in the form of a draft white paper. The chair asked Jackie Collett, John Lim, Bill Winters, and Phil Huff along with Scott Mix to take the lead in the development of the draft white paper in advance of the April meeting, building on the discussion and outcomes of this meeting. Other members would be welcome to send ideas and reactions as well as listen in and participate on the WebEx meetings that would be convened. The goal would be to share the white paper with the industry following either the May, 2009 or June, 2009 meeting.

The SDT members completed calendar forms regarding possible dates for future SDT meetings. Upon review of the forms and SDT member scheduling conflicts, the following dates and tentative locations were established and agreed to by the team.

Project 2008-06 — CSO 706 SDT
Proposed Dates and Locations for Future Meetings 2009

Dates in 2009	Location
April 14–16	Charlotte, NC
May 13–14	Boulder City, NV
June 17–18	Portland, OR
July 13–14	Toronto, CA
August 20–21	Chicago, IL
September 9–10	Denver, CO
October 20–22	New Orleans, LA
November 17–18	Atlanta, GA
December 15–17	Key West or FRCC (Tampa, FL)

The SDT agreed to seek to make a progress report to the MRC at its May meeting in Arlington, Virginia and provide a substantive briefing on the Phase 2 white paper for input at their August meeting. The team discussed the timing and objectives for a workshop. The SDT decided to hold open the question of convening an expert/stakeholder workshop pending the Chair and Vice Chair's discussion with Michael Assante, NERC Chief Security Officer, to gain a clearer understanding of the potential objectives, design, and timing of a workshop in light of the SDT's progress and schedule.

The facilitators offered some observations on the SDT's work over the past six months and suggested it would be timely to survey the team on the experience over the past six months to provide an opportunity for deeper shared reflections on the ways to improve the team's process.

The chair asked the facilitators to develop and distribute a survey to review the results at the April meeting.

The meeting adjourned at 11:30 a.m. on March 12, 2009.

I. Introductions, Agenda Review and Review of SDT Work plan

The Chair, Jeri Domingo-Brewer, welcomed the members. She welcomed Frank Kim, Power System IT oversight — Ontario Hydro as a new member of the SDT replacing Michael Winters. She also noted that this meeting will be Tom Hoffstetter's last meeting on the SDT as he will be starting work with NERC in their compliance group. She also noted that Bryan Singer had resigned as he was chairing a related group and had been unable to fully participate in the SDT. Finally, Kevin Perry, Vice Chair, noted that he would be taking up a new position as SPP director of Critical Infrastructure Protection.

Joe Bucciero conducted a roll call of members and participants in the room and on the conference call for each day *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed with the team and participants the proposed meeting agenda.

Mr. Bucciero reviewed with the team the need to comply with NERC's Antitrust Guidelines. He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The team reviewed and unanimously adopted on March 12 the SDT February 18–19, 2009 meeting summary.

Stuart Langton, SDT facilitator, reviewed the current work plan and meeting schedule for both Phase 1 and Phase 2 development. (*See Appendix #4)*

II. Technical Feasibility Exception Update and SDT Discussion

Scott Mix noted that NERC staff believes it is ready for posting for industry comment. Regional entities will receive an early preview of the TFE for any compliance and resource implications (March 6). Michael Assante, CSO at NERC met with FERC staff to brief them on the TFE and the SDT 706 Phase 1. He noted that Dave Cook, NERC General Counsel indicated that the target was to post the TFE at end of week. This would bring it within the 14 days the SDT agreed to when it approved the phase 1 products for industry review. This would allow industry balloting starting in early April.

SDT Member comments

- Any substantial change since December? As was discussed in the February 18-19 SDT meeting, the TFE can be claimed only where it is specifically allowed to be claimed under the FERC Order 706.
- SDT may support a TFE through a standard modification regarding operations and safety in phase II.

- Removing risk acceptance- didn't put back in where "technically feasible" requirement for compensating measures. Just not a procedure through the TFE. Like documenting the compensating controls.
- The SDT can deal with TFE in Phase 2 standards
- People in industry are worried- when will they get it? TFE not applicable to every standard and requirement.
- R5- would language have to exist in each sub-requirement? No, if in main requirement applies to all sub-requirements.
- Applicability model will be part of the posting for TFE? Yes it is there.

III. VSL and VSR Committee Update

Dave Taylor set out the process for developing the Version 2 VSLs. He noted that NERC was seeking to get the Version 1 VSL document posted by Monday, March 16. He noted the plan is to pre-ballot review for Version 2 VSL (i.e. Phase 1) by May 11, 2009 and provide a 30 day industry comment period.

SDT Member Comments on VSLs

- Interrelationship between the two VSLs need to be clarified for the industry.
- If industry doesn't approve version 2 (i.e. Phase I) CIPs OR the VSLs, NERC will have to file something with FERC. The NERC BOT has to approve any filing. May take a BOT override on the process.
- Along with VSL and standards timing. Industry needs to understand the TFE process. Many things to understand in terms of the inter-relationships.
- NERC planning to launch a separate web page and a separate announcement and a note in the NERC newsletter.
- NERC should consider making a "Gant chart" on web page- highlighting the timing for review and adoption with definitions of what they each do and why it is important that they happen in the right timing.
- Is NERC planning on providing information to the ballot body of the ramifications of a failed Phase I ballot? Industry should know what will happen if it fails to pass. Prefer to know beforehand what will happen.
- NERC needs to be careful about the perception of threatening the industry. NERC will do the bare minimum to meet FERC directive if the ballot doesn't pass.
- Can FERC be approached for an extension? No, it has already passed and it is now federal law.
- We need some kind of dialogue mechanism with the industry- blog, webinar, get information to the industry. Need to careful about managing expectations about the turnaround.
- Who would be responding to industry questions? With what authority? etc. NERC would have to dedicate a full time person to response.

- What happens if registered ballot body votes down version 2 standards. This is a non-trivial thing in the era of the ERO. "Smoldering anomaly." Ask FERC- what do we can/should do. We played the game and industry won't budge. There is precedent for BOT overruling a no vote in the period before the current ERO status. In the era of ERO will this fly?
- Same problem with FAC standards-. NERC understands and has to follow the ANSI process.
- The audit issue in July may pose a unique problem and NERC might be able to get through the filing process without raising too many eyebrows.
- If Phase I does fail, NERC and the SDT should look at responses before make decisions what to take to FERC.
- We should encourage NERC all with ideas for engagement with the industry stressing the importance of a consistent message- Will NERC be going to all regions?
- SDT 706 Slide presentation to timelines- send to all members- Scott Mix- Dave Taylor , Joe Bucciero and Kelly at NERC will do so. Also work with regions through the team.

On day-three, David Taylor reviewed with the SDT the VRFs and additional language for Requirement 1.8, noting that most reviews were judge to be "medium". He asked for feedback on the proposed levels. He noted that if the SDT approved they would be posted today along with the Version 1 VSLs. A motion for the SDT to accept the draft (John Lim, Bill Winters 2nd) and unanimously adopted by the SDT (18-0).

IV. Phase I Response and Timeline

Joe Bucciero noted that the Phase 1 Response document was circulated to the team earlier in March for their review. The chair entertained a motion (Freese, Edwards 2nd) and the SDT unanimously approved the response document for posting.

V. Phase II Concept Development

Stu Langton noted that the Phase 2 concept development was initiated in the fall of 2008 by the SDT. In November there were criteria suggested for the design of the process. In December there were presentations and discussions regarding risk management. In January and February two concept papers were developed that looking at two approaches to Phase 2: one which worked within the current CIP and sought to integrate applicable NIST and other ideas; the other which started with a review of the NIST approach and sought to bring some of the CIP elements into a NIST-like model. At the conclusion of the February 18–19 meeting the SDT agreed to ask the two teams working on the concepts to produce an initial draft of CIP-002 consistent with their concepts for review and comparison and possibly merger.

A. CIP 002 Strawman #A — Concept Proposal Presentation Overview

Bill Winters presented the drafting team's CIP-002 strawman (See Appendix # 6) as was agreed at the February 18–19 SDT meeting. SDT members participating on the team included: Jerry Domingo Brewer, Phil Huff, Kevin Perry, John Southern, Keith Stoffer and Bill Winters. He noted they used Kevin Perry's concept paper presented at the last meeting as the guide for

developing the CIP 002 and that this was a systems-based approach in terms of systems control and systems awareness which started with looking at core function systems/assets. He described a reverse "peeling of the onion" approach, starting from the insider out. The team started with a series of "nested" definitions of cyber asset, cyber system and control systems- all nested within cyber systems.

The team's intent was to try to simplify a systems approach — e.g. start at your SCADA server, what is connected to it providing data to it, continuing to walk out to your historically system and on to determine full scope of the system using in control and system awareness. They sought to define one or more security boundaries (R2) then identity security boundaries around systems. They introduce a categorization criteria model (low, med high) to apply to cyber systems (R4.) That would be approved and reviewed at regional level. The approach allows some flexibility, region-to-region. E.g. working groups within regional entities could work to define for each region. Then remaining CIP standards apply. Deal with mapping to low, medium and high. (R5) Implement a change- need to assess. How to capture interconnected external entities (R7)

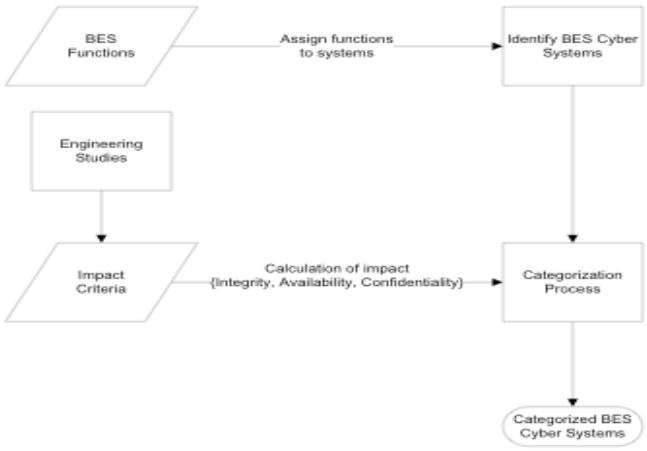
SDT Member Q & A and Discussion

- **Categorization at the regional level.** R4 — regional categorization? Which entity? The region itself. E.g. ERCOT. Do they have the capacity to do this? Regions will need to understand this approach going forward.
- Region would approve the criteria for the thresholds, e.g. less than 300 mw low, 300-800 moderate, above 800 high. Region wouldn't look at the cyber asset or system.
- **Confidentiality —** Are there confidentiality issues that need to be addressed with the approach? Establishing a framework for the categorization model- would be a risk impact model at a regional level.
- **Inconsistent regional interpretations —** If we regionalize decision making around R4- how does NERC deal with inconsistent interpretations?
- Regions might petition to NERC.
- Does R7 create a legal duty to do something? Why there? Concern we may have inconsistent responses across the regions, one entity take action against another?
- High medium and low- needs to be consistent across all regions and entities. What is in the standard is what is audited to. Sounds like a "fill in the blank" standard.
- **Connectivity to Networks —** Concern about idea of connectivity or network connectivity having been lost? Implies this evaluation of systems would have to take place on any equipment regardless of their connectivity to networks. Would all these have to be evaluated?
- Network communications was left out of the description because communications standards would take care of this. Systems approach looks at interconnection. Isolated item would be assessed for connectivity- unless it was in the "lower than low" category.
- Approach focuses on system and data exchanged within system and between systems.

- **Increase in scope —** A facility with serial connected devices collecting data would not be covered by the current CIP? This may pose a significant scope increase in terms of assessment.
- Terminology needs to be tightened. Ran into that in trying to implement and audit the current CIP standards. Need to make immediately obvious to anyone what is a reasonable understanding of what it is we are after in these standards.
- **RROs and REs —** Regional approval? Region doesn't exist- either RRO or RE. Is it a jurisdictional entity that requirements can be tied to? Regions RROs RE may not have technical competency to do this yet.
- **Focus on information security —** Are we focusing on hardware vs. information/data we need to perform functions that will come through different systems that are "data feeds?" Information security is the focus. Region is not where it is at. Reliability coordinators will need to decide this. Not operating in a vacuum. Region could have function of holding meetings of RCs.
- Look at the mission then look at the equipment. Different levels of requirement based on your threat profiles.
- There is a disconnect on how regions will apply this. One company can cover 5 regions. How will one system be treated with 5 regions telling us what to do. Needs to be applied the same. This is important and not sure how it will be taken care of in the "systems" approach.
- Jeri Domingo Brewer shared a presentation of how BOR does asset categorization process at the February 2-4 meeting in Phoenix. The same situation happened in the Federal sectors when they had to categorize their systems. There is a corporate impact that needs to be assessed if you lose functional capability.
- Address realities in how infrastructure is operated so that standards can be audited in a consistent manner.
- The SDT may be caught in the language. Focus instead on the approach that is being proposed. Fundamental to the approach is the way of arriving at which assets should be protected. IT marries a functional view with the traditional engineering approach. There will be follow on activities as to what to do with the standards.
- ERCOT region/ISO wide area visibility- criticality of any assets. ISO functioning as a RC? Lots of things to look at. If you declare assets to be critical that the responsible entity doesn't agree. Number of aspects are complicated need to recognize this.
- Acknowledge the point about addressing companies who straddle multiple regions. Didn't want NERC to mandate across the board what the threshold criteria would be. E.g. the nature of congestion of northeast may be different than that of the midwest etc.
- Engineering model applied to cyber asset vs. the other way around.
- **Updates —** Updating once every 3 years vs. annually. Consider all the assets that manage the grid. High moderate low and maybe "lower than low." After initial investment in the classification, the future efforts will be building on that.

- **Boundaries** — R2 — one or more boundaries allows flexibility. In concept paper did not represent telecommunications functioning- you can't manage or control it. Preserved the concept of it being out of scope-not including devices.
- Limit to Cyber systems that do something. Protect the data. Depending on where you draw your boundaries, scope of telecommunications.
- R7- doesn't exist in the standards today. Finds this to be a huge problem. Need to find a way to address. Calls for communication with external RE.
- **Critical** — The strawman doesn't use word critical. Current reliability standards — BPS — violation of risk factors high, medium low. Equivalency? Somebody has to protect anything that could possibly violate a requirement. Label that as a critical asset. If you violated that requirement because of cyber security incident.
- Look at existing tools and concepts used to try to determine how important things are.
- **3rd Party Review** — FERC order- appropriate 3rd party approval — region was an attempt. "appropriate 3rd party review to be determined"
- Description of the process proposed:
    - R1- scope your systems affecting BES. (kick out such things as customer service etc).
    - R4 Assess as low, medium, high.
    - Start with information — captures intent of CIP. 3rd party concept allows for not a solution but a requirement.
    - R3 prevent gaming.
    - R6 internal controls
    - R7- heartburn- negotiation and arbitration method to agree on a list- walk away equally unhappy.
    - "Networks" captured in cyber assets definition.
    - Better model for defining function.
    - Take approach for determining critical functions.
    - Public concern is with remote configuration capability (a la Aurora) engineering support and maintenance. Systems in place but with remote access.
    - Treatment — "my identify" password synchronization- HR system. Shut off access in a keystroke in Corporate IT land. What is a peripheral system?

On the afternoon of day two the following flowchart was presented and discussed:



Bill Winters presented the straw man A CIP-002 flow chart process and summarized the steps:

- Assign function to systems
- Identify BES cyber systems
- Engineering studies leading to Impact criteria
- Use criteria in Calculation of impact (integrity, available confidentiality)
- Categorization process (hi, med low, not)
- Categorized BES cyber systems.

SDT Member Comments on Strawman A Flowchart

- Incorporate engineering into categorization?
- Power systems and computer systems networks. 2 and 3 are power systems.
- Where do lists of functional impacts come from and at what point? (identify BES cyber systems)
- Shrink to cyber systems? Need to have all the pieces to perform a function? Shrink or whittled?
- Categorization to each cyber system on list- box? Oval- CIP standards on 002 applied to categorized BES cyber systems.

B. CIP-002 Strawman #B — Concept Proposal Presentation Overview — Jackie Collett, John Lim, Scott Rosenberg and John Varnell

Jackie Collett presented the team's CIP-002 strawman (*See Appendix #7).* She noted the ~~CIPSE~~CIPCCIPC Risk Assessment Working Group's (RAWG) work and draft report was helpful. Their concept started with the connection to BES — which is an engineered system. Cyber assets support the reliability of the BES. They address facilities, equipment and systems but acknowledge a need to define systems going forward. Their approach is not a risk but an impact assessment of the reliability of the BES. ~~CIPSE~~CIPCCIPC RAWG, focuses on "impacts." Cyber assets are one of many elements supporting the process. They propose that properly applying top down approach will ensure the reliability of the BES. She suggested the SDT should consider including some concepts from the RAWG in the standard where it makes sense. Their approach avoids a prescriptive approach but considers categorization of critical assets of BES — critical or not. Consider critical cyber assets: (3) low, (2) moderate, and (1) high and some that need no protection in transmission and generation. The oversight of critical asset lists- remains an open question at this point. Use and incorporate NIST controls that provide some good starting points.

She suggested the approach builds on: industry work, experience and investments in compliance programs but noted that the identified risks will increase scope of compliance. She then reviewed CIP 002 draft requirements and changes.

SDT Q & A Member Comments

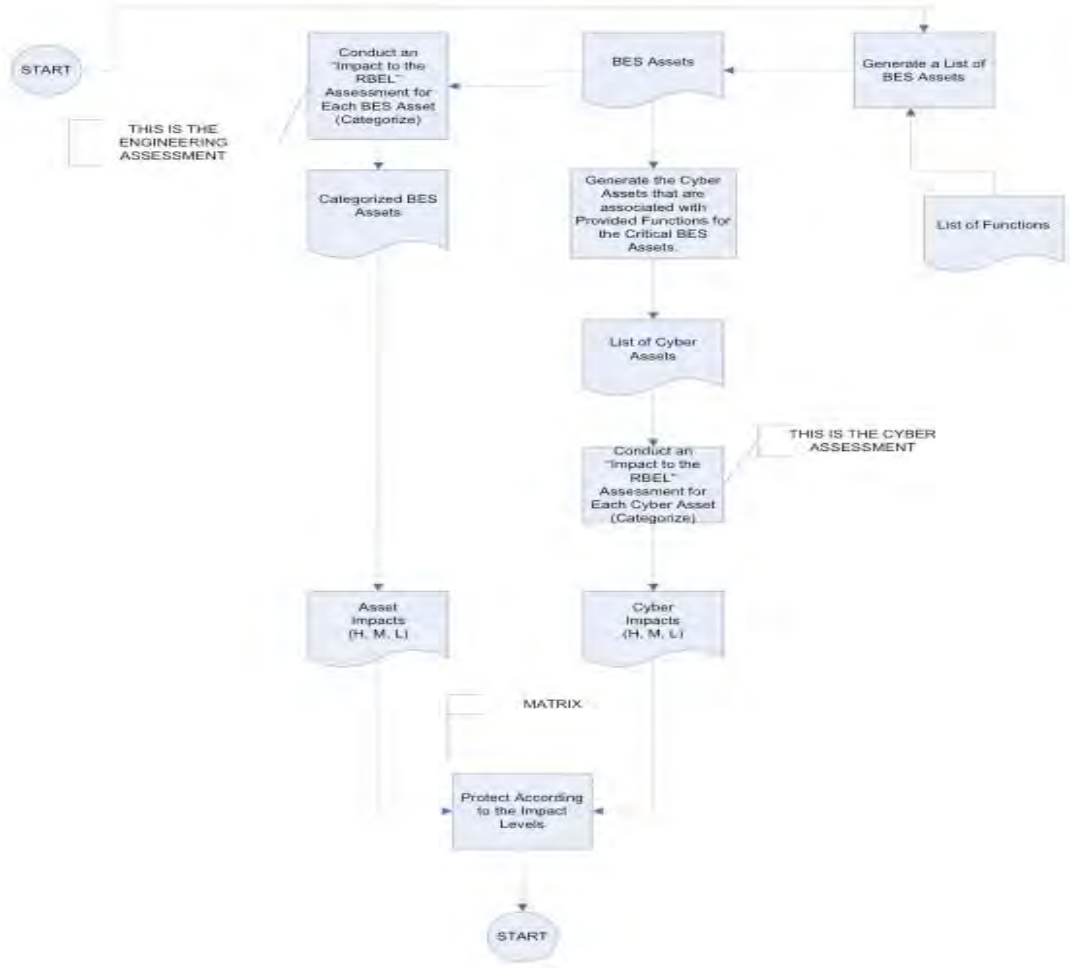
- What is the right balance between overly prescriptive and too loose?
- The six NEC principles of adequate levels of reliability can be core principles for developing standards. This will go a long way towards providing credibility for the SDT's proposed CIP standards.
- Didn't see a requirement for assessing the impact of the assets before assessing impact of cyber assets. This is a two-step process. Assess high, medium low none, on electrical assets

and then on cyber asset. Matrix: rigor for requirements. High and high highest level of rigor etc.

- Lends itself to NIST approach. Goes a long way
- The team agrees with these comments and left it out for simplicity case.
- The two strawman proposals (A & B) are not at polar opposites of positions. There are many commonalties with the main differences being the risk assessment vs. impact assessment.
- High impact? Critical asset that is also a cyber asset — current CIP don't address.
- EMS data system- cyber asset. Our control system (function) was the critical asset.
- Agree that there is a huge amount of judgment around identifying the assets.
- Why haven't we asked industry — to submit examples of excellent methodologies of categorizing assets? Did ask through the ~~CIPSE~~CIPCCIPC last year.
- Many are paid for methodologies and there is a reluctance to share methodologies based on issues of confidentiality.
- Cyber being a critical asset. Last drafting team- moved to function.
- Impact categorization- high medium low. Network automation-
- Substation lab with metering doesn't work through fire walls. Look at function of relay- may have some pieces not as important as others.
- Network automation "support" vs. "intrinsic" to the operation?
- How do we do this.
- A9- how far apart are we? End result of both approaches is a list of cyber assets. Both identify all. If critical assets — start with systems. Apply engineering criteria.
- Not all things considered as part of system. One looks first at physical then others supporting it.
- Both looking at impact of cyber system on reliability of the BES.
- Not just focusing on physical assets. Important to look at function. Inclusion of systems if they are assets related to that function.
- Strawman A suggests that threshold criteria for impact determination be set. Can we link criteria to adequate level of criteria?
- Difference from engineering look and then the other way around.
- Engineering based assessment is critical to both approaches. R4 — assess the risk of those systems. First criteria — what asset it supports 25 mw or 1000.
- Start with a list of systems or a list of assets. Starting point is the difference.
- Differences- one is bottom up and the other top down. Subtle differences in terminology. Asset vs. system.
- Consistent guidance in body of standards — white paper as an attachment to body of standard. De facto implementation guide. Consistent method of categorizing assets. Because it is part of standard, it becomes binding.
- E.g. operational standards — calculate ACE — formula is not in a requirement, but an attachment to a standard.

- It is during the implementation phase that we see big difference between approaches. If just securing systems, or facilities- limit the locale where we control access to computer rooms. Think if intent is to secure- both facilities and systems.
- Load study analysis as part of identifying critical asset list.
- 706 "guidelines"- white paper might serve as that? How to do things is a guideline. Do we write the guideline as a part of it? Who would do this? Not NERC staff. May need the standards, the implementation convention, guideline that talks about approaches. E.g. an attachment about what a high impact is.
- Prescriptive vs. non-prescriptive.
- Look at some existing standards- allowable method.
- Took "supporting functions" intent out of CIP 002 to not raise this? Can't audit an intent- intent can be in a white paper. Nature of guidelines — options

On the afternoon of day two the following flowchart was presented and discussed:



Jackie Collett presented a flow chart depicting their approach that included reference to Scott Mix's matrix.

SDT Member comments on the Strawman B 002 Flow Chart

- What is a cyber impact? Impact on the BES? Yes. Independent of impact on physical asset that it is controlling.
- Why bother generating list of cyber assets for low impact? Low represents some level of protection.
- The impact on that asset and impact on BES comes in through the use of the Mix matrix.

C. Strawman Proposals Alignment with Guiding Principles

At the end of the day the members agreed to complete a matrix that highlighted the degree of alignment of each strawman with the guiding principles developed by the SDT at its last meeting. The results were compiled overnight and were presented to launch the discussion on the second day.

The members suggested that the rankings supported the suggestion that the strawman approaches were generally in alignment with the principles and have more in common with each other.

SDT GUIDING PRINCIPLES	Strawman B – CIP-002 Lim et al.						Strawman A: CIP 002 Huff et al					
Alignment=	*Fully*	*Generally*	*Somewhat*	*Not*	*NA*	*Avg.*	*Fully*	*Generally*	*Somewhat*	*Not*	*NA*	*Avg.*
	4	*3*	*2*	*1*	*NA*	*Avg.*	*4*	*3*	*2*	*1*	*NA*	*Avg.*
1. Map CIPs to NIST 800-53 to help quantify and assess any gaps	**4**	**4**	**4**	**0**	**5**	**3.0**	**3**	**6**	**3**	**0**	**5**	**3.0**
2. Protection of communication devices outside the electronic security perimeters is out of scope.	**7**	**6**	**2**	**0**	**2**	**3.3**	**4**	**4**	**4**	**0**	**2**	**3.3**
3. Create non-prescriptive standards and employ a technical exception/ compensating measures documentation and guidance process to accommodate variations.	**2**	**9**	**0**	**0**	**3**	**3.2**	**0**	**8**	**6**	**0**	**3**	**2.6**
4. Strive to preserve existing security investments and build upon the existing CIP requirements.	**6**	**10**	**0**	**0**	**2**	**3.4**	**2**	**9**	**5**	**0**	**2**	**2.8**

6. Consider the unique locational characteristics (e.g. substations, data centers, generation plant) and functional capabilities of the cyber assets to be protected in CIP requirements.	**4**	**8**	**0**	**0**	**0**	**3.3**	**7**	**6**	**3**	**1**	**0**	**3.1**
7. Use a consistent risk-based model to classify cyber assets (as critical/high impact, moderate impact, low impact) allowing for expansion of standards beyond "critical."	**7**	**7**	**2**	**1**	**0**	**3.2**	**7**	**6**	**3**	**1**	**0**	**3.1**
8. Consider the minimum security controls for high, moderate, low within NIST 800-53 to help model the CIP requirements for each level.	**6**	**6**	**1**	**1**	**3**	**3.2**	**4**	**7**	**3**	**0**	**3**	**3.1**

NOTE: The SDT acknowledges that currently an entity's cyber asset classification is subject to scrutiny by the compliance enforcement authority and applicable regulators. *(February 18, 2009)*

3–10 SDT Members Written Comments on Matrix Form:

- I like the Grid-based approach in principles 1-4. I believe the systems-based approach is the favored approach. I think the issue of starting point is key- i.e. what is it we are trying to protect.
- Principle #1- NIST is system-focused against mission, no asset based

- Principle #4 Both approaches end in a list of cyber assets

D. Strawman A & B Areas of Strengths and Commonalities

The facilitators asked members to offer elements of the strawman approaches they felt were strengths:

- Several liked critical asset identification of the Strawman B paper. Engineering. Electric and cyber system interrelated.
- Strawman B's identification of cyber assets touching BES. Deals with cherry picking today with cyber assets
- Strawman A's simplicity and definitions.

The facilitators offered the following straw common propositions drawn from day one's discussion on the two CIP 002 strawman approaches for the SDT's review and discussion:

1. The current CIP language is insufficient for the future.

~~1. The current CIP approach is not a sound basis going forward to protect cyber assets and BES reliability (as exhibited by the five issues identified by Jackie et al).~~

SDT Member comments and suggestions.

- Both groups agree but this statement is too negative
- We have a sound basis- need to improve upon. Started from ground zero. It was a starting point. Need to do better.
- Delete and substitute: "The current CIP language is insufficient for the future. "
- What is the starting point of the security standard? Focus on systems or facilities and systems?
- Do we need a different approach?
- Yes because the problem with current approach is inconsistent and non-uniform protection of cyber assets. Giving each responsible entity authority to devise various processes with no approval and oversight get to the crux of problem. Goal of standard should be to keep the lights on and protect the BES, not to maximize shareholder concern.
- Focus on closing the loop holes. Don't cut unnecessarily into innovation and flexibility.
- Have to look at and find agreement on the problems we are trying to solve so we can look at each option's ability to solve problems.

2. Ground the approach in the context of NERC's 6 elements of reliability adding cyber security to each.

SDT Member comments and suggestions

- This is not in Kevin's approach. Not documented.

- Probably need to add, “adding cyber security to each” at end of the statement.
- Protecting from cyber security attack might be the 7th element of reliability. Malicious compromise of an asset. Currently talk of “critical”- reliable enough to sustain a cyber attack. Thus need to address all electronic control devices- high medium low as to how
- Problem is not cyber attacks but configuration management.
- Knowledge of IT and info security is not widespread. Let’s ground this in problems we are facing.
- Who has a good inventory of what we each have and don’t have? Do we know what we are managing? Put emphasis here on “care and feeding”
- “Adequate level of reliability document”- cyber security not a 7th element of reliability. Adjunct to all other six elements. Cyber security so that… we can recover from contingency, etc.
- N-1 is a concept that can’t work in cyber security. What do you have to do for resiliency in the cyber world: confidentiality, integrity, availability. Probably not a 7th element.
- Address what is the minimum for reliable operations.
- Keep the goal in mind in terms of cyber- ensure reliable power withstand an attack. Believes should be a 7th element.
- “Support” – cyber security/ computing systems are integral. Primary critical- can’t run what we are doing without computers. Central to our thinking about the problem.
- What is the goal of standards? Mitigate the risk or deal with reliability in wake or presence of attack? Goal is to prevent, deflect or recover from the attack.
- Engineering vs. IT approaches. This was faced when the federal entities began dealing with NIST in 1998. They were mandated to protect both physical and cyber, interconnected network systems connected to physical infrastructures. Take digital world into account new threats grounded in engineering foundation. It takes both- CIO, engineering and CEO viewpoints to do the job and solve the problem.
- Smart grid discussions have identified 16 critical infrastructures
- What are we trying to protect? Where to focus our attention? On terror or hackers?
- Focus on impact to organization and assets/people mission when any of the triad is compromised. Don’t have good info on who we are trying to protect against. Get away from the vector causing the impact, focus instead on what to do to protect against impacts.
- Creating false divisions- IT won’t be doing the engineers’ jobs designing power system elements. Engineers need to understand IT principles.

- CIPS have done a good job opening eyes to engineers- they now appreciate IT security components. Build upon this—the CIPs that are good but need to get better. Even below 100KV is automating.
- CIP 002 is about classification- regardless of IT or engineering. Extend to IT systems or networks?
- Holistic approach to IT- many threats from inside network. Not focusing on who but on what and where.
- CIP has both engineering and IT portions. 3 layers of classification will be helpful to them. CIP 002 needs to do both. More of an engineering function.

3. Utilize the ~~NIST~~ graduated levels (high, moderate low, and "who cares") in the approach.
   SDT Member comments and suggestions
   - Is this in terms of controls?
   - We have lost FIPS 199 in that. Self-assessment of impact to mission.
   - Assessment of impact to mission.
   - JP: value of exploring categorization of critical assets. Covered in concept paper. Impact assessment- organizational or asset?
   - Need to add a "inconsequential" or "who cares" level, lower than low.
   - How many levels we need? 3 right approach. FIPS 199 is using 4.

4. Include systems, facilities and equipment *(build on the ~~CIPSE~~CIPCCIPC Working Group Draft Guidelines)*
   SDT Member comments and suggestions
   - Everyone needs to look at guideline before we can agree to "build on".
   - Focused on identifying critical assets- CIP 2 version 1. Would have to modify it for both approaches.

5. Provide for 3rd party oversight and accountability in approach

6. Address the external interfaces impacting on BES reliability
   SDT Member comments and suggestions
   - Is this addressed in Strawman A only? Strawman B team agrees with this and do reference in their concept paper.

7. Oversight is addressed

8. Build upon the NIST 800-53 suite of controls
   SDT Member comments and suggestions
   - Are there others that should be considered?
   - Drawing upon system identification by risk development working group.

- Configuration management: is the focus of CIP to address this or cyber security vulnerability? We weave these together without answering either.
- Should deal with both. Should identify separately.
- CM is a core element to what we have. Ground engineering approach in this cyber standard. What is original intent of CIP 002?
- Gaps- trying to close with CIP 002- clear path to capturing all system elements for evaluation to ensure protected at a minimal level.
- We have to get a grounding in our cyber security sector. Create a 7th element to help ensure
- One is a top down focusing on what you are trying to do, the other is bottom up. Is it best to spend resources on deciding which to protect or invest in the protection itself?
- Need to focus on differences. Look at the starting point for differences.
- Should we get away from where the vector comes in and instead look at whether there is an impact to my system?
- Strawman A focuses on control vs. addressing vulnerability.
- May not be an either/or. Create a merger between the 2.
- R1. 7 and .8 overlaps with Huff approach. Move to R4. Corollary to FIPS 199 process.
- Is there a place for R2 and 3?
- R4- merge the two. Look at 1.1. Merge the two together and discuss functional description of assets.
- Let's not talk about how. Let's focus on their function and effect on BPS. Nail this down. Then look at rest of standards. Good controls, effective, cover threats.
- Stay focused on what we should accomplish- good for cyber assets but ignore 1.1. We need to deal with these--are they in/out?
- Keep "critical assets" in there because of VSLs and compliance associated with these. Thinks merger suggestions are good.

E. Exploring the Merging of the Two Approaches- Merger Small Groups.

The facilitators suggested several discussion questions following the presentation and discussion of the strawman options including:

- What is the best place for the CIP 002 approach to start? From facilities? From Systems? From either? From both?
- What is the best approach to 3rd party oversight and accountability?
- What is the best approach to addressing external interfaces?

After some discussion, the SDT members agreed to break into two discussion groups on the morning of day two to discuss and focus on the possible merger of the approaches of the two

Strawman 002 concepts to Requirements 1 and 4. Following lunch, each group reported the results of their discussion and engaged in a full SDT discussion of the issues.

1. **Requirement #1 Small Group Report**
   (Participants: Gerry Freese, Kevin Perry, Sharon Edwards (scribe), Rich Kinas (reporter, moderator), John Lim, Jackie Collete, William Winter, David Revill and Scott Fixmer)

Rich Kinas presented to the full team a summary of the small group's discussion. The group reviewed how it would be possible to merge facilities vs. functional approach. They agreed that the starting point should be to identify the functions necessary for reliability of BES. There were questions as to whether that should be part of the standard. Some urged that there was a need to pre-define the functions. The group agreed that it would then be necessary to identify the systems or hardware used to perform those functions. It would then be necessary to incorporate the high, moderate, low threshold each into category.

SDT Member discussion comments

- Some look at systems approach vs. assets/hardware.
- Who identifies functions? It is not clear at this point would need to be addressed. It may be the SDT.
- Continue to land on fundamental differences- e.g. do we do a filter before systems assessment using BES components, or do we jump to cyber system and then roll into a component basis. May not matter that much which is the starting point. Important to get to appropriately identify systems so an entity could take either approach.
- Can we provide or point to a methodology?
- If go to a systems approach- Bill Winters might word smith an option
- Hardware-
- Define systems? Electrical vs. cyber systems.
- If "system" in R1 what is reason for R4?
- Function definition in R1 only. System to support function in R4. Keep at power stuff or functions level (e.g. AGC).
- Are reliability functions defined within reliability standards? Where is the right place to define these functions? Those requirements in operations horizon. Look for those in the High Violation risk factors?
- A control system- command and control function of controlling BES.
- Operator certification?
- Defined by other standards?
- A participant offered the following list of 9 functions for SCADA systems from their consulting work: 1. Core and Critical SCADA functions; 2. HMI & Information Network Equipment; 3. SCADA Master; Real-Time Communications Systems; 4. Data

Acquisition; 5. Automatic Generation Control; 6. Breaker Control; 7. Voltage Control; 8. State Estimation; and 9. Remote Configuration/Troubleshooting/Maintenance
- Concern about limiting to operations. Asset management. Configuration management, firm ware etc. inventory system
- SR: concept- look at already developed items to come up with a list. Look at the conceptual.
- From the R1 small group perspective: Thresholds are R3 and Cyber devices are R4.
- In the NERC Adequate Levels of Reliability document- all have standards associated with those functions.
- By using approved standards, do we have an asset list?

2. Requirement #4 Small Group Report

(Participants: Frank Kim, Phil Huff (scribe/presenter), Jeri Domingo Brewer, Scott Mix, John Varnell, Rob Antonishen, Jay Cribb, Mike Winters and Keith Stoffer

Phil Huff presented the small group's report offering the following summary points:

- The Small Group suggested taking "systems" references out of R1 and only include functions of BES in R1.
- R4 should identify the systems that support and perform the R1 functions
- Physical assets- stayed away from system categorization (R5)

3. SDT Discussion of Merging the Approaches

SDT Member Discussion Comments on Merging the Approaches

- Refreshing to see what the Strawman B did in R1- lets go forward.
- How do we identify functions? How many standards exist? About 120 standards with over 1000 Requirements. Is it realistic to point to them when defining the functions? Note, there are over 150 high risk factors.
- The OC/PC chairs- believe that the SDT is using the standards for something other than what they were designed for.
- Definition of adequate level of reliability by FERC- scope of the functions we are talking about. Characteristics.
- Concerned about ambiguity- of standard. Draft 2 of standards had numbers in it.
- Should we dictate assessment methodology in the standard?
- Standard says what- with parameters. "How" is placed elsewhere.
- Specificity has a place in certain standards. How to shed vs. when to shed.
- SDT must figure out where the specificity belongs keeping in mind that a standard is a "what" not a how. Guidelines are generally the place to lay out the "hows."
- Keep in mind we are now in the ERO era.
- Float as a white paper vs. a list of requirements?
- Adequate level of reliability paper-was it balloted?

- Will it be possible through a onetime process, to identify the functions that support the reliability of the electric system? This needs to be done. Perhaps it can be defined in standard and referred to as an appendix.
- Defining the criteria for high, mod, low, inconsequential, should be taken out of industry hands on a case by case basis and put in the standard. If REs make up their own rules, we will still have problems with consistency and uniformity of application of standards.
- The steps are: identify assets; map against functions; map against potential impact (criteria); and come up with a list of what protected to what degree.
- Don't need to define these functions- don't reiterate existing reliability standards. Cherry pick the key functions. Black and white filter may be needed here. Would simplify for end users and cut down on interpretation.
- Don't lose sight of the consensus reached in having the functions in R1, the systems in R4.
- Address the functional aspects of BES in R1. Recognize it is good to separate functional objectives of BES from systems and assets that support use.
- There is disagreement over whether the functions are defined in R1. They need to get defined as onetime process external to entities using them and then reference in standards.

F. CIP-002 Requirements 2 and 3 Critical Asset Identification Methodology (R2) and Identification (R3) Strawman

Scott Mix presented a strawman for an approach to CIP 002 Requirements 2 and 3 for consideration by the SDT. He suggested starting with functions and map to the physical equipment. Consider determining "Asset Impact" as high, moderate, low and none and "Cyber impact" as high, moderate, low and none for CIP 3-9.

Asset Impact -->	High	Medium	Low	None
Cyber Impact:				
High	5	4	3	1
Medium	4	3	2	1
Low	3	2	1	0
None	2	1	0	0

SDT Member comments on the strawman R2 and R3 matrix

- What about load shed for economic reasons? Conceptual level
- Have to come under standards since the risk is there and need to mitigate.
- The pre-supposes a lot. Look at asset based on function and rate. Take a more systems approach tied to function. When you do categorization, look at the threat vectors.
- Very ineffective security controls may result in undermining the intent of the standard.

- **Asset based impact —** likes approach. Availability- how would loss of asset affect BES? How would misuse of system affect?
- If you look at asset before this is done, it may lead to mistakes. Take information and fold into the categorization effort.
- Shouldn't include/exclude systems with a filter/matrix.
- This will cover more systems than are covered now under the CIP.
- Developing standards guiding production systems.
- If required to have zone protections. Shouldn't design standards to accommodate
- **Remapping from function to asset —** Keep this at the function impact. You may be opening this up for avoidance behavior.
- Redundant protection is tied to the adequate level of reliability
- We haven't talked yet about oversight and wide-area view component
- Asset and function may combine — Modify- level of effort to compromise device? vs. cyber impact. Impact divided by effort? Ratio- high risk of impact, little effort to compromise. Threshold of value to provide additional protection.
- Is there a potential for "gamesmanship"? Internal actor, external actor, etc.
- Start with the function — can't secure AGC, secure computer that calculates. Need to get to functional level.
- Just do cyber impact with criteria- may not have to go through asset impact drill.
- Framework is a good thing. If you do categorization impact- after identify functions.
- **Defining thresholds —** Need to make sure we don't start putting numbers to thresholds. They may increase and then you will have to revisit to deal with the changes needed.
- Is getting down to the BES element device necessary? Keep focus on system level.
- Not excluding assets, including the system.
- "Contingency reserve"
- Added impacts into asset classification R.2.3 (get from Joe/Scott)
- Helps with appropriate levels for controls
- Relate to specific standards to give people a sense of this. Create an attachment. Binding explanation of what "significant" means.
- Put as an attachment vs. a glossary.
- Categorization?
- "Support the reliable operation of the BES". Need to clarify this.
- E.g. insignificant devise?
- What is the correlation between R2 and R3 and cyber assets in R4? Connection between R4 and R1. Moved under R4. Come into play then? Cyber approach
- R1 and R2- are generally focused on electric R4 and R5 focus on cyber.
- Each requirement by itself a simple requirement to meet.
- Break line between R3 and R4? Do both. Proposing to maintain the hierarchical order?
- Anticipating "controls"

- Are these exclusive. Do we need R2 and 3 any more? Can't apply a control to a function.
- Control framework- requirements 003-009. NIST calls security controls. NERC
- Hierarchal ranking of assets-
- Look at functions, correlate to cyber systems, apply controls 003-009
- Without an engineering review of impact- R2.3 do it as overt operation that can be audited.
- Put in the relevant detail. Don't do before you know what cyber assets perform what functions.
- R2 and R3 are top down. Does each requirement stand alone? Each is building as a filter or additive. If leave out 2 and 3, then you can't build later the matrix.
- This may allow RE pick and choose and make up own rules? If we can define the threshold criteria identification importance. If you want RE to do, then leave 2 and 3 in. Determine in an appropriate manner.
- R 2.3 process. IROL caused by cyber asset? If remove R2.3- won't
- Pre suppose cyber assets everywhere.
- R1 now. Most are systems. R2 and R3 is part of categorization process. Need engineering criteria in R5.
- Use matrix approach — complex- 16 cells. Meld to high medium low or none.
- Options include: 1. Keep R2 and R3; 2. Keep with SM's language; 3.Move
- Need to clarify what "cyber impact" means. Cyber impact on a particular asset? Include going forward- components of connectivity, impact of cyber system on asset/function.
- Supports a 2 dimensional matrix.
- R2 and R3 — captured in the external engineering studies on Strawman A flow chart. Not a requirement in this because it would be done externally. R2 and R3 performed external to the entity process.
- Impact assessments: need to keep separate? Performing 1 impact analysis.
- Haven't had good results in getting new methodology out to the industry quickly. Will any of these be better than what we have today? Looking for more consistent answers from each utility.
- Similar enough to be the same flow chart. Are they the same flow if you move that one box?
- Is there agreement with moving the arrow will result in no 2 dimensional matrix? Cyber impacts may have not bearing on the functions.
- Cyber impact assessments — consider impact on physical assets of BES due to impacts of a cyber asset?
- Breaker control relay- cyber asset impacts the breaker associated with.
- What is a cyber impact? Impact on the BES. Independent of impact on physical asset that it is controlling? Why bother generating list of cyber assets for low impact? Low but some level of protection.
- Impact on that asset and impact on BES comes in through the matrix.

- We are looking at this from bottom up and top down.
- Left side of flow chart covers the impacts and consequences. Right side- cyber impacts as a vulnerability assessment. What kind of connectivity does it have etc. Sounds like 2 pieces of a risk score. Take the controls and apply to.
- Cyber impact is the impact to the operation of the specific asset using vector of protected system- does it cause the engineering asset to misbehave.
- We are struggling with a difference in terminology. Cyber impact on the Strawman B chart is blind to the broader system. Impacts on the Strawman A chart take holistic view of the system.
- Is the difference a vulnerability vs impact assessment?
- What happens with malicious behavior?
- Part of cyber assessment — assess use of un-authenticated relay.
- Interpretation of cyber impacts — what is the reach of cyber assets- how many units can it kill. How bad can it make things from its viewpoint?
- Should we make a decision based on that impact-
- Common mode impact from the guideline and put in standard to be become binding?
- Cyber impacts- how they impact the BES.
- Vulnerability assessment to R5-

The facilitators suggested polling on three proposals for going forward that emerged from the discussions:

Proposal 1 Keep R2 + R3 with Scott's Language (Matrix)
Proposal 2 Move R2 & R3 into R5 (Vector Analysis)
Proposal 3 R2 + R3 Performed by External Entity

1. **Proposal #1: Keep R2 + R3 with Scott's Language (Matrix)**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
Proposal 1- R 2& R3	**6**	**5**	**6** (5/1)	**1**	**2.9 of 4**

Comments after ranking:

- #1s: This is not right framework- misplaced. Concept of keeping R2 and R3. Placement is a big deal
- #2s: not convinced complexity of 2 way matrixes is necessary.
- #2s splitting the assessments — what physical are you looking at? Cyber impact doesn't have meaning within methodology.
- #2s Not seeing the meaning of the cyber impact assessment

- #2sTaking us as group we are not on the same page- we will have difficulty pushing concept to industry.
- #2sWhat if we split this into 2 analyses. May be a lot of work that may not matter in the long run. Better to have in 1 integrated process. Bring all into 1 assessment process.

SDT Comments

- Important to be clear about ultimate requirements that we write.
- Cyber impact- left hand side- what happens if BES asset is compromised, goes away.
- Right hand column- cyber impact- what bad things could be done with device if it were compromised on the target of evaluation.
- Next version of standards- keeping R2 and R3 asset ranking is necessary. Applying more gradations vs. roll into big process with cyber impact. Industry might prefer to keep 2 & 3.
- Didn't vote- didn't get any sense of a system- in this.
- Is the process based on theory? Why you can't take last arrow and connect to impact- not mapping functionally? What is the cyber assessment. Other flow chart- engineering studies.
- Ranking based on reality-
- Risk vs. impact analysis- e.g. vulnerabilities.
- Are we ever going to bring in vulnerability?—yes, when we get to 003-009 for the control selection phase but we have to determine how many and how tough need to be.
- Analogy- FIPS 199- before categorize, incorporate risk assessment and existing plan and previous assessment. Impacts how you rate the system. Impact has no meaning if you don't have risk appetite. Audited for insufficient risk assessment before categorize system- and picking controls.

2. Move R2 and R3 to R5 for a single vector analysis- concept

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
Proposal 2- R 2& R3	**4** (3/1)	**5**	**9** (8/1)	**0**	**2.7 of 4**

Member comments after ranking

- 2's: value in evaluating BES independently of the cyber assets. May be easier for industry to get head around. May help with other standards.

3. Have R2 and R3 Performed by External Entity

Acceptability Ranking Scale	*4 = acceptable, I*	*3 = acceptable, I agree with minor*	*2 = not acceptable unless major reservations*	*1 = not acceptable*	*Avg.*

	agree	*reservations*	*addressed*		
Proposal 2- R 2& R3	**1**	**0**	**9**	**5**	**1.8 of 4**

G. Developing A Common Framework

At the end of the second day, a small group agreed to work further on a draft common framework. The group included Phil Huff, John Lim, Scott Mix, Jackie Collett, Scott Rosenberg and John Varnell. Jackie Collett introduced a flow chart as a strawman designed to be flexible to allow for further development and refinements. She understands that it will be important to clear up terminology so references are understood. Phil Huff offered that this concept captures the focus on cyber systems (not on assets) and does not offer a hierarchal model. The "vector" categorization- matrix offers some more granularity as to what we are meaning to accomplish. It offers a cyber impact analysis of impacts on the function. Still performing the same transitive impact analysis that is logically equivalent.

Concept

Identification of BES functions which support the reliability and operability of the BES

Need 1 layer of specificity below ALR

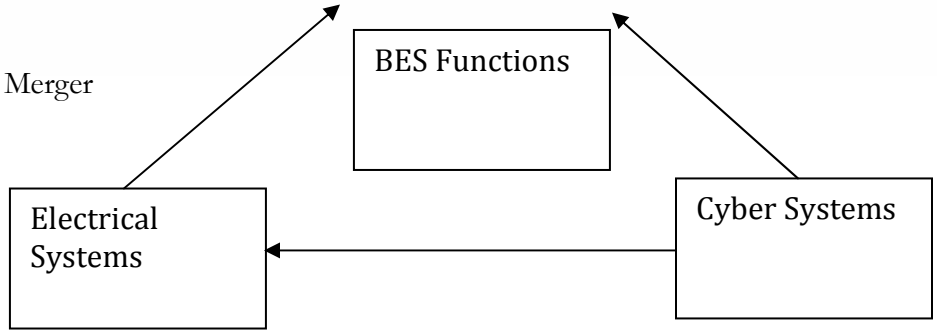
Cyber Impact — the local impact due to loss of CIA of the cyber asset for a BES element

System — a set of components which must work together

Electric System — a set of BES elements which must work together

Cyber System — a set of cyber components which must work together

Pre-Determined Functions			
R1	List of Electric Systems which support the BES functions	R4	List of Cyber Systems which support the Electric Systems and/or BES Functions
R2	Method of Categorization - impact to BES	R5	Method of Categorization - local impact to Electric System components
R3	List of Systems & Categories	R6	List of Systems & Categories
R7	Matrix: combines the 2 impact levels		
R8	Local Approval		
R9	Oversight		



Member comments on the Concept

- Is the definition of a cyber incident being only local? Does this suggest any difference of between cyber and electric.
- Haven't yet defined criteria. Connectivity on the cyber side might fit. They don't map well together. Cyber asset impact side put something in on connectivity.
- SM: formative stages. Focusing on local BES impact from a cyber stand point. Open to addressing network interconnectivity. Detail to be fleshed out later.
- Clarification- which bucket would a sweitzer 100 series relays (with a micro processor) fall in? What would industry think. Clarify what is a cyber asset. Helpful to have a one page on the guiding principles for the CIP effort.
- Network connectivity — weigh in on the cyber impact analysis
- Right side- call "control system" vs. "cyber system"? Direction can provide clarity. However, puts you in the weeds quickly.
- What is the object of the requirements?
- Terms should be fairly self explanatory. Not only systems that control, but also coordinate, alarm, situation awareness.
- Terminology- from different niches- "cyber" system is problematic. Move away from it.
- Go to control systems- nested definition sequence. Look at those definitions from Strawman A.
- Decouple- like the fact there is no discriminating filter. Solves that problem. Not convinced 2 matrixes. Willing to see how progresses. Key point in Huff approach-
- Detail didn't get to last night. There will be an oversight component. Difficult for 2 entities to talk with each other.
- Get captured in the pre determined function list that is built- e.g. exchange of data could be a function unto itself.
- System selections identified. Is intent to end with a list of systems that we've established an impact level of? Then identify elements you have to apply to? Put into additional CIP requirements.

- Don't part the sheep's from goats, blanket that covers everything but focuses attention are areas for greatest impact. May take 10-15 year timeframe to get there. There is a pile of assets we should worry about fixing in 2 years. Next level- have 5 years to do something with applying a lesser set of controls to a broader family of systems; another layer taking 10 years to get all of those done. At end, broad scope of coverage.
- How big a blanket? No agreement yet. However, more protection that what is currently implemented today.
- Identify an implementation time frame that would be reasonable to the industry.
- Use definitions- Alphabet soup draft- Cyber asset, system control systems.
- Any device that is programmable is in scope.
- Careful about using terms, mixing them up. Makes it confusing. Need come up with terms we agree on.
- Terminology-- careful we don't reuse terms- e.g. critical asset. Inventing new terms and using consistently. Do this sooner vs. later. NERC glossary — e.g. element.
- Note that this is a work in progress.
- Drafting team glossary before the next meeting. Beneficial.
- R1-3 pieces as planning type elements. R4-6 micro processor. Don't mix initially. Then combine.
- Other advantage — FERC 706 order — oversight is on the electrical side not on the cyber side. That's where there is oversight authority related to BES.
- "Big Iron" piece.
- Appreciation for this work. This concept is a benefit to entire effort. CIP standards are incomplete. Physical side needs to be developed. Leaves in that side that will address the physical side for the next SAR. I Like this.
- R1 and R4- how to scope down so not lists of 10 million? Will be scoped down on the identification of BES functions. "Generation control"
- Functions will be "pre determined" by the SDT.

Following the discussion the SDT agreed to rank the acceptability of the following proposition:

Adopt as a working conceptual model for SDT to develop frame and concept paper that includes a set of definitions/glossary, Develops a list of functions and uses list of scenarios to test the concept.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
3-12 SDT rank	**15**	**3** *(1/2)*	**1**	**1**	**3.6 of 4**
Second Rank with D Norton's Concept	**15**	**3**	**2**	**0**	**3.65 of 4**

Comments after the ranking

- Dave Norton ranked this with a 1 and explained it by presented a flow chart he had been working on *(See Appendix #9)* that was titled "Scoping Logic Synthesis Proposal"
- Rich Kinas gave it a 2 indicated his preference would be to create and compare a range of multiple competing approaches before settling on a framework for Phase 2.
- Voted 3: those working with both federal and NERC compliance at same time may find it hard to look at reliability from a cyber perspective- need to put in context. Hard for understanding each other. Federal experience suggests we will have a hard time with this.
- If on the cyber side we do a good job = functional description of systems and how relate to functions of BES.
- Good controls on cyber system to minimize risk. Demonstrate positive impact on BES. Setting stage for better dialogue with the industry.
- Could make it worse than now but on balance this is a good positive step.
- Voted 3- Shared Rich's view point. Taken aback- on the complexity of matrix approach. Left hand side- look to planners how are these falling out. Cyber side is right hand side is what is depicted. Complexity is an issue. Perception that standards are unnecessarily complex and wastes time. The more direct we make this the better.
- We can incorporate Dave Norton's ideas into this model. E.g. system restoration? Right hand or left side? Functions.
- There are lots of options but we should do something with this and see if it makes sense, see how this actually work in practice.
- DN ideas might fit in R4-6. Add this in.
- Standards should help provide everything in BES needs to be protected at some level.
- Engage in DN's next about how left and right side map.
- Voted 4 because it is a concept. DN's proposal is CIP 002 supported by concept paper. Where the criteria gets set is key. If criteria for categorizing set externally to RE, then single column can work and simplify the process.
- If RE's continue to make own rules, will strive to make low or none and it is hard
- R 1-3 what is the product of that? BES inventory run. Categorizing now with N-1, list will be automatically high. Leads to maximum controls. R3 is the documentation.

In the discussion of the approach going forward concern was expressed about whether the SDT was the right group to develop the concepts for Requirements 1,2, and 3 (the left hand side). Planning and operations perspectives would be helpful. The current SDT is 90% cyber folks. Dave Taylor volunteered and the SDT agreed that he should draft a white paper to present to the next meeting on a process for determining Requirements 1, 2 and 3.

Bill Winters requested the SDT rank the following proposition that if acceptable would be incorporated into the white paper going forward as the CIP 002 intent statement:

CIP 002 is intended to provide a discovery methodology that will lead to explicit identification and categorization of all cyber elements that <u>performs or supports</u> BES functions.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
3-12 SDT rank	**18** (16/2)	**1**	**0**	**0**	**3.9 of 4**

VI. NEXT STEPS and Assignments

A. Drafting Assignments

The SDT agreed that a helpful next step would be to refine the concept presented and tested on the third day in the form of a draft white paper. The chair asked Jackie Collett, John Lim, Bill Winters and Phil Huff along with Scott Mix to take the lead in the development of the draft white paper in advance of the April meeting building on the discussion and outcomes of this meeting. Other members would be welcome to send ideas and reactions as well as listen in and participate on the webex meetings that would be convened. The goal would be to be able to share the white paper with the industry following either the May, 2009 or June, 2009 meeting.

B. SDT Meetings Schedule, 2009

The SDT members completed calendar forms regarding possible dates for future SDT meetings. Upon review of the forms and SDT member scheduling conflicts, the following dates and tentative locations were established and agreed to by the team.

Proposed Dates and Locations for Future Meetings 2009

Dates in 2009	Location
April 14–16	Charlotte, NC
May 13–14	Boulder City, NV
June 17–18	Portland, OR
July 13–14	Toronto, CA
August 20–21	Chicago, IL
September 9–10	Denver, CO
October 20–22	New Orleans, LA
November 17–18	Atlanta, GA
December 15–17	Key West or FRCC (Tampa, FL)

The SDT agreed to seek to make a progress report to the MRC at its May meeting in Arlington, Virginia and provide a substantive briefing on the Phase II white paper for input at their August meeting.

The team discussed the timing and objectives for a workshop. Some members suggested it could be an opportunity to brief on the Phase II approach and receive input from experts from other standards bodies as well as FERC and Congressional members and staff. The chair noted that the NERC standards committee had carefully selected subject matter experts to serve as members.

The SDT decided to hold open the question of convening an expert/stakeholder workshop pending the Chair and Vice Chair's discussion with Michael Assante, NERC Chief Security

Officer, to gain a clearer understanding of the potential objectives, design and timing of a workshop in light of the SDT's progress and schedule.

C. Meeting and SDT Process Evaluation
The facilitators offered some observations on the SDT's team work over the past six months including:

- The SDT 706 team is larger that many SDTs
- The issues under review are complex and contentious technical and operational issues
- Contentious
- The members are highly knowledgeable and articulate with strong opinions.
- There has been measurable progress in proceeding on a two phase approach to their work.
- There has been a helpful sharing among the team members on what has been working and constructive suggestions on what could be improved.
- The facilitators should help to clarify within meetings the objectives sought for each session and check on the chair's, vice chair's and the team's sense of whether they have been met before transitioning to other sessions.
- The team members often in the context of reviewing and debating key issues will use experiences to illustrate points or test proposition which takes time and in some instances may not advance the discussion.
- The team and facilitators have been sensitive to the "violent agreement" rule but may need to manage that more assertively so that members know that it is being captured in the record and there may not be a need to repeat.

The facilitators suggested and the Chair and team agreed that it would be timely to survey the Team on the experience over the past six months to provide an opportunity for deeper shared reflections on the ways to improve the team's process.

The SDT adjourned at 11:45 a.m. on March 12.

Appendix 2 — Meeting Attendee List

Attending in Person — SDT Members

1. Rob Antonishen	Ontario Power Generation
2 Jeri Domingo-Brewer, Chair	**U.S. Bureau of Reclamation**
3. Jackie Collett	Manitoba Hydro
4. Jay S. Cribb	Information Security Analyst, Southern Company Services, Inc.
5. Sharon Edwards	Duke Energy
6. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp.
7. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
8. Phillip Huff	Arkansas Electric Coop Corporation
9. John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
10. Frank Kim	Ontario Hydro
11. Richard Kinas	Orlando Utilities Commission
12. David Norton	Policy Consultant, CIP Energy Corporation
13. **Kevin B. Perry, Vice Ch.**	Director, IT-Infrastructure, Southwest Power Pool
14. David S. Revill	Georgia Transmission Corporation
15. Scott Rosenberger	Luminant Energy
16.Keith Stouffer	National Institute of Standards & Technology
17. John D. Varnell	Technology Director, Tenaska Power Services Co.
18.Michael Winters	Ontario Hydro
19.William Winters	Arizona Public Service, Inc.
1. Roger Lampilla	*NERC*
2. David Taylor	*NERC*
3. Scott R. Mix	*NERC*
4. Joe Bucciero	*NERC/Bucciero Assoc.*
6. Robert Jones	*FSU/FCRC Consensus Center*
7. Stuart Langton	*FSU/FCRC Consensus Center*
Hal Beardall	*FSU/FCRC Consensus Center*

SDT Members Attending via WebEx and Phone

20. Tom Hoffstetter	Midwest ISO, Inc
21. Kevin Sherlin	Sacramento Municipal Utility District
22. Jonathan Stanford	Bonneville Power Administration

SDT Members Unable to Attend

1. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co.
2. Christopher A. Peters	ICF International

Others Attending in Person

Jim Breton	ERCOT
Roger Fradenburgh	Netsecctech
Judy Fry	ICFI
Darren Highfill	ENERNEX

Sam Morrell	CERT
Farzaneh Tafreshi	ICFI

Others Attending via WebEx and Phone

Chris Wright	
Dan Mishra	
David Batz	
Monica Coflin	
Karen Yoder	

Appendix 4 — Michael Winters Note to SDT

From: **WINTERS Michael**

To: **'CS_706_SDT@NERC.COM' <CS_706_SDT@NERC.COM>**

Sent: **Thu Mar 12 07:27:27 2009**

Subject: **All the best Fellow SDTers –**

I had to leave prior to us finishing up yesterday so I didn't get a chance to say goodbye.

It has been a pleasure working with each of you and being a part of this very important team. It goes without saying that these standards are much needed in our industry and the direction you are taking them is a good one. They have already served to introduce good information technology practices into power system engineering. These practices need to be applied at different degrees to all cyber assets used for power system operations (or at least allow for an explicit and auditable decision to not apply them to some assets).

I have learned a significant amount as part of this team and for that I thank you. I look forward to seeing where you take us.

All the best, Mike

Appendix 5

Cyber Security Order 706 SDT — Project 2008-06
January through June 2009 Draft Schedule

Short Term 2009 SDT Schedule Draft Criteria

- Follow the ANSI standard development process but use creative ways to efficiently secure input from the industry on emerging concepts and approaches to the CIP standards.
- Seek creative ways to get advice and input to the SDT from experts in cyber security.
- Seek creative ways to get focused input from industry stakeholders.
- Take advantage of input opportunities from related NERC committees that will be meeting in the first half of 2009 (e.g. working with the NERC Members Representative Committee, CIPC, BOT, and industry committees such as the Electricity Sector Coordinating Council, etc.)
- Seek, as soon as possible but no later than late Spring, 2009, to establish a consensus on the way forward for the SDT in its efforts to revise the CIP standards.
- Track any follow up to the "Securing Cyberspace for the 44th Presidency" report of the Commission on Cyber security for the 44th President.

SDT Draft Schedule — January through June 2009

OVERVIEW

- 7 SDT Face-to-Face Meetings
- Multiple SDT subgroup and subcommittees WebEx Meetings
- 1 Cyber Expert Workshop (March 10 or 11, 2009)
- 1 NERC CIPC presentation? (February 9, 2009)
- Industry Comments on CIP-002 White Paper (April 17 through June 3)
- 1 NERC Members Representative Committee, May 1, 2009
- Other Meetings?

1. **January 7–9, 2009 Meeting in Phoenix, AZ —** half, full, half day format **—** Wednesday through Friday
   - Review of Technical Feasibility Exceptions white paper
   - Review of Industry Comments on Phase 1 products- Establish and convene small groups
   - Review of Phase 2 White papers

January 15 WebEx meeting(s)

- Small group draft responses to industry.

- Phase 2 drafting concept group?

January 21 WebEx meeting(s)
- Small group draft responses to industry.
- Phase 2 drafting concept group?

2. **February 2–4, 2009 Meeting in Phoenix, AZ — half, full, half day format — Monday through Wednesday**
   - Review of Industry Comments on Phase 1 products and proposed revisions and adoption of Phase 1 products.
   - Review of Phase 2 White papers and Testing of a Phase 2 CIP-002 Concept going forward

February 9, 200 — CIPC Meeting — Update on SDT Progress and Input

3. **February 18–19, 2009 Meeting in Boulder City, NV**
   - Review of Phase 2 White papers and Adoption of a Phase 2 CIP-002 Concept for review by experts and stakeholders

February 25 WebEx meeting(s)
- Development of Phase 2 CIP 002 Workshop for review by experts and stakeholders

4. **March 10–11, 2009 Meeting in Tampa, FL, 2-day format**
   - **Invited Cyber Security Experts join SDT in a workshop** to provide expert feedback to draft CIP-002 concept.
   - Further SDT refinement of the CIP-002 proposed concept

March NERC Balloting on Phase 1 Products

March 18, Webex meeting(s)
- Phase 2 drafting concept group?

5. **April 14–16, 2009 Meeting in Charlotte NC — half, full, half day format — Wednesday through Friday**
   - Continue review and refinement of CIP-002 concept
   - Adopt White Paper on CIP-002 concept for Industry Comment

Industry Comment Period on White Paper — 45-days (April 17 through June 3)

*May 1, **NERC Member Representative Committee**, Presentation of the Phase 2 CIP-002 Approach for MRC input. (Agenda item, Possible Workshop?)*

6. May 13–14, 2009 Meeting in Dallas TX — 2-day format

- Respond to MRC input and further SDT refinement of the CIP-002 proposed concept and SDT CIP roadmap.
- Organize SDT in subcommittees to draft revisions to CIP-003-CIP-008 or to address key issue areas.

Early June WebEx meeting(s)

- SDT subcommittee meetings to review and draft responses to Industry comments on the CIP-002 concept.

7. June 17–18, 2009 Meeting — Location TBD — 2-day format

- Review Subcommittee responses to Industry comments on CIP-002 approach
- Charge subcommittees and conduct organizational meetings
- Subcommittees meet to draft revisions to CIP-003-CIP-008

June, 2009 WebEx meeting

- SDT Subcommittee meetings

July–December, 2009 — SDT and subcommittees meet and continue CIP drafting

Second Draft Phase 2 Roadmap Approach Assessment Criteria
(Presented, Revised and Added to by SDT in its review on November 14, 2008)

1. The approach is consistent with the SDT purpose statement and is responsive to the FERC 706 directives and the SAR.
2. The approach is achievable given the SDT schedule and work plan.
3. The approach does most to advance and enhance cyber security in the BES.
4. The approach helps the SDT address the foundational issues with the current standards.
5. The approach is capable of implementation.
6. The approach is capable of improving compliance.
7. The approach helps protect the current investments and wherever possible builds on what has already been done.
8. The approach helps to identify and mitigate risk on an ongoing basis.
9. The approach balances a “systems” orientation with a “facilities” orientation to asset protection.
10. The approach is capable of being extended into related interests by others (distribution, AMI, Smart Grid, etc.).

11. The approach enables the industry to provide the appropriate level of security (i.e. not over securing nor under securing the BES cyber assets).
12. The approach allows for discrimination among and targeting the various types of infrastructure that support the BES

Appendix 6 — CIP-002 Strawman A

(Phil Huff, Jeri Domingo Brewer, Kevin Perry, Keith Stoffer, and Bill Winters)

Definitions:

Cyber Asset — Programmable electronic devices and communication networks including hardware, software, and data. [NERC Glossary]

Cyber System — A discrete set of Cyber Assets organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information. [Adapted from NIST SP 800-53 definition of Information Systems]

Control Systems — computer-based facilities, Cyber Systems, and equipment used to remotely monitor and control sensitive processes and physical functions. These systems collect sensor measurements and operational data from the field, process and display this information, then relay control commands to local or remote equipment. [Joint DOE/DHS Roadmap to Secure Control Systems in the Energy Sector – January 2006]

B. Requirements

R1. The Responsible Entity shall produce through an annually applied process, a list of Cyber Systems that are to be protected per the requirements of the CIP standards. The Responsible Entity shall at least annually:

R1.1. Identify all Control Systems that perform supervisory control functions (e.g. open/close breakers, raise/lower generation) for the Bulk Electric System or provide situational awareness of the state of the Bulk Electric System. This would include:

- Systems that provide situational awareness
- Systems performing EMS/SCADA functions
- Special Protection systems
- Systems essential to BES restoration
- Systems performing automatic load shedding
- Other systems that may perform a function directly related to BES system reliability

R1.2. Identify internal and external data interconnections between Cyber Systems that provide data necessary for the reliability functions of the previously identified Cyber Systems or Control Systems.

R2. The Responsible Entity shall define one or more security boundaries to encompass the identified Cyber Systems.

R3. The Responsible Entity shall review, update as necessary, and obtain Regional approval of its Cyber System categorization criteria at least once every three years.

R4. The Responsible Entity shall annually categorize each identified Cyber System as low, moderate, or high potential impact to the Bulk Electric System using Regionally-approved categorization criteria. The categorized list shall reflect the importance of integrity, availability, and confidentiality the Cyber System or data and the potential risk to the reliability of the Bulk Electric System in the event the Cyber System is lost or compromised.

R5. The Responsible Entity shall evaluate and categorize new and replacement Cyber Systems using the applied process and categorization criteria prior to being placed into service.

R6. The Responsible Entity shall designate a senior manager with the responsibility and authority to approve the categorized list of Cyber Systems.

R7. The Responsible Entity shall communicate and coordinate with the external Responsible Entity any identified external data interconnections between Cyber Systems and the potential impact to the reliability functions of the Responsible Entity.

Appendix 7 — CIP-002 Strawman B
(John Lim, Jackie Collett, Scott Rosenberger, and John Varnell)

Introduction

Title: Cyber Security — Cyber Asset Identification and Categorization

Number: CIP-002-3

Purpose: NERC Standards CIP-002-3 through CIP-009-3 provide a cyber security framework for the identification, categorization and protection of Cyber Assets to support the reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-3 requires the identification, categorization and documentation of the Cyber Assets associated with the Assets that support the reliable operation of the Bulk Electric System. These Assets are to be identified and categorized as Critical and non-Critical based on the application of an impact assessment.

Applicability:

Within the text of Standard CIP-002-2, "Responsible Entity" shall mean:

Reliability Coordinator.
Balancing Authority.
Interchange Authority.
Transmission Service Provider.
Transmission Owner.
Transmission Operator.
Generator Owner.
Generator Operator.
Load Serving Entity.
NERC.
Regional Entity.

The following are exempt from Standard CIP-002-2:

Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.
Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

Effective Date:

The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

Requirements

R.1 Identification of BES Assets – The Responsible Entity shall identify and document a complete list of BES Assets. Assets may be identified as facilities, equipment or systems. The Responsible Entity shall include, wherever applicable, the following:

Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.

Transmission substations that support the reliable operation of the Bulk Electric System

Generation resources that support the reliable operation of the Bulk Electric System.

Systems and facilities used for system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.

Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more

Special Protection Systems that support the reliable operation of the Bulk Electric System.

Systems that support wide-area reliability through one or more of the following:

Situational awareness
Supervisory and control capability
Other systems that may perform a function directly related to the reliability or operability of the BES.

Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.

Critical Asset Identification Method — The Responsible Entity shall identify and document an impact assessment methodology to use to identify its Critical Assets.

(Note: This requirement assumes that the NERC guideline will provide more specific guidance in the development of the methodology. As suggested by Scott Mix, a change in terminology may reflect more accurately the nature of this methodology.)

The Responsible Entity shall maintain documentation describing its impact assessment methodology that includes procedures and evaluation criteria. The evaluation shall include consideration for Common Mode Impact and Adequate Level of Reliability.
The impact assessment shall be applied to the BES Assets identified in R1.

Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the impact assessment methodology required in R2. The Responsible Entity shall review this list at least annually, and update it as necessary.

Cyber Asset Identification — Using the list of Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Cyber Assets essential to the operation of the BES Assets.

Cyber Assets which support the following shall be included:

The operation and control of these BES Assets

The monitoring and alerting functions for the reliable operation of these BES assets

The data acquisition equipment and systems which support automated or operator assisted real-time reliable operation of these BES assets

Any cyber asset which directly interfaces with these Cyber Assets, and which is not identified as a Cyber Asset performing the functions in R4.1 on a BES Asset, will be identified.

The intent here to identify cyber assets which interface with BES Cyber Assets, in most cases for providing data for non-realtime analysis (such as PI data servers or data base servers. These may warrant adequate protection because of their relationship with BES Assets.

The Responsible Entity shall review this list at least annually, and update it as necessary.

Huff R1.1. Identify all Control Systems that perform supervisory control functions (e.g. open/close breakers, raise/lower generation) for the Bulk Electric System or provide situational awareness of the state of the Bulk Electric System. This would include:

Systems that provide situational awareness

Systems performing EMS/SCADA functions

Special Protection systems

Systems essential to BES restoration

Systems performing automatic load shedding

Other systems that may perform a function directly related to BES system reliability

Huff R1.2. Identify internal and external data interconnections between Cyber Systems that provide data necessary for the reliability functions of the previously identified Cyber Systems or Control Systems.

Categorization of Cyber Assets — The Responsible Entity shall apply the following criteria to categorize the identified Cyber Assets:

(In a perfect world, entities should be allowed to determine on their own which cyber assets are high, medium or low. Unfortunately, the current enforcement model does not lend itself to this kind flexibility and requires a more prescriptive categorization scheme.)

High Impact Cyber Assets — All identified Cyber Assets which perform the functions in R4.1 for Critical Cyber Assets shall be included in this category.

Other High Impact Cyber Assets may be identified as a result of further standards.

Medium Impact Cyber Assets — All identified Cyber Assets which directly interface with a High impact system in a protected ESP is a Medium impact cyber asset. Interface is defined as an application based data exchange across an ESP access point.

(Note: Other Medium Impact Cyber Assets will be categorized when the ESP is defined as part of CIP-005 and “incidental” cyber assets in the same perimeter as High Impact cyber assets will be categorized as Medium Impact systems).

Low Impact Cyber Assets — Any cyber asset not categorized as either High or Medium Impact shall be categorized as a Low Impact Cyber Asset.

Annual Approval — The senior manager or delegate(s) shall approve annually the impact assessment methodology, the list of Critical Assets and the list Cyber Assets and their categorization. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the impact assessment methodology, the list of Critical Assets and the list of Cyber Assets and their categorization.

Appendix 8 — CIP-002-3 Strawman (Scott Mix)

Standard CIP–002–3 — Cyber Security — Cyber Asset Identification and Categorization

A. Introduction

1. **Title:** Cyber Security — Cyber Asset Identification and Categorization

2. **Number:** CIP-002-3

3. **Purpose:** NERC Standards CIP-002-3 through CIP-009-3 provide a cyber security framework for the identification, categorization and protection of Cyber Assets to support the reliable operation of the Bulk Electric System.

   These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

   Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

   Standard CIP-002-3 requires the identification, categorization and documentation of the Cyber Assets associated with the Assets that support the reliable operation of the Bulk Electric System. These Assets are to be identified and categorized as Critical and non-Critical based on the application of an impact assessment.

4. **Applicability:**

   4.1. Within the text of Standard CIP-002-2, "Responsible Entity" shall mean:

   - **4.1.1** Reliability Coordinator.
   - **4.1.2** Balancing Authority.
   - **4.1.3** Interchange Authority.
   - **4.1.4** Transmission Service Provider.
   - **4.1.5** Transmission Owner.
   - **4.1.6** Transmission Operator.
   - **4.1.7** Generator Owner.
   - **4.1.8** Generator Operator.
   - **4.1.9** Load Serving Entity.
   - **4.1.10** NERC.
   - **4.1.11** Regional Entity.

   4.2. The following are exempt from Standard CIP-002-2:

   - **4.2.1** Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.
   - **4.2.2** Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. **Effective Date:** The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

B. Requirements

R1. Identification of BES Assets – The Responsible Entity shall identify and document a complete list of BES Assets. Assets may be identified as facilities, equipment or systems. The Responsible Entity shall include, wherever applicable, the following:

Author
Comment: How to determine?

R1.1. Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.

R1.2. Transmission substations that support the reliable operation of the Bulk Electric System.

Author
Comment: How to determine?

R1.3. Generation resources that support the reliable operation of the Bulk Electric System.

Author
Comment: How to determine?

R1.4. Systems and facilities used for system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.

R1.5. Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

R1.6. Special Protection Systems that support the reliable operation of the Bulk Electric System.

Author
Comment: How to determine?

R1.7. Systems that support wide-area reliability through one or more of the following:

R1.7.1. Situational awareness

R1.7.2. Supervisory and control capability

R1.7.3. Other systems that may perform a function directly related to the reliability or operability of the BES.

R1.8. Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.

R2. Critical Asset Identification Method — The Responsible Entity shall identify and document an impact assessment methodology to use to *classify* ts Critical Assets *based on each asset's impact to reliable operations of the BES*.

Author
Deleted: identify i

(Note: This requirement assumes that the NERC guideline will provide more specific guidance in the development of the methodology. As suggested by Scott Mix, a change in terminology may reflect more accurately the nature of this methodology.)

R2.1. The Responsible Entity shall maintain documentation describing its impact assessment methodology that includes procedures and evaluation criteria. The evaluation shall include consideration for Common Mode Impact and Adequate Level of Reliability.

R2.2. The impact assessment shall be applied to *all* BES Assets identified in R1.

Author
Deleted: the

R2.3. The impact assessment shall describe methods or thresholds for assigning one of the following impact levels to each asset:

Author
Formatted: Bullets and Numbering

- *High Impact – loss damage or misuse of the identified asset results in significant impact or significant potential impact to reliable operations of the BES*
- *Medium Impact – loss damage or misuse of the identified asset results in moderate impact or significant potential impact to reliable operations of the BES*
- *Low Impact – loss damage or misuse of the identified asset results in minimal, but identifiable, impact or potential impact to reliable operations of the BES*

Author
Comment: need to define

Author
Comment: need to define

Author
Comment: need to define

- *No Impact – loss damage or misuse of the identified asset results in no identifiable impact or potential impact to reliable operations of the BES*

R3. Critical Asset Identification — The Responsible Entity shall develop a list of its Critical Assets *and their impact classification, as* determined through an annual application of the impact assessment methodology required in R2. The Responsible Entity shall review this list at least annually, and update it as necessary.

R3.1. *The resultant list shall include both the identification of each Asset, as well as its classification level using the impact levels described in Requirement R2.3*

R4. Cyber Asset Identification — Using the list of Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Cyber Assets essential to the operation of the BES Assets.

R4.1. Cyber Assets which support the following shall be included:

R4.1.1. The operation and control of these BES Assets

R4.1.2. The monitoring and alerting functions for the reliable operation of these BES assets

R4.1.3. The data acquisition equipment and systems which support automated or operator assisted real-time reliable operation of these BES assets

R4.2. Any cyber asset which directly interfaces with these Cyber Assets, and which is not identified as a Cyber Asset performing the functions in R4.1 on a BES Asset, will be identified.

The intent here to identify cyber assets which interface with BES Cyber Assets, in most cases for providing data for non-realtime analysis (such as PI data servers or data base servers. These may warrant adequate protection because of their relationship with BES Assets.

R4.3. The Responsible Entity shall review this list at least annually, and update it as necessary.

R5. Categorization of Cyber Assets – The Responsible Entity shall apply the following criteria to categorize the identified Cyber Assets:

(In a perfect world, entities should be allowed to determine on their own which cyber assets are high, medium or low. Unfortunately, the current enforcement model does not lend itself to this kind flexibility and requires a more prescriptive categorization scheme.)

R5.1. High Impact Cyber Assets - All identified Cyber Assets which perform the functions in R4.1 for Critical Cyber Assets shall be included in this category.

Other High Impact Cyber Assets may be identified as a result of further standards.

R5.2. Medium Impact Cyber Assets – All identified Cyber Assets which directly interface with a High impact system in a protected ESP is a Medium impact cyber asset. Interface is defined as an application based data exchange across an ESP access point.

(Note: Other Medium Impact Cyber Assets will be categorized when the ESP is defined as part of CIP-005 and "incidental" cyber assets in the same perimeter as High Impact cyber assets will be categorized as Medium Impact systems).

Author
Comment: 2-step process: Cyber asset impact AND Cyber-asset-impact to Asset impact

R5.3. Low Impact Cyber Assets – Any cyber asset not categorized as either High or Medium Impact shall be categorized as a Low Impact Cyber Asset.

R6. Annual Approval — The senior manager or delegate(s) shall approve annually the impact assessment methodology, the list of Critical Assets *and their categorization,* and the list Cyber Assets and their categorization. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the impact assessment methodology, *a signed and dated record of* the list of Critical Assets and *a signed and dated record of* the list of Cyber Assets and their categorization. *The Region / RC must approve the methodology and list of Assets and their characterization.*

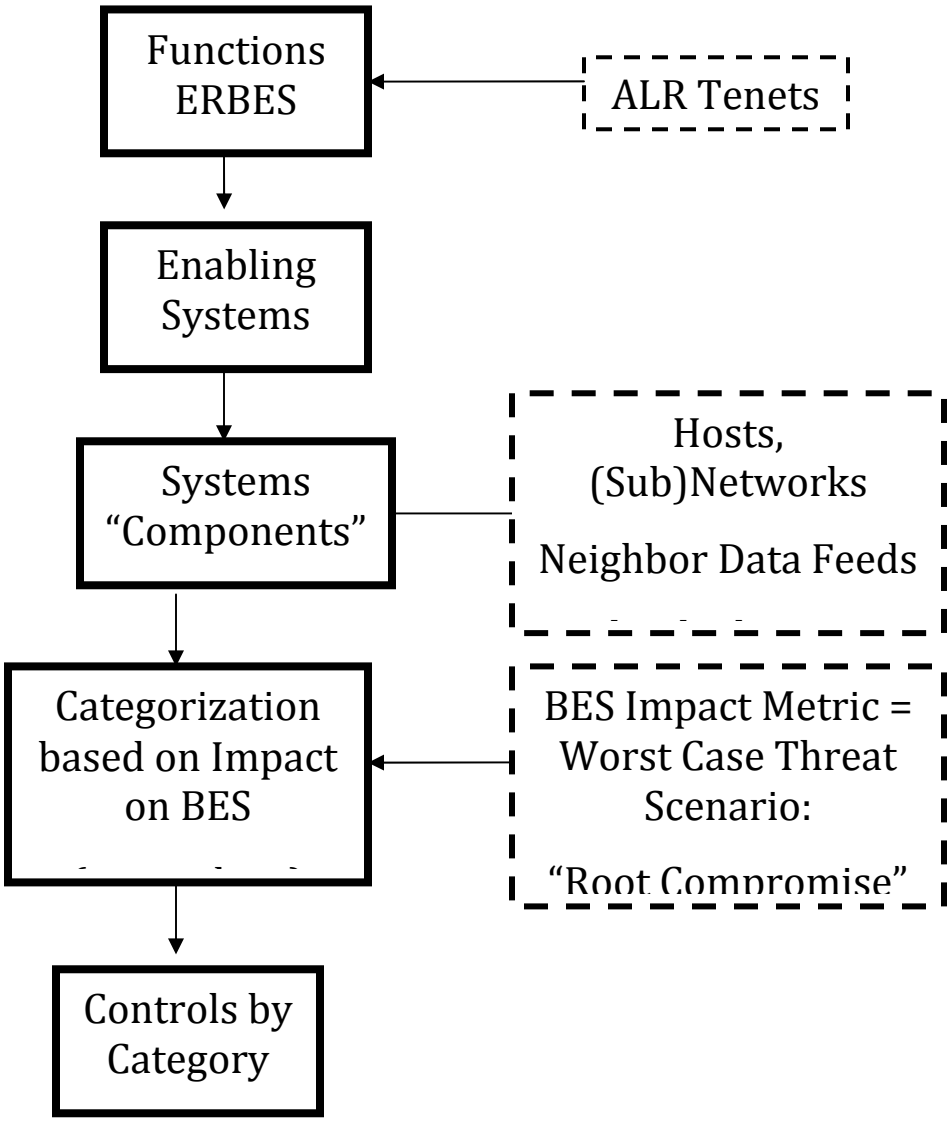
Comment: Need external oversight and approval per FERC order

Scoping Logic Synthesis Proposal



SDT 706 Meeting Schedule 2009 Calendar Form

NAME:_____

CHECK ONLY THOSE DATES ON WHICH YOU HAVE A CONFLICT!

Instructions: The SDT will set the dates for its July-December, 2009 at the March 10-12 Meeting. You can email you completed form as an attachment to: rmjones@fsu.edu by COB March 9. OR if you plan to attend the meeting you can bring your completed form which will be collected at the end of day one (March 10). We will announce the meeting dates based on the fewest number of member conflicts. Locations are TBD.

July 2009

WEEK OF July 13	Mon July 13	Tues. July 14	Wed. July 15	Thurs. July 16	Fri. July 17
WEEK OF July 20	Mon July 20	Tues. July 21	Wed. July 22	Thurs. July 23	Fri. July 24
WEEK OF July 27	Mon July 27	Tues. July 28	Wed. July 29	Thurs. July 30	Fri. July 31

August 2009

WEEK OF August 3	Mon Aug 3	Tues. Aug 4	Wed. Aug 5	Thurs. Aug 6	Fri. Aug 7
WEEK OF August 10	Mon Aug 10	Tues. Aug 11	Wed. Aug 12	Thurs. Aug 13	Fri. Aug 14
WEEK OF August 17	Mon Aug 17	Tues. Aug 18	Wed. Aug 19	Thurs. Aug 20	Fri. Aug 21
WEEK OF August 24	Mon Aug 24	Tues. Aug 25	Wed. Aug 26	Thurs. Aug 27	Fri. Aug 28
WEEK OF August 31	Mon Aug 31	Tues. Sept 1	Wed. Sept 2	Thurs. Sept 3	Fri. Sept 4

September 2009

WEEK OF September 7	Mon Sept 7 Labor Day	Tues. Sept 8	Wed. Sept 9	Thurs. Sept 10	Fri. Sept 11
WEEK OF September 14	Mon Sept 14	Tues. Sept 15	Wed. Sept 16	Thurs. Sept 17	Fri. Sept 18
WEEK OF September 21	Mon Sept 21	Tues. Sept 22	Wed. Sept 23	Thurs. Sept 24	Fri. Sept 25

WEEK OF September 28	Mon Sept 28	Tues. Sept 29	Wed. Sept 30	Thurs. Oct 1	Fri. Oct 2

October 2009

WEEK OF October 5	Mon Oct 5	Tues. Oct 6	Wed. Oct 7	Thurs. Oct 8	Fri. Oct 9
WEEK OF October 12	Mon Oct 12 Thanksg CA	Tues. Oct 13	Wed. Oct 14	Thurs. Oct 15	Fri. Oct 16
WEEK OF October 19	Mon Oct 19	Tues. Oct 20	Wed. Oct 21	Thurs. Oct 22	Fri. Oct 23
WEEK OF October 26	Mon Oct 26	Tues. Oct 27	Wed. Oct 28	Thurs. Oct 29	Fri. Oct 30

November 2009

WEEK OF November 2	Mon Nov 2	Tues. Nov 3	Wed. Nov 4	Thurs. Nov 5	Fri. Nov 6
WEEK OF November 9	Mon Nov 9	Tues. Nov 10	Wed. Nov 11 Vet/Rem. Day	Thurs. Nov 12	Fri. Nov 13
WEEK OF November 16	Mon Nov 16	Tues. Nov 17	Wed. Nov 18	Thurs. Nov 19	Fri. Nov 20
WEEK OF November 23	Mon Nov 23	Tues. Nov 24	Wed. Nov 25	Thurs. Nov 26 US Thanksgiv.	Fri. Nov 27
WEEK OF November 30	Mon Nov 30	Tues. Dec 1	Wed. Dec 2	Thurs. Dec 3	Fri. Dec 4

December 2009

WEEK OF December 7	Mon Dec 7	Tues. Dec 8	Wed. Dec 9	Thurs. Dec 10	Fri. Dec 11
WEEK OF December 14	Mon Dec 14	Tues. Dec 15	Wed. Dec 16	Thurs. Dec 17	Fri. Dec 18
WEEK OF December 21	Mon Dec 21	Tues. Dec 22	Wed. Dec 23	Thurs. Dec 24	Fri. Dec 25

Draft Seventh Meeting Summary,
February 18-19, 2009
Fairfax, VA

MEETING SUMMARY CONTENTS

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team
Draft Seventh Meeting Summary,
February 18-19, 2009
Fairfax, VA

EXECUTIVE SUMMARY

The Vice Chair, Kevin Perry welcomed the members. NERC consultant Joe Bucciero conducted a roll call of members and participants in the room and on the conference call/webex. He then reviewed with the Team the need to comply with NERC's Antitrust Guidelines**.** Mr. Perry reviewed with the Team and participants the proposed meeting agenda and objectives. The facilitators reviewed with the Team the consensus guidelines adopted at the SDT November 2008 Little Rock meeting. The Team reviewed and unanimously adopted the SDT February 2-4, 2009 meeting summary with corrections suggested by David and Michael Winter. The Team adopted unanimously the revised January 7-9, 2009 SDT summary. Stuart Langton, SDT facilitator, reviewed the current workplan and meeting schedule for both Phase I and Phase II development.

For the Phase I review, the SDT reviewed and unanimously adopted the Response report that has been developed at the February 2-4 meeting and was finalized and circulated to the SDT on February 13. Dave Taylor noted that Maureen was reviewing the response document and once completed it would be submitted to the Standards Committee possibly at their February 20 conference call.

Scott Mix, NERC staff provided the Team with an update on the status of the Technical Feasibility Exception white paper that the SDT last reviewed in December, 2008 and the effort to convert it into a compliance document under NERC Rules of Procedure. He noted that NERC attorneys have been reviewing and that there are no "show stoppers" as of this point. Prior to posting, NERC will share with the SDT. They anticipate posting for NERC industry wide input in the coming weeks for a 45-day posting period. The SDT discussion stressed the importance linking the posting of the TFE along with the Phase I ballot issues in terms of the industry's response to Phase I standards/requirements proposals. Following a broad discussion of issues and concerns, the SDT took a straw poll (11 in favor, 1 opposed) on the proposition to move forward as planned and agreed to on February 4, 2009. On Thursday morning the SDT unanimously (18-0) adopted a motion to proceed forward on the agreed upon Phase 1 timeline and all related documents.

Dave Taylor talked to standards process manager earlier in the week and it appears that NERC will propose the standards process manager work with subset of SDT and VSL SDT to craft the VSLs for version 2 and be responsible for responding comments. The comments submitted by SDT 706 members urging the VSL SDT address both Version 1 and Version 2 VSLs to the VSL SAR were received but not accepted by the committee. VSL version 1 and Version 2 will for industry

comment simultaneously. Kevin Perry suggested that Dave Taylor distribute it to all SDT members and invite their review and comments. Kevin Perry and Jackie Collett agreed to take the lead.

Michael Winters presented a 2nd draft of guiding principles for SDT consideration that were initially ranked but not discussed by the SDT on February 2. He reviewed the changes he made and suggested the SDT rank the revised principles. The SDT agreed that these should be considered by the Team and industry as a work in progress and preliminary and should be prefaced in our summaries in that fashion. The set of preliminary guiding principles as revised and ranked Are as follows:

These SDT draft guiding principles are a **work in progress** and have been reviewed ranked and refined by the SDT. The SDT will use these principles as it develops its approach and strategies for revising the CIP standards. The SDT expects that these principles will continue to be refined going forward in its standards development process. The draft guidelines are listed below in order of greatest average acceptability (*using a 4 point acceptability scale with 4= acceptable/agreement, 3=agreement with minor reservations; 2= unacceptable unless major reservations addressed and 1= unacceptable)*

1) A mapping of CIPs similar to the NIST 800-53 mapping will help quantify and assess the gaps, if any. *(3.9 of 4)*
2) Protection of the communication devices outside to the electronic security perimeters, are out of scope. *(3.75 of 4)*
3) Create non-proscriptive standards and employ a technical exception/compensating documentation process and guidance process to accommodate variations. *(Resist creating exception based standards to accommodate every possible business and operations scenario) (3.7 of 4).*
4) Strive to preserve existing security investments and build upon the existing CIP requirements. *(3.7 of 4)*
5) It is imperative to protect the integrity of data throughout its transit. *(3.7 of 4)*
6) CIP requirements should consider the unique locational characteristics (e.g. substations, data centers, generation plant) and functional capabilities of the cyber assets to be protected. *(3.7 of 4)*
7) Use a consistent risk-based model to classify cyber assets (as critical/high impact, moderate impact, low impact. This will allow for expansion of standards beyond Critical. *(3.7 of 4)*
8) Consider the minimum security controls for high, moderate, low within NIST 800-53 to help model the CIP requirements for each level. *(3.6 of 4)*

NOTE: The SDT acknowledges that currently an entity's cyber asset classification is subject to scrutiny by the compliance enforcement authority and applicable regulators.

Bill Winters followed up on his white paper presentations at the previous two meetings and provided a power point on a possible approach to integration. He suggested the following in his presentation:

- Leverage work begun by NIST and MITRE- overlay CIP and NIST
- Heavy integration- CIP 002 with NERC versions of FISPS 199, 200. Etc.
- Moderate Integration- update CIP 002 to include categorization standard (FIPS 199 analog). Update CIP 003-009 with 800 53 elements to address gaps in 706. (10-21 MITRE/NIST e.g. CIP 005 augmentation.
- Light integration- 003-009 requirements to align with 800-53 controls. Draw on 800-53 controls to fill in gaps id in 706. Use NIST docs as guidance references throughout CIP.
- Start with light and migrate overtime to moderate and heavy.

Kevin Perry distributed a concept paper titled, "Risk Management Framework and Protected Cyber Asset Identification" a day prior to the meeting. *(See Appendix #)* He introduced it at the end of day one with the following comments. The discussion started on day one and continued onto day two.

Jackie Collett presented the approach developed by a team with John Lim, Scott Rosenberger and John Varnell, that suggested the SDT should revise existing CIP –002 to include the functional and systems approach including some levels of protection. She noted that the reliability of the BES was the basis for the proposed approach to Phase II with a clear link between cyber assets and their function in the BES. A Functional risk assessment methodology could define critical vs. non-critical operating functions and define which cyber assets are involved. The approach would include addressing significant gaps in CIP (they identified 5) She acknowledged that there are benefits in providing some gradations in protection of assets. E.g. control centers need protection. Finally she cautioned against the CIP being too tightly coupled to a standard developed and maintained by another group that when changed would affect the CIP. The discussion highlighted that: a systems approach is missing from CIP 002; a link should be made with NERC Principles of Reliability; and the standards should address enforcement of requirements.

Scott Mix presented his strawman on FISMA asset selection first presented in Phoenix. The Team discussed the implications of his strawman for the SDT workplan and the connection with other approaches under discussion.

In the morning and afternoon of day-two the members discussed the implications of the various approaches to Phase II. They agreed there were evolutionary and revolutionary gradations in the approaches discussed and suggested that their focus should initially be on CIP 002 even thought there may be other issues that need to be addressed in the other standards. The challenge from NERC's Mike Assante was to try to produce an outcome-based standard vs. a prescriptive-based standards. We should be focusing on what is it we want as a desired outcome and less initially on how to get there. Their comments ranging over a number of issues including: how to address un-trusted connections; demarcation of transmission and distribution; building on and tailor controls to

BES; addressing changes in accelerating data rates; addressing industry expectations; and addressing computer vs. physical Standards.
In the afternoon of day two, Michael Winters with assistance from the facilitators presented the following for SDT consideration and further discussion based on the review of the different concept papers. Consistent with SAR and FERC Order 706, Mr. Winters presented potential SDT Approaches to Phase II:

1) Take Bill Winter's proposed low to mid-level approach using the framework outlined by Scott Mix but going beyond status quo by addressing gaps as outlined in 706 as part of the NIST-CIP mapping and gap analysis.
   (How: Perform the mapping analysis of CIP to NIST using 706 view of where gaps exist in the CIPs)
   Consistent with Principle 1, 4, 5, 7 & 8
2) Address a consistent cyber asset selection and categorization method by leveraging Kevin's and Jackie's (and others) thoughts on where gaps exist. Use FIPS 199 as another input or even the starting point but produce a BES version.
   (How: Build a prototype, highlight the differences from existing CIP002 and let's test it.)
   Consistent with Principle 4, 7

Guiding Considerations *(taken from the SDT discussion)* could include:

- Start with the NERC/BES assigned mission
- Take a functional approach CIP 002
- Take a systems approach in CIP 002
- We need to address gradations of risk (e.g. high medium low)
- A deficiency in the current NIST/FISMA regarding measurement and enforcement needs to be addressed in the SDT process.
- Address key challenges identified with current CIP: (e.g. piecemeal approach, not protecting assets needing protection; gaming; all or nothing; loss of asset, integrity/misuse, etc.)
- Address both the physical protection issues and the cyber protection issues, separately or not.
- Assume all outside an entity's direct control should be treated as a un-trusted connection.
- Seek to develop more guidance and less modification of standards as an approach.
- Address CIP 2 R2 so that it doesn't drive people towards the physical assets.
- Taking a cyber view should not preclude a physical view.
- Where possible, build on the existing work and research, models etc. E.g. Build upon MITREs cross walk to the control families.
- Focus on a shared view of the outcome that can capture all the attack vectors to make sure they have been assessed and have minimum security controls that we have not addressed in CIP.

The SDT members agreed they were not yet prepared to proceed with the approaches suggested by Michael Winters. Some suggested further clarification of what was meant by "functional" or

"systems" approaches to 002. After further discussion, the SDT agreed that a helpful next step would be to produce two strawman drafts of a revised CIP 002 based on the work to date. One would be prepared by Jackie Collett & John Lim and another would be prepared by Bill Winters and Kevin Perry with assistance from interested SDT members. These would be distributed in advance of the March meeting and form the basis for the agenda in Orlando.

At the end of day two the SDT took stock of its progress and reviewed the schedule for both an cyber expert and stakeholder workshop and presentation to the NERC Members Representative Committee in early May, 2009. The SDT agreed it needed to have sorted out and developed a clearer understanding and agreement on the Phase II approach prior to presenting a substantive briefing to the MRC. As as a result the SDT agreed to seek to provide a short "progress report" to the MRC in May and seek to present a substantive briefing at their August, 2009 meeting. The SDT suggested scheduling the expert/stakeholder workshop in the early Summer.

The Team then evaluated the meeting in terms of what worked and what could be improved. The meeting adjourned at 3:30 p.m.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team

DRAFT SEVENTH MEETING SUMMARY, FEBRUARY 18-19, 2009 FAIRFAX, VA

I. INTRODUCTIONS, AGENDA REVIEW AND REVIEW OF SDT WORKPLAN

The Vice Chair, Kevin Perry, welcomed the members. Joe Bucierro conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). Mr. Perry reviewed the meeting objectives and Bob Jones, facilitator, reviewed with the Team and participants the proposed meeting agenda *(See appendix #1*). Mr. Perry noted that at lunch on both days Harry Tom, NERC, would be seeking informal feedback from SDT team members on

Mr. Bucierro reviewed with the Team the need to comply with NERC's Antitrust Guidelines *(See, Appendix #3).* He urged the Team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The Team reviewed and unanimously adopted the SDT February 2-4, 2009 meeting summary with corrections suggested by David and Michael Winter. The Team adopted unanimously the revised January 7-9, 2009 SDT summary.

Stuart Langton, SDT facilitator, reviewed the current workplan and meeting schedule for both Phase I and Phase II development. (*See Appendix #4)* In particular he noted the proposed "expert workshop" that was currently scheduled for its April, 2009 meeting in Charlotte which Scott Mix was to help organize with the SDT members assistance, the opportunity to present a progress report to the MRC in early May and the possibility of a white paper for industry comment on the SDT's conceptual approach to Phase II.

SDT Comments on Workplan

- Industry expert workshop planning- Is Duke aware of workshop plans? Facilities to support the workshop? Workshop plus? Sharon Edwards has indicated she has reserved a big room. The plan is to run it on Wednesday morning for four hours
- Mike Assante expressed a desire that the workshop take place in D.C. List of industry experts. Invitations will need to be made quickly.
- Where is the Orlando Utility Commission meeting location in Orlando? It is near the airport and NERC will issue a meeting announcement with nearby hotels.

- Mike Winters- what is the white paper product on Phase II? CIP 002? By July 2009? Can we get there faster? Phase II items. Can we hasten the pace.?
- The SDT has been seeking to develop more understanding and possibly consensus for basic concepts and approach to Phase II from industry. This should make it easier to turn into requirements in standard development review cycles and get quicker into the refinement stage. If we can get the concept agreed to, then we can debate the particulars. Issues with pace.
- White paper for industry comment? What are procedural implications. Nothing in guidelines about a white paper as a tool. The purpose is to gauge the level of industry support for direction and help to brief and educate early on. Need to clarify what the intent of the paper will be and what will be in it.

II. TECHNICAL FEASIBILITY EXCEPTION UPDATE AND SDT DISCUSSION

Scott Mix, NERC staff provided the Team with an update on the status of the Technical Feasibility Exception white paper that the SDT last reviewed in December, 2008 and the effort to convert it into a compliance document under NERC Rules of Procedure. He noted that NERC attorneys have been reviewing and that there are no "show stoppers" as of this point. Prior to posting, NERC will share with the SDT. They anticipate posting for NERC industry wide input in the coming weeks for a 45-day posting period. He noted the default language in Appendix 4C includes a self reporting non compliance procedure being proposed with a similar record keeping model. Since the SDT 706 most knowledgeable on issues, NERC wants to coordinate and consult with members. However the SDT is not responsible for the TFE.

The SDT discussion stressed the importance linking the posting of the TFE along with the Phase I ballot issues in terms of the industry's response to Phase I standards/requirements proposals. Following a broad discussion of issues and concerns, the SDT took a straw poll (11 in favor, 1 opposed) on the proposition to move forward as planned and agreed to on February 4, 2009. **On Thursday morning the SDT unanimously (18-0) adopted a motion to proceed forward on the agreed upon Phase 1 timeline and all related documents.**

Member Discussion Comments

- Need to make sure this is at least static by the time we put out phase I for vote.
- SDT intent in passing Phase I products is that NERC Rules of Procedures will posted for industry comment for at least 14 days prior to initial ballot on Phase I. Pre- ballot period is normally 30 days but will be extended connected with the TFE posting.
- 45 day comment will be followed by response to "significant" comments by NERC. Updating, as necessary and then submitted to BOT for approval. Then to FERC for approval with an opportunity for public comment.

- SDT role? FERC said SDT could apply at TFE in other areas that support operations and safety to insert TFE into a requirement. What about a removal of business judgment and acceptance of risk? TFE doesn't address.
- No drafting teams involved in ROP. Mike Assante will present for industry comment. SDT can have input to NERC staff but no control over ROP language.
- Does the current TFF draft say what language must be in a requirement? Requirements say do if technically feasible. Does it say TFE anywhere? Does that language appear in every standard?
- Appears in 4 areas in Phase I requirements: 3 areas in CIP 7 and 1 area in CIP 6 alternative measures of protection.
- May be other places where a TFE might be applicable.
- Requirements are the only thing that is enforceable. Operational and safety concerns included as order provides. FERC would be open to accepting TFE into requirements.
- Requirement by requirement. Sub requirement by sub requirement.
- Do we need to put in Phase I document?
- Timing issues. If SDT pulls back Phase I. Given language proposing, are we going to have to do emergency phase 1A on heels of it that clarifies TFE? In the form of an interpretation?
- Current draft of TFE says, as "specifically identified in standard."
- Problem is the July 1, 2009 audit date from the FERC order. TFE will go through NERC ROP process. The posting and comment process won't be nailed down until later in the year. It is apparent that concern is TFE is applicable to "Version 1 CIP Standards." Working on Version 2. Draft TFE identifies version 1. Then going forward Version 2 applicable as designated within requirement itself.
- Modify version 2 (phase 1) figure out which requirements are applicable to use a TFE. 30 days in the current schedule is provided for Board review. Pre-ballot review period.
- It will be difficult to still meet schedule if we modified requirements to include TFE language. Posting for comments for modifying language again. "Comment response and resolution"
- Practically speaking, we received a number of comments on the Phase I TFE language, and we should expect the same amount of comments if not more for the TFE process.
- Worried about CIP 002-009 review- SDT never had a safety and operations review. What is harm in submitting TFE on any standards?
- It is a potential resource issue in terms of NERC processing, investigating, and reviewing requests.
- If you want to take a TFE, you will have to provide justification. People are going to be aware of need for justification and won't try to abuse the system. We can try to guess where TFE is applicable. But that will not be a valuable effort. E.g. what are all the emergency conditions are requiring a TFE. If we miss it we harm somebody. Entity can choose to file TFE if they can justify and get approved, if not they will be in jeopardy.

- Compliance philosophy- may be seen as shooting holes in standards if you can request TFE for anything.
- ROP: "Comment resolution process"- NERC must incorporate the "well founded" comments and respond to the others.
- Problem is not the TFE process. We took things out of Phase I that people think were covered by TFE. If we don't do something about this the industry will vote this down.
- Need a review and cover "heavy hitters" that would cause industry to vote down Phase I.
- This doesn't address reasonable business judgment piece. FERC take it out. If it looks like this it will be rejected.
- TFE can be a valuable tool to better protect the BES. Industry shouldn't hide, but call it out. By calling it out, it allows peers in industry to share strategies. Allows for another set of eyes to say we figure it out. Is there another mechanism to allow for peer review? Not as part of ROP. If we limit it, it will take away from what we are trying to do.
- The current compliance process calls this out at the regional and NERC levels. Regional entity and ERO allowed to say we've run across this in other audits etc. have you thought of this?
- FERC requires report each year on which requirements are having TFEs being requested for? Yes but redacted at a high level, not on an entity or regional basis. But there should be enough to allow industry to see what the actual technical problem is. Can we leverage this to improving our overall security posture?
- Regions have other venues to discuss how to do something, such as work groups.
- If we go back and address TFEs we will have to hear from industry. Version 2 standards will address this, and the Phase I language that is there now may be sufficient.
- SDT should be responsive to industry once TFE settles. May need to put out Version 3 quickly to address any industry issues.
- Let's go forward and respond as needed.
- Concerned about SDT standard response to comments regarding reasonable business judgment and TFE process. Is this true "should" as part of the response? E.g. page 188, Removal of reasonable business judgment comment and response: "The expansion of TFE should address."
- FERC 158- should not be allowed to use TFE on basis of reasonable business judgment"
- "Address concerns," not replace TFE. We can acknowledge concerns regarding removal of reasonable business judgment. Inserted some flexibility back with TFE. Enough flexibility in all the right places? It is in all places we think it needs to be.
- SDT should go with what we have in terms of Phase I with the risk it industry voting it down. Don't have a good solution. Need to pick the best of a set of bad solutions.
- Team has gone through responses. Documents are consistent with comments.
- If we change TFE language, would we have to change responses? Possibly yes.
- SDT should move forward with track we are on. Post for pre-ballot review. Industry can vote no with negative comment. If ballot is no, NERC will file something by June, 2009 to

FERC. Let the TFE debate take place in that ROP procedure. Phase 2 version 3- include language in those standards.

- If we make even 1 change- fall prey to "hurry up". Let's not let perfection get in the way of adequate here.
- If it goes out for initial ballot and a negative vote recirculation, can we change the standards before re-circulating? No, can't modify at that point.
- If we get 1 negative vote with comments, that will trigger a recirculation ballot. Develop reply comments and post those. Ballot is same unless you change it.
- Test by straw poll going forward:
- Go ahead and proceed with approved Phase I documents including response document to posting for pre-ballot comment period, post for balloting at least 14 days after TFE posted by NERC and see what happens. *(Straw poll: 11 (10/1) for and 1 against)*
- If the industry is opposed, will become apparent after first ballot. If that happens, SDT can withdraw the standards.
- On Thursday morning the SDT unanimously (18-0) adopted a motion to proceed forward on the agreed upon Phase 1 timeline and all related documents.

III. VSL SAR COMMITTEE UPDATE

Dave Taylor talked to standards process manager earlier in the week and it appears that NERC will propose the standards process manager work with subset of SDT and VSL SDT to craft the VSLs for version 2 and be responsible for responding comments. The comments submitted by SDT 706 members urging the VSL SDT address both Version 1 and Version 2 VSLs to the VSL SAR were received but not accepted by the committee. VSL version 1 and Version 2 will for industry comment simultaneously. Kevin Perry suggested that Dave Taylor distribute it to all SDT members and invite their review and comments. Kevin Perry and Jackie Collett agreed to take the lead.

IV. PHASE I RESPONSE DOCUMENT

Kevin Perry noted the SDT had provisionally accepted the Response Document at its February 2-4 in Phoenix. Dave Taylor noted that Maureen was reviewing the response document and once completed it would be submitted to the Standards Committee possibly at their February 20 conference call. The SDT members indicated they were happy with the draft that was completed following the meeting that was consistent with the SDT decisions on responses made at the Phoenix meeting. The Response document sent to the SDT members on February 13.

SDT Member comments and suggestions:

- Suggest a sentence as part of the deferral to Phase 2 response: "The Phase 1 revision to the CIP 002 were focused on the high priority issues raised by FERC in its Order 706 and by the

industry. Additional comments provided are better suited for feedback in Phase 2 and subsequent phases of the CIP standards."
- Senior manager his/her role

V. PHASE II CONCEPT DEVELOPMENT

A. Guiding Principles- *Michael Winters*

Michael Winters presented a 2nd draft of guiding principles for SDT consideration that were initially ranked but not discussed by the SDT on February 2. (*See Appendix #5 for rankings and comments)* He reviewed the changes he made and suggested the SDT rank the revised principles. Below are the "clean version" for the principles resulting from the discussion and suggestions on February 18. The SDT agreed that these should be considered by the Team and industry as a work in progress and preliminary and should be prefaced in our summaries in that fashion.

The set of preliminary guiding principles as revised and ranked are:

These SDT draft guiding principles are a **work in progress** and have been reviewed ranked and refined by the SDT. The SDT will use these principles as it develops its approach and strategies for revising the CIP standards. The SDT expects that these principles will continue to be refined going forward in its standards development process. The draft guidelines are listed below in order of greatest average acceptability (*using a 4 point acceptability scale with 4= acceptable/agreement, 3=agreement with minor reservations; 2= unacceptable unless major reservations addressed and 1= unacceptable)*

1. A mapping of CIPs similar to the NIST 800-53 mapping will help quantify and assess the gaps, if any. *(3.9 of 4)*
2. Protection of the communication devices outside to the electronic security perimeters, are out of scope. *(3.75 of 4)*
3. Create non-proscriptive standards and employ a technical exception/compensating documentation process and guidance process to accommodate variations. *(Resist creating exception based standards to accommodate every possible business and operations scenario)*
    a. *(3.7 of 4).*
4. Strive to preserve existing security investments and build upon the existing CIP requirements. *(3.7 of 4)*
5. It is imperative to protect the integrity of data throughout its transit. *(3.7 of 4)*
6. CIP requirements should consider the unique locational characteristics (e.g. substations, data centers, generation plant) and functional capabilities of the cyber assets to be protected. *(3.7 of 4)*

7. Use a consistent risk-based model to classify cyber assets (as critical/high impact, moderate impact, low impact. This will allow for expansion of standards beyond Critical. *(3.7 of 4)*
8. Consider the minimum security controls for high, moderate, low within NIST 800-53 to help model the CIP requirements for each level. *(3.6 of 4)*

NOTE: The SDT acknowledges that currently an entity's cyber asset classification is subject to scrutiny by the compliance enforcement authority and applicable regulators.

B. NIST/CIP Integration- *Bill Winters*

Bill Winters followed up on his white paper presentations at the previous two meetings and provided a power point on a possible approach to integration *(See appendix #6)*. He suggested the following in his presentation:

- Leverage work begun by NIST and MITRE- overlay CIP and NIST
- Heavy integration- CIP 002 with NERC versions of FISPS 199, 200. Etc.
- Moderate Integration- update CIP 002 to include categorization standard (FIPS 199 analog). Update CIP 003-009 with 800 53 elements to address gaps in 706. (10-21 MITRE/NIST e.g. CIP 005 augmentation.
- Light integration- 003-009 requirements to align with 800-53 controls. Draw on 800-53 controls to fill in gaps id in 706. Use NIST docs as guidance references throughout CIP.
- Start with light and migrate overtime to moderate and heavy.

The facilitators asked the SDT members to address what do you like most about the proposal.

Member Comments and Suggestions

- Do you intend a sequential work process? Yes explore this moving into this over some timeline. Assessment of how fast to move. Proposing heavy with a ramp up.
- NIST mapped initially CIP 005. Then looked at gaps with 800-53- harmonized standards by adding into CIP standard 005. This was done as an example and exercise to see how that worked. Full spread sheet- 2nd document is the entire mapping. (*see pp 2 of Bill Winter's ppt.).*
- When this was done, they didn't take into account all the CIP standards other than 005 nor consider the FAQ?
- How to do this and address conceptual differences between two? What are the differences. E.g. CIP 005 doesn't have controls. Tried to keep CIP as existed and tried to do.
- Suggest the SDT continue to explore this going forward.
- What are the limits, if any, in regards to ANSI process?
- I.e. do our own processes hamstring us? Do we need to think further outside our box?

- Ways both around and through- e.g. guidance documents- guidelines in support of a standard. Including supporting docs and supplemental info. Solves issue of "embedded" guidance. Informative vs. normative ? This is non binding and functional.
- NIST/FISMA- extensive supportive reference documents builds a stronger approach to cyber security.
- Not ready to go to heavy integration. Do like the graduated approach. It is essential that we address CIP 002 first. Kevin's paper seems to attempt that. Going from light to heavy doesn't address the CIP 002. Concept is great, but not ready for the whole cup of koolaide.
- Jump to the medium. It will be a long march through "corn starch" of "light." Starting at medium makes sense. We are most interdependent of structures. Chemical, water, transportation, all going towards the NIST standards approach.
- ISA 99- security standards work group. SDT 706 should review how they are approaching it. KS willing to report back.
- Considering more than 3 levels. Requirements are very near to 800-53. Appendix- applied in a control system environment. Making them control system specific.
- 800-82 guidance document- not a standard without requirements. Provides implementation guidance.
- We should be careful not to limit ourselves.
- Light to moderate approach is complementary to our principles.
- Identification of challenges for CIP.
- "How"
- ISA 99- is similar to the moderate integration proposal.

C. Risk Management Framework and Protected Cyber Asset Identification- *Kevin Perry*

Kevin Perry distributed a concept paper a day prior to the meeting. *(See Appendix #7)* He introduced it at the end of day one with the following comments. The discussion started on day one and continued onto day two.

- Set of cyber assets (control systems) directly affecting the BES.
- Identify those systems that have direct control function or direct visability function. Doesn't matter where it is.
- Look at those critical/essential to reliability function.
- Who is feeding data that you must have, keeping going out. You may cross your neighbor's border? KC power and light feeds EMS data to SPP, SPP feeds them data. Essential to SPP. You get cyber assets having some impacts on BES. What is that impact on the BES? High, medium low impacts determined.
- List of cyber assets that have to be protected. Define perimeters. Apply graduated set of controls based on the impact like 800-53.
- Set criteria on regional basis for conformity.

- Consistent with the principle, depending on the cyber asset itself, the controls will vary.
- Address cherry picking approach. --vulnerability
- Ignored cyber assets with similar functions

Initial SDT Comments

- Is this not a big departure? Still have to establish relationship between cyber assets and other BES. BES Critical assets and then cyber assets associated with them. Identify all cyber assets that touch things.
- This turns process upside down.
- Dynamic system- things change.
- Description of functional approach.
- ERCOT annually reassessing what is critical.
- This is consistent with how to develop NERC equivalent with FIPSE documents. Consistent with risk assessment model. Those describe what need to be in NERC version of these documents.
- Today we look at physical facilities. Determine if it is critical to BES if it is lost. Then sub-set of facilities look at cyber assets for that facility. E.g. Entergy has over 100 generating plants. If 5 or 6 or critical, then don't look at the others. IPPs under certain conditions may be in the path.
- Inventory all cyber assets and impacts of each and then protect accordingly. Conditions can change but the cyber assets have the same characteristics.
- Like the idea of giving the primary charge at the reliability coordinator level.
- A lot of issues raised are also discussed in the draft critical asset id guideline. How close will this concept apply? Are we casting the net too wide? Protecting everything that is a computer? Is industry prepared to accept?
- Under today's approach, we wouldn't consider the SM Honda 2.0 generator vulnerability. Proposal has an impact analysis- and as such is loosely related to current method.
- Under this model, how many would be deemed to be "securable"? All 103 minimum on control systems at the plants. Different number of controls on control systems impact.
- Are we expanding this for the industry by a factor of 20?
- Yes, but this should be phased in over time- phased roll out to transition. This causes you to look at everything, but phase in over time.
- Common mode failure is a problem. One system considered critical another may not be. Tied together systems- sending or receiving data- need some way of verifying data validity. Lots of systems in use to keep bad things from happening. Focus should be on checking validity of data to keep common mode failures to a minimum. This scenario is not as bad as portrayed. The SDT can work on standards to improve. Common mode failure should not drive us to say every thing is a critical cyber.
- Concept requires industry to figure out what systems are talking to other systems. I am feeding data to your system and you are relying on my data, my system is a critical asset.

- Shouldn't data validity checks take care of this?
- Conceptually we shouldn't start with an engineering study before identifying cyber assets.

Day Two Discussion

- Desired outcome as stated in the paper is consistent with CIP 2 outcome.
- Get to a list of cyber assets having an impact on BES and an entity has to be able to justify how they got there.
- Rather not tell them how they are going to do this. Problem is R2 of CIP 002. List of facilities that have a high impact on BES. It has meant we don't look at first cyber asset until the facilities list is developed. That is where heartburn exists with existing standard approach.
- Jackie Collett has a good approach. Others took a different approach- engineering analysis if unit went off line or disappeared. Didn't consider cyber systems/assets until they narrowed the list of facilities.
- Could be a "high impact" system of a broader approach.
- Kevin Perry agrees that not every cyber asset has to be protected. If it touches, or open and close breakers needs some minimum set of controls. Look at Aurora vulnerability to understand concern. It wasn't they blew up industrial generator but it was the gaining access and turn from a protective to a damaging device.
- CIP 002 R2 has to go. R3- how we get there- look at and justify the right list. Any approach will work.
- We have to apply NIST experience and Kevin's paper incorporates a functional view as Jackie is describing. FIPS 199 is categorization process. Are we in "violent" agreement but approaching from different ends of perspective?
- NIST- not good guidance on how to do 199- learn by experience. Look at system from a functional perspective.
- If we take a systems perspective we will get too granular or lose broader perspective. Look at from functional perspective, how they map back to systems in terms of impact- that is where the industry needs SDT to head.
- Deficiencies in 002- give industry the guidance it needs. Through the guidance process. Need to agree that we are talking about the right assets.
- Key problem- keep looking at CIP standards and 800-53. Should acknowledge CIP deficiencies. Tools to mitigate identified risk that have impact on mission functions. Process of tailoring and scoping.
- Look at system that has a function, may not apply all controls. Can't do under CIP making it difficult to implement.
- CIPs are black/white, requirements-based approach vs. an objectives-based approach.

D. Revise existing CIP –002 to include the functional and systems approach including some levels of protection. *Jackie Collett, John Lim et al*

Jackie Collett presented the approach developed by a team with John Lim, Scott Rosenberger and John Varnell, that suggested the SDT should revise existing CIP –002 to include the functional and systems approach including some levels of protection. *(See Appendix #8 for White Paper)* She noted that the reliability of the BES was the basis for the proposed approach to Phase II with a clear link between cyber assets and their function in the BES. A Functional risk assessment methodology could define critical vs. non-critical operating functions and define which cyber assets are involved. The approach would include addressing significant gaps in CIP (they identified 5) She acknowledged that there are benefits in providing some gradations in protection of assets. E.g. control centers need protection. Finally she cautioned against the CIP being too tightly coupled to a standard developed and maintained by another group that when changed would affect the CIP. The discussion highlighted that: a systems approach is missing from CIP 002; a link should be made with NERC Principles of Reliability; and the standards should address enforcement of requirements.

Member Discussion Comments

- Key difference with Kevin's approach. Functional risk assessment methodology- define critical vs. non-critical operating function and define which cyber assets are involved.
- Operations functions may be broader. Generation is the function provided not just by the physical unit and is treated as part of the system. Includes plant control and functions and other systems.
- Common modes have to be protected. The Team may need to provide more explanation as they did this before the risk assessment guidelines came out last week.
- Why do we need to look at all cyber assets if they won't have an impact on BES?
- The approach suggests providing more guidance and less change/modification in the CIP standards.
- **Systems Approach Missing from CIP 002.** The SDT seems to agree that 002 is missing a systems approach- is there consensus?
- You can't leave the SCADA system off the list.
- Does a systems approach adjustment or replacement of CIP 002?
- Industry is ready for more specific guidance on what should be included and not included in the assets category.
- R1.2- assets- listed. Systems not mentioned until R1.2.4. Only 2 places where "systems" show up in CIP 002.
- Way the CIP is written today, it drives most to the individual physical asset not to a system approach.
- Is that the intent of CIP 001 critical assets.
- However, SCADA system is not starting with whole world. Identify the systems that open control breakers, etc. Looking only at physical asset approach is the concern with the approach Jackie et al are proposing.
- Industry may not want specificity back in? Needs to be there but they may not want it. Indicated in the guideline- "135% of applicable ratings on line"- comments from industry on

guidelines- we were "being way too specific." Pulled out the detail. Guideline will be missing from the next version.

- **Link with NERC Principles of Reliability.** Observation: important to tie back to the NERC adequate levels of reliability documents- 6 principles of a reliable bulk electric system.
- "One principle #4 is to maintain operations within normal ratings under normal conditions"
- Assigned adequate level assigned. Nothing in control centers about damage to equipment running too much power through.
- What classifications, characteristics, need to be put back in to get at principle #4?
- Disconnect between what industry wants, needs and finds acceptable.
- Remember that when standards passed- NERC was voluntary. Wrote to be innocuous as possible. The world has changed. SDT charged with "husbandry" for the industry.
- Electrical engineering mindset. E.g. no EHV substations are deemed as critical. Some of the largest entities across many states and none are critical. TVA ran modeling- applied the "sniff test" in addition to the electrical engineering. By policy (common sense) include all EHV and all nuclear plants, switchyards and loop stations and provide minimum standards.
- The SDT is charged with doing the right thing. Anything dancing around it won't do. "The terrible swift sword will come down upon us." This is our last, best shot at getting this right.
- NERC has responsibility over BES. Different governing bodies dealing with other standards. CIP standards directed only at things NERC has responsibility for.
- **Address Enforcement of Requirements.** Nothing in current CIP precludes a systems based approach. The requirements approach provides measures for compliance/enforcement and auditing. Guidelines should say here are things to meet the requirement, but Requirements need to be measureable.
- No need to for "engineer- bashing" on the team. Agree with the load flow approach and the planning approach.
- Keep in mind (in response to auditability), that in the NIST world the enforcement structure is a shortcoming and a deficiency in the NIST process. Are security controls in place operating as intended?
- Assumption that if you do those things- requirements- you do those thing you are managing risk. This doesn't necessarily buy security. This is one of the fundamental things we are grappling with. In this and other control frameworks. Is it operating as intended, does it mitigate risk? Fundamental assumption-
- Look at sub-standards that exist to make measureable today. Identify the appropriate series of control.

E. FISMA Asset Selection Strawman, *Scott Mix*

Scott Mix presented his strawman on FISMA asset selection first presented in Phoenix *(See, Appendix #9)*. The Team discussed the implications of his strawman for the SDT workplan and the connection with other approaches under discussion. He provided the following overview comments:

- Step 2- Control categories and catalogues- 3-9 more focused. Control based approach. More than control selection. More agreement on control selections.
- FIPS- mission focused- accomplish the organization's defined, assigned mission. Get agreement on SDT and in industry at large
- What is the impact to mission if confidentiality compromised. (e.g. computer by computer and data_
- Is it systems? It is information system and information. Run through for each piece separately
- Distribution- VPS and aggregated distribution. Where is the demarcation? 100 kv? Law says excluding "distribution" facilities. Marketing/NASBE. Not strictly reliability
- What if these systems are used by those controlling reliability?
- Current CIP- focused on high impact assets and ignored the rest. Have we done a good job at identifying the high impact assets?
- Is there a class of assets that really doesn't matter in terms of mission.
- Within scope, based on some form of analysis. Still have low and medium assets. Consider category of "lower than low assets. Discuss whether there is a lower than low set of assets that don't matter.
- This is a mid level approach to FISMA using Bill Winter's terms- Current 002 modify to classify all transmission assets/functions and set a high, medium, lows. Minimum level for everything that matters. 800-53 may provide a good starting point for categorization.

SDT Member Comments

- How long will that take? Decades probably.
- Factor of 9 to maintain status quo?
- Does this meet requirements of 706?
- Haven't address multi layers defense in depth.
- "Treading water" is not what the SDT should do- there will be the perception of avoidance. Keep in mind Congress is paying attention.
- How best to accomplish and modify standards
- Apply high water impact mark. Not three layers. Vast majority doing low now. There is actually not so much difference from low to high.
- Flaw in logic- bad guys seek to attack a high value asset from a low value asset. Not the same logic process. Cutting edge of the problem. E.g. use substation to attack upstream.
- Probably not a factor of 9. If look at CIP now and do the math- then yes. Look at how NIST framework- changes.
- Comes back to the systems approach earlier
- This is anything but treading water maintaining status quo. We are proposing to bring more into scope. Follow a different framework. Identify gaps and fill them. Achieve a better application of controls to BES reliability.

- Pinecone power- low trusted zone to high trusted zone. Need access control in high zone for protection.
- That is a requirement today. It is Null on list. Entergy protects itself from Pinecone power whether it is on the list or not.
- SDT is converging to same thing- the need for a consistent risk base- whether its functional.

F. SDT Discussion of Phase II Approaches

In the morning and afternoon of day-two the members discussed the implications of the various approaches to Phase II. They agreed there were evolutionary and revolutionary gradations in the approaches discussed and suggested that their focus should initially be on CIP 002 even thought there may be other issues that need to be addressed in the other standards. The challenge from NERC's Mike Assante was to try to produce an outcome-based standard vs. a prescriptive-based standards. We should be focusing on what is it we want as a desired outcome and less initially on how to get there. Their comments ranging over a number of issues are noted below:

- **Untrusted connections.** Remember that we have to take care of our own assets. Anything coming in from another system, we have to verify all that goes over that.
- Is this an isolationist viewpoint that narrows the focus? Don't disagree,
- We agree that entities should assume all outside control should be treated as a un-trusted connection. Need to be in a cooperative mode throughout industry to achieve security protection.
- Under existing law- don't know what they are doing. Either or? Both/and. Take a systems approach without having to know a system next to you or elsewhere vs. everything about every system that connects with him.
- E.g. SPP members- I have an ICCP- we have in out in a DMZ- nothing coming in important to us and our balancing authority. Declared it not in the scope of CIP. Probably spot on right. That node is essential to SPP ability to see what goes even if not essential to their system. SPP has a reliability role.
- You can handle two of those nodes going down under current system. Data down is an application thing. Key problem with the Perry proposal?
- Protect what you need to protect- just because it was not on list doesn't mean it is not being protected.
- Concepts- identify high, med, low- if there is an electronic security perimeter, all assets may have to be treated as most restrictive. Look for policies and procedures.
- **Demarcation – transmission and distribution**. 100kv and above. Where is that generation and control systems. Relates to how big the scope will be.
- Agree line is fuzzy. But from a NERC viewpoint- load shedding happens a lot at less than 100 kv systems with an impact on BES under NERC.
- Does this satisfy 706? Does 800-53 have a control for it?

- **Build on and tailor controls to BES.** We can push back into 800-53 those controls we think we need for our purposes. Wouldn't need to create new controls. Could modify NIST controls to fit BES environment.
- Caution against bringing in FERC 706 terms such as "defense in depth."
- It is more than what we are doing right now. The SDT should ask FERC to describe what it means.
- **Address Changes in Data Rates.** We have to anticipate for the future. NASPEE- net being designed. Sustained data rates of 6 megabits among data centers- Agree to protect your boundaries. Difficult challenge ahead: latency performance and security. In future real time high speed sharing
- Practical concern about "lower than low"
- **Industry expectations.** "Acceptability"- haven't sold the need for cyber security to the industry. Tell me what I have to do if it is regulatory.
- Our current CIP is not an approach that can serve the industry well. We want an outcome- list of cyber assets- to be protected commensurate with impact.
- **Computer vs. Physical Standards.**
- Possibility of ending up with 2 different methods one for computer one for physical systems.
- Correct- offer that the threat vectors for physical attacks are far different from a vector for a cyber attack. Threat and opportunity is different. Some overlap.
- Point out- if we follow this approach, we are creating a default position eliminating an analysis of physical assets and electronic asset.
- Assume physical asset standards may be used. Make a conscious decision.
- We will end up not having intermediate product. Critical electrical needing physical approach. ignore physical protection of physical assets. Jackie's approach what's critical to BES reliability- drive to cyber.
- Fan of the idea of a separate set physical standards. Systems based approach doesn't preclude that. Every NIST effort includes physical standards.
- Critical asset id methodology would not go away? Still a systems view bottom up approach. Take work already been done and use to determine impact level.
- Let's not assume that that is the case.
- good research going on now on intertwined nature of cyber and physical system. OakRidge National Lab- simulation and modeling on front.
- Relation between 2 is subtle and complicated than we have understood in the past. Research bear this out. Why you shouldn't start with physical in the CIP standard. Electronic security perimeter- treated as critical assets. Attacker isn't going for critical stuff, start from a print server and hop scotch from there.
- What happens when entire system overwhelmed by 3 million bites. Good sound reasons for disconnecting physical analysis and cyber analysis.
- Anything that opens or closes breaker, open generator unit, etc

- Connectivity- are they and in what manner, they become in scope for assessment. May not be essential but assessment will be instructive.
- Impact not just on the function but also whether the path can be used. How explicit in functionality in terms of interconnectedness, determining where you need to implement control.

In the afternoon of day two, Michael Winters with assistance from the facilitators presented the following for SDT consideration and further discussion based on the review of the different concept papers. Consistent with SAR and FERC Order 706, Mr. Winters presented potential SDT Approaches to Phase II:

1) Take Bill Winter's proposed low to mid-level approach using the framework outlined by Scott Mix but going beyond status quo by addressing gaps as outlined in 706 as part of the NIST-CIP mapping and gap analysis.

(How: Perform the mapping analysis of CIP to NIST using 706 view of where gaps exist in the CIPs)
Consistent with Principle 1, 4, 5, 7 & 8

SDT Comments on approach

- Happen in parallel.?#1 is 03-09. #2 is more about 002.
- Includes every approach we discussed.
- Bill Winters and Keven Perry's in line. Scott is along same lines.
- 7 goes with one as well
- Are we going into the how?
- Can't separate categorization from selection. FIPS 199 process most important and least understood. Can they stand alone?
- Need to be able to see where approaches align and where there are gaps. Jackie vs. Kevin or Bill's approach drives to selection and applying controls

2) Address a consistent cyber asset selection and categorization method by leveraging Kevin's and Jackie's (and others) thoughts on where gaps exist. Use FIPS 199 as another input or even the starting point but produce a BES version.
(How: Build a prototype, highlight the differences from existing CIP002 and let's test it.)
Consistent with Principle 4, 7,

Comments:

- Split between controls and 002 piece? Yes
- How to select and categorize.
- How to address gaming etc. how you select cyber assets.
- Bill Winters and Scott Mix covered both.

- If starting with FIPS 099-
- Kevin Perry discussed controls-how you are applying them.
- Try to get a small team together to do some drafting?

Guiding Considerations *(taken from the SDT discussion)* **could include:**

- Start with the NERC/BES assigned mission
- Take a functional approach CIP 002
- Take a systems approach in CIP 002
- We need to address gradations of risk (e.g. high medium low)
- A deficiency in the current NIST/FISMA regarding measurement and enforcement needs to be addressed in the SDT process.
- Address key challenges identified with current CIP: (e.g. piecemeal approach, not protecting assets needing protection; gaming; all or nothing; loss of asset, integrity/misuse, etc.)
- Address both the physical protection issues and the cyber protection issues, separately or not.
- Assume all outside an entity's direct control should be treated as a un-trusted connection.
- Seek to develop more guidance and less modification of standards as an approach.
- Address CIP 2 R2 so that it doesn't drive people towards the physical assets.
- Taking a cyber view should not preclude a physical view.
- Where possible, build on the existing work and research, models etc. E.g. Build upon MITREs cross walk to the control families.
- Focus on a shared view of the outcome that can capture all the attack vectors to make sure they have been assessed and have minimum security controls that we have not addressed in CIP.

Comments on Considerations

- First consideration bullet is a given? Yes, but may help to restate.

The SDT members agreed they were not yet prepared to proceed with the approaches suggested by Michael Winters. Some suggested further clarification of what was meant by "functional" or "systems" approaches to 002. After further discussion, the SDT agreed that a helpful next step would be to produce two strawman drafts of a revised CIP 002 based on the work to date. One would be prepared by Jackie Collett & John Lim and another would be prepared by Bill Winters and Kevin Perry with assistance from interested SDT members. These would be distributed in advance of the March meeting and form the basis for the agenda in Orlando.

Jay Cribbs proposed that the SDT ask the two teams to each produce a strawman CIP 002 in order to ground the discussion and move it forward. The members comments are set out below:

- Could we produce a current single strawman CIP- bring back a CIP 002?
- Fundamental question? Are we going to produce a set of documents codified as standards that are risk-based or traditional requirements based approach?
- Risk based approach deals with asset selection and how to apply controls to mitigate the risks. Depends on the organization's appetite for risk
- CIP 002 is risk-based is to identify assets then apply requirements. No risk-based decision making after that, just comply with requirements.
- Application of security measures takes a risk based vs. requirements approach. How do we merge those two.
- How to apply requirements to a risk based model to security controls?
- Going forward, continue the requirement-based approach or head in another direction.
- Unless the SDT develops a performance-based/requirement-based standard, it is not a NERC standard- would violate FERC order.
- "Risk based requirements?" Focus session on CIP 002. And a focus session on approaches to integrate the 2 models.
- Is it possible? Mandated that the SDT explore this.
- Audit process- subjective process. Deficiency of model.
- If we are going to produce requirements without a risk assessment.
- CIP 002 is risk based but requirements verified for
- Words say risk based but in practice it is not a risk assessment.
- Is there SDT consensus on a risk based approach?
- We should be taking a risk-based controls approach to the development of requirements. How can we craft requirements that include a risk basis?
- Opposite of one size fits all. Require you use a risk-based approach.
- We have a set of requirements that map to risk levels. For a given asset at a given location assigned a level of risk, we know the expectations are, focus in on that requirement at that location.
- Comes out of our catalogue of requirements vs. controls
- Allows for gradations.
- Create a document that contains a control.
- Requirement that they select their own controls.
- In FISMA process you have the base line-
- Nothing to stop SDT- NERC 800-53. Then have requirement that you will select based on risk level, controls appropriate to the device.
- Is the key issue, how can we craft requirements that include a risk based approach?
- Looking a how to apply controls. May timeframe- how to identify systems. Can we get to the Workshop?
- That plus our approach to risk based controlled model integrates into requirements.
- Closing in nicely but not there yet.

- Don't get into constraints of the standards development process. Whether or not to embrace NIST standards. Try not to burden with procedural discussions.
- The current constraints may take things off the table. Whatever we proposed should be within the constraints.
- Catalogue- will have to be run through the ANSI process.
- Basic disagreement between 2 camps revolving around order in which things are done. Get rid of CIP 2 R2. Do this as part of the impact assessment. Jackie/John/John. Have to do the critical asset identification first even though we have talked about systems approach. If correct, need to resolve before.
- Need to test an approach. Do we want to test employ a risk based categorization methodology to assets and apply to levels?
- May need to gut CIP 2 R2 and replace with FIPS 199 categorization vs. selection process to figure out high, medium low based on something.
- Not just on identification of critical assets. Categorization of cyber assets based on function. Proposing that take the functions for the operation and reliability BES and based on functions, id assets providing those functions, categorize and identify connections with external systems.
- To move forward, SDT needs an education/briefing on what is a "systems approach"? Straw documents to drill down on that.
- Need another NIST briefing: little deeper than 101. 200 class on NIST 800-53. Lack of complete understanding of how those would apply.
- We are both talking systems and functions. Each team should identify and define what is meant by a systems based approach and identification of essential functions.
- What kind of documentation should be clearly described.
- Let's look at high-level requirements for CIP 002 that would support each approach.
- What are the functions that are essential to retaining the reliability of the BES?
- Some out there So.Cal Edison. NERC documents- 5 elements:, Supervisor Control of BES assets…… Critical Asset Identification Draft Posted.
- FISP 199 document- list all of the key considerations, run through categorization process. Look at the impact to the function that supports your mission. Not easy. Put together a strawman doc to illustrate this. Somewhat subjective. In control area easier than in the admin area. Specific functions that support reliability. That would lead us to new set or modified set of requirements.
- Proposals- map them over, or a new requirement, adopt the NERC 800-53. Simple in concept with the difficulty evaluating.
- "Defining the system"? may be more difficult than discussions suggest. Consider what the possible gaps in that process.
- 2 documents with strawman CIP 002- 1 based on bill/Kevin method other by John Lim et al. When we look at them both.

- Work with whoever is interested to respond to John Stanford's categorization process clarification.
- Address the mission of BES not just the entity.
- Control function- industry has a good idea. Some structure.
- List of asset types that have to be considered.
- Scott's list of 5- could spread across a number of entities. Comes down to functional entity. Formulaic language at the functional entity level.
- CIP 002 - tell an entity what to assess, here is how to assess and here is what comes out of the process.

VI. NEXT STEPS AND ASSIGNMENTS

A. Expert/Stakeholder SDT Workshop and MRC.

At the end of day two the SDT took stock of its progress and reviewed the schedule for both an cyber expert and stakeholder workshop and presentation to the NERC Members Representative Committee in early May, 2009. *(See Appendix # 4)* The SDT agreed it needed to have sorted out and developed a clearer understanding and agreement on the Phase II approach prior to presenting a substantive briefing to the MRC. As as a result the SDT agreed to seek to provide a short "progress report" to the MRC in May and seek to present a substantive briefing at their August, 2009 meeting. The SDT suggested scheduling the expert/stakeholder workshop in the early Summer.

SDT Comments

- Workshop- both inside and outside the industry. Bringing in peers at level of people from companies didn't make the cut. People consulting vendor, national lab, government, agencies, congress DHS. Community at large consider in the large direction.
- MRC- Maybe in August vs. May?
- When we get up in front of people, have to be ready to present.
- Provide a modest progress report.
- Concern about a mid April workshop and a May 1 MRC. May not be enough time to reflect on the workshop input and prepare a presentation for the MRC a couple weeks later.
- Do we tell the MRC there will be significant potential change in the standards? We will be applying the CIP standards to more assets than included now. Modify existing protections to provide less.
- Given the number of things that need to be protected- net will be cast wider.
- We need to consider before MRC, a concept of how this would be rolled out (timeline and transition plan) so as not to cripple the industry.
- Must be prepared to answer why additional provisions or tougher on some standards. Need to have something focusing on our mission that says why we are doing it.

- Mike Assante and Rick Sergel- high level responses to those kinds of questions.
- Workshop in May and get the August. Workshop right after MRC meeting. BOT meeting. In D.C.
- Know what the questions are. Difficulty closing the deal.

B. Drafting Assignments

The SDT agreed that a helpful next step would be to produce two strawman drafts of a revised CIP 002 based on the work to date. One would be prepared by Jackie Collett & John Lim and another would be prepared by Bill Winters and Kevin Perry, each with assistance from interested SDT members. These would be distributed in advance of the March meeting (by March 6) and form the basis for the agenda in Orlando.

C. Meeting Evaluation

The Team then evaluated the meeting:

What worked or were helpful?

- All of it - staff assistance. Productive session.
- Quality of discussion
- Things went incredibly well kept out of the weeds.
- Heartfelt kudos to the group. The Chair and Vice Chair are exceptionally pleased. Good discussions, not getting into fisticuffs. Respective working with each other trying to understand each other's point of view.
- SDT is coming together, during the last few hours light bulbs were coming on. Bounds checking introduced.
- Kudos to the good work of drafters--Jackie- John John, kudos- engineering angle. Good work.
- All can be used in a NIST like process. All selected for perspectives, no right /wrong answer.

What things to improve/ correct

- Going forward reconnect on SDT objectives

The SDT adjourned at 3:30 a.m.

Appendix # 1
Cyber Security Order 706 SDT — Project 2008-06
Draft Meeting Agenda
February 18, 2009 - 8 AM to 5 PM EST
February 19, 2009 - 8 AM to 5 PM EST
ICF, Fairfax VA

Proposed Meeting Objectives/Outcomes

- Receive updates on Phase I actions, TFE and VSL processes;
- Receive White Paper updates;
- Presentation of a Case Study on a FISMA Application;
- Review and refinement of Phase II principles;
- Develop a series of principles, propositions and approaches that can serve as a foundation for a strawman Phase II concept and guidance document; and
- Agree on next steps in the Workplan and assignments.

Draft Agenda

Wednesday	**February 18, 2009**
8:00 p.m.	Welcome and Opening Remarks- *Jeri Domingo-Brewer/Kevin Perry* a. Roll Call b. NERC Antitrust Compliance Guidelines c. Facilitator Review of January meeting and adoption of February 2-4, 2009 Meeting Summary and Revised January 7-9, 2009 Meeting Summary
8:10	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Jeri Domingo and Bob Jones*
8:15	Organizational Issues and Review of Phase 1 and early Phase II Schedule- Stuart Langton ▪ Update on Phase 1 Workplan, February 2009 ▪ Overview of Phase 2 Workplan- February-June, 2009
8:30	Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure Posting- *Scott Mix*
8:40	Update on VSL SAR for SDT and Implications for SDT 706
8:50	Overview of FERC Order and Steps to Date in the SDT Phase II Development Process- *Stu Langton*
9:00	Discuss and Clarify February 2 SDT Ranking and Refinement of Phase II Principles (Michael Winters)
10:30	*Break*
10:30	2nd Presentation and Discussion of the Phase II White Paper- Potential Applicability of NIST to CIP- *John Lim (with Jackie Collett, Scot Rosenberg, John Varnel)*
12:00	*Working Lunch (Return to plenary meeting at 12:45)*
12:45	2nd Presentation and Discussion of the Phase II White Paper- Potential Applicability of CIP to NIST, Bill Winters
2:15	Applying FISMA – Asset Categorization--A Case Study- *Jeri Domingo Brewer*
3:00	*Break*
3:15	2nd Review of Revised FISMA/CIP Strawman- Scott Mix
4:50	Summary of Day Two Outcomes and Review of Day Three Agenda
5:00	*Recess*
Thursday	**February 19, 2009**
8:00	Welcome and Agenda Review
8:10	Integration and NIST/FISMA Potential Applicability Discussion- Assumption and Principles
10:00	*Break*
10:15	Remaining "Tough Issues" Discussion *(to be identified)*

12:00	*Working Lunch*
12:45	Building a Phase 2 Strawman Concept and Guidance Document
2:45	*Break*
3:00	Building a Phase 2 Strawman Concept and Guidance Document- Continued
4:30	Assignments, Next Steps and Review of Work-plan
4:40	Meeting Evaluation--What Worked. What Needs Improvement
4:50	Review of SDT March meeting objectives
5:00	*Adjourn*

Appendix # 2
Cyber Security for Order 706 Standard Drafting Team and Attendees List
Project 2008-06 — CS 706 SDT
Fairfax, Virginia

Attending in Person – SDT Members

1. Jay S. Cribb	Information Security Analyst, Southern Company Services, Inc.
2. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp.
3. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
4. Phillip Huff	Arkansas Electric Coop Corporation
5. John Lim	CISSP, Department Manager, Consolidated Edison Co.NY
6. David Norton	Policy Consultant, CIPEnergy Coporation
7. **Kevin B. Perry, Vice Ch.**	Director, IT-Infrastructure, Southwest Power Pool
8. Christopher A. Peters	ICF International
9. David S. Revill	Georgia Transmission Corporation
10.Keith Stouffer	National Institute of Standards & Technology
11.Michael Winters	Hydro One
12.William Winters	Arizona Public Service, Inc.
1. Roger Lampilla	*NERC*
2. David Taylor	*NERC*
3. Harry Tom	*NERC*
4. Scott R. Mix	*NERC*
5. Joe Bucciero	*NERC/Bucciero Assoc.*
6. Robert Jones	*FSU/FCRC Consensus Center*
7. Stuart Langton	*FSU/FCRC Consensus Center*

SDT Members Attending via Webex/Phone

1. Rob Antonishen	Ontario Power Generation
2. Jackie Collett	Manitoba Hydro
3. Tom Hoffstetter	Midwest ISO, Inc
4. Kevin Sherlin	Sacramento Municipal Utility District
5. Jonathan Stanford	Bonneville Power Administration
6. John D. Varnell	Technology Director, Tenaska Power Services Co.

SDT Members Unable to Attend

1 Jeri Domingo-Brewer	U.S. Bureau of Reclamation
3. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co.
3. Sharon Edwards	Duke Energy
4. Richard Kinas	Orlando Utilities Commission
5. Scott Rosenberger	Luminant Energy
6. Bryan Singer	Kenexis Consulting Corp.

Others Attending in Person

Jim Breton	ERCOT

Roger Fradenburgh	Netsecctech
Judy Fry	ICFI
Darren Highfill	ENERNEX
Sam Morrell	CERT
Farzaneh Tafreshi	ICFI

Others Attending via Webex/Phone

Chris Wright	
Dan Mishra	
David Batz	
Monica Coflin	
Karen Yoder	

Appendix # 3
NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and

subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 4

Cyber Security Order 706 SDT —Project 2008-06

JAN.-JUNE 2009 DRAFT SDT SCHEDULE

SHORT TERM 2009 SDT SCHEDULE DRAFT CRITERIA

- Follow the ANSI standard development process but use creative ways to efficiently secure input from the industry on emerging concepts and approaches to the CIP standards.
- Seek creative ways to get advice and input to the SDT from experts in cyber security.
- Seek creative ways to get focused input from industry stakeholders.
- Take advantage of input opportunities from related NERC committees that will be meeting in the first half of 2009 (e.g. working with the NERC Members Representative Committee, CIPC, BOT, and industry committees such as the Electricity Sector Coordinating Council, etc.)
- Seek, as soon as possible but no later than late Spring, 2009, to establish a consensus on the way forward for the SDT in its efforts to revise the CIP standards.
- Track any follow up to the "Securing Cyberspace for the 44th Presidency" report of the Commission on Cybersecurity for the 44th President.

SDT DRAFT SCHEDULE-JANUARY-JUNE, 2009

OVERVIEW

- **7 SDT FACE-TO-FACE MEETINGS**
- **MULTIPLE SDT SUBGROUP AND SUBCOMMITEES WEBEX MEETINGS**
- **1 CYBER EXPERT WORKSHOP (MARCH 10 OR 11, 2009)**
- **1 NERC CIPC PRESENTATION? (FEB. 9, 2009)**
- **INDUSTRY COMMENTS ON CIP 002 WHITE PAPER** (APRIL 17-JUNE 3)
- **1 NERC MEMBERS REPRESENTATIVE COMMITTEE, MAY 1, 2009**
- **OTHER MEETINGS?**

SDT DRAFT SCHEDULE-JANUARY-JUNE, 2009

1. January 7-9 SDT Meeting, Phoenix, AZ ½ / 1/½ day format. Wed-Friday

- Review of Technical Feasibility Exceptions white paper
- Review of Industry Comments on Phase 1 products- Establish and convene small groups
- Review of Phase 2 White papers

January 15 Webex meeting(s)

- Small group draft responses to industry.

- Phase 2 drafting concept group?

January 21 Webex meeting(s)

- Small group draft responses to industry.
- Phase 2 drafting concept group?

2. February 2-4 SDT Meeting, 2009, Phoenix, AZ, ½ / 1/½ day format. Mon-Wed.

- Review of Industry Comments on Phase 1 products and Proposed revisions and adoption of Phase 1 products.
- Review of Phase 2 White papers and Testing of a Phase 2 CIP 002 Concept going forward

February 9, 2009, CIPC Meeting- Update on SDT Progress and Input?

3. February 18-19, SDT Meeting Boulder City, NV

- Review of Phase 2 White papers and Adoption of a Phase 2 CIP 002 Concept for review by experts and stakeholders

February 25, Webex meeting(s)

- Development of Phase 2 CIP 002 Workshop for review by experts and stakeholders

4. March 10-11, SDT Meeting 2009, Tampa, FL, 2-day format

- **Invited Cyber Security Experts join SDT in a workshop** to provide expert feedback to draft CIP 002 concept.
- Further SDT refinement of the CIP 002 proposed concept

March NERC Balloting on Phase 1 Products

March 18, Webex meeting(s)

- Phase 2 drafting concept group?

5. April 14-16, SDT Meeting, Charlotte NC, ½ / 1/½ day format. Wed-Friday

- Continue review and refinement of 002 concept
- Adopt White Paper on CIP 002 concept for Industry Comment

Industry Comment Period on White Paper- 45 days (April 17- June 3)

*May 1, **NERC Member Representative Committee**, Presentation of the Phase 2 CIP 002 Approach for MRC input. (Agenda item, Possible Workshop?)*

6. May 13-14, SDT Meeting, Dallas TX, 2-day format

- Respond to MRC input and further SDT refinement of the CIP 002 proposed concept and SDT CIP roadmap.
- Organize SDT in subcommittees to draft revisions to CIP 003-008 or to address key issue areas.

Early June, Webex meeting(s)

- SDT subcommittee meetings to review and draft responses to Industry comments on the CIP 002 concept.

7. June 17-18, SDT Meeting, Location TBD, 2-day format

- Review Subcommittee responses to Industry comments on 002 approach
- Charge subcommittees and conduct organizational meetings
- Subcommittees meet to draft revisions to CIP 003-008

June, 2009 Webex meeting

- SDT Subcommittee meetings

July-December, 2009- SDT and subcommittees meet and continue CIP drafting

2nd DRAFT PHASE 2 ROADMAP APPROACH ASSESSMENT CRITERIA

(Presented, Revised and Added to by SDT in its review on November 14, 2008)

1. The approach is consistent with the SDT purpose statement and is responsive to the FERC 706 directives and the SAR.
2. The approach is achievable given the SDT schedule and workplan.
3. The approach does most to advance and enhance cyber security in the BES.
4. The approach helps the SDT address the foundational issues with the current standards.
5. The approach is capable of implementation.
6. The approach is capable of improving compliance.
7. The approach helps protect the current investments and wherever possible builds on what has already been done.
8. The approach helps to identify and mitigate risk on an ongoing basis.
9. The approach balances a "systems" orientation with a "facilities" orientation to asset protection.
10. The approach is capable of being extended into related interests by others (distribution, AMI, Smart Grid, etc.).
11. The approach enables the industry to provide the appropriate level of security (i.e. not over securing nor under securing the BES cyber assets).
12. The approach allows for discrimination among and targeting the various types of infrastructure that support the BES

Appendix #5 Guiding Principles Ranking and Comments

1. **~~(8)~~ A mapping ~~similar~~ to NIST 800-53 ~~Appendix G~~ to CIPs will help quantify and assess the gap, if any.**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2-2-09 rank	**11**(10/1)	**2**	**2**	**0**	**3.6 of 4**
2-18- rank	**13(**11/2)	**1**	**0**	**0**	**3.9 of 4**

SDT Comments 2-18 before ranking

- "Similar" = almost the same as? Matrix with other standards. Mapping of 53 to other standards not including mapping to NERC CIP standards. See the MITRE document.
- We do have some "mappings" 53 and NERC CIPs, not in same format as appendix G. DOE has done one as well.
- Michael Winters suggested the principle is to build on work already done, to highlight possible gaps in the CIP standards.
- 800-53 part of a guideline. CIP is a standard. Needs to be a high level piece.
- Quantify the gap is the essence of the principle. Not suggesting adopting 900-53. It can be a tool to identify the size of the problems/gaps.
- Clarification for those thinking 800-53 isn't a standard vs. guidelines. FIPS 200 is the standard. Meet the 800-53 guideline.
- Separate guidelines changes are easier than changing standards.
- There isn't a mapping in the Version 3 IPP document.
- Need to analyze the gaps first. We may find there is not be a gap after all.

2. **~~(2)Resist creating exception-based standards to accommodate every possible business and operations scenario. Instead~~, Create ~~clear~~ non-proscriptive standards and employ a technical exception/compensating ~~controls reporting~~ documentation and guidance process to ~~that~~ accommodates ~~deviations~~ variations.** (Resist creating exception based standards to accommodate every possible business and operations scenario)

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2-2-09 rank	**11**(10/1)	5	1	0	3.6 of 4
2-18- rank	**10** (7/3)	**5** (4/1)	**0**	**0**	**3.7 of 4**

Michael Winters introduction comments

- TFE has a guidance peer process. Feedback loop for mitigate at the regional or other levels. Not just a reporting requirement.
- First sentence is the intent- can delete but remember.
- This principle suggests we write requirements/controls at a higher level so we don't get into

all the details? Bottom line? Make sure you have something at the end. Not just a reporting but a mitigating process.

- In terms of "What vs. how." This principle suggests we avoid the how in our standards.

SDT Member Comments and suggestions before ranking

- Does "clear"= prescriptive? Should avoid the how. Use "Non-prescriptive."
- What is the "guidance" process? Reporting all of our compensating controls?
- SDT could write standards that provide for something like a TFE when you can't do what the standards require you to do. From a compliance standpoint- must do what is in the standards. TFE, meet intent of standard, doing something and explain how you are handling it to meet e.g. 75% level and then address the 25% mitigation measures.
- "Create non prescriptive standards and utilize a defined TFE … to accommodate deviations or variations.
- What is a guidance process? Another guideline? This is the feedback loop.
- Puts compliance into a role of consultants/education. Is this allowed by current procedure or acceptable to industry?
- Audits- make recommendations- entity respond to it. NERC compliance- possible violation goes to region to enforcement component- look at evidence, and make a final decision. Then an alleged violation and a discussion about what can be done. Registered entity can post alongside the violation their position.
- Federal agencies use an inspector generals- process? GAO letter of management.
- "Variance" vs. deviation.

~~3.~~ ~~(3)~~Use a consistent risk-based model to classify ~~all~~ cyber assets ~~(i.e. facilities, sites, physical perimeters) (i.e. not cyber assets at this point)~~ as critical/high impact, moderate impact, low impact. ~~This will allow for expansion of standards beyond Critical(i.e below 100 kV – accommodates AMI, Dx automation, etc). Classifying at the physical perimeter level~~ This would allow for expansion of the standards beyond critical. ~~different classifications to exist within a building or at a site (e.g. control room, computer rooms, dev and testing rooms, and back-office at a control centre).~~

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2-2-09 rank	**9**(8/1)	6	2	0	3.4 of 4
2-18- rank	**11** (9/2)	**5** (3/2)	**0**	**0**	**3.7 of 4**

Michael Winters introduction comments

- Consistency of application is intent and also levels of graduation- high medium and low.

SDT Member Comments and suggestions before ranking

- Strike the classifying sentence? Yes.

- May be headed down the same problematic path. This is an "engineering frame of reference." "Consistent risk based model"? "Holy grail" Any out there? What is important is the function in terms of reliability. Function needs to be preserved. What do we need to know to run the system in reliable fashion. Looked at applications. From SCADA to EMS to generation dispatch. They run on these boxes and use this data on a storage area network. E.g. hurricanes.
- Working group of CIPSE identifying critical asset guidelines. Many came to same conclusion. Functional and impact analysis based on loss or compromise not just of machines but of functions is key. Its draft will be out next Tuesday.
- They identify functional analysis in 4 classes of systems: transmission, generation, control centers and special systems dealing with load shedding etc. (most important at last 2). Criticism- guideline doesn't support the language in the standard? OK, but it is just a non-binding guideline. NERC has told FERC, that document will be made available to this drafting team. Are there things in guideline that should be in the standards in version 3?
- Functional analysis is a good candidate for that. CIPSE agenda packet released March 3. Will send a link to the SDT.
- Functional analysis- important for ERCOT. Identify systems that were critical for situation awareness for BES in Texas. Have control systems but 4000 centers, control systems. Don't own assets. We can't declare it critical unless we are the asset owner. Provide guidance. No authority to do this. We need help.
- We didn't call it a functional model. We didn't get at application side. They are the key to maintaining both reliability and security. Need to address in Phase II.
- Function vs. application: If focus on function vs. assuming a computer involved. Apply first step where there are not computers. E.g. control centers provided this before computers involved. Computers became important because they have performed critical functions. There are still non-computer systems in place.
- Intent is to close gap on the systems we leave out. Everything having to do with controlling the BES. Everything gets a classification and a set of controls and is consistent from entity to entity.
- Aren't these cyber security standards to protect computer systems?
- Classify "all"
- Applications-
- Needing feeds from other places, e.g. ERCOT's comment. Reliability coordinators role?
- Transmission, congestion studies each year. Growth expected. Critical today may not be tomorrow. Each year CA determination may be different. Will be very dynamic. Like more authority to get things done. FERC order 706- reliability coordinator role.
- Focusing on applications has been a challenge. What are mission critical systems? E.g. Weather systems are critical with wind power. What systems required to functionality.
- Identifying cyber assets high medium low. Related to threat profile in FISPE 200- mission focused. Not individual assets. Mission high.

- Placing at end. These principles are driven by the following:……
- Violation risk factors- single risk factor. May have to assign a high? That may depend on how draft the standards.
- Risk factor- what impact will failure to comply have on the reliability of the BES- high impact- e.g. cascading failures. Impact cyber security if asset is compromised. Different assessment. Will there be confusion about the similarity.
- High medium low threat profile organization

~~4.~~ ~~(4)~~An entity's cyber asset classification is ~~would be open~~ subject to scrutiny by the compliance enforcement authority and ~~ERO~~ and applicable regulator(s). ~~The extent of scrutiny to be defined and tightly controlled.~~

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2-2-09 rank	**4**(3/1)	11	2	0	3.1 of 4
2-18- rank	*No rank*	*Agreed to list as a*	*fact or assumption*	-	-

Michael Winter's introduction comments

- Intent is to have a review to make sure interpretation is not incorrect. Regional entities are the front line for compliance today.
- When auditors show up an entity can show a risk-based assessment.
- Reliability coordinator review is by implication in principle #3 in terms of consistent application.

SDT Member Comments and suggestions before ranking

- Roger Lampilla noted what has been learned in compliance through five CIP training classes. First 13 requirements. 8 regions manager of compliance. On CIP 002, if you say you will id high medium low. They will ask the auditor to suggest what category it is. If they don't see an asset that is not on the list you will be asked to run through methodology to explain not on the list. Hearing from the regional audit staff.
- Balance to check in the first one. Demonstrate you have applied the method consistently.
- Regional entity- "compliance enforcement authority"
- Regional entity- sounds like an audit? This is on the back end in #4.
- Asset classification is a requirement? Is this different than what we have today in the audit process?
- Principle #3 is the requirement while principle #4 is the application. Intent is external review component.
- Add cyber asset? Do away with physical basis. Stop thinking of existing CIP standards and approach. Danger we will lock in by default.
- Is this part of compliance process or part of identifying assets? Which is it?
- "Authority" may be giving some heartburn? Broaden to external review?
- "auditable"? Is this the intent? Then "sanctionable". Scope of statement extends to that.

- That is an extreme. Intended to suggest a more collaborative peer review process
- Scope of SDT is to write requirements. We need to write standards that can be audited.
- The scrutiny this draft principle calls for already exists. Authority to challenge and refute
- Take this out. It is a given. It is awkward at part of #3
- Include as a statement of fact or assumption at the bottom or to introduce the principles.

5. ~~(7)Use~~ Consider **the minimum security controls for high, moderate and low within NIST 800-53 to help model the CIP** ~~controls~~ requirements **for each level.** ~~**Address any gaps at the same time but keep the same CIP002 to CIP0XX general format. Re-arrange existing CIPs as previously discussed within SDT to make them flow more effectively. Industry knows this format, is building policies and programs around it, has commented on it and has voted on it.**~~

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2-2-09 rank	**5**(4/1)	8	4	0	3.0 of 4
2-18- rank	**9**	**6** (3/3)	**0**	**0**	**3.7 of 4**

Michael Winter's introduction comments

- Looking at principle not adopting the FIPS/NIST framework.
- High medium low= impact to operation and reliability of BES. That is how you would view cyber security.

SDT Member Comments and suggestions before ranking

- High, moderate, low? Affected how we talk about functions, asset by asset vs. utility by a whole? What about multi-site contingency. Breaking down requirements based on facility.
- OK if doing an organizational threat profile. These are cyber controls which assume the systems have been.
- More risk there is the BES, higher level of protection on the asset.
- Show me the metric--this will be difficult.
- Risk assessment methodology consultants. As you develop your priorities. Impact evaluation criteria- here is what is most, less and least important. What does the high mean? Based on everyone's priorities for the BES. Will reveal how to grade and evaluate,. What are some of those factors. Security categorization is the first step of the risk management assessment- risk in terms of mission. Shared mission re BES: system wide services that need to be assured. Keep in mind thresholds. What is high? Fundamental piece missing from the puzzle.
- Fits in terms of the functional discussion.
- Bring in people to test the nature of the functions- systematically, data flows and end to end.

6. ~~**(6) Any cyber devices that are not within or on the perimeters, including telecom, are not part of the CIPs – the CIPs remain perimeter-based where devices on and within the perimeter are protected and everything beyond is considered untrusted.**~~

Protection of the communication devices outside to the electronic security perimeters, are out of scope.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2-2-09 rank	**4**(3/1)	6	6	0	2.9 of 4
2-18- rank	**10**	**3** (1/2)	**3** (1/2)	**0**	**3.7 of 4**

Michael Winter's introduction comments

- Intent was to exclude- what is not in.

SDT Member Comments and suggestions before ranking

- JL: Establish zones of trust and treat cyber communication devices and data accordingly.
- Worry about serial lines? Routable protocols. It is a hole we have to close. FERC 706 doesn't talk about serial lines. If not.
- General principle? Zones -Define by governing bodies.
- We have 2 zones. Direct control and stuff you don't. E.g. ATT wire circuit. Data in motion is the asset to protect.
- Sheet- need to protect the BES.
- What is the basis of "trust"? Must define this. Info system perimeter that is not technology specific is better?
- What are the zones and levels of trust- and how to treat them accordingly. Certain devices we trust and treat differently. Principle is one of different level of trust.
  After ranking
- Split into two principles: Communication devices out of scope; and Transit data as a core principle.

7. It is imperative to protect the integrity of data throughout its transit.

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2-18- rank	**13** (12/1)	**1**	**2**	**0**	**3.7 of 4**

Comments following ranking

- 2: "imperative" vs. "important"
- 2. Don't like "integrity"

David Revill proposed the following principle for SDT consideration:

8. **CIP requirements should consider the unique locational characteristics (e.g. substations, data centers, generation plant) and functional capabilities of the cyber assets to be protected.**

Acceptability Ranking Scale	*4 = acceptable, I agree*	*3 = acceptable, I agree with minor reservations*	*2 = not acceptable unless major reservations addressed*	*1 = not acceptable*	*Avg.*
2-18- rank	**11** (8/3)	**5(**4/1)	**0**	**0**	**3.7 of 4**

SDT Comments before ranking

- Consider the application of asset-class specific requirements.
- The requirements need to consider the environment and class of the cyber asset
- Suggest- standards to "guidance"?
- Focus on functionality of the system. E.g. fire wall and a server.
- System functionality?
- Different assets
- Highlights different between an asset vs. computer focused approaches.
- Asset classes envisioned by current CIP.
- Are these mutually exclusive? Physical security requirements of different when
- Asset specific functionality- device. The characteristics of the cyber asset.
- Protection on devices- various ways to place anti viruses to protect on router itself or in front of it.

Delete Old #7 ~~(5)As part of a power system (non-corporate IT) inventory of cyber assets, add an attribute to each device that associates the high/moderate/low classification of the physical perimeter/facility/site within which it resides. Apply security controls based on the classification.~~

~~*Acceptability Ranking Scale*~~	~~*4 = acceptable, I agree*~~	~~*3 = acceptable, I agree with minor reservations*~~	~~*2 = not acceptable unless major reservations addressed*~~	~~*1 = not acceptable*~~	~~*Avg.*~~
~~2-2-09 rank~~	~~**4**(3/1)~~	~~6~~	~~7~~	~~0~~	~~2.8 of 4~~

Michael Winters comment:

- Deleted as this is already covered in Principles#3 and Principles#5.

9. ~~**(1)Protect critical/high, moderate, low cyber assets that are within scope of NERC CIPs – not just the Critical Cyber Assets – but to different degrees of controls depending on their classification.** [NTD: this is the natural progression of #5. The minimum security controls have been defined by level. This principle now states that those controls should also be implemented. Note that 'low' impact may stop at taking the CIP-002 inventory with no other controls required – if that is what the SDT decides.]~~

~~*Acceptability Ranking Scale*~~	~~*4 = acceptable, I agree*~~	~~*3 = acceptable, I agree with minor reservations*~~	~~*2 = not acceptable unless major reservations addressed*~~	~~*1 = not acceptable*~~	~~*Avg.*~~

~~2-2-09 rank~~	~~**3**(2/1)~~	~~8~~	~~6~~	~~0~~	~~2.8 of 4~~

Michael Winter's introduction comments

- Intent of principle: protect all of your assets #5 defined levels and controls.
- This is an implementation principle and should be deleted as a guiding principle.

Appendix # 6

Risk Management Framework and Protected Cyber Asset Identification A Concept

Kevin Perry, February 17, 2009

Desired Outcome

The Responsible Entity shall produce at least annually through an applied risk assessment methodology, a categorized list of Cyber Assets that are to be protected per the requirements of the CIP stan dards. The categorized list shall reflect the importance of the Cyber Asset and the potential risk to the reliability of the Bulk Electric System in the event the Cyber Asset is lost or compromised.

Background

The current risk management approach requires a Responsible Entity to first identify its physical assets (typic ally control centers, generation plants, and transmission substations) that are essential to the reliability of the Bulk Electric System. Once the Critical Assets are identified, the Responsible Entity then identifies the Cyber Assets essential to the operation of the Critical Asset. There has been confusion throughout the industry as to what constitutes a Critical Asset and the FER C has required additional guidance to be provided in this regard. The FERC has also expressed concern that N-1 redundancy is not a valid criterion for Critical Asset selection.

While not all Cyber Assets pose the same level of risk, it is reasonable to assume that any Cyber Asset capable of performing a supervisory control action against the Bulk Electric System or providing visibility of the Bulk Electric System conditions should be protected to some degree. Likewise, any Cyber Asset providing essential functions or data to the control system should alsobe protected based upon the potential risk. It is reasonable to assume that while the loss or compromise of a single Cyber Asset may have no meaningful impact on the Bulk Electric System, the loss or compromise of some number of these Cyber Assets with common points of vulnerability could rise to become a significant impact to the Bulk Electric System. It is also important to remember that the Bulk Electric System is dynamic and that system conditions change constantly. What is not critical today may well be critical tomorrow due to such factors as outages an d extreme weather.

By relying on an engineering approach and focusing on the physical facilities that make up the Bulk Electric System, there is a real chance that potentially risky Cyber Assets will be overlooked or ignored. A systems approach that focuses on the functions and interaction of Cyber Assets and not the physical facility would better serve the reliability of the Bulk Electric System.

A Concept

This concept proposes that a systems approach to identifying and categorizing Cyber Assets thatmust be prot ected per the CIP standards can be used that does not rely upon initially determining the criticality of the physical asset where the Cyber Asset happens to reside. While not focusing on the physical asset as a discriminator, this concept recognizes the levels of risk

posed by individual Cyber Assets and recognizes the interconnection, interdependency, and commonality of Cyber Assets. This concept builds upon the NIST risk management framework by categorizing Cyber Assets as low, moderate, or high risk and applying security controls appropriate to the Cyber Asset and its categorization.

An Approach

This concept proposes an iterative approach to identifying and categorizing Cyber Assets that perform or support supervisory control and/or visibility of the Bulk Electric System. The approach starts out identifying the Cyber Assets and later applies the risk analysis to categorize the systems.

The first step is to identify the Responsible Entity's Cyber Assets that either perform a supervisory control function or provide operational visibility of the Bulk Electric System. This should result in a list of the SCADA/EMS systems (including operator consoles) in the control centers along with plant control systems, substation RTUs, and digital protective control devices;basically any thing that can open or close breakers, move generation, or present information necessary for the operational control of the Bulk Electric System.

The next step is to identify the adjacent connected Cyber Assets and determine which either provide a support function (such as database management) or provide data (such as an ICCP node) essential to the operation (reliability functions only) of the control system. In this scenario, a Cyber Asset that receives data from the control system (such as a Pi Historian) would not be identi fied as an essential system unless it also provided essential data to the control system.

The iterative process is continued until the rest of the Cyber Assets that are ultimately essential to the reliabilit y functions of the control system have been identified. In the iterative process, the Responsible Entity may find a Cyber Asset owned or operated by another Responsible Entity as essential. An example would be an ICCP node at a Balancing Authority providing SCADA data to the Reliability Coor dinator. In this example, the Reliability Coordinator SCADA/EMS relies upon the data provided by the Bala ncing Authority ICCP node to perform its own reliability functions. The Balancing Authority might not rely upon any data received by its own ICCP node and therefo re might not have identified the Cyber Asset as essential. The Balancing Authority would be obligated nonetheless to accept the declaration of essential system from the Reliability Coordinator and continue the iterative process, eventually working its way back to its own SCADA /EMS system.

Once all essential Cyber Assets have been identified through the iterative process, the Responsible Entity would complete the identification process by establishing the Electronic Security Perimeters and identifying any additional Cyber Assets within. The Responsible Entity would then c ategorize each Cyber Asset based upon its potential impact to the reliability of the Bulk Electric System shoul d it be lost or compromised. In the instance of example where the Reliability Coordinator identified a Cyber Asset belonging to the Balancing Authority as essential, the two par ties would need to coordinate the categorization of that Cyber Asset.

Assuming the NIST framework is used as the categorization model, each asset would be categorized as low, moderate, or high impact, depending upon its potential risk to the reliability of the Bulk Electric System. In an ideal world, all entities would have identified similar categorization criteria. In reality, it may be necessary to define or at least review and approve the categorization thresholds based upon NERC-wide or Regional criteria.

Protection Levels

Under the NIST framework concept, the Responsible Entity would apply a minimum set of cyber security controls to all Cyber Assets identified in the discovery process. The minimum control set would be tailored to the type of Cyber Asset. In other words, a firewall or other layer three communication device would have a different set of security controls, appropriate to its configuration and function, than a conventional server or workstation. Likewise, the security controls for a plant control system would necessarily be different from those applied to an RTU.

Moderate risk Cyber Assets would apply additional security controls on top of the minimum set applied to all systems. High risk Cyber Assets would apply yet more security controls in recognition of the potential risk.

Impact to the Responsible Entity

If the Responsible Entity's existing Critical Cyber Asset identification program was properly designed, the Responsible Entity should identify few if any additional High Risk Cyber Assets. Therefore, the sunk costs of protecting the Critical Cyber Assets would not be expected to be lost.

The implementation plan could be designed in such a manner to allow a phased implementation of the security controls for the newly identified essential systems taking into consideration the desire to protect the higher risk systems more quickly.

The minimum set of security controls that apply to all identified systems would be expected to be the normal good security practice controls appropriate for the Cyber Asset, such as patch and password management. Whether additional controls, such as personnel risk assessments, detailed training, and offline test systems are necessary is still to be determined.

Summary

In the end, this concept recognizes that system protection should take risk into consideration while approaching the subject from a systems perspective, not an engineering perspective. The concept helps ensure that all Cyber Assets with a potential risk to the Bulk Electric System are protected commensurate with the level of risk by identifying a uniform approach to Cyber Asset identification. It eliminates the confusion introduced by a lack of transmission system information, especially on the part of the merchant generators and protects the investment already made by the Responsible Entities.

Appendix #7 NIST/CIP Integration Overview- Bill Winters

NIST/CIP Integration Overview

Moving toward public/private adoption

William Winters
Arizona Public Service

Leverage work begun by NIST and MITRE

- **Significant effort has already been done to map CIP and NIST and provide the overlay groundwork**
  - **Applying NIST SP 800-53 to Industrial Control Systems** http://csrc.nist.gov/groups/SMA/fisma/ics/documents/papers/Apply-SP-800-53-ICS-final-22Aug06.pdf
  - **Addressing Industrial Control Systems in NIST Special Publication 800-53** **http://csrc.nist.gov/groups/SMA/fisma/ics/documents/papers/ICS-in-SP800-53_final_21Mar07.pdf**
- SDT team work with these organizations to further refine NIST 800-53 ICS related BES controls

Heavy Integration

- Replace CIP 002 with NERC versions of FIPS 200 and FIPS 199
  - FIPS 199 **Standards for Security Categorization of Federal Information and Information Systems**
  - FIPS 200 **Minimum Security Requirements for Federal Information and Information Systems**
- Replace CIP 003-009 with 800-53 and 800-53a
  - Modify 800-53 controls with ICS Utility BES operation elements
  - Modify 800-53A accordingly
- Common categorization process will provide risk assessment methodology that is consistent across industry.
- Establish low medium and high level controls that correspond to component impact on BES operation
  - Regardless of level of impact on BES, systems used in operation and control of BES will have minimum CIP cyber security standards

Moderate Integration

- Update CIP 002 to include a Categorization Standard (FIPS 199 analog)
- Update CIP 003-009 with 800-53 elements to address gaps identified in 706
- Example: MITRE_NIST_Example_Augmentation_CIP-005.pdf
  - Presented by Keith Stouffer at SDT Meeting 10/21

Light Integration

- Update CIP 003-009 requirements to align more explicitly with 800-53 controls
- Draw on 800-53 controls to fill in gaps identified in 706
- Use NIST documents as guidance references throughout CIP

Migrating towards heavy

- SDT Team Work with NIST (and MITRE?)
  - update and refine 800-53 (eg. 800-53-rev3) with ICS Utility BES operation focus
    - Use NIST/MITRE comparison overlay as starting point
  - Refine related guidance documents
  - Develop new guidance documents as necessary
- Start with light integration
  - Begin to develop direct linkage from CIP to NIST
    - Utilize NIST documents for guidance, particularly 800-53 controls that directly map to existing CIP standard
  - Break out in to CIP standard subgroups
    - Iterative process
    - NIST provide guidance on approach
  - Possibly implement categorization standard in CIP 002 at this stage
- Move to medium integration
  - Implement categorization standard in CIP 002
  - CIP standards previously mapped to 800-53 for guidance updated to specify 800-53 as standard
  - Continue to work with NIST in refining 800-53 and guidance documents
- Finish with full adoption of NIST standard 800-53
  - Industry collaboration refinement of 800-53 complete
  - Guidance documents complete
  - CIP 002 specifies requirement to use 800-53

DRAFT 01/29/09

INDEPENDENT ASSESSMENT OF FISMA AND RELATED NIST DOCUMENTS FOR ADOPTION FOR ELECTRIC SECTOR CRITICAL INFRASTRUCTURE PROTECTION.

William Winters, Arizona Public Service
*(Distributed before the Meeting)_*

What

First, I have to commend the NIST staff responsible for the development of the guidelines and standards documents that form the FISMA framework. This body of work provides an incredibly comprehensive background and framework for information security.

To a limited degree, the current version of CIP standards at least attempted to capture the essence of fundamental cyber security implementation and management however, as is evidenced by the creation of the SDT 706 team, the full extent of what is required was missed. In the years since the CIP standards were conceived, NIST expanded and refined the cyber security framework and standards documents required for FISMA. These documents embody the essence and the detail required for Information Security Management. In fact, the NIST FISMA documents go beyond a framework by providing the narrative background at a fundamental level necessary to develop a clear understanding of the framework, intent and method of implementation to non-cyber security professionals. A clarity that is largely lacking in the CIP standards.

To date the SDT 706 Phase II discussions have largely centered on NIST 800-53 and integration with the CIP standards. To a lesser degree, FIPS-199, NIST 800-53A and FISMA have been discussed.

I feel at this time expanding the discussion to FISMA and the full body of associated NIST standards and guidelines is warranted. Not simply should or how NIST 800-53 can be integrated but to what degree should or can CIP integrate or parallel FISMA.

After review of FISMA as documented and the supporting NIST documents, I count myself an advocate of integration and, to a significant degree, adoption of the FISMA/NIST approach to Information Security Management for electric sector CIP standard.

Why

The FISMA/NIST framework provides a consistent methodology to install a set of security protections appropriate to the criticality of an information system and the associated information.

It is well thought out, documented and based on the fundamentals of cyber security and SDLC. The guidelines provide the fundamental security background as well as the guidance for application.

It is a body of work that is easily accessible by all industries and sectors and all sizes of entities, service providers, vendors, auditors, etc. It is a requirement for federal agencies including those in the electric sector. As such, it represents a common framework. Ambiguity is minimized. Knowledge sharing is maximized.

The use of a common framework will provide the greatest opportunity for uniform application of cyber security controls to protect our Critical Infrastructure. Fundamentally, it provides a common basis for assessment, implementation and audit regardless of sector or service entity.

As much as the existing CIP standards may get most entities to the point of implementing appropriate cyber security controls, it will not have been done in a consistent manner with clear mutual understanding of the objectives.

Though the body of NIST documents is of significant volume, the effort required to understand and apply is in no way more difficult than the effort that has been expended to understand and apply the CIP standards. The most significant difference is that after the NIST process is assimilated, security controls may be implemented consistently, monitored consistently, changed consistently and, assessed consistently.

Protecting our cyber managed supply of electricity in a consistent manner across all entities is the best thing to do.

It's paid for.

How

Integration approaches can range from drawing on individual elements in the NIST documents to fill in the CIP gaps requirement by requirement to wholesale adoption of FISMA.

My recommendation is that we take an approach that establishes a strong parallel to FISMA, utilizing the NIST standards and guidelines as much as possible.

In it's most pervasive manifestation, this would entail a combination of adopting the FISMA/NIST documents directly and/or creating parallel documents/supplements tailored to the electric sector. This would likely result in an overhaul of the current CIP requirement layout and require transition education.

At a minimum, this would entail developing a set of controls (800-53), related assessment procedures (800-53A) and FIPS 200 Minimum Security Requirements equivalent specific to BES

entities, creation of FIPS 199 Security Categorization equivalent that integrates to CIP 002 and other CIP requirements to relevant NIST documents.

The degree to which the FISMA/NIST framework should be adopted will need to be discussed and debated.

A couple of fundamental questions:

- Does FERC feel that adoption of FISMA/NIST framework will meet all the concerns in Order 706?
- What were the concerns with adopting the FISMA/NIST framework as the basis for the existing CIP standards and do those concerns still exist?

W Winters 02/02/09

THOUGHTS FOR DISCUSSION OF CIP/NIST OPPORTUNITIES

(Handed out at the meeting)

- Develop set of controls for each area/entity which could be done regionally
- Entities can create control extensions. This is currently allowed in the NIST method
- Allow option for federal entities currently subject to FISMA and CIP to use FISMA/NIST to satisfy CIP
- Encourage use of FISMA/NIST today. Entities have the option today to use FISMA/NIST as a basis for meeting CIP requirements.

- Develop a process for application of FISMA/NIST (e.g. Develop as an overlay of CIP or Develop as standalone)

Controls Development Approach

- SDT sub-Team(s) could develop initial minimum controls (they could be entity tailored controls and/or "exception" based controls)
- Create clearinghouse for sharing of controls amongst entities as different organizations develop control extensions
- Develop controls using working group model at the regional level. This could be extended to development of educational framework and more effective open information sharing.
- Lifecycle management of controls for improvement/refinement and adoption
- Regional controls could feed to national and periodic update with regional, national and NIST representation.

- NIST and/or SDT team create initial draft of documents for "CIP" (e.g. appendices to existing or separate set of docs,)

- Build transition education program based on mapping of CIP to NIST.

- As body of controls are refined and standardized, auditors, developers of compliance programs (internal, consultant/vendor), developers of applications, support personnel, etc. have common reference and interpretation of the standards

Heavy alignment:

1. Expand/replace CIP 002 to require assessment of:

a) Systems used in control and monitoring of BES/BPS
b) Systems directly connected and/or exchange data with
c) Systems which transport data used in control and monitoring
d) ….

2. Develop equivalent FIPS 199, FIPS 200

3. Develop Risk Assessment process (800-37 equivalent/appendix) tailored to industry.

Integration light (in the beginning):

1. Develop set of controls (can use existing NIST controls as starting point) for each of the CIP requirements. Some of these exist within the CIP standards today but not consistently.

2. Systems that are determined in CIP 002 to be CCA are classified as high, as are all systems within the same ESP and form the ESP. Monitoring systems get medium?

3. Map CIP requirements to NIST docs as guidelines particularly for Risk Assessment

Appendix # 8

CIP-002-1 DISCUSSION DOCUMENT, 1-29-09

Jackie Collett, John Lim, Scott Rosenberger, and John Varnell

I. ORIGINAL INTENT OF THE CIP-002 VERSION 1 STANDARD

- **Starting Point**: A "reasonable" initial attempt to applying cyber security to the electric infrastructure.
  - Initial Baseline – starting from zero
- High Impact Focus: Reduces the scope of implementation to the transmission and generation assets which have the highest impact on the reliability and operability of the BES.
- Cyber Assets: directly linked to the BES elements *FAQ Q2*
- Cyber Asset Scope: limited to control centres, remote access and "jumping-off" points, which may not be evident in the standard *FAQ 2*
- What to Do: Not How to Do
- Non-prescriptive: Allows flexibility for a wide range of scenarios

- **Key Decisions**:
  - Create "trusted zones"
  - Exclude communications outside of "trusted zones": often external carriers and indeterminate paths

- **Assumptions**: Not explicit in the standard, but required for good security
  - **Redundancy**: Critical Asset / Cyber Asset redundancy does not eliminate the requirement for cyber protection. *FAQ Q5*
    - Need to protect common modes of failure.
    - Multiple attacks / compromises are possible electronically.
  - **"Systems approach"**: A systems approach to identifying Critical Assets / Critical Cyber Assets can and should be used. CIP-002 does not preclude a systems approach, but does not explicitly require it.
  - **"Consider**": Consider means include if at all applicable.
  - **"Essential to operation":** Critical Assets and Critical Cyber Assets should be identified and protected to ensure sustainable and reliable operation indefinitely. Loss or compromise of the Control Centre or other critical functions is not sustainable.
  - **Critical Assets**: Critical Assets may include sites, elements and systems.
  - **CCA Compromise**: In addition to the BES impact due to loss of the Critical Asset or Critical Cyber Asset, compromise of the Critical Cyber Asset must be included in the risk assessment (Integrity).

- FERC conditionally approved the Version 1 standards, and directed changes for a "final" version
  - The "gap" is what is currently under discussion

II. IMPORTANT ASPECTS OF CIP-002-1

1. **Relationship to BES**: There is a very clear relationship between the BES assets required for reliability and the cyber assets essential for their operation. The reliability and operations segments of the electric industry are structured upon BES assets. This includes processes, procedures, inventories and terminology.
2. **High Impact Focus**: CIP-002-1 focuses the efforts and resources for protection to the most important BES assets and associated cyber assets, recognizing that resources are not unlimited. Assets which do not affect the reliability and operability of the BES are not considered. As a result, the majority of the BES assets are not included for protection under the CIP standards.
3. **Industry Acceptance**: The electric industry has invested thousands of hours and millions of dollars to meet CIP-003-1 through CIP-009-1 based on CIP-002-1. The industry would not favour a significant or radical change to the asset identification method, and could reject it.

III. ISSUES IDENTIFIED WITH THE CURRENT CIP-002 + STANDARDS

A	PIECEMEAL APPROACH
Description	By identifying individual Critical Cyber Assets, security gaps exist when the CCAs operate in a system. (Eg. data integrity impact for a cyber asset outside of the ESP)
Comment	• The identification of Critical Cyber Assets does not preclude a systems approach, but does not explicitly require it. • A Critical Cyber Asset may be part of a system or network, including other cyber assets, which is currently addressed somewhat by the ESP. • The standards do not address interdependent functions across ESP boundaries, which may be essential to the Critical Cyber Asset and/or the BES.
Options	1. Need to include both Critical Cyber Assets and critical functions. 2. Need to include an impact assessment of the components required for the critical function. 3. Need to include consideration and protection for interfaces into the Critical Cyber Assets – may be at a different risk level. Protection may be required outside of the ESP.

B		**NOT PROTECTING ASSETS NEEDING PROTECTION**
	Description	Assets which may have an impact on the BES, either singly or in conjunction with other assets, are not being identified under CIP-002.
	Comment	• Compliance with the NERC cyber security standards is onerous. • There are large penalties for non-compliance. • Criticality based on BES system planning models (eg. PSSE) are not adequate. BES interconnectivity and interdependencies are very different from cyber connectivity and interdependencies. • Area requirements or impacts may not be available or considered in the identification of Critical Assets and Critical Cyber Assets (eg. generation units' impact on the reliability and operability of the BES in a geographical area). • Perception of "missing Critical Assets" creates a lack of confidence in the industry to self-manage.
	Options	1. Include some responsibility for the BA in determining Critical Assets based on area impact (area overview). 2. Single largest contingency must be included in the impact / Critical Asset identification. 3. The Identifying Critical Assets Guideline[1] provides detailed guidance for Critical Asset evaluation. 4. Targeting specific risks / impacts can help focus the protection requirements.
C		**GAMING**
	Description	Entities are striving to create minimal or null Critical Asset Lists to avoid the effort and expense of complying with the standards.
	Comment	• Some entities are taking a very literal interpretation of the standards, and some oppose guidance that is not explicitly included in the standards. • Asset identification by some entities has been perceived as "unreasonable" and generated criticism of the industry.

[1] The NERC Guideline "Identifying Critical Assets" is presently under development by the Critical Infrastructure Protection Committee Risk Assessment Working Group. The development of this guidance document was directed by FERC in its NOPR, and reconfirmed in FERC Order 706 p253.

	• All compliance avoidance (gaming) cannot be completely anticipated or eliminated. • Gaming will occur regardless of the methodology or framework applied. These issues can be addressed over time through the audit and compliance enforcement process. • "Zero tolerance" for non-compliance: sef-report a violation and possibly be fined (compliance culture vs. good security practice)
Options	1. Improve clarification of the intent of the standards and the requirements.
D	**ALL OR NOTHING**
Description	Assets or cyber assets are either critical and require protection, or not critical and do not require any protection.
Comment	• Conducted diligently, including the interdependencies of systems required for essential functions, the asset identification can provide an adequate level of security for the BES. • NERC's mandate is to protect the BES. This does not include distribution and the related assets. • There are no graduations or levels of assets, and no levels of protection for cyber assets.
Options	1. The fundamental tenet of the NERC reliability standards is to protect the reliable operation of the BES; therefore the focus of cyber protection, for both BES assets and cyber assets, should be on their impact to the reliable operation of the BES. 2. The Identifying Critical Assets Guideline[1] provides some criteria to help define impact to the BES. 3. There may be a need to define what systems beyond the current Critical Assets need protection. 4. Required protection of cyber assets may be related to some characteristics (contains an operating system / purpose-written software / no software). 5. Multiple levels of protection do exist in the standards: critical cyber asset vs. non-critical cyber asset in an ESP vs. cyber asset outside an ESP. May want to provide a different granularity. 6. Define the breadth and depth of protection.
5	**LOSS OF ASSET - INTEGRITY / MISUSE**

Description	Determining the criticality of BES assets tends to focus on a loss (outage) of the asset. Loss of data integrity or misuse of the cyber assets may not be considered.
Comment	– Loss of an asset is a traditional risk analysis approach which may be incomplete for cyber impacts. – Can be combined with other system or cyber events, increasing the impact – Need to include the analysis of intentional and unintentional misuse.
Options	1. Consider magnitude of impact of loss of data integrity / misuse: o Generation or Transmission Control Centre – possible impact. o Transmission Substation or Generation Assets – little or no impact depending upon the size or function of the facility. May be related to the single largest contingency. o ISO – possible impact. 2. Need to educate industry to consider intentional and unintentional misuse

Appendix # 9

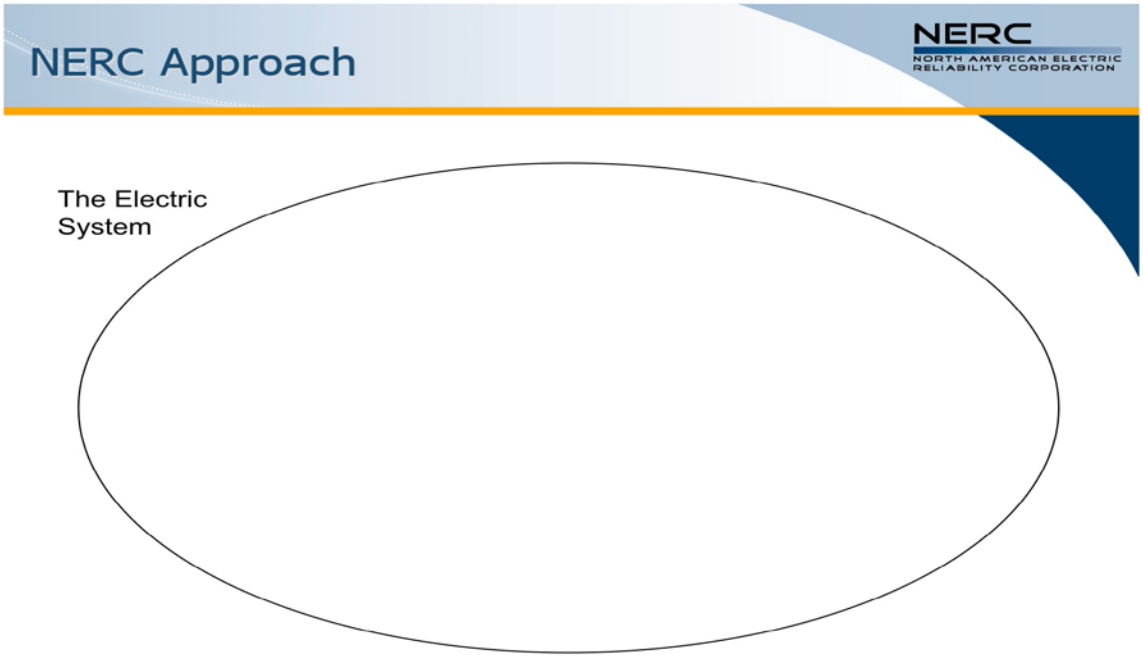
SCOTT MIX, STRAWMAN-FISMA ASSET SELECTION

Categorization of Assets

- FIPS-199:
  - Mission Focus:
    - "The security categories are based on the potential impact on an organization should certain events occur which jeopardize the information and information systems needed by the organization to accomplish its assigned mission, protect its assets, fulfill its legal responsibilities, maintain its day-to-day functions, and protect individuals." (emphasis added)
    - "Security categories are to be used in conjunction with vulnerability and threat information in assessing the risk to an organization."

Categorization of Assets

- FIPS-199:
  - Characterize in 3 categories:
    - Confidentiality
    - Integrity
    - Availability
  - Assign level to each category:
    - Low
    - Medium
    - High
  - High Water Mark
  - Customize controls (later)



NERC Approach

NERC Approach

- This would require changes:
  - CIP-002 to classify ALL transmission assets by impact category
  - CIP-003 to CIP-009 – requirement-by-requirement specificity for obligations at each impact category level
    - SP800-53 Catalog as an example

NERC Approach

- Separate set of standards for:
  - Control Centers
  - Transmission Facilities
  - Generation Facilities
- Each with 3 levels of requirements
  - Not every requirement would expand – but most would
  - Essentially expanding current requirement set by practically a factor of 9 just to maintain *status quo* with requirement scope

NERC Approach

- Would this meet all the mandated (ordered) changes from FERC Order 706???
  - Probably not by itself
  - Would require significant additional work on top of what was just described.

Draft Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

March 10, 2009 | 1–5 p.m. EDT
March 11, 2009 | 8 a.m.–5 PM EDT
March 12, 2009 | 8 a.m.–noon EDT
Orlando Utilities Commission- Pershing Facility
6003 & 6113 Pershing Avenue
Orlando, FL (407-423-9100)

Proposed 706 SDT Meeting Objectives and Outcomes:

- Receive updates on Phase I actions, TFE and VSL processes;
- Review Phase II guiding principles;
- Review, clarify, assess alignment with principles of two CIP 002 strawman proposals;
- Test integration of CIP 002 strawman proposals;
- Agree on 2009 meeting schedule, next steps in the SDT Work plan and assignments.

Tuesday March 10, 2009

1:00 p.m. **Welcome and Opening Remarks — Jeri Domingo-Brewer and Kevin Perry**

a. Roll Call
b. NERC Antitrust Compliance Guidelines
c. Review and adoption of February 18-19, 2009 Meeting Summary
d. Review of Team membership changes

1:15 **Review of Meeting Objectives, Agenda and Meeting Guidelines — Jeri Domingo and Bob Jones**

1:20 **Organizational Issues and Review of Phase 1 and early Phase II Schedule — Stuart Langton**

a. Update on Phase 1 Workplan, March 2009
b. Overview of Phase 2 Workplan — March–June 2009
c. Schedule for July–December 2009, Calendar Forms
d. Update on SDT Membership

1:40 **Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure Posting — Scott Mix**

1:50 **Update on VSL SAR for SDT and Implications for SDT 706 — David Taylor**

2:00 **Review of Phase 1 Timeline — David Taylor**

2:10	**Overview of SDT Phase II Development Process Steps and CIP 002 Review — Stu Langton**
2:20	**CIP 002 Strawman #A — Concept Proposal Presentation Overview — Bill Winters and Kevin Perry — Q & A and Discussion**
3:20	**Break**
3:35	**CIP 002 Strawman #B — Concept Proposal Presentation Overview — Jackie Collett and John Lim — Q & A and Discussion**
4:35	**Complete and Pick up Calendar Forms and Summary of Day One Outcomes and Review of Day Two Agenda**
5:00	**Recess**

Wednesday March 11, 2009

8:00	**Welcome, Agenda Review and Roll Call**
8:15	**CIP-002 Strawman #B Review of Positives/Negatives; Gauge Alignment with Guiding Principles and Acceptability Testing — Jackie Collett and John Lim**
10:15	**Break**
10:30	**CIP-002 Strawman #A Review of Positives and Negatives; Gauge Alignment with Guiding Principles and Acceptability Testing — Bill Winters and Kevin Perry**
12:30	**Working Lunch**
1:15	**Exploration of Potential Integration of Positive Elements of CIP 002 Strawman #A and #B**
3:00	**Break**
3:15	**Building a Phase II Strawman Concept and Guidance Document — Continued**
4:45	**Review of Work-plan and Meeting Schedule through 2009**
5:00	**Adjourn**

Thursday March 12, 2009

8:00	**Welcome, Agenda Review and Roll Call**
8:10	**Review and Refinement of a Strawman Phase II Concept Document — Continued**
10:00	**Break**
10:15	**Refine Strawman Phase II Concept Document**
11:15	**Initial Discussion of SDT Organizational models for Phase II**
11:45	**Review of April SDT agenda and objectives**
11:50	**Meeting Evaluation — What Worked, What Could be Improved**
12:00	**Adjourn**

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CYBER SECURITY ORDER 706 SDT JANUARY–DECEMBER DRAFT PROJECT SCHEDULE *(REVISED MARCH 2009)*

Short Term 2009 Schedule Draft Criteria

- Follow the ANSI standard development process but use creative ways to efficiently secure input from the industry on emerging concepts and approaches to the CIP standards.
- Seek creative ways to get advice and input to the SDT from experts in cyber security.
- Seek creative ways to get focused input from industry stakeholders.
- Take advantage of input opportunities from related NERC committees that will be meeting in the first half of 2009 (e.g. working with the NERC Members Representative Committee, CIPC, BOT, and industry committees such as the Electricity Sector Coordinating Council, etc.)
- Seek, as soon as possible but no later than late Spring, 2009, to establish a consensus on the way forward for the SDT in its efforts to revise the CIP standards.
- Track any follow up to the "Securing Cyberspace for the 44th Presidency" report of the Commission on Cyber security for the 44th President.

SDT Draft Schedule — January–December 2009

Overview

- 12 SDT Face-to-Face Meetings
- Multiple SDT subgroup and subcommittees WebEx Meetings
- 1 Cyber Expert/Stakeholder Workshop (August, 2009)
- Industry Comments on CIP 002 SDT White Paper (June–July, 2009)
- 2 NERC Members Representative Committee, (May and August, 2009)

SDT Draft Schedule — January–June, 2009

1. **January 7–9, 2009 SDT Meeting, Phoenix, AZ ½, 1, ½ day format. Wednesday–Friday**
   - Review of Technical Feasibility Exceptions white paper
   - Review of Industry Comments on Phase 1 products- Establish and convene small groups to draft responses
   - Review of Phase 2 White papers

   January 15 — WebEx meeting(s)
   - Small group draft responses to industry.

January 21 — WebEx meeting(s)
- Small group draft responses to industry.

2. **February 2–4, 2009 SDT Meeting Phoenix, AZ,** ½, 1, ½ day format. Monday–Wednesday
   - Update on NERC Technical Feasibility Exceptions process
   - Review of VSL process and SDT role
   - Review of Phase 2 White papers, strawman and principles
   - Review and Adoption of SDT Responses to Industry Comments on Phase I and Phase I Product Revisions.

3. **February 18–19, 2009 SDT Meeting, Fairfax, VA**
   - Update on Phase I process
   - Update on NERC TFE process
   - Update on VSL Team process
   - Review, discussion and refinement of Phase II/CIP 002 White papers, strawman and principles

4. **March 10–11, 2009 SDT Meeting Orlando, FL,** ½ , 1, 1 day format
   - Update on NERC TFE process
   - Update on VSL Team process
   - Review and Refinement of Phase II CIP 002 Strawman Proposals

March 2–April 1 — 30-day Pre Ballot
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment

April, 2009 NERC Balloting on Phase 1 Products

March 18 — WebEx meeting(s)
- As needed

March 25— WebEx meeting(s)
- As needed

5. **April 14–16, 2009 SDT Meeting, Charlotte NC, ½, 1/½ day format. Wednesday–Friday**
   - Update on NERC TFE process
   - Update on VSL Team process
   - Review, Refinement and Adoption of Phase II Strawman Proposal

April, 2009 Phase I Ballot Results

May 4, 2009, Member Representative Committee Meeting, Arlington, VA, SDT progress report.

6. **May 13-14, SDT Meeting, Boulder NV, 2-day format**
   - Review and respond to Phase I Ballot Results.
   - Review MRC presentation and any input to SDT on Phase II Concept
   - Further SDT refinement of the Strawman Phase II White Paper
   - Adopt a Phase II White Paper for Industry Comment
   - Review potential SDT subcommittee structure for Phase II

   Industry Comment Period on SDT Phase II White Paper- 45 days (June 1-July 15, 2009)

7. **June 17–18, 2009 SDT Meeting, Manitoba, 2-day format**
   - As necessary, review and respond to Phase I Ballot Results.
   - Organize SDT in subcommittees to draft revisions to CIP and/or to address key issue areas.
   - Agree on and Charge subcommittees and conduct organizational meetings
   - Subcommittees meet to begin drafting revisions to CIP and/or addressing assigned issues.
   - Subcommittee Plenary reports to SDT.

   June, 2009 — WebEx meeting
   - SDT Subcommittee meetings.

8. **July, 2009 Date, Location, and Time — TBD**
   - Convene workshop of cyber experts to review Phase II-CIP 002 Strawman White Paper.
   - Continue review and refinement of Strawman White Paper.
   - Adopt Strawman White Paper as refined for MRC Comment and Input.

9. **August, 2009, Date, Washington D.C., Time — TBD**
   - SDT Expert/Stakeholder Workshop, Washington D.C.
   - SDT Plenary Session(s) review of workshop input on key issues and review and revision, as needed of sub committees' charges.
   - SDT Phase II Subcommittee meetings and reports back.
   - August 2009, NERC Member Representative Committee, Presentation of the Phase 2 CIP 002 Approach for MRC input. Winnipeg, Manitoba

10. **September, 2009 Date, Location, and Time — TBD**
    - SDT Plenary Session(s)
    - SDT Subcommittee meetings.

    September WebEx meeting
    - SDT Subcommittee meetings.

11. October, 2009 Date, Location, and Time — TBD

- SDT Plenary Session(s)
- SDT Subcommittee meetings.

October WebEx meeting

- SDT Subcommittee meetings.

November WebEx meeting

- SDT Subcommittee meetings.

12. December, 2009 Date, Location, and Time — TBD

- SDT Plenary Session(s)
- SDT Subcommittee meetings.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Draft Meeting Summary

Cyber Security Order 706 SDT — Project 2008-06

April 14, 2009 | 1–5 p.m. EST
April 15, 2009 | 8 a.m.–5 p.m. EST
April 16, 2009 | 8 a.m.–noon EST
Charlotte, North Carolina

Meeting Summary Contents

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

EXECUTIVE SUMMARY

Joe Bucciero conducted a roll call of members and participants, the Chair reviewed the meeting objectives and the facilitator, reviewed with the team and participants the proposed meeting agenda.

Mr. Bucciero reviewed with the team the need to comply with NERC's Antitrust Guidelines. The team reviewed and unanimously adopted on March 12 the SDT February 18–19, 2009 meeting summary. Stuart Langton, SDT facilitator, reviewed the current work plan and meeting schedule for both Phase 1 and Phase 2 development. At the conclusion of the meeting the SDT agreed on a schedule of meetings from July–December, 2009. The team reviewed and unanimously adopted on April 16 the SDT March 10–12, 2009 meeting summary.

Scott Mix, NERC staff, provided an update on the TFE process. He indicated that he is aware that EEI has indicated it will be filing comments. Once the comments are in, NERC's legal staff and leaders will address the comments. He believes the comments will be addressed and the document will be sent to the NERC board for approval in the summer of 2009. After NERC board approval, the modification to the NERC Rules of Procedure for the TFE will be sent to FERC for approval and filed with the appropriate Canadian governmental authorities.

Dave Taylor, NERC staff, provided an update on VSL/VSR process. FERC issued a recent order on two standards. FERC said in their order that it was not sure about the use of a 'roll-up' approach to VSLs. FERC asked that NEC provide further explanation of the approach. The VSLs proposed for CIP-002 through CIP-009 have included some of these roll-up VSLs embedded in them. He noted that the there may to be a future reassessment if FERC doesn't allow for this approach.

During a pre-session on Tuesday morning, a team, lead by Kevin Perry, prepared responses to the comments received in the ballot of CIP Version II. The SDT reviewed each of the draft responses, suggested changes and reached consensus on all of the responses by Thursday morning. Some of the major issues contained in the comments were:

- Comments concerning the constrictive nature of the Technical Feasibility Exception Process;
- Designation of the Senior Manager as overly prescriptive;
- Objections to the inclusion of "continuous" monitoring in CIP-006 for physical security;
- Several commented and expressed concerns on the reduction from 90 days to 30 days for changes to be made in the standards.

The group reviewed Kevin Perry's initial draft, refined and finalized the team responses to the comments made after the posting of CIP Version II to the industry. The team unanimously adopted the Response Document (16-0) as revised on Thursday morning and asked Kevin Perry with assistance from Joe Bucciero to finalize the document for submission to NERC and to initiate the recirculation ballot.

The team discussed the publicity and media stories last week regarding the vulnerability of the electric grid raising concern with the hyperbole (characterizing as “Pearl Harbor”, “Hiroshima”, “9/11”) and lack of evidence for many of the claims. A letter from Representative Markey, House Homeland Security to FERC and draft legislation filed by Senators Rockefeller and Snow were noted.

Michael Assante, NERC’s Chief Security Officer, provided the team with a briefing on NERC’s response to the media coverage of the last week beginning with the Wall Street Journal article. He noted that NERC has sought to strike the right tone in a complex area of policy and practice. NERC worked behind the scenes with press, congress, FERC and industry associations and issued a press statement noting that the industry is committed to working hard on cyber security and the SDT effort to develop new standards is a leading example of this effort. While acknowledging the reality of continuing vulnerability, NERC challenged the notion that there was evidence of any cyber security compromises that have adversely affected reliability. He noted NERC is working with industry associations. He suggested SDT has a role to play and that it shouldn’t be seeking to defend the industry. NERC will be trying to get the message out as to the progress to date and the SDT role in addressing cyber security and reliability.

Gerry Freese made a proposal made to put together a comprehensive presentation that might be given to Congressional staffers to get out the message that the industry is taking cyber security seriously and has made great efforts. In addition the message would explain some of the inaccuracies contained in the recent publicity concerning vulnerabilities of the electric grid. Facilitators suggested that the briefing for congress might be created in conjunction with the update. In general team members supported a message responding to the recent publicity. The Chair suggested the SDT form a “Key Messages Task Group” and solicited members who would want to participate: Gerry Freese agreed to lead the effort, and John Stanford, Jerry Domingo Brewer, Jay Cribb, Dave Norton, Phil Huff, Rich Kinas and Jim Breton all agreed to participate.

Mr. Langton, SDT facilitator, reviewed the significant progress the team has made together since October 2008. He then set the stage by saying that the point of the Phase II Concept paper presentation is to assure SDT member understanding of the concept and invite ideas for strengthening and clarifying aspects of the concept.

John Lim introduced the white paper noting contributions from Jackie Collett, Bill Winters, Phil Huff and assistance from Scott Mix in refining the white paper since the March SDT meeting in Orlando. He noted the group met two times by phone and WebEx, and convened a SDT WebEx meeting and met this morning. They agreed that they needed additional input and contributions from other SDT members in developing the concept paper. He also noted that the group will need to define terms used in the document. One change in the approach is to move away from a “risk assessment” to an “impact based assessment.” He offered the following overview of the concept:

- Identification and categorization of BES Assets.

- Identification of the cyber systems that support functions or BES assets.
- The idea is to combine the two categorizations to supply the categorization for the asset.
- All applicable cyber assets (EMS, substation, relay, etc.) will need to be identified with a categorization level.
- Total impact on the BES system will need to be determined using the table.
- The categorization will then be utilized for the requirements that follow.

Following a review and discussion of each section of the paper the facilitator asked if any of the SDT members had any fundamental difficulty with the approach and then polled the SDT members as to whether all were comfortable at the conceptual level with the current white paper approach. All members agreed to go forward indicated that they liked the direction the white paper was taking. All acknowledged that they would continue to test this as the details were developed.

On day two, John Lim and Phil Huff agreed to draft some general draft consensus points from the white paper that could be presented by the Chair to the NERC Members Representative Committee on May 4, 2009. They were joined by Jackie Collett, Scott Rosenberg, John Varnell and Rich Kinas. The SDT reviewed and refine these on Thursday morning resulting the following 11 points which received a 3.8 of 4 rank in terms of their acceptability. The chair agreed to base her presentation on the points:

A. The Standards should require a BES impact assessment as an initial approach to categorizing BES Cyber Systems.
B. The impact categorization of Cyber Systems will be based on reliability functions of the BES to achieve Adequate Levels of Reliability.
C. The Standard's BES Impact Assessment will consider a categorization process.
D. The Standards will require oversight of the categorized list of BES assets by entity types which have a more complete wide-area view of the BES.
E. The Standards will categorize Cyber Systems supporting, either directly or indirectly, the reliability functions of the BES and apply security requirements (or controls) that are commensurate and appropriate to their impact on the BES.
F. The final Cyber System categorization will reflect the impact to the BES based on a loss of availability, integrity, or confidentiality of the Cyber System.
G. The Standards will provide Organizations with reasonable flexibility in applying equivalent security controls on the basis of compensating controls and environmental considerations.
H. The Standards will address the complex nature of BES functions and interconnected Cyber Systems, both within and between multiple organizations.
I. The Standards will state explicit criteria for the BES Impact Assessment.
J. The Standards will state explicit criteria for the Cyber Impact Assessment (including use and mis-use of cyber systems).

K. The Standards will include a methodology to merge the BES Impact Assessment and Cyber Impact Assessment into a final Cyber System categorization.

The Chair also agreed to put these points in a narrative format for a letter to Mike Assante as part of the SDT's input to NERC as it develops its input to FERC in response to Rep. Markey's letter.

Bob Jones, SDT facilitator presented the concept of CIP-002- requirements and measures being the work undertaken for the rest of 2009 with the goal of posting for industry comments on a complete CIP-002 standard and go to ballot on it. This might include taking a requirement from CIP-003 through CIP-009 to illustrate how CIP-002 would related to the later development of CIP-003 through CIP-009. The SDT would then develop the entire CIP-003 through CIP-009 package and post for comments and balloting as a complete package. The schedule proposes that the SDT will be into 2012 when a full version of CIP version III is posted for comments.

The Chair reminded people to register for the Boulder City meeting and that the September meeting would take place in Folsom, California near Sacramento and not in Denver:

The CIP-002 sub team will continue working on the parts of the white paper that need development. Categorization of the BES assets still needs refinement and help. The sub team asks for assistance from outside the group. Scott Mix will take the lead to see if additional expertise can be provided to the sub team.

The team offered an evaluation regarding what was accomplished, what helped and what might help for the future.

The Chairman concluded the meeting concluded by thanking the host (Duke Energy) and is looking forward to hosting the meeting in Boulder City. The SDT adjourned at 11:45 a.m. on April 16.

I. Introductions, Agenda Review and Review of SDT Workplan

The Chair, Jeri Domingo-Brewer, welcomed the members. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call for each day *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed with the team and participants the proposed meeting agenda *(See appendix #1*).

Mr. Bucciero reviewed with the team the need to comply with NERC's Antitrust Guidelines *(See, Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion. The team reviewed and unanimously adopted on April 16th the SDT March 10–12, 2009 meeting summary.

Stuart Langton, SDT facilitator, reviewed the current work plan and meeting schedule for both Phase 1 and Phase 2 development. (*See Appendix #4)* The Chair noted that the meeting location in September would be changed from Denver to Sacramento or Folsom, California. The facilitators noted that the team may want to adjust the work plan so that it is clear that when the Phase II White Paper is ready for release, it will be done so by informally posting on the NERC Web site, inviting industry reactions without triggering the need for a formal ANSI step. This will enable the team to focus in on the development of CIP-002 for potential posting by the end of the calendar year.

Mr. Langton noted that by the conclusion of the meeting, the SDT needed to have the responses to the industry comments completed and sent to NERC for posting and to begin the recirculation ballot and to have made progress on the Phase II white paper and approach.

II. Technical Feasibility Exception Update and SDT Discussion

Scott Mix, NERC staff, provided an update on the TFE process. He indicated that he is aware that EEI has indicated it will be filing comments. Once the comments are in, NERC's legal staff and leaders will address the comments. He believes the comments will be addressed and the document will be sent to the NERC board for approval in the summer of 2009. After NERC board approval, the modification to the NERC Rules of Procedure for the TFE will be sent to FERC for approval and filed with the appropriate Canadian governmental authorities. The modification to the NERC Rules of Procedure becomes effective after regulatory approvals. Scott noted that NERC staff will not be provided individual responses to each comment. See, http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html

III. VSL and VSR Committee Update

Dave Taylor, NERC staff, provided an update on VSL/VSR process. FERC issued a recent order on two standards. FERC said in their order that it was not sure about the use of a 'roll-up' approach to VSLs. FERC asked that NERC provide further explanation of the approach. The VSLs proposed for CIP-002 through CIP-009 have included some of these roll-up VSLs

embedded in them. He noted that the there may to be a future reassessment if FERC doesn't allow for this approach.

Mr. Taylor noted that VRF (violation risk factors) must be assigned to each requirement and any sub requirement. The team that was working on these assigned the VSL's at the requirement level, rather than at each sub requirement level. Therefore, the VSL's for the CIP standards that have been created may have to be un-wound and applied at the sub requirement level. See http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html

IV. Phase I Response Document Review

During a pre-session on Tuesday morning, a team, lead by Kevin Perry, prepared responses to the comments received in the ballot of CIP Version II. The SDT reviewed each of the draft responses, suggested changes and reached consensus on all of the responses by Thursday morning. Some of the major issues contained in the comments were:

- Comments concerning the constrictive nature of the Technical Feasibility Exception Process;
- Designation of the Senior Manager as overly prescriptive;
- Objections to the inclusion of "continuous" monitoring in CIP-006 for physical security; and
- Several commented and expressed concerns on the reduction from 90 days to 30 days for changes to be made in the standards.

The group reviewed Kevin Perry's initial draft, refined and finalized the team responses to the comments made after the posting of CIP Version II to the industry. The team unanimously adopted the Response Document (16-0) as revised on Thursday morning and asked Kevin Perry with assistance from Joe Bucciero to finalize the document for submission to NERC and to initiate the recirculation ballot. For the final response document see: http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security.html

V. Review of Media and Congressional Treatment of Cyber Security Issues

The team discussed the publicity and media stories last week regarding the vulnerability of the electric grid raising concern with the hyperbole (characterizing as "Pearl Harbor", "Hiroshima", and "9/11") and lack of evidence for many of the claims. A letter from Representative Markey, House Homeland Security to FERC and draft legislation filed by Senators Rockefeller and Snow were noted.

A. NERC's Response

Michael Assante, NERC's Chief Security Officer, provided the team with a briefing on NERC's response to the media coverage of the last week beginning with the Wall Street Journal article. He noted that NERC has sought to strike the right tone in a complex area of policy and practice. NERC worked behind the scenes with press, congress, FERC and industry associations and issued a press statement noting that the industry is committed to working hard on cyber security and the SDT effort to develop new standards is a leading

example of this effort. While acknowledging the reality of continuing vulnerability, NERC challenged the notion that there was evidence of any cyber security compromises that have adversely affected reliability. He noted NERC is working with industry associations.

He suggested the SDT has a role to play and that it shouldn't be seeking to defend the industry. NERC will be trying to get the message out as to the progress to date and the SDT role in addressing cyber security and reliability.

Member Comments:

- Someone needs to set the media straight on the facts.
- Why not securing the whole infrastructure. What about water, etc.
- External communication plan for SDT not for the industry.
- Need to distinguish between securing and complying?
- Better standard does not imply better security. It is not the be-all-end-all.
- NIST as a dismal failure in federal systems?
- As a vendor, 85% of the approach that electric industry clients want to know: how do I get around this?
- If you look at other industries, their public relations efforts are far more effective. Our industry is doing good things and making a valuable contribution but the industry woefully poor in blowing it own horn.
- Standards with a compliance focus give leverage for IT/cyber managers to get things done right. Tool and level for security. Tell our story.
- Need some communication. CIP standards 1 part of puzzle. NERC alerts and Mike Assante. Not necessarily spokesman for cyber security.
- Need to show we are making progress. Need to get on board on Phase III. Need to establish consensus.
- NERC has been relatively quiet. It appears that NERC gets the industry to do things because they are forced to. The standards should be directed towards getting people on the right path to a secure grid.
- If we and industry don't come forward with reforms, Congress will tell us exactly how to do it and we will not like it.
- Impact Assessment= just the consequences. Technical impact- cyber impact- (level of access and results of exploit) BPS impact- impact of effect of denied or compromised
- Concerned that we seemed focused on external threats and system level compromises. Cyber threats much larger. This may reinforce fear and alarmism related to threats to BPS.
- Insider threats, physical threats. E.g. the NIST family of controls- 17 control areas and none have to do with this type of threat.
- What the venue would be to expand the scope- other aspects of security that don't fit cleanly into matrix?
- How to categorize- e.g. technical impact- other forms of attack that may not be categorized. More inclusive in terms of other forms.

- We would do well in our analysis to first assume the worst case scenario- will that result in BPS impact on that cyber assets. Open breakers, etc. What is the worst that can happen?
- If this is for rapid assessment it will be ok. If this is for the longer term it could confuse the industry.
- Breakthrough- work from planning for the worst possible thing- bad or stupid guy from the inside, bad from outside. Later do a care and feeding. Figure out what problem we are solving. Care and feeding and prevention- handled in 03-009. 002 scope, what do I need to do, how much and where.
- NIST standards- like the simplicity. Little more than wording.
- Matrix doesn't take into account the compromise of one leading to stepping up to others and affect the whole system.
- BPS impact side- operating security event level.
- Make sure the likelihood of the impact is reality based. What are components of BES we need to spell out. What are things we have seen that are likely to happen we should focus on. Flushing out BPS impact.
- General sentiment- useful but content may not be appropriate for what we are trying to do.

B. Representative Markey's letter to FERC

On April 9, 2009 Rep. Edward J. Markey (D-Mass.), Chairman of the House Energy and Commerce Committee Subcommittee on Energy and the Environment, sent a letter to FERC regarding the escalating cyber breaches threatening to compromise the electricity grid. NERC is preparing a set of responses to FERC for their consideration in responding to Representative Markey. Mike Assante welcomed the SDT suggestions for NERC's input to FERC.

Member Comments

- Who loaded their gun on this?
- NERC hopes FERC sets the context. The standards piece is just a part of a greater whole in terms of responding to Congress. Minimum standards- uniformly across system because you are interconnected.
- Standards were to provide a "comprehensive…"
- Care taken in addressing the 3rd bullet. "implementing"
- Compliance enforcement piece; spot checks and audits are beginning-
- CERP started audits last fall on the 13 requirements. Midwest ISO.

C. SDT Communication Efforts Going Forward — A "Key Messages Task Group"

Gerry Freese made a proposal made to put together a comprehensive presentation that might be given to Congressional staffers to get out the message that the industry is taking cyber security seriously and has made great efforts. In addition the message would explain some of the inaccuracies contained in the recent publicity concerning vulnerabilities of the electric grid. Facilitators suggested that the briefing for congress might be created in conjunction

with the update. In general team members supported a message responding to the recent publicity.

Member Comments

- Take advantage of some industry presentation opportunities upcoming and coordinate the message: e.g. Jon Stanford is participating on a RSA Panel? Mike Assante on a RSA panel.
- Don't think about the industry as a monolith. Break it up. Deal with different pieces. 3200 organization in NA half with no SCADA system at all.
- Analysis — 160 systems with a profile of interest to terrorists. Spending time and money on security that doesn't work.
- Cannot stop professional hackers — we put up "honey pots" to trip them up. Operational military networked hacked. Gene Spafford testified before Rockefeller until improve quality we will have problems. Until we get the stuff built into the products, its going to be
- We should be getting congressional staffers together organized, structured, where we are, where we have been. Briefing. If materials prepared, Mike Assante offered to gather staffers. Timing is critical, should happen within 1-2 months.
- In terms of the discussion in DC, there is willingness to hear this message. We should strike while the iron is hot.
- Toiling in anonymity — the public and congress only getting 1 side of the picture.
- We should use all approaches (briefings, conference presentations, press coverage) as vehicles. Premier security event. Opportunity.
- Do we need have professionals help us in shaping the message? We can use some our best industry corporate communications. Concern about "misshaping the message." We should guard against not too much outside influence.
- Staff briefings can help dialogue and discussion.

The Chair suggested the SDT form a "Key Messages Task Group" and solicited members who would want to participate: Gerry Freese agreed to lead the effort, and John Stanford, Jerry Domingo Brewer, Jay Cribb, Dave Norton, Phil Huff, Rich Kinas and Jim Breton all agreed to participate.

VI. SDT Phase II CIP 002 White Paper Review and Refinements

Mr. Langton, SDT facilitator, reviewed the significant progress the team has made together since October 2008 including completing Phase I and agreeing conceptually on a thoughtful mix of CIP and NIST approaches to Phase II. He noted that additional SDT members will need to assist and contribute to the development of the Phase II White Paper. He then set the stage by saying that the point of the Phase II Concept paper presentation is to assure SDT member understanding of the concept and invite ideas for strengthening and clarifying aspects of the concept.

A. Phase II White Paper Review

John Lim introduced the white paper noting contributions from Jackie Collett, Bill Winters, Phil Huff and assistance from Scott Mix in refining the white paper since the March SDT meeting in Orlando. He noted the group met two times by phone and WebEx, convened a SDT WebEx meeting and met this morning. They agreed that they needed additional input and contributions from other SDT members in developing the concept paper. He also noted that the group will need to define terms used in the document. One change in the approach is to move away from a "risk assessment" to an "impact based assessment." He offered the following overview of the concept:

- Identification and categorization of BES Assets.
- Identification of the cyber systems that support functions or BES assets.
- The idea is to combine the two categorizations to supply the categorization for the asset.
- All applicable cyber assets (EMS, substation, relay, etc.) will need to be identified with a categorization level.
- Total impact on the BES system will need to be determined using the table.
- The categorization will then be utilized for the requirements that follow.

R1 — Identification of BES Assets

Member comments

- How will this be done?
- The SDT goal should be to create a set of criteria that are specific enough to characterize BES assets.
- Did David Taylor/NERC have a concept paper on this point? Scott Mix noted a paper was prepared but upon review was not sufficiently on point.
- There were several questions for the small group that was putting this paper together. Several in the group had questions around the role of the planning assessments in determining categorization of BES assets.
- The group answered that planning engineers will need to be involved, but those details had not all been worked out. The group asked for volunteers from SDT members who have planning engineering background.
- Need Power system engineers and transmission planners to assist in this part of the concept. Perhaps people like John Sykes who briefed the SDT in Phoenix?
- Jason Marshall, Midwest ISO volunteered to assist in this effort

R2 — Critical Asset Identification Method
R3 — Critical Asset Identification
R4 — Cyber Asset Identification
R5 — Categorization of Cyber Assets

Member comments

- There was much discussion about the use of RTO's and/or RC's for oversight of the categorization.

- The group also questioned the oversight process and whether that would be done by the RC function or by the regions of NERC. A team member explained that RC's, RTO's, etc. may not want to oversee the process and categorization due to liability concerns.

R6 — Annual Approval

Member comments

- What about third party oversight? Third party oversight is provided for in the whitepaper as was specified in FERC Order 706.

Member final comments on the Concept

- Need to acknowledge that the way the SDT is working is different.
- We need to address all sections of the white paper and stay at a fairly high level.
- We know we have agreement. Address shortcomings of the current system.
- Cover all the BES assets not just the critical — categorize all.
- Cover all relevant cyber systems related to BES assets.
- The focus on reliability of functions.
- 5 major points list. Short paragraph on each to enable Jerry fields questions. Enough
- Does this build on principles and on industry investments?
- Flexibility is important

The facilitator asked if any of the SDT members had any fundamental difficulty with the approach and then polled the SDT members as to whether all were comfortable at the conceptual level with the current white paper approach. All members agreed to go forward indicated that liked the direction the white paper was taking. All acknowledged that they would continue to test this as the details were developed.

B. Phase II Consensus Points — Preparing for the Member Representative Committee Presentation

On day two, John Lim and Phil Huff agreed to draft some general draft consensus points from the white paper that could be presented by the Chair to the NERC Members Representative Committee on May 4, 2009. They were jointed by Jackie Collett, Scott Rosenberg, John Varnell and Rich Kinas. The SDT agreed to review and refine these on Thursday morning.

Below is the initial draft and strikethrough/underlined following the SDT discussion.

1. **The Standards should require a BES impact assessment as an initial approach to categorizing BES Cyber Systems. ~~The Standards will require a BES impact assessment as opposed to risk based assessment.~~**

   Member Comments

   - Drafters intended this as a "soft ball."

- Didn't have the criteria to do a risk based assessment.
- "As an approach to Risk based assessment."?
- Standards "will"? The proposed version "will seek to"?
- Concerned about the removal of risk based in #1
- Agree. the standards will incorporate ~~be primarily~~ ~~based solely on~~ a BES impact assessment. Include a BES impact assessment in lieu of a risk based assessment.
- If keep in, consider "instead of a primarily risk based assessment"
- CIA- risk management is also an accepted lexicon.
- Members agreed with changes reflected above.

2. **The impact categorization of Cyber Systems will be based on reliability functions of the BES to achieve Adequate Levels of Reliability.**

   Member Comments
   - None, ok

3. **The Standard's BES Impact Assessment will ~~include categorizing~~ consider a categorization process ~~all BES assets~~**

   Member Comments
   - If you categorize "all", will still come up with equivalences
   - Uncomfortable with "all" Haven't defined at what level we are going to categorize. "More" vs. "all"? Delete "all"
   - Categorize now as critical and non critical. Flag each asset or classes
   - "categorize all BES assets"?
   - "More categories"
   - Will each have some security requirements associated with it?
   - Will consider including more categories than we have today.
   - "risk" or "impact" categories. Impact level categories than previous versions of CIP
   - Will include a categorization process.
   - Members agreed with changes reflected above.

4. **The Standards will require oversight of the categorized list of BES assets by entity types which have a more complete wide-area view of the BES.**

   Member Comments
   - None, ok

5. **The Standards will categorize ~~and apply security requirements (or controls) to all~~ Cyber Systems supporting, either directly or indirectly, the reliability functions of the BES and apply security requirements (or controls) that are commensurate and**

appropriate to their potential impact on the BES. ~~**The standards will require Entities to apply security controls to Cyber Systems commensurate and appropriate to their potential impact on the BES.**~~

Member Comments

- "All"?
- Categorize requirements "to those systems."?
- Members agreed with changes reflected above.

6. **The final Cyber System categorization will reflect the impact to the BES based on a** ~~**security incident i.e.**~~ **loss of availability** ~~**confidentiality,**~~ **integrity,** ~~**and/or**~~ **confidentiality** ~~**availability**~~ **of the Cyber System.**

   Member Comments

   - Shows how we are going to do the categorization.
   - "Loss of confidentiality"?
   - Standard lexicon — remove reference to "incident" CIA standards order
   - Switch confidentiality to last and availability to first?
   - Data confidentiality is a concern.
   - Cyber system — impact of cyber assets if compromised. Doing a translation from power engineering and cyber engineering side of the house. Need to be understood by the multiple disciplines.
   - Military is focused on confidentiality and that was the primary driver of the early models.
   - If take off table, we are presupposing it is not important.
   - "As appropriate?
   - Data and system integrity? Common understanding? Normal understanding includes.
   - The order doesn't matter.
   - Data applied to system only? No. we have background check requirements.
   - Members agreed with changes reflected above.

7. **The Standards will provide Organizations with reasonable flexibility** ~~**should have reasonable flexibility**~~ **in applying equivalent security controls on the basis of compensating controls and environmental considerations.**

   Member Comments

   - Members agreed with changes reflected above.

8. **The Standards will address the complex nature of BES functions and interconnected Cyber Systems, both within and between multiple organizations.**

   Member Comments

- Members agreed with changes reflected above.

9. **The Standards will state explicit criteria for the BES Impact Assessment.**

   Member Comments
   - Missing criteria for the cyber impact assessment? Add an additional point.
   - Use and misuse of cyber assets
   - This is concept not detailed idea.

10. **The Standards will state explicit criteria for the Cyber Impact Assessment (including use and misuse of cyber systems).**

    Member Comments
    - Members agreed with adding the new point reflected above.

11. **The Standards will include a methodology to merge the BES Impact Assessment and Cyber Impact Assessment into a final Cyber System categorization.**

    Member suggestions for the MRC presentation
    - Use the flow chart to present
    - Use diagrams where possible to illustrate the concept.
    - Keep in mind that MRC mostly senior mgrs VP- markets,
    - A participant on the phone suggested the SDT consider the following language as part of the consensus point, "Seek to have more understandable, streamlined with fewer cross references, clearer set of standards." The chair noted these consensus points were to present to the MRC the sense of the SDT on how they agreed to go forward for Phase II standards development. She noted the language suggested may or may not reflect the sense of the SDT at this point. The facilitator suggested that the comment would be included in the meeting summary.

Acceptability Ranking Scale	4 = acceptable, I agree	3 = acceptable, I agree with minor reservations	2 = not acceptable unless major reservations addressed	1 = not acceptable	Avg.
Consensus Points	**10 (5/5)**	**2**	**0**	**0**	**3.8 of 4**

The Chair will base her MRC presentation on these consensus points. She will also put these points in a narrative format for a letter to Mike Assante as part of the SDT's input to NERC as it develops its input to FERC in response to Rep. Markey's letter.

VII. Workplan, White Paper, Meeting Evaluation and Next Steps

A. 2009 SDT Workplan Approach

Bob Jones, SDT facilitator presented the concept of CIP-002- requirements and measures being the work undertaken for the rest of 2009 with the goal of posting for industry comments on a complete CIP-002 standard and go to ballot on it. This might include taking a requirement from CIP-003 through CIP-009 to illustrate how CIP-002 would relate to the later development of CIP-003 through CIP-009. Scott Mix noted that it would be important to get CIP-002 to industry ahead of consideration of the catalogue of controls. The SDT would then develop the entire CIP-003 through CIP-009 package and post for comments and balloting as a complete package. The schedule proposes that the SDT will be into 2012 when a full version of CIP version III is posted for comments.

Phil Huff noted that Bill Winters suggested NIST has done a lot of work on guidelines. The SDT may want to dedicate a future meeting to get input and cooperation from those experts familiar with implementing NIST. John Varnell reminded team members that Keith Stoffer, John Stanford and Jeri Brewer were on the team to bring that perspective.

B. Workplan Schedule

The Chair reminded people to register for the Boulder City meeting and that the September meeting would take place in Folsom, California near Sacramento and not in Denver.

Proposed Dates and Locations for Future Meetings 2009

Dates in 2009	Location
April 14–16	Charlotte
May 13–14	Boulder City, NV
June 17–18	Portland
July 13–14	Toronto
August 20–21	Chicago
September 9–10	Folsom, California
October 20–22	New Orleans
November 17–18	Atlanta
December 15–17	Tampa (FRCC)

C. CIP 002 White Paper Development.

CIP 002 White paper development: The sub team will continue working on the parts of the white paper that need development. Categorization of the BES assets still needs refinement and help. The sub team asks for assistance from outside the group. Scott Mix will take the lead to see if additional expertise can be provided to the sub team.

D. Meeting Evaluation — What worked and what could be improved?

Wireless connectivity has turned out to be an expectation of the group. On the final day of the Charlotte meeting, connectivity was intermittent for some members.

What did the SDT accomplish?

- Got through recommendations and responses to industry comments to enable the recirculation ballot.
- Identified the need for communication within and beyond the industry.
- Made a big step forward in consensus on the principles to be included in the white paper.

What things helped us to accomplish these?

- Strawman documents are very helpful — e.g. Kevin's response document.
- Getting facilitators to the meeting.
- Having a quorum.
- Having the WebEx stay up.
- Continued open engagement and attention of all SDT members.
- Silence is golden consent rule worked well.

What suggestions are there for the future?

- Periodically spend about 30 minutes brainstorming future concepts/ideas that may become topics for future white papers.

The Chairman thanked the host (Duke Energy) and is looking forward to hosting the SDT meeting in Boulder City. The SDT adjourned at 11:45 a.m. on April 16.

Appendix # 1 — Meeting Agenda

April 14, 2009 | 1–7 p.m. EST
April 15, 2009 | 8 a.m.–7 p.m. EST
April 16, 2009 | 8 a.m.–noon EST
Duke Office — Conference room number 2313
400 South Tryon St
Charlotte, NC

Proposed Meeting Objectives and Outcomes

- Receive updates on TFE and VSL processes
- Receive a briefing on the NERC Critical Assets Industry Survey
- Review and Draft Responses to Phase I Industry Comments
- Review and Refine Phase II Framework White Paper
- Agree on assignments and next steps in the SDT Work plan.

Tuesday, April 14, 2009

1. Phase II White Paper Team Drafting Session
2. Welcome and Opening Remarks — Jeri Domingo-Brewer and Kevin Perry
    a. Roll Call
    b. NERC Antitrust Compliance Guidelines
    c. Review and adoption of March 10-12, 2009 Meeting Summary
3. Review of Meeting Objectives, Agenda and Meeting Guidelines — Jeri Domingo and Bob Jones
4. Organizational Issues and Review of Phase 1 and early Phase II Schedule — Stuart Langton
    - Review of April-December 2009 SDT Schedule
5. Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure Posting — Scott Mix
6. Update on VSL/VSR for Version 1 and 2 CIP-002-009 — David Taylor
7. Overview of SDT Phase II Development Process Steps and CIP 002 Review — Stu Langton
8. Critical Assets Industry Survey — Mike Assante
9. CIP-002 White Paper Presentation — Bill Winters and Jackie Collett
10. Q & A and Discussion and Initial Consensus Testing
11. Break
12. Phase I Small Group Proposal for Response Drafting
13. Small Groups Draft Responses to Industry Comments
14. Break — If Needed, Small Groups may continue working until 7:00 p.m.
15. Recess

Wednesday, April 15, 2009

1. Welcome, Agenda Review and Roll Call

2. Phase I Small Group — Draft Responses to Industry Comments
3. Break
4. Phase I Small Group — Draft Responses to Industry Comments
5. Working Lunch
6. Small Group Reports and SDT Review and Consensus Testing of Draft Responses
7. Break
8. Small Group Reports and SDT Review and Consensus Testing of Draft Responses
9. Break — If Needed, Full or Small Groups may continue working until 7:00 p.m.
10. Recess

Thursday, April 16, 2009

1. Welcome, Agenda Review, and Roll Call
2. CIP-002 White Paper Consensus Testing
3. Break
4. CIP-002 White Paper Consensus Testing
5. Review of May SDT Agenda and Objectives
6. Meeting Evaluation — What Worked, What Could be Improved?
7. Adjourn

Appendix #2 — Attendees List for March 10–12, 2009 Meeting in Orlando, Florida

Attending in Person — SDT Members

1. Rob Antonishen	Ontario Power Generation *(Tuesday and Wednesday)*
2 Jeri Domingo-Brewer, Chair	**U.S. Bureau of Reclamation**
3. Jay S. Cribb	Information Security Analyst, Southern Company Services, Inc.
4. Sharon Edwards	Duke Energy
5. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp.
6. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
7. John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
8. Frank Kim	Ontario Hydro
9. David Norton	Policy Consultant, CIPEnergy Corporation *(Tues & Wed.)*
10. **Kevin B. Perry, Vice Chair**	Director, IT-Infrastructure, Southwest Power Pool
11.Keith Stouffer	National Institute of Standards & Technology
12. John D. Varnell	Technology Director, Tenaska Power Services Co.
1. Roger Lampilla	*NERC*
2. David Taylor	*NERC (Tuesday)*
3. Scott R. Mix	*NERC*
4. Tom Hoffstetter	*NERC (Formerly Midwest ISO, Inc)*
4. Joe Bucciero	*NERC/Bucciero Assoc.*
6. Robert Jones	*FSU/FCRC Consensus Center (Wed. & Thursday)*
7. Stuart Langton	*FSU/FCRC Consensus Center*
Hal Beardall	*FSU/FCRC Consensus Center*

SDT Members Attending via WebEx and Phone

13. Jackie Collett	Manitoba Hydro
14. Joe Doetzl	
15. Phillip Huff	Arkansas Electric Coop Corporation
16. Richard Kinas	Orlando Utilities Commission
17. Scott Rosenberger	Luminant Energy
18. Kevin Sherlin	Sacramento Municipal Utility District
19. Jonathan Stanford	Bonneville Power Administration

SDT Members Unable to Attend

1. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co.
2. Christopher A. Peters	ICF International
3. David S. Revill	Georgia Transmission Corporation
4.William Winters	Arizona Public Service, Inc.

Others Attending in Person

Jim Breton	ERCOT
Travis Jafray	Subnet Solutions
Jason Marshall	Midwest ISO
Darren Highfill	ENERNEX
Sam Morrell	CERT

Others Attending via WebEx and Phone

Chris Wright	
James Bassett	Lafayette
David Huff	FERC
Bob Tallman	E.ON
Chris Wright	Burns & Mac
Raghu Rayalu	SCE (Wed.)

Appendix # 3
NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely

impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix #4
January–December Draft Project Schedule (Revised April 2009)

OVERVIEW

- **13 SDT Face-to-Face Meetings**
- **Multiple SDT subgroup and subcommittees WebEx Meetings**
- **One Cyber Expert and Stakeholder Workshop (**Summer/Fall 2009 — Tentative)
- **Industry Comments on CIP-002 SDT White Paper** (June–July 2009)
- **2 NERC Members Representative Committee Meetings,** (May & August 2009)

SDT Draft Schedule — January-December 2009

1. **January 7–9 Meeting in Phoenix, AZ** (half, full, half day format Wednesday–Friday)
   - Review of Technical Feasibility Exceptions white paper
   - Review of Industry Comments on Phase 1 products — Establish and convene small groups to draft responses
   - Review of Phase 2 White papers

January 15 WebEx meeting(s)
- Small group draft responses to industry.

January 21 WebEx meeting(s)
- Small group draft responses to industry.

2. **February 2–4 Meeting in Phoenix, AZ** (half, full, half day format Monday–Wednesday)
   - Update on NERC Technical Feasibility Exceptions process
   - Review of VSL process and SDT role
   - Review of Phase 2 White papers, strawman and principles
   - Review and Adoption of SDT Responses to Industry Comments on Phase I and Phase I Product Revisions.

3. **February 18–19 Meeting in Fairfax, VA**
   - Update on Phase I process
   - Update on NERC TFE process
   - Update on VSL Team process
   - Review, discussion and refinement of Phase II and CIP-002 White papers, strawman and principles

4. **March 10–11 Meeting in Orlando, FL** (half, full, full day format)
   - Update on NERC TFE process
   - Update on VSL Team process
   - Review and Refinement of Phase II CIP 002 Strawman Proposals

March 2–April 1 — 30-day Pre Ballot
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment
March 30 — WebEx meeting(s) White Paper Drafting Team
April 1–10 — NERC Balloting on Phase 1 Products
April 6 — WebEx meeting — White Paper Drafting Team
April 8 — WebEx meeting(s) — White Paper Preview — Full SDT Conference Call
April 11 — Phase I Ballot Results and Industry Comments

5. **April 14–16 Meeting in Charlotte NC** (half, full, half day format Wednesday–Friday)
   - Update on NERC TFE process
   - Update on VSL Team process
   - Update on the NERC Critical Assets Survey
   - Review in SDT small groups and respond to Phase I Ballot Results and Industry Comments
   - Review and Refinement of Phase II Whitepaper and Progress Report to MRC

May 4 — Member Representative Committee Meeting in Arlington, VA — SDT progress report.

6. **May 13–14 Meeting in Boulder City NV** (2-day format Wednesday–Thursday)
   - Review MRC presentation and any input to SDT on Phase II white paper
   - Further SDT refinement of the strawman Phase II White Paper in plenary and small groups.

7. **June 17–18 Meeting in Portland OR** (2-day format)
   - Further SDT refinement and adoption of the Draft Phase II White Paper for industry comment.
   - Review potential SDT subcommittee structure and work plan for implementation of Phase II.

~~**Industry Comment Period on SDT Phase II White Paper- 45 days** (June 20-August 5, 2009)~~

8. **July 13–14 Meeting in Toronto, ON**
   - Agree on and charge subcommittees and conduct organizational meetings
   - SDT Subcommittees meet to organize and begin drafting revisions to CIP and/or addressing assigned issues.
   - Subcommittee organizational reports to SDT

July–August WebEx meeting(s)
- SDT Subcommittee meetings to review applicable industry input on white paper

9. August 20–21 Meeting in Chicago, IL

- SDT Plenary and Subcommittee meetings to review and respond to industry input on white paper.

August 2009 — NERC Member Representative Committee, Presentation of the Phase 2 White Paper and Summary of Industry Comment and Response for MRC input, Winnipeg, Manitoba

10. September 9–10 Meeting in Denver, CO

- SDT Plenary review industry and MRC input on White paper and consider and agree on refinements
- SDT Subcommittee drafting meetings
- SDT Plenary Session(s)- briefings and subcommittee reports
- Review Workplan through Summer, 2010, as needed

September WebEx meeting

- SDT Subcommittee drafting meetings

11. October 20–22 Meeting in New Orleans, LA

- SDT Subcommittee drafting meetings
- SDT Plenary Session(s)- briefings and subcommittee reports
- Adopt Workplan through Summer, 2010, as needed

October WebEx meeting

- SDT Subcommittee drafting meetings

12. November 17–18 Meeting in Atlanta, GA

- SDT Subcommittee drafting meetings
- SDT Plenary Session(s)- briefings and subcommittee reports

November WebEx meeting

- SDT Subcommittee drafting meetings

13. December 15–17 Meeting in Tampa, FL

- SDT Plenary Session(s)
- SDT Subcommittee drafting meetings

December WebEx meeting

- SDT Subcommittee meetings

April 9, 2009

The Honorable Jon Wellinghoff
Chairman
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Dear Chairman Wellinghoff:

I have long been concerned about threats to our energy infrastructure, from terrorist attacks on LNG facilities to assaults on nuclear power plants from the air or the ground. Recent reports raise concerns about a more modern threat: cyber attack to our nation's electricity generation and transmission infrastructure. This matter warrants serious attention and I ask your assistance as we investigate the nature of the threat and what can be done to repel it.

As you know, the North American Electric Reliability Corporation, which is mandated to ensure the reliability of the nation's electricity supply, recently completed a survey of industry stakeholders to determine compliance with the Critical Cyber Asset Identification Standard. The results of this survey raise two issues of serious concern. First, the survey makes clear that industry has not fully adhered to this Standard, which is only concerned with identifying – not defending – facilities and equipment critical to the reliability of the electrical supply. This lack of adherence by industry to the Standard is disturbing because it indicates the vulnerability of the nation's electrical grid to cyber attack. If we have not yet even identified which assets need to be defended from cyber attack, how can we possibly defend them?

The second, and more disturbing, concern arises from recent news reports that the computer-based infrastructures of the grid have been repeatedly and systematically compromised through the Internet by foreign nations and groups. All Americans are troubled to learn that foreign nations and potentially hostile groups are apparently preparing a detailed "map" of the grid and its vulnerabilities, possibly to be used to facilitate some sort of attack in the future.

In light of these reports on growing threats to our electrical grid, I request additional information on what steps the Federal Energy Regulatory Commission (FERC) is taking to respond to these threats in the near term and prevent such breaches in the future.

In January of 2008, FERC approved eight mandatory critical infrastructure protection (CIP) standards, as developed by the North American Electric Reliability Corporation, to protect the nation's grid from cyber security attacks and other reliability breaches. The mandatory reliability standards required certain users, owners and operators of the bulk power system to

PRINTED ON RECYCLED PAPER

establish policies, plans and procedures to safeguard physical and electronic access to control systems, to train personnel on security matters, to report security incidents, and to be prepared to recover from a cyber incident. These standards were to provide a "comprehensive set of requirements to protect the Bulk-Power System from malicious cyber attacks."

Please answer the following questions regarding FERC's actions in response to these threats and what additional measures may need to be taken by the industry, the Commission, and by Congress.

- What is the Commission's view of the results of the North American Electric Reliability Corporation survey? What percentage of Critical Cyber Assets have been identified? What is the significance of the information backbone of the electric grid being compromised? What immediate steps is the industry taking to stop these breaches?
- If foreign nations or hostile groups already have gathered detailed information to develop a "map" of the electricity grid, what actions can be taken now to prevent this information from being used to attack the grid?
- Have the CIP standards been fully implemented by industry? If not, why not?
- Are the current CIP standards sufficient to prevent cyber-security attacks and to respond to breaches? If not, what additional standards are needed?
- Has FERC developed metrics to measure the efficacy of the CIP standards? If so, what are these metrics? If not, why not?
- What processes are on-going at NERC to identify the need for new cyber-security standards?
- Is too much discretion given to industry participants in creating the cyber-security standards, since two-thirds of the group's members must support a standard before it is adopted or modified?
- What authorities does FERC possess to prevent and respond to cyber-security threats and breaches? Does FERC need additional authorities to protect the electricity grid from these threats?

Thank you for the attention to these matters. If you have any questions regarding this request, please contact Will Huntington of my staff at 202-225-2836.

Sincerely,

Edward J. Markey

Categorizing Cyber Systems

An Approach Based on BES Reliability Functions

NERC Cyber Security Standards Drafting Team for Order 706
4/14/2009

CATEGORIZING CYBER SYSTEMS: AN APPROACH BASED ON IMPACT ON BES RELIABILITY FUNCTIONS

EXECUTIVE SUMMARY

Intentionally left blank – to be redacted last

INTRODUCTION

The North American Electric Reliability Corporation (NERC) Reliability Standards are a set of standards aimed at preserving and enhancing the reliability of the Bulk Electric System (BES). The objective of the CIP series of these standards is to protect the critical infrastructure elements necessary for the **reliability and operability** of this system. One must not forget the overarching mission of preserving and enhancing the reliability of this system, which consists of assets engineered to perform functions to achieve this objective. The CIP Cyber Security Standards define cyber security requirements to protect cyber systems used in support of these functions and the reliability and operability of these assets.

CIP-002 – Cyber Security – Critical Cyber Asset Identification requires "the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of a risk-based assessment." In reviewing the current CIP-002 version, the drafting team considered FERC's comments in its Order 706 approving the Cyber Security Standards and common perceptions and observations from various other commenters. In particular, the Standard Drafting Team considered these characteristics of the current CIP-002 approach which needed to be addressed beyond a first revision standard:

- A piecemeal approach
- Not protecting assets needing protection
- Allows "gaming" in the application of the requirements
- Uses an all or nothing approach
- Concentrates on loss of an asset and requires more explicit consideration of loss of integrity or misuse

This paper describes an approach based on the concepts of NERC's definition of Adequate Level of Reliability (ALR) and the characteristics of the BES described therein that will achieve this ALR, namely:

1. The System is controlled to stay within acceptable limits during normal conditions;
2. The System performs acceptably after credible Contingencies;
3. The System limits the impact and scope of instability and Cascading Outages when they occur;
4. The System's Facilities are protected from unacceptable damage by operating them within Facility Ratings;
5. The System's integrity can be restored promptly if it is lost; and
6. The System has the ability to supply the aggregate electric power and energy requirements of the electricity consumers at all times, taking into account scheduled and reasonably expected unscheduled outages of system components

In particular, the approach relies on the identification of functions which are essential to achieving these characteristics and the BES assets which support these functions. These BES assets may be defined as facilities, equipment or systems performing functions to ensure that the BES achieves an Adequate Level of Reliability.

The methodology proposes to identify all cyber systems essential to the reliable operation of these BES assets: one must note that a cyber system can itself be a BES asset if it directly performs one or more of the identified functions.

Once BES assets and their cyber systems are identified, the methodology proposes a two pronged categorization which results, on one side, in a categorization of BES assets based on their impact on the reliability and operability of the BES, and on the other, a categorization of their associated cyber systems and their elements based on their impact on the BES assets they support. A rigorous merger of the two categorizations for any given cyber system results in a deterministically derived categorization of each cyber system based on its impact on the BES.

One must note that the scope of the CIP Cyber Security standards as defined during the SAR drafting team discussions exclude the elements associated with the market functions UNLESS they also affect the reliable operation of the BES. In addition, these standards explicitly exclude facilities, equipment and systems regulated by US and Canadian nuclear regulatory bodies, since they are regulated outside of NERC. Note that there may be facilities, equipment or systems which may be in a nuclear facility associated with the BES which are outside of the regulatory realm of these nuclear regulatory organizations, and would therefore be regulated under these NERC CIP standards. It is also worth noting is that the CIP Cyber Security Standards do not include those assets associated with BES Planning activities UNLESS they also have a direct effect on the reliable operation of the BES. There will however be cases where these types of BES Planning and market function systems may be required to be protected under the CIP standards if they meet the protection requirements of the Cyber Security Standards (e.g. if they are within an Electronic Security Perimeter which is subject to the standards).

The concepts associated with an impact based approach to determining the criticality of certain facilities, equipment and systems are particularly well covered in the Draft Volume 1 of NERC's Security Guideline for the Electric Sector: Identifying Critical Assets. The development of this guidance document was in direct response to a directive by FERC in Order 706. An additional important concept in this approach is the inclusion of assets based on their functions in the operation of the BES. The group is currently engaged in Part 2 of the series, which addresses the identification of Critical Cyber systems.

The concepts and approach in this paper draw on elements of approaches already defined in several presentations by members of the Cyber Security Standards Drafting Team for Order 706 (CSSDTO706) to the drafting team. The approach on the identification and classification of BES assets also draws heavily on the work done by the NERC Risk

Assessment Working Group on the Draft Security Guideline for the Electric Sector: Identifying Critical Assets and current work being done by this group in the Identification of Critical Cyber Assets. The presentations by CSSDTO706 members to the group include the application of a FIPS199-like approach to classifying Cyber systems, NIST integration, a cyber systems based approach and discussions on Guiding Principles used for development, as well as comments and discussions by other members of the drafting team.

The overall approach includes the consideration of NERC's mission, the essential functions necessary in achieving this mission, an impact based methodology to categorize its BES assets and the associated cyber systems engaged in the process, and finally the deterministic derivation of an overall impact based categorization of the cyber elements, with the anticipated application of cyber security requirements commensurate with that categorization. This is in keeping with general approaches to risk management practices, which focus first on identifying key processes necessary for meeting high level objectives, then drilling down into supporting processes.

BES RELIABILITY FUNCTIONS

A pre-requisite to the start of the identification of BES assets which affect the reliability and the operability of the BES is the identification of functions which support the characteristics of ALR.

These include, at a minimum, support for:

1. Generation for the BES
2. Transmission for the BES
3. Voltage and voltage stability in the BES
4. Frequency and frequency stability in the BES
5. Protection of BES generation and transmission equipment from damage
6. Control and operation of BES assets
7. Wide-area situational awareness for real-time BES reliability and operability
8. Restoration of the BES

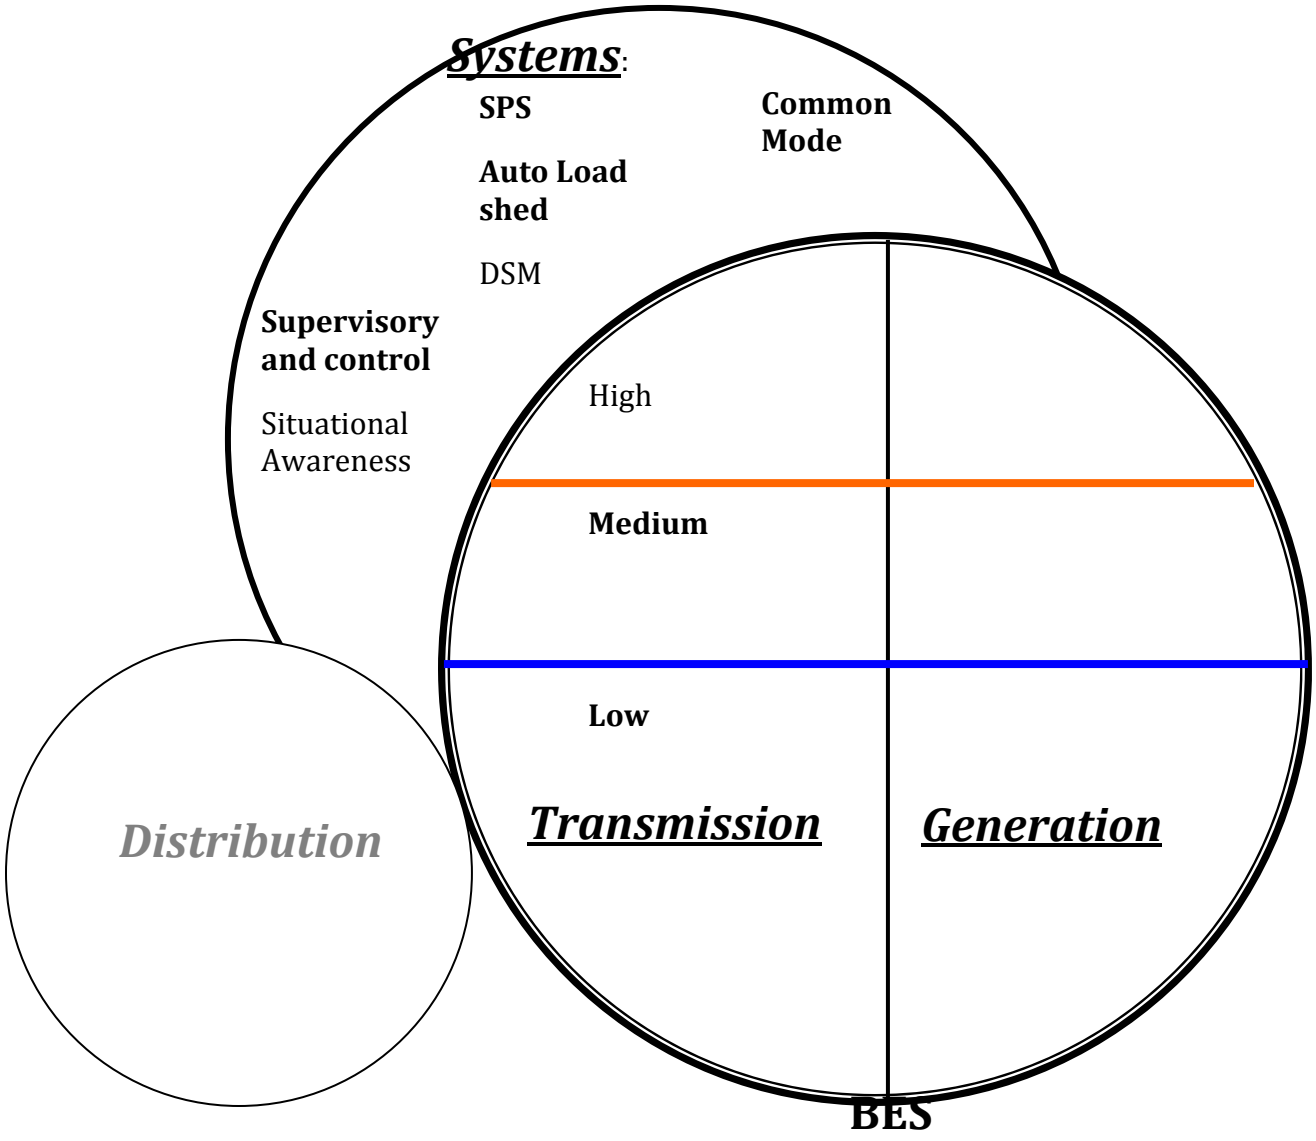
IDENTIFICATION OF BES ASSETS

The functions above are then used to identify all BES assets which support them. The inclusive list of these identified BES assets constitute the overall scope for application of criteria for their categorization based on their impact on the reliability and operability of the BES as defined by the characteristics of an ALR. In addition to facilities and equipment, the included BES assets must include systems which perform the following, at a minimum:

– Situational awareness

- Supervisory and control capability
- Special Protection Systems
- Systems essential to BES restoration
- Systems performing automatic load shedding
- Other systems that may perform a function directly related to the reliability or operability of the BES.

Bulk Power Assets



CATEGORIZATION OF BES ASSETS

(I would propose that we review the criteria defined in the Critical Asset Identification Guideline in the Transmission, Generation, Control Center and Special Systems sections (tables) be used as a minimum set for defining High Impact BES assets. I do not know how practical it is to ask a separate group, as discussed in the last SDT session, to come up with the categorization standards, unless substantial other work which can be translated into a categorization standard has already been done in this area. The guideline uses operating limits as credible criteria for determining criticality: I think the operating folks will be hard pressed further classifying this. Let's see what Dave Taylor provides at the next session. In the absence of adequate prior work, I am strongly tempted to propose using a 2 tier approach (i.e. a 2x3 matrix), High and Low for assets, and H,M,L for Cyber Systems. Anyway, whatever categorization scheme for assets goes here depending on what is determined).

Try for support from operations and planning committees to help define criteria for assigning assets to impact levels of high, medium, low, and none or others.

THIRD PARTY OVERSIGHT OF BES ASSETS AND THEIR CATEGORIZATION

An additional concept introduced in the approach is the inclusion of oversight of the critical asset list by entity types which have a more complete wide-area view of the BES. The approach uses a hierarchical approach to the oversight structure.

- Entities performing the functions of Balancing Authority, Interchange Authority, Transmission Service Provider, Transmission Owner, Transmission Operator, Transmission Operator, Generator Owner, Generator Operator, and/or Load Serving Entity submit their list of Critical Assets to their Reliability Coordinator for review.
- Each Reliability Coordinator submits its list of Critical Assets to its Regional Entity for review.
- Each Regional Entity submits its list of Critical Assets to NERC for review.
- NERC has its list of Critical Assets reviewed by the Regional Entities.

Based on their wider-area view, reviewers may add, but not remove, Critical Assets from lists and will provide justification for the addition of assets. In cases of disputes, there will be an arbitration process adjudicated by the next higher entity type.

The compliance responsibility of the identification and categorization of BES assets and their review and approval ultimately rests with the Responsible Entity owning and operating the assets.

IDENTIFICATION OF CYBER SYSTEMS

Two new terms have been introduced in this approach. The terms Cyber System and Cyber Component are defined in the glossary section of this paper. Cyber System is intended to replace the term Cyber Asset and more accurately represents the intended use of the term. Cyber Components are those discrete elements which make up the Cyber System (e.g. processors, disks, network interfaces, data). In particular, there have been some questions of whether requirements apply individually to the elements or the Cyber System as a whole. The use of these terms will hopefully clarify the intent of the application of these requirements.

Once the list(s) of BES assets have been defined, and all the essential functions performed by the BES Assets have been identified, the Responsible Entity uses this list to define those Cyber Systems which will support:

- The operation and control of these BES assets

  Examples of these are HMI systems in Generating Stations and Transmission Substations, Generating Plant DCS systems, RTUs and PLCs with control and operation functions for BES elements, EMS systems providing control and operate functions for operators *(review examples from CA Guideline)*

- The monitoring and alerting functions for the reliability and operability of these BES assets

  Examples of these are RTUs providing remote metering functions, Dynamic Feeder Rating systems *(review examples from CA Guideline)*

- The data acquisition equipment and systems which support wide-area situation awareness for automated or operator assisted real-time reliable operation of these BES assets

  Examples include Phasor Measurement Units when used in State Estimators for real-time operator assisted actions/alerts. *(review examples from CA Guideline)*

Any BES and non-BES cyber system which directly exchanges data with these cyber systems and elements will be identified for assessment. The judicious design and definition of electronic security perimeters and the application of access controls to these perimeters should be considered by entities to avoid the over-inclusion of cyber systems which do not affect the reliability or operability of the BES. Connectivity considerations will be discussed further in a separate section of this document.

CATEGORIZATION OF CYBER SYSTEMS

The proposed criteria for the classification of these cyber systems are based on the criticality of the function they provide on the BES asset: for each cyber system, an assessment is made on the effect of loss or compromise of the system on the availability, integrity and/or confidentiality of the BES asset it supports. The classification proposed is a 3-tier classification into High, Medium and Low.

(Should we insert here a matrix with A, I, C and H,M,L which would determine how to end up with the categorization of the cyber system based on this assessment? The meaning of what H, M, L in each of the 3 legs of Infosec should also be included. This would be intended to provide some rigor in categorization rather than simply leaving the criteria for the assessment to the entity). Consider the "high-water mark" approach from NIST to determine the impact characteristic of each element. See the FIPS 199 as a reference.

All cyber systems which meet the criteria defined in the Identification of Cyber Systems section above must be within a defined ESP. If there is no communication from inside the ESP to the outside, there is no access point to the ESP.

Cyber systems which perform the functions defined in the Identification of Cyber Systems section above on a set of more than one BES assets will be evaluated based on the impact of the common mode failure or compromise and may be classified a High, Medium or Low impact.

It should be noted that cyber systems which have a common mode impact on a set of BES assets and meet threshold criteria for affecting the reliability and operability of the BES should have been classified as BES assets, and these cyber systems will be assessed based on the common mode impact.

Systems classified as Critical Cyber Assets in versions 1 and 2 of CIP-002 (excepting those non-critical cyber assets that are in the same ESP) would be classified as high impact cyber systems.

Discussion of Cyber System Interconnections Impacts --– Phil

The proposed criterion for the classification of BES Cyber Systems is based on the impact to the function they provide or BES Asset they support: for each Cyber System, an organization determines the impact to the BES of the Cyber System's loss of confidentiality, integrity and availability. Categories of impact are defined as follows:

The potential impact is **High** if the loss of confidentiality, integrity, or availability directly causes or contributes to BES instability, separation, or a cascading sequence of failures, or places the BES at an unacceptable risk of instability, separation, or cascading failures.

The potential impact is **Medium** if the loss of confidentiality, integrity, or availability directly affects the electrical state or the capability of the BES, or the ability to effectively

monitor and control the Bulk-Power System, but is unlikely to lead to BES instability, separation, or cascading failures.

The potential impact is **Low** if the loss of confidentiality, integrity, or availability would not be expected to affect the electrical state or capability of the BES or the ability to effectively monitor and control the BES.

To perform the impact assessment, the organization would assign BES function types and/or BES Assets to each applicable Cyber System. Then for each function type and/or asset, the organization would determine the ~~BES~~ impact on the BES asset/s or function/s based on the loss of confidentiality, integrity, or availability within the Cyber System.

This methodology recognizes that a single Cyber System may support multiple BES function types and/or BES assets as shown in Figure 1. For example, a SCADA system may provide control functionality to a generator with minimal impact on the BES. However, the same SCADA system also provides control for substations on a high impact transmission line. So the organization would assign the final security categorization as *High* for the SCADA system.

This categorization approach makes two important advancements to ensuring a more complete and accurate assessment of Cyber System impact to the BES. First of all, the impact analysis requires a consideration of all BES functions and assets that the Cyber System provides or supports. Secondly, the final categorization ties directly to the security requirements of the Cyber System. As a result, the later security control selection should have its basis in reducing risk to the BES caused by a security breach in Cyber Systems.

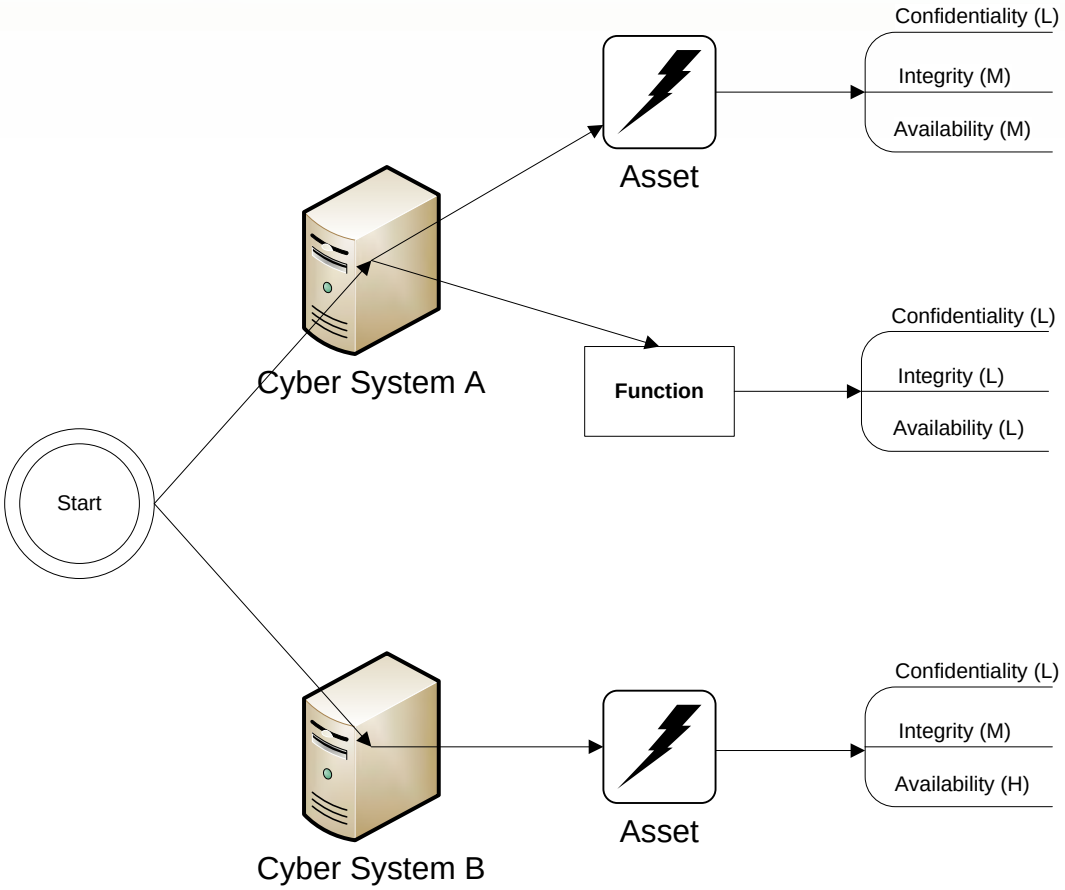


Figure 1: Cyber System Security Impact Analysis

Cyber system interconnections

Many BES Cyber Systems exist within a complex network of interconnected systems and exchange information necessary for the reliable operation of the BES. Just as downstream fault could cause cascading power outages, so a security breach in one Cyber System could utilize a trusted path to affect systems outside of an organization. Consequently, the security assurance of the Cyber System should reflect the level of risk associated with any interconnections.

Since this document only addresses the selection and impact analysis of BES Cyber Systems, the exercise of documenting and protecting interconnections is left as a security control to apply to the target Cyber Systems. However, the identification of essential interconnections into a Cyber System indirectly has a role in identifying BES Cyber Systems. For example, if Utility A classifies one of its Cyber Systems *High* and identifies an essential Cyber System interconnection with Utility B, then Utility B must consider the interconnected system in its BES impact categorization.

The drafting team recognizes the complex nature of interconnected systems and feels the Cyber System connection controls should be non-prescriptive. An organization should define, authorize and monitor connections as part of its secure operation of the Cyber System. An agreement should also be in place between two Responsible Entities to ensure the communication and consideration of Cyber System interconnections.

This approach ensures the standards address the complex nature of Cyber Systems operating the BES and assist organizations operating Cyber Systems downstream to understand the impact these systems have to the BES.

FINAL CATEGORIZATION OF CYBER SYSTEM BASED ON OVERALL IMPACT ON THE BES

The final categorization of each cyber system is determined by the application of a matrix which has predetermined outcomes based on the supported BES asset categorization and the categorization of the cyber system derived from its impact on the BES asset it supports.

This deterministic methodology will provide a more consistent approach than the looser requirement of any risk-based methodology in CIP-002-1 and CIP-002-2. The approach is based on an impact based methodology and will provide for more uniform application of a methodology for categorizing cyber systems.

An example of the application of this approach in an evaluation matrix is shown below:

Asset Impact -->	High	Medium	Low	None
Cyber Impact:				
High	5	4	3	1
Medium	4	3	2	1
Low	3	2	1	0
None	2	1	0	0

EFFECT OF CYBER SYSTEMS CATEGORIZATION ON REQUIREMENTS

CIP-002 provides for the identification and categorization of BES cyber systems. Once categorized, the definition and applicability of requirements based on the category of the cyber system must be completed throughout the standards. This paper proposes that the current overall control (requirement) grouping in the respective CIP standard be kept wherever possible. The Drafting Team will review, change and augment the requirements in these standards as necessary and appropriate based on an analysis of the catalog of controls in the NIST guidelines when mapped to the CIP requirements. It must be noted that the High, Medium and Low categorization resulting from the proposed CIP approach does not necessarily correspond to the categorization levels defined in the NIST guidelines. This should be resolved during the analysis and mapping of the CIP requirements to the NIST controls by the Drafting Team.

In particular, in the review of these standards, this paper proposes that consideration be made for the different general cyber system types and their capabilities. In particular, the Drafting Team will consider differences in characteristics of cyber systems built on general-purpose platforms from proprietary purpose-built systems. The Drafting Team recognizes that proprietary purpose-built systems may have vulnerabilities similar to general-purpose systems. The Drafting Team will consider the preponderance of purpose-built systems and the implication on exception management, oversight and enforcement.

The Drafting Team will also consider the differences in transmission field and substation, generating plant and control center, equipment types and operating environments, and evaluate an approach to include them without unduly providing exceptions in the standards.

CONCLUSION

The approach proposed in this paper builds on work which the industry has already done in complying with the current standards, the guidance to be available soon in using a risk-based methodology for classifying BES assets, the industry's experience and investments in current compliance programs, and a recognition that the reliability of the BES is based on an engineered system increasingly supported by cyber systems. It is an incremental approach and addresses many areas of the perceived or real deficiencies in the current CIP-002 standard. It certainly ensures that all cyber systems related to the reliable operation of the BES are required to implement a security posture commensurate to the level of criticality of the BES assets they are supporting.

Action Items:

1. John — Will prepare the Introductory paragraph additions
2. Phil — Cyber Security Impact assessment description
3. Jackie — Categorization levels for impacts write-up
4. Scott — List of committees and disciplines for BES analysis support
5. Scott — John Sykes example white paper
6. ALL — send all inputs to John by Friday (4/3/09) for incorporation in to the next version.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Draft Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

April 14, 2009 | 1–7 p.m. EST
April 15, 2009 | 8 a.m.–7 p.m. EST
April 16, 2009 | 8 a.m.–noon EST
Duke Office — Conference room number 2313
400 South Tryon St
Charlotte, NC

Dial-in Number: 888-237-9331
Conference Code: 745311
*Note the dial-in information is the same for all three days.

Proposed Meeting Objectives and Outcomes

- Receive updates on TFE and VSL processes
- Receive a briefing on the NERC Critical Assets Industry Survey
- Review and Draft Responses to Phase I Industry Comments
- Review and Refine Phase II Framework White Paper
- Agree on assignments and next steps in the SDT Work plan.

Tuesday, April 14, 2009

9:00 a.m. Phase II White Paper Team Drafting Session

1:00 p.m. Welcome and Opening Remarks — Jeri Domingo-Brewer and Kevin Perry

a. Roll Call
b. NERC Antitrust Compliance Guidelines
c. Review and adoption of March 10-12, 2009 Meeting Summary

1:15 Review of Meeting Objectives, Agenda and Meeting Guidelines — Jeri Domingo and Bob Jones

1:20 Organizational Issues and Review of Phase 1 and early Phase II Schedule — Stuart Langton

- Review of April-December 2009 SDT Schedule

1:40 Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure Posting — Scott Mix

1:50 Update on VSL/VSR for Version 1 and 2 CIP-002-009 — David Taylor

2:00 Overview of SDT Phase II Development Process Steps and CIP 002 Review — Stu Langton

2:10 Critical Assets Industry Survey — Mike Assante

2:40 CIP-002 White Paper Presentation — Bill Winters and Jackie Collett

Q & A and Discussion and Initial Consensus Testing

4:00 Break

4:10 Phase I Small Group Proposal for Response Drafting

4:20 Small Groups Draft Responses to Industry Comments

3:15 Small Group Reports and SDT Review and Consensus Testing of Draft Responses

5:00 Break — If Needed, Full or Small Groups may continue working until 7:00 p.m.

7:00 Recess

Thursday, April 16, 2009

8:00 Welcome, Agenda Review, and Roll Call

8:10 CIP-002 White Paper Consensus Testing

10:00 Break

10:15 CIP-002 White Paper Consensus Testing

11:40 Review of May SDT Agenda and Objectives

11:50 Meeting Evaluation — What Worked, What Could be Improved?

12:00 Adjourn

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 SDT January–December 2009 Draft Project Schedule (Revised April, 2009)

Overview

- **Thirteen SDT Face-to-Face Meetings**
- **Multiple SDT Subgroup and Subcommittees WebEx Meetings**
- **One Cyber Expert/Stakeholder Workshop — Summer or Fall 2009 — Tentative**
- **Industry Comments on CIP-002 SDT White Paper — June–July 2009**
- **Two NERC Members Representative Committee Meetings — May and August, 2009**

Draft Schedule — January–December 2009

1. **January 7–9, 2009 Meeting in Phoenix, AZ (half, full, half day format, Wednesday through Friday)**
   - Review of Technical Feasibility Exceptions white paper
   - Review of Industry Comments on Phase 1 products — Establish and convene small groups to draft responses
   - Review of Phase 2 White papers

   January 15, 2009 WebEx meeting
   - Small group draft responses to industry

   January 21, 2009 WebEx meeting
   - Small group draft responses to industry

2. **February 2–4, 2009 Meeting in Phoenix, AZ (half, full, half day format, Monday through Wednesday)**
   - Update on NERC Technical Feasibility Exceptions process
   - Review of VSL process and SDT role
   - Review of Phase 2 White papers, strawman and principles
   - Review and Adoption of SDT Responses to Industry Comments on Phase I and Phase I Product Revisions.

3. **February 18–19, 2009 Meeting in Fairfax, VA**
   - Update on Phase I process
   - Update on NERC TFE process
   - Update on VSL team process
   - Review, discussion and refinement of Phase II and CIP-002 White papers, strawman, and principles

4. **March 10–11, 2009 Meeting in Orlando, FL (half, full, full day format)**
   - Update on NERC TFE process
   - Update on VSL Team process
   - Review and Refinement of Phase II CIP-002 Strawman Proposals

March 2–April 1 — 30-day Pre Ballot Review
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment
March 30, 2009 — WebEx meeting White Paper Drafting Team
April 1–10, 2009 — NERC Balloting on Phase 1 Product
April 6, 2009 — WebEx meeting — White Paper Drafting Team
April 8, 2009 — WebEx meeting — White Paper Preview — Full SDT Conference Call
April 11, 2009 — Phase I Ballot Results and Industry Comments

5. **April 14–16, 2009 Meeting in Charlotte NC (half, full, half day format, Wednesday through Friday)**
   - Update on NERC TFE process
   - Update on VSL team process
   - Update on the NERC Critical Assets Survey
   - Review in SDT small groups and respond to Phase I Ballot Results and Industry Comments
   - Review and Refinement of Phase II Whitepaper and Progress Report to MRC

May 4, 2009 — Member Representative Committee Meeting in Arlington, VA — SDT progress report.

6. **May 13–14, 2009 Meeting in Boulder City, NV (2-day format, Wednesday through Thursday)**
   - Review MRC presentation and any input to SDT on Phase II white paper
   - Further SDT refinement of the strawman Phase II White Paper in plenary and small groups.

7. **June 17–18, 2009 Meeting in Portland OR (2-day format)**
   - Further SDT refinement and adoption of the Draft Phase II White Paper for industry comment.
   - Review potential SDT subcommittee structure and work plan for implementation of Phase II.

Industry Comment Period on SDT Phase II White Paper — 45 days (June 20–August 5, 2009)

8. **July 13–14, 2009 Meeting in Toronto, ON**
   - Agree on and charge subcommittees and conduct organizational meetings

- SDT Subcommittees meet to organize and begin drafting revisions to CIP and/or addressing assigned issues.
- Subcommittee organizational reports to SDT

July–August 2009 WebEx meeting(s)

- SDT Subcommittee meetings to review applicable industry input on white paper

9. August 20–21, 2009 Meeting in Chicago, IL

- SDT Plenary and Subcommittee meetings to review and respond to industry input on white paper.

August 2009 — **NERC Member Representative Committee**, Presentation of the Phase 2 White Paper and Summary of Industry Comment and Response for MRC input in Winnipeg, Manitoba

10. September 9–10, 2009 Meeting in Denver, CO

- SDT Plenary review industry and MRC input on White paper and consider and agree on refinements
- SDT Subcommittee drafting meetings
- SDT Plenary Session(s)- briefings and subcommittee reports
- Review Work plan through summer 2010, as needed

September 2009 WebEx meeting

- SDT Subcommittee drafting meetings

11. October 20–22, 2009 Meeting in New Orleans, LA

- SDT Subcommittee drafting meetings
- SDT Plenary Session(s)- briefings and subcommittee reports
- Adopt Work plan through Summer, 2010, as needed

October 2009 WebEx meeting

- SDT Subcommittee drafting meetings

12. November 17–18, 2009 Meeting in Atlanta, GA

- SDT Subcommittee drafting meetings
- SDT Plenary Session(s)- briefings and subcommittee reports

November 2009 WebEx meeting

- SDT Subcommittee drafting meetings

13. December 15–17, 2009 Meeting in Tampa, FL

- SDT Plenary Session(s)

- SDT Subcommittee drafting meetings

December 2009 WebEx meeting

- SDT Subcommittee meetings

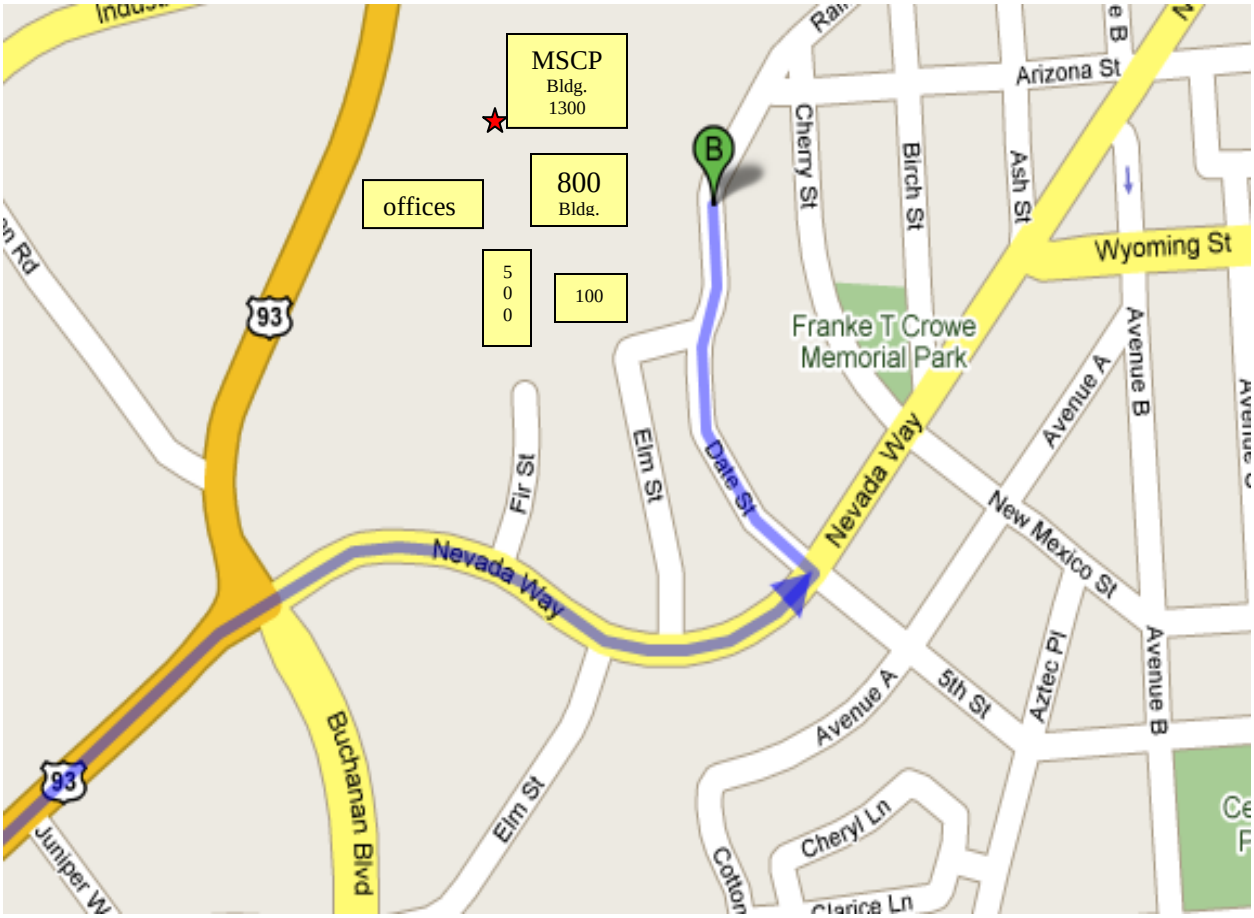
Railroad Pass	2800 South Boulder Hwy, Boulder City	294-5000
Sam's Town	5111 Boulder Hwy, Las Vegas	456-7777
Sunrise Resort & RV Park	4575 Boulder Hwy, Las Vegas	434-0848
Sunset Station	1301 Sunset Road, Henderson	547-7777
Fiesta (formerly Reserve)	777 West Lake Mead Drive, Henderson	737-0777
Town and Country Manor	4360 Boulder Hwy, Las Vegas	547-9393

Directions to the
Multi-Species Conservation Program
(MSCP BUILDING 1300) 500 Fir Street
Multi-Species Conference Room



Directions: After Railroad Pass Casino, continue on US-93 through the second stoplight (Buchanan Blvd), the road becomes Nevada Highway (Nevada Way). Pass by the restaurant called Casa De Flores on the corner of Fir Street. Do not turn on Fir Street because these gates are usually locked. Stay on Nevada Highway and pass Elm Street then **take a left onto Date Street** and drive past the apartments. The entrance will be on your left. **These gates should be open**. The class will meet in the MSCP Building 1300, Multi-Species Conference Room . If you have any questions feel free to contact the training office at 702-293-8444.

Draft 10th Meeting Summary,
May 13-14, 2009
Boulder City, NV

MEETING SUMMARY CONTENTS

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team
Draft Eighth Meeting Summary,
May 13-14, 2009
Boulder City, NV

EXECUTIVE SUMMARY

The Chair, Jeri Domingo-Brewer, welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call for each day. The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed with the Team and participants the proposed meeting agenda.

Mr. Bucciero reviewed with the Team the need to comply with NERCs Antitrust Guidelines including avoiding behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion. The Team reviewed and unanimously adopted on the SDT 706 April 14-16, 2009 meeting summary with editorial corrections suggested by the Vice Chair. The Chair and Vice Chair welcomed Jim Breton as a newly appointed member of the SDT representing ISO perspectives. The Chair then congratulated the SDT members on the overwhelming industry approval of the Phase I package of changes to the CIP 002-009 (April 17-27 Recirculation Results: Quorum: 94.37 percent Approval: 88.32 percent). Stuart Langton, SDT facilitator, reviewed the current work plan and meeting schedule Phase 2.

The Chair noted that she was unable to present to the MRC but Jim Brenton noted he was present and that the SDT materials were well received by the MRC.

Scott Mix provided an update briefing to the SDT noting that the posting period closed for the TFE had closed with 52 organizations providing comments over 450 pages. He said that NERC staff is now analyzing the comments. All comments have been posted on NERC web site. Mr. Mix noted there were concerns over the 60-day automatic approval and issues concerning where a TFE can be applied. Members reviewed the history of the TFE process and the SDT's role in their development and clarified the procedural and substantive implications of the TFEs for the CIP 002-009 standards development.

David Taylor, NERC, provided an update on the VSL/VSRs. Since the last meeting they were posted out for industry comment. The comment period is now closed and the 93 pages of comment from 10 entities are being reviewed by the SAR drafting team at their meeting on May 14, 2009.
Version 1 and 2 VSLs must be filed by July 1.

Gerry Freese presented an update from the "Key Messages" discussion at the April SDT meeting in Charlotte. He noted there was perhaps less emphasis than last time given the flood a media attention in April. Members discussed the fact that there were several bills that had been filed in both the Senate and House that focus on different aspects of cyber security policy including the Senators Snow and Rockefeller bill that focuses on Education - R&D, a Senators Bingaman, Lieberman and Thompson bill and a bill Markey is working on in the House.
Michael Assante noted that NERC had been focused on developing key points for Rick Sergel's (President, NERC) testimony in the past weeks. He suggested that there was still value in having good communications and engaging with congressional staff on pending legislation. Gerry agreed to share his draft with the sub team and bring it back on the second day for considerations regarding next steps. On Day Two he agreed to work with the Key Messages Team in refining this and developing a strategy going forward.

Stu Langton reviewed with the SDT the milestones in Phase 1 and Phase 2 of the SDT. The facilitators made a suggestion to consider calling this a "working paper" as the term "white paper" suggested a less dynamic, more static state. The working paper provided a basis for developing the consensus points that were tested and refined in April at the Charlotte meeting.

The Vice Chair proposed the SDT's consideration of a different timeline for CIP 002. The current proposal seeks industry comment on CIP 002 by the end of the year but then develops CIP 003-009 before going out for ballot. Instead consider taking CIP 002 for ballot when ready. In terms of the implementation plan, limit it to those assets considered high and continue to apply the existing CIP 003-009 until they are redrafted. This approach gets improved asset protection out faster. Wouldn't cause anyone to lose under existing standards. The SDT members discussed this option and left it open for further consideration.

The SDT discussed when it would be timely to consider whether to maintain the current CIP structure 002-009 or consider streamlining and addressing overlaps and duplication and possibly creating one set of standards.

The facilitators summarized the discussion of possible directions and next steps**.** First there appeared to be SDT support for getting out the new CIP 002 as early as possible for comment, refinements, and on to ballot. As the SDT develops CIP 002 with measures and requirements, it will need to address how it wants to develop the structure for the present CIP 003-009. The suggestion was made to review all of these issues at the next meeting and to talk about our schedule and strategy.

The Chair thanked John Lim, Phil Huff and their drafting team for working hard since the Charlotte SDT meeting and expressed on behalf of the SDT her gratitude for their leadership and good effort. John Lim, Phil Huff, Jackie Collett and Bill Winters jointly presented the next draft of the Phase 2 Working Paper. They noted the expanded team met twice by phone-WebEx following the Charlotte meeting. They noted they cleaned up the introduction and sought to expand some sections based on the SDT discussion in April. They underscored the fact that there remain significant gaps in the documents, in particular: the critical assets categorization

methodology; and the criteria for categorization of the cyber assets. They have tried to define a couple of additional terms. Overall, the team is not very close to finalizing the document. The members discussed the fact that the evolving document has been made accessible to industry and that it is already being broadly discussed. The SDT needs to be prepared to address inquiries as it continues to refine this document.

The SDT reviewed, discussed and offered suggestions for each section of the working paper including sections addressing: Introduction; the Terms and Definitions; BES Reliability Functions; Identification of BES Subsystems; Categorization of BES Subsystems; Third Party Oversight; Identification of Essential Cyber Systems; Categorization of Cyber Systems; Cyber System Interconnections; Final Categorization of Cyber System Based on Overall Impact on the BES; Risk Based Approach to Security Control Selection; and Effect of Cyber Systems Categorization on Requirements

On Day two the facilitators reviewed the following SDT areas of possible agreement with the Working Paper approach and concepts from the Day One SDT discussion:

- Recognize different audiences: develop Executive Overview (e.g., will have to protect more assets than before; will require identification of more BES assets than did before; will require different levels of protection) that clarifies the intent at a high level regarding methodology;
- Address structured and unstructured threats;
- Develop graphic and tabular depictions of key concepts in white paper;
- Terms and definitions- take a step back and address in content sections;
- Address connectivity as an important concept;
- Seek outside assistance from operating and planning committees for identifying and categorizing BES sub systems and reliability function; and
- Categorize the cyber systems.

The facilitators suggested that the following were outstanding Working Paper issues from the Day One discussion, some of which could be taken up in small group discussions. The SDT reviewed the 3rd Party Review section and ultimately agreed to clarify how much ability each entity has to categorize BES subsystems and what kinds of overview is intended.

The SDT worked in small groups to further explore and refine the issues and options surrounding:

- Identification of Essential Cyber Systems
- Risk Based Approach to Security Control Selection; and
- A third small group participated in a phone conference with FERC staff regarding an issue that was discussed under the Technical Feasibility Exception.

In general, going forward the SDT agreed that the Working Paper focus should be on the overall approach to the CIP-002 issues. The drafting team agreed to continue working on refining the working paper including taking a more conceptual approach while holding the details for

consideration as the SDT begins development of the new CIP 002. Categorization of the BES assets still needs refinement and help from outside experts. Scott Mix and Joe Bucciero will take the lead to see if additional expertise can be provided to the sub team.

Bob Jones, SDT facilitator, noted the proposal to proceed with CIP 002's development in the remaining half of 2009 and refine it after a sequence of comments from the industry before going to the ballot. The Chair reminded people to register for the Portland Bonneville Power meeting and that the July meeting would take place in Vancouver, B.C., Canada.

Hal Beardall reviewed with the SDT the results of the process survey undertaken in March and April. Following the review, Stu Langton led an onsite meeting evaluation discussion and members completed written evaluation forms.

The SDT adjourned at 3:45 p.m. on May 14.

The SDT Order 706 turns a corner in Boulder City

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team
DRAFT TENTH MEETING SUMMARY,
MAY 13-14, 2009
BOULDER CITY, NEVADA

I. INTRODUCTIONS, AGENDA REVIEW AND REVIEW OF SDT WORKPLAN

The Chair, Jeri Domingo-Brewer, welcomed the members at 8:30 a.m. having been delayed by technical problems with the WebEx and phone. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call for each day (See appendix #2). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed with the Team and participants the proposed meeting agenda (See appendix #1).

Mr. Bucciero reviewed with the Team the need to comply with NERC's Antitrust Guidelines (See, Appendix #3). He urged the Team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The Team reviewed and unanimously adopted on the SDT 706 April 14-16, 2009 meeting summary with editorial corrections suggested by the Vice Chair. The Chair and Vice Chair then welcomed Jim Brenton as a newly appointed member of the SDT representing ISO perspectives.

The Chair congratulated the SDT members on the overwhelming industry approval of the Phase I package of changes to the CIP 002-009 (April 17-27 Recirculation Results: Quorum: 94.37 percent Approval: 88.32 percent). Stuart Langton, SDT facilitator, reviewed the current work plan and meeting schedule for Phase 2. (See Appendix #4) The Chair noted that the location for the SDT July meeting would be in Vancouver, Canada.

II. UPDATE ON NERC MEMBER REPRESENTATIVE COMMITTEE MAY 5, 2009 PRESENTATION

The Chair noted that she was prepared but unable to present as she was ill. Jim Brenton noted he was present and that the SDT materials were well received by the MRC. At this juncture the MRC did not have feedback for the SDT. SDT Members requested that the written presentation materials including a power point be circulated to them and the Chair agreed to do so.

III. UPDATE ON TECHNICAL FEASIBILITY EXCEPTION (TFE) NERC RULES OF PROCEDURE POSTING

Scott Mix provided an update briefing to the SDT noting that the posting period closed for the TFE had closed with 52 organizations providing comments over 450 pages. He said that NERC staff is now analyzing the comments. All comments have been posted on NERC web site. Mr. Mix agreed to send a link to the members. Some of the common themes in the comments included:

- Concerns over the 60-day automatic approval which no one appeared to like.
- Issues around the requirements where a TFE can be applied.

NERC staff is now reviewing and considering modifications and will try to get this done as quickly as possible. Mike Assante, the NERC CSO is the Corporate Officer in charge of content. Dave Cook, NERC General Counsel is in charge of procedure. Mr.Mix noted that the Edison Electric Institute had submitted both a redline version change to the appendix. The SAR hasn't been submitted as of yet to the standards committee.

Member Discussion Comments on TFE Update

- Version 1 of standards compliance July 1. Version 2 effective date kicks in after FERC approves the standards.
- Canadian entities without regulation (e.g. Manitoba) January 1, 2010 is the effective date for the Version 2 CIP Standards.
- Is there a compliance gap? It is a self report, as before.
- "Version 1 of CIP standards- auditably compliant by July 1, 2009.
- "Reasonable business judgment"- what does it provide entities now?
- Roger Lampila, NERC Compliance, indicated that by taking away reasonable business judgment the auditor will determine if you used reasonable business judgment. Always has the appeal.
- Version 1- "what's the shell game"? TFE draft- could apply to other reliability standards not just CIP? Yet it seems to be all about CIP. Industry will want to see this in the CIP standard.
- If it is in the standard, there needs to be a requirement around a TFE process that compliance could hold you to.
- The TFE has not been approved yet by the NERC BOT nor filed with FERC. This is to get NERC/industry started in the rules of procedure. What do you do now? Self report, the same as before.
- Why are we amending the blanket rules of procedure with language specific to CIP? Why not write this more generically?
- Mike Assante noted that NERC will be responding to the comments.
- No other standard has the triggering language. Don't want a blanket exception in CIP or at large. That is what NERC is trying to prevent. E.g. TFE tree trimming, etc.
- TFE makes more formally recognized process within mitigation plan. Changing the cover page. From a regional entity perspective, today NERC receives, evaluates approves/rejects TFE.

- What should the role be for the regional entity?
- Given TFE says can't ask for TFE unless standard says you can. Do we have to do through a separate SAR or can the group do this under our charter. Limited focus, placement of TFE in the standard?
- SAR should allow the SDT to address TFE where appropriate. David Taylor indicated that he would recommend to the Standards Committee that the SDT have ability to do so in the current SAR. It would take a lot of discussion to determine which requirements this should apply to.
- If the group wanted to do it would be an appropriate thing. Possible consider doing this in a SDT subcommittee - could do this. This will not be a trivial or easy task for the SDT. If it is the right thing to do we should do it even if it will take time to complete.
- Industry is between rock and hard place - if need for TFE and standard doesn't permit.
- TFE has to be approved and in place. Could be part of the SDT's Phase II, (i.e. Version 3) of standards.
- The SDT should come back to this and do some preparation and thinking regarding how to frame and how to organize to get the work done.
- NERC and RE role in evaluation? There are industry comments on that and NERC staff will be responding.
- Mike Assante noted that there has been discussion in the industry on whether there will be modifications where RE's could play a different or bigger role and its budget implications.
- There are some practical issues with the FERC order and the TFE: e.g. the 24 hr removal of access after termination for cause. Proceeded on assumption - remove access. Isn't a TFE designed to take care of this? Puts in non-compliance. 706 said 24 hours was too long. Can't be done practically. Could have addressed some of these issues in version 2 and will need to address this in Version 3. Is there a way we can address, "All assets"?
- Version 1 issue - TFE, document through self report.
- E.g. password - exception against own compliance policy and a TFE against standard. "Where technically feasible" - No process to file at TFE. Have to do self-reported compliance.
- Where requirement allows TFE exception - do I have to file a compliance exception separately. In 007 or e.g. 005 R3.2. Doesn't specify exception. This one tells you what to do in the requirement. Others don't.
- What you have written into a policy.
- You can see the level of TFE contention in the SDT and this is also happening in the industry. Lots of questions around this "can of worms."
- TFE concerns - version 1 and 2 going forward. Time takes to respond when standards have specificity. We could go through with blanket statement - take TFE where applicable. Changes in technology. With reasonable business judgment stripped away. Limit TFEs to a limited number of standards with changing technology will be a losing proposition. Should approach more generally. Shouldn't specify only certain places.
- If you take away physical and network access, you have removed access and fix other policies.

- Compliance auditors only audit to standards and not to policies.
- Version 2 - BOT approved in May, 09. Canadians need to file with regulatory authorities. Effective date - 1st day of 3rd quarter. (i.e. Jan. 1, 2010).
- Communication to industry - let everyone know when things become effective. There is confusion. For any new standards what is the effective date. NERC needs to get info out on TFE's.
- Can't take a TFE until then. Self report of non-compliance with a mitigation plan. E.g. Passwords - 6 characters. CIP 007 R5.3 "as technically feasible". If device supports only 4 characters. Required by standards to do anything? What was the intent? 4 position password. Would have to demonstrate why only using 4- produce industry.
- In the meantime perhaps the SDT can put together an explicit document - here is what you need to do. Focus on what does the industry need to do today. This is what enforceable at what dates.
- Industry and auditors don't know how to handle these.

IV. UPDATE ON VSLS/VSRS -

David Taylor, NERC, provided an update on the VSL/VSRs. Since the last meeting they were posted out for industry comment. The comment period is now closed and the 93 pages of comment from 10 entities are being reviewed by the SAR drafting team at their meeting on May 14, 2009.
Version 1 & 2 VSLs must be filed by July 1. Didn't receive a lot of comments on Version 2. Asked questions about changes in VRS. Didn't receive comments. These will soon get out for ballot/recirculation.

V. UPDATE ON THE "KEY MESSAGES" TASK GROUP

Gerry Freese presented an update from the "Key Messages" discussion at the April SDT meeting in Charlotte. He noted there was perhaps less emphasis than last time given the flood of media attention in April. Members discussed the fact that there were several bills that had been filed in both the Senate and House that focus on different aspects of cyber security policy including the Senators Snow and Rockefeller bill that focuses on Education/R&D, a Senators Bingaman, Lieberman and Thompson bill and a bill Markey is working on in the House. All want cyber security but the question is how to fund this. Concern about the industry being log-rolled with a poorly designed solution. Need to identify who is the driving force and find that out and seek out their staff for the key messages.

Mr. Freese noted that he went on vacation immediately following the Charlotte meeting. He has since put together presentation which he suggested showing to those who agreed to work with him on the "team" which included John Stanford, Jerry Domingo Brewer, Jay Cribb, Dave Norton, Phil Huff, Rich Kinas and Jim Brenton. He asked the Team and Michael Assante if this was still worthwhile going forward with. Michael Assante noted NERC had been focused on key points for Rick Sergel's (President, NERC) testimony in the past weeks. He suggested that there was still value in having good communications and engaging with congressional staff on pending

legislation. Gerry agreed to share his draft with the sub team and bring it back on the second day for considerations regarding next steps. On Day Two Gerry noted he had inadvertently sent the draft out to the SDT plus list. He agreed to work with the Key Messages Team in refining this and developing a strategy going forward.

VI. SDT PHASE II/VERSION 3 DEVELOPMENT PROCESS- THE "WORKING PAPER"

A. Overview of Phase II/Version 3 Work Plan

Stu Langton reviewed with the SDT the milestones in Phase 1 and Phase 2 of the SDT work including the work in Little Rock to begin to frame the challenges, the development of "white papers" following the Washington D.C. meeting in December and further review and refinement of those and other papers and the convergence on an single consensus approach in Orlando that was refined further in Charlotte with John Lim and Phil Huff leading a team to continue to refine the white paper. The facilitators made a suggestion to consider calling this a "working paper" as the term "white paper" suggested a less dynamic, more static state. The paper provided a basis for developing the consensus points that were tested and refined in April and offered to the industry Members Representative Committee.

Member Discussion of Progress To Date

Overall

- Congress - wants to see standards that protect all the control networks.
- What congress will do or not do shouldn't drive the SDT process, rather the SDT should seek to do the "right thing.
- Productivity in working together as a group - confidence in producing a lot and working at a good pace.
- At the end of the day NERC - industry should be in control of the shaping of the CIP standards.

CIP 002 Workplan - Go to Comment and Ballot First with a Complete CIP 002.

- The Vice Chair proposed the SDT's consideration of a different timeline for CIP 002. The current proposal seeks industry comment on 002 by the end of the year but then develops 003-009 before going out for ballot. Instead consider taking CIP 002 for ballot when ready. In terms of the implementation plan, limit it to those assets considered high and continue to apply the existing 3-9 apply until we get they get redone. This gets improved asset protection out faster. Wouldn't cause anyone to lose under existing standards.
- The idea of completing CIP 002 makes sense. Nobody can tell us what CIP 002 should be. Congress could say "secure all." Nobody can do this for us. In following the Smart Grid Task Group - there are many consultants but few industry representatives there.
- CIP 002 is the big ticket item for the industry. The SDT effort to tackle CIP 002 can provide leadership guidance to Smart Grid group. May need to jump in on that? $4.3 billion is

devoted to supporting its development. By getting the scope and methodology in CIP 002 earlier we will help provide leadership for other efforts including NASBEE.

- CIP 002 - angst with Version 1 and 2. Doubts regarding industry's willingness to adopt without 003-009. May need to know about controls and effect on controls.
- CIP 002 - critical asset identification is a challenge but the SDT should make this happen quickly and deliver.
- Got to get past the industry push back. We should be doing the right thing. Won't be an easy process.
- Scott Mix suggested that procedurally it would not be a big issue in going to ballot on CIP 002 first. Would need to make clear on the impacts with other standards. Assuming the first draft is out for comment in December, will probably take multiple times back and forth responding to industry comments before going to the ballot with CIP 002. In the meantime during 2010 the SDT could be working in parallel making headway on CIP 003-009.

Structure of CIP 002-009

- Are we stuck with 002-009 Standards structure? Can we think about 1 set of standards? There are problems with the structure of current standards? Give consideration to putting into one set?
- All NERC standards have a family and sequence number.
- Structure of CIP 002-009. This works together- structure is there is you read the whole thing.
- Renumbering the standards - straighten out. List existing, list by categories. Cross-referencing makes interpretation difficult. Industry willing to spend $ just needs to know what to spend it on.
- There may be more understanding - on structure than is suggested by the discussion. Careful not to throw out the baby with the bathwater.
- Jon Southern noted he was not suggesting that. There are some overlapping and duplicative aspects to the current structure, e.g. audit logging in several sections. 005 and 006 are circular. NIST doesn't have this issue. The movement is to view cyber security assets more holistically as correlating systems.

The facilitators summarized the discussion of two possible directions and next steps**.** First there appeared to be SDT support for getting out the CIP 002 as early as possible for comment, refinements and on to ballot. As the SDT develops CIP 002 with measures and requirements, it will need to address how it wants to develop the structure for the present CIP 003-009. The suggestion was made to review all of these issues at the next meeting and to talk about our schedule and strategy.

B. Phase II Working Paper Presentation and Discussions

The Chair thanked John Lim, Phil and their team for working productively since the Charlotte SDT meeting and expressed on behalf of the SDT her gratitude for their leadership and good effort. John Lim, Phil Huff, Jackie Collett and Bill Winters jointly presented the next draft of the Phase II Working Paper (See Appendix #6) They noted the expanded team met twice by phone-WebEx following the Charlotte meeting. They pointed out that they cleaned up the introduction

and sought to expand some sections based on the SDT discussion in April. They underscored the fact that there remain significant gaps in the documents, in particular, the critical assets categorization methodology and the criteria for categorization of the cyber assets. They have tried to define a couple of additional terms. Overall, they suggested the drafting team was not close to finalizing the document yet and that there were a number of issues the SDT needed to address and resolve. The members discussed the fact that the evolving document is accessible to industry and that it is already being discussed. The SDT needs to be prepared to address inquiries as it continues to refine this document and minimize any confusion that making the evolving draft available might cause.

1. Overall SDT Comments on Working Paper

The Team engaged in an initial discussion of the working paper. A summary of their comments are noted below:

- Industry is interested in what we are doing. Asset identification. Compress the timeline. Sooner the better.
- Consciously stayed away from reviewing the paper until this draft. Through 1st half. Struck by definitions and some more later. Could we create a taxonomy of the terms? E.g. a BES system can be used in different ways. Diagram showing the logical relationship of high order concepts,
- Members should consider this a very early draft that still includes some contradictory statements and inconsistency on terms.
- Scott Mix reported on his discussions with Operating Committee members to help the SDT with the engineering side of the analysis. Big topic last week. Lack of inability to participate in the standards process. Will be well received by the Committee members and hope we will get some who can participate. Won't get names from the Committee until mid June which will be just before Portland. If goal is to have a draft good enough for industry comment. Hold off a month to get the benefit of the Committee members input.

2. Introduction- Section

- The Team cleaned up and accepted changes suggested from the April meeting. Not much new work in the Introduction.

Member Comments and Suggestions

- Reference to the 6 characteristics? Adequacy is the last of the 6? Is that separate and distinct? Problem with implications see it in the table later.
- Reaction of 6 points of the NERC ALR - "reasonably expected " Protect to the normal, vs. protecting for the for unexpected and unplanned in cyber. The focus. Understand focus on ALR - send the wrong message to industry. Emphasize from cyber security.
- Mike Assante noted the same concern - we should think about multiple loss of assets in an abnormal instance.

- Mike Assante's letter of April 6 noted the industry will have to address structured and unstructured threats. The standards will have to be tailored to deal with unstructured. That is how the cyber side works.
- ALR is the granite cornerstone to grow our efforts? If 6 " 2. "Credible contingencies". Leave these as they are? If we play with them everywhere.
- "Everything is credible after it happens" pp 12 5 functions - focus on that - forget about other?
- References to previous presentations to SDT - not helpful in current form, because they need to be understood by the reader who hasn't heard those presentations. Consider our audience.
- Illustration diagram-graphically captures the relationship between the 3.

3. Terms and Definitions Section

John Lim and Phil Huff indicated that the drafting Team was trying to ideally define cyber system vs. asset. Realizing the audience, it will be important to delineate an "essential" cyber system from a cyber system. The Drafting Team decided to look at the essential cyber system first to delineate the target of protection and the essential cyber system and determine what is our target of protection when later developing controls.

Member comments

- Define systems (cyber). What is a BES subsystem? Thought about this in pieces - systems vs. assets on both the power system and cyber side.
- Discussion of cyber systems - pp 8- aggregation and segregation. Embellish all applicable cyber assets that need to be slotted into those systems in a logical and manageable way. Point not well made yet in this paper.
- The drafting team grappled with how much do we want to go into that in the terms and definitions section vs. later in substantive sections. May have gone too far in the terms and definition section in this draft. Address this in a content section.
- We may have gotten too detailed, in trying to get the content down first and then think about whether rearranging. Entity allowed to cherry pick?
- Segregation will take you to controls. We were trying to hit a higher level in first run.
- May have to move some of this further into the paper and consider the effects on requirements.
- Perhaps the new terms and concepts can be defined in this section. There is typically some confusion in a technical paper. Maybe in the introductory section address the high level view-framework of what we are trying to say here. Concept of cyber system introduced, drill down later.
- How does the identification work, when will it become clearer? Is the goal of the paper to let industry know what they need to protect?
- No. This is a rough conceptual draft. This section has continued to get less clear with the introduction of new concepts. There is a need for a new taxonomy. Is there any input on whether we have presented a clear enough concept to get reactions? Tripping over things. How far off base are we with the intent?

- This paper's intent is to give an idea of the methodology we are considering. It will say this at a high level. The takeaway for industry is: 1) You will have to protect more assets than before. 2) You will have to identify more BES assets than did before. 3) There will be different levels of protection but you won't get a list yet as this is not a standard but a concept.
- Overview of the approach is needed - executive summary. Introduction doesn't do it yet. It should include Jackie's points. Jackie agreed to write it up.
- Who is the audience we are addressing in the working paper? Technical people? Higher level Execs? Focused intent of what this is about. Jackie's points are perfect for that audience.
- Tried to focus on full gamut of audiences from executive viewpoints and the technical viewpoints. Should we consider breaking this up into 2 papers one for technical folks, one for executive management?
- Take the highest level approach for discussion of the concept which can set the context for details that follow.
- The diagram shows the departure from critical asset. Cyber isn't limited by electronic security perimeter. Proper network segmentation.
- Protection requirement applies to assets not directly part of the BES. Because of "interconnectedness" and FERC's direction, this may end up in assessment and controls. There may be a minimum set of controls to other systems because of the interconnectedness of cyber systems that are used to control them.
- If generation unit, has no impact on BES is it off the table? It would be brought in if you establish its interconnectedness and vulnerability and implementation of minimum set of controls to mitigate.
- Can be separate electronic security parameters. Maybe we can try to get at that with an additional diagram.
- End point security model is another alternative to the perimeter model. That is where CIP 007 comes in?
- RFI team and WEC - integrated firewalls and routers etc. Some discovery in that discussion?

4. BES Reliability Functions

The Drafting Team shared that the intent was to capture work and discussion on critical asset identification of risk assessment working group translation. They hope to get some help from the operating and planning committees and this is a work in progress not intended as final. They are looking for suggestions.

Member Comments

- Criteria in table - criticality and impact factors concern of their appearance here. Credit to Sam Merrill. He is working on a paper of a services approach to critical infrastructure protection.
- With terminology change - might work. (diagram) Is this what we are trying to get at? Consider this? Phil believes this aligns nicely. Overload the term "systems" It should be clear that BES - cyber can be a sub-system of BES. There is no diagram yet to show it can be both.

- Parallel categorization effort presents a concern: BES on one side, cyber on the other and merge later? BES should feed into cyber categorization. May be problematic to do this independently.
- Drafting Team had the same concerns with cyber impact assessment - on the function not on the BES sub system. You don't know to what degree it has an impact on BES. You need to know to what degree high-medium-low affect the BES.
- Come up with some e.g. a protective relay is a cyber system. Whether it's on a 500 kv line, or 115 kv line in middle of nowhere. Same equipment but the impact on BES is different. Put minimum security on 115 kv.
- I like both the diagram and table. Need to present in different ways for different audiences.
- Two concerns: generation too all encompassing. Avoid "other" catch alls in these standards.
- Contingency reserve = single unit bigger than reserve - not all units together? "Biggest unit"? Combined units.
- Drafting Team's intent to signal that lots of generation not included in current assets. It will be more than your black start units but less than everything. We will need help from the Operating and Planning committees. That is hard work ahead.
- Words - use the same label on both tracks. Use other words (assembly, components, etc.)? NERC glossary is a concern. Some of terms we like to use, such as element, doesn't work.
- Relays as cyber systems and be consistent: is connectivity-risk is missing from the document? Don't see it explicitly here. Vulnerability isn't discussed, but impact is. Look at the section: Risk Based Approach to Security Control Selection)
- We are talking about assets and we don't have enough generation on list? That is not the right question. If there is connectivity then maybe all are there. Don't like the approach - if it doesn't provide security - won't be doing the job.
- The paper is trying to relate assets to functions (services approach) which weren't done before.
- We have fuzzy boundaries, generation, transmission, distribution. Turf state and federal. Cyber security view - if you can get into and move up line on a common controls network this is a problem. Smart grid lumped together Transmission and Distribution.
- Capture even with distribution level system that "connect" to transmission and impact reliability of BES.
- The SDT needs to get more involved with the smart grid security task group.

5. Identification of BES Subsystems

The Working Paper characterizes cyber system as a BES asset.

Member Comments

- Is the diagram in original paper clearer? See the outline of the white circle.
- Labels systems - suggestion to make clearer that h/m/l in each transmission, generation

6. Categorization of BES Subsystems

The Working Paper makes no changes in this section since April. The drafting team will get this fleshed out when help comes for the identification BES assets from the Operations and Planning committees.

7. **Third Party Oversight**

While there were no major changes but a rewrite of the format with some help from Sam Merrill and a clarification of the process for disputes and appeals.

Member Comments

- Focuses approval - oversight on BES engineering side not the cyber side. No oversight provisions on the cyber side.
- What about the Reliability Coordinator role?
- Does this relate to oversight of entities to make up their own rules? Better approach -- the development of regional interconnect wide categorization criteria for BES subsystems. Simplify the process. Map your assets to regional criteria and functions. The categorization is a mapping exercise vs. an oversight exercise.
- Can the paper explore this as an option? Put both options on table making the case for each? Or present to SDT for decision. Does this section currently assume entities will make up own rules?
- Why not be told what the assets are vs. providing the criteria?
- Industry has been involved with this e.g. 100kv. If you go to region to make decision, the entities will be making the criteria. Might be looser criteria if done at the regional level.
- Looking for uniformity around this asset categorization. E.g. Reliance on redundancy, etc.
- Regional criteria for bulk power hasn't worked in other instances.
- This is an idea worth exploring. Weakness in federal model lack of uniformity across federal agencies. This could help industry address CIP 002 process and send a message to congress that the industry is looking at holistic solutions.
- Whoever has responsibility - they should pay the fine if this is not done right. Need to think this through. Don't want to touch this with a 10 ft pool. Policy is no thank you. We determine our critical assets. Lean much towards compliance.
- Categorization is dynamic process. Add and retiring transmission. Continual nightmare keeping a list up-to-date and current.
- Move towards criteria by which multiple entities come to the same conclusion. Three entities with the same equipment should come up with the same solution.
- Why not have the SDT come up with criteria?
- Problem with creating a fill in the blank standard. Dead end. Can we require each region to come up with own independent standard? Have to be able to justify. What would it be?
- Single NERC standard with West, East, ERCOT, nailed at an interconnection level. E.g. criticality of a control center would be same across the three.
- Challenge is you can't audit "reasonability"-- this would bring the entities to the same place. The pass through of the region is to check if something was missed.

- Can we define a criteria that sets minimum expectations. If there are regional differences, there can be a process that will define and justify any differences. Gets away from "reasonableness", but allows for differences between the regions and their infrastructure to be taken into account.
- A regionally specific standard - can be more stringent than a continent wide standard.
- SDT should come up with a base set of minimum criteria.
- Why have a different set of rules for a region to identify BES subsystems?
- We are trying to run through two sets of filters - will we get the same answer? Focus on categorizing cyber assets side first BES. See if we can categorize those. We have similar e.g. control centers, etc.

8. Identification of Essential Cyber Systems

The Drafting Team noted that the change in the introduction of BES subsystems is consistent with the new definitions. This is the introduction of essential cyber systems.

Member Comments

- Focus is BES and generation - on back end, are the other systems managing those part of this? Coal, gas etc.?
- Fuel inventory managing piles, timelines no. Control over pulverizer-conveyor belt. Possibly?
  Does this capture those things?
- Go back to 215 a (1) - doesn't include distribution facilities.
- Essential at this point. Doesn't preclude other systems coming in within the scope of protection.
- "Critical systems"- systems at the control center level are complex. ISO's challenge-zonal vs. nodal markets, market system may be essential to reliability. We have found in working with operations staff that key functions are not always obvious.
- Need to look at this section more closely for its implications.
- Is the market system itself a critical asset? May depend and vary. How you schedule a function may be in or out. Moving towards more integrated systems and this will present a challenge.
- Should we have a list that limits what systems?
- Identifying different levels of protection required. Are we focused too much on BES assets.
- Mindful of as developing the standards, if it is in the standards and there is not fuzziness, then everything is included. Other systems that impact reliability?

9. Categorization of Cyber Systems

The Drafting Team noted that this section was clarified, not substantively added to.

Member Comments

- BES functionality concern - problem regarding lack of clarity is a critical assets. Does it require a wholesale move away?
- With CIP 002 we have learned that one size doesn't fit all. The challenge is in applying good security practices to interrelated assets. This is the cyber security realm.
- The concept proposes a melding of two approaches to meet the security outcomes sought.
- The concept is looking to understand the impacts to the BES functions. Not tying it to BES reliability. That is done however, implicitly, through the matrix.
- Still perform both assessments. BES subsystem assessment feed into.

10. Cyber System Interconnections

Member Comments

- Requirement of standard should be that two parties negotiate an agreement to protect the security device.
- This is in part addressed by the oversight section.
- If utility A has interconnection, then they will address in a service agreement with Utility B.

11. Final Categorization of Cyber System Based on Overall Impact on the BES

Member Comments

- Merging of the categorizations of BES and Cyber to be used for applying of controls appropriate to the level
- Review and clarify the Table- low = no impact and none = consistency. Are low to none the same?
- Start/End.
- BES assets would replace BES sub systems.

12. Risk Based Approach to Security Control Selection

The drafting team asked if they have adequately addressed risk after categorization?

Member Comments

- Provide a framework (similar to NIST) to use to provide your security controls.
- Address what doing with controls - commensurate with the cyber system they will be protecting.
- Overall objective mitigating the risk- high impact system- take what you are trying to protect and reduce the risk commensurate to its impact on the BES.
- Addresses the earlier comment about connectivity.
- Concept of controls - incorporate risk assessment into that construct. Not assuming everyone does their own risk assessment. Perhaps not as extensive as NIST.

- A device that doesn't have impacts but could have. As you change the connectivity. Pick a different control now that you have modified the environment.
- This adds another layer of complications in implementation (3 impact ratings; 5 more)
- 1 size fits all doesn't work. Flexibility should make sense from several perspectives.
- Cyber - less important. Applicable to all BES systems?
- Intent is to significantly address cyber issue.
- Physical security - applicability broad enough to reach beyond cyber. Cyber is a part.
- 1st half of 002 is not a cyber - BES impact method will be
- Security issues - overlaps - categorization exercise sets up for CIP 10 -18 family, physical protection of equipment. Electro mechanical vs. digital.
- Upgrading equipment - don't have to go through the process.
- Unclear section of white paper. Trying to address risk in the writing of the controls addressing different operating environments. Addressing risk in the entity level - applying a vulnerability analysis.
- If we don't know how we are going to do this.
- Trying to write a requirement for this will be very hard.
- Remember Mike Assante's advice to the Team in December: look at what you want to accomplish and then think out of the box on how to get there.
- Focusing on what is our method of identify protections. After feedback, we will move forward flushing out another white paper focusing on the controls and protection.
- Concerned about expectations regarding risk assessments and small entities

13. Effect of Cyber Systems Categorization on Requirements

The Drafting Team did the best we could laying out levels we know today.

Member Comments

- Focus on the importance of connectivity.
- We need to evaluate - the appropriate format, vs. assuming we will keep the same format. This may be an issue to take up further into to the development of the CIP 002 Standard.

C. Phase 2/Version 3 Working Paper Discussion - Day Two

1. Day One Summary

On Day two the facilitators reviewed the following SDT areas of possible agreement with Working Paper approach and concepts from the day one SDT discussion:

- Recognize different audiences: develop Executive Overview (e.g. will have to protect more assets than before; will require identification of more BES assets than did before; will require different levels of protection) that clarify the intent at a high level regarding methodology;

- Address structured and unstructured threats;
- Develop graphic and tabular depictions of key concepts in white paper;
- Terms and definitions - take a step back and address in content sections;
- Address connectivity as an important concept;
- Seek outside assistance from operating and planning committees for identifying and categorizing BES sub systems and reliability function; and
- Categorize the cyber systems.

The facilitators noted there were several outstanding issues raised by the Working Paper issues and the day-one discussion which could be taken up in small group discussions.

2. 3rd Party Review and Risk Based Approach

The facilitators first reviewed the day one discussion on the section, "3rd Party Review of BES Subsystem Categorization Options"and the related point of consensus from the April 2009 SDT meeting upon which the drafting team had drafted this section which stated: "The Standards will require oversight of the categorized list of BES assets by entity types which have a more complete wide-area view of the BES." The facilitators then reviewed several possible oversight options from the day one discussion including:

- White Paper option - hierarchal structure (entities, reliability coordinator, regional entity and ERO) area wide perspective, entities categorize BES subsystems with oversight by RC, RE and ERO and with burden on reviewer to justify adding to the entities list of categorized BES subsystems and an appeals process.
- Regional Entities develop criteria for categorization of BES subsystems through regional standards development process and ERO review and approval.
- BES System Categorization criteria will be established at the Interconnect wide level and SDT drafts the criteria and augment with subject matter expertise with oversight through the normal audit process.
- BES System Categorization minimum criteria established at the continental level and SDT drafts the criteria and augment with subject matter expertise with oversight through the normal audit process with an option for interconnections to argue for variation or additional more stringent criteria.

The SDT discussed the working paper section on Risk Based Approach to Security Control Selection. Members suggested the needs for some level of flexibility given that this is an exercise in reducing the risk.

SDT Comments on the Risk Based Approach

- Give entity some level of flexibility other than just the TFE – propose a move to a performance based security assessment – write controls to address risk to the asset – valuable based assessment

- Rewriting the requirements and decoupling them from the controls – different types of controls to address requirements – look at environment and have options to address
- Changing the requirements to better point to the controls – with different ways to mitigate the risk
- How do we do what we feel needs to be done within the bounds of the NERC requirements – what a properly written requirement or standard is still a question – these standards are different but can not throw out the auditing system – still have to play within those confines
- Categorizing according to risk impact
- Vulnerability is easier to figure out than threat
- Remember that audits will be to the requirement
- Control based audits work in certain contexts to work out conflicts – that is not how NERC audits – need to write requirements to meet NERC audits
- Gaining consensus on a control based audit system – need to get NERC staff (legal, standards development and audit) on board
- Need to write what the objective is into the working paper to open dialogue with NERC staff
- This aligns with the industry – performance based auditing – sets basis for standards to evolve over time, for lessons to fold back into the standards – this is a culture shift
- Don't agree that the audit system can give much back – because of the way the penalties are assessed

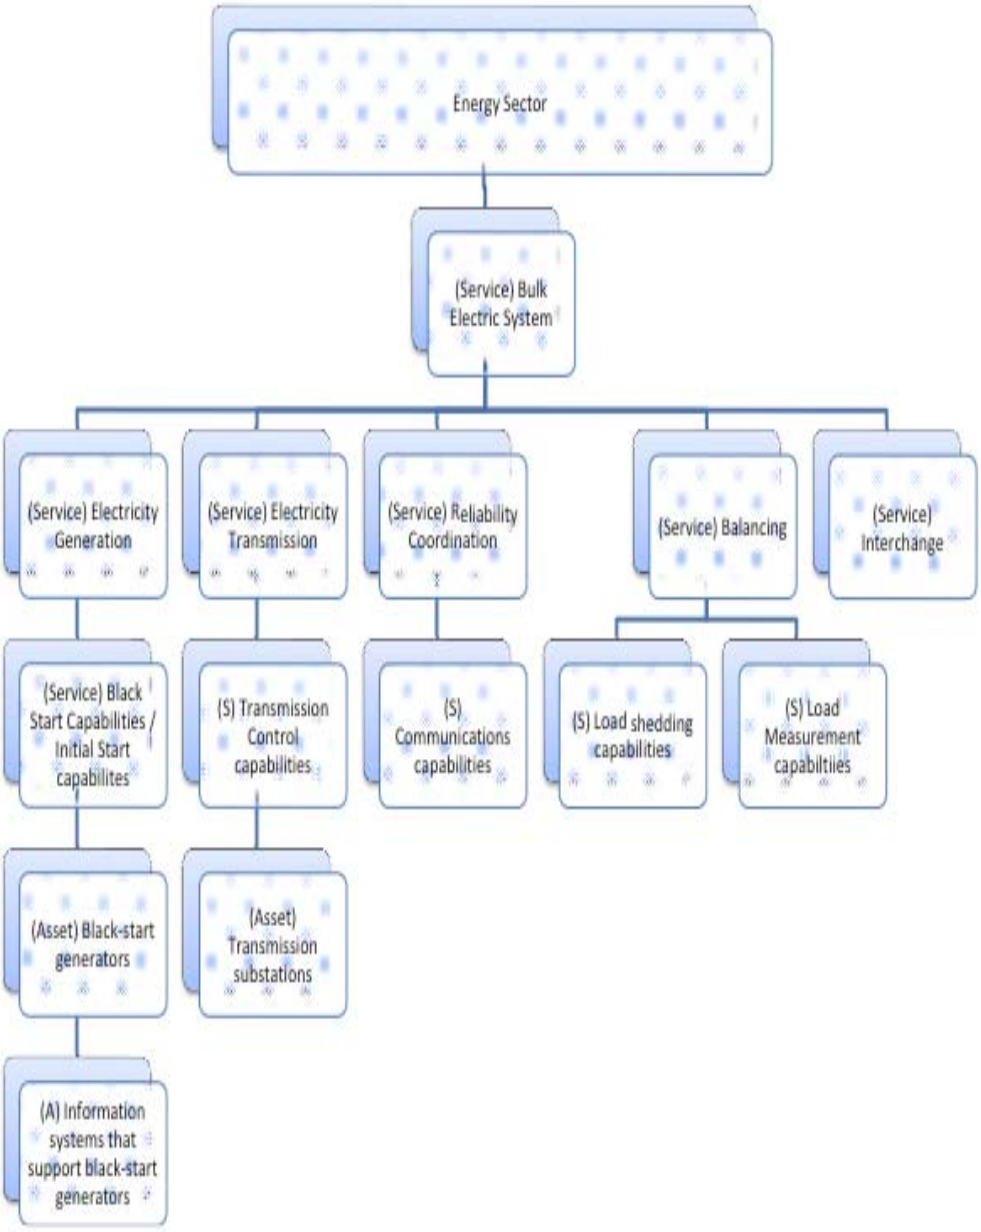
3. Identification of Essential Systems and Categorization of BES Subsystems.

After some clarifying discussion regarding the intent of the white paper, the drafting team agreed to refine the existing section and clarify to what degree the entity should have the discretion to categorize any of the BES subsystems. Of the areas of concern the facilitators identified from day one's discussion, the SDT agreed to work in two small groups to further explore and refine the issues and options.

a. Identification of Essential Systems

Frank Kim provided a summary of the small group take away points including:

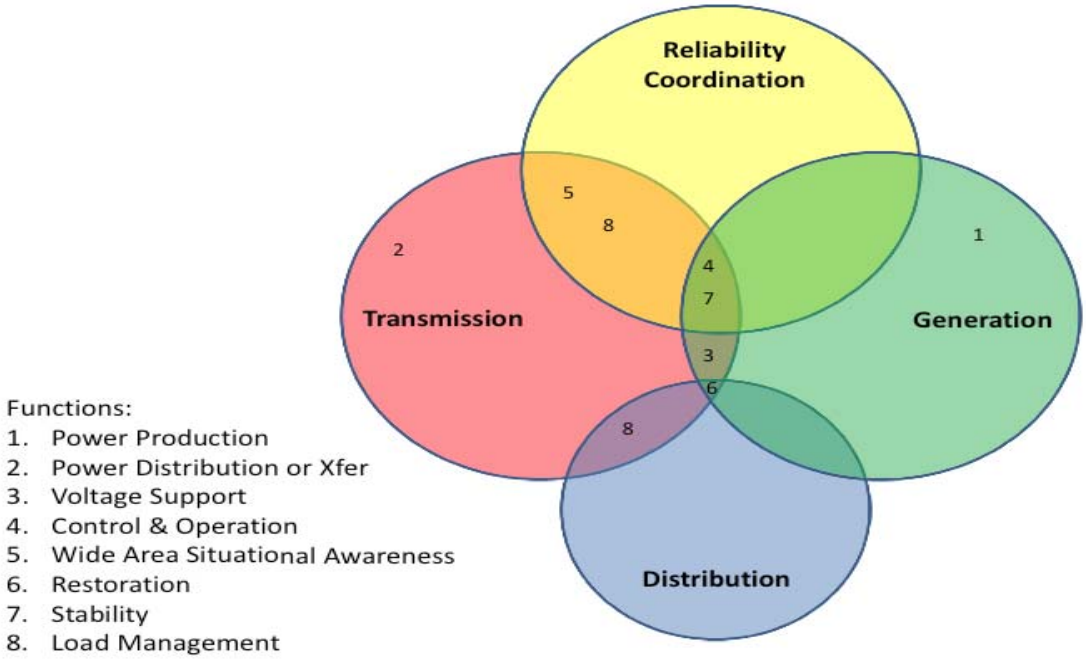
- Reduce ambiguity about what is and is not within the scope;
- Clarify what is meant or included in "other" – list what was meant as examples for the industry; and
- Whether or not integrity of data as to communications is a requirement – integrity of function of the links between systems.



Energy Sector
(Service) Bulk Electric System
(Service) Electricity Generation
(Service) Electricity Transmission
(Service) Reliability Coordination
(Service) Balancing
(Service) Interchange
(Service) Black Start Capabilities / Initial Start capabilites
(S) Transmission Control capabilities
(S) Communications capabilities
(S) Load shedding capabilities
(S) Load Measurement capabiltiies
(Asset) Black-start generators
(Asset) Transmission substations
(A) Information systems that support black-start generators

b. Categorization of BES subsystems

Jackie Collett presented the small group's report using the chart below. She noted they have attempted to graphically relate the eight functions (set out in the working paper) to some of the services – roles. They may try to put in some specific examples for clarity for the industry. Once they flesh this out we can ask committees for their thoughts and reactions**.** They deliberately tried not to use some of the common NERC terms and they are getting away from who owns it. This will be is an iterative process, a series of steps. The current CIP standards are system – based but you may not be protecting what you really need to protect for purposes of reliability – this is a more holistic approach to what you need to protect. While you may have to protect a thing, it is a collection of things that must operate together**.** Assessments help compartmentalize what you need to look at – those who claim to not have anything may actually have assets that need to be protected. We will be trying to identify the set of controls needed to protect an asset. In the end the objective will be to come up with categorized list – categorized by level of risk. How can we quantify the impact without knowing its impact on the BES? Most entities currently do not know the impact. We need to set criteria to establish the impact**.** What is missing now is protecting cyber system and functions – current CIPs do not get us there. The process we come up will need to be agreed to and understood by the industry. We want to apply a consistent level of control – not everything should be protected at high – if filtered through the right criteria – that is the key. We must make sure everyone has a minimum level of protection**.** Smaller entities need to be made aware of their impact on the larger system. We will have to resolve the issue of market sensitive data.



Functions:
1. Power Production
2. Power Distribution or Xfer
3. Voltage Support
4. Control & Operation
5. Wide Area Situational Awareness
6. Restoration
7. Stability
8. Load Management

SDT Comments on the Report

- Still concerned about process of applying everything and categorizing BES stuff – subject to penalties, but have we protected anything?
- Role intended to replays subsystem? No, it is something different
- What is generation? Staying away from it because it means different things to different people
- Question regarding the second column
- Did not consider the question the criteria but rather the level of criticality to the system
- Intent of paper to address the system in terms of functions to get to integrity of the data – address in cyber system interconnections
- Some in industry may be looking for a list – call out some items
- For BES we may offer some examples, not a list – do not want to end up with a check list – reluctant to do so this early – illustrative examples only
- Trying to identify where a system or function fits – examples may help clarify
- EMS is critical because of what it can affect – not critical itself
- Also question of ownership

4. FERC Conference Call and the TFE

Another small group (including Team Members Jeri Domingo Brewer, Kevin Perry, John Lim and Gerry Freese and David Norton and NERC staff) participated in a phone conference with FERC staff regarding the pending interpretation requests for the CIP standards requirements including the including the six wall boundary issues. The SDT members brought up the issue of the currently proposed TFE process limiting TFE requests to only those requirements where technical feasibility was specifically referenced in the standard requirement. FERC staff indicated it was never their intent to limit TFE requests in that fashion and that FERC staff would get with NERC to discuss this further. FERC noted its intent was only to sever the relationship between TFE requests and Reasonable Business Judgment and that they actually intended to broaden the applicability of the TFE request, not narrow it. FERC, NERC and the SDT small group will participate in a follow up call on June 2.

D. SDT CIP Version 3/Phase 2 Process Going Forward

1. Focusing on CIP 002 and Deferring Decisions on CIP 003-009?

The SDT discussed how or whether we need to stay within the current framework of CIP 2-9. Some believe the SDT needs to nail down the broad scope of 002 before having that discussion. The working paper is trying to capture conceptually our expected approach – may need to rephrase how we will go about modeling the existing 002-009. Perhaps the SDT can discuss the expectations about this at an upcoming meeting.

2. Seeking Expert Assistance

The Planning and Operating Committees cannot nominate anyone until June, 2009. The SDT discussed whether it might solicit the informal input of a few individuals respected in the industry. This would not be a substitute for the ongoing participation and contributions of those participating at the meetings and on the WebEx, nor the outreach to the Operating and Planning Committees, nor the briefing of the NERC Members Representative Committee. Several names were mentioned in the SDT conversation and staff agreed to coordinate with member in making the contacts and requests.

3. Concept/Working Paper Readiness for Industry Review, Level of Detail and Audience

The concept for the working paper is to put forward an approach to 002 initially and later fleshing out the detail after getting industry reactions. Many expressed concerns with the level of detail for this working paper and suggested it be more conceptual at this point.

- Use the executive summary to explain the concept without the detail in the rest of the document – the high level overview you want others to review – will not overwhelm others with the detail
- Higher level paper to send out – can not have high level in one section and more detail in others – more detail we put out the more reaction – comments we will get back
- BES continue to put out the system approach to explain change from current system
- Would have to pull back some of the details in the paper today – some of the details go to how to redraft the standards – people already talking about the paper and members are getting questions on details.
- There may need to split into two documents with a summary for the larger body and the detailed version for our use. However care should be taken in splitting the paper into two – the SDT needs input from key individuals with the qualifications necessary to look at both sides

4. Expectations for Adoption of 002

- Multiple rounds of drafts will be needed before we gain consensus with industry – should be parallel to development of standards and controls – if consensus on 002 occurs first then move to ballot but if takes longer than securities control then we may wait and issue together.
- Some prefer putting it out as a whole – less need to put out first if FERC will address TFE interpretation with NERC
- I also agree with waiting till everything is ready – but the SDT and NERC must keep industry updated with drafts – not comfortable voting without the whole package.
- This can remain an open question as needed.

VI. NEXT STEPS

A. 2009 SDT Workplan Approach

Bob Jones, SDT facilitator, noted the proposal to proceed with CIP 002's development in the remaining half of 2009 and refine it after a sequence of comments from the industry before going to the ballot.

B. Workplan Schedule

The Chair reminded people to register for the Portland Bonneville Power meeting and that the July meeting would take place in Vancouver, B.C., Canada.

C. CIP 002 Working Paper Development

The drafting team agreed to continue working on refining the working paper including taking a more conceptual approach while holding the details for consideration as the SDT begins development of the CIP 002. Categorization of the BES assets still needs refinement and help from outside experts. Scott Mix will take the lead to see if additional expertise can be provided to the sub team.

D. Process Evaluation - What has Worked, What could be Improved?

Hal Beardall reviewed with the SDT the results of the process survey undertaken in March and April. (See Appendix #7). Following the review, Stu Langton led a onsite meeting evaluation discussion and members completed written evaluation forms (See, Appendix #3)

The meeting concluded by the SDT members thanking the Chair for her hosting and for the very productive meeting and informative field trip.

The SDT adjourned at 3:45 p.m. on May 14.

Appendix # 1
Cyber Security Order 706 SDT — Project 2008-06
Draft Meeting Agenda
May 13, 2009 | 8:00 a.m. to 3:00 p.m. EDT
May 14, 2009 | 8:00 a.m. to 5:00 p.m. EDT
Bureau of Reclamation
Boulder City, NV

Proposed Meeting Objectives/Outcomes

- Receive update Phase I Recirculation Ballot results
- Review MRC presentation and input
- Receive update on TFE and VSL processes;
- Receive update on the SDT "Key Messages Task Group"
- Review, refine and adopt the Phase II White Paper as a conceptual framework going forward;
- Agree on next steps in the Work plan and assignments.

Draft Agenda

Wednesday	**May 13, 2009**
8:00 a.m.	Welcome and Opening Remarks- *Jeri Domingo-Brewer/Kevin Perry* a. Roll Call b. NERC Antitrust Compliance Guidelines c. Facilitator review of April meeting summary and adoption d. Update on SDT Team Membership
8:20 a.m.	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Jeri Domingo Brewer and Bob Jones*
8:25 a.m.	Update on the Phase 1 Recirculation Ballot Results-*Jeri Domingo Brewer*
8:30 a.m.	Update on NERC Member Representative Committee May 5, 2009 Presentation
8:40 a.m.	Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure Posting- *Scott Mix*
8:45 a.m.	Update on VSLs/VSRs - *David Taylor*
8:50 a.m.	Update on the "Key Messages" Task Group - *Gerry Freese*
9:20 a.m.	Overview of FERC Order and Steps to Date in the SDT Phase II Development Process- *Stu Langton*
9:30 a.m.	Phase II Concept Paper Presentation and Discussion- John Lim, Phil Huff, et al
10:30 a.m.	Break
10:30 a.m.	Phase II Concept Paper Presentation, Discussion and Refinements- John Lim, Phil Huff, et al
12:00 p.m.	Working Lunch (Return to plenary meeting at 12:45)

12:45 p.m. Phase II Concept Paper Discussion
2:50 p.m. Drafting Assignments for Thursday

3:00 p.m. Recess (Field Trip to Hoover Dam)

Thursday **May 14, 2009** (As revised May 14, 8:00 a.m.)
8:00 a.m. Welcome and Agenda Review and Review of Portland Logistics
8:05 a.m. "Key Issues" Communications Task Group Discussion and Next Steps - Gerry Freese
8:20 a.m. Phase II Concept Paper Discussion
Review of SDT Areas of Agreement with White Paper Approach and Concepts-Day One

- Recognize different audiences: develop Executive Overview (e.g. will have to protect more assets than before; will require identification of more BES assets than did before; will require different levels of protection) that clarify the intent at a high level regarding methodology.
- Address structured and unstructured threats
- Develop graphic and tabular depictions of key concepts in white paper.
- Terms and definitions - take a step back and address in content sections
- Address connectivity as an important concept
- Seek outside assistance from operating and planning committees for identifying and categorizing BES sub systems and reliability functions
- Categorization of Cyber systems

Outstanding White Paper Issues
3rd Party Review of BES Subsystem Categorization Options (pros-cons and ranking)
Identification of Essential Cyber Systems
Risk Based Approach to Security Control Selection
Final categorization of cyber systems based on overall impact on the BES
8:45 a.m. 3rd Party Review of BES Subsystem Categorization Options (pros/cons and ranking)

10:30 a.m. Break

10:45 a.m. Phase II Concept Paper- Small Group Discussion

- Identification of Essential Cyber Systems
- Risk Based Approach to Security Control Selection
- Final categorization of cyber systems based on overall impact on the BES

12:15 p.m. Working Lunch

12:45 p.m. Phase II Small Group Reports
2:00 p.m. Clarification of Next Steps on White Paper Development
White Paper Development and Release - input on BES from Operating and Planning Committees.

2:15 p.m. Break

2:30 p.m. Work plan and Schedule Issues
- TFE and the SDT - weighing the value and costs of the SDT addressing TFE in 2009
- CIP 002 - Review and Test Consensus on Developing CIP 002 for Industry Comment and Ballot

3:25 p.m. Review of SDT Member Process Evaluation and Steps Forward

4:00 p.m. Other Issues

4:30 p.m. Assignments, Next Steps and Review of Work-plan and June meeting objectives

4:45 p.m. Meeting Evaluation – What was accomplished? What helped? What can be improved?

5:00 p.m. Adjourn

Appendix # 2
Cyber Security for Order 706 Standard Drafting Team and Attendees List
May 13-14, 2009 Project 2008-06 — CS 706 SDT

Orlando, Florida

Attending in Person – SDT Members

1. Rob Antonishen	Ontario Power Generation (Tuesday and Wednesday)
2. Jim Breton	ERCOT
3. Jeri Domingo-Brewer, Chair	**U.S. Bureau of Reclamation**
4. Jackie Collett	Manitoba Hydro
5. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp.
6. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
7. Phillip Huff	Arkansas Electric Coop Corporation
8. John Lim	CISSP, Department Manager, Consolidated Edison Co.NY
9. Frank Kim	Ontario Hydro
10. David Norton	Policy Consultant, CIPEnergy Coporation *(Tues & Wed.)*
11. **Kevin B. Perry, Vice Ch.**	Director, IT-Infrastructure, Southwest Power Pool
12. David S. Revill	Georgia Transmission Corporation
13. Scott Rosenberger	Luminant Energy
14. Kevin Sherlin	Sacramento Municipal Utility District
15. Jonathan Stanford	Bonneville Power Administration
16.Keith Stouffer	National Institute of Standards & Technology
17. John D. Varnell	Technology Director, Tenaska Power Services Co.
18.William Winters	Arizona Public Service, Inc.
1. Roger Lampilla	NERC
2. Mike Assante	NERC (Wednesday)
3. David Taylor	NERC (Wednesday)
4. Scott R. Mix	NERC
5. Tom Hoffstetter	NERC (Formerly Midwest ISO, Inc)
6. Joe Bucciero	NERC/Bucciero Assoc.
7. Robert Jones	FSU/FCRC Consensus Center (Wed. & Thursday)
8. Stuart Langton	FSU/FCRC Consensus Center
9.Hal Beardall	FSU/FCRC Consensus Center

SDT Members Attending via WebEx-Phone

19.Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co.
20. Richard Kinas	Orlando Utilities Commission (Wednesday)
21. Christopher A. Peters	ICF International

SDT Members Unable to Attend

1. Jay S. Cribb	Information Security Analyst, Southern Company Services, Inc.
2. Sharon Edwards	Duke Energy

Others Attending in Person

Bob Tallman	E.ON

Others Attending via WebEx-Phone

Chris Wright	

Sam Morrell	CERT
James Bassett	Lafayette
Jason Marshall	Midwest ISO
Chris Wright	Burns & Mac

Appendix # 3 Meeting Evaluation Feedback

CYBER SECURITY ORDER 706 SDT
MAY 13-14, 2009, BOULDER CITY, NV
MEETING EVALUATION FEEDBACK

Members used the following 0 to 10 scale in evaluating the meeting: 0 means totally disagree and 10 means totally agree. The ranks reflect the average for each category statement.

1. Please assess the overall meeting.

8.29 The agenda packet was very useful.
8.71 The pre-meeting papers (White Paper and Process Evaluation Summary) were very useful.
6.17 The WebEx document display and the audio were effective
7.06 The quality of the meeting facility was good.
8.88 The objectives for the meeting were stated at the outset.
8.00 Overall, the objectives of the meeting were fully achieved.
Were each of the following meeting objectives fully achieved:
9.13 Receive update Phase I Recirculation Ballot results
8.06 Review MRC presentation and input
8.31 Receive update on TFE and VSL processes;
7.19 Receive update on the SDT "Key Messages Task Group"
8.12 Review, refine and adopt the Phase II White Paper as a conceptual framework going forward.
8.31 Agree on next steps in the Work plan and assignments.

2. Please tell us how well you believe the Team members and participants engaged in the meeting.

8.33 The Chair and Vice Chair provided leadership and direction to Team and Facilitators
8.76 The Facilitators made sure the concerns of all members were heard.
8.29 The Facilitators helped clarify and summarize issues.
8.29 The Facilitators helped members build consensus.
8.29 The Facilitators made sure the concerns of all participants were heard.
8.41 The Facilitators helped us arrange our time well.

3. What is your level of satisfaction with what was achieved at the meeting?

8.59 Overall, I am very satisfied with the results of the meeting.
8.65 Overall, the design of the meeting agenda was effective.
8.44 I was very satisfied with the services provided by the Facilitators.
8.50 I am satisfied with the outcome of the meeting.
8.60 I know what the next steps following this meeting will be.
8.00 I know who is responsible for the next steps.

4. Other comments:

What did we achieve?

- Some progress on concept paper

- Consensus on WP
- Improving consensus
- We are getting consensus on the direction the group wants to go
- We obtained a significant amount of consensus on our next steps forward. We needed a lot of direction in the working paper and I think this was achieved.
- We have a course of action that should when complete provide a substantive improvement to electric sector security.
- Major progress on the working paper
- Jon did a good job of summarizing the key points of consensus
- Need for the Key Messages" task group seems to have dissipated.

What are our biggest challenges going forward?

- Keeping to agreed consensus items
- Not getting sidetracked. Keep us on goal!
- After we figure it out…selling it to the industry who did not go through the process.
- Getting industry to agree to this direction
- A lot of work left to do. We need to stay on task
- Industry consensus
- Consensus, industries education
- Time

What suggestions do you have for making our group more productive?

- Better internet access
- Provide copies of all documents prior to meeting
- Small groups remain productive

Appendix # 4
NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and

subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 5
CYBER SECURITY ORDER 706 SDT JANUARY- DECEMBER DRAFT PROJECT SCHEDULE (REVISED MAY, 2009)

OVERVIEW

- **13 SDT FACE-TO-FACE MEETINGS**
- **MULTIPLE SDT SUBGROUP AND SUBCOMMITEES WEBEX MEETINGS**
- **2 NERC MEMBERS REPRESENTATIVE COMMITTEE MEETINGS,** (MAY & AUGUST, 2009)

CYBER SECURITY ORDER 706 SDT DRAFT SCHEDULE
JANUARY-DECEMBER, 2009

DEVELOPMENT OF CIP FRAMEWORK JAN-JUNE, 2009

1. January 7-9 SDT Meeting, Phoenix, AZ ½ / 1/½ day format. Wed-Friday

- Review of Technical Feasibility Exceptions white paper
- Review of Industry Comments on Phase 1 products - Establish and convene small groups to draft responses
- Review of Phase 2 White papers
  January 15 WebEx meeting(s)
- Small group draft responses to industry.
  January 21 WebEx meeting(s)
- Small group draft responses to industry.

2. February 2-4 SDT Meeting, 2009, Phoenix, AZ, ½ / 1/½ day format. Mon -Wed.

- Update on NERC Technical Feasibility Exceptions process
- Review of VSL process and SDT role
- Review of Phase 2 White papers, straw man and principles
- Review and Adoption of SDT Responses to Industry Comments on Phase I and Phase I Product Revisions.

3. February 18-19, SDT Meeting, Fairfax, VA

- Update on Phase I process
- Update on NERC TFE process
- Update on VSL Team process
- Review, discussion and refinement of Phase II/CIP 002 White papers, straw man and principles

4. March 10-11, SDT Meeting 2009, Orlando, FL, ½ /1/1 day format

- Update on NERC TFE process
- Update on VSL Team process
- Review and Refinement of Phase II CIP 002 Straw man Proposals

March 2 - April 1 30-day Pre Ballot
Mid-March - NERC posts TFE draft Rules of Procedure for industry comment
March 30, WebEx meeting(s) White Paper Drafting Team
April 1-10, NERC Balloting on Phase 1 Products
April 6, WebEx meeting- White Paper Drafting Team
April 8, WebEx meeting(s) - White Paper Preview- Full SDT Conference Call
April 11, 2009 Phase I Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments-

5. April 14-16, SDT Meeting, Charlotte NC, ½ / 1/½ day format. Wed-Friday

- Update on NERC TFE process
- Update on VSL Team process
- Update on the NERC Critical Assets Survey
- Agree and Adopt Responses for Phase I Industry Comments- Recirculation Ballot
- Review and Refinement of Phase II Whitepaper and Progress Report to MRC

April 28 and May 6 White Paper Drafting Team Meetings - WebEx.

April 17-27 Recirculation Results: Quorum: 94.37% Approval: 88.32%

May 5, 2009, NERC Member Representative Committee Meeting, Arlington, VA- SDT progress report.

6. May 13-14, Wed.-Thursday, SDT Meeting, Boulder City NV, 2-day format

- Review MRC presentation and any input to SDT on Phase II approach
- Further SDT refinement of the Phase II White Paper.

CIP 002 DEVELOPMENT OF REQUIREMENTS, MEASURES, ETC. JUNE-DEC 2009
7. June 17-18, SDT Meeting, Portland OR, 2-day format

- Further SDT refinement and adoption of the Draft Phase II White Paper.
- Review implementation plan for June-December CIP 002- potential SDT subcommittee structure and deliverables.
- Agree on and charge subcommittees and conduct subcommittee organizational meetings

8. July 13-14, 2009 SDT Meeting, Vancouver, B.C., Canada

- SDT Subcommittees meet to organize and begin drafting revisions to CIP 002 and/or addressing assigned issues.
- SDT Plenary and Subcommittee meetings to review and respond to any industry input/comments on white paper.
- Subcommittee organizational reports to SDT
  July-August, WebEx meeting(s)
- SDT Subcommittee meetings as needed

9. August 20-21, 2009, Chicago IL

- SDT Plenary and Subcommittee meetings to develop and test support for CIP 002 products

August, 2009, **NERC Member Representative Committee**, Progress Report presentation on CIP 002 for MRC input, Winnipeg, Manitoba

10. September 9-10, 2009 Folsom, CA

- SDT Plenary review industry and MRC input on CIP 002 approach and consider and agree on refinements
- SDT Subcommittee drafting meetings- requirements etc.
- SDT Plenary Session(s)- briefings and subcommittee reports
- Review Work plan through Summer, 2010, as needed

September, WebEx meeting

- SDT Subcommittee drafting meetings

11. October 20-22, New Orleans LA

- SDT Subcommittee drafting meetings
- SDT Plenary Session(s) - briefings and subcommittee reports on CIP 002 Requirements, etc.
- Adopt Work-plan through Summer, 2010, as needed

October, WebEx meeting

- SDT Subcommittee drafting meetings

12. November 17-18, Atlanta GA

- SDT Subcommittee drafting meetings
- SDT Plenary Session(s) - briefings and subcommittee reports on CIP 002 requirements, etc.

November, WebEx meeting

- SDT Subcommittee drafting meetings

13. December 15-17, Tampa

- SDT Plenary Session(s) to review, refine and agree on Draft CIP 002 Initial post for industry review and comments
- SDT Subcommittee drafting meetings

December, WebEx meeting

- SDT Subcommittee meetings

SDT 706- 2010

- CIP 002- SDT Respond to Industry Comments, Refine CIP 002
- Initiate CIP 003-009 Development of Requirements, Measures, and Controls etc.
- Develop a full set of CIP 002-009 Standards for Industry Comment

- Refine and Submit for Industry Ballot
- NERC Board of Trustees Adopts
- FERC Approves and NERC Implements

Appendix # 7 SDT Process Survey and Recommendations

TO: **SDT 706 Team Members**

FROM: **Jeri Domingo Brewer, Chair and Kevin Perry, Vice Chair, SDT 706.**

RE: **SDT 706 DRAFT PROCESS SUGGESTIONS GOING FORWARD**

DATE: **May 11, 2009**

Thanks again to the members who provided their thoughts and reflections on the online SDT process survey that our facilitators produced. Your responses underscore the Team's commitment to practical improvements that help us to seek to continue to improve our productivity as a team. Attached to this memo is an executive summary and the complete results *(without attribution but with respondents listed)* of the survey for your information.

Below are our thoughts and reflections based on your responses. We have organized these in 7 areas with suggestions on how we might respond to the survey results and institute practical improvements. We plan to discuss these suggestions at our upcoming meeting with an eye towards implementing those the Team believes will be helpful going forward.

1. **SEEK GREATER EFFICIENCY IN OPEN SDT DISCUSSIONS**
   - SDT members should continue to share the airtime and keep their points brief and well focused.
   - SDT facilitators should clarify the objectives of sessions at the outset and manage discussions to achieve those objectives. Use of the "parking lot" tool should be used to keep the SDT on track and bring back off-topic points.

2. **USE OF WEBEX AND PHONE-AUDIO FOR SDT MEETINGS**
   - In planning for meetings, take into account the quality of the facilities' telephone, audio web connections. This is important for the Team members and for others following the SDT process.
   - Facilitators should use WebEx to engage members who are participating by phone and ensure that meeting participants voices are clearly captured

3. **USE OF SDT SUB-GROUPS TO DRAFT PHASE I STANDARDS (OCTOBER-NOVEMBER, JANUARY-FEBRUARY)**
   - Subgroups have and will continue to be critical to making progress with the SDT given its size and the complexity of the charge.
   - Greater care should be taken in charging the subgroups with clear objectives and consistent formats and consistent definitions of terms to guide their efforts.

- Provide sufficient time for reporting back and agreement for suggestions for further refinements and consensus building.
- Continue to use small groups for drafting responses to industry comments.
- When possible, develop a draft straw man of responses that are consistent and can be refined through the SDT small and full group review and discussion.

4. USE OF STRAWMAN DRAFTS

- Straw man drafts have been effective ways to engage the SDT but multiple, competing straw man documents require more time and effort.

5. USE OF A 4-POINT ACCEPTABILITY SCALE TO PROVIDE A GAUGE OF SDT SUPPORT FOR PROPOSALS

- Facilitators should make sure the SDT is clear on draft conceptual proposals prior to using the ranking tool to test acceptability. It should be used for flushing out divergent perspectives and seeking to find common ground.

6. DISTRIBUTION OF TIMED AGENDAS AND MEETING OBJECTIVES IN ADVANCE OF SDT MEETINGS AND DETAILED MEETING SUMMARIES INCLUDING EXECUTIVE SUMMARIES AND APPENDICES.

- Continue to produce and circulate agendas with objectives
- Facilitators should be clear and explicit with the SDT when the discussion is off the agenda. When the time allotted for the discussion needs adjustment the facilitators should clarify the tradeoffs and make a proposal to chair and team.
- Make summaries available on website and let the members know and give them the precise link where they can draw it down.

7. USE OF ONSITE MEETING EVALUATION

- Use a combination of a group onsite evaluation and an individual evaluation form. Capture and summarize in the meeting summary.
- Facilitators should encourage members to provide informal side-bar feedback on process concerns that can be shared with the Chair-Vice Chair for consideration.

Cyber Security Order 706 Standard Drafting Team
On-Line Process Evaluation Survey Results (19 of 23 members)

EXECUTIVE SUMMARY
(May 12, 2009)

HOW SATISFIED ARE YOU WITH THE PROGRESS THE SDT HAS MADE AND OUTCOMES IT HAS ACHIEVED SINCE OCTOBER, 2008?

Ranking Scale	*Very Satisfied-4*	*Generally Satisfied-3*	*Somewhat Satisfied-2*	*Dissatisfied-1*	*Avg.*
Totals for	**5**	**8**	**5**	**1**	**2.9**
Totals for	**1**	**1**	**0**	**0**	**3.5**

STRENGTHS
- Productive group in spite of size
- The breadth of knowledge and experience of team members
- The independent facilitation team allows Team to focus on content
- Phase I was very successful

CHALLENGES
- Managing time effectively
- Managing external issues and pressures - Smart Grid, legislative proposals,
- Managing the impact on the SDT deliberation of high profile issue with lots of media attention.
- Phase II is getting off to a rocky start.
- Balance between discussion and decisions.
- This was a 'fast' process overall. I'd like to be further along with the Phase II ideas
- The development of these standards is complex, and our progress is non-linear.
- It is likely that we won't be able to take a direct path to the result, and will need to wander around. This, at times, may frustrate some team members more than others (and frustrate us all sometimes!).
- The process seems to work, but the progress seems difficult. I expect that once the framework is fully developed, progress will speed up.
- Fear of introducing real security to the electric sector. Given the current environment we need to shift our focus to providing justification and building confidence in the plan we have.

SDT PROCESS ITEMS
(Note: Summary comments are offered for those areas receiving less than 3.0 average)

1. USE OF WEBEX AND PHONE-AUDIO FOR SDT MEETINGS

Ranking Scale	Very Satisfied-4	Generally Satisfied-3	Somewhat Satisfied-2	Dissatisfied-1	Avg.
Totals for	**0**	**10**	**8**	**1**	**2.5**
Totals for	**1**	**1**	**0**	**0**	**3.5**

Summary of Points

- Effectiveness directly proportional to quality of teleconferencing facilities at the face-to-face site. Quality of audio and WebEx has been inconsistent.
- This working is essential to the whole premise of remote participation.
- Participating via phone is very tough to follow. It is usually hard to hear everyone plus when numerous conversations are going on at once you get lost in the noise.
- This has been a combination of process and logistical slip-ups.
- Audio quality seems to be a continuing issue.

2. USE OF WEBEX FOR SUB-TEAM MEETINGS

Ranking Scale	Very Satisfied-4	Generally Satisfied-3	Somewhat Satisfied-2	Dissatisfied-1	Avg.
Totals for	8	7	2	1	3.2
Totals for	1	1	0	0	3.5

3. USE OF SDT SUB-GROUPS TO DRAFT PHASE I STANDARDS (OCTOBER-NOVEMBER)

Ranking Scale	Very Satisfied-4	Generally Satisfied-3	Somewhat Satisfied-2	Dissatisfied-1	Avg.
Totals for	**9**	**8**	**1**	**1**	**3.3**
Totals for	**1**	**1**	**0**	**0**	**3.5**

4. USE OF SMALL GROUPS TO DRAFT RESPONSES TO PHASE I (JANUARY-FEBRUARY)

Ranking Scale	Very Satisfied-4	Generally Satisfied-3	Somewhat Satisfied-2	Dissatisfied-1	Avg.
Totals for	**8**	**10**	**1**	**0**	**3.4**
Totals for	**0**	**2**	**0**	**0**	**3.0**

5. USE OF STRAWMAN DRAFTS

Ranking Scale	Very Satisfied-4	Generally Satisfied-3	Somewhat Satisfied-2	Dissatisfied-1	Avg.
Totals for	**8**	**7**	**3**	**1**	**3.2**
Totals for	**1**	**1**	**0**	**0**	**3.5**

6. USE OF A 4-POINT ACCEPTABILITY SCALE TO PROVIDE A GAUGE OF SDT SUPPORT FOR PROPOSALS

Ranking Scale	Very Satisfied-4	Generally Satisfied-3	Somewhat Satisfied-2	Dissatisfied-1	Avg.
Totals for	**3**	**10**	**4**	**1**	**2.8**
Totals for	**1**	**1**	**0**	**0**	**3.5**

Summary of Points

- Very helpful - to hear alternate points of view and especially the expectation that dissenters need to provide alternative language and not just vote "no".
- Good mechanism for gauging general group preferences, divergent perspectives and agreements on conceptual approach. Less effective at actually garnering support for a particular approach. Can lead to too much focus on words while missing the idea.
- Need more succinct issues to vote on, or more discussion time up front to more fully flesh out broad ideas.

7. Adoption and use of a 75 percent consensus decision rule with a 2/3's quorum

Ranking Scale	*Very Satisfied-4*	*Generally Satisfied-3*	*Somewhat Satisfied-2*	*Dissatisfied-1*	*Avg.*
Totals for	**8**	**10**	**0**	**0**	**3.4**
Totals for	**1**	**1**	**0**	**0**	**3.5**

8. Distribution of timed agendas and meeting objectives in advance of SDT meetings

Ranking Scale	*Very Satisfied-4*	*Generally Satisfied-3*	*Somewhat Satisfied-2*	*Dissatisfied-1*	*Avg.*
Totals for	**9**	**7**	**1**	**0**	**3.5**
Totals for	**1**	**1**	**0**	**0**	**3.5**

9. Detailed meeting summaries including executive summaries and appendices

Ranking Scale	*Very Satisfied-4*	*Generally Satisfied-3*	*Somewhat Satisfied-2*	*Dissatisfied-1*	*Avg.*
Totals for	**9**	**8**	**1**	**0**	**3.4**
Totals for	**2**	**0**	**0**	**0**	**4.0**

10. Use of onsite meeting evaluation

Ranking Scale	*Very Satisfied-4*	*Generally Satisfied-3*	*Somewhat Satisfied-2*	*Dissatisfied-1*	*Avg.*
Totals for	**3**	**10**	**5**	**0**	**2.9**
Totals for	**2**	**0**	**0**	**0**	**4.0**

Summary of Points

- Some people are in a hurry to leave and may not give the evaluation a lot of thought.
- Comments helpful while they are fresh.
- The process is getting pretty well honed at this point.
- You may get more candid and pragmatic response with a one-on-one sidebar discussion with those that are visibly frustrated during a meeting.
- Evaluations provide an opportunity to address what isn't working

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Draft Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

May 13, 2009 | 8 a.m.–3 p.m. EST
May 14, 2009 | 8 a.m.–5 p.m. EST
Bureau of Reclamation
Boulder City, NV

Proposed Meeting Objectives and Outcomes

- Receive update Phase I Recirculation Ballot results
- Review NERC Members Representative Committee presentation and input
- Receive update on TFE and VSL processes
- Receive update on the SDT "Key Messages Task Group"
- Review, refine, and adopt the Phase II White Paper as a conceptual framework going forward
- Agree on next steps in the Work plan and assignments

Wednesday, May 13, 2009 | 8 a.m.–3 p.m. PST (with working lunch from noon to 12:45 p.m.)

- Welcome and Opening Remarks — Roll Call; NERC Antitrust Compliance Guidelines; Facilitator review of April meeting summary and adoption; Update on SDT Membership
- Updates on — Phase 1 Recirculation Ballot Results; NERC Member Representative Committee May 5, 2009 Presentation; Technical Feasibility Exception (TFE) NERC Rules of Procedure Posting; VSLs and VSRs; and "Key Messages" Task Group
- Overview of FERC Order and dteps to date in the SDT Phase II Development Process
- Phase II Concept Paper Presentation Discussion — John Lim, Phil Huff, et al

Thursday, May 14, 2009 | 8 a.m.–5 p.m. PST (with working lunch from noon to 12:45 p.m.)

- Welcome and Agenda Review
- Phase II Concept Paper Refinements and Discussion — John Lim, Phil Huff, et al
- Phase II Concept Paper Framework Adoption and Discussion of Implementation Steps
- Review of SDT Member Process Evaluation and Steps Forward
- Assignments, Next Steps, Review of Work plan, and June meeting objectives
- Meeting Evaluation — What was accomplished? What helped? What can be improved going forward?
- FERC Approves and NERC Implements

MEETING SUMMARY CONTENTS

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team
Draft Eleventh Meeting Summary,
June 17-18, 2009
Portland, OR

EXECUTIVE SUMMARY

The Chair, Jeri Domingo-Brewer and Vice Chair Kevin Perry welcomed the members at 8:00 a.m. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call for each day. The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed with the Team and participants the proposed meeting agenda *(See appendix #1*).

Mr. Bucciero reviewed with the Team the need to comply with NERC's Antitrust Guidelines. He urged the Team and other participants in the process to carefully review the guidelines as they would cover all participants and observers.

Scott Mix provided an update briefing to the SDT noting that the posting period closed for the TFE had closed with 52 organizations providing comments over 450 pages. He reviewed his presentation made a week earlier at the NERC CIPC meeting and noted that NERC staff is now analyzing the comments. NERC staff, including SAIS and outside counsel, is reviewing comments, making responses, and preparing modifications. The NERC BOT will need to approve the resulting TFE document. There is not a requirement for another round of public comments and responses, like the ANSI standards process. The revised TFE will be sent to the Management Representative Committee (MRC) of NERC before being presented to the NERC BOT for adoption. The TFE document will be filed with FERC and will follow the same process for approval as the CIP standards.

Scott also referenced the FERC Order 706 B, which clarified that facilities within each nuclear generation plant in the United States that are not regulated by the NRC are subject to compliance with the eight mandatory Critical Infrastructure Protection (CIP) Reliability Standards, noting that NERC has reconstituted the version 1 SDT and recently convened a town hall meeting that produced a good dialogue and excellent questions.

Scott Mix, on behalf of David Taylor, NERC, also provided an update on the VSL/VRFs. They were posted in May, 2009 for industry comment, and the comment period is now closed. The 93 pages of comments from 10 entities are being reviewed by the respective NERC drafting team. Version 1 & Version 2 VSL/VRFs must be filed by July 1, 2009.

Stu Langton reviewed with the SDT the milestones in Phase 1 and Phase 2 of the SDT work. The working paper has provided a basis for developing the consensus points the SDT agreed to at its Charlotte meeting in April. Joe Bucciero, with the SDT facilitation team, reported that following the Boulder City meeting the Drafting Team has been supplemented with BES expertise from Jim Case,

Jamey Sample, Jack Bernhardsen, Jason Marshall, and Sam Merrill. Others have also been invited to participate, but have not yet done so.

John Lim and Jackie Collett jointly presented the next draft of the Phase 2 Working Paper and invited the SDT to pose clarifying questions, note concerns, and offer options for addressing the concerns. Mr. Lim noted the working paper suggests that this "proposed cyber system categorization" approach includes the consideration of NERC's mission, the essential functions necessary in achieving this mission, an impact-based methodology to categorize the BES subsystems and the associated cyber systems, and finally the deterministic derivation of an overall impact-based categorization of the cyber systems, with the anticipated application of cyber security requirements commensurate with that categorization. This parallels general approaches to risk management practices, which focus first on identifying key processes necessary for meeting high-level objectives, then drilling down into supporting processes.

Jackie Collett noted that the drafting team received help from James Case and Jason Marshall in refining the BES reliability functions and that generation was, in part, revised as a result. The Working Paper Subgroup presented examples of BES subsystems that were intended as simple ways to conceptually illustrate that while the individual impact may be small, it might be big when controlled and is the reason for a high impact determination under common control system. The challenge for the SDT in going forward is developing clear language and criteria when trying to describe these things that can capture the different aspects.

John Lim provided an overview of the current Section on 3rd Party Overview noting that two oversight entities identified in Order 706 - were Reliability Coordinators and Regional Entities. The SDT engaged in a substantial discussion of this section.

The Working Paper Subgroup also presented a new depiction of the"targets of protection" noting that the essential cyber systems don't necessarily stop there. The SDT suggested ways to provide a graphic description without the use of a target metaphor, as was included in the draft Working Paper.

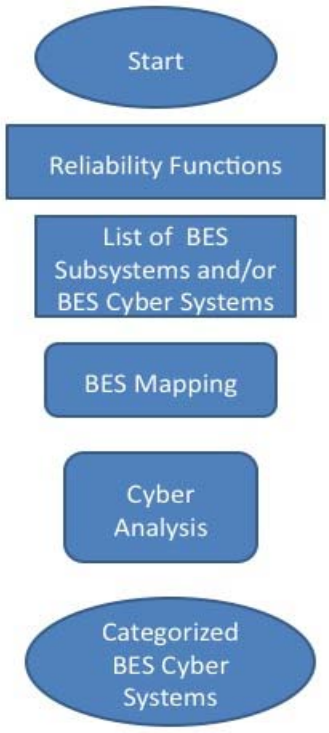
To gain a sense of the SDT and to provide a focus for ongoing SDT discussions, the facilitators asked the members to rate each section of the working paper based on their view of whether the current sections were ready for sharing with the industry (*Are the concepts contained in the working paper sections acceptable for sharing with the industry? 4= Acceptable; 3= Acceptable with minor concerns; 2= Unacceptable unless Address serious concerns; 1=Unacceptable)* Following the rating, the SDT took up a second round of focused comments and suggestions for changes to the seven sections of the document receiving less than a 3.0 average rating. These discussions occurred in the afternoon of June 17 and the morning of June 18 including:

1. 3rd Party Oversight of BES Subsystems Categorization - Review of Concerns (1.9 of 4 Avg.)
2. Defining the Target of Protection (2.5 of 4 Avg.)
3. External Cyber Systems (2.6 of 4 Avg.)
4. Categorization- BES Subsystems, Cyber Systems, and Final Cyber System
   - Categorization of BES Sub-Systems (2.8 of 4 Avg.)
   - Categorization of Cyber Assets (2.8 of 4 Avg.)

- Final Categorization of Cyber System based on Impact to BES (2.5 of 4 Avg.)

5. Identification of Essential Cyber Systems (2.7 of 4 Avg.)

The SDT broke into small groups to discuss and further develop the following scenario concerning the BES Subsystem and Cyber System categorization approach. This led to a further discussion of developing a different sequence for the categorization approach. There was broad SDT member support for this simpler graphic depiction as a working concept for inclusion in the Working Paper.



The SDT Chair, Co-chair, and Members expressed their thanks and appreciation to all those participating on the Working Paper Drafting Subgroup. Before the Vancouver meeting, John Lim agreed to work with Phil Huff, Jackie Collett, and all other interested SDT members to:

- Produce the next draft of the Working Paper, which will be circulated as a final draft for consideration in Vancouver before seeking industry comments.
- Take the review comments of the "target" and produce another graphic using an alternative depiction.
- Continue efforts to develop additional working papers for SDT review going forward on BES Risk Management and Security Controls.

Bob Jones, SDT facilitator, noted the proposal to proceed with CIP 002's development in the remaining half of 2009 and refine it after several of rounds of comments from the industry.

The Chair reminded the SDT Team Members that the SDT would try to establish the 2010 meeting schedule at the July SDT meeting in Vancouver, B.C., Canada. For the time being she noted that the August meeting will take place as scheduled in Chicago pending confirmation of available meeting space. *(Note: The venue for the August Meeting was changed to SERC's facilities in Charlotte, NC subsequent to the close of the meeting.)*

Dave Norton advised the group of a call for self-nominations closing on June 25 for a new SAR drafting team which would be defining next generation of situational awareness control tools for the BES.

The Chair (Jeri Domingo-Brewer) thanked Jon Stanford for hosting this meeting at BPA in Portland, Oregon. The Chair also noted the progress made on the draft Working Paper and, in particular, the refining and simplifying of the process flow chart in determining the categorization of cyber systems and BES System assets. The Chair thanked the Working Paper Drafting Subgroup members for an outstanding job. Members completed an onsite meeting evaluation form.

The SDT adjourned at 3:00 p.m. on June 18.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 Standard Drafting Team
DRAFT ELEVENTH MEETING SUMMARY,
JUNE 17-18, 2009
PORTLAND, OREGON

I. INTRODUCTIONS, AGENDA REVIEW AND REVIEW OF SDT WORKPLAN

The Chair, Jeri Domingo-Brewer, and Vice Chair Kevin Perry welcomed the SDT members and guests, and called the meeting to order at 8:00 a.m. on June 17th. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call for each day *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed with the Team and participants the proposed meeting agenda *(See appendix #1*).

Mr. Bucciero reviewed with the Team the need to comply with NERC's Antitrust Guidelines *(See, Appendix #3).* He urged the Team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

II. UPDATES

A. Technical Feasibility Exception (TFE) NERC Rules of Procedure Posting

Scott Mix provided an update briefing to the SDT noting that the posting period for the TFE had closed with 52 organizations providing comments over 450 pages. He reviewed his presentation offered a week earlier at the NERC CIPC meeting and noted that NERC staff is now analyzing the comments received on the TFE posting. All comments have been posted on the NERC web site. NERC staff is now reviewing and considering modifications to the TFEs and will try to get this done as quickly as possible. Mike Assante, the NERC CSO is the Corporate Officer in charge of content. Dave Cook, NERC General Counsel is in charge of procedure.

Mr. Mix noted several issues raised in the industry comments including:

- Making TFEs applicable to other standards where there is "triggering language"
- Requirement vs. sub requirement - anything under requirement can be covered by a TFE without change.
- CIP 003 R2.3, and/or CIP 003 R3 - an exception to an internal policy is not a compliance issue since it is not a reliability issue.
- NERC staff is currently cleaning up definitions.
- Economic security - doesn't appear in this section.

- Clarification of the Pre-approval process in terms of review and approval by regions. There will probably be a greater role than in the original posting.

Member Comments

- Has NERC considered issuing a statement on requirements/sub-requirements? The statement should cover all reporting so it is consistent.
- Any reaction from CIPC to CIP 003 R2.3? No reactions to this.
- TFE under new procedure is in effect July 1? However, the TFEs are not approved yet. If the TFE process is not approved before June 30, it is in play? If it is in play, and we have a TFE on the table, can we be held out of compliance? Problem for registered entity, ERO and regional. Self-reports of non-compliance? Bad position based on scheduling, workload.
- Adhere to the spirit of the process? Need to resolve this. Sanctions component may be adjusted in this transition period.
- Does NERC have an alternative plan?
- FERC is aware of issue and plans to discuss with NERC to handle this.
- Escalate the TFE issues to the Commission. Roger Lampila will take a note and check with Mike Assante.
- Single request covering multiple requirements for a covered asset.
- How to submit to multiple regional entities?
- Need to resolve the senior manager language - the senior manager or delegate. Why would it be any different? The company's assigned authorizing officer? Sign off on the TFE.
- Removing automatic 60 days. Maybe NERC has 60 days to extend the request. Won't be an automatic disapproval.
- NERC needs to be timely in its response.
- Mitigation plans go to regional entity.
- Will a TFE disapproval generate a spot-check? Problem is a self-report compliance plan. If you don't, self report a denied TFE. Will that invoke a spot check? Sufficient cause to trigger a spot check. No surprise. Advantage to do as a self-report.
- Canadian entities - self report to whom? To the regional entity? Follows the rules for self-reporting. Agreement in place but different for each province.
- Wide area analysis - not as justification for denying TFE. Rewording with fairness in mind - understanding the impact not necessarily for purpose of denial (maybe the first one, not subsequent ones).
- TFE's need to be dealt with on their technical merit only.
- Anticipate BOT to adopt TFE. When? No sooner than August 4-5. Realistically looking at the November meeting.
- BOT Actions without a meeting? Doesn't apply to this.
- FERC process for acceptance probably 2010.
- Reaction at CIPC? Mostly they understand.
- NERC and the industry are trying to make the best of a bad situation.

Mr. Mix concluded that:

- NERC staff, including SAIS and outside counsel, is reviewing comments, making responses, and preparing modifications. NERC BOT will authorize for adoption. There isn't a requirement for another round of public comment nor a response-by-response submittal like the ANSI standards process. Will pass by the Members Representative Committee (MRC) before presenting to BOT for authorization.
- Will follow the same process for adoption and FERC approval.
- In addition Scott referenced FERC Order 706 B on CIP standards for nuclear. NERC has reconstituted the Cyber Security Version 1 SDT. It has 180 days after issuance of the Order (Sept 15). It has met twice by teleconference and convened a 4-hour town hall meeting. Tim Roxy, Scott Mix, and Gerry Adamski were present from NERC, and Scott Morris with the NRC talked about NRC revisions and noted the newly identified critical asset plan was a good starting point for the implementation plan. Scott also noted the town hall produced a good dialogue and excellent questions

B. Update on VSLs-VRFs

Scott Mix, on behalf of David Taylor, NERC, provided an update on the VSL/VRFs. They were posted in May 2009 for industry comment, and the comment period is now closed. The 93 pages of comment received from 10 entities are being reviewed by the SAR drafting team, and Version 1 & 2 VSLs must be filed by July 1. NERC didn't receive a lot of comments on Version 2.

Member Comments

- Does the NERC BOT have authority to file even if industry rejects the VSLs? Yes, with "extenuating circumstances."

III. SDT PHASE 2/VERSION 3 DEVELOPMENT PROCESS - THE "WORKING PAPER"

A. Overview of Phase 2/Version 3 Work Plan

Stu Langton reviewed with the SDT the milestones in Phase 1 and Phase 2 of the SDT work including the work in Little Rock that framed the challenges, the subsequent development of "white papers" following the Washington D.C. meeting in December, 2008 and further review and refinement of those and other papers. This resulted in the SDT convergence on a single consensus approach in Orlando that was refined further in Charlotte and Boulder City with John Lim, Jackie Collett, and Phil Huff leading an expanded drafting team to continue to refine the draft working paper between meetings. The working paper provided a basis for

developing and testing the following consensus points in April that were subsequently offered to the NERC Members Representative Committee (MRC):

1. The Standards should require a BES impact assessment as an initial approach to categorizing BES Cyber Systems.
2. The impact categorization of Cyber Systems will be based on reliability functions of the BES to achieve Adequate Levels of Reliability.
3. The Standard's BES Impact Assessment will consider a categorization process.
4. The Standards will require oversight of the categorized list of BES assets by entity types which have a more complete wide-area view of the BES.
5. The Standards will categorize Cyber Systems supporting, either directly or indirectly, the reliability functions of the BES and apply security requirements (or controls) that are commensurate and appropriate to their potential impact on the BES.
6. The final Cyber System categorization will reflect the impact to the BES based on a loss of availability, integrity, or confidentiality of the Cyber System.
7. The Standards will provide Organizations with reasonable flexibility in applying equivalent security controls on the basis of compensating controls and environmental considerations.
8. The Standards will address the complex nature of BES functions and interconnected Cyber Systems, both within and between multiple organizations.
9. The Standards will state explicit criteria for the BES Impact Assessment.
10. The Standards will state explicit criteria for the Cyber Impact Assessment (including use and misuse of cyber systems).
11. The Standards will include a methodology to merge the BES Impact Assessment and Cyber Impact Assessment into a final Cyber System categorization.

Joe Bucciero, with the SDT facilitation team, reported that following the Boulder City meeting the Drafting Team has been supplemented with BES expertise from Jim Case, Jamey Sample, Jack Bernhardsen, Jason Marshall, and Sam Merrill. Others have also been invited to participate, but have not yet participated.

B. Phase II Working Paper Overview Presentation and SDT Discussions

On behalf of the SDT, the Chair thanked John Lim, Jackie Collett, Phil Huff, and the other members of the drafting team for working productively since the Boulder City SDT meeting and expressed her gratitude for their leadership and good efforts. John Lim and Jackie Collett jointly presented the working paper (*See Appendix #6).* They noted the expanded team met twice by phone/WebEx following the Boulder City meeting.

1. Overall SDT Comments on Working Paper

The Team engaged in an initial discussion of the working paper as part of the overview presentation. A summary of the SDT member comments are noted below. The presentation

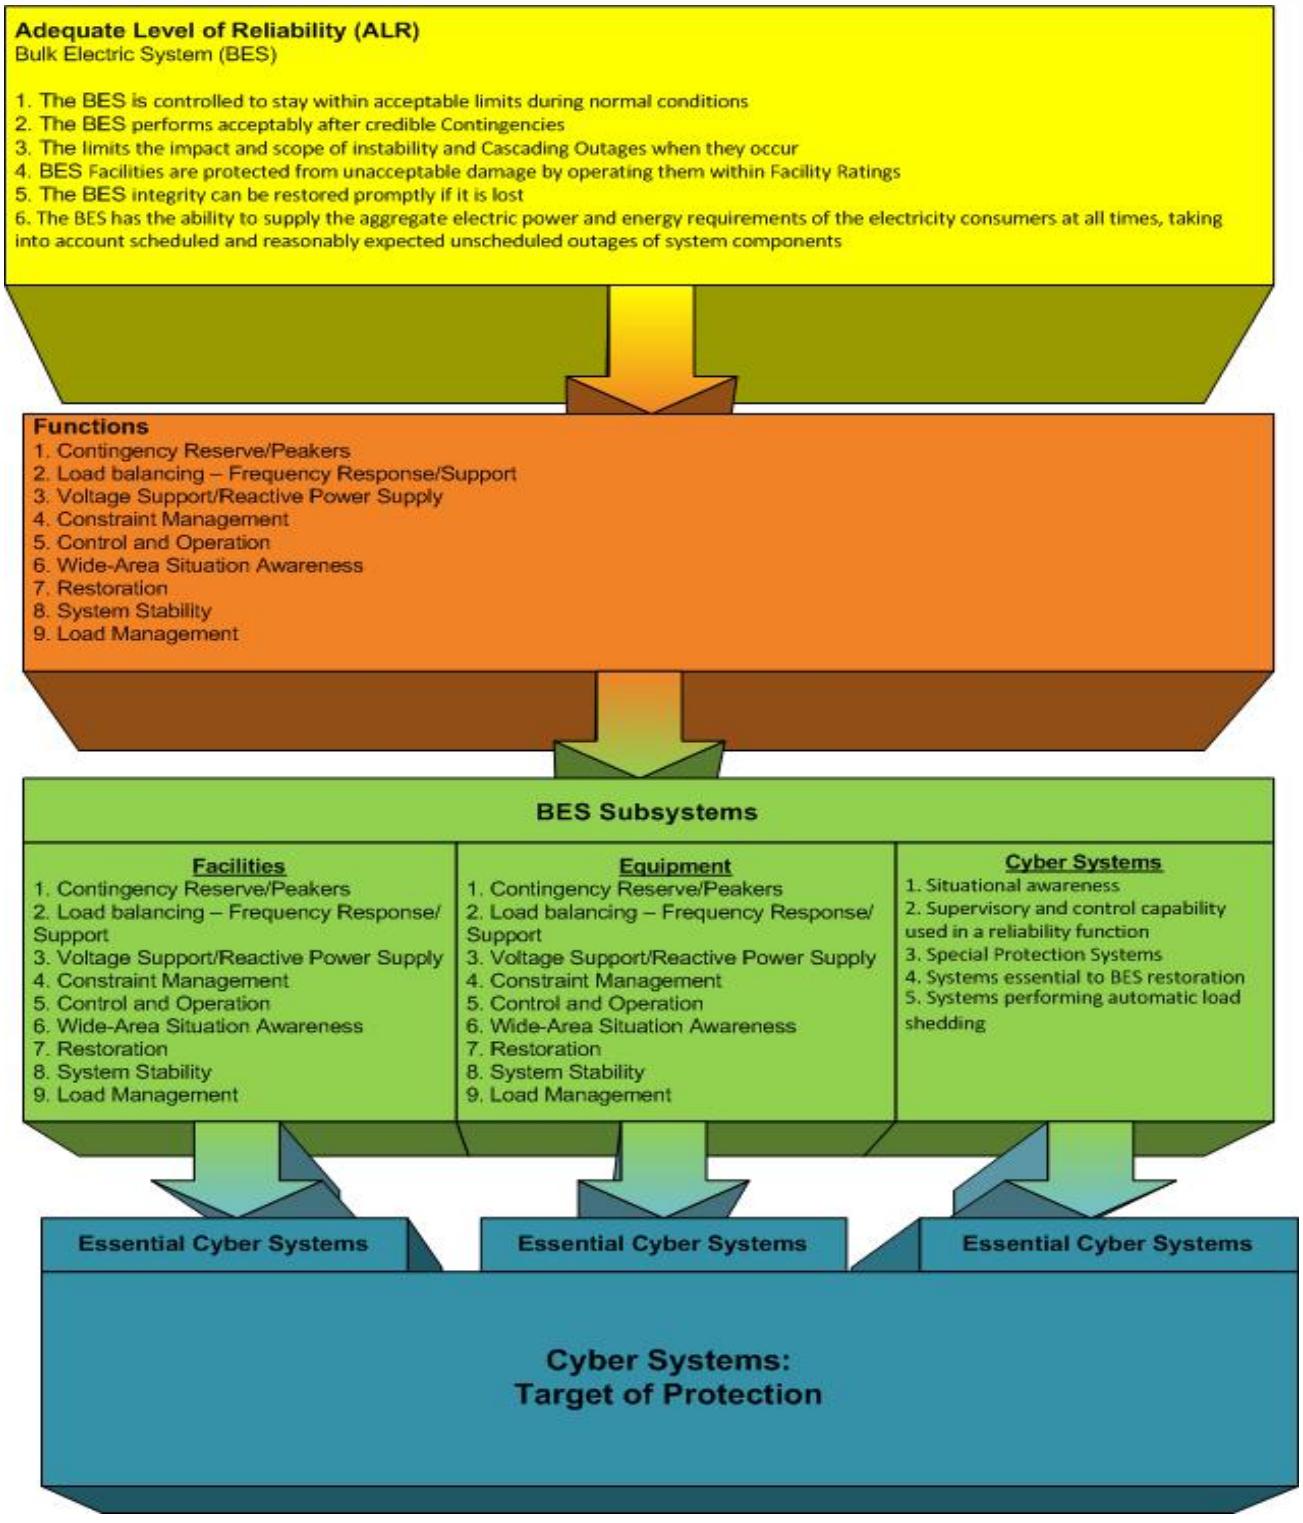
was interactive with the SDT who posed clarifying questions and offered ideas for refinements.

Member Comments- Overview

- The SDT should note that the recent Congressional testimony speaks of dealing with a "sustained cyber attack" which may be different from providing CIP protection.

2. Introduction

John Lim provided an overview for a new chart highlighting BES reliability functions and the conceptual approach the paper is taking in categorizing cyber systems:



Adequate Level of Reliability (ALR)
Bulk Electric System (BES)
1. The BES is controlled to stay within acceptable limits during normal conditions
2. The BES performs acceptably after credible Contingencies
3. The limits the impact and scope of instability and Cascading Outages when they occur
4. BES Facilities are protected from unacceptable damage by operating them within Facility Ratings
5. The BES integrity can be restored promptly if it is lost
6. The BES has the ability to supply the aggregate electric power and energy requirements of the electricity consumers at all times, taking into account scheduled and reasonably expected unscheduled outages of system components
Functions
1. Contingency Reserve/Peakers
2. Load balancing – Frequency Response/Support
3. Voltage Support/Reactive Power Supply
4. Constraint Management
5. Control and Operation
6. Wide-Area Situation Awareness
7. Restoration
8. System Stability
9. Load Management
BES Subsystems
Facilities
1. Contingency Reserve/Peakers
2. Load balancing – Frequency Response/ Support
3. Voltage Support/Reactive Power Supply
4. Constraint Management
5. Control and Operation
6. Wide-Area Situation Awareness
7. Restoration
8. System Stability
9. Load Management
Equipment
1. Contingency Reserve/Peakers
2. Load balancing – Frequency Response/ Support
3. Voltage Support/Reactive Power Supply
4. Constraint Management
5. Control and Operation
6. Wide-Area Situation Awareness
7. Restoration
8. System Stability
9. Load Management
Cyber Systems
1. Situational awareness
2. Supervisory and control capability used in a reliability function
3. Special Protection Systems
4. Systems essential to BES restoration
5. Systems performing automatic load shedding
Essential Cyber Systems
Essential Cyber Systems
Essential Cyber Systems
Cyber Systems:
Target of Protection

He noted the working paper suggests that this "proposed cyber system categorization approach includes the consideration of NERC's mission, the essential functions necessary in achieving this mission, an impact based methodology to categorize its BES subsystems and the associated cyber systems engaged in the process, and finally the deterministic derivation of an overall impact based categorization of the cyber systems, with the anticipated application of cyber security requirements commensurate with that categorization. This parallels general approaches to risk management practices, which focus first on identifying key processes necessary for meeting high level objectives, then drilling down into supporting processes."

Member Comments on the Chart

- Are the ALR references taken verbatim? Are these words "chiseled in granite"? Change to BES vs. systems. If it meets all of the following characteristics.
- Received some comments on last bullet.
- These are BES reliability functions believed to be necessary to maintain a reliable BES.
- Consider annotating the diagram to illustrate what is meant.
- The Working Paper Drafting Subgroup knew going in this would be more cumbersome than what we have.
- Should we identify the cyber assets first?
- Working Paper Drafting Subgroup presented the concept for reaction
- Identifying cyber assets first may be better in some cases. Whether you do the assets - you are coming back to same list in the end. Perhaps we can provide some flexibility on which way entities may want to go on this?
- Clarify what is the difference/distinction of a cyber impact vs. BES impact? Look at cyber impact in terms of its function and how it fits in BES. Impact of cyber device on BES subsystem.
- Positive side of big picture is that we are signaling we are proposing going in considering both aspects and how they interact to achieve the reliability outcome is important.
- Should the "hard and fast line" of over 500 kV be a minimum baseline?

3. BES Reliability Functions

Jackie Collett noted that the Working Paper Drafting Subgroup received help from James Case and Jason Marshall in refining the BES reliability functions *(pp 11-15 of the Working Paper)* and that generation was, in part, revised as a result.

Member Comments- Overview (**BOB: These are duplicate comments from the previous section above. Is that what you wanted?**)

- "Peakers"? Each will touch on some or multiple components of ALR.
- Are the ALR references taken verbatim? Are these chiseled in granite words? Change to BES vs. systems. If meets all of the following characteristics.
- Consider annotating the diagram to illustrate what is meant in different parts of the chart.

- The Working Paper Drafting Subgroup knew going in this would be more cumbersome than what we have.
- Should we identify the cyber assets first?
- Working Paper Drafting Subgroup presented the concept for reaction
- Identifying cyber assets first may be better in some cases. Whether you do the assets - you are coming back to same list in the end. Perhaps we can provide some flexibility on which way entities may want to go on this?
- Clarify what is the difference/distinction of a cyber impact vs. BES impact? Look at cyber impact in terms of its function and how it fits in BES. Impact of cyber device on BES subsystem.
- Positive side of big picture is that we are signaling we are proposing going in considering both aspects and how they interact to achieve the reliability outcome is important.
- Should the "hard and fast line" of over 500 kV be a minimum baseline?

4. Identification of BES Subsystems

The Working Paper Drafting Subgroup presented examples of BES subsystems that were intended as simple ways to conceptually illustrate that while the individual impact may be small, it might be big when controlled and is the reason for high impact for under common control system. The challenge for the SDT in going forward is developing clear language and criteria when trying to describe these things that can capture the different aspects.

Member Comments

- SDT should be careful - when we talk about "restoration" as people may tune out if they believe reliability is not the issue. Let's try to address these issues with the industry head on.
- In the Final Categorization of Cyber system- Example 1. BES Subsystem A with Relays A, B & C. What changes the BES subsystem impact.

5. Third Party Oversight

John Lim provided an overview of the current section noting that two entities were identified in FERC Order 706 - Reliability Coordinators and Regional Entities. The current draft pointed out that, "Of the 17 Reliability Coordinators in the NERC Compliance Registry, 12 are registered under multiple functions (i.e., BA, TOP, IA, TSP, TP, PC). These 12 RCs could not meet the FERC Order 706 requirement for "external" review for their other registered functions. As an example, Midwest ISO is registered as a RC, BA, PA, and TSP. Midwest ISO RC could not review the list of BES subsystems from the Midwest ISO BA while meeting the FERC requirement for an "external" review. Thus, a third-party review of the third-party review would be required."

Member comments

- RC's oversight authority? Liability and risk in determining whether an asset should have been identified or not.
- Task the RCs to provide guidance. We will need a "safe harbor".
- FRCC - Regional reliability Organization. Member services functions with FRCC - with different committees. Regional organizations that perform functions other than compliance. E.g. FRCC operating committee.
- RCs don't perform reliability function - this is separate function. They have the proper view/ability to have the proper view that REs don't have.
- Is there a conflict of interest for the REs?
- Is there a way to develop this so that you don't need a 3rd party review- because you can agree on the methodology as producing the correct result.
- RE vs. RRO issue: Different interconnections do things differently. Jurisdictional elements - RE is it right now for the new NERC ERO. RROs only exists in the previous "council" world. RROs were never functional models.
- RRO vs RE functionality - different in different areas. Varies on how functions are set up, e.g. differences between Eastern and Western interconnection?
- RC's probably come the closest for surveillance. Need to do it in a "hold harmless" environment.
- Is this an IMPO (???) like function? Technical arbiter. If they are told not to go towards the RCs, they won't go there. Not clear for how industry is overlaid on functional model.
- Conflict of interest with the Regions.
- Create a new kind of arms length entity - serious experts and knowledgeable people. This is not a small thing. No big picture.
- FERC representative, Mr. Peters, indicated that this is a difficult issue. Should be some way for companies to get assistance so they don't get nailed if they get something wrong. There will be conflict of interest on some options. He will be talking with staff and briefing new commissioner coming in soon.
- This implies analysis but how much is not clear. RC to the RE function. Not purely a statutory function. Only because compliance exists that it has to be performed. Is it reliability related? If it is falls under RC. Don't have the capacity currently to provide level of analysis.
- This is based on an electrical system view of the world.
- We need consistency.

6. Identification of Essential Cyber Systems

The Working Paper Drafting Subgroup noted that the change in the introduction of BES subsystems is consistent with the new definitions. This is the introduction of essential cyber systems.

Member Comments

- What are the key systems we need to put a focus on protecting vs. identifying high/medium/low?
- SDT is okay with the current draft section.

7. Categorization of Cyber Systems

The Working Paper Drafting Subgroup presented an overview of this section noting that:

- The draft is tentative and conceptual.
- The availability and integrity have a bigger impact than confidentiality on the BES.
- Work out how to deal with these further when SDT works on the standards and controls.

Member Comments

- How would a periphery system (AC) be lumped into groups? We will address that when we get to "target of protection" section.
- "Directly" vs. "indirectly"?
- Is this an impact assessment vs. a categorization? How does time factor into this concept? For a minute, hour, day, month a year. Does it factor into high, medium, low. Longer period for availability, shorter for integrity.
- May factor into criteria.

8. Final Categorization of the Cyber System Based on Overall Impact on the BES

The Drafting Team described the concept they are presenting as suggesting you will have finite ways to do this with the end product resulting in the same number. This categorization in turn will determine the selection of the menu of controls.

An example of the application of this approach in an evaluation matrix is shown below:

> **Note:** This table is a visual representation of what the categorization should look like, it's not the actual table.

Asset Impact -->	High	Medium	Low
Cyber Impact:			
High	5	4	3
Medium	4	3	2
Low	3	2	1

The Drafters noted that to the left is the BES system, to the right is the Cyber System, and you merge these to get final categorization.

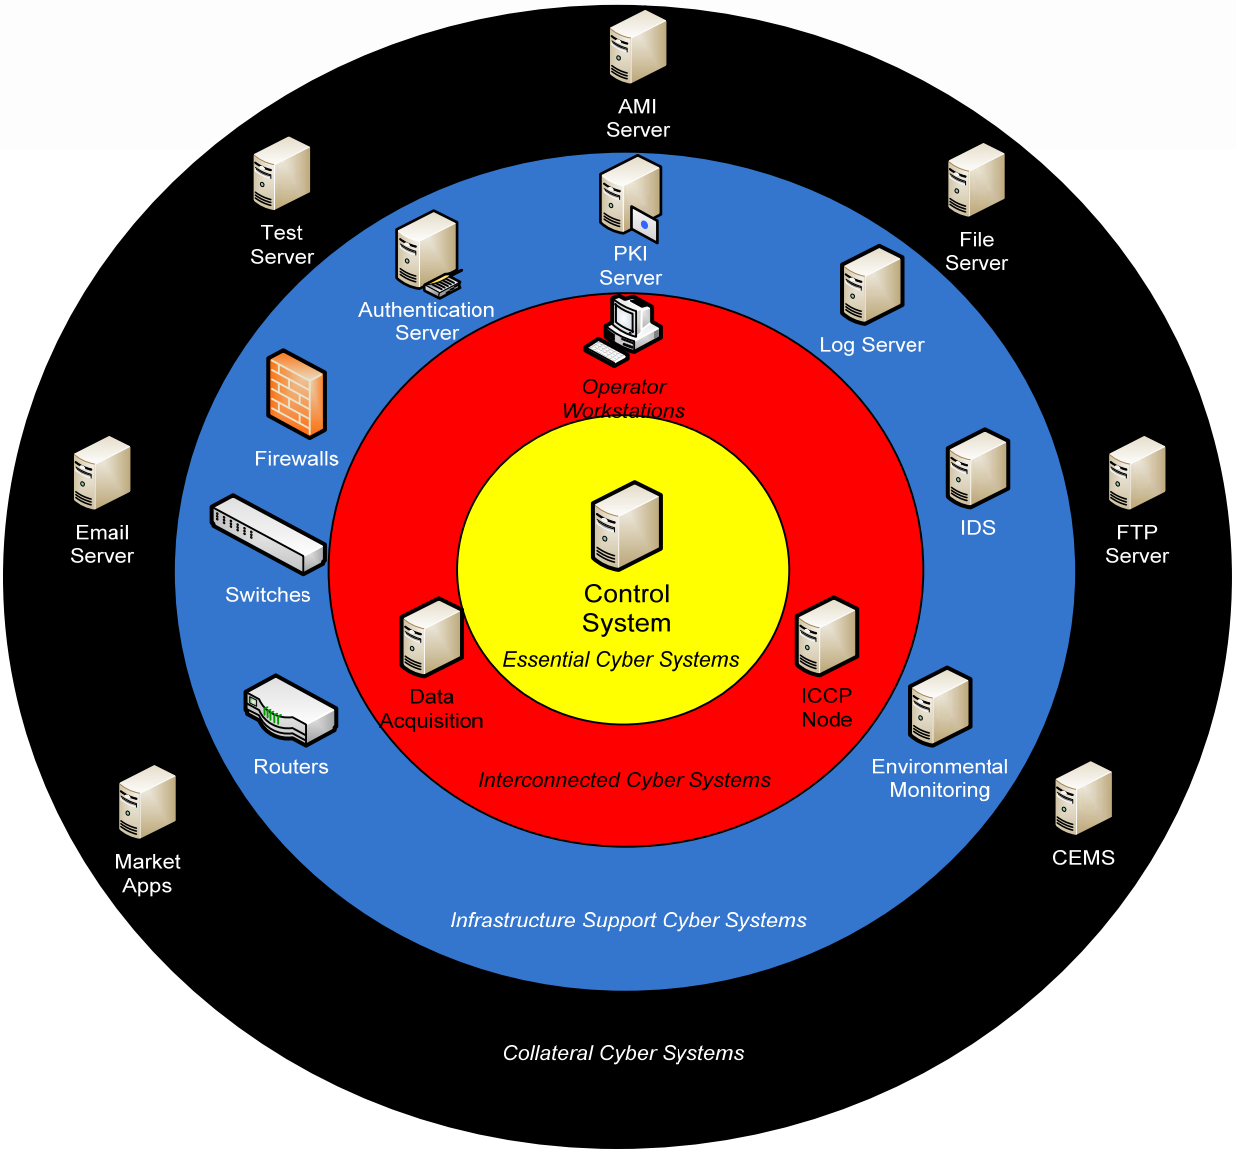
9. Target of Protection

The Drafters noted that the essential systems don't stop there:

1. Essential cyber systems - in middle, e.g. control system
2. Next: Interconnected Cyber Systems, e.g. data acquisition, ICCP node, operator workstation
3. Infrastructure Support Cyber Systems: e.g. switches, routers, firewalls, log service etc.
4. Collateral Cyber Systems: market apps, email server, test server, AMI server, etc.

Comments on Target of Protection

- EMS system in a control center? Fire suppression system and AC control system? Conceptual point is that you must protect them to some level and you can't just ignore. Level of protection depends on impact.
- Environmental monitoring and controls included. Checklist of the things you need to include. Sounds workable.



- AMI systems (smart grid) will be more in the mix going forward. Those may need more protection than collateral cyber systems.
- Market applications and control systems work together in an integrated fashion and may need to be treated together as essential.
- Is there going to be flexibility in this? Don't want the industry to draw the wrong idea from this depiction.
- Market centers playing an increasing role in reliability (nodal). They may need to be in closer to essential. E.g. retail electric provide - way you control and represent your load may make it more essential.
- Address more of these emerging entities.
- "Enabling technology" for perimeter devices and how to protect is an issue.
- Virtual systems coming in - virtual switchers and routers = where do they fit?

- Need to be clear as to what time frame we are focusing on.
- Time frame - CIP does not include planning - real time operation. Worry as well about how it is connected not just when.
- Included because it is a collateral system.
- Not all market operations/functions are day - ahead planning.
- Functions and balancing authorities - how are they treated?
- Ask what is the application doing, and how is that function impacting on the BES? Keep this in mind we may need to locate it in both realms. Real time market control system may belong in essential systems.
- As companies "virtualize" environments, functions become "cloudier." Does the level of protection change because of function or an attack perspective? If they don't perform an essential function, they will be on the collateral list.
- From the perspective of a vertically integrated utility - 8 or 9 BA functions. Who is what, where? What scared Jim Case the most when he was reliability coordinator? "spooks, schedules and tags." E.g. billing is out of this. When put IP on then it changes.
- Salience of market applications - 1 hour in the life of reliability coordinator.
- Who is running email in their control environment?
- Talking first, now, about **what** to protect then later we will get to how to protect it. Shouldn't worry now about how to do this. 1 road leads down reliability requirement another goes another way.
- E.g. OATI - market app to remote platform - used to drive AGC. Not the server, it is the data that is important not the market app unit.
- Got into contract SAS70-2- NERC CIP is in contract will be compliant. Have protection on server.
- Different systems - where is the back to maintain as a critical asset - back up email system to support - costs are significant. Layer of targets and ways we lay application - up to each SCADA engineer - won't be able to categorically say - no two will probably look alike.
- Critical server for business reasons vs. reliability.

10. External Cyber Systems

The Drafting Team provided an overview of this section noting that references to the Interconnection section in the paper. The concept is to put adequate controls to protect the whole system with contractual agreements to protect system to the level needed. The Registered Entity is responsible for protecting cyber systems.

11. Applying Security Controls

The drafting team provided an overview of the section noting that under the current standard you are either in or out, but the application of security controls will allow a greater degree of protection and this would be taken up in the hard work ahead in 2010.

C. Rating the Current Acceptability of the Working Paper Sections following the Overview

To get a sense of the SDT and to provide a focus for ongoing SDT discussions, the facilitators asked the members for rate each section on their view of whether the current sections are ready for sharing with the industry. Following the rating the SDT took up a second round of focused comments in the afternoon of June 17 and the morning of June 18.

Categorization of Cyber Systems Concepts – SDT RATING RESULTS 6-17-09
Are the concepts contained in the working paper sections ready/acceptable for sharing with the industry?
4= Acceptable**; 3**= Acceptable with minor concerns; **2**= Unacceptable unless Address serious concerns; **1**=Unacceptable

	Avg.	4	3	2	1	T
•BES RELIABILITY FUNCTIONS	3.6	11	5	1	0	17
•IDENTIFICATION OF BES SUBSYSTEMS	3.0	2	13	2	0	17
• CATEGORIZATION OF BES SUBSYSTEMS	2.8	1	11	5	0	17
• **THIRD-PARTY OVERSIGHT OF BES SUBSYSTEMS/ CATEGORIZATION**	**1.9**	**0**	**0**	**16**	**1**	17
•IDENTIFICATION OF ESSENTIAL CYBER SYSTEMS	2.7	2	8	7	0	17
•CATEGORIZATION OF CYBER SYSTEMS	2.8	2	9	6	0	17
•EXTERNAL CYBER SYSTEM DEPENDENCIES	2.6	2	7	8	0	17
•FINAL CATEGORIZATION OF CYBER SYSTEM BASED ON OVERALL IMPACT ON THE BES	2.5	4	8	4	1	17
•DEFINING THE TARGET OF PROTECTION	2.5	2	4	**11**	0	17
SECURITY CONTROLS TO THE TARGET OF PROTECTION	3.3	6	10	1	0	17

D. Second Round of SDT Comments on Working Paper

The SDT reviewed on a second round the seven sections of the Working Paper which received less than a 3.0 average rating. Members were asked to describe the concerns that led them to provide a 2 or 1 rating for a section and the SDT discussed possible options for addressing these concerns.

1. 3rd Party Oversight of BES Subsystems Categorization- Review of Concerns

Are the concepts contained in the working paper sections acceptable for sharing with the industry?
4= Acceptable; 3= Acceptable with minor concerns; 2= Unacceptable unless Address serious concerns; 1=Unacceptable

Working Paper Section	*Avg.*	4	3	2	1	*Total*
3rd Party Oversight of BES Subsystems Categorization	**1.9**	**0**	**0**	**16**	**1**	**17**

Member Comments on 3rd Party Oversight Ratings

- Were there any 2 or 1 ratings based on the level of detail? None.
- Do we need this in our concept paper? Should it be removed?
- **Audit vs. Oversight?** Concept of being audited- doesn't that imply 3rd party oversight?
- Does oversight= audit? Audits do play a role in this at an untimely expensive stage in the process.
- Analysis associated with this oversight- point is reliability not compliance.
- Let in the Reliability Coordinator and call it done?
- We need a front loaded process- what do I need to do to get it right going forward. Should not be considered audit function.
- Should we get industry feed back on having the RC do this?
- 706A- rehearing order- FERC- industry sorts out on a contractual basis.
- Voted 1 because of the belief that this section is a non-starter. Issue is fraught with problems and pitfalls. Rather than trying to propose a solution, drop it out or acknowledge and discuss all the problems that have to be overcome in order to do a 3rd party review.
- Discuss the problems vs. a solution.
- This issue is larger than CIP 002- it might be wise to take it out of paper altogether. Consider developing a separate working paper?
- Industry might respond - why don't they tell me what to protect?
- **Quality Control vs. Categorizing Cyber Systems.** Voted 2 because it doesn't fit in terms of concepts trying to communicate to the industry. More of a quality control element vs. a concept about identifying and categorizing cyber systems and assets. FERC in the order was looking directly at version 1`of CIP and its "all or nothing approach." This is a different concept that directs us towards what is most important to protect.
- The drafting group can take the verbiage out and identify there is an issue and will address going forward.
- Concerned this, as drafted, will provide a distraction from the paradigm shift suggested by the broader conceptual approach.
- Criticality level of BES and cyber asset. More impetus for 3rd party overview. Acknowledge to extent "individualism" is taken out of the process, it will be less important for this overview.

- To certain extent- we need more industry input. If we can show them there is a necessity for 3rd party oversight if we go with the old CIP approach, it will be clearer why change is needed. Everyone is responsible for security if you are connected to it. If we go with the new approach, oversight not as big an issue. Anyway we go we have a lot of work to do in this area for both 002 and for the industry.
- If we have a 3rd party analyzing these lists- we will need to provide a whole process for appeals etc. If we could come up with a way that utilities can't use "don't have any critical assets." The current draft calls for an arbitration procedure.
- Mike Assante is taking the lead. This will need to be performed.
- Last thing we want to see is increasing gamesmanship through a new approach. We must get around and place behind us those people trying to keep cyber assets off their list.
- Lots of stuff falls between the cracks. Need to keep coming back to reliability and not compliance.
- Clearly this isn't ready for prime time. Could we reword some of this? Oversight will depend on how it is written- change language- depends on how proscriptive the standards develop.
- That could get some comments from industry as to one approach or the other.
- Somebody will need to take a big picture look at this.
- Sub station - e.g. CIP 002 - task the asset owners. None of the questions focus on ownership vs. operators.
- As a practical matter, is this more bother and trouble that it is worth. Suggest pulling this out and put off to another white paper.
- We should say something but pull the "proposal".
- Question for group- do we strike it totally or do we acknowledge briefing- any issue of wide area overview will be dependent on latitude given to the entity. In favor of getting rid of it outright.
- If a Balancing Authority has the requirement for another entity to protect the other entity assets- occurs in the wide area view? Is there another way to determine?
- Everyone knows that 706 said you need oversight, so we probably have to say something. Even to say, method of oversight doesn't impact on this methodology. Have to say something about "the elephant in the room."
- Reliability considerations- don't use oversight in the paper. Give FERC time to work.
- Note that there are "other issues" in the order that the SDT is not addressing, e.g. BPA's confidentiality issue. Shouldn't place the focus in on this.

At the conclusion of the discussion, the facilitators conducted a straw poll asking members to choose the conceptual approach they preferred for this section:

- Improve it and include as a full section - 0 yes
- Strike it entirely - 10 yes
- Acknowledge in a limited way. 7 yes

The facilitators then tested the support for the following: "Regardless, we should have a group that will continue to look at this issue"–14 yes/2 no

Scott Mix agreed to craft some draft language that there are other considerations in the order that do not directly play into a categorization methodology and will be taken care of at the appropriate time. On June 18, Mr. Mix offered the following sentence to add into the Introduction of the Working Paper:

> "This paper deals only with the identification and classification of BES assets and cyber systems. There are a number of other issues raised in 706 not addressed in this paper. The Team will be soliciting industry feed back on other issues as a part of the CIP standards development process."

Member Comments

- Should be noted as a future consideration
- Focus on task at hand on this paper.
- RK: likes the words. "Dealt with separately"- through additional working paper- will the industry think "secret"
- The team will be soliciting industry feed back at a future date as part of the development process.

6. Defining the Target of Protection

Are the concepts contained in the working paper sections acceptable for sharing with the industry?

4= Acceptable; 3= Acceptable with minor concerns; 2= Unacceptable unless Address serious concerns; 1=Unacceptable

Working Paper Section	*Avg.*	4	3	2	1	*Total*
Defining the Target of Protection	**2.5**	**2**	**4**	**11**	**0**	**17**

Member Comments on Rating and Concerns

- Were there any 2's on the issue of insufficient detail? No
- Gave it a 2. Confused the issue of after categorization of systems - seemed to add a additional piece of complexity. What did it mean in terms of applying controls.
- Any box becoming compromised, becomes easy to compromise every other box. Does this imply there is less protection needed in blue vs. red ring?
- Need to look at the paper and the diagram to understand the intent. Intended to get people trying to think about. Text indicates the sequential of identification vs. relative importance.
- Target of evaluation - common criteria of security mechanisms. Each device in the target has to have a profile for that in terms of high/medium/low.
- We need to make sure it communicates message-i.e. level of importance.

- Could modify showing arrows from center out, with language saying the intent of the sequence of identification?
- The words are there. It is a presentation issue.
- We don't have any substation gear represented? Wouldn't hurt to throw a few in. Lots of people in that world.
- We could come up with another example. PLC control system in the center.
- The graphic reinforces the "control center-centric" perception of the SDT's effort. Have a couple of illustrations: 1 for control center, and 1 with a plant perspective? 2 of the same diagrams with different devices on it.
- Essential cyber assets identification- a cyber system essential to operation of BES system and have low impact if compromised.
- A relay is essential to transmission line. How does it fit into overall BES reliability- low.
- Cyber asset essential to operation? Probe collecting info on penetrating.
- High voltage transformer is essential - high impact asset electrically. This protects from overloads, high impacts.
- Epiphany - cyber asset - RTU. In the substation. High impact to the substation. Where is the substation? Or generating plan. In high congestion part of system - loss causes other issues. In rural outpost different impact. Both cases it is a high cyber system.
- Has a high BES impact - rate asset as a 5. Can't view cyber asset in a vacuum by itself. Pay attention to BES ranking as well.
- Still conflicted order in which you do things.
- Confused - "essential cyber system." When talking about cyber impact - how could it be anything other than a high? Essential cyber system - digital relay not connected to anything. Cyber impact is low or medium. Same relay but talking to other relays, maybe a high cyber impact.
- Are we mixing threat, vulnerability and impact? That may be the source of the confusion.
- Cyber system could be everything or small - flexibility of deciding for yourself. Give a broadly scoped cyber system and narrowly scoped cyber system for the targets.
- CEMS e.g. of "targets"-- power plant only, substation only, control system only,
- 2 impact ratings. Analogy to FIPS 199.
- Categorized BES subsystems as drawn as 2 independent processes.
- If the arrow goes up to cyber systems and feeds into categorization.
- Change the terminology - want to end up with a categorized assets.
- Short cut - line distance protection relay. H/M/L to line protected. Apply that to all BES lines.
- Some confusion in the terms e.g. essential cyber systems vs. "critical".
- This is the impact part of a risk analysis. Don't focus on final result of numbers as they apply to protection. Going from categorization concept into protection concept. Should be based on threat and vulnerabilities.

- May be jumping here from impact levels- to target of protection without consideration of other elements - e.g. risk analysis, threat analysis? The leap from categorization to protection without reviewing the role of risk
- Missing piece - across the top - what is the impact of the cyber asset? Where it is? What substation in. What is the BES impact.
- May need a "susceptibility score"- how much control does it have, how is it connected? Is it a stand alone, dial up? What kind of operating system does it have? Consider these attributes to determine what is its impact?
- We will deal with some of this in the control side of the analysis. Mentioned in paper that we will deal with this in the assessment of controls.
- May need to deal with this in the working paper.
- More confused. Asset impact and cyber impact - if either is high, then it is considered high?
- Talking about tentacles of control system in assets - if I can get back into control system.
- Logistic management systems - broke into system - bar code readers -
- Think in terms of security in the event of an attack. Risk - high and low. On a given day, risk changes. Make sure you have it partitioned and cover.
- Are we over complicating this process? Overwhelming number in the industry are the smaller entities without the assets to perform this function. New piece - impact of identified cyber asset on the BES. What is the risk or probability? Big companies have resources to do this kind of work. Smaller ones don't have the capacity.
- Let's not use "risk" = financial exposure. Threat vulnerability of impact or possibly "susceptibility."
- Scott Fixmer offered the following process for evaluating facilities:
    1. Id facility assets and loss impact/consequence. By type of facility.
    2. If lose asset what is the criticality (10 different considerations)
    3. Characterize the threat- e.g. is a physical or cyber attack- what are the methods.
    4. Motivation and capability of those who might carry these out.
    5. Relative ease/probability of getting caught/ and of different types of attacks being applied to assets.
    6. Identify who the attacker is likely to be.
- This helps to sort it out but there may be more mitigating factors to apply. This may be most helpful when being audited- numerical ranking of criticality. Semi qualitative.

3. External Cyber Systems

Working Paper Section	*Avg.*	4	3	2	1	*Total*
External Cyber Systems	**2.6**	**2**	**7**	**8**	**0**	**17**

Member Comments

- How many who rated this low was due to the lack of detail? 2 ratings
- Reservations - hadn't gotten a clear representation - is this all inclusive? Service level or other contractual agreement - concern about the turf to cover. Not reliability based.
- This was like an external review topic.
- This may not be helpful.
- Remove or improve?
- Take it off line- there is a lot of work n terms of what this would be. This may be a distraction and may be technically infeasible.
- Many areas this could touch. Require lots of brainstorming to understand the scope of this.
- What do we expect from industry in reacting to this? Feedback on ideas or suggestions for improving
- In the NIST management world- impact analysis and categorizing, selecting controls is next. This is a consideration in selecting controls.
- If this is about the categorization, shouldn't mix with external.
- Is this a necessary segue way? Could it be pulled out?
- Interconnections section. Compress it and move?
- Middle bullet. Consider dropping the sentence?
- Thought of this in terms of EMS consultants.
- Put in something about need to coordinate?
- Vendor connection- vs. interconnection issues?
- You are relying on their data- integrity of that system. Some coordination with provider of data.
- This is exactly what we will see/hear from the industry. We are getting a preview in this discussion.
- This is a lot of work for a couple of people. Get more participation in these kinds of efforts.
- Analogous to 3rd party?

4. Categorization - BES Subsystems, Cyber Systems and Final Cyber System

Working Paper Section	*Avg.*	4	3	2	1	*Total*
Categorization of BES Sub-Systems	**2.8**	**1**	**11**	**5**	**0**	**17**

Member Comments –Categorization of BES Sub-Systems

- More fine tuning need. This was intended as an overview
- Bright line concern with BES subsystem definition
- 3-categorization has to match the population of all possibilities - write definitions to cover the entire population. (45% of population covered?).

- Provide a quick list vs. the definitions provided. Top level or quick overview.
- This simply says categorized assets are needed - method and criteria will come later. Using VRF model of high/medium/low.
- Stop fixating on e.g. rank the criticality of BES assets somehow.
- Throws out as e.g. - industry has current CIP 002 and paper on risk assessment. Provide another example?
- Get together with the BES guys and tighten it up. Get RCs together (Jim Case, Jason, Jack Bernhardsen, etc.).
- References "event classifications" on NERC site - 5 categories. This might be a helpful analogous effort to describe levels. Specific when you see it you know which category you are in. Something along those lines? Look at this conceptually as a graded approach.
- When this goes out - lawyers and engineers will pick apart. Clarity and distinctiveness of the definitions. Will this be subject to too much speculation in terms of interpretation?
- Is industry capable of this? Many won't be able to do the analysis.
- NERC websites - events analysis - alerts, classification scale on left.
- Generator 800 mw, congested area - impact because environment around it compared with one in low congestion area. Approach - 2 identical plants in different parts of country don't have same impact.
- From a RC perspective, concern is stability. Clarify wording vs. examples. Pick something concrete.
- How does a cyber event correlate to these categories? Having a hard time in making the logical connections.
- Does nailing this down help us get our point across?
- Impact of making an impact decision. Scott Mix – items - who are we trying to cover with these standards. Internal problem before - CIP 002 self-selected out of process. Careful not to allow continue that behavior. Will this provide a loophole?

Working Paper Section	*Avg.*	4	3	2	1	*Total*
Categorization of Cyber Assets	**2.8**	**2**	**9**	**6**	**0**	**17**

Member Comments

- Needs more detail and fleshing out.
- This highlights the complexity of the issue.
- Concern we could have cyber systems not associated with BES component with h/m/l. Components not part?
- EMS/ market management system ISO/ITO, not tied to BES components - huge amount of calculations across all different components - info for situational awareness.
- Goes back to cyber system that supports a BES function- good example of cyber system that directly support a BES function vs. a BES asset.
- Okay with words, they are not overly complex. Having to do stuff with BES first. Categorize cyber systems and protect. Leverage what is out there and use that.

- Original proposal- find cyber assets--establish high water mark- high will be high and may work in simplifying. Control center is a BES asset.
- Does the language in definitions, supported by examples, make it clear as to what they are and how to categorize them?
- Correlation between asset and cyber system. Functional piece is the good part. Agree on simplification. List of functions or impacts and then go find cyber systems and map to them. Must be the correlation because we don't know which are important. Hurdle of BES asset correlation part having trouble with.
- 800 mw in Connecticut vs. Texas. Cyber protection purely- does it matter? That today one has greater impact than the other. Does the BES asset impact mean anything?
- If you are a hacker - go at lesser impact asset and go from there.

Working Paper Section	*Avg.*	4	3	2	1	*Total*
Final Categorization of Cyber System based on Impact to BES	**2.5**	**4**	**8**	**4**	**1**	**17**

Member Comments

- From cyber perspective- go for unimportant. Have to have some basic level of cyber security protection. Then may need additional protection. What that it is open to debate.
- Concerns in paper- ALR- credible contingencies don't relate to cyber issues. Don't inadvertently leave open.
- Target to get to h/m/l of systems. Leads to protected measures/controls. 003-009. Idea is to have a baseline set of minimum controls. Whatever low.
- Double impact language- asset correlation. Cyber categorization vs. impact.
- Agree we need to map the functions- through the lens of the assets or some other lens. Clarify that and the industry will understand.
- Numbers in box don't relate to audits?
- Applying controls in different ways? We will have set of controls apply to some and not to others. Threat landscape comes in. Once you get the target. Applying the catalogue- looking at moderate asset and apply controls in high way and that is what would be audited.
- If low BES impact?
- Controls are objectives- e.g. to put encryption in place. (Federal FIPS compliance).
- Five levels too complex. Three is sufficient.
- Government high/medium/low- federal sector it is applied to systems. TVA is a bad example.
- Double impact- how determine resulting impact. If you high water mark this, is this 1 size fits all/ all or nothing.

5. Identification of Essential Cyber Systems

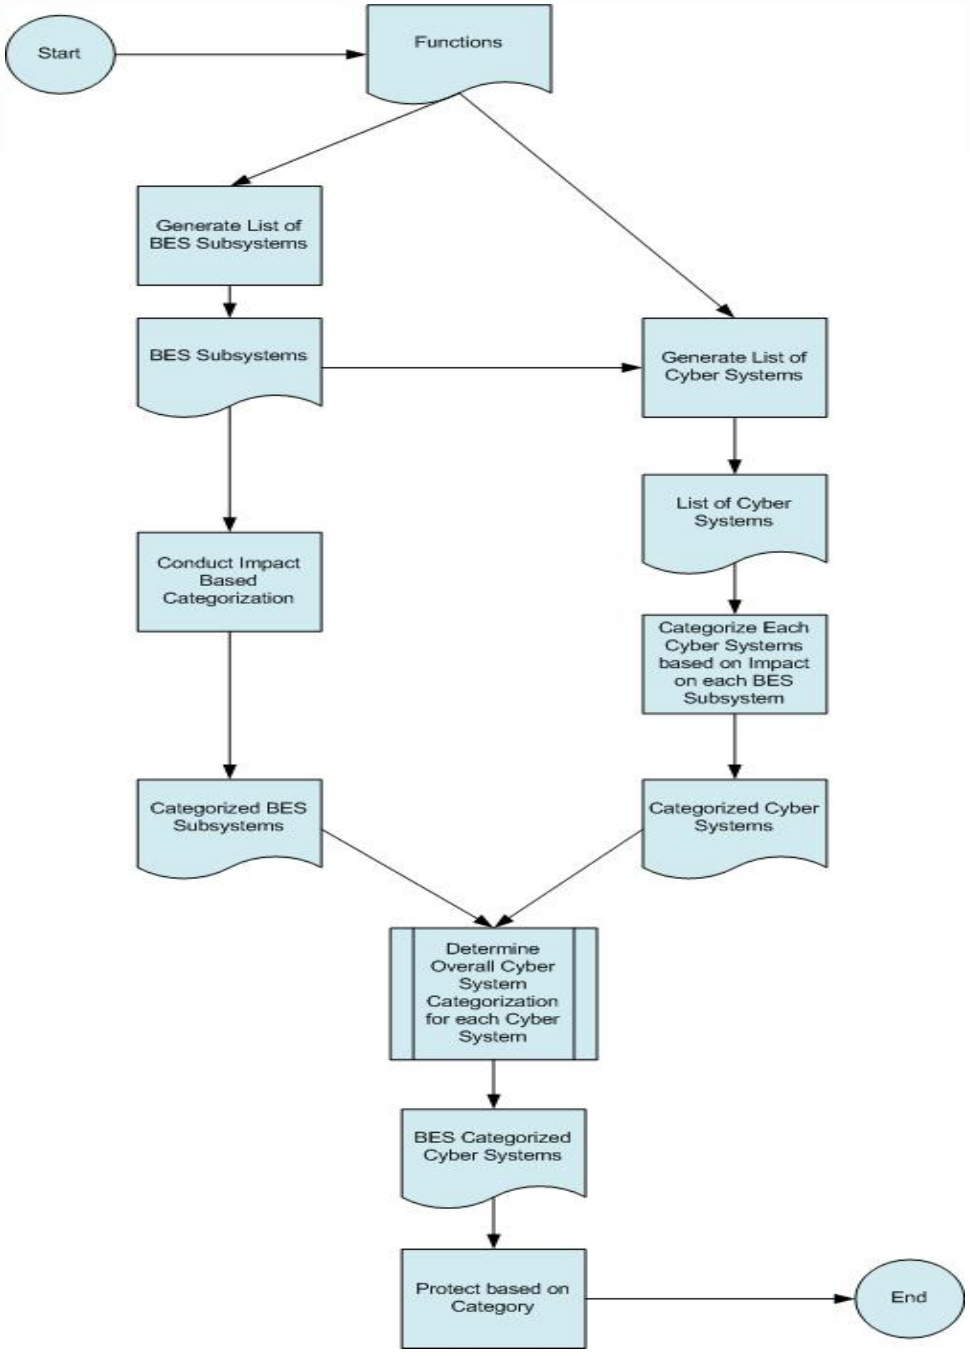
Working Paper Section	*Avg.*	4	3	2	1	*Total*
Identification of Essential Cyber Systems	**2.7**	**2**	**8**	**7**	**0**	**17**

Member Comments

- Was this meant to cover the entire population or an example? More work if intended to cover.
- Show why this would be critical. E.g. metering.
- "Essential"? Low impact essential- distinction- back office- real time. BES related cyber?

E. Review and Refinement of Working Paper Categorization Approach

On the second day, the SDT discussed whether to break into small groups to develop further guidance for refining the working paper. They considered breaking into groups focusing on: Categorization- BES, Cyber and Final; Identification of Essential Cyber Systems; and Target of Protection & External Cyber (including working on chart). They decided to have an open discussion of the categorization concept followed by the development of at least one or more scenarios to put it to a test.



1. Open Discussion on the Categorization Approach

Member Comments

- How should we approach categorization- from cyber systems or from BES asset/sub systems and then looking at cyber systems? The matrix has brought the discussion out.
- At this juncture- may need to take a second step in the matrix.

- Do we need the matrix anymore? Maybe we should talk about different concrete examples in order to identify the benefits and drawbacks of two approaches to categorization. Take an example of a cyber system approach and an example from a BES asset perspective and see if we would come up with the same cyber system.
- Reclamation's experience with 16 SCADA systems. In mapping those to the mission, people came up with different answers and not just a single interpretation for different systems and projects. In the Federal process, everything is included by default- CIP doesn't get this. FIPS 199 divides them up.
- Test cases- can make the correlation between the asset piece and the cyber asset.
- Smaller entities easier to get the cyber part?
- Don't forget that the "C" in CIP is critical not cyber. Critical BES assets that don't have a cyber component.
- We may need a SAR for physical security standards.
- NERC recent response to DHS – clear classification tier 1-3 assets- high med low- megawatts.
- Test both approaches- if both get you there. Pick the simpler one to go to the industry with.
- There is agreement on the approach. We have just engineered something and we need to test it. Will it produce the result we are looking for? The industry will also test this.
- Do we have enough details to test the model?
- FIPS 199- hard process- to get categorization process. Federal starting with a system. Tied to business/mission and mapped the two together.
- Biggest concern that is driving the parallel approach is making sure the impact of BES asset is considered when protecting cyber asset.
- Can we account for the impact of the BES asset without going through the left side using a pure cyber approach? That is the piece to test for the cyber approach.
- If both approaches work, we then agree on a couple assumptions.
- Does the actual impact of BES asset, based on where you are in the grid, have any bearing on how you protect the cyber asset?
- Lots of time, money and vested interest involved in this. In the end, we have to produce a set of standards that can be implemented by the industry, consistently complied with by the industry, from Pinecone Power to the large utilities.
- SDT has been struggling with this in terms of the overall complexity.
- You do protect your cyber assets differently. I pick PLC system in a sub station identical to one in another substation. I shouldn't need to protect at the same level. We will have more controls on the more essential system. Don't see it as overly complicated. I don't think you can come to that result by just working down the cyber side.
- "Back in the day"- cyber linkage to engineering. Don't have to sell the need any more. Cyber important. Access can be gained to trivial equipment. General frame of reference. We don't have to sell the need for linkage quite so hard.

- DHS Tiers 1, 2, 3. It is similar to the left side. If it makes sense and it helps us, it serves our purposes.
- Going to have to both- electrical assets focus- where I roll out protection. Not a one vs. the other?
- Possible test candidates considered: balancing Authorities- Test AGC from the cyber side. Test a transformer over current. Pick a restoration. Control and Operation and Load Balancing- 2 functions? Calculate ACE? Load Management-Function- Control and Operation. 2 transmission and generation operations.

The SDT broke before lunch and a small group developed the following scenario that was presented and discussed following lunch:

Scenario: A large investor-owned utility with 35,000 MW generation capacity across 103 units. One of their plants has three 800 MW generating units. A single RTU receives the control signals (pulses or set-points) for all three units. Each unit is managed with its own PLC/control system. From a span of control perspective, the SCADA/EMS at the generation control center can potentially control or impact all 35,000 MW of generation capacity.

Discussion: It does not matter whether the units are base loaded, on regulation, in reserve, or running at their maximum capacity. It is what the control system is capable of impacting, not what it can impact at this moment in time. If the SCADA/EMS can open plant substation breakers and disconnect the units from the grid, the system impacts that generation whether or not the SCADA/EMS is actually directing generation output (sending the units raise/lower pulses or MW set-points). The RTU in the plant is managing the telemetry data for all three 800 MW units, thus it can impact 2400 MW of generation capacity if it is compromised. The PLC/control system for each unit only controls its own unit, thus its impact is 800 MW. In the scenario, the SCADA/EMS system would have been categorized as High Impact, the RTU as Medium Impact, and the PLC/control system as Low Impact.

Presentation of the Scenario

- Factored in the impact of BES asset in identifying cyber assets performing the function. Identify cyber assets- may be supporting BES asset and have a greater impact.
- 2nd control system used for monitoring /situational awareness- could be pressed into service to control under abnormal situations. It has a capacity to control- not what it is used for. Ergo- higher impact based on what it potentially can do, not what it normally does.
- ICCP node - low- it can go away, I don't care. System not that important to our operations but it may be to some one else.
- All 3500 mw to reliability coordinator via ICCP. From RC perspective it is high.

- I am sending 3500 mw info to RC- categorize as a high- because of what it is actually and what is it capable of doing.

Member Comments on the Scenario and the Categorization Approach

- "Span of control" notion is critical
- If you did it from BES side get to the same result.
- It was essential to setting up scenario- to start with BES functions. It is the branching underneath we are struggling with.
- System Frequency for AGC considered? Yes. How do you ensure you haven't missed something from an audit perspective?
- How to demonstrate to auditor under CIP 002- that you are at least mapping the functions.
- When you de-construct the functions and look at interactions necessary to support the function.
- The key is you started with function.
- Standard should seek to ensure effectiveness. Are you protecting the right thing and how well protecting is the next phase? Could overlook a core piece – in 002 specify mandatory criteria you have to look at.
- If I didn't look at substation first, I wouldn't have known of the problem upstream.
- Factors in BES asset impact with span of control without having to categorize the BES asset.
- Class the RTU as a medium. 2400 mw plant depending on where it is could be low or high in terms of BES impact. Because of where it is and its impact on BES.
- System impact assessment based on modeling of BES - lots of work. NPCC has done it that way.
- Start with impact of asset on the BES.
- Should we give the entity the choice to which side to chose?
- BES asset view point - system conditions change.
- Problem on the Cyber side. Restoration- how to identify a cyber system that supports restoration for a cranking path? Starting from cyber side - numerous elements in BES system- to identify what cyber systems are related to them. A cyber system can support multiple BES functions. Find all cyber assets in the cranking path. Will first find the BES assets.
- Do you need to categorize and impact assess? Yes you do.
- Don't mix cyber and physical systems?
- Some functions it may be done, other functions it may not be done.
- Missed common load generator.
- Sounds like we are saying we need to do both. Eliminate arrow between the 2 paths.
- Cyber perspective - span of control concept on BES side - merge together have a super list. Not two competing process. In the end consider BES. If only do left side you may miss or lower the rating mistakenly.
- Focus on cyber subsystems that directly support BES.

- It is iterative approach (but back and forth, not circles).
- Two parallel supporting efforts to get a super list vs. one subordinate of the other.
- Goal of a categorization of cyber system- consistent methodology.
- Implicit in doing both approaches is the assumption that you have an incomplete inventory on one side or the other. If you had a complete inventory of cyber assets do that side only. With a complete inventory of BES, do that one side?
- Give some more flexibility to do what they want
- Horizontal line should go away at top. Impact assessment of BES assets is a question of what to address first. The impact of BES asset shouldn't alter the level of the
- Generate list of BES subsystems under functions. One system supports moving power and one that support analysis and wide area view.
- It is the "span of control" that we are driving at.
- We are not asking the entity to devise a methodology to do an impact categorization. Standard will provide the criteria to assess and categorize their assets.
- Planning uses catastrophic conditions as a base.
- Try to remove the impression that one side is subordinate to the other. However can't be done in a vacuum. Have to understand the electric system.
- Try to create a single line for the diagram?
- If IT, supporting operations side of business. Start with generating list of cyber systems. Will have a hard time completing an assessment. If you don't start with functions - how do you know?
- The standard needs to give industry the criteria for the categorization.
- Give a list of functions? Will that change -
- Operating functions - these have already been defined by the industry. Version 5 of the functional model -
- However, note that functions are different from functional model. E.g. Entergy - single registered entity with six different functional models. Implementation convention within the organization.

- The reliability functions are applicable to you. Functional model - is not that clean.
- Rely on the functions and then map to BES and cyber assets. Will need lots more detail in the boxes in terms of text explaining the boxes.
- If you took BES analysis - called it "criticality" of specific elements - Cyber analysis- look at consequence of compromising and give it ranking. Where is the synthesis point - gives your impact. Take impact merge with "susceptibility" - and get to your impact
- Interconnectivity is at play? Yes.
- Do we want to say in certain areas of the working paper that the SDT is not sure of the answer? We need to present something with conviction, but not at a great level of detail.
- Link the last box to the next process
- Like the model that has emerged, it should be consistent with the Working Paper but not as detailed. Reflects more flexibility and identifies the big concepts.
- Bottom box is the outcome of the process- identifying what you need to protect- and arriving at the appropriate categorization
- What is the span of control?

- Existing 002 and this? Wrapping all within the reliability function. Every BES asset will be protected at some level.
- Can the SDT live with this conceptual graphic depiction for inclusion in the working paper? Yes.
- Can I go through this? Can't disregard but may not start with inventory of BES assets.
- What is the expectation of the BES analysis, i.e. what will be done with the analysis? All cyber assets inventoried.
- What to do with the BES analysis. Not all 115 relays need the same protection.
- BES analysis? What if left fed into the right vs. working in parallel. Feed this into cyber analysis/ span of control exercise?
- Default BES analysis is high - then purely assessment of cyber assets.
- BES changing all the time? System accounts for contingencies. Changing so much? No.
- We need 75-80% of relays to work when we need them.
- Consider US DHS - Tier I II Critical assets each sector tasked to come up with criteria based list. How to figure out where "big uglies" are. Tier 1 - most impactful. High capacity, high voltage. Tier 2 - size and scope. Tier 3 - everything else. This could eliminate the need for extensive analysis.
- Conceptual language drafted to codify into a standard. This becomes the analysis-identify and classify as a mapping exercise - Find cyber assets BES mapping (criteria) and analysis (use DHS tiers)
- Is this an external process? BES system comparing against criteria?
- Does BES mapping belong here? External process to this sequence? Entity still must categorize. Something needed to verify that mapping is still correct?
- Do once a year. Don't devise the criteria every year. Established outside an entity's process.
- Criteria should appear in a Reliability Standard.
- BES Subsystems vs. assets. Control center are included.
- Restoration is included in Tiers 1,2, + 3.
- Does this pull distribution into criteria?
- IT is a linear model with the same components. Using the DHS = tiers as a departure point. Stand alone standard.
- Perhaps CIP 002 (include the tiers) and CIP 003 features cyber characterization

Member Final Comments on the New Graphic

- Broad support for this depiction on SDT.
- Both start with reliability functions. This is a single vs. parallel path.
- This has BES mapping.
- Big difference - don't need 3rd party oversight of categorization of subsystems.
- More a performance based model - how well did you do the mapping and applying the controls.
- Less a black and white compliance exercise.

- How big a deviation with the current document? Language may need to be clearer that criteria will be provided.
- The diagram doesn't conflict with philosophy behind the working paper.
- Scope of impact and span of control are good concepts.
- SDT should plagiarize content of DHS- refer in more general terms. If want to avoid confusion, pick up concepts without numbers.

2. Identification of Essential Cyber Systems

Member Comments

- Other synonyms for "Essential": Vital, crucial, fundamental, critical, Quintessence-Imperative, indispensible, germane, etc.
- BES cyber systems. Intent to distinguish market systems. Corp cyber assets - we don't want to think about. Control systems and things impacting control systems.
- Is more information needed on "essentiality" criteria mapping? Cross sector cyber security working group.
- Sam Merrill's document? Scott will get this and share it with SDT.
- Equivalent levels between bulk and cyber side. E.g. non routable no longer an in/out criteria. Everything is in, but to a degree.
- Ramifications for Canadian? If DHS, tier 1 and tier 2. If the Canadians can adapt or augment, based on these concepts, there is no issue, much like NIST.

F. SDT CIP Version 3/Phase 2 Process Going Forward

1. Drafting Group Follow Up Steps before Vancouver

Members expressed thanks and appreciation to all those participating on the Drafting Team and to John, Phil and Jackie for leading a tremendous effort in "taking us down this road." John Lim agreed to work with Phil Huff and all other interested SDT members to:

- Produce the next draft which will be circulated as a final draft for consideration and adoption in Vancouver before seeking industry comments on the concepts.
- Take the SDT comments on the "target" section and produce another graphic using an alternative depiction.

The following members agreed to joint the drafting group: Dave Norton, Dave Revell, Jon Stanford, Joe Doetzl, Jay Cribb, Jim Breton and Kevin Perry. The BES experts will be joining and working with the team as well. NERC produced a 2 page statement of work for the experts: they will help finish working paper and requirement statements; be available to respond to draft posting comments associated with pieces; and have no expectation of a need to travel.

There will be additional working papers developed for SDT review going forward including:

- BES Risk Management concept paper
- Security Control concept paper.

IV. NEXT STEPS

A. 2009 SDT Workplan Approach and Schedule

Bob Jones, SDT facilitator, noted the proposal to proceed with CIP 002's development in the remaining half of 2009 and refine it after a sequence of rounds of comments from the industry before going to the ballot.

Member Comments

- Regardless of what the controls are, nothing/no one will be able to tell us how to solve the CIP 002 challenge. This is clear in reviewing the five competing bills in congress.
- The SDT should stay as focused on CIP 002 related. Let the political winds blow wherever.
- Always will think about controls and some hierarchy. We should focus on the "what" in the short term.
- For the SDT December release- we should consider picking some security control to give as an example as to what it means in terms of high medium low on a password protection.
- We don't have too bad a set of controls- 003 -009 will serve us for a little while.
- Focus on CIP 002 only? A little bit of both.
- Flagging issues for the industry that need to be done.
- Highly desirable –the sooner we get the concept out to industry the more time they will have to read and digest.
- Decoupled approach, multiple levels of analysis- more time they have to get comfortable with concept, the better.
- Industry will provide us with comments.
- When the operating people got on the team. Reaction was surprising- they pointed out that this is really a paradigm shift from the operating standpoint.

The Chair reminded people that the SDT would try to establish the 2010 meeting schedule at the July SDT meeting in Vancouver, B.C. Canada. For the time being she noted that the August meeting will take place as scheduled in Chicago pending confirmation of available meeting space. SDT will be notified soon if we need to change locations.

B. Other Items

Dave Norton advised the group of a call for self-nominations closing on June 25 for a new SAR drafting team which would be defining next generation of situational awareness control tools for the BES. Going out to operations and planning only. This is fundamentally a systems

project - command and control, remote telemetry. Part of what they want to do is constrained by what actually can be done. He suggested this will be highly interrelated with the 706 SDT's efforts and they will need more cyber perspectives from people who know how to run high speed wide area networks. It will be related to the further development of the smart grid and the use of the internet. He believes presently there are mostly vendors and academics interested in serving as members. As all of these intersect at the BES there is a need to get involved, and provide some cyber visibility.

He also noted that a big document was released today on 291 smart grid interoperability.
http://www.nist.gov/smartgrid/InterimSmartGridRoadmapNISTRestructure.pdf
It has a big section on cyber security with lots of financial resources behind this effort. The report's introduction includes the following context:

> "In early 2009, responding to President Obama's energy-related national priorities, NIST acted to accelerate progress and promote stakeholder consensus on Smart Grid interoperability standards. On April 13, NIST announced a three-phase plan to expedite development of key standards.
> This document is input into the first phase: engaging utilities, equipment suppliers, consumers, standards developers and other stakeholders in a participatory public process to identify applicable Smart Grid interoperability standards, gaps in currently available standards and priorities for new standardization activities.
> NIST awarded the Electric Power Research Institute (EPRI) a contract to engage Smart Grid stakeholders and develop a draft interim standards roadmap; NIST will use this document as a starting point in developing a NIST interim "roadmap" for Smart Grid interoperability standards. EPRI technical experts compiled and distilled stakeholder inputs, including technical contributions made at two EPRI-facilitated, two-day, public workshops. Other inputs include the accomplishments of six domain expert working groups established by NIST in 2008, and the cyber security coordination task group established in 2009. To date, hundreds of people have participated in the road mapping process."

C. Closing

The Chair thanked Jon Stanford for hosting the meeting and noted that she and Kevin appreciated the spirited debate that was honest, painful, but did make some progress in particular refining and simplifying the flow chart. The SDT is now aware of the concept of paradigm shift and will continue to incorporate broad spectrum of background and experiences represented around the table. Once again she thanked the Drafting Group members for an outstanding job.
Members completed an onsite meeting evaluation form *(See, Appendix #3).*
The SDT adjourned at 3:00 p.m. on June 18.

Appendix # 1
Project 2008-06 Cyber Security Order 706 SDT
Draft Meeting Agenda
June 17, 2009 | 8:00 a.m. to 5:00 p.m. PDT
June 18, 2009 | 8:00 a.m. to 5:00 p.m. PDT
Bonneville Power Administration
905 NE 11th Ave
Portland, OR

Proposed Meeting Objectives/Outcomes

- Receive update on TFE and VSL/VRF processes
- Receive update on the SDT "Key Messages Task Group"
- Review and refine the CIP Version 3 Working Paper as a conceptual framework going forward in plenary and small groups;
- Agree on next steps in the Work plan and assignments.

Draft Agenda
Wednesday June 17, 2009

8:00 a.m. Welcome and Opening Remarks- Jeri Domingo-Brewer/Kevin Perry
a. Roll Call
b. NERC Antitrust Compliance Guidelines
c. Facilitator review of May 13-14 Boulder City meeting summary and adoption

8:20 a.m. Review of Meeting Objectives, Agenda and Meeting Guidelines - Jeri Domingo Brewer and Bob Jones

8:30 a.m. Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure - Scott Mix
Update on VSLs/VRFs - Scott Mix

9:20 a.m. Overview of Steps to Date in the SDT CIP Version 3 (Phase 2) Development Process - Stu Langton

9:40 a.m. CIP Version 3 Categorizing Cyber Systems Working Paper - Big Picture Concepts Presentation - John Lim, Jackie Collett

10:45 a.m. Break

11:00 a.m. CIP Version 3 Working Paper Review and Discussion of Key Outstanding Issues - John Lim, Jackie Collett, et al

12:30 p.m. Working Lunch (Return to plenary meeting at 1:15)

1:15 p.m. CIP Version 3 Working Paper Review and Discussion of Key Outstanding Issues - John Lim, Jackie Collett, et al

	Test for SDT Consensus and Endorsement of Big Picture Concepts
2:45 p.m.	Consider Small Group Key Issue Breakouts
3:00 p.m.	Break
3:00 p.m.	Small Group Discussion of Key Outstanding Issues
5:00 p.m.	Recess

Thursday June 18, 2009

8:00 a.m.	Welcome and Agenda Review
8:10 a.m.	CIP Version 3 Small Group Reports – Plenary Session
10:00 a.m.	Break
10:15 a.m.	CIP Version 3 Small Group Reports – Plenary Session
12:00 p.m.	Working Lunch
12:45 p.m.	CIP Version 3 Working Paper(s) Refinements and Discussion - Small Group or Plenary
2:45 p.m.	Break
3:00 p.m.	Next Steps and SDT CIP Version 3 Process Working Paper(s) Assignments Initial discussion of CIP 002 Version 3 SDT Subgroup Structure in 2009 (Requirements, Measures, etc.) Consensus Testing of Development of CIP 002 Version 3 for Industry Comment and Ballot in early 2010 apart from Other CIP Standards Review of Next Steps and Work Plan
4:30 p.m.	Review July Meeting Objectives
4:45 p.m.	Meeting Evaluation - Review June Meeting Progress (What was accomplished? What helped? What can be improved going forward?)
5:00 p.m.	Adjourn

Appendix # 2
Cyber Security for Order 706 Standard Drafting Team and Attendees List
May 13-14, 2009 Project 2008-06 — CS 706 SDT
Orlando, Florida

Attending in Person – SDT Members

1. Rob Antonishen	Ontario Power Generation *(Tuesday and Wednesday)*
2. Jeri Domingo-Brewer, Chair	**U.S. Bureau of Reclamation**
3. Jay S. Cribb	Information Security Analyst, Southern Company Services, Inc.
4. Joe Doetzl	Manager, Information Security, Kansas City Power & Light Co.
5. Scott Fixmer	Senior Security Analyst Exelon Corporate Security, Exelon Corp.
6. Gerald S. Freese	Director, Enterprise Information Security America Electric Power
7. Phillip Huff	Arkansas Electric Coop Corporation
8. John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
9. Frank Kim	Ontario Hydro
Richard Kinas	Orlando Utilities Commission
10. David Norton	Policy Consultant, CIP Entergy Corporation
11. **Kevin B. Perry, Vice Ch.**	Director, Critical Infrastructure Protection, Southwest Power Pool
12. Christopher A. Peters	ICF International
13. David S. Revill	Georgia Transmission Corporation
14. Kevin Sherlin	Sacramento Municipal Utility District
15. Jonathan Stanford	Bonneville Power Administration
16.Keith Stouffer	National Institute of Standards & Technology
1. Roger Lampilla	*NERC*
2. Scott R. Mix	*NERC*
3. Joe Bucciero	*NERC/Bucciero Assoc.*
4. Robert Jones	*FSU/FCRC Consensus Center (Wed. & Thursday)*
5. Stuart Langton	*FSU/FCRC Consensus Center*

SDT Members Attending via Webex/Phone

17. Jim Breton	ERCOT
18. Jackie Collett	Manitoba Hydro
19. Scott Rosenberger	Luminant Energy

SDT Members Unable to Attend

1. Sharon Edwards	Duke Energy
2. John D. Varnell	Technology Director, Tenaska Power Services Co.
3.William Winters	Arizona Public Service, Inc.

Others Attending in Person

Darrell Hobbs	NU Energy
Chris Ewing	SEL
Curt Wilkins	BPA
Kim Long	Duke Energy
Forrest Gist	CH2MHill
Clark Goodlett	CH2MHill
Robert L. Windus	CH2MHill

Others Attending via Webex/Phone

James Bassett	Lafayette
Steve Dougherty	
Mike Fischette	
Travis Jaffrey	
Jason Marshall	Midwest ISO
Sam Merrell	CERT
Hoang No	
Mike Peters	FERC
Chris Wright	Burns & Mac

Appendix # 3 Meeting Evaluation Feedback

CYBER SECURITY ORDER 706 SDT
JUNE 17-18, 2009, PORTLAND, OR
MEETING EVALUATION FEEDBACK FOR INCLUSION IN FACILITATOR'S REPORT

Use the following 0 to 10 scale in evaluating the meeting: 0 means totally disagree and 10 means totally agree. A summary of the SDT responses will be placed in the Meeting Summary

1. Please assess the overall meeting.

7.5 The agenda packet was very useful.
8.0 The pre-meeting paper (Working Paper) was very useful.
8.5 The WebEx document display and the audio were effective
9.4 The quality of the meeting facility was good.
9.0 The objectives for the meeting were stated at the outset.
7.4 Overall, the objectives of the meeting were fully achieved.
Were each of the following meeting objectives fully achieved:
9.3 Receive update on TFE and VSL/VFR processes
N/A Receive update on the SDT "Key Messages Task Group"
7.4 Review, refine and adopt the CIP Version 3 Working Paper as a conceptual framework going forward in
plenary and small groups;
7.9 Agree on next steps in the Work plan and assignments.

2. Please tell us how well you believe the Team members and participants engaged in the meeting.

8.3 The Chair and Vice Chair provided leadership and direction to Team and Facilitators
8.8 The Facilitators made sure the concerns of all members were heard.
8.5 The Facilitators helped clarify and summarize issues.
8.0 The Facilitators helped members build consensus.
8.6 The Facilitators made sure the concerns of all participants were heard.
7.3 The Facilitators helped us arrange our time well.

3. What is your level of satisfaction with what was achieved at the meeting?

7.8 Overall, I am very satisfied with the results of the meeting.
8.3 Overall, the design of the meeting agenda was effective.
8.7 I was very satisfied with the services provided by the Facilitators.
8.0 I am satisfied with the outcome of the meeting.
7.3 I am satisfied with the progress we are making as a Team.
8.8 I know what the next steps following this meeting will be.
8.4 I know who is responsible for the next steps.

4. Other comments (use other side)

It's just painfully slow…So was building Rome…☺

What did we achieve?

- Significant breakthrough on working paper concept
- Synthesis of the BEX/Cyber process tracks
- We got the entire team on-board with the document. Progress was made, but was painful
- Refine flow-chart

What are our biggest challenges going forward?

- Team acceptance of revisions stemming from meeting
- Industry acceptance of new approach
- Getting something done before congress tells us what to do!
- Finalizing the concept paper
- Organizing the SDT to evolve the standards

What suggestions do you have for making our group more productive?

- Try to control chasing of rabbit trails
- Put end to repetitive arguments/discussions
- Don't know what…
- There should be a more cncerted effort to research existing work (such as the DHS Tier I/Tier II document) that may be beneficial to the progress of the group
- Organize for results
- Smaller groups
- Iterative development
- Organize by capabilities
  - Experience
  - Capability/expertise
  - BES function
  - Interest
- Too much open group dialogue – letting 25 people weigh-in on all issues is
- arduous/counter-productive.
- We need to come to each meeting ready to make decisions – Decide/Act

Appendix # 4
NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and

subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 5
CYBER SECURITY ORDER 706 SDT JANUARY- DECEMBER DRAFT PROJECT SCHEDULE *(REVISED MAY, 2009)*

CYBER SECURITY ORDER 706 SDT MEETING SCHEDULE

OCTOBER 2008-DECEMBER, 2010

DEVELOPMENT OF CIP FRAMEWORK OCTOBER 2008-JULY, 2009

1. October 6-7, 2008, NIST, Gaithersburg, MD, Review of CIP 002-009, Agreement on Phase 1/Version 2 approach
2. October 20-21, Sacramento, CA, Phase 1/Version 2 Development
3. November 12-14, 2008, Little Rock, Phase 1/Version 2 Adoption; Phase 2/Version 3 Process review
4. December 4-5, 2008, Washington D.C., Phase 2/Version 3 review and debate, white papers assigned.
5. January 7-9 SDT Meeting, Phoenix, AZ ½ / 1/½ day format. Wed-Friday

- Review of Technical Feasibility Exceptions white paper
- Review of Industry Comments on Phase 1 products- Establish and convene small groups to draft responses
- Review of Phase 2 White papers

January 15 Webex meeting(s)

- Small group draft responses to industry.

January 21 Webex meeting(s)

- Small group draft responses to industry.

6. February 2-4 SDT Meeting, 2009, Phoenix, AZ, ½ / 1/½ day format. Mon-Wed.

- Update on NERC Technical Feasibility Exceptions process
- Review of VSL process and SDT role
- Review of Phase 2 White papers, strawman and principles
- Review and Adoption of SDT Responses to Industry Comments on Phase 1 and Phase 1 Product Revisions.

7. February 18-19, SDT Meeting, Fairfax, VA

- Update on Phase 1 process
- Update on NERC TFE process
- Update on VSL Team process
- Review, discussion and refinement of Phase 2/CIP 002 White papers, strawman and principles

8. March 10-11, SDT Meeting 2009, Orlando, FL, ½ /1/1 day format

- Update on NERC TFE process
- Update on VSL Team process
- Review and Refinement of Phase 2 CIP 002 Strawman Proposals

March 2- April 1 30-day Pre Ballot
Mid-March- NERC posts TFE draft Rules of Procedure for industry comment

March 30, WebEx meeting(s) White Paper Drafting Team
April 1-10, NERC Balloting on Phase 1 Products
April 6, WebEx meeting- White Paper Drafting Team
April 8, WebEx meeting(s) - White Paper Preview- Full SDT Conference Call
*April 11, 2009 Phase 1 Ballot Results (*Quorum: 91.90% Approval: 84.06%) *and Industry Comments-*

9. April 14-16, SDT Meeting, Charlotte NC, ½ / 1/½ day format. Wed-Friday

- Update on NERC TFE process
- Update on VSL Team process
- Update on the NERC Critical Assets Survey
- Agree and Adopt Responses for Phase 1 Industry Comments- Recirculation Ballot
- Review and Refinement of Phase 2 Whitepaper and Progress Report to MRC

April 28 and May 6 White Paper Drafting Team Meetings/Webex
April 17-27 Recirculation Results: Quorum: 94.37% Approval: 88.32%
May 5, 2009, NERC Member Representative Committee Meeting, Arlington, VA- SDT progress report.

10. May 13-14, Wed.-Thursday, SDT Meeting, Boulder City NV, 2-day format

- Review MRC presentation and any input to SDT on Phase 2 approach
- Further SDT refinement and discussion of the Phase 2 White Paper.

June, Working Paper Drafting Team Meetings/WebEx, June 8 & June 15, 2008

11. June 17-18, SDT Meeting, Portland OR, 2-day format

- Further SDT refinement of the Draft CIP Version 3 Working Paper(s).
- Review SDT development process for June-December 2009
- Discuss potential SDT subcommittee structure and deliverables.

June, WebEx meeting(s)

- Working Paper Sessions including inputs from selected industry personnel to help establish BES Categorization Criteria
- Agree on and charge SDT subcommittees

12. July 13-14, 2009 Vancouver, B.C., Canada

- SDT Plenary session to review and respond to any input/comments on Working Paper
- Adopt Version 3 CIP Working Paper for industry review
- Confirm SDT Subcommittees and Deliverables
- Conduct subcommittee organizational meetings
- SDT Subcommittees meet to begin drafting assigned issues and deliverables
- Subcommittee organizational and deliverable reports to SDT

July, WebEx meeting(s)

- Working Paper Sessions including inputs from selected industry personnel to help finalize BES Categorization Criteria
- SDT Subcommittee meetings (as needed)

CIP 002 DEVELOPMENT OF REQUIREMENTS, MEASURES, ETC. AUG.-DEC 2009

13. August 20-21, 2009, Chicago IL

- SDT Plenary session to review and respond to any industry input/comments on Working Paper
- SDT Plenary and Drafting Subgroup meetings to develop and test support for deliverable CIP 002 provisions

*August, 2009, **NERC Member Representative Committee***
Progress Report and presentation on new CIP Version 3 Working Paper-Concept-Reliability Standards on Cyber Security for MRC input, Winnipeg, Manitoba

August, WebEx meeting(s)

- SDT Subgroup meetings (as needed)

14. September 9-10, 2009 Folsom, CA

- SDT Plenary session to review and respond to any additional industry input/comments on Working Paper
- SDT Plenary session to review MRC input on approach to Version 3 CIP Reliability Standards on Cyber Security and consider and agree on refinements

- SDT Subgroup drafting meetings- prepare deliverables
- SDT Plenary Session(s)- provide briefings and Subgroup reports
- Review Work Plan through Summer, 2010, as needed
- Establish SDT Meeting Dates and Locations for Jan-December 2010

September, WebEx meeting

- SDT Subcommittee drafting meetings

15. October 20-22, New Orleans LA

- SDT Subgroup drafting meetings
- SDT Plenary Session(s) - Subgroup reports on CIP 002 deliverables
- SDT Subcommittee drafting meetings
- Review, Revise and Adopt Work Plan through Summer, 2010, as needed
- Confirm Meeting Dates and Locations for Jan-December 2010

October, WebEx meeting

- SDT Subcommittee drafting meetings

16. November 17-18, Atlanta GA

- SDT Plenary Session(s) – to review and refine CIP 002 deliverables from SDT Subcommittees
- SDT Subcommittee drafting meetings to refine products based on SDT input

November, WebEx meeting

- SDT Subcommittee drafting meetings to finalize drafts

17. December 15-17, Tampa

- SDT Plenary Session(s) to review, refine, and agree on and adopt CIP 002 deliverables of new Categorizing BES and Cyber Systems Standard
- Agree on initial Posting of draft CIP 002 for industry review and comment

December, WebEx meeting

- SDT Subgroup meetings

DEVELOPMENT OF OTHER CIP STANDARDS- JAN.-DEC 2010

SDT Meetings 18-30. 2010 *(12 SDT monthly meetings and subgroup webex meetings as needed)*

- SDT Responds to Industry Comments on Initial and Subsequent Postings of CIP 002, Version 3 *(may be multiple comment periods, as required)*
- Refine the CIP 002 and submit new CIP 002 Version 3 Standard for Balloting while permitting industry to rely on CIP 003-009 until the full suite is reviewed and presented for balloting.
- Initiate Development of the full suite of CIP Reliability Standards on Cyber Security including Requirements, Measures, Controls, etc.
- Submit the full suite of CIP Reliability Standards on Cyber Security for Industry Comment
- Refine and Submit the full suite of CIP Standards for Industry Ballot
- NERC Board of Trustees Adoption of the full suite of Standards
- FERC Approves and NERC Implements the full suite of CIP Standards

Categorizing Cyber Systems

An Approach Based on BES Reliability Functions

NERC Cyber Security Standards Drafting Team for Order 706
06/15/2009 –Team

This draft Categorizing Cyber Systems paper is a “Work in Progress” that is meant to convey the initial thoughts and ideas that should be addressed and considered by the full CSO706 SDT as part of the deliberations related to the revised CIP Reliability Standards addressing Cyber Security. This is a Working Concept Paper, and is subject to change as these initial concepts are addressed and discussed by the SDT.

Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

June 17, 2009 | 8 a.m. – 5p.m. PDT
June 18, 2009 | 8 a.m. – 5p.m. PDT

Proposed Meeting Objectives — Outcomes

- Receive update on TFE and VSL/VRF processes
- Receive update on the SDT "Key Messages Task Group"
- Review and refine the CIP Version 3 Working Paper as a conceptual framework going forward in plenary and small groups
- Agree on next steps in the Work plan and assignments

Wednesday, June 17, 2009

Welcome and Opening Remarks — Jeri Domingo Brewer — Kevin Perry

a. Roll Call
b. NERC Antitrust Compliance Guidelines
c. Facilitator review of May 13–14 Boulder City meeting summary and adoption

Review of Meeting Objectives, Agenda and Meeting Guidelines — Jeri Domingo Brewer and Bob Jones

- Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure — Scott Mix
- Update on VSLs/VRFs — Scott Mix
- Update on the "Key Messages" Task Group — Gerry Freese
- Overview of Steps to Date in the SDT CIP Version 3 (Phase 2) Development Process — Stu Langton
- CIP Version 3 Categorizing Cyber Systems Working Paper – Big Picture Concepts Presentation — John Lim and Jackie Collett

Break

- CIP Version 3 Working Paper Review and Discussion of Key Outstanding Issues — John Lim, Jackie Collett, et al

Working Lunch (Return to plenary meeting at 1:15 p.m.)

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

- CIP Version 3 Working Paper Review and Discussion of Key Outstanding Issues – John Lim, Jackie Collett, et al
- Test for SDT Consensus and Endorsement of Big Picture Concepts
- Consider Small Group Key Issue Breakouts

Break

- Small Group Discussion of Key Outstanding Issues

Recess

Thursday, June 18, 2009

Welcome and Agenda Review

- CIP Version 3 Small Group Reports — Plenary Session

Break

- CIP Version 3 Small Group Reports — Plenary Session
- Working Lunch
- CIP Version 3 Working Paper(s) Refinements and Discussion — Small Group or Plenary

Break
Next Steps and SDT CIP Version 3 Process

- Working Paper(s) Assignments
- Initial discussion of CIP 002 Version 3 SDT Subgroup Structure in 2009 (Requirements, Measures, etc.)
- Consensus Testing of Development of CIP 002 Version 3 for Industry Comment and Ballot in early 2010 apart from Other CIP Standards
- Review of Next Steps and Work Plan
  Review July Meeting Objectives
  Meeting Evaluation — Review June Meeting Progress (What was accomplished? What helped? What can be improved going forward?)

Adjourn

Meeting Summary Contents

EXECUTIVE SUMMARY

The Chair, Jeri Domingo-Brewer and Vice Chair Kevin Perry welcomed the members. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call for each day. The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed with the team and participants the proposed meeting agenda.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines. He urged the team and other participants in the process to carefully review the guidelines as they cover all participants and observers.

Kevin Perry made the presentation the Technical Feasibility Exception (TFE) and the NERC Rules of Procedure posting and Gerry Adamski, NERC's Director of Standards offered additional information on behalf of Scott Mix who was not able to attend the meeting. Kevin noted several areas that are under review and Mike Assante was leading a "tiger team" with regional entity representatives to address a number of issues that have been raised in the industry comments received to date. Gerry Adamski noted the plan to submit to NERC Board of Trustees for review and adoption at the upcoming August meeting has been delayed until the next BOT meeting in the Fall given the open issues and the need to clarify the implications and questions for NERC's implementation including how to capture the process in the 2010 plan and budget. NERC hopes to produce a final TFE process sometime next year before FERC. The members discussed the range of questions and issues that had been raised by the industry and both the interim and final TFE.

David Taylor provided an update report to the SDT on VSLs and VRFs noting that he does not expect that the SDT will need to address or deal with this going forward as the assigned SDT is handling the process. The SDT discussed the Smart Grid effort that is being led by NIST. Keith Stouffer reported that the effort is addressing system level requirements from the top down and component level details from the bottom up. They are working with 800-53 NIST and ISA 99 work and are keenly aware of the work of the SDT. He also referenced the work now on ISA 99 — Part 4 — detailed cyber security for industrial control systems. These requirements will be harmonized with other activities.

NERC requested that the SDT review its CIP-006-1 Interpretation. The CIP Standards Interpretation Team met the first day over lunch to reconsider the interpretation of CIP-006-1 requested by SCE&G regarding the need to physically protect Critical Cyber Assets that are dial-up accessible but do not use a routable protocol. The interpretation was previously approved by the industry but not yet submitted to the FERC for approval. The interpretation asserted that the exclusion of such Critical Cyber Assets is a correct interpretation of the standard. The team examined CIP-002-1, CIP-005-1, and CIP-006-1, along with the FAQ for the Version 1 CIP standards and determined that the exclusion might not have been written had the standards been developed with present day knowledge, the interpretation team agreed and the SDT concurred that the interpretation approved by the ballot body and the NERC Board of Trustees is a correct interpretation of CIP-006-1, Requirement R1.1.

Stu Langton reviewed the milestones in Version 2 and Version 3 of the SDT work and the SDT convergence on a single consensus approach in Orlando that was refined further in Charlotte, Boulder City and Portland with John Lim and Phil Huff leading an expanded drafting team to continue to refine the paper between meetings. Joe Bucciero, with the SDT facilitation team, reported that following the Portland meeting the SDT has been supplemented with additional members and BES expertise and has produced its proposed concept paper for the SDT's review and adoption.

On behalf of the SDT, the Chair thanked John Lim, Phil Huff and the other members of the drafting team for working productively since the Portland SDT meeting and bringing to Vancouver a proposed concept paper that can be adopted by the SDT for sharing with the industry as the basis for the SDT's efforts in developing the Version 3 standards. John Lim presented the working paper noting the significant changes and improvements that emerged from the Portland SDT meeting. The SDT discussed the paper, agreed to some minor wording changes and agreed that the paper would be archived. The SDT agreed that industry comments should be focused on the development of CIP-002 requirements in the key areas set forth in the concept paper. Following the discussion the SDT unanimously adopted the concept paper as revised for sharing with the industry and agreed to develop a draft cover letter and comment form for posting with the paper. The team discussed a "game plan" for communications with the industry on the working concept paper and agreed to post the paper, brief the Members Representative Committee and present a Webinar in August and provide an update on progress at the NERC October workshop in Dallas, Texas.

The Chair reviewed the July-December 2009 work plan proposal circulated in advance noting that all members of the SDT would participate in at least one of five proposed subgroups drawn from the concept paper, (i.e. Reliability Functions; List of BES Subsystems and/or BES Cyber Systems; BES Mapping; Cyber Analysis; and Definition and Selection of Controls. Member noted their preferences and the Chair and Vice Chair made assignments guided by those preferences. Each subgroup was charged to draft requirements for consideration by the SDT to be included in a draft CIP-002 Version 3 to be shared with the industry in December 2009.

On the afternoon of the first day and the morning of the second day the five subgroups met in parallel conducting organizational sessions to: review scope of the assigned topic; identify areas that may need development of related CIP-002 requirements; determine what information they will need going forward; select a leader/spokesperson, a scribe and a timekeeper; sketch out a work plan, including a meeting schedule in order to get the work done by the October SDT meeting. Finally the subgroups were asked to draft questions for their topic for use in the concept paper comment form.

The SDT discussed the roles that would be played by the members, subgroup members, subgroup leaders, and a coordinating team and staff. On the second day the SDT agreed that it would be helpful to develop a set of consistent coordination guidelines for the subgroups.

The Chair reviewed the schedule for getting the concept paper, announcement and comment form finalized and posted on the NERC website for industry comment. She expressed the hope that this could be accomplished for NERC posting by the week of July 20. The Chair thanked the members for their hard work together and in the subgroups and commended them on the adoption of the concept paper and the development of the announcement and comment form. The SDT adjourned at 3:00 p.m. on July 14.

I. Introductions, Agenda, and SDT Work plan Review

The Chair, Jeri Domingo-Brewer and Vice Chair, Kevin Perry welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). The SDT adopted the May 13–14 and June 17–18 meeting summary without comment or objection.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

II. UPDATES

A. Technical Feasibility Exception (TFE) NERC Rules of Procedure Posting

Kevin Perry made the presentation and Gerry Adamski, NERC Vice President and Director of Standards, offered additional information on behalf of Scott Mix who was not able to attend the meeting. Mr. Perry noted several areas that are under review by NERC. Mike Assante, NERC Chief Security Officer, is leading a "tiger team" with regional entity representatives to address a number of issues that have been raised in the industry comments received to date. Gerry Adamski noted that the plan to submit to NERC Board of Trustees for review and adoption at the upcoming August meeting has been delayed until the next BOT meeting in the Fall in light of the open issues and the need to clarify the implications and questions for NERC's implementation. Following its consultation with the regional entity representatives, NERC BOT hopes to adopt a final TFE process sometime next year to submit to FERC.

SDT Comments on TFEs

- Lots of questions have been raised but not yet answered.
- What are the advantages and disadvantages to NERC centrally processing all TFEs or RE's processing?
- Will TFE requests to Regional Entity be evaluated/approved or rejected in the context of CIP audits or spot check?
- Is it resolved as to whether the interim process limits TFEs to the 9 requirements? No. Proposed changes to NERC ROP (footnote 1).
- May add more requirements to list — e.g. CIP-004 R3 — personnel risk assessment.
- What role will statutory law play with the TFE? Bargaining unit agreements?
- CIP-007 R2.3 — Ports and services — document compensating measures. TFR
- CIP-007 R3.2 — Monitoring and alerts. Document compensating measures
- Submit TFE by secured means? 30 days before audit or spot check. Should they do it at point of compliance? We don't currently have a secure means yet for submission. A submittal form is under review by NERC.

- Concerns have been expressed that entities will be reluctant to submit the information on the submittal form
- TFE — remedy shortcomings and get approved if TFE rejected. Within 30 days- respond and get TFE.
- Does the violation period start when TFE rejected? NERC's intent is that the violation period begins with effective date of rejection notice but that didn't make it into the bulletin.
- There are also no penalties for frivolous filings in the current draft.
- In the proposal and interim bulletin, it doesn't cite reasons why entity could request a TFE e.g. operational, safety concerns, and conflicts with other standards.
- Is there a concern about opening up to all reliability requirements? Limit to CIP standards?
- CIP spot checks currently work with 13 requirements, none of which provide for TFE requests.
- Are pieces of TFEs covered for CIP-007? Don't have to file for that? It says "it will be documented" no TFE there now.
- The "Tiger Team" will be discussing the meaning of "where technically feasible" compliant if the entity demonstrates can't comply for technical reasons. Will there be a subset of requirements for which TFE can be received? Or will it be more open to real technical infeasibility? Lawyers are proposing tight control of the TFE.
- Some Canadian jurisdictions have issues regarding the TFE reporting through regional entities and/or NERC (e.g. Ontario). Is NERC looking to regional entities to sort through issues? If entity unsure can they work with REs vs. NERC? Should entity approach and work through RE or go through NERC directly?
- REs have presented a proposal which addresses the subject of Canadian entities. Is there an issue with submitting to NERC vs. RE? NERC expected all data on site in context with audit. Logistically and practically this won't work.
- In Ontario different frameworks been proposed about who should or not report to RE? E.g. IESO contracts. In a July 1 letter, certain entities should respond directly to the regional entity which is not currently the case. Hydro One is unclear about this. They are NERC registered entities.
- Joint regional proposal — NERC should evaluate "class type TFEs" and identify acceptable outcomes and provide for these. E.g. standards don't accommodate — field devices, anti virus etc. If we know classes of devices, we should identify acceptable alternatives to meet reliability.
- We must distinguish between interim process and long-term process.
- There is industry concern about different answers for same equipment within and across regions. The industry needs consistent methodology across all NERC regions.
- Regions are aware of this concern. They suggest the RC ask the entity to identify if other regions are being asked to address the TFE. These need the same response.
- Is our focus on interim procedures? Shouldn't we keep our eye on the longer term? Interim may look a lot like the final procedure. This will not be wasted work.

B. VSLs and VRFs

David Taylor provided an update report to the SDT on VSLs and VRFs. He noted that the SDT is making progress having developed comment forms with posting for pre-ballot review in early August. He noted that he does not expect that the SDT will need to address or deal with this going forward.

C. Update on other Related Cyber Security Initiatives

The SDT discussed the Smart Grid effort that is being led by NIST. Keith Stouffer reported on the effort led by Annabelle Lee at NIST that is addressing system level requirements from the top down and component level details from the bottom up. They are working with 800-53 NIST and ISA 99 work and are keenly aware of the work of the SDT. They have weekly telephone conferences which some members of the SDT participate and are following.

He also referenced the work now on ISA 99- Part 4 — detailed cyber security for industrial control systems. These requirements will be harmonized with other activities. They are developing their own requirements document.

Currently the categorization approach under review contains four levels of response at a system level. Next they will be developing detailed component level requirements. A proposed security compliance institute might set forth requirements which vendors can build products consistent with and have their products certified by the institute. He noted that at the upcoming ISA Expo in fall, 2009 the requirements document is scheduled to be presented for review.

Member Comments

- Is there any consideration to coordinating and synchronizing schedules and linkages among these efforts? What is the perception of the pace of the SDT's work? The perception is the SDT is not as slow as other groups.
- The Smart Grid effort is politically charged with a short time frame. Some believe the speed they are moving at will not result in effective and acceptable products.
- NIST cyber security documents are defining requirements. But what and who are the requirements to be applied to? Are they being written for those applying for DOE RFPs/grants from the $4.5 billion allocated for the smart grid? Are they also intended for those responsible with the electric grid?
- The system level requirements would apply across the whole grid — detailed cyber security requirements for different aspects of the grid. They are looking at what requirements are in the standards.
- Are there any NERC security initiatives that connect with the SDT efforts? Mike Assante will keep the SDT apprised of this.
- Nuclear initiatives? NERC alerting. Hydra — any thing needed to be known? Potential in future with hydra — BOT approved process in 2008. All procedural aspects being balloted going forward. Expedited standards development process.
- Order 706 B-Nuclear plants — how to carry forward initiatives? Development of an MOU with NRC and NERC is being developed. Development of exemption process for nuclear plants is under consideration as well as alternatives to NERC CIP umbrella under the NRC

jurisdictions. The implementation schedule for when nuclear plants held to standards is the subject of a conference call tomorrow with FERC, NERC and NRC. NERC must file by September 15, 2009, under a FERC order. NEI taken an active role on behalf of members.

- How will the process play out in terms of auditing? NERC, Regions, and NRC taking over? Permit to take more active role over auditing even though jurisdiction within NERC is still under consideration.
- NRC may a conduct audit with compliance proceeding turned over the RE.
- Looks like timeframe for proposal will dovetail with CIP Version 2 efforts. Will be handled through FERC approval of Version 2. Plants looking at Version 2 in compliance.

III. CIP-006-1 Interpretation

NERC requested that the CIP review its CIP-006-1 Interpretation. The CIP Standards Interpretation Team met the first day over lunch to reconsider the interpretation of CIP-006-1 requested by SCE&G regarding the need to physically protect Critical Cyber Assets that are dial-up accessible but do not use a routable protocol. The interpretation was previously approved by the industry but not yet submitted to the FERC for approval. The interpretation asserted that the exclusion of such Critical Cyber Assets is a correct interpretation of the standard. The FERC has questioned whether the interpretation is valid, believing that the original interpretation evaluated the Additional Compliance Information as opposed to the requirement.

The team examined CIP-002-1, CIP-005-1, and CIP-006-1, along with the FAQ for the Version 1 CIP standards and determined the following:

- CIP-006-1 contains Additional Compliance Information that was referenced in the interpretation, specifically.
- D-1.4.4 — for dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006 for that single access point at the dial-up device. This additional compliance information is supported by language in the CIP-002-1 and CIP-005-1 standards and the Version 1 FAQ that clearly document the intent of the original standards drafting team.
- Put simply, the Critical Cyber Asset that does not utilize a routable protocol and is “dial-up” accessible does not have to be within an Electronic Security Perimeter per CIP-005-1, Requirement R1.2. As the CCA is not within an ESP, it is not included in protection requirement of CIP-006-1, Requirement R1.1.

While the exclusion might not have been written had the standards been developed with present day knowledge, the interpretation team agreed and the SDT concurred that the interpretation approved by the ballot body and the NERC Board of Trustees is a correct interpretation of CIP-006-1, Requirement R1.1 when viewed in the context of the complete set of Version 1 (and 2) CIP Cyber Security Standards. Any shortcomings of the requirements themselves must be remedied through standards development action.

IV. SDT Phase II — Version 3 Development Process — the “Working Paper”

A. Overview of Phase II — Version 3 Work Plan

Stu Langton reviewed the milestones in Version 2 and Version 3 of the SDT work including the work in Little Rock that framed the challenges, the subsequent development of the SDT "white papers" following the Washington D.C. meeting in December 2008 and further review and refinement of those and other papers. *(See Appendix # 5)* This resulted in the SDT convergence on a single consensus approach in Orlando that was refined further in Charlotte, Boulder City and Portland with John Lim and Phil Huff leading an expanded drafting team to continue to refine the paper between meetings. The working paper provided a basis for developing and testing the following consensus points in April that were subsequently offered to the NERC industry Members Representative Committee in May 2009. These included:

1. The standards should require a BES impact assessment as an initial approach to categorizing BES Cyber Systems.
2. The impact categorization of Cyber Systems will be based on reliability functions of the BES to achieve Adequate Levels of Reliability.
3. The standard's BES Impact Assessment will consider a categorization process.
4. The standards will require oversight of the categorized list of BES assets by entity types which have a more complete wide-area view of the BES.
5. The standards will categorize Cyber Systems supporting, either directly or indirectly, the reliability functions of the BES and apply security requirements (or controls) that are commensurate and appropriate to their potential impact on the BES.
6. The final Cyber System categorization will reflect the impact to the BES based on a loss of availability, integrity, or confidentiality of the Cyber System.
7. The standards will provide Organizations with reasonable flexibility in applying equivalent security controls on the basis of compensating controls and environmental considerations.
8. The standards will address the complex nature of BES functions and interconnected Cyber Systems, both within and between multiple organizations.
9. The standards will state explicit criteria for the BES Impact Assessment.
10. The standards will state explicit criteria for the Cyber Impact Assessment (including use and misuse of cyber systems).
11. The standards will include a methodology to merge the BES Impact Assessment and Cyber Impact Assessment into a final Cyber System categorization.

Joe Bucciero, with the SDT facilitation team, reported that following the Portland meeting the SDT has been supplemented with additional members and BES expertise and has produced its proposed paper for the SDT's review and adoption.

B. Phase II Concept Paper Overview Presentation and SDT Adoption of the Concept Paper

On behalf of the SDT, the Chair thanked John Lim, Phil Huff and the other members of the drafting team for working productively since the Portland meeting and bringing a proposed concept paper that can be adopted by the SDT to share with the industry as the basis for the SDT's efforts in developing the Version 3 CIP-002 standards. John Lim presented the working

paper noting the significant changes that emerged from the Portland SDT meeting (*See Appendix #9).* He noted the expanded team met twice by phone and WebEx following the Portland meeting. Following the presentation, the Chair thanked the team members and others who produced an outstanding product. A motion was made by John Lim, and seconded by Phil Huff, to adopt the paper by the SDT to post for industry comment. The following member comments were offered in the discussion of the motion.

Member Comments on the Motion to Adopt the Concept Paper

- Do generation assets = networking equipment? DCS control system — switches can be critical assets. Cyber or BES consideration? Cyber consideration — more detail than the paper addresses at the conceptual level.
- Network issues = supporting SCADA communications? More detail vs. conceptual, however look at the "Target of protection" illustrations.
- Pp 12 BES subsystem e.g. Load balancing function: Plant control room- change from "center"? Guideline — control center vs. room. This was intended to reflect the same campus environment, 1 facility multiple rooms. Guidelines as a "room"(s).
- SDT agreed to change control centers to "room(s).
- Contingency reserve section. Any units company has 150 mw? This is done by hardware — shared groups multiple owners of same equipment.
- What level trying to drive at? 150 mw? Not looking at individual units. 10 150 mw in a plant.
- How can we head off and deal with the industry "CIP-002-009 mentality?" Will there be a mountain of documentation for every digital asset? Every digital asset in BES and everything it talks to as well? Everything will now be at least a "low."
- How will we handle industry comments back on the concept? Is the SDT bound to all aspects of the concept paper? The SDT should consider the concept paper as complete and out for industry comment. The input on the concept paper will help the SDT as it develops CIP-002-009 standards and requirements going forward.
- The SDT should consider the lessons learned in the CIPC guidelines approach. The comment form was structured to ask the industry to comment on particular issues. This approach could directly facilitate efforts for the SDT to use the input as the process goes forward
- The SDT should work today and tomorrow to develop a clear and structured comment form for the concept paper.
- Important to convey that this is a "big picture concept approach" signaling the direction of changes from previous versions in terms of approach (vs. Version 1 and 2). The cover letter/announcement will be crucial in setting the stage.
- Make sure the concept paper has Reference line numbers and invites suggestion.
- Will there be an opportunity for industry to say maybe this is too much? Yes.
- Concerns with the idea that this paper will never see a character changed in it is overblown. These tend to become reference archived documents. We should clarify to the industry that the SDT will not mount concerted effort to respond to every comment and seek to adjust the

concept paper accordingly. But as we develop the requirements and address industry concerns, we can update the concept paper as appropriate.

- We have to do a selling job on both concept paper and standards themselves. We need to convince the industry that this is the right approach. While this may look to the industry to be onerous, in reality it will be easier, more consistent, easier to comply with standards over the longer term. The industry will build upon, not lose the work they have put into the CIP to date.
- We need to consider as we write requirements how the entity can demonstrate compliance with the requirement. Today it is an exercise with mountains of paperwork. We should try to address this as we go forward.
- Concept Paper will be archived as a background document. Address comments by incorporating responses in the first draft of CIP-002 requirements.
- The concept paper has provided a visual representation of our ideas. Agree that industry is wary of documents.
- Jackie Collett offered to take a look at the concept paper with the "Queen's" English in mind. The chair accepted the offer.
- The SDT needs to let industry know we are making progress. We should be prepared to present at the NERC October 14–15 Dallas workshop this approach as a "paradigm shift" in cyber security.

Following the discussion the SDT unanimously adopted the concept paper as revised for sharing with the industry and agreed to develop a draft of a comment form for the paper.

The team discussed a "game plan" for communications with the Industry on the working concept paper and agreed to the following steps:

1. Post in July the Working Concept Paper for Comment and Suggestions (with a cover and comment form with key questions to be developed on July 14 by the subgroups and the SDT);
2. Presentation of the concept paper to MRC on August 4, 2009;
3. Webinar(s) to the Industry in August 2009; and
4. Presentation of the industry comment and SDT progress at NERC Workshop on Compliance and Cyber Security (October 14–15, 2009)

V. Development of Concept Paper, Draft Announcement, and Comment Form

On the second day the SDT agreed to develop a draft announcement and comment form. Each of the 5 subgroups was asked to draft questions for the industry to respond to in each of their areas. The SDT believed this would help to solicit industry comments that the sub-groups could use in developing draft requirements. The Chair, with assistance of staff drafted an announcement and cover letter for the paper which was reviewed, refined, and adopted by the SDT. (*See Appendix #11*) The subgroups presented their draft questions to the SDT which offered suggestions. The subgroups then redrafted their questions and the SDT adopted the following for use in the comment form to be posted with the concept paper:

Reliability Functions

1. Is the concept of the categorizing by function instead of by asset clear? If not why?
2. The BES Reliability Functions listed in the "BES Function" column of the table were not meant to be comprehensive. Are there any others functions we need to address and why?

BES Subsystems and BES Cyber Systems

1. Does the methodology presented in the Identification of BES Subsystems and the Identification of BES Cyber Systems sections capture all of the systems that will need to be protected to achieve an acceptable level of reliability? What other issues need to be considered?

BES Mapping

1. The concept paper proposes that all identified BES subsystems are mapped into categories based on pre-defined criteria which reflect their impact on the reliability and operability of the BES: this mapping will be based on pre-defined criteria in the functions they provide or support, which determine the level of that impact. Do you agree with this approach and if not, what alternative suggestions do you have?
2. The paper gave an example of High, Medium and Low impact levels. What do you believe is the appropriate number of levels for impact mapping of the BES subsystems?
3. Do you prefer discrete thresholds or performance based criteria for mapping BES sub-systems? E.g. MW values as opposed to percentage of total generation. Please explain.

Cyber Analysis

1. Section X.X, Categorization of Cyber Systems, describes how an entity determines the impact a specific Cyber System has on to its assigned BES reliability functions. Do you agree with this process described in the concept paper? Please explain.
2. Section X.X, Final Categorization of Cyber Systems Based on Overall Impact on the BES, describes an example process of how an entity combines the BES impact mapping and Cyber System impact analysis to determine the overall impact a Cyber System has on the BES. Do you agree with this process described in the concept paper? Please explain.
3. Section X.X, Defining the Target of Protection, describes how an entity determines the set of Cyber Assets necessary to provide security assurance in the BES functions the Cyber System performs. Do you agree with this process described in the concept paper? Please explain.

Definition and Selection of Controls

1. Provide your company's thoughts on applying different levels of protection (i.e. security controls) based on characteristics and impact categories of specific BES cyber systems (e.g. transmissions substations, generating plants, control centers) as discussed in Section XX of the concept paper.
2. Section XX of the paper introduces the concept of a library of security controls:
    a. What sources would you recommend the drafting team consider when developing a library of security controls for protecting categorized BES cyber systems?

b. What specific challenges would you anticipate in implementing controls from among a library of security controls?

The SDT agreed that the Chair will oversee the final agreed upon edits to the adopted concept paper, announcement, and comment forms. She indicated she would circulate it to the members for one last look later in the week and then work with NERC to post it for an industry comment period the week of July 20.

VI. CIP-002 SUBGROUPS

A. Introduction, Organization, Appointment and Charge to the CIP-002 Subgroups

In advance of the meeting the Chair and Vice Chair circulated to members a proposal for the work plan from July–December, 2009. The Chair reviewed the proposal which set forth roles and responsibilities and included involving all members of the SDT in at least one of five proposed subgroups to develop draft requirements for consideration by the SDT to be included in a draft CIP-002 Version 3. Through SDT Subgroups and the full SDT, an initial draft of CIP-002 requirements and measures would be produced by December 2009 consistent with the Working Paper concepts and consensus points. In the fall of 2009, the SDT would begin initial drafting of the standards that will replace the current versions of CIP-003 through CIP-009 in parallel with the CIP-002 posting and balloting. In 2010 the SDT would respond to industry comments and post the new CIP-002-009 for balloting later in 2010-2011.

Building on the Working Paper, the following topical SDT subgroups were proposed and agreed to by the SDT to develop an initial set of CIP-002 requirements:

1. Reliability Functions
2. List of BES Subsystems and/or BES Cyber Systems
3. BES Mapping
4. Cyber Analysis
5. Definition and Selection of Controls (sample control or set of controls from the controls catalogue as a “proof of concept”).

Each SDT member present ranked, in order of preference, their interest in participating in each of the 5 subgroups. (*See Appendix #7*). In light of preferences, the Chair and Vice Chair proposed the following composition for the 5 working groups:

Subgroup Name	Members and Observers
Reliability Functions	John Varnell (1), Jim Brenton (1), Dave Norton, Rich Kinas, Doug Johnson, James Bassett
List of BES Subsystems and/or BES Cyber Systems	Jackie Collett, Scott Rosenberger, Jay Cribb, and Gerry Freese.
BES Mapping	John Lim (1), Jeri D. Brewer (1), Dave Revill (2)

	Sharon Edwards and Kevin Sherlin
Cyber Analysis	Chris Peters, Phil Huff , Rob Antonishen, Frank Kim and Joe Doetzl. Sam Merrell and Mike Toecker
Definition and Selection of Controls	Kevin Perry, Bill Winters, Jon Stanford, Keith Stouffer. Peter Schneider

On the morning of day two, Stu Langton presented some tips and guidelines for the subgroup leaders and members on small group discussion and shared leadership. *(See, Appendix 10)*

B. Subgroup Organizational Meetings and Comment Form Questions

On the afternoon of the first day the 5 groups met in parallel organizational sessions to: review scope of topic and identify areas that may need development of related CIP-002 requirements; determine what information they will need going forward; select a leader/spokesperson, a scribe and a timekeeper; sketch out a work plan, including meetings, to get the work done by the October SDT meeting. Subgroups reported back at the end of day one and day two the issues they identified and their plans going forward.

1. Reliability Functions Subgroup

This subgroup agreed that John Varnell will serve as the subgroup lead and Jim Breton would serve as the subgroup scribe and Rich Kinas would perform the timekeeper role. They agreed to the request of James Basset, IPS and Doug Johnson, Commonwealth Edison to help with the subgroup's work. They met both the first and second day of the meeting. John reported the group will plan on meeting weekly starting with July 20 and use WebEx and offered the following report on their work:

Purpose: Define Reliability Functions for new CIP-002-3 (Version 3) NLT Oct 2009 Meeting

Members attending (July 13) in Vancouver, BC: John Varnell, Chair, Jim Brenton, EROCT, Secretary, Rich Kinas, Sgt at Arms/Time keeper, Dave Norton, not in Conf call (may be on bench) James Bassett, IPS, Observer Doug Johnson, Commonwealth Edison

Schedule: Weekly Meetings — WebEx and conference calls — Richard Kinas (set first WebEx for July 20 at 9 a.m. CDT)

Goals and Objective: Fully defined basic reliability functions prior to the October SDT meeting using key inputs from those who have not been previously involved with team efforts(Observers: Doug Johnson (NERC OC member) and James Basset). Need to provide list of key Reliability Functions to BES Mapping Group ASAP

Needed Resources: Review functions:

- Executive Summary of Paper and ALRs (from the CA Guidelines),
- Version 4 and 5 Functional Model,
- Draft Working Paper, and
- Reliability Functional Model Technical Document,

- CA and CCA Identification Guidelines.

Initial Activity:
ID functional model elements needed for reliability--Then break down for each Functional Entity.

Major Activities reported to Full Team

1) Set schedule to discuss weekly with key team of members and observers — Done
2) Structured organization — John Leads, Jim types, Rich watches as timekeeper and Sgt at Arms
3) Collect and distribute Five key documents to all team members — Done

Out of Scope: We may not be able to develop Detailed Requirement Specs since this is a structural segment of the overall model, and does not lend itself to detail requirement specification TBD with John Varnell.

Concept Paper Comment Form Questions regarding Reliability Functions

- Is the concept of the categorizing by function instead of by asset clear? If not why?
- The BES Reliability Functions listed in the "BES Function" column of the table were not meant to be comprehensive. Are there any others functions we need to address and why?

2. List of BES Systems/BES Cyber Systems Subgroup
Jackie Collett is the Subgroup lead, Jay Cribb will serve as scribe and Scott Rosenberger will serve as timekeeper and Gerry Freese will serve as a member.

The Subgroup met on both days and reported to the SDT the following 10 key questions they will be exploring in developing their recommendations:

a) We need definitions and requirements from other standards that apply (Contingency Reserve, etc). Will the BES Reliability group be providing these?
b) How do we handle systems that cross functional model entities?
c) What is the definition of "system"? (This is foundational).
d) Will there be minimum criteria to be on the lists?
e) What is the methodology for identifying BES assets and cyber assets?
f) How do we limit the cyber assets included in 'connections'? What are the boundary conditions for BES systems/cyber systems?
g) How do we handle the dynamic nature of the grid and the BES systems/assets? Example: Contingency Reserve is a MW threshold and the units designated for it may change often.
h) What is "common mode failure"? It is used several times in the white paper.
i) How do we handle controls at the 'perimeter' vs. controls on every 'inside' asset/component?
j) What is the proper granularity of "system" identification?

Concept Paper Comment Form Questions regarding List of BES Subsystems

- Does the methodology presented in the Identification of BES Subsystems and the Identification of BES Cyber Systems sections capture all of the systems that will need to be protected to achieve an acceptable level of reliability? What other issues need to be considered?

3. BES Mapping Subgroup

John Lim will serve as leader, Sharon Edwards as scribe, Dave Revill (as timekeeper), Kevin Sherlin and Jeri Domingo Brewer as members. They reviewed and agreed on the subgroup's scope as primarily defining criteria/ numerical thresholds. They noted they needed input from the reliability function subgroup and they would need to address overlap and coordination as their output is our input. In terms of Impact level (for example, DHS tiers) the subgroup will define the number of levels that will be used.

The subgroup brainstormed the following:

- Review DHS Critical Asset Tiers, NERC Event Classification Criteria, NERC Critical
  - Other documents may help us including the DHS Critical Tiers
  - NERC Event Classification Criteria — guidance for people to classify events
  - NERC Critical Asset Guideline
  - Guideline for Critical Cyber Asset identification
- Asset Risk Assessment Guide
- Other NERC Reliability Standards
- Get input from our own shops as to their level of support for the various concepts and thresholds

The subgroup agreed to meet once per week in the near term on Wednesdays at 3 p.m. EST. The next meeting would be on August 5 from 3 to 5 p.m. by phone. Also the group will meet early for the August drafting team meeting at 1 p.m. on the day prior, which is August 19, face to face at a meeting place TBD.

Assignments for subsequent meeting: Take the DHS and the BES and CA Guideline and get comments from the operating groups.

The group developing the following initial input/questions for the comment form which were reviewed by the SDT with suggestions for refinements and consolidation:

- Would the industry prefer criteria for minimum thresholds & then the industry can define whether they want to do more?
- Please provide your thoughts on the appropriate thresholds to establish criticality.
- Does your company support numeric thresholds for categorizing generation?
- Does your company support numeric thresholds for categorizing substations?

- Does your company support a numeric threshold for categorizing control centers?
- The paper proposes a categorization of all BES assets
  - Do you support this concept?
  - Why or why not?
- The paper proposes categories based on pre-defined criteria
  - Do you support this approach?
  - If not, what alternative method do you suggest?
- What do you believe is the appropriate number of levels for categorization of the BES assets?
- Do you have other suggestions for categorization of assets?

Following their presentation to the SDT, the subgroup refined and consolidated a proposed list of 3 questions:

Concept Paper Comment Form Questions regarding BES Mapping

- The concept paper proposes that all identified BES subsystems are mapped into categories based on pre-defined criteria which reflect their impact on the reliability and operability of the BES: this mapping will be based on pre-defined criteria in the functions they provide or support, which determine the level of that impact. Do you agree with this approach and if not, what alternative suggestions do you have?
- The paper gave an example of High, Medium and Low impact levels. What do you believe is the appropriate number of levels for impact mapping of the BES subsystems?
- Do you prefer discrete thresholds or performance based criteria for mapping BES sub-systems? E.g. MW values as opposed to percentage of total generation. Please explain.

4. Cyber Analysis Subgroup

Phil Huff will serve as leader, Chris Peters as scribe, and Rob Antonishen as timekeeper, Frank Kim and Joe Doetzl will serve as members. Sam Merrell and Mike Toecker will participate as observers. The subgroup will seek to address "defining the target of protection" and dealing with 3rd party interconnections. The reported on the following issues to the SDT:

- Interconnections — how to address of about cyber assets- functional perspective or within controls.
- Lots of interface with security controls in terms of what the impact categories will be, how many levels we need and interface with the selection of controls.
- Risk analysis in selecting controls. Look at how to implement risk assessment to replace the TFE process, work with controls group. Somewhere between cyber analysis and controls

In the discussion of the report one members urged the subgroup to keep in mind that the standards process needs to produce measurable requirements which may be challenges to do in the context of risk analysis.

Concept Paper Comment Form Questions regarding Cyber Analysis

- Section X.X, Categorization of Cyber Systems, describes how an entity determines the impact a specific Cyber System has on to its assigned BES reliability functions. Do you agree with this process described in the concept paper? Please explain.
- Section X.X, Final Categorization of Cyber Systems Based on Overall Impact on the BES, describes an example process of how an entity combines the BES impact mapping and Cyber System impact analysis to determine the overall impact a Cyber System has on the BES. Do you agree with this process described in the concept paper? Please explain.
- Section X.X, Defining the Target of Protection, describes how an entity determines the set of Cyber Assets necessary to provide security assurance in the BES functions the Cyber System performs. Do you agree with this process described in the concept paper? Please explain.

5. Definition and Selection of Controls Subgroup

Keith Stouffer will serve as Subgroup leader and they will employ floating scribes and timekeepers among the members: Kevin Perry, Bill Winters and Jon Stanford. Peter Schneider will participate as an observer. They discussed how best to organize the controls framework. Should it be the same as the CIPS have; or the 27001, NIST framework, or the ISA 99 framework? They agreed to work on keeping the current CIP structure and framework but propose collapsing Standards 005 and 007 into a single standard. They will use work from ISA 99 and 853 and map them into a CIP structure. They agreed to work with 3 levels of security controls. Keith noted that the subgroup hopes to have a strawman of the control set done for SDT review by the next SDT meeting in August in Charlotte.

They will take current ISA 99 foundational requirements and start looking at samples of controls for examples. They hope to show examples of low, moderate and high to demonstrate to the industry how it will work and what it will change. The subgroup will work by email between meetings.

Concept Paper Comment Form Questions regarding Definition and Selection of Controls

- Provide your company's thoughts on applying different levels of protection (i.e. security controls) based on characteristics and impact categories of specific BES cyber systems (e.g. transmissions substations, generating plants, control centers) as discussed in Section XX of the concept paper.
- Section XX of the paper introduces the concept of a library of security controls:
    - What sources would you recommend the drafting team consider when developing a library of security controls for protecting categorized BES cyber systems?
    - What specific challenges would you anticipate in implementing controls from among a library of security controls?

C. Subgroup Roles, Responsibilities, Coordination and Guidelines

The SDT discussed the roles that would be played by SDT members, subgroup members, subgroup leaders a coordinating team and staff.

On the second day the SDT agreed that it would be helpful to develop a set of coordination guidelines for the subgroups and suggested:

- Each subgroup should create its own email distribution list to share documents and ideas
- When a subgroup is ready to issue something to the SDT PLUS List, the subgroup leader will send it electronically to Joe Bucciero and he will send it out to the SDT PLUS List.
- Subgroups are expected to meet and coordinate their activities between SDT Meetings. Each subgroup leader will work with the Coordinating Group between SDT Meetings to report on progress and ensure coordination among the 5 subgroups.

VII. NEXT STEPS AND CLOSING

The Chair reviewed with the SDT the schedule for getting the concept paper, the announcement and comment form finalized and posted on the NERC website for industry comment. She suggested this could be accomplished by the week of July 20.

The Chair thanked the members for their hard work together and in the subgroups and commended them on the adoption of the concept paper.

The Chair noted that she and Kevin appreciated and thanked on behalf of the SDT the Drafting Group members for an outstanding job in bringing the SDT to consensus on the concept paper.. Members completed an onsite meeting evaluation form *(See, Appendix #3).*
The SDT adjourned at 3:00 p.m. on July 14.

APPENDICES TABLE OF CONTENTS

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix # 1— Meeting Agenda

Monday, July 13, 2009 | 8 a.m.–5 p.m. PDT
Tuesday, July 14, 2009 | 8 a.m.–5 p.m. PDT
Vancouver, B.C. Canada

Proposed Meeting Objectives and Outcomes

- Receive update on TFE and VSL/VRF processes;
- Review, refine, and adopt the CIP Version 3 Working Paper as a conceptual framework going forward;
- Test SDT consensus on the NERC Request for Response for Interpretation CIP 006-1;
- Agree on SDT 002 Drafting Subgroups organization;
- Convene SDT 002 Drafting Subgroups organizational sessions and report back to SDT; and
- Agree on next steps and assignments.

Monday July 13, 2009

1. **Welcome and Opening Remarks — Jeri Domingo-Brewer and Kevin Perry**
   - Roll Call; NERC Antitrust Compliance Guidelines
   - Facilitator review of May 13–14 Boulder City, NV meeting summary and adoption; and
   - Facilitator review of June 17–18 Portland, OR meeting summary and adoption
2. **Review of Meeting Objectives, Agenda, and Meeting Guidelines — Jeri Domingo Brewer, and Bob Jones**
3. **Update on Technical Feasibility Exception NERC Rules of Procedure — Scott Mix**
4. **Update on VSLs and VRFs — David Taylor**
5. **Update on Other Related Cyber Security Initiatives — SDT Members**
6. **Overview of Steps to Date in the CIP Version 3 (Phase 2) Development Process — Stu Langton**
7. **CIP Version 3 Categorizing Cyber Systems Working Paper — Presentation — John Lim, Phil Huff et al**
8. **Key Outstanding Issues — John Lim, Phil Huff et al**
9. **Proposed CIP-002 Subgroup Process-Members Complete Preference Forms**
10. **Working Lunch — Convene SAR Interpretation Team to Review possible Responses to NERC on Interpretation of CIP 006-1**
11. **Review SAR Interpretation Team Proposed Response to NERC Request for Interpretation of CIP-006-1**
12. **CIP Version 3 Working Paper — Resolve Any Key Issues — John Lim, Phil Huff et al**
13. **Test Consensus and Seek Adoption of the Working Paper for Industry Review**

14. **Review SDT Communication Plan — MRC Meeting, Posting Paper for Comment (14 days), SDT Webinar, Comment Period (30 days)**
15. **Review CIP-002 Work Plan Proposal and Proposed Subgroups and Membership**
16. **Adjourn**

Tuesday July 14, 2009

1. **Welcome and Agenda Review — Jeri Domingo-Brewer**
2. **Summary of Day One Outcomes — Bob Jones**
3. **Subgroup Protocols — Herding Cats 101 — Stu Langton**
4. **Organizational Sessions of the CIP-002 Subgroups — Small Group Breakouts**
5. **CIP-002 Drafting Group Reports and SDT Input — Plenary Session**
6. **Next Steps and CIP Version 3 Process and Work Plan — Review Proposed 2010 Meeting Schedule**
7. **Review Charlotte August Meeting Objectives**
8. **Meeting Evaluation**
9. **Adjourn**

Appendix # 2

Attendees List
July 13–14, 2009 Vancouver, BC

Attending in Person — SDT Members

1. Rob Antonishen	Ontario Power Generation
2. Jeri Domingo-Brewer, Chr.	U.S. Bureau of Reclamation
3. Jim Breton	ERCOT
4. Jackie Collett	Manitoba Hydro
5. Jay S. Cribb	Information Security Analyst, Southern Company Services
6. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
7. Phillip Huff	Arkansas Electric Coop Corporation
8. John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
9. Frank Kim	Ontario Hydro
10. Kevin B. Perry, Vice Ch.	Director Critical Infrastructure Protection, Southwest Power Pool
11. Christopher A. Peters	ICF International
12. David S. Revill	Georgia Transmission Corporation
13. Scott Rosenberger	Luminant Energy
14.Keith Stouffer	National Institute of Standards & Technology
15. John D. Varnell	Technology Director, Tenaska Power Services Co.
16.William Winters	Arizona Public Service, Inc.
1. Roger Lampilla	NERC
3. Joe Bucciero	NERC/Bucciero Assoc.
4. David Taylor	NERC
5. Gerry Adamski	NERC
6. Robert Jones	FSU/FCRC Consensus Center (Wed. & Thursday)
7. Stuart Langton	FSU/FCRC Consensus Center

SDT Members Attending via WebEx and Phone

17. Joe Doetzl	Manager, Information Security, Kansas City Pwr. & Light Co.
18. Rich Kinas	Orlando Utilities Commission
19. Sharon Edwards	Duke Energy
20. Kevin Sherlin	Sacramento Municipal Utility District
21. Jonathan Stanford	Bonneville Power Administration

Others Attending in Person

Sam Merrill	CERT/SEI
Michael Toecker	BMcD
Peter Schneider	Subnet Solutions

Others Attending via WebEx and Phone

James Bassett	Lafayette
Mark Braendle	ABB
Mark Grace	
Doug Johnson	ConEd
Travis Jeffery	
Kim Long	Duke
Jerry Mannerino	
Mike Mertz	SCE
Hoang Ngo	RI Eng
Nitin Patel	
Mike Sanders	SoCal
Robin Siewart	EON

Appendix # 3 — Meeting Evaluation Feedback Summary

Members used the following 0 to 10 scale in evaluating the meeting: 0 means totally disagree and 10 means totally agree.

1) **Please assess the overall meeting.**
   9.14 The agenda packet was very useful.
   8.29 The pre-meeting papers (White Paper and Process Evaluation Summary) were very useful.
   7.33 The WebEx document display and the audio were effective
   7.21 The quality of the meeting facility was good.
   9.29 The objectives for the meeting were stated at the outset.
   9.50 Overall, the objectives of the meeting were fully achieved.
   Were each of the following meeting objectives fully achieved:
   9.29 Receive update on TFE and VSL/VRF processes;
   9.29 Review, refine and adopt the CIP Version 3 Working Paper as a conceptual framework going forward;
   9.30 Test SDT Consensus on the NERC Request for Response for Interpretation CIP 006-1;
   9.29 Agree on SDT 002 Drafting Subgroups organization;
   8.93 Convene SDT 002 Drafting Subgroups organizational sessions and report back to SDT; and
   8.67 Agree on next steps and assignments.

2) **Please tell us how well you believe the Team members and participants engaged in the meeting.**
   8.93 The Chair and Vice Chair provided leadership and direction to Team and Facilitators
   9.14 The Facilitators made sure the concerns of all members were heard.
   9.07 The Facilitators helped clarify and summarize issues.
   7.73 The Facilitators helped members build consensus.
   7.93 The Facilitators made sure the concerns of all participants were heard.
   8.43 The Facilitators helped us arrange our time well.

3) **What is your level of satisfaction with what was achieved at the meeting?**
   9.07 Overall, I am very satisfied with the results of the meeting.
   8.36 Overall, the design of the meeting agenda was effective.
   8.93 I was very satisfied with the services provided by the Facilitators.
   9.00 I am satisfied with the outcome of the meeting.
   9.29 I know what the next steps following this meeting will be.
   9.43 I know who is responsible for the next steps.

4) **Other comments:**
   What did we achieve?
   - Approved concept paper; organized for development of requirement language.
   - White paper is done
   - Approving the whitepaper provided a basis for moving forward.
   - Sub group, updates, scheduling.
   - Approval and concept paper

   What are our biggest challenges going forward?

- Moving along the same path
- Industry consensus
- V3, control development
- Moving concepts to reality through requirements. Maintaining group involvement in a recession.
- Keeping sub group momentum.
- Achieved drafting so COP 002- Approval to catalog of controls.

What suggestions do you have for making our group more productive?

- Set up earlier to start on schedule
- Better facilities for subgroup meetings. Internet access for everyone.
- Continue levering sub groups.
- Problems with room on 1st day could have been better resolved.

Appendix # 4 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost
- information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups)

should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on
- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

APPENDIX # 5
Meeting Schedule
October 2008–December 2010

Development of CIP Version 2 and Version 3 Framework

October 2008–July 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.

2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development

3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 Version 3 process reviewed.

4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white papers assigned.

5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed Version 3 white papers.

January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.

January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.

6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.

7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.

8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals

March 2–April 1, 2009 — 30-day Pre Ballot

Mid-March — NERC posts TFE draft Rules of Procedure for industry comment

March 30, 2009 — WebEx meeting(s) White Paper Drafting Team

April 1–10 — NERC Balloting on Version 2 Products

April 6, 2009 — WebEx meeting — White Paper Drafting Team

April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call

April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments-

9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.

April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx

April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%

May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.

10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.

June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx

11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.

June — WebEx meeting(s)

- Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria

CIP-002 Development of Requirements, Measures, Etc. July-December 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada

- SDT plenary session to review, refine, and adopt SDT Working Paper
- Adopt SDT response to NERC for Interpretation of CIP-006-1
- Review and adopt proposal for CIP-002 Subgroups and Deliverables
- Convene subgroup organizational meetings to develop work plans
- Adopt 2010 Meeting Schedule

July–August Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)
- CIP-002 Coordination Team meeting (as needed)

August 3–5, 2009 in Winnipeg, Manitoba **NERC Member Representative Committee**

Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.

13. August 20–21, 2009 in Charlotte, NC

- SDT Plenary session to review and respond to MRC input on Working Paper/CIP-002 Concepts
- SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper

NERC Webinar

August–September Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)
- CIP-002 Coordination Team meeting

14. September 9–10, 2009 in Folsom, CA

- SDT plenary session to review and respond to any additional industry comments on Working Paper and CIP-002 Concepts
- SDT subgroup drafting meetings- consider industry comments, draft requirements and "proof of concept" control (s).
- SDT plenary session(s) Subgroup reports on requirements
- Review of CIP-002 Standards, Requirements, Measures, and Outline
- Address coordinating issues.
- Establish SDT meeting dates and proposed locations for January–December 2010

September–October Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)
- CIP-002 Coordination Team meeting

15. October 20–22, 2009 in New Orleans, LA

- SDT Subgroup drafting meetings — day one
- SDT Plenary Session(s) — day two subgroup reports on CIP-002 requirements
- Review and refine initial draft of CIP-002 single text

October–November Interim WebEx meeting(s)

- CIP-002 Coordination Team meeting

16. November 17–18, 2009 in Tampa, FL

- SDT plenary session(s) — to review and refine CIP-002 standard, requirements, measures and controls.

November–December Interim WebEx meeting(s)

- Drafting teams as needed to finalize drafts
- CIP-002 Coordination Team meeting

17. December 15–17, 2009 in Atlanta, GA

- SDT plenary session(s) to review, refine, and agree on and adopt CIP-002 standard, requirements, measures and controls.
- Agree on initial posting of draft CIP-002 for industry review and comment.

Refinement of CIP-002 and Development of Other CIP Standards

January–December 2010

(12 SDT monthly meetings and subgroup WebEx meetings as needed)

- SDT responds to industry comments on initial and subsequent postings of CIP-002, Version 3 (may be multiple comment periods, as required)
- Refine the CIP-002 through the comment period and submit new CIP-002 Version 3 Standard for Balloting along with the catalogue of controls (i.e. CIP-003-CIP-009 or its successor) OR
- Ballot CIP-002 while permitting industry to rely on CIP 003-CIP-009 until the full suite of controls (i.e. CIP-003-CIP-009 or its successor) is reviewed and presented for balloting.
- Submit the full suite of CIP Reliability Standards on Cyber Security for Industry Comment
- Refine and Submit the full suite of CIP standards for industry ballot
- NERC Board of Trustees adoption of the full suite of standards
- FERC approves and NERC Implements the full suite of CIP standards

Proposed 2010 Meeting Schedule

January 20–21 — Wednesday–Thursday	July 14–15, Wednesday–Thursday
February 17–18 — Wednesday–Thursday or February 16–18 — Tuesday–Thursday	August 11–12, Wednesday–Thursday
March 10–11 — Wednesday–Thursday or March 9–11 — Tuesday–Thursday	September 8–9, Wednesday–Thursday
April 14–15 — Wednesday–Thursday or April 13–15 — Tuesday–Thursday	October 13–14, Wednesday–Thursday or October 12–14
May 12–13 — Wednesday–Thursday	November 17–18, Wednesday–Thursday
June 9–10 — Wednesday–Thursday or June 9–11 — Tuesday–Thursday	December 15–16, Wednesday–Thursday

Appendix # 6
Project 2008-06 Cyber Security Order 706 SDT CIP-002 Work plan Proposal — July 2009

A. CIP-002 Work plan Objectives

1. Establish the overall schedule and milestones for developing the new CIP reliability standards on cyber security
2. Involve all members of the SDT in at least one of five proposed subgroups to develop draft requirements for consideration by the SDT to be included in a draft CIP-002 Version 3.
3. Present the SDT Working Paper (Categorization of Cyber Systems) to the NERC Member Representative Committee at its August 2009 meeting.
4. Post, host a webinar, and receive and consider industry comments on the Working Paper in August-September 2009 as the SDT drafts CIP-002 Version 3.
5. Through SDT Subgroups and the full SDT, produce an initial draft of CIP-002 requirements and measures by December 2009 that are consistent with the Working Paper concepts and consensus points.
6. Seek and respond to industry comment and post the new CIP-002 for balloting in 2010
7. Begin initial drafting of the standards that will replace the current versions of CIP-003 through CIP-009 in parallel with the CIP-002 posting and balloting.
8. Prepare and issue the replacements for CIP-003 through CIP-009 for posting and balloting in 2010/2011.

B. Proposed CIP-002 Subgroups

Building on the Working Paper, the following topical subgroups are proposed to develop an initial set of CIP-002 requirements:

1. Reliability Functions
2. List of BES Subsystems and/or BES Cyber Systems
3. BES Mapping
4. Cyber Analysis
5. Definition and Selection of Controls (sample control or set of controls from the controls catalogue as a "proof of concept").

C. Proposed Steps for Forming CIP-002 Subgroups- Vancouver

1. On day one, ask each SDT member to rank in order of preference their interest in participating in each of the 5 subgroups. In light of preferences, propose composition for the 5 working groups with 3-6 members in each.
2. On day two, convene the 5 groups in parallel and ask members to: 1) review scope of topic and identify areas that may need development of related CIP-002 requirements; 2) determine what information they will need going forward; 3) select a leader/spokesperson, a scribe and a timekeeper; 4) sketch out a work plan, including meetings, to get the work done by the October SDT meeting. Subgroups will report back their plans on Day 2 of the Vancouver Meeting to the SDT.

3. Where possible, provide staff /facilitator support for the subgroups.
4. Follow up with SDT members not attending the Vancouver meeting for team placement, as needed.

D. Roles and Responsibilities

1. **CSO706 SDT Members.** Review, build consensus, and adopt a draft CIP-002 by December 2009. Members will also begin parallel development efforts in 2010 to draft the new standards that will eventually replace the current CIP-003 through CIP-009 standards once the requirements and measures for the new CIP-002 standard have been defined and vetted.

2. **CIP-002 Subgroup Members.** Subgroup members will be responsible for producing a draft set of requirements related to their topic prior to the October 20-22 SDT meeting. Subgroup members will be responsible for selecting a leader/spokesperson, a scribe and a timekeeper.

3. **CIP-002 Subgroup Leaders.** The Leader will be responsible for leading and facilitating the subgroup's effort in creating and implementing a plan (deliverables, timeline, assignments, review and consideration of industry comments) in consultation with members and with help, as needed, by staff and facilitators.

4. **CIP-002 Coordinating Team.** The SDT Chair and Vice Chair along with the Subgroup Leaders and facilitators will participate on a Coordinating Team that will meet by conference call in advance of each monthly SDT meeting through October 2009 to address any duplication of tasks, identify needs for coordination among the subgroups and vetting of the approaches being considered by each of the subgroups to help smooth the way for preparation of a complete draft of CIP-002 to be reviewed, refined, and adopted in November and December 2009.

5. **Staff and Facilitation Support.** Where/when needed and/or requested, facilitation or other staff support will be provided to the subgroups.

Appendix # 7 — SDT Member Subgroup Assignments

Subgroup Name	Members and Observers
Reliability Functions	John Varnell (1), Jim Brenton (1), Dave Norton, Rich Kinas, Doug Johnson, James Bassett
List of BES Subsystems and/or BES Cyber Systems	Jackie Collett, Scott Rosenberger, Jay Cribb, and Gerry Freese.
BES Mapping	John Lim (1), Jeri D. Brewer (1), Dave Revill (2) Sharon Edwards and Kevin Sherlin
Cyber Analysis	Chris Peters, Phil Huff, Rob Antonishen, Frank Kim and Joe Doetzl. Sam Merrell and Mike Toecker
Definition and Selection of Controls	Kevin Perry, Bill Winters, Jon Stanford, Keith Stouffer. Peter Schneider

Subgroup Preference Form

(Jeri DB, Chris P, Keith s, Jay C, John L., Jim Breton, John Varnell, Dave Revill, Kevin P, Phil H, Rob A., Bill W. Jackie Collett , Jon Stanford, Dave Norton, Scott R, Frank Kim

No forms: Rich Kinas, Sharon Edwards, Gerry Freese, Kevin Sherlin,

Reliability Functions
Potential members: **John Varnell (1), Jim Brenton (1), Dave Norton,**

[Preferences: JDB (5) CP (4) KS (5) JCr (5) JL (3) **JB (1) JV (1**) DR (5) KP (5) PH (5) RA (5) **JC (2)** JS (5) DN SR (5) FK (5)]

List of BES Subsystems and/or BES Cyber Systems

JDB (4) DN, SR (3)]

Appendix # 8
Version 3 SDT Points of Consensus — April 16, 2009

A. The Standards should require a BES impact assessment as an initial approach to categorizing BES Cyber Systems.

B. The impact categorization of Cyber Systems will be based on reliability functions of the BES to achieve Adequate Levels of Reliability.

C. The Standard's BES Impact Assessment will consider a categorization process.

D. The Standards will require oversight of the categorized list of BES assets by entity types which have a more complete wide-area view of the BES.

E. The Standards will categorize Cyber Systems supporting, either directly or indirectly, the reliability functions of the BES and apply security requirements (or controls) that are commensurate and appropriate to their potential impact on the BES.

F. The final Cyber System categorization will reflect the impact to the BES based on a loss of availability, integrity, or confidentiality of the Cyber System.

G. The Standards will provide Organizations with reasonable flexibility in applying equivalent security controls on the basis of compensating controls and environmental considerations.

H. The Standards will address the complex nature of BES functions and interconnected Cyber Systems, both within and between multiple organizations.

I. The Standards will state explicit criteria for the BES Impact Assessment.

J. The Standards will state explicit criteria for the Cyber Impact Assessment (including use and misuse of cyber systems).

K. The Standards will include a methodology to merge the BES Impact Assessment and Cyber Impact Assessment into a final Cyber System categorization.

Categorizing Cyber Systems

An Approach Based on BES Reliability Functions

NERC Cyber Security Standards Drafting Team for Order 706

07/15/2009 — Team

TABLE OF CONTENTS

Appendix #10
Herding Cats 101
Some Tips on Small Group Discussion and Shared Leadership

Purposes:

- Increase Member Participation
- Idea-Creation
- Problem-Solving, Product-Development
- Consensus-Building

Needs:

- Adequate Time
- Leadership
- Right-Size, Right-Composition
- Right Space/Technology, Connecting with others
- Full member engagement and active listening

Some Tips for Leaders and Members:

1. Clarify purpose, tasks, and end results (products/outcomes)
2. Select leaders to organize, chair, keep-records of discussion and proposals, keep-time
3. Create a timed agenda/schedule (get group input, review, and agreement)
4. Identify challenges regarding issues or tasks
5. Identify shared values and principles to guide
6. Use questions to guide (and get them right)
7. Involve everyone in discussion and work
8. Review/summarize discussions frequently and re-clarify question/task
9. Stimulate discussion (brainstorm, nominal group process, strawman drafts, etc.)
10. Use visuals to communicate and connect ideas
11. Connect with absent members
12. Be evaluative (review decisions, processes, and performance).

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix #11 — Working Concept Paper Draft Announcement 7-14-09

July XX, 2009

TO: INDUSTRY STAKEHOLDERS

RE: **REQUEST FOR INFORMAL SUGGESTIONS AND COMMENTS REGARDING THE CONCEPTS CONTAINED IN THE CSO 706 SDT WORKING CONCEPT PAPER "CATEGORIZING CYBER SYSTEMS AN APPROACH BASED ON BES RELIABILITY FUNCTIONS"**

Ladies and Gentlemen:

In 2008, FERC Order 706 paragraph 236 directed the ERO to develop modifications to Standard CIP-002-1 Cyber Security – Critical Cyber Asset Identification to address their concerns regarding: (1) need for ERO guidance regarding the risk-based assessment methodology; (2) scope of critical assets and critical cyber assets; (3) internal, management, approval of the risk-based assessment; (4) external review of critical assets identification; and (5) interdependency analysis.

A Standards Drafting Team (SDT) was appointed by the NERC Standards Committee on August 7, 2008 to develop these modifications as part of Project 2008-06 – Cyber Security Order 706. The SDT has been charged to review each of the CIP reliability standards and address the modifications identified in the FERC Order 706. The SDT began meeting in October, 2008.

The SDT believes the CIP-002 standard and requirements provide a foundation for effective cyber security to protect the systems that support a reliable Bulk Electrical System (BES). After months of deliberation, the SDT is considering an approach to CIP-002 that identifies and categorizes critical assets and critical cyber assets according to impacts on reliability functions. This approach is outlined in the attached draft working paper, *Categorizing Cyber Systems: An Approach Based on BES Reliability Functions*.

The Team seeks informal industry feedback and suggestions on the concepts presented in the attached draft working paper. The SDT seeks suggestions and comments particularly regarding four areas set forth in the draft working paper: BES Reliability Functions; Identification of BES subsystems and/or BES Cyber systems; BES Mapping; Cyber Analysis. The informal industry feedback will be considered by the SDT in developing CIP-002 draft requirements. A draft CIP-002 standard will be posted for formal industry comment as part of the ANSI standards development process later this year.

The concepts presented in the draft working paper, propose a broader and more comprehensive cyber security approach to protect the systems that support a reliable BES. The draft working paper deals primarily with the identification and classification of BES assets and cyber systems.

The SDT has provided a form for industry participants to offer their informal suggestions and comments on the concepts in the draft working paper.

Suggestions and Comments Due: September 1, 2009

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

Monday, July 13, 2009 | 8 a.m.–5 p.m. PDT
Tuesday, July 14, 2009 | 8 a.m.–5 p.m. PDT
Vancouver, B.C. Canada

Proposed Meeting Objectives and Outcomes

- Receive update on TFE and VSL/VRF processes;
- Review, refine, and adopt the CIP Version 3 Working Paper as a conceptual framework going forward;
- Test SDT consensus on the NERC Request for Response for Interpretation CIP 006-1;
- Agree on SDT 002 Drafting Subgroups organization;
- Convene SDT 002 Drafting Subgroups organizational sessions and report back to SDT; and
- Agree on next steps and assignments.

Monday July 13, 2009

1. **Welcome and Opening Remarks — Jeri Domingo-Brewer and Kevin Perry**
   - Roll Call; NERC Antitrust Compliance Guidelines
   - Facilitator review of May 13–14 Boulder City, NV meeting summary and adoption; and
   - Facilitator review of June 17–18 Portland, OR meeting summary and adoption
2. **Review of Meeting Objectives, Agenda, and Meeting Guidelines — Jeri Domingo Brewer, and Bob Jones**
3. **Update on Technical Feasibility Exception NERC Rules of Procedure — Scott Mix**
4. **Update on VSLs and VRFs — David Taylor**
5. **Update on Other Related Cyber Security Initiatives — SDT Members**
6. **Overview of Steps to Date in the CIP Version 3 (Phase 2) Development Process — Stu Langton**
7. **CIP Version 3 Categorizing Cyber Systems Working Paper — Presentation — John Lim, Phil Huff et al**
8. **Key Outstanding Issues — John Lim, Phil Huff et al**
9. **Proposed CIP-002 Subgroup Process-Members Complete Preference Forms**
10. **Working Lunch — Convene SAR Interpretation Team to Review possible Responses to NERC on Interpretation of CIP 006-1**

11. **Review SAR Interpretation Team Proposed Response to NERC Request for Interpretation of CIP-006-1**
12. **CIP Version 3 Working Paper — Resolve Any Key Issues — John Lim, Phil Huff et al**
13. **Test Consensus and Seek Adoption of the Working Paper for Industry Review**
14. **Review SDT Communication Plan — MRC Meeting, Posting Paper for Comment (14 days), SDT Webinar, Comment Period (30 days)**
15. **Review CIP-002 Work Plan Proposal and Proposed Subgroups and Membership**
16. **Adjourn**

Tuesday July 14, 2009

1. **Welcome and Agenda Review — Jeri Domingo-Brewer**
2. **Summary of Day One Outcomes — Bob Jones**
3. **Subgroup Protocols — Herding Cats 101 — Stu Langton**
4. **Organizational Sessions of the CIP-002 Subgroups — Small Group Breakouts**
5. **CIP-002 Drafting Group Reports and SDT Input — Plenary Session**
6. **Next Steps and CIP Version 3 Process and Work Plan — Review Proposed 2010 Meeting Schedule**
7. **Review Charlotte August Meeting Objectives**
8. **Meeting Evaluation**
9. **Adjourn**

Phase 2 SDT Points of Consensus — April 16, 2009

A. The Standards should require a BES impact assessment as an initial approach to categorizing BES Cyber Systems.

B. The impact categorization of Cyber Systems will be based on reliability functions of the BES to achieve Adequate Levels of Reliability.

C. The Standard's BES Impact Assessment will consider a categorization process.

D. The Standards will require oversight of the categorized list of BES assets by entity types which have a more complete wide-area view of the BES.

E. The Standards will categorize Cyber Systems supporting, either directly or indirectly, the reliability functions of the BES and apply security requirements (or controls) that are commensurate and appropriate to their potential impact on the BES.

F. The final Cyber System categorization will reflect the impact to the BES based on a loss of availability, integrity, or confidentiality of the Cyber System.

G. The Standards will provide Organizations with reasonable flexibility in applying equivalent security controls on the basis of compensating controls and environmental considerations.

H. The Standards will address the complex nature of BES functions and interconnected Cyber Systems, both within and between multiple organizations.

I. The Standards will state explicit criteria for the BES Impact Assessment.

J. The Standards will state explicit criteria for the Cyber Impact Assessment (including use and misuse of cyber systems).

K. The Standards will include a methodology to merge the BES Impact Assessment and Cyber Impact Assessment into a final Cyber System categorization.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Project 2008-06 Cyber Security Order 706 SDT

Work plan Proposal, July 2009

A. CIP-002 Work Plan Objectives

1. Establish the overall schedule and milestones for developing the new CIP reliability standards on cyber security
2. Involve all members of the SDT in at least one of five proposed subgroups to develop draft requirements for consideration by the SDT to be included in a draft CIP-002 Version 3.
3. Present the SDT Working Paper (Categorization of Cyber Systems) to the NERC Member Representative Committee at its August 2009 meeting.
4. Host a webinar, and receive and consider industry comments on the Working Paper in August-September 2009 as the SDT drafts CIP-002 Version 3.
5. Through SDT Subgroups and the full SDT, produce an initial draft of CIP-002 requirements and measures by December 2009 that are consistent with the Working Paper concepts and consensus points.
6. Seek and respond to industry comment and post the new CIP-002 for balloting in 2010.
7. Begin initial drafting of the standards that will replace the current versions of CIP-003 through CIP-009 in parallel with the CIP-002 posting and balloting.
8. Prepare and issue the replacements for CIP-003 through CIP-009 for posting and balloting in 2010–2011.

B. Proposed CIP-002 Subgroups

Building on the Working Paper, the following topical subgroups are proposed to develop an initial set of CIP-002 requirements:

1. Reliability Functions
2. List of BES Subsystems and/or BES Cyber Systems
3. BES Mapping
4. Cyber Analysis
5. Definition and Selection of Controls (sample control or set of controls from the controls catalogue as a "proof of concept")

C. Proposed Steps for Forming CIP-002 Subgroups — Vancouver

1. On day one, ask each SDT member to rank in order of preference their interest in participating in each of the 5 subgroups. In light of preferences, propose composition for the 5 working groups with 3-6 members in each.
2. On day two, convene the 5 groups in parallel and ask members to: 1) review scope of topic and identify areas that may need development of related CIP-002 requirements; 2) determine what information they will need going forward; 3) select a leader/spokesperson, a scribe and a timekeeper; 4) sketch out a work plan, including meetings, to get the work done by the October SDT meeting. Subgroups will report back their plans on Day 2 of the Vancouver Meeting to the SDT.

3. Where possible, provide staff /facilitator support for the subgroups.
4. Follow up with SDT members not attending the Vancouver meeting for team placement.

D. Roles and Responsibilities

1. **CSO706 SDT Members.** Review, build consensus, and adopt a draft CIP-002 by December 2009. Members will also begin parallel development efforts in 2010 to draft the new standards that will eventually replace the current CIP-003 through CIP-009 standards once the requirements and measures for the new CIP-002 standard have been defined and vetted.
2. **CIP-002 Subgroup Members.** Subgroup members will be responsible for producing a draft set of requirements related to their topic prior to the October 20-22 SDT meeting. Subgroup members will be responsible for selecting a leader/spokesperson, a scribe and a timekeeper.
3. **CIP-002 Subgroup Leaders.** The Leader will be responsible for leading and facilitating the subgroup's effort in creating and implementing a plan (deliverables, timeline, assignments, review and consideration of industry comments) in consultation with members and with help, as needed, by staff and facilitators.
4. **CIP-002 Coordinating Team.** The SDT Chair and Vice Chair along with the Subgroup Leaders and facilitators will participate on a Coordinating Team that will meet by conference call in advance of each monthly SDT meeting through October 2009 to address any duplication of tasks, identify needs for coordination among the subgroups and vetting of the approaches being considered by each of the subgroups to help smooth the way for preparation of a complete draft of CIP-002 to be reviewed, refined, and adopted in November and December 2009.
5. **Staff and Facilitation Support.** Where/when needed and/or requested, facilitation or other staff support will be provided to the subgroups.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 SDT Meeting Schedule
October 2008 — December, 2010

Development of CIP Framework October 2008 — July, 2009

1. October 6–7, 2008 — **NIST, Gaithersburg, MD,** Review of CIP 002-009, Agreement on Phase 1 Version 2 approach

2. October 20–21, 2008 — **Sacramento, CA,** Phase 1 Version 2 Development

3. November 12–14, 2008 — **Little Rock,** Phase 1 Version 2 Adoption; Phase 2 Version 3 Process review

4. December 4–5, 2008 — **Washington D.C.,** Phase 2 Version 3 review and debate, white papers assigned

5. January 7–9 — **Phoenix, AZ**

- Review of Technical Feasibility Exceptions white paper
- Review of Industry Comments on Phase 1 products- Establish and convene small groups to draft responses
- Review of Phase 2 White papers

January 15 Webex meeting

- Small group draft responses to industry

January 21 WebEx meeting

- Small group draft responses to industry

6. February 2–4 — **Phoenix, AZ**

- Update on NERC Technical Feasibility Exceptions process
- Review of VSL process and SDT role
- Review of Phase 2 White papers, strawman and principles
- Review and Adoption of SDT Responses to Industry Comments on Phase 1 and Phase 1 Product Revisions

7. February 18–19 — **Fairfax, VA**

- Update on Phase 1 process
- Update on NERC TFE process
- Update on VSL Team process
- Review, discussion and refinement of Phase 2 CIP-002 White papers, strawman and principles

8. March 10–11 — **Orlando, FL**

- Update on NERC TFE process
- Update on VSL Team process
- Review and Refinement of Phase 2 CIP 002 Strawman Proposals

March 2–April 1 30-day Pre Ballot

Mid-March — NERC posts TFE draft Rules of Procedure for industry comment

March 30 — WebEx meeting White Paper Drafting Team

April 1–10 — **NERC Balloting on Phase 1 Product**

April 6 — WebEx meeting — White Paper Drafting Team

April 8 — Webex meeting — White Paper Preview- Full SDT Conference Call

April 11 — Phase 1 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments-

9. April 14–16 — **Charlotte, NC**

- Update on NERC TFE process

- Update on VSL Team process
- Update on the NERC Critical Assets Survey
- Agree and Adopt Responses for Phase 1 Industry Comments- Recirculation Ballot
- Review and Refinement of Phase 2 Whitepaper and Progress Report to MRC

April 28 and May 6 — White Paper Drafting Team Meetings and Webex

April 17–27 — Recirculation Results: Quorum: 94.37% Approval: 88.32%

May 5 — NERC Member Representative Committee Meeting, Arlington, VA — SDT progress report

10. May 13–14 — Boulder City NV

- Review MRC presentation and any input to SDT on Phase 2 approach
- Further SDT refinement and discussion of the Phase 2 White Paper

June — Working Paper Drafting Team Meetings and WebEx — June 8 and June 15, 2009

11. June 17–18 — Portland OR

- Further SDT refinement of the Draft CIP Version 3 Working Paper(s).
- Review SDT development process for June-December 2009
- Discuss potential SDT subcommittee structure and deliverables.

June, WebEx meeting(s)

- Working Paper Sessions including inputs from selected industry personnel to help establish BES Categorization Criteria

CIP 002 Development of Requirements, Measures, Etc. July-Dec 2009

12. July 13–14, 2009 — Vancouver, B.C., Canada

- SDT Plenary session to review, refine, and adopt Working Paper
- Adopt Responses to NERC for Interpretation of CIP-006-1
- Review and Adopt Proposal for CIP-002 Subgroups and Deliverables
- Convene subgroup organizational meetings to develop work plans
- Adopt 2010 Meeting Schedule

July-August Interim WebEx meeting(s)

- CIP 002 Subgroup meetings (as needed)
- CIP 002 Coordination Team meeting (as needed)

August 3–5, 2009 — Winnipeg, Manitoba — **NERC Member Representative Committee** Progress Report and presentation on new CIP Version 3 Working Paper Concept — Reliability Standards on Cyber Security for MRC input

13. August 20–21, 2009 — Charlotte NC

- SDT Plenary session to review and respond to MRC comments on Working Paper and CIP-002 Concepts
- SDT Subgroup and Plenary meetings to develop CIP-002 requirements and “proof of concept” control(s)

August-September — 45-day Industry Comment Period on CIP-002 Working Paper
NERC Webinar

August-September Interim WebEx meeting(s)

- CIP 002 Subgroup meetings (as needed)
- CIP 002 Coordination Team meeting

14. September 9–10, 2009 — Folsom, CA

- SDT Plenary session to review and respond to any additional industry comments on Working Paper and CIP-002 Concepts
- SDT Subgroup drafting meetings — consider industry comments, draft requirements and "proof of concept" control(s)
- SDT Plenary Session(s) — Subgroup reports on requirements
- Review of CIP-002 standard, requirements, and measures outline
- Address coordinating issues
- Establish meeting dates and proposed locations for January-December 2010

September-October Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)
- CIP-002 Coordination Team meeting

15. October 20–22 — New Orleans LA

- SDT Subgroup drafting meetings — day one
- SDT Plenary Session(s) — Day Two Subgroup reports on CIP-002 requirements
- Review and refine initial draft of CIP 002 single text

October-November Interim WebEx meeting(s)

- CIP-002 Coordination Team meeting

16. November 17–18 — Tampa, FL

- SDT Plenary Session(s) — to review and refine CIP-002 single text — standard, requirements, measures and controls.

November-December Interim WebEx meeting(s)

- Drafting teams as needed to finalize drafts
- CIP 002 Coordination Team meeting

17. December 15-17, Atlanta, GA

- SDT Plenary Session(s) to review, refine, and adopt CIP-002 standard, requirements, measures, and controls.
- Agree on initial posting of draft CIP-002 for industry review and comment

Refinement of CIP-002 and Development of Other CIP Standards — January-December 2010

SDT Meetings 18-30. 2010 (12 SDT monthly meetings and subgroup WebEx meetings as needed)

- SDT Responds to Industry Comments on Initial and Subsequent Postings of CIP-002, Version 3 (may be multiple comment periods, as required)
- Refine the CIP-002 through the comment period and submit new CIP-002 Version 3 Standard for Balloting along with the catalogue of controls (i.e. CIP-003-009 or its successor) **OR**
- Ballot CIP-002 while permitting industry to rely on CIP-003-009 until the full suite of controls (i.e. CIP-003-009 or its successor) is reviewed and presented for balloting.
- Submit the full suite of CIP Reliability Standards on Cyber Security for Industry Comment
- Refine and Submit the full suite of CIP Standards for Industry Ballot
- NERC Board of Trustees Adoption of the full suite of Standards
- FERC Approves and NERC Implements the full suite of CIP Standards

Proposed 2010 Meeting Schedule

January 20–21	July 14–15
February 17–18 or February 16–18	August 11–12
March 10–11 or March 9–11	September 8–9
April 14–15 or April 13–15	October 13–14 or October12–14
May 12–13	November 17–18
June 9–10 or June 9–11,	December 15–16

EXECUTIVE SUMMARY

The Chair, Jeri Domingo-Brewer and Vice Chair, Kevin Perry welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). The SDT adopted the July 13–14 meeting summary without comment or objection on Friday morning.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

Vice Chair Kevin Perry announced, effective at end of October meeting, he will be stepping away from the SDT due to his responsibilities with his new job. He later suggested four principles to bear in mind as we develop the new standards requirements: remove variability; remove arbitrary decision making; criteria (requirements/controls) must be clearly understandable; and criteria performance must be auditable — the entity must be able to demonstrate compliance.

Mr. Langton reviewed the CIP-002 work plan between August and December 2009 which the SDT adopted at its meeting in Vancouver and set up subgroups and some ground rules for their work and coordination with each other. The monthly agenda planning meetings with the Chair and Vice Chair have been expanded to include a leadership coordination meeting with the leads from each of the five subgroups. He noted the five subgroups have about four months to finish work of developing the CIP-002 draft to be released for industry comment in December 2009.

Jeri Domingo-Brewer briefed the SDT on the chair and vice chair's presentation to the Standards Committee on a conference call earlier in August. The chair and vice chair agreed to provide the Committee with a "heads up" if there are any issues that might affect the SDT's ability to get the job done in a timely fashion.

Kevin Perry and Scott Mix made the presentation on the development of the Technical Feasibility Exception process. Mr. Perry described the work of a NERC "Tiger Team" led by Mike Assante, NERC Chief Security Officer, with regional entity representatives to address a number of issues that have been raised in the industry comments received to date. Scott noted that the plan is to submit to NERC Board of Trustees for review and adoption at the October meeting following its consultation with the regional entity representatives. NERC BOT hopes to adopt a final TFE process sometime next year to submit to FERC.

On the first day the SDT discussed the current situation with the TFE process and whether the SDT should support efforts to find a standards solution approach to the challenge presented by TFE interim process in advance of the adoption of CIP Standards Version 3. Mr. Perry noted

that NERC's current view is that explicit or implicit "enabling language" references in the CIP standards will be required for an entity to request a TFE. Mr. Perry noted the current timelines associated with the NERC ROP.

Kevin Perry presented a proposal to the SDT to consider a relatively focused and narrow effort undertaken by a small team of SDT members to build upon the "Technical Feasibility Exceptions Matrix of Applicable Requirements" that he and others in the industry have been developing. It would propose a broader interim TFE process that will allow for a safe harbor for technical feasibility exceptions granted in the interim. An alternative presented by Gerry Freese would be to create a broader effort that would address the TFE and other interpretation issues raised by CIP Version 1 and Version 2. The SDT then identified the following pros and cons related to the proposals.

On day two, Mr. Perry noted he was withdrawing his proposal from day one and offered the following points for a new proposal in light of yesterday's discussion: The SDT should consider expressing support for the use of the NERC Urgent Action process to address the current TFE dilemma. This was done with the 1200 standard. He described the steps in the process and the SDT discussed the intent of the urgent action process and whether to adopt a resolution urging the Standards Committee to consider an urgent action approach. The facilitators noted this was an important issue and there seemed to be support for the SDT to help in some way to facilitate a solution.

After review of a possible resolution, the chair suggested instead that she draft a statement to the chair of the Standards Committee which should note that the SDT has identified an urgent challenge for the industry and that the Standards Committee should consider how to address the gaps that have been identified in terms of Version 2 of CIP standards and the proposed TFE procedure. The statement would note the SDT looked at trying to help with a solution given the skills, abilities and experience on the team, but the time needed would take away from the SDT's main charge and ability to complete the current work plan in a timely fashion. There could then be a summary of various options and implications in terms of the SDT work plan and the matrix attached. The team agreed by common consent that the chair should prepare and send a statement consistent with the spirit of the SDT's review and discussion.

Scott Mix reported on Dave Taylor's behalf that Version 1 is complete with a 92% quorum and 84% approval rate. This has been submitted to FERC on July 30. It will be adopted by FERC rule or by NOPR. Version 2 VSLs and VRFs is in the 30-day pre ballot review period. The expectation is for the second ballot to conclude in early October. NERC anticipates that FERC will take action on the CIP Version 2 standards in September/October 2009 as an Order or a NOPR. The SDT Webinar scheduled for next week was described by Phil Huff

The SDT reviewed the Subgroup process for developing CIP 002. Scott Mix noted that the SDT should begin focusing on both the content and format of a NERC standard and pointed to the possibility of a short set of clear requirements backed up by more detailed appendices or attachments.

CIP-002 Subgroup Reports presented their progress reports on day one and a follow up report on day two from their subgroup meetings.

Reliability Functions Subgroup leader John Varnell reviewed a draft list of assets the Subgroup was developing. He noted they haven't added any more functions but did combine some functions and expand on what was meant by each. He noted they hope to have a complete list by the end of the meeting. On day two he presented the following 9 functions noting each had a set of sub functions:

1. Dynamic response
2. Balancing Load and Generation
3. Controlling Frequency (real power)
4. Controlling Voltage (reactive power)
5. Managing Constraints
6. Control & Operation
7. Restoration of BES
8. Situational awareness
9. Inter-Entity coordination and communication

The List of BES Subsystems/BES Cyber systems Subgroup leader, Jay Cribbs presented an overview of the work done since the Vancouver meeting. Subgroup Leader Jackie Collett was on vacation but the group met once in the interim. He described the subgroup scope and expected output. He noted the subgroup has identified a list of issues and questions ("in this phase the subgroup is coming up with all questions and no answers") that will guide their efforts to develop draft requirements. On day two he offered the following points:

1. We will not outline the process for "how" to create the lists. The white paper gives flexibility in the creation of the lists and allows entities to take a primarily cyber systems oriented view if they wish.
2. Assets and systems that are below the mapping team's "Low" thresholds could be included as minimum criteria in our requirements. This should address the concern over having a "negligible" ranking without requiring us to have an explicit 'negligible' impact category.
3. Are the 'R' statements at the right level? In the current CIP-002, each asset category has its own 'R' statement but we think this is unnecessary.

In terms of next steps he noted the subgroup would:

- Convene the remainder of our team to gather input and wordsmith our requirements.
- Obtain and incorporate the work of the Reliability Functions team into our requirements.
- Work with the Mapping team to determine minimum requirements for our lists.

BES Mapping Subgroup leader John Lim noted they met twice since Vancouver and have reviewed and used/borrowed concepts from three key documents: a set of critical asset

guidelines; the NERC DHS proposal for tiering BES assets (3 tiers) depending on impact on reliability of BES; and a classification of events. The resulting first draft of Requirement #2 will address how responsible entities will apply set of criteria to map list from requirement to high/medium and low tiers. The Subgroup is still debating this but it appears that there is a fundamental problem with hard thresholds. While there is more work to be done, it appears that High impact is the most important to be clear on, then Moderate impact. And then all else remaining may be in Low.

On day two John Lim presented the Subgroup's report noting they have lively discussions in the last few days. Changed the format to a matrix for a number of assets in 3 sections: Control Centers and Back up Control Centers; Transmission; and Generation. There was a general aversion to thresholds. If we have to use thresholds, provide the way for entities to say if I meet the threshold with engineering analysis. The common thread is that this will require a lot of use of engineering analysis. John will take last 2 days of discussion; redraft the standard requirement format previously to reflect the discussion. He noted the following issues as outstanding: coordinating with the first 2 groups: functions and BES subsystems. Have a session with Phil Huff to ensure consistency with analysis in both groups.

Phil Huff presented a report on the Cyber Analysis Subgroup's work since Vancouver. He reviewed the 3 teams the Subgroup has formed: Cyber impact categorization; target of protection team; and external cyber systems. Phil reviewed the inputs and outputs of the Cyber System Categorization Process and described the objectives. Phil Huff presented the subgroup report on day 2. They are looking at functional impact. For example in terms of generation — what does it mean for cyber system to impact generation at a h/m/l. What does it mean to affect situational awareness? Short of detrimental, moderate, no impact.

Joe Doetzl presented the subgroups ideas on Target of Protection noting they are proposing to expand the scope of what needs to be protected, e.g. collateral system. The hope is that if we are able to apply the appropriate controls, it may take care of target of protection.

Frank Kim presented on requirements for external cyber systems and presented the issues for consideration. Most External Cyber Systems or Third Party Data Connection NERC CIP-related compliance areas are not thoroughly covered in the existing version of the Standards. Therefore further clarification is required. Amplifying External Third Party system, user, and agreement security considerations are further detailed in other industry security standards such as ISO 27002 and NIST 800-53 that could be leveraged for future iterations of the NERC CIP Standards that pertain to external third party system security. On External Cyber systems, if 2 registered entities with cyber connections then some arbitration agreement should be in place to define the assurance. Assurance is provided by NERC. Putting that over to security controls not in CIP 2 version 3.

Keith Stouffer presented the Definition and Selection of Controls Subgroup's work since Vancouver noting that he had hoped to have a set of controls for the SDT to review but hasn't had a chance to do that yet. On day two Keith Stouffer presented the review of ISA 99 Work.

They looked at controls in draft — voluntary standard. Some controls watered down and may not be useful. Looking at 800 53 controls as they may be more applicable to current environment. Proposing to keep same general CIP-003-009. Should 5 and 7 combined? Contained ½ or 2/3s of all requirements. Decided to propose keeping CIP-005 and make it electronic asset controls. The subgroup is fleshing out new CIP-005 to serve as a model for what the SDT will ultimately do with the rest of standards. Starting with 1 requirement from 800-53, R1 Account Management, they came up with low medium and high.

The chair reviewed with the SDT the schedule for the next couple of meetings reminding members that at the conclusion of the October meeting in Kansas City we hope to have a single text of CIP-002 which we can refine in November and December. She thanked the members for their hard work together and in the subgroups and encouraged them to continue working to make headway on each of their charges. She noted she would forward to the chair of the Standards Committee a statement on behalf of the SDT relating to TFE and the urgent action process. The SDT adjourned at 2:45 p.m. on August 21.

I. INTRODUCTIONS, AGENDA, AND SDT WORK PLAN REVIEW

The Chair, Jeri Domingo-Brewer and Vice Chair, Kevin Perry welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). The SDT adopted the July 13–14 meeting summary without comment or objection on Friday morning.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

Vice Chair Kevin Perry announced, effective at end of October meeting, he will be stepping away from the SDT due to his responsibilities with his new job. He noted he will miss working with the team which has been a superb group to work with. Following the meeting, Mr. Perry asked that the following additional comments be shared with the SDT and placed in the meeting summary: "I believe there are four principles to bear in mind as we develop the new standards requirements: Remove variability; Remove arbitrary decision making; Criteria (requirements/controls) must be clearly understandable; and Criteria performance must be auditable - the entity must be able to demonstrate compliance. As we go through this process, step back and ask yourself two questions: 1) as an entity, how would I comply with the requirement and demonstrate my compliance? 2) As an auditor, how would I confirm compliance?"

Mr. Langton reviewed the CIP-002 work plan between August and December 2009 which the SDT adopted at its meeting in Vancouver, setting up subgroups and some ground rules for their work and coordination with each other. The monthly agenda planning meetings with the chair and vice chair have been expanded to include a leadership coordination meeting with the leads from each of the five subgroups. He noted the five subgroups have about four months to finish work of developing the CIP-002 draft to be released for industry comment in December 2009. He noted by the conclusion of the October 2009 SDT meeting, the goal is to have a single draft CIP-002 that can be debated and refined in November and adopted in December.

Jeri Domingo-Brewer briefed the SDT on the chair and vice chair's presentation to the Standards Committee on a conference call earlier in August. They noted the SDT's appreciation for the ongoing significant support for their work. When the Committee members indicated concerns with the length of the schedule, the chair indicated the SDT's plan is to have the bulk of their work done by the end of 2010. The chair and vice chair agreed with the Standards Committee that the SDT needs to make significant and visible progress or its effort will be overtaken by events and efforts outside the industry. Finally the Committee asked the SDT leadership to provide them with a "heads up" if there are any issues that might affect the SDT's ability to get the job done in a timely fashion.

II. UPDATES

A. Technical Feasibility Exception (TFE) NERC Rules of Procedure Posting

1. Introduction

Kevin Perry made the presentation and Scott Mix, NERC offered additional information. Mr. Perry noted the work of the NERC "Tiger Team" led by Mike Assante, NERC Chief Security Officer, with regional entity representatives to address a number of issues that have been raised in the industry comments received to date. Scott noted that the plan is to submit to NERC Board of Trustees for review and adoption at the October meeting following its consultation with the regional entity representatives. NERC BOT hopes to adopt a final TFE process sometime next year to submit to FERC.

2. Review of Initial Proposals for Addressing TFEs.

On the first day the SDT discussed the current situation with the TFE process and whether the SDT should support efforts to find a standards solution approach to the challenge presented by TFE interim process in advance of the adoption of CIP Standards Version 3. Mr. Perry noted that NERC's current view is that explicit or implicit "enabling language" references in the CIP standards will be required for an entity to request and receive a TFE. NERC came out July 1 with interim guidance. The ROP put out for comment has received significant comments and concerns. There is currently no program and process in place to support the guidance. Regional Entities are asking the industry entities to hold off submitting their TFEs until this is sorted out. Regional Entities have proposed to take over the processing of TFEs and final touches on a joint NERC Region proposal ("Plan C") are being made. It will call for TFE requests submitted to regions in 2 parts. Part A: identification type of equipment and issue and why the TFE is needed. Part B. will require a "deep dive" into how the mitigation plan will appropriately protect grid in absence of strict compliance. The current TFE proposal today would limit the applicable requirements to 14 requirements and sub requirements in CIP-005, CIP-006, and CIP-007.

If you have a compliance issue other than those requirements where a TFE is available, there is a 90-day schedule. Regions have 60-days to triage the TFE requests and determine whether to conditionally accept them: 1. Saying yes and give an exception or 2. Telling the entity to try again, and why they are being rejected. The entity will have one opportunity to revise and resubmit the TFE request in 30-60 days. If provisionally accepted they will be granted safe harbor from compliance action. If you fail to do anything promised you may lose safe harbor, e.g. not maintaining the mitigation plan — and it goes back to initial request date for compliance. Regional Entities are not currently staffed to do this. The TFE Process is supposed to hit the streets next week for an abbreviated comment period. Mr. Mix noted that the initial 60 days is extendable subject to approval by NERC. Also it was clarified that there could be multiple rounds if done within 30 days.

Kevin Perry presented a proposal that the SDT consider a relatively focused and narrow effort to propose standards changes undertaken by a small team of SDT members to build upon the

"Technical Feasibility Exceptions Matrix of Applicable Requirements" (see Appendix # 6**)** that he and other in the industry have been developing. It would propose a broader interim TFE process that will allow for a safe harbor for technical feasibility exceptions granted in the interim. An alternative proposal, presented by Gerry Freese, would propose creating a broader effort that would address the TFE and other interpretation issues raised by CIP Version 1 and Version 2.

The SDT then identified the following pros and cons related to the TFE proposals:

Pros	Cons
It addresses an urgent issue confronting the industry that may undermine the effectiveness of the SDT in producing a CIP Version 3 the industry will adopt.	It will divert and dilute SDT time and resources and time to getting the CIP 002-009 version 3 done ASAP
The SDT is best positioned currently to get this job done	The SDT may have to adjust and lengthen its Version 3 CIP schedule to respond to industry comments and engage in the ballot process.
Shows FERC and congress the industry is doing something in the interim before Version 3 adopted and approved by FERC.	The Standards Committee has asked the SDT to move as expeditiously as possible to complete its charge
	The SDT will address and seek to minimize the need for invoking TFEs in the CIP Version 3 conceptual approach and should focus on that.
	May result in further confusion about the relationships among the NERC ROP, Version 3 SDT standards development process, the Version 2 guidelines and the TFE Interim Guidance and the permanent process.
	May appear to Congress, FERC and others that SDT resources are being redirected to deal with TFEs
	Expanding the TFE process to address other issues will be difficult to fend off industry members who will want to see the rational for not addressing others.

Member Discussion Comments on Proposals Day One

- There is confusion on the status and the development of the TFEs. The initial draft ROP Scott Mix worked with the SDT on. Lawyers got involved. Regions didn't like the approach to the process. Concerned about entities and audits. Struggling how to deal with practical things. What are entities allowed to do with the TFEs?

- NERC needs to make this simpler — for asset owners and members so they can get their jobs done and spend more time thinking about good security in grid. Good security on grid is possible.
- Should there be any limitations for when you ask for a TFE? Why not provide that TFEs can be requested for all requirements. Let each be reviewed and stand on the merits. If it will mean more work for NERC and the regions, so be it.
- Is the position that the TFE exception, unless explicitly authorized, is not allowed supported by FERC staff?
- Concerned about Congress' perception of the industry diverting resources/efforts away from the reform of the 002-009 from Order 706.
- Mr. Perry sent matrix around seeking input from TFE tiger team and the CIP auditors in other regions. The current draft reflects consensus of opinion across the regions as to areas one should be able to take a TFE. NERC however has not accepted it. FERC did not state in Order 706 that TFEs only could be taken where explicitly set forth in the standards. In fact in May, FERC staff suggested they envisioned broadening the ability of TFEs. However FERC legal and NERC legal have developed a different opinion leaving the industry stuck between a rock and hard place.
- Industry folks are increasingly asking SDT members to explain the rules. Hard to describe where the process is: first had a SDT proposal, then a NERC proposal, then a regional proposal. Don't know what the rules are. Bottom line- people in industry will do everything they can, but are concerned about getting caught in the confused mess. Risk is great with this much confusion.
- Other things in the original proposal. Issues of criteria on safety for e.g. If you have a safety issue it is valid? But only applies to certain requirements. Go ahead because don't care about the safety issue?
- Question from 1 region — making security policy reasonably available to everyone. E.g. Janitor — give him the entire policy. Translation. Supervisors do this. Laudable to put clarity into the standards. Keep in mind. Take hard look from entity's perspectives how to comply — look at auditors' perspective — how to verify compliance without an onerous.
- Distressed if CCWG focusing on this? Have regional compliance entities lost focus?

The Chair and facilitators suggested that this proposal be tabled to review on day 2 when the facilitators could summarize the pros/cons and work with the chair to develop a potential way forward for consideration by the SDT.

3. TFE Urgent Action Proposal

On Day 2 the chair mentioned that she and the vice chair reflected on the TFE day 1discussion over dinner last night and offered an alternative proposal for the SDT consideration. Mr. Perry noted he was withdrawing his proposal from day 1 and proposed an "urgent action" path for TFE changes to the CIP standards. He included the following points:

- The SDT should express support for the use of the NERC Urgent Action process to address the current TFE dilemma as was done with the 1200 standard.

- In the Urgent Action process: someone drafts both a SAR and a modified standard that SAR covers and submits to the Standards Committee for their consideration. It differs from regular procedure in several respects. If the Standards Committee concurs, they will appoint a team and post the urgent action standard language for pre-ballot review followed by ballot and pre ballot.
- The Team will respond to comments from first ballot. If adopted by industry it goes to NERC BOT and to FERC.
- The urgent action standard will remain applicable for a set period of time but can be extended annually. A permanent standard must be placed in development to replace the urgent action standard.
- A major advantage to this approach is it doesn't distract the SDT from pursuing its charge.
- The Standards Committee might form another team, perhaps it is handed off to Larry Bugh chair of the original Version 1 SDT who has now completed the work with VSLs.
- It addresses the timeliness issue since the team is asked to do this it would respond only to comments following the first ballot. It does bypass collaborative nature of normal standards process.
- Mr. Perry briefly summarize scope for urgent action contained in the matrix *(see Appendix 6)*

Member Discussion of the Urgent Action Proposal and Matrix

- Did SDT have in mind covering the non-technical reasons in FERC order, safety etc. or strictly the technical?
- Mr. Perry spoke with NERC and urged them to figure this out. Non-technical exceptions treatment is inconsistent. NERC's paper currently has it both ways.
- How much time would it save if we took matrix and go and file without going through urgent action. Doesn't think it will take much time to draft? The mandate for posting for comment, accept, respond to comments, go out for pre-ballot review, respond to 1st ballot comments. We would have to follow all normal action process and it would take many more months and effort if there are significant comments.
- Why won't NERC accept the matrix? Standards Committee may say this is rewriting the standards outside the standards process.
- With the December compliance deadlines for generation folks, how long will this take?
- It will depend. Standards Committee must appoint team to handle the balloting process and they must respond to balloting comments. Post for pre ballot review. Best of all possible worlds. 10 day initial ballot period. 10 business days- only comment response. Not proposing difficult to understand issues. Industry won't be concerned where we are not making. 30 day posting, 30 day balloting. BOT review. Expedited board action. 30 days. Filing submitted to FERC.
- Upon board approval- standards are mandatory but not sanctionable.
- The generation folks will join the pool of entities that already are out there that in absence of TFE, will not be in compliance. That's why the urgency.

- Original intent of the Urgent Action process was to address situations that had an immediate impact to bulk power. Not to provide relief to standards however poorly written. Technical, operations and safety called out in the FERC Order 706. Is this the right use of the urgent action process. I don't believe it is.
- Scott Mix quoted the Urgent Action opening paragraph indicating intent for the SDT: "Under certain conditions, the Standards Committee may designate a proposed standard or revision to a standard as requiring urgent action. Urgent action may be appropriate when a delay in implementing a proposed standard or revision can materially impact the reliability or security of the bulk power systems or be inconsistent with statutory or regulatory requirements for reliability standards, such as by causing adverse impacts on markets or undue discrimination. The Standards Committee must use its judgment carefully to ensure an urgent action is truly necessary and not simply an expedient way to change or implement a standard." Pg 26 of http://www.nerc.com/fileUploads/File/Standards/RSDP_V6_1_12Mar07.pdf
- We shouldn't worry about the industry approval for this. It should be presented as a valid reliability issue. What will entity do with equipment they might have to replace because of TFE can't get. Submit SARs with standards.
- The expectation will be that when an entity is found out of compliance they will go through investigation, confirmation, plan, self-report and take steps to becoming compliant. Will have some form of reliability impacts. Standards Committee understands the issue.
- What's the alternative? The industry needs to do this. Even if helping a smaller group than all. I would vote to head in this direction. The TFE process is important to fix.
- This will help all entities. RC, Vas and TOPs are in need now. But others will be affected going forward. TFE needed? Spoke with head of his compliance. ERCOT would probably be very supportive and other ISOs would be support.
- The SDT needs to be careful and aware of the "optics" that may be seen as way of avoiding the process.
- The SDT could decline the opportunity to take this on because interferes with our mission and charge but support any efforts to take an Urgent Action approach.
- We are looking at the very best April 1 of 2010 of effective date of Version 2. Assumes FERC issues an order by end of September. Urgent action would not become effective until April 1 2010.
- This could mean that the requirements are enforceable but not sanctionable? Regions would take TFE requests for new requirements.

The facilitators noted this was an important issue and there seemed to be support for the SDT to help in some way to facilitate a solution. They presented for SDT consideration the following draft SDT Resolution:

The SDT supports the streamlined treatment of the interim TFE standards issues through the NERC Urgent Action Process utilizing the "Technical Feasibility Exceptions Matrix of

Applicable Requirements" (see Appendix # 6) as a basis for developing a discrete set of proposed modifications to CIP Version 2 standards.

Following some discussion of the resolution language, the Chair suggested that instead she draft a statement to the Chair of the Standards Committee which should note that the SDT has identified an urgent challenge for the industry and that the Standards Committee should consider how to address the gaps that have been identified in terms of Version 2 of CIP Standards and the proposed TFE procedure. The statement would note the SDT looked at trying to help with a solution given the skills, abilities and experience on the Team, but the time needed would take away from the SDT's main charge and ability to complete the current work plan in a timely fashion. It could be sent to Scott Henry Chair of Security Committee, copying Dave Taylor and Gerry Adamski at NERC. This would be consistent with the Committee's request that the SDT give them a heads up on challenges. The Vice Chair offered separately to bring SDT concerns to the NERC TFE group that was meeting by conference call later in the day.

The team agreed by common consent that the chair should prepare and send a statement consistent with the spirit of the SDT's review and discussion.

B. VSLs and VRFs
Scott Mix reported on Dave Taylor's behalf that Version 1 is complete with a 92 percent quorum and 84 percent approval rate. This has been submitted to FERC on July 30. It will be adopted by FERC rule or by NOPR. Version 2 VSLs and VRFs is in the 30-day pre ballot review period. The expectation is for the second ballot to conclude in early October.

NERC anticipates that FERC will take action on the CIP version 2 standards in September/October 2009 as an Order or a NOPR.

C. Update on other Related Cyber Security Initiatives
The SDT Webinar is scheduled for next week. Phil Huff described the presentation 20–30 minutes leaving 1 hour for questions and discussion. It will introduce the industry to the concept paper. As of today over 240 have registered. Phil agreed to send slides to SDT members. There will be a "dress rehearsal" before the webinar.

SDT Member Comments

- Confusion of concept paper with the Critical asset identification guidelines which a working group has out for wide industry comments.
- Part of CIPC package for its September meeting. Will include a redline and comments and response. Working group working on companion critical cyber asset identification.
- Confusion in the industry is running rampant. Mixed up between the two- follow concept paper for audit. Transmittal letters.
- Went back through the document — couldn't find where this is roadmap for CIP-002 for version 3. May need a disclaimer on there.

III. CIP 002 SUBGROUP REPORTS TO THE SDT

A. Overall

Scott Mix noted that the SDT should begin focusing on both the content and format of a NERC standard. He mentioned he had discussed with Dave Taylor to possibility of a short set of clear requirements backed up by more detailed appendices or attachments. He noted that this would be a departure from how NERC normally does standards and that the sooner the SDT can get some samples to NERC to review format and structure the better.

Member Comments

- Do other standards have attachments associated with them? Scott reported that is precedent in that there are 8-10 standards that have attachments, e.g. EOP 2 (EEA Attachment) and IRO 6 (TLR procedures as an attachment).
- The functions group may have a proposed format to present to the SDT for their section by the end of the meeting.
- It will also be important to be able to show the flow and linkages from one requirement and any supporting appendix to the next

The Chair reviewed with the SDT the subgroups and their members and observers.

Subgroup Name	Members and Observers
Reliability Functions	John Varnell (1), Jim Brenton (1), Dave Norton, Rich Kinas, Doug Johnson, James Bassett
List of BES Subsystems and/or BES Cyber Systems	Jackie Collett, Scott Rosenberger, Jay Cribb, and Gerry Freese.
BES Mapping	John Lim (1), Jeri D. Brewer (1), Dave Revill (2) Sharon Edwards and Kevin Sherlin
Cyber Analysis	Chris Peters, Phil Huff, Rob Antonishen, Frank Kim and Joe Doetzl. Sam Merrell and Mike Toecker
Definition and Selection of Controls	Kevin Perry, Bill Winters, Jon Stanford, Keith Stouffer. Peter Schneider

B. CIP 002 Subgroup Reports and Discussion

1. Reliability Functions Subgroup Report

a. 8-20 Progress Report

John Varnell reviewed a draft list of assets the Subgroup was developing. He noted they haven't added any more functions but did combine some functions and expand on what was meant by each. He noted they hope to have a complete list by the end of the meeting.

Member comments

- Not sure we are all is clear on what each subgroup is to do and produce. Our group has come up with wording for a strawman for requirements would be worded and how functions would be used in the wording of the requirements.
- This subgroup will come up with list of functions. E.g. Requirement 1 in CIP 002 is to come up with list of BES subsystems. Need to list the functions and use list to come up with inventory of relevant subsystems. This might result in a list of minimum types of sub systems that must be used.
- Requirement 2 is the categorization itself and then onward.
- This subgroup will need to work with and help the BES Subsystems/BES Cyber systems Subgroup to come up with list of subsystems.

b. 8-21 Progress Report

John Varnell presented the following proposed functions critical to the reliable operation of the BES:

Defining Functions critical to reliable operation of the BES

The following functions must be evaluated by each Register Entity (RE) for all functions that the RE is responsible for as identified by the NERC Functional Model. The RE must identify ALL equipment required to perform the function, not just the RE owned equipment!

1. Dynamic response
2. Balancing Load and Generation
3. Controlling Frequency (real power)
4. Controlling Voltage (reactive power)
5. Managing Constraints
6. Control & Operation
7. Restoration of BES
8. Situational awareness
9. Inter-Entity coordination and communication

1. Dynamic Response

1.1. Spinning reserve (contingency reserves)

1.2. Governor response
1.3. Protection System (transmission & generation)
1.4. Special Protection System
1.5. Under frequency relay protection
1.6. Under voltage relay protection
1.7. Power System Stabilizers

2. Balancing Load and Generation

2.1. Load management
2.2. Demand Response
2.3. Load shedding
2.4. Unit commitment
2.5. Non-spinning reserve(contingency reserve)
2.6. Calculation of ACE

3. Controlling Frequency (real power)

3.1. Regulation (regulating reserves)
3.2. Generation Control (such as AGC)

4. Controlling Voltage (reactive power)

4.1. AVR (Automatic Voltage Regulation)
4.2. Capacitive and Inductive resources
4.3. SVC (Static VAR Compensators)
4.4. Synchronous Condensers

5. Managing Constraints

5.1. Interchange schedules
5.2. Generation re-dispatch and unit commit
5.3. Identify and monitor SOL's and IROL's
5.4. Identify and monitor Flowgates

6. Control & Operation

6.1. All methods of operating breakers and switches (such as SCADA)

7. Restoration of BES

7.1. Blackstart restoration including planned cranking path (nuke?)

8. Situational Awareness

8.1. Monitoring and alerting (such as EMS alarms)
8.2. Change management
8.3. Current Day & Next Day planning
8.4. Contingency Analysis
8.5. Frequency monitoring

9. Inter-Entity coordination and communication

9.1. Scheduled interchange
9.2. Facility status
9.3. Operational directives

He noted that there are no preconceived notions of regions as these don't exactly match current reliability standard requirements. The subgroup also changed some names so as not to confuse with other terms.

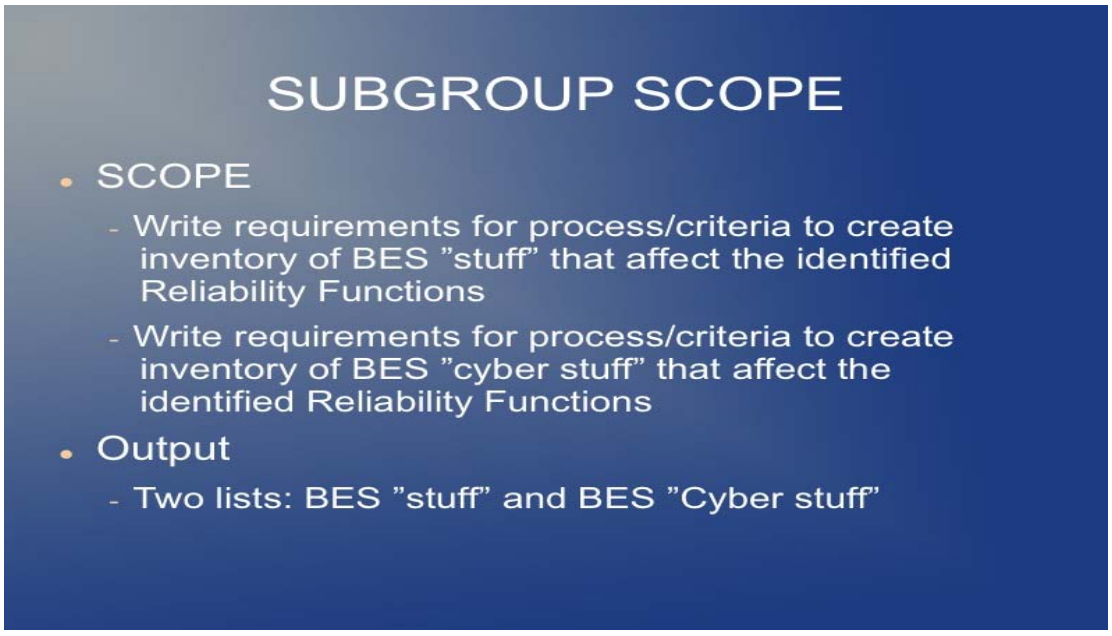
Member Comments

- It is a good idea to put numbers on everything to be able to follow this as we add detail, if necessary. Use numbers to refer to specific functions. Attachments to standards- will be consistent across all entities.
- Why the calculation of ace and not ACE and load balancing? 4. Synchronous condensers here? Yes.
- ACE is specifically laid out in the standards. It is a piece of balancing load and generation.
- Looking at functions based on impact on BES. Thought it might be clearest way to identify the functions.
- The subgroup will develop the real thing and get the requirements. These are the categories the subgroup wanted to get out to other subgroups and their leaders so they can start out their pieces with some idea of the functions.
- Jason Mason offered to run by the Assist Team- OC meeting in September pass by them. The subgroup agreed this would be helpful.

2. List of BES Subsystems/BES Cyber systems Subgroup Report

a. 8-20 Progress Report

Jay Cribbs presented an overview of the work done since the Vancouver meeting. Jackie Collett was on vacation but the group met once in the interim. He described the subgroup scope and expected output.



He noted the subgroup has identified a list of issues and questions ("in this phase the subgroup is coming up with all questions and no answers") that will guide their efforts to develop draft requirements:

- We're step 2. What is step 1's output? Meet with Reliability Functions team to see what their output consists of.
- How do we handle system that cross functional model entities or is owned/controlled by different entities? Whose list does it go on? What if different entities assess things differently?
- What is the definition of "system"? What is the proper granularity of system identification? Must provide clarity not confusion Focus on "stuff" for now then we'll determine the right terminology that considers the NERC Glossary.
- Will there be minimum criteria to be on the lists? This is not an asset management system how do we insure complete list without requiring everything?
- What is the methodology for identifying BES and cyber assets? How do we write a methodology in a requirement?
- Are assets in "connections" to be included in the lists, or do these come in later in the TOP?
- How to handle the dynamic nature of the grid?

SDT Member Comments

- The interface requirements underscore the coordination effort that is critical re output and input.
- This subgroup is the first requirement.
- What is definition of "system"? What level of granularity is needed to define /identify system. Provide clarity not confusion.
- Minimum criteria- to be on list? This isn't an asset management system. Don't want to require everything but where is the line?
- Will there be things like generation at some level or higher?
- What will be the methodology for identifying BES? How to write a methodology in a requirement will be challenging.
- Assets in connection to be included? Target of Protection team will handle.
- One of the things the functions group has discussed. Will have some problems with not having said anything about the overview of the area/region and not being the regional coordinator. This will be challenging all the way through.
- The OC/Planning Committee nominees are now organized and up to speed. They have been given them the list of contacts of the subgroup chairs. The first 3 subgroups groups will be most applicable.
- Can't meet external reviews in the FERC order.
- We hope to be looking at established or establishing thresholds for classification in order to eliminate need for external reviews. Conflicts with RCs. Wrong guesses= liability. This may no longer applicable given new approach. What they ordered was tweaking the existing standards not a rewrite.

- This doesn't mean the RCs are completely out of picture. Criteria may be based on criteria set by RCs. E.g. Contingency reserves set by RCs? That is a BA function or an RSU function? RC can provide insight and information which is different from oversight and review.
- You don't need to know what kind of control system, just know what things required to make the system work reliability.

b. 8-21 Progress Report

Jay Cribb presented the Subgroups report on day two offering the following points:

- We will not outline the process for "how" to create the lists. The white paper gives flexibility in the creation of the lists and allows entities to take a primarily cyber systems oriented view if they wish.
- Assets and systems that are below the mapping team's "Low" thresholds could be included as minimum criteria in our requirements. This should address the concern over having a "negligible" ranking without requiring us to have an explicit 'negligible' impact category.
- Are the 'R' statements at the right level? In the current CIP-002, each asset category has its own 'R' statement but we think this is unnecessary.

In terms of next steps he noted the subgroup would:

1) Convene the remainder of our team to gather input and wordsmith our requirements.
2) Obtain and incorporate the work of the Reliability Functions team into our requirements.
3) Work with the Mapping team to determine minimum requirements for our lists.

3. BES Mapping Subgroup Report, Q & A

a. 8-20 Progress Report

John Lim, the Subgroup leader noted they met twice since Vancouver on August 5 and on August 19. They have reviewed and used/borrowed concepts from three key documents: a set of critical asset guidelines; the NERC DHS proposal for tiering BES assets (3 tiers) depending on impact on reliability of BES; and a classification of events. The resulting first draft of Requirement #2 will address how responsible entities will apply set of criteria to map list from requirement to high/medium and low tiers. The Subgroup has sorted and put the requirements in 3 buckets as an initial exercise. The Subgroup is Still debating this but it appears that there is a fundamental problem with hard thresholds. E.g. 2000 mw, doesn't make sense unless you have an analysis backing that up in terms of impact on reliability. Key need is an analysis to support or not for a bright line threshold. In general, they are trying to get away from hard thresholds. Will be probably qualifying requirements based on this analysis. While there is more work to be done, it appears that High impact is the most important to be clear on, then Moderate impact. And then all else remaining may be in Low.

SDT Member Q & A/ Comments

- How were the levels arrived at? SGWG critical guidelines? Took from 3 documents.
- What is status of the NERC/DHS document process?
- Other criteria were taken from the guideline at the time it was published. Will recheck with final document submitted.
- Members comments on the work. Rod joined from the SIS with good input.
- Subgroup gather together these documents as some of ways to look at criticality. Only begun to vet. Member companies have vetted. Next steps on vetting.
- While there were initially 19 measures for assessing criticality, the subgroup hopes to condense them down to a handful.
- Vetting with SDT- seems to be a resistance to a numerical thresholds. All but 5 members expressed concerns/problems with numerical thresholds.
- 1st requirement. 2000 mw? Is there a way to determine that is universal, and standardize that so that it is not up to a company to figure out?
- Dilemma is you need clear criteria to allow entities to make the correct determination of level (e.g. high). Haven't yet got to the point of how to handle this. This is a threshold, unless you can demonstrate through engineering analysis etc. that it is not. Is it "high unless demonstrate it is not high?"
- Congress won't believe that 2000 mw is not critical. If this were the threshold it wouldn't fly.
- The issue shouldn't be is 2000 the right number , but are big generators critical? Then focus on what "big" is in different interconnections, regions. Sound engineering based on what "big" is and document it in an attachment. It will have to be persuasive. Note that it may make sense in eastern connection and irrelevant everywhere else.
- Big transmission stations- how much is lots of stuff, and what is stuff? John Lim's group will have this job.
- Sharon questioned whether thresholds good. Want to know what the impact is on the BES. Don't care for e.g. lose generation in sharing event exceeding contingency reserve level. Focus on how does it impact the BES. Not thrilled with the tiers. Need to keep in mind the on potential for cascading. There is fear about what "misuse" means. E.g. Aurora turned off a bunch of protections to use this.
- It is important we cover not just the loss of but also misuse of an asset. Operators don't have a long history this.
- How big is big is going to be different in different areas. RCs are going to be the ones understanding this. Not just for oversight but for definition before oversight. Need to discuss this sooner than later.
- To extent you can define common mode contingencies, RCs can provide that guidance.
- Any threshold is wrong. Being big is not the right question. Transmission planner for 11 years. Size of substation or generator. Has to be room evaluation and rational decision that would avoid inconsistent answers in different regions.

- Differences between different regions are presently handled by event analysis. Do other standards have differentiation among the regions?
- Keep in mind "small guys" in the low impact category. Any thing will be weighed against NIST menu of controls.
- Do we need to look at a "non applicable" or negligible category?
- All cyber assets need some level of protection. Thresholds may not be the way to go. Address the different thresholds among interconnections. Those are going to be dynamic and change on a temporal basis and thresholds will be affected by that.
- Mike Assante's- protect control systems in general, large, medium and small.
- Even a small asset with connection needs to be protected. Be careful about what we say should and should not be protected.
- Perception out there may be driving this- if you have a big piece it has to be critical or high impact. If freedom given to reach those determinations then we have the materials to address them.
- VRF team- tendency to call "high" because it is part of standard. This is similar. Don't rush to categorize as high impact as there will be implications down the line.
- Appreciate the SDT feedback- importance of being able to assess the impact to the BES as they are the driving focus of what we are trying to do. If anyone has any across the board strategies we are all ears. What is the best approach to do this? John Lim's approach was valid as a starting point. When you look at these individually they are very flawed.
- Recognize system dynamics causes daily changes. Got to remove variability aspect from any criteria we have. Shouldn't change way we view impact on BES.
- Remove arbitrary decision process that we have today, understandable, repeatable and makes sense. Get away from entity gets to make that choice.
- What ever performance criteria developed- can demonstrate compliance.
- Hard limit on generator output as a threshold related to BES reliability? Balancing generation and load when they get out of whack, they can become a real problem overtime.
- How you can address control systems of neighbors. RC can't really do this. This is a hole in our concept.
- Inadvertent interchange- can be a good thing, not necessarily a bad thing.
- BES Asset and associated cyber stuff. High, medium low. Concerned about time needed to come up with thresholds vs. set of controls applied to everything.
- Focus of NERC and FERC has been on documentation. We potentially have a system with sanctions for something that is not important to reliability.
- The schedule proposed to implement a security control may be different/ (shorter or longer) if it is a high, medium or low impact. E.g. 2 years for high, medium 5, lows 10. 10 year plan. Prioritize work. Keith Stouffer and the Controls subgroup work may help.
- Assign VSF/VSL differently to high medium low?
- References entities criteria be arbitrary? Variable maybe. Not as arbitrary as a threshold standards. N-1 methodology- look at extreme events not N-1- TPL standard

studies include more than N-1. Include contingency events in terms of terrorist actions. Concerned about global national thresholds.
- Differences in controls in the baselines. Some are same, some different. Access control suite of family. Low has 11 requirements; moderate 34 requirement/enhancements; high 39 requirements.
- Awareness and training- same across the board.

b. 8-21 Progress Report

John Lim presented the Subgroups report noting they have lively discussions in the last few days. Changed the format to a matrix for a number of assets in 3 sections: Control Centers and Back up Control Centers; Transmission; and Generation. The subgroup discussed what are control centers, discussed thresholds whether they should be yes/no or performance based. There was a general aversion to thresholds. If we have to use thresholds, provide the way for entities to say if I meet the threshold with engineering analysis. The common thread is that this will require a lot of use of engineering analysis What is it? Will be a challenge to formulate this to put in a standards requirement that is auditable. John will take last 2 days of discussion; redraft the standard requirement format previously to reflect the discussion. He noted the following issues as outstanding: coordinating with the first 2 groups: functions and BES subsystems. Have a session with PH- to ensure consistency with analysis in both groups. Call scheduled in early September- functions group invited to join.

SDT Members Q & A
- High. Medium and low for each category. Specific to another layer- table with 50 rows of h/m/l impact?
- Purpose of functions will be different. Higher level of granularity. Lower level functions useful in providing guidance to entities to identify who is doing what. Keep functions in mind when looking at criteria.
- If this will be auditable, you have a reliability function, go to table to find h/m/l and that is what you would share with the auditor.
- Single subsystem performing a high and lower function, will be placed in the higher.
- Need to be clear so there is no question as to how someone arrived at the rankings.

4. Cyber Analysis Subgroup Report, Q & A

a. 8-20 Progress Report

Phil Huff presented a report on the Subgroup's work since Vancouver. He reviewed the 3 teams the Subgroup has formed: Cyber impact categorization; target of protection team; and external cyber systems. He outlined some issues and assumptions including:

- Cyber analysis- impact assessment on the BES cyber system reliability function
- What impact do reliability functions have on the BES?

- Impact levels: perfect process with impact level the weak point in terms of verifiability.
- Impact levels for each reliability function. High impact to situational awareness, generation control.
- Most BES cyber system will likely have high impact on the function.
- Impact of information disclosure (CEII).

Phil reviewed the inputs and outputs of the Cyber System Categorization Process objectives as:

- To ensure the Responsible Entity categorizes all of its BES Cyber Systems according to the impact a violation in the Cyber System security requirements would have on the BES.
  - To correlate BES reliability functions directly to the BES Cyber System.
  - To correlate the objectives of protecting the confidentiality, integrity, and availability of the Cyber System directly to its BES impact categorization.
- The cyber impact categorization takes the high water mark of impact on each of the supported functions.
- State explicit criteria for the Cyber Impact Assessment (including the misuse of Cyber Systems) [*from the SDT Points of Consensus*].
- Include a methodology to merge the BES and Cyber Impact assessments [*from the SDT Points of Consensus*].

He noted the following issues the subgroup has identified for consideration:

- Impact levels or Cyber categorization are difficult to audit. The alternative to having generic impact descriptions would be to have specific descriptions for each reliability function.
- Assumption: Almost all BES Cyber Systems are *High* impact to the function they provide. If this is the case, then the Cyber Impact Assessment is trivial. This is equivalent to the BES Subsystem impact mapping determining the final categorization.
- In the paper, the cyber impact categorization ties to the final categorization through a matrix. The purpose of having a matrix is to provide some control in how an entity categorizes Cyber Systems. So the cyber impact categorization limits the view of impact only to the reliability functions it supports without considering the importance of those reliability functions to the BES. However, we define a BES Cyber System as one which directly supports reliability functions of the BES. One could argue that, by definition, all BES Cyber Systems have a high impact on the reliability functions they support.

- Instead of a matrix, we might consider using the BES Subsystem mapping as an upper bound which results in the following:

Asset Impact -->	High	Medium	Low
Cyber Impact:			
High	H	M	L
Medium	M	M	L
Low	L	L	L

- Cyber impact would have an upper bound of the function(s) it supports. Using this methodology, it would not be necessary to include the matrix within the Standard.

- We assume the BES Subsystem mapping will have (high/medium/low) criteria. If this is the case, then the Cyber Impact Assessment would look to the criteria for the loss of confidentiality, integrity and availability.
  - The BES Subsystem mapping provides input by mapping the worst case.
  - When assessing the impact of a Cyber System, the organization would first map all of the BES Subsystems which the Cyber System can impact.
  - The organization would look at the loss of confidentiality to a BES Subsystem, as an example. It should not have greater impact to the BES than the BES Subsystem impact mapping. However, justifying a lower impact category would be on the basis of the functional mapping criteria.
- Need to work with *Reliability Functions* team to ensure information such as CEII fits into the proposed assessment model.

He then noted the following steps:

Step 1 — BES subsystem mapping, e.g. SCADA system.
Step 2 — Assess the potential functional impact. E.g. what impact does SCADA have for every reliability function (blackstart etc.) E.g. Situational awareness.
Step 3 — Combine in categorization look up table. Have BES mapping for functions.
Step 4 — Final categorization. High water mark approach.

SDT Member Q & A

- How are you handling the aggregation issue? Mapping to BES sub systems. When multiple, taking a high water mark? Yes.

Joe Doetzl presented the subgroups ideas on Target of Protection noting the are proposing to expand the scope of what needs to be protected, e.g. collateral system. The hope is that if we are able to apply the appropriate controls, it may take care of target of protection.

Frank Kim presented on requirements for external cyber systems noting the following objective:

- Identify and manage risk associated with External Cyber Systems or Third Party Data Connections operating within the Target of Protection

He then presented the following issues for consideration:

- Most External Cyber Systems or Third Party Data Connection NERC CIP-related compliance areas are not thoroughly covered in the existing version of the Standards. Therefore; further clarification is required. In addition, industry security practices and controls such as modifying existing entity contractual agreements and processes to meet applicable NERC CIP requirements should be addressed.
- Amplifying External Third Party system, user, and agreement security considerations are further detailed in other industry security standards such as ISO 27002 and NIST 800-53 that could be leveraged for future iterations of the NERC CIP Standards that pertain to external third party system security. These are not necessarily germane to this requirement but several examples include:

    - **Security Assessment and Authorization (CA-3) Cyber System Connections**
        - Control: The Responsible Entity:
        - Authorizes connections from the Cyber System to other Cyber Systems outside of the Target of Protection through the use of Interconnection Security Agreements;
        - Documents, for each connection, the interface characteristics, security requirements, and the nature of the information communicated; and
        - Monitors the Cyber System connections on an ongoing basis verifying enforcement of security requirements.
    - **Personnel Security (PS-7) Third-Party Personnel Security**: policies and procedures for personnel position categorization, screening, transfer, penalty, and termination; also addresses third-party personnel security.
        - The Responsible Entity:
        - Establishes personnel security requirements including security roles and responsibilities for third-party providers;
        - Documents personnel security requirements; and
        - Monitors provider compliance.
    - **Supplemental Guidance:** Third-party providers include, for example, service bureaus, contractors, and other organizations providing Cyber System development, information technology services, outsourced applications, and network and security management. The Responsible Entity explicitly includes personnel security requirements in acquisition-related documents.
    - **System and Services Acquisition (SA-9) External Cyber System Services**
        - Control: The Responsible Entity:
        - Requires that providers of external Cyber System services comply with Responsible Entity Cyber System security requirements and employ

appropriate security controls in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance;
  - Defines and documents government oversight and user roles and responsibilities with regard to external Cyber Systems services; and
  - Monitors security control compliance by external service providers.
- **System and Communications Protection (SC-7): Boundary Protection**
  - Control: The Cyber System:
  - Monitors and controls communications at the external boundary of the Cyber System and at key internal boundaries within the Cyber System; and Connects to external networks or Cyber Systems only through managed interfaces consisting of boundary protection devices arranged in accordance with an organizational security architecture.

SDT Comments Q & A

- 3rd party connections not covered in the standards. Will ultimately require
- Borrowed from IS0 27 002, NIST 853.
- 2 types of external cyber systems- those under realm subject to NERC. Others not under NERC regulations but have some impact.
- Mix of 3rd parties: vendors, consultants.
- How far to go in 3rd party cyber systems? Should we go for a more narrow focus?

b. 8-21 Progress Report

Phil Huff presented the subgroup report on day 2. They are looking at functional impact. For example in terms of generation what does it mean for cyber system to impact generation at a h/m/l. What does it mean to affect situational awareness? Short of detrimental, moderate, no impact.

SDT Member Q &A

- However we make these decisions, important to capture the thought process. This is what we used to determine high, medium or low.
- Is the impact specific to the function and not the cyber?
- Aren't we looking to the reach of each cyber asset with the reach determining high/med/low
- What is the relationship of cyber asset to functions or sub-functions? The functions themselves dictate what the impact is.
- EMS e.g. impact is high water marking. If it touches 40 of 50, it is high, don't need to look at the other 39. Make sure as soon as you hit the high, you are done. This has to be clear to auditors.
- Target of Protection- security controls- not a requirement that goes in CIP 2 for this. Working hard on definitions in terms of consistency and intent in terms of BES and cyber systems you want to protect.

- On External Cyber systems, if 2 registered entities with cyber connections then some arbitration agreement should be in place to define the assurance. Assurance is provided by NERC. Don't need more.
- Issues with external cyber systems. Putting that over to security controls not in CIP 2 version 3.

5. Definition and Selection of Controls Subgroup Report, Q & A

a. 8-20 Progress Report

Keith Stouffer presented the subgroup's work since Vancouver noting that he had hoped to have a set of controls for the SDT to review but hasn't had a chance to do that yet. He hopes to start working on that soon and bring to the next session. The Subgroup needs help from the SDT on which requirements have the highest priorities that controls are needed for? The Subgroup will need guidance on which to do first and on to last. They have looked at ISA 99- 4 baselines (security assurance levels, and DHS Catalogue of Control System Security just a catalogue NIST 800-53, ISA 99

SDT Member Q & A

- Shows the connection with the ISA and NIST work as well as
- Mike Assante's Congressional testimony training and awareness, incidence response addressed at an organizational level.
- Pull out of catalogue controls and look at general requirements.
- In the Federal system can take care of some of these at organizational level
- From Policy at high org level down to specific controls, vary by installation or by system.
- SDT need to get arms around the consistent use of terminology. Lets refer to these as a "Catalogue of security controls" vs. the familiar process controls.

b. 8-21 Progress Report

Keith Stouffer presented the review of ISA 99 Work. They looked at controls in draft-voluntary standard. Some controls watered down and may not be useful. Looking at 800 53 controls as they may be more applicable to current environment. Proposing to keep same general CIP 003-009. Should 5 and 7 combined? Contained ½ or 2/3s of all requirements. Decided to propose keeping CIP 5 and make it electronic asset controls. The Subroup is fleshing out new CIP 5 to serve as a model for what the SDT will ultimately do with the rest of standards. Starting with 1 requirement from 800-53, R1 Account Management, they came up with low medium and high R1 Account management e.g.

SDT Member Comments

- a and b used in making your documents. Why struck? Seemed odd. Will sort out.
- Exclusion #2 don't agree. Default accounts need to be authorized. Aware they are there. Should remove as well. Requirement for reviewing, for approving.

- The Subroup had the same discussion among themselves.
- Changing the name of account is not changing the account. System id. Can't be changed. Name vs. the function/role.
- On the low 11 controls apply? On this one requirement of one standard. If there are no minimum then every asset is at least a low. Everything- with a chip in it. Is there no "lower than low"?
- I.e. a negligible category? Other piece trying to match requirement to the characteristics of the device and says you don't have to . Malware on an old relay.
- Already have 2 standards- as developing controls- document that says this is why we are not applying this.
- Minimum- utilizing exclusions to manage the "negligible"? 800-53 more extensive, and more guidance. Will be developing a guidance to go along with standard.
- Look at version 1 experience, following 2nd draft, had to take out word "exclusion"
- We should talk in version 3- 200-300 controls? Think about some formal presentation different variations. Formulate a way for dealing with exceptions. Consider controls
- R 1.5.3 remove access to the role, therefore can't perform in the role. Timeline needed here. Cover the entire populations of individual transferred. When someone leaves, remove access and then grant access again.
- Would you consider applying different levels- for high it will be removed. For a low we may not need to do.
- 1 hour termination- how audited?
- Implement system- termination person- within 24 hours. Need to provide documentation. Multi-million access control by profiles. Lots of resources to do this.
- Deletion of temporary-R1.2 f. striken.
- 1.5 sections - 10k switzer relays. 24 hours to change passwords- no inheritance of higher level controls.
- Have to look at environment has to be recognized in drafting controls and requirements.
- Current sub standards don't address this. Users that have access but are not authorized, e.g. system administrators. Need to clearly address.
- Timeline on transferred users etc. can't tell entity that in 1 week to something. "Removing unneeded access" simplifies.
- Technical merits- discussion is good.
- Concerned about this requirement- looks different from everything we've done as part of a standard.
- Get format in front of dt, ga, Maureen, compliance, legal.
- As soon we figure out what it will look like. How will it work? Can it be an acceptable NERC reliability standard.
- Had discussion. Will do what they want and then hear from NERC on whether or not it is possible. Get it down for one requirement. See if it is acceptable.
- NERC no longer putting Rs on sub requirements.
- Applicability and exclusions?

- Need to get Maureen in with this team ASAP.
- If applicability was at beginning- that would flow better than at end.
- Embed applicability in requirement language. Figure out how to draft the structure of the requirements.
- If requirement has sub requirement. Roll up requirements. E.g. the Entity shall do the following
- Some requirements have more than 1 within the requirement itself.
- If roll up function why does it have a VRFs? Have to have a VSL with the main requirements.
- We need to get a hold of filing- and look at Version 2. Such as—bullets. Kept sub requirement.
- Information "Filing" attach to the minutes. Jason will send.
- Need to encourage Maureen to produce a style guide. Scott will follow up.
- This requirement, consolidates all or parts several of CIP 4 R4, CIP 5 2.4.1 2.1.3,
- Is this drafting team going to develop VSLs for version 3? Yes.
- Encouraged by approach- getting all related to a functional area in one place vs. the spaghetti approach.
- Shouldn't have to do all standards at one time.
- Any areas identified where need communication coordination?
- 1 area- make sure opportunity for someone analyzing a function needs to i.d. all hardware used to perform that function whether they own it or not. Assets that do not belong to them.
- John Lim talked about that in criteria. E.g. generation and transmission owner context. Requirement for generator to notify your transmission owner and operators of impact level of facility.

VI. NEXT STEPS AND CLOSING

The Chair reviewed with the SDT the schedule for the next couple of meetings reminding members that at the conclusion of the October meeting in Kansas City we hope to have a single text of CIP 002 which we can refine in November and December. She thanked the members for their hard work together and in the Subroups and encouraged them to continue working to make headway on each of their charges.

She noted that she would draft up the letter to the Standards Committee Chair based on the SDT's discussion of the TFE and Urgent Action approach.

Members completed an onsite meeting evaluation form *(See, Appendix #3).*

The SDT adjourned at 2:45 p.m. on August 21.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

APPENDICES TABLE OF CONTENTS

Appendix # 1— Meeting Agenda

Proposed Meeting Objectives and Outcomes

- Review the work plan going forward;
- Receive update on the MRC presentation and Leaders Coordination call;
- Receive updates on TFE, VSL/VRF and related cyber security efforts;
- Receive and discuss reports from CIP 002 Subgroups;
- Convene CIP 002 Subgroup meetings;
- Subgroup reports back to SDT; and
- Agree on work plan, next steps and assignments.

Thursday August 20, 2009
8:00 a.m. – 12:45 p.m.

1. **Review of CIP 002 Work plan and Subgroup Process including pros – cons of a possible TFE Exception "Version 2.5" — Kevin Perry and Jerry Freese' Version 2.5 Proposal**

2. **Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure and VSLs – VRFs**

3. **Subgroup Reports to the SDT**
   - Reliability Functions Subgroup Report
   - List of BES Subsystems/BES Cyber systems Subgroup Report
   - BES Mapping Subgroup Report
   - Cyber Analysis Subgroup Report
   - Definition and Selection of Controls Subgroup Report

4. **Subgroup Meetings (at various locations)**

5. **Adjourn**

Friday August 21, 2009

1. **Subgroup Meetings**

2. **Subgroup Reports — Plenary Session**
   - Reliability Functions Subgroup Report, Q & A
   - List of BES Subsystems/BES Cyber systems Subgroup Report, Q & A
   - BES Mapping Subgroup Report, Q & A
   - Cyber Analysis Subgroup Report, Q & A

- Definition and Selection of Controls Subgroup Report, Q & A

3. Review and Decide on Work Plan – Review Proposed 2010 Meeting Schedule

4. Adjourn

Appendix # 2
Attendees List
August 20–21, 2009 Charlotte NC

Attending in Person — SDT Members

1. Jeri Domingo-Brewer, Chr.	U.S. Bureau of Reclamation
2. Jim Breton	ERCOT
3. Jay S. Cribb	Information Security Analyst, Southern Company Services
4. Joe Doetzl	Manager, Information Security, Kansas City Pwr. & Light Co.
5. Sharon Edwards	Duke Energy
6. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
7. Phillip Huff	Arkansas Electric Coop Corporation
8. John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
9. Frank Kim	Ontario Hydro
10. Rich Kinas	Orlando Utilities Commission
11. Sharon Edwards	Duke Energy
12. Kevin B. Perry, Vice Ch.	Director Critical Infrastructure Protection, Southwest Power Pool
12. David S. Revill	Georgia Transmission Corporation
13. Kevin Sherlin	Sacramento Municipal Utility District
14.Keith Stouffer	National Institute of Standards & Technology
15. John D. Varnell	Technology Director, Tenaska Power Services Co.
16.William Winters	Arizona Public Service, Inc.
1. Roger Lampilla	NERC
3. Joe Bucciero	NERC/Bucciero Assoc.
6. Robert Jones	FSU/FCRC Consensus Center (Wed. & Thursday)
7. Stuart Langton	FSU/FCRC Consensus Center

SDT Members Attending via WebEx and Phone

1. Rob Antonishen	Ontario Power Generation (Friday)
2. Jonathan Stanford	Bonneville Power Administration

SDT Members Unable to Attend

1. Jackie Collett	Manitoba Hydro
2. David Norton	Entergy
3. Christopher A. Peters	ICF International
4. Scott Rosenberger	Luminant Energy

Others Attending in Person

Sam Merrill	CERT/SEI
Michael Toecker	BMcD
Peter Schneider	Subnet Solutions

Others Attending via WebEx and Phone

James Bassett	Lafayette
Mike Fischette	Lancing BWI

Matt Greek	
Rob Hardiman	
Doug Johnson	ConEd
Kim Long	Duke
Mike Mertz	SCE
Hoang Ngo	RI Eng
Nitin Patel	
Brian Smith	EnerNex
Robin Siewart	EON
Peter Schneider	

Appendix # 3 — Meeting Evaluation Feedback Summary
August 20–21, 2009, Charlotte, NC
Meeting Evaluation Feedback for Inclusion in Facilitator's Report

Members used the following 0 to 10 scale in evaluating the meeting: 0 means totally disagree and 10 means totally agree.

1. Please assess the overall meeting.

7.78 The agenda packet was very useful.
6.83 The WebEx document display and the audio were effective
8.50 The quality of the meeting facility was good.
7.40 The objectives for the meeting were stated at the outset.
8.30 Overall, the objectives of the meeting were fully achieved.

Was each of the following meeting objectives fully achieved:
7.90 Review the work plan going forward and assess "Version 2.5" possibilities.
8.10 Receive MRC presentation and Leadership Coordination Meeting summary.
7.13 Receive updates on TFE, VSL/VRF and related cyber security efforts;
8.50 Receive and discuss reports from CIP 002 Subroups identifying key issues and coordination points;
9.00 Convene CIP 002 Subroup meetings;
9.20 Receive and discuss Subroup reports on progress made; and
8.80 Agree on Work plan, next steps and assignments

2. Please tell us how well you believe the Team engaged in the meeting.
8.70 The Chair and Vice Chair provided leadership and direction to Team and Facilitators
9.20 The Facilitators made sure the concerns of all members were heard.
8.30 The Facilitators helped clarify and summarize issues.
7.63 The Facilitators helped members build consensus.
9.10 The Facilitators made sure the concerns of all participants were heard.
8.10 The Facilitators helped us arrange our time well.

3. What is your level of satisfaction with what was achieved at the meeting?

8.11 Overall, I am very satisfied with the results of the meeting.
8.13 Overall, the design of the meeting agenda was effective.
8.22 I was very satisfied with the services provided by the Facilitators.
7.89 I am satisfied with the outcome of the meeting.
7.25 I am satisfied with the progress we are making as a Team.
8.75 I know what the next steps following this meeting will be.
8.75 I know who is responsible for the next steps.

See other side

4. Other comments (use other side)

- Small groups good!
- I'd like the sub-teams to do most work offline rather than taking most of our time in sub-team meetings. We need more time together as a group reviewing each other's work and integrating it.
- The inclusion of additional personnel with operating experience was helpful.
- No space on the other side! Until everyone sees responses from the paper we are doing make-work. I believe our over all direction will change when we see the replays. I am a lemming running over the cliff because the facilitators don't know the subject and history. Jerry, Kevin, Jon D, Philip only know normal IT processes.

What did we achieve?

- Make work
- Concrete work on CIP 002

What are our biggest challenges going forward?

- Finishing the amount of work within time parameters.
- Teaching history.
- A coherent/consistent and clear CIP 002.

What suggestions do you have for making our group more productive?

- Sub-team meetings are difficult without projectors.
- Much work is being done in sub-team Silos. This approach created some of the issues with CIP v1. More coordination is required among the various teams to ensure all issues are addressed but NOT addressed by multiple teams.

Appendix # 4 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost
- information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Subroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and Subroups)

should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on
- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

APPENDIX # 5
Meeting Schedule
October 2008–December 2010

Development of CIP Version 2 and Version 3 Framework
October 2008–July 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.
2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development
3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 Version 3 process reviewed.
4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white papers assigned.
5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed Version 3 white papers.
January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.
7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.
8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals
March 2–April 1, 2009 — 30-day Pre Ballot
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment
March 30, 2009 — WebEx meeting(s) White Paper Drafting Team
April 1–10 — NERC Balloting on Version 2 Products
April 6, 2009 — WebEx meeting — White Paper Drafting Team
April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call
April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments-
9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.
April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx
April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%
May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.
10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.
June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx
11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.
June — WebEx meeting(s)

- Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria

CIP-002 Development of Requirements, Measures, Etc. July-December 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada

- SDT plenary session to review, refine, and adopt SDT Working Paper
- Adopt SDT response to NERC for Interpretation of CIP-006-1
- Review and adopt proposal for CIP-002 Subroups and Deliverables
- Convene Subroup organizational meetings to develop work plans
- Adopt 2010 Meeting Schedule

July–August Interim WebEx meeting(s)

- CIP-002 Subroup meetings (as needed)
- CIP-002 Coordination Team meeting (as needed)

August 3–5, 2009 in Winnipeg, Manitoba **NERC Member Representative Committee**
Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.

13. August 20–21, 2009 in Charlotte, NC

- SDT Plenary session to review and respond to MRC input on Working Paper/CIP-002 Concepts
- SDT Subroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper
NERC Webinar
August–September Interim WebEx meeting(s)

- CIP-002 Subroup meetings (as needed)
- CIP-002 Coordination Team meeting

14. September 9–10, 2009 in Folsom, CA

- SDT plenary session to review and respond to any additional industry comments on Working Paper and CIP-002 Concepts
- SDT Subroup drafting meetings- consider industry comments, draft requirements and "proof of concept" control (s).
- SDT plenary session(s) Subroup reports on requirements
- Review of CIP-002 Standards, Requirements, Measures, and Outline
- Address coordinating issues.
- Establish SDT meeting dates and proposed locations for January–December 2010

September–October Interim WebEx meeting(s)

- CIP-002 Subroup meetings (as needed)
- CIP-002 Coordination Team meeting

15. October 20–22, 2009 in Kansas City, MI

- SDT Subroup drafting meetings — day one
- SDT Plenary Session(s) — day two Subroup reports on CIP-002 requirements
- Review and refine initial draft of CIP-002 single text

October–November Interim WebEx meeting(s)

- CIP-002 Coordination Team meeting

16. November 17–19, 2009 in Orlando, FL

- SDT plenary session(s) — to review and refine CIP-002 standard, requirements, measures and controls.

November–December Interim WebEx meeting(s)
- Drafting teams as needed to finalize drafts
- CIP-002 Coordination Team meeting

17. December 15–16, 2009 in Little Rock AK
- SDT plenary session(s) to review, refine, and agree on and adopt CIP-002 standard, requirements, measures and controls.
- Agree on initial posting of draft CIP-002 for industry review and comment.

Refinement of CIP-002 and Development of Other CIP Standards
January–December 2010
(12 SDT monthly meetings and Subroup WebEx meetings as needed)

- SDT responds to industry comments on initial and subsequent postings of CIP-002, Version 3 (may be multiple comment periods, as required)
- Refine the CIP-002 through the comment period and submit new CIP-002 Version 3 Standard for Balloting along with the catalogue of controls (i.e. CIP-003-CIP-009 or its successor) OR
- Ballot CIP-002 while permitting industry to rely on CIP 003-CIP-009 until the full suite of controls (i.e. CIP-003-CIP-009 or its successor) is reviewed and presented for balloting.
- Submit the full suite of CIP Reliability Standards on Cyber Security for Industry Comment
- Refine and Submit the full suite of CIP standards for industry ballot
- NERC Board of Trustees adoption of the full suite of standards
- FERC approves and NERC Implements the full suite of CIP standards

Proposed 2010 Meeting Schedule

18. January 20–21 — Wednesday–Thursday, Atlanta GA	24. July 14–15, Wednesday–Thursday
19. February 18–19 —Thursday –Friday, Austin TX	25. August 11–12, Wednesday–Thursday
20. March 9–11 — Tuesday–Thursday, Phoenix, AZ	26. September 8–9, Wednesday–Thursday
21. April 14–15 — Wednesday–Thursday, Atlanta GA	27. Oct. 13–14, Wednesday–Thursday or Oct.12–14
22. May 12–13 — Wednesday–Thursday, Dallas TX	28. November 17–18, Wednesday–Thursday
23. June 9–10 — Wednesday–Thursday, Sacramento CA	29. December 15–16, Wednesday–Thursday

Appendix # 6

Technical Feasibility Exceptions
Matrix of Applicable Requirements

CIP-002-1/R1	Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.	No exceptions
CIP-002-1/R1.1	The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.	No exceptions
CIP-002-1/R1.2	The risk-based assessment shall consider the following assets: • Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard. • Transmission substations that support the reliable operation of the Bulk Electric System. • Generation resources that support the reliable operation of the Bulk Electric System. • Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration. • Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more. • Special Protection Systems that support the reliable operation of the Bulk Electric System. • Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.	No exceptions
CIP-002-1/R2	Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology required in R1. The Responsible Entity shall review this list at least annually, and update it as necessary.	No exceptions
CIP-002-1/R3	Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R2, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics: • The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, • The Cyber Asset uses a routable protocol within a control center; or, • The Cyber Asset is dial-up accessible.	No exceptions

CIP-002-1/R4	Annual Approval — A senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)	No exceptions
CIP-003-1/R1	Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:	No exceptions
CIP-003-1/R1.1	The cyber security policy addresses the requirements in Standards CIP-002 through CIP-009, including provision for emergency situations.	No exceptions
CIP-003-1/R1.2	The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.	No exceptions
CIP-003-1/R1.3	Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.	No exceptions
CIP-003-1/R2	Leadership — The Responsible Entity shall assign a senior manager with overall responsibility for leading and managing the entity's implementation of, and adherence to, Standards CIP-002 through CIP-009.	No exceptions
CIP-003-1/R2.1	The senior manager shall be identified by name, title, business phone, business address, and date of designation.	No exceptions
CIP-003-1/R2.2	Changes to the senior manager must be documented within thirty calendar days of the effective date.	No exceptions
CIP-003-1/R2.3	The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.	No exceptions
CIP-003-1/R3	Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).	No exceptions
CIP-003-1/R3.1	Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).	No exceptions
CIP-003-1/R3.2	Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures, or a statement accepting risk.	No exceptions
CIP-003-1/R3.3	Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.	No exceptions
CIP-003-1/R4	Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.	No exceptions
CIP-003-1/R4.1	The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and	No exceptions

	security configuration information.	
CIP-003-1/R4.2	The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.	No exceptions
CIP-003-1/R4.3	The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.	No exceptions
CIP-003-1/R5	Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.	No exceptions
CIP-003-1/R5.1	Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.	No exceptions
CIP-003-1/R5.1.1	Personnel shall be identified by name, title, business phone and the information for which they are responsible for authorizing access.	No exceptions
CIP-003-1/R5.1.2	The list of personnel responsible for authorizing access to protected information shall be verified at least annually.	No exceptions
CIP-003-1/R5.2	The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.	No exceptions
CIP-003-1/R5.3	The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.	No exceptions
CIP-003-1/R6	Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.	No exceptions
CIP-004-1/R1	Awareness — The Responsible Entity shall establish, maintain, and document a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as: • Direct communications (e.g., emails, memos, computer based training, etc.); • Indirect communications (e.g., posters, intranet, brochures, etc.); • Management support and reinforcement (e.g., presentations, meetings, etc.).	No exceptions
CIP-004-1/R2	Training — The Responsible Entity shall establish, maintain, and document an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and review the program annually and update as necessary.	No exceptions
CIP-004-1/R2.1	This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained within ninety calendar days of such authorization.	No exceptions

CIP-004-1/R2.2	Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities: • The proper use of Critical Cyber Assets; • Physical and electronic access controls to Critical Cyber Assets; • The proper handling of Critical Cyber Asset information; and, • Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.	No exceptions
CIP-004-1/R2.3	Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.	No exceptions
CIP-004-1/R3	Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access. A personnel risk assessment shall be conducted pursuant to that program within thirty days of such personnel being granted such access. Such program shall at a minimum include:	Exception permitted for statutory restrictions. Exception permitted for collective bargaining agreement if entity can demonstrate good faith effort to negotiate this requirement into the contract.
CIP-004-1/R3.1	The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.	Exception inherited from CIP-004-1/R3 criteria. No exception required for more detailed background check – optional component of the requirement.
CIP-004-1/R3.2	The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.	Exception inherited from CIP-004-1/R3 criteria.
CIP-004-1/R3.3	Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004.	Exception inherited from CIP-004-1/R3 criteria.
CIP-004-1/R4	Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.	No exceptions
CIP-004-1/R4.1	The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber	No exceptions.

	Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.	
CIP-004-1/R4.2	The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.	No exceptions.
CIP-005-1/R1	Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).	Exceptions inherited from CIP-005-1/R1.5 criteria. Note exemption (see CIP-005-1/R1.2 and explanatory information in the FAQ) for a Critical Cyber Asset that does not use a routable protocol and is only dial-up accessible.
CIP-005-1/R1.1	Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).	No exceptions.
CIP-005-1/R1.2	For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.	No exceptions.
CIP-005-1/R1.3	Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).	No exceptions.
CIP-005-1/R1.4	Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005.	No exceptions.
CIP-005-1/R1.5	Cyber Assets used in the access control and monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003, Standard CIP-004 Requirement R3, Standard CIP-005 Requirements R2 and R3, Standard CIP-006 Requirements R2 and R3, Standard CIP-007, Requirements R1 and R3 through R9, Standard CIP-008, and Standard CIP-009.	Exception criteria inherited from the referenced requirements that the applicable Cyber Assets are subject to.
CIP-005-1/R1.6	The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.	No exceptions.
CIP-005-1/R2	Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).	No exceptions.
CIP-005-1/R2.1	These processes and mechanisms shall use an access control model that denies	Exception permitted where access control

	access by default, such that explicit access permissions must be specified.	rule set does not provide for "deny by default."
CIP-005-1/R2.2	At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.	Exception permitted where ports and services cannot be configured.
CIP-005-1/R2.3	The Responsible Entity shall maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).	No exceptions.
CIP-005-1/R2.4	Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.	Exception permitted for technical infeasibility.
CIP-005-1/R2.5	The required documentation shall, at least, identify and describe: • The processes for access request and authorization. • The authentication methods. • The review process for authorization rights, in accordance with Standard CIP-004 Requirement R4. • The controls used to secure dial-up accessible connections.	No exceptions.
CIP-005-1/R2.6	Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.	Exception permitted for technical infeasibility.
CIP-005-1/R3	Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.	Exceptions permitted for technical infeasibility of sub requirements R3.1 and/or R3.2 only.
CIP-005-1/R3.1	For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.	Exception permitted for technical infeasibility.
CIP-005-1/R3.2	Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.	Exception permitted for technical infeasibility.
CIP-005-1/R4	Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:	Exceptions inherited from CIP-005-1/R4.2 and R4.3 criteria.
CIP-005-1/R4.1	A document identifying the vulnerability assessment process;	No exceptions.
CIP-005-1/R4.2	A review to verify that only ports and services required for operations at these access points are enabled;	Exception inherited from CIP-005-1/R2.2.

CIP-005-1/R4.3	The discovery of all access points to the Electronic Security Perimeter;	Exception permitted if the only means to discover all ESP access points is an active scan of the network segment and such a scan would put the Critical Cyber Assets at risk.
CIP-005-1/R4.4	A review of controls for default accounts, passwords, and network management community strings; and,	No exceptions.
CIP-005-1/R4.5	Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.	No exceptions.
CIP-005-1/R5	Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005.	No exceptions.
CIP-005-1/R5.1	The Responsible Entity shall ensure that all documentation required by Standard CIP-005 reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005 at least annually.	No exceptions.
CIP-005-1/R5.2	The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.	No exceptions.
CIP-005-1/R5.3	The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008.	Exception permitted if logs cannot be offloaded from the logging device, there is no alternative to the logging device, and the device cannot retain logs for the prescribed period of time.
CIP-006-1/R1	Physical Security Plan — The Responsible Entity shall create and maintain a physical security plan, approved by a senior manager or delegate(s) that shall address, at a minimum, the following:	Exceptions inherited from CIP-006-1/R1.1 and R1.8 criteria.
CIP-006-1/R1.1	Processes to ensure and document that all Cyber Assets within an Electronic Security Perimeter also reside within an identified Physical Security Perimeter. Where a completely enclosed (“six-wall”) border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to the Critical Cyber Assets.	Exception permitted when completely enclosed (“six wall”) border cannot be established and alternative protective measures are implemented. Complete exception from the requirement is not permitted.
CIP-006-1/R1.2	Processes to identify all access points through each Physical Security Perimeter	No exceptions.

	and measures to control entry at those access points.	
CIP-006-1/R1.3	Processes, tools, and procedures to monitor physical access to the perimeter(s).	No exceptions.
CIP-006-1/R1.4	Procedures for the appropriate use of physical access controls as described in Requirement R3 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.	No exceptions.
CIP-006-1/R1.5	Procedures for reviewing access authorization requests and revocation of access authorization, in accordance with CIP-004 Requirement R4.	No exceptions.
CIP-006-1/R1.6	Procedures for escorted access within the physical security perimeter of personnel not authorized for unescorted access.	No exceptions.
CIP-006-1/R1.7	Process for updating the physical security plan within ninety calendar days of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the physical security perimeter, physical access controls, monitoring controls, or logging controls.	No exceptions.
CIP-006-1/R1.8	Cyber Assets used in the access control and monitoring of the Physical Security Perimeter(s) shall be afforded the protective measures specified in Standard CIP-003, Standard CIP-004 Requirement R3, Standard CIP-005 Requirements R2 and R3, Standard CIP-006 Requirement R2 and R3, Standard CIP-007, Standard CIP-008 and Standard CIP-009.	Exception criteria inherited from the referenced requirements that the applicable Cyber Assets are subject to.
CIP-006-1/R1.9	Process for ensuring that the physical security plan is reviewed at least annually.	No exceptions.
CIP-006-1/R2	Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods: • Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another. • Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems. • Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station. • Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets.	No exceptions.
CIP-006-1/R3	Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008. One or more of the following monitoring methods shall be used: • Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response. • Human Observation of Access Points: Monitoring of physical access	No exceptions.

	points by authorized personnel as specified in Requirement R2.3.	
CIP-006-1/R4	Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent: • Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method. • Video Recording: Electronic capture of video images of sufficient quality to determine identity. • Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R2.3.	No exceptions.
CIP-006-1/R5	Access Log Retention — The responsible entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008.	No exceptions.
CIP-006-1/R6	Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R2, R3, and R4 function properly. The program must include, at a minimum, the following:	No exceptions.
CIP-006-1/R6.1	Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.	No exceptions.
CIP-006-1/R6.2	Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement R6.1.	No exceptions.
CIP-006-1/R6.3	Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.	No exceptions.
CIP-007-1/R1	Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.	Exception permitted for technical infeasibility if no offline testing environment can be established. Offline test environments can include stand-by production and DR systems as well as more traditional test environments. Typically, the permitted exception will be limited to plant and possibly substation control systems. Network management environments (switches, firewalls, domain controllers)

		might also qualify for an exception.
CIP-007-1/R1.1	The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.	No exceptions.
CIP-007-1/R1.2	The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.	Exception permitted to the extent the production environment cannot be replicated. See CIP-007-1/R1 exception comments.
CIP-007-1/R1.3	The Responsible Entity shall document test results.	No exceptions.
CIP-007-1/R2	Ports and Services — The Responsible Entity shall establish and document a process to ensure that only those ports and services required for normal and emergency operations are enabled.	Exception permitted where ports and services cannot be configured.
CIP-007-1/R2.1	The Responsible Entity shall enable only those ports and services required for normal and emergency operations.	Exception permitted where ports and services cannot be configured.
CIP-007-1/R2.2	The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).	Exception permitted where ports and services cannot be configured.
CIP-007-1/R2.3	In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure or an acceptance of risk.	No exceptions.
CIP-007-1/R3	Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003 Requirement R6, shall establish and document a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).	No exception
CIP-007-1/R3.1	The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.	No exceptions.
CIP-007-1/R3.2	The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure or an acceptance of risk.	Exception permitted when security patch cannot be implemented for technical reasons. Compensating measures MUST be applied per the requirement. The exception only applies to the inability to apply

		the security patch itself. Note, need to consider the case where the system vendor declines to support the system if unapproved patches are installed. Is this a valid reason for a TFE?
CIP-007-1/R4	Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).	Exception permitted for technical infeasibility.
CIP-007-1/R4.1	The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure or an acceptance of risk.	Exception permitted for technical infeasibility.
CIP-007-1/R4.2	The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.	Exceptions inherited from CIP-007-1/R4.1 criteria.
CIP-007-1/R5	Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.	No exception.
CIP-007-1/R5.1	The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.	No exception.
CIP-007-1/R5.1.1	The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003 Requirement R5.	No exception.
CIP-007-1/R5.1.2	The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.	No exceptions.
CIP-007-1/R5.1.3	The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003 Requirement R5 and Standard CIP-004 Requirement R4.	No exceptions.
CIP-007-1/R5.2	The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.	No exceptions.
CIP-007-1/R5.2.1	The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.	No exceptions.
CIP-007-1/R5.2.2	The Responsible Entity shall identify those individuals with access to shared accounts.	No exceptions.
CIP-007-1/R5.2.3	Where such accounts must be shared, the Responsible Entity shall have a policy	No exceptions.

	for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).	
CIP-007-1/R5.3	At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:	Exceptions inherited from CIP-007-1/R5.3.1 and R5.3.2 criteria.
CIP-007-1/R5.3.1	Each password shall be a minimum of six characters.	Exception permitted for technical infeasibility.
CIP-007-1/R5.3.2	Each password shall consist of a combination of alpha, numeric, and "special" characters.	Exception permitted for technical infeasibility.
CIP-007-1/R5.3.3	Each password shall be changed at least annually, or more frequently based on risk.	No exception.
CIP-007-1/R6	Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.	Exceptions inherited from CIP-007-1/R6.3 and R6.4 criteria.
CIP-007-1/R6.1	The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	No exceptions.
CIP-007-1/R6.2	The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.	No exception.
CIP-007-1/R6.3	The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008.	Exception permitted for technical infeasibility.
CIP-007-1/R6.4	The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.	Exception inherited from CIP-007-1/R6.3 criteria.
CIP-007-1/R6.5	The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.	No exceptions.
CIP-007-1/R7	Disposal or Redeployment — The Responsible Entity shall establish formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005.	No exceptions.
CIP-007-1/R7.1	Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.	No exceptions.
CIP-007-1/R7.2	Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.	No exceptions.
CIP-007-1/R7.3	The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.	No exceptions.

CIP-007-1/R8	Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:	Exception inherited from CIP-007-1/R8.2 criteria.
CIP-007-1/R8.1	A document identifying the vulnerability assessment process;	No exceptions.
CIP-007-1/R8.2	A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;	Exception inherited from CIP-005-1/R2.2 and CIP-007-1/R2, R2.1, and R2.2.
CIP-007-1/R8.3	A review of controls for default accounts; and,	No exceptions.
CIP-007-1/R8.4	Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.	No exceptions.
CIP-007-1/R9	Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007 at least annually. Changes resulting from modifications to the systems or controls shall be documented within ninety calendar days of the change.	No exceptions.
CIP-008-1/R1	Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan. The Cyber Security Incident Response plan shall address, at a minimum, the following:	No exceptions.
CIP-008-1/R1.1	Procedures to characterize and classify events as reportable Cyber Security Incidents.	No exceptions.
CIP-008-1/R1.2	Response actions, including roles and responsibilities of incident response teams, incident handling procedures, and communication plans.	No exceptions.
CIP-008-1/R1.3	Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES ISAC either directly or through an intermediary.	No exceptions.
CIP-008-1/R1.4	Process for updating the Cyber Security Incident response plan within ninety calendar days of any changes.	No exceptions.
CIP-008-1/R1.5	Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.	No exceptions.
CIP-008-1/R1.6	Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident.	No exceptions.
CIP-008-1/R2	Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.	No exceptions.
CIP-009-1/R1	Recovery Plans — The Responsible Entity shall create and annually review recovery plan(s) for Critical Cyber Assets. The recovery plan(s) shall address at a minimum the following:	No exceptions.
CIP-009-1/R1.1	Specify the required actions in response to events or conditions of varying duration and severity that would activate the recovery plan(s).	No exceptions.

CIP-009-1/R1.2	Define the roles and responsibilities of responders.	No exceptions.
CIP-009-1/R2	Exercises — The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident.	No exceptions.
CIP-009-1/R3	Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within ninety calendar days of the change.	No exceptions.
CIP-009-1/R4	Backup and Restore — The recovery plan(s) shall include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.	No exceptions.
CIP-009-1/R5	Testing Backup Media — Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.	Exception permitted for technical infeasibility when there is no ability to create a suitable test environment to restore the backup information to.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

Thursday, August 20, 2009 | 8:00 a.m. – 5:00 p.m. EDT
Friday, August 21, 2009 | 8:00 a.m. – 3:30 p.m. EDT
Charlotte, North Carolina

Proposed Meeting Objectives and Outcomes

- Review the work plan going forward;
- Receive update on the MRC presentation and Leaders Coordination call;
- Receive updates on TFE, VSL/VRF and related cyber security efforts;
- Receive and discuss reports from CIP 002 Subgroups;
- Convene CIP 002 Subgroup meetings;
- Subgroup reports back to SDT; and
- Agree on work plan, next steps and assignments.

Thursday August 20, 2009
8:00 a.m. – 12:45 p.m.

1. **Review of CIP 002 Workplan and Subgroup Process including pros – cons of a possible TFE Exception "Version 2.5" — Kevin Perry and Jerry Freese' Version 2.5 Proposal**

2. **Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure and VSLs – VRFs**

3. **Subgroup Reports to the SDT**
   - Reliability Functions Subgroup Report
   - List of BES Subsystems/BES Cyber systems Subgroup Report
   - BES Mapping Subgroup Report
   - Cyber Analysis Subgroup Report
   - Definition and Selection of Controls Subgroup Report

1:15 p.m. – 5:00 p.m.

1. **Subgroup Meetings *(at various locations)***
2. **Adjourn**

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

Friday August 21, 2009
8:00 a.m. – 12:30 p.m.

1. **Subgroup Meetings**

12:30 p.m. – 3:00 p.m.

1. **Subgroup Reports – Plenary Session**
    - Reliability Functions Subgroup Report, Q & A
    - List of BES Subsystems/BES Cyber systems Subgroup Report, Q & A
    - BES Mapping Subgroup Report, Q & A
    - Cyber Analysis Subgroup Report, Q & A
    - Definition and Selection of Controls Subgroup Report, Q & A

3:00 p.m. – 3:30 pm

1. **Review and Decide on Work Plan – Review Proposed 2010 Meeting Schedule**

3:30 p.m.

1. **Adjourn**

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Notes
CS706SDT Leadership Team

September 1, 2009

Coordination with Subgroup Leaders

Comments on the Concept paper are due by September 4, 2009. Scott Mix will attempt to put the comments together quickly in ways that each of the subgroups can use.

The proposed meeting agenda for next week includes a brief overview of the industry comments up front, and if the subgroups have had a chance to review the comments in advance, they can offer any initial reflections as part of their initial progress report. The agenda includes 45 minutes for each subgroup report on day one. The subgroups will review these inputs when they break out in the afternoon of day one and the morning of day 2.

Subgroup Leaders Roll Call:

- Scott Mix
- Kevin Perry
- Joe Bucciero
- Hal Beardal
- Phil Huff
- John Lim
- Joe Doetzl
- Jay Cribb
- Jim Breton

1. Reliability Functions Subgroup Update and Coordination Issues — Jim Breton (for John Varnell)

The Subgroup is meeting Thursday morning and trying to set up a meeting with Jackie Collett's BES Subsystems and BES Cyber systems subgroup on Thursday at 11:00 a.m. CST to talk about transition. How to turn our work over to that group is the key. What would this look like in terms of applicability and how to evaluate which functions do you perform?

Participant Comments

- This gets more complex as we move forward. One server can be on four components with different high or low values.

- Everything will have security on it. It will be a huge job to evaluate everything.

2. List of BES Subsystems and BES Cyber systems Subgroup Update and Coordination Issues — Jay Cribb (for Jackie Collett)

The team was unaware of the Functions subgroup trying to set up a joint meeting. They have base requirements but need reliability functions to complete their task. The concept paper is very loose regarding lists. There is a remaining concern about possibly requiring compliance on every nut and bolt on the system.

Participant Comments

- Documentation for compliance taking time away from and attention to security? Focus on high and medium for audits and not audit low unless there is an event that must be documented.
- Acknowledge that that is the NIST model and the Rockefeller/Snowe Bill.
- Lot of work but industry will probably vote it down
- The current politics, waiting for a negative vote. What is the alternative?
- Cannot demonstrate everything on every system. I would love for the SDT to step through the process on each system from start to finish. No one has gone through to make sure it will work.
- Other participants thought this was a good idea
- Internally within the SDT? Yes
- Get requirements first then walk through demonstration.
- Need to make the whole process as simple as possible and limit discretionary decision making. What do I need to do to be in compliance?
- Looking at systems impacting reliability
- What are we auditing against?
- Review with Jeri, Keith and others in terms of how NIST works now
- Should be looking at compliance not management
- Take a look at risk based methodology now

3. BES Mapping Subgroup Update and Coordination Issues — John Lim

The team is scheduled to meet this Wednesday to clean up the document. If we have performance based criteria will not applicable to all cases. What if thresholds don't work?

For generation, transmission, etc. looking to group in related systems. They will need a full list of functions

4. Cyber Analysis Subgroup Update and Coordination Issues — Phil Huff

The Subgroup is working to determine the final categorizations to present next week. The team is not sure they have the experts they need to finish the list. Even if you have all the BES functions, what does high mean in certain power generation situations? The team may need more input from John or Jackie's teams. Detailed thresholds would be a serious bottleneck. Jay's suggestion is that the SDT needs to walk through examples to illustrate application and

identify implications make sense. Perhaps in California the team could go through some real life examples.

Participant Comments

- We will need to understand how evaluation will be applied and implications. Apply to digital pressure gauge on a steam line?

Definition and Selection of Controls Subgroup Update and Coordination Issues — Keith Stouffer

Kevin Perry reported that there have been no meetings of Keith's group since Charlotte.

Summary and Next Steps

- Each group will review with others key issues in reports on day one
- Small group work will follow that
- Thursday morning small groups can look at and work on the "seams"
- Possibly end with a concept outline to integrate drafts on Thursday afternoon
- Can we work out guidelines?
- Auditors can only audit to standards/requirements, not to guidelines. Auditors assess compliance.
- Phil, Scott and Kevin (with other minor contributions) got into discussing an example to illustrate possible application of high/medium/low categorization on a BES – low production transformer. Assess function, not the asset? Asset may serve different functions
- Jay Cribb ended the conversation by noting this was a good discussion and illustrated why they need to walk through example(s) as a full group

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Agenda

Cyber Security Order 706 SDT — Project 2008-06

September 9, 2009 | 8 a.m.–5 p.m. PDT
September 10, 2009 | 8 a.m.–5 p.m. PDT
Western Area Power Administration, Sierra Nevada Regional Office
114 Parkshore Drive
Folsom, California
(916-353-4416)
NOTE: Subgroup Meetings May Not Have Access to Telephones and WebEx

Proposed Meeting Objectives and Outcomes

- Review the CIP-002 Work plan going forward
- Receive updates on TFE, VSL, VRF, and related cyber security efforts
- Receive an overview of industry comments on the SDT concept paper
- Receive and discuss reports from CIP-002 Subgroups identifying key issues and coordination points
- Convene CIP-002 Subgroup meetings
- Receive and discuss Subgroup reports on progress made and responses to industry comments
- Agree on Work plan, next steps, and assignments

Wednesday September 9, 2009

1. **Welcome and Opening Remarks — Jeri Domingo-Brewer**
   a. Roll Call and NERC Antitrust Compliance Guidelines
   b. Facilitator review of August 20–21 Charlotte meeting summary and adoption
2. **Review of Meeting Objectives, Agenda, and Meeting Guidelines — Jeri Domingo Brewer and Bob Jones**
3. **Review of CIP-002 Work plan and CIP-002 Subgroup Process — Stu Langton**
4. **Webinar Report — Jackie Collett, Phil Huff, and Jeri Domingo Brewer**
5. **Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure — Jeri Domingo Brewer and Scott Mix**
6. **Update on VSLs and VRFs — David Taylor or Scott Mix**

7. **Update on other Related Cyber Security Initiatives — SDT Members**
8. **Overview of the Industry Comments on the Concept Paper — Scott Mix**
9. **Subgroup Reports to the SDT**
    a. Reliability Functions Subgroup Report and Reflections on Industry Comments, John Varnell
10. **List of BES Subsystems, BES Cyber Systems Subgroup Report and Reflections on Industry Comments — Jackie Collett**
11. **BES Mapping Subgroup Report and Reflections on Industry Comments — John Lim**
12. **Cyber Analysis Subgroup Report, and Reflections on Industry Comments — Joe Doetzl**
13. **Definition and Selection of Controls Subgroup Report and Reflections on Industry Comments — Keith Stouffer**
14. **Coordination Discussions and Plans among Sub Groups**
    a. Subgroup Meetings (at various locations)
15. **Recess**

Thursday September 10, 2009

1. **Subgroup Meetings**
2. **Welcome and Agenda Review — Jeri Domingo-Brewer**
3. **Subgroup Reports — Plenary Session**
    a. Reliability Functions Subgroup Report and Reflection on Industry Comments
    b. List of BES Subsystems and BES Cyber Systems Subgroup Report and Reflection on Industry Comments,
    c. BES Mapping Subgroup Report and Reflection on Industry Comments
    d. Cyber Analysis Subgroup Report and Reflection on Industry Comments
    e. Definition and Selection of Controls Subgroup Report
4. **Discussion of and Agreement on Subgroup Coordination Strategies**
5. **Review Work Plan**
    a. Review Next Steps for Subgroups and SDT and the creation of a single CIP 002 text

6. **Review Proposed 2010 Meeting Schedule**
7. **Review October Kansas City, Missouri Meeting Objectives**
8. **Meeting Evaluation**
9. **Adjourn**

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Project 2008-06 Cyber Security Order 706 SDT Members

1. Rob Antonishen	Ontario Power Generation
2. **Jeri Domingo-Brewer, Chr**.	U.S. Bureau of Reclamation
3. Jim Breton	ERCOT
4. Jackie Collett	Manitoba Hydro
5. Jay S. Cribb	Information Security Analyst, Southern Company Services
6. Joe Doetzl	Manager, Information Security, Kansas City Pwr. & Light Co.
7. Sharon Edwards	Duke Energy
8. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
9. Phillip Huff	Arkansas Electric Coop Corporation
10. John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
11. Frank Kim	Ontario Hydro
12. Rich Kinas	Orlando Utilities Commission
13. David Norton	Entergy
14. Kevin B. Perry, Vice Ch.	Director Critical Infrastructure Protection, Southwest Power Pool
15. Christopher A. Peters	ICF International
16. David S. Revill	Georgia Transmission Corporation
17. Scott Rosenberger	Luminant Energy
18. Kevin Sherlin	Sacramento Municipal Utility District
19. Jonathan Stanford	Bonneville Power Administration
20.Keith Stouffer	National Institute of Standards & Technology
21. John D. Varnell	Technology Director, Tenaska Power Services Co.
22.William Winters	Arizona Public Service, Inc.
Roger Lampilla	NERC
Scott Mix	NERC
Dave Taylor	NERC
Joe Bucciero	NERC/Bucciero Assoc.
Robert Jones	FSU/FCRC Consensus Center

Stuart Langton	FSU/FCRC Consensus Center

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Schedule — October 2008–December 2010

Development of CIP Version 2 and Version 3 Framework
October 2008–July 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.

2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development

3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 Version 3 process reviewed.

4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white papers assigned.

5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed Version 3 white papers.

January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.

January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.

6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.

7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.

8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals

March 2–April 1, 2009 — 30-day Pre Ballot

Mid-March — NERC posts TFE draft Rules of Procedure for industry comment

March 30, 2009 — WebEx meeting(s) White Paper Drafting Team

April 1–10 — NERC Balloting on Version 2 Products

April 6, 2009 — WebEx meeting — White Paper Drafting Team

April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call

April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments-

9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.

April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx

April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%

May 5, 2009 **—** NERC MRC Meeting, Arlington, VA- SDT progress report.

10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.

June 8 and June 15, 2009 **—** Working Paper Drafting Team Meetings and WebEx

11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.

June **—** WebEx meeting(s)

- Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria

CIP-002 Development of Requirements, Measures, Etc. July-December 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada

- SDT plenary session to review, refine, and adopt SDT Working Paper
- Adopt SDT response to NERC for Interpretation of CIP-006-1
- Review and adopt proposal for CIP-002 Subgroups and Deliverables
- Convene Subgroup organizational meetings to develop work plans
- Adopt 2010 Meeting Schedule

July–August Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)
- CIP-002 Coordination Team meeting (as needed)

August 3**–**5, 2009 in Winnipeg, Manitoba **NERC Member Representative Committee**
Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.

13. August 20–21, 2009 in Charlotte, NC

- SDT Plenary session to review and respond to MRC input on Working Paper/CIP-002 Concepts
- SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper
NERC Webinar
August–September Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)
- CIP-002 Coordination Team meeting

14. September 9–10, 2009 in Folsom, CA

- SDT plenary session to review and respond to any additional industry comments on Working Paper and CIP-002 Concepts
- SDT Subgroup drafting meetings- consider industry comments, draft requirements and "proof of concept" control (s).
- SDT plenary session(s) Subgroup reports on requirements
- Review of CIP-002 Standards, Requirements, Measures, and Outline
- Address coordinating issues.
- Establish SDT meeting dates and proposed locations for January–December 2010

September–October Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)

- CIP-002 Coordination Team meeting

15. October 20–22, 2009 in Kansas City, MI
- SDT Subgroup drafting meetings — day one
- SDT Plenary Session(s) — day two Subgroup reports on CIP-002 requirements
- Review and refine initial draft of CIP-002 single text

October–November Interim WebEx meeting(s)
- CIP-002 Coordination Team meeting

16. November 17–19, 2009 in Orlando, FL
- SDT plenary session(s) — to review and refine CIP-002 standard, requirements, measures and controls.

November–December Interim WebEx meeting(s)
- Drafting teams as needed to finalize drafts
- CIP-002 Coordination Team meeting

17. December 15–16, 2009 in Little Rock AK
- SDT plenary session(s) to review, refine, and agree on and adopt CIP-002 standard, requirements, measures and controls.
- Agree on initial posting of draft CIP-002 for industry review and comment.

Refinement of CIP-002 and Development of Other CIP Standards
January–December 2010
(12 SDT monthly meetings and Subgroup WebEx meetings as needed)

- SDT responds to industry comments on initial and subsequent postings of CIP-002, Version 3 (may be multiple comment periods, as required)
- Refine the CIP-002 through the comment period and submit new CIP-002 Version 3 Standard for Balloting along with the catalogue of controls (i.e. CIP-003-CIP-009 or its successor) OR
- Ballot CIP-002 while permitting industry to rely on CIP 003-CIP-009 until the full suite of controls (i.e. CIP-003-CIP-009 or its successor) is reviewed and presented for balloting.
- Submit the full suite of CIP Reliability Standards on Cyber Security for Industry Comment
- Refine and Submit the full suite of CIP standards for industry ballot
- NERC Board of Trustees adoption of the full suite of standards
- FERC approves and NERC Implements the full suite of CIP standards

Proposed 2010 Meeting Schedule

18. January 20–21 — Wednesday–Thursday, Atlanta GA	24. July 14–15, Wednesday–Thursday
19. February 18–19 —Thursday –Friday, Austin TX	25. August 11–12, Wednesday–Thursday
20. March 9–11 — Tuesday–Thursday, Phoenix, AZ	26. September 8–9, Wednesday–Thursday
21. April 14–15 — Wednesday–Thursday, Atlanta GA	27. Oct. 13–14, Wednesday–Thursday or Oct.12–14
22. May 12–13 — Wednesday–Thursday, Dallas TX	28. November 17–18, Wednesday–Thursday
23. June 9–10 — Wednesday–Thursday, Sacramento CA	29. December 15–16, Wednesday–Thursday

SDT 706 September 9-10, 2009 Meeting Summary Contents

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

SDT 706 SEPTEMBER 9-10, 2009 MEETING

EXECUTIVE SUMMARY

The Chair, Jeri Domingo-Brewer welcomed the members to Folsom California and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). On day two the SDT accepted the August 20-21 meeting summary without comment or objection.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

Mr. Langton reviewed the CIP 002 work plan between August and December 2009 which the SDT adopted at its meeting in Vancouver, setting up subgroups and some ground rules for their work and coordination with each other. The monthly agenda planning meetings with the Chair and Vice Chair have been expanded to include a leadership coordination meeting with the leads from each of the five subgroups. Mr. Langton reminded the five subgroups that they have about two more months to finish their work of developing proposed draft language for the new CIP-002 Version 4 standard, and the full SDT will then work to finalize the new draft CIP-002-4 standard for posting to the industry for comment in December 2009. He noted by the conclusion of the October 2009 SDT meeting, the goal is to have a single draft CIP 002-4 that can be debated and refined in November and adopted in December.

Jackie Collett & Phil Huff & Jeri Domingo Brewer provided the SDT with a review of the August 25th Industry Webinar on the concept paper. The Webinar participation was estimated to be over 650 participants with more than 800 registered.

Jeri Domingo Brewer and Scott Mix jointly presented an update on the TFE process. The Chair noted that at the conclusion of the August meeting, she had agreed to follow up with the Standards Committee regarding the SDT support for addressing TFE issues as an urgent matter. She indicated she will be presenting these to the Committee soon. Scott Mix noted that on the Rules of Procedure side the NERC 2nd draft posting is in comment process now and the Comment period has been extended to Sept 11.

Scott Mix provided a brief update on Version 2 VRF and VSLs noting that the pre-ballot comment period will close September 10 with a 10-day ballot period immediately following the comment period. A recirculation ballot is a high probability, since there is likely to be a comment from an entity voting no. He noted that in the future, the SDT 706 will be responsible for Version 3 VSLs and VRFs and will need to accomplish this in its 2010 workplan.

The following related industry initiatives update was provided:

- In the past week an industry meeting was convened to update the DOE Control Systems Security Roadmap which was initially developed 3 years ago.
- There is a NIST working group, Cyber Security Coordination Task Group (CSCTG), that is focused on smart grid cyber security issues that has been holding weekly conference calls, and its current face-to-face meeting is being held at the same time as this SDT meeting. The CSCTG is in the process of defining cyber security requirements for the various application and functional interfaces that exist among the various computer systems that are utilized by utilities. They are organizing their work to address FERC's four priority policy areas for the smart grid (Demand Response, Electric Storage, Electric Vehicles, and Wide Area Situational Awareness), plus two additional areas of AMI/AMR and Distribution Grid Management. They will be consolidating their inputs into a Smart Grid Framework and Roadmap document, as well as providing a NIST Interagency Report (NISTIR) on Cyber Security. For each interface, they will propose security controls. The NIST site has documents posted, and they should be released shortly for industry comment and feedback.
- The NERC Planning Committee has established a small working group and is soliciting applications for membership in the working group that will focus on cyber security of smart grid components.

Scott Mix presented an overview of the industry comments received on the draft concept paper, noting that 49 comments were submitted by the deadline (Sept. 4) with three additional sets being received following the deadline for a total of 52 comments consisting of over 140 pages. Scott suggested the comments were "all over the map." Few of the commenters, if any, expressed general agreement with the approach. Many struggled to understand of the process and either didn't understand or didn't agree with process.

The SDT reviewed the draft concept paper comments and discussed what the SDT's vision for success is in putting these pieces together from the feedback and comments. Below are the elements of the vision of success suggested by SDT members:

- Standards that will assure the reliability of the BES.
- Multiple groups of people running through the process with same inputs/requirements will reach the same conclusion.
- The end result passes the "smell test"- engineering analysis would agree with the results.
- Industry recognition that reliability functions are important and understanding why protection is needed and beneficial. Focus on reliability functions can demonstrate reliability of BES.
- A clear enforceable standard that doesn't create an unnecessary hardship on entities.
- Get requirements on paper that are simple for entities to follow but may be complex in their development.

The SDT identified the following themes in the industry comments:

- Clarify the SDT philosophy and approach in terms of the degree of flexibility vs. prescription provided in the standards.
- Seek simplification in the final standard but engage in complex hard issues in getting there. Achieve some simplification: workable, clear and doable.
- Engineering analysis needs to support any thresholds. SDT should do this as part of setting the standard.

The SDT identified the following issues from industry comments:

- Complexity.
- CIP-002 Not Yet Tested.
- Augment existing CIP requirements with elements of SDT concept paper.
- Should the SDT take on CIP 003-009 sooner than 2010?
- Value of a walk through example for the SDT and industry.
- Role of Adequate Level of Reliability (ALR) in Concept.
- Pilot the Concept Paper approach.
- CIP 002 as Cornerstone.
- Concern about scope.
- Thresholds and Engineering Analysis needed to support standard.

Scott Mix brought a request from Mike Assante at NERC to the SDT. He asked whether the SDT could confirm that the existing exemption for non-routable protocols will not be carried forward into Version 3? Or in the alternative, can the SDT confirm it will be considering the removal of the non-routable exception for future systems and any modifications to current systems? He noted that the impact of a device is not a function of communication protocols-which are better covered in the list of requirements on how to secure the device.

In light of the SDT discussion, Mr. Mix brought the following statement to the SDT for its consideration, and it indicated a 3.6 out of 4 point consensus scale indicating support for the following statement:

Concerning the elimination of the blanket exemption for non-routable protocol connected serial devices, as is being considered for inclusion in the scope of the CIP Cyber Security Standards, assume the following:

1. The removal of the exemption will not be applicable to the existing approved Version 1 or Version 2, but will be considered in future versions of the standards.
2. The specific security requirements for serially connected devices will be contained in the “catalog of security requirements” (currently CIP-003 through CIP-009), properly accounting for the threat and vulnerability components to the risk to the device.
3. An appropriate implementation plan will need to be adopted recognizing the number of devices brought into scope by this change

The SDT will recommend that the blanket exemption not continue into Version 3, such that communications to a device will not be a consideration for the impact to reliability of the

device. Mr. Mix agreed to provide Mr. Assante with a sense of the team's position on this issue.

Jackie Collett, SDT member, agreed to conduct an informal concept walk-through the proposed conceptual approach to CIP 002 for the SDT with an example that starts with identification of the functions. She started by noting that the SDT needs to develop a vision of what this is going to look like comparing it to designing a vehicle when you are not sure if it's a bike, truck, car, or van.

Using restoration as a function, she suggested that a list of generating units, transformers, station busses, transmission lines, and associated loads for balancing as the BES subsystems supporting this function.

Members identified the following key questions in the course of the Functional Walk-Through:

- One of the industry's questions was how much flexibility should be given to the entities in determining the applicable BES subsystems. If no flexibility in identification and categorizing is given, then you don't need to put a methodology in the standard.
- Do the supporting pieces together create the BES subsystem?
- Will there be consistent outcomes going through the restoration functional analysis first or going through the cyber analysis first?
- If same generator does both restoration and other reliability functions, how to address aggregation in terms of its categorization?
- How to deal with multiple reliability functions from multiple entities?
- Do you need reliability functions mentioned in the standards? This might be part of the development of the standards but would reduce complexity if functions not included in the standards.
- Should there be a "none" or "no impact" category for the functions included in the BES list?
- For which subsystems do we need to do BES mapping?
- Is redundancy protection aimed at failure vs. compromise?
- Should we apply controls at cyber system level, or a methodology to a device level?
- What do we apply controls to: system or components of the system?
- How can we address interconnected systems and systems we are dependent?
- What about interconnectivity with other systems that are ranked differently?
- What is the SDT philosophy and approach- i.e. degree of flexibility vs. prescriptive, guide or impose? How to go about this? What is our strategy?
- Who can determine impact to the reliability of BES? Owner of asset has to even if they have no way to. Is this the right way to go. Who has wide enough view and capable of doing this?

On day two, Joe Doetzl reminded the SDT that the concept paper offered entities the choice of an alternative approach that started with the cyber systems and map those. The concept suggested that the different starting points should result in the same ending point. The

complexity comes from the BES mapping and reliability functions and different levels of impacts on each of those systems. The question is whether if you start with the cyber system it will be a simpler approach to cyber security than starting with the reliability functions.

Members identified the following key questions in the course of the Cyber Analysis Walk-Through:

- What would a responsible entity do in determining what should be in the scope to protect?
- On cyber side, if the cyber is deemed impactful does it inherit the impact level of the function supporting the BES assets? Is anything not impactful not in scope?
- For the assessment of functions or on asset supporting reliability function, do you need an intermediate step?
- Do we agree we want to have multiple levels of impacts on function so we can connect the controls to those?
- Can the assets mapping be capable of translation to a systems approach?
- Any way to diminish the impact of the audit process on low impact sites?
- What does it mean for a BES cyber system to support a reliability function? Is it info for situational awareness, control to generation, etc?
- Are there systems we unequivocally expect to be protected? Basic SCADA systems shouldn't have a minimum set of auditable controls. Even isolated generation. This might take some complexity out.

SDT members discussed what was learned through the walk through of the functional and cyber approaches including:

- The two walk-throughs indicated there is a similarity in complexity in both approaches.
- The issue is how do we eliminate complexity regardless of which side we start the analysis. For example in the cyber approach the complexity is contained in Step 3 whereas in the functional approach it appeared in Step 2.
- Neither is more complex that the other as it will depend on the environment and context. Large number of BES and small number assets may start on cyber side. Small number BES and lots of cyber may want to start on the BES functional side. Neither is wrong.

On the first day of the meeting, the SDT heard and discussed reports from each of the subgroups. The subgroups then met on the second day to review and respond to the comments and suggestions of the SDT.

On the first day Rich Kinas reported, on behalf of John Varnell, on the Reliability Functions Subgroup's work. He noted the subgroup has redistributed its members into other subgroups. The subgroup will continue to try to put more definitions around what was meant by different functions including a brief paragraph on each and what is meant for benefit of and guidance to the other subgroups.

Jackie Collett noted the BES Subsystems subgroup had no further meetings since the August Charlotte meeting. She noted that Jim Case and Matt Greek from the NERC Operating Committee are now participating on the subgroup. On day two, she reported that the subgroup still needs to put time and effort into defining what these BES subsystems are and move into drafting requirements.

John Lim noted the BES Mapping Subgroup met to continue its work in developing the BES Mapping draft markup and was joined by members from the Functions subgroup. Two major issues the subgroup is dealing with include: how do we validate an engineering study? Approval by regional reliability assurer? TFE type process? Need to look at this more. Note that no entities currently are performing the role of reliability assurer. Also, what is meant by "Misuse"- need to describe this term.
John Lim reported following the BES Mapping Subgroup's meeting on day two. The Subgroup is drafting a set of requirements for High, Medium, and Low. There are still questions on how to handle industry studies. In terms of generation subsystems, he noted they are using terms that are not very well defined (e.g., subsystems in generating stations). The terminology they are using must be precise and consistent and coordinated with Jackie Collett's subgroup.

Phil Huff delivered the initial Cyber Analysis Subgroup report noting his confusion about how the subgroup should go forward. BES impact categorization as the black box is a flawed assumption. The subgroup could reduce some of the complexity in the process. We assumed each function mapped would have an impact categorization so we could combine through a "look-up table." On day two, Mr. Huff noted that his subgroup would huddle when the SDT breaks. He noted that there may not be as much confusion as was stated yesterday. Impact criteria that are involved in John Lim's one-to-one mapping will be considered. The subteam needs to develop a strategy on the cyber analysis side.

Keith Stouffer presented the Definition and Selection of Controls subgroup's report. He noted that during the Charlotte meeting the subgroup developed and presented an example based on access control. We pulled together into one location the access control referenced in many places. Keith mentioned that the format is new and the subgroup doesn't know if this is acceptable. Need to nail down as soon as possible what is an acceptable format. The Subgroup on day two noted they will seek to nail the format decision down with NERC. Joe Bucciero will send latest work in progress of the Subgroup to all group leaders.

The SDT agreed that a brief statement should be drafted for publication in NERC's newsletter. Gerry Freese agreed to draft the summary. The Chair reviewed with the SDT the schedule for the next couple of meetings, reminding members that at the conclusion of the October meeting in Kansas City we hope to have a single text of CIP 002 which we can refine in November and approve for posting in December. She thanked the members for their hard work together and in the Subgroups and encouraged them to continue working to make headway on each of their charges. Members completed an onsite meeting evaluation form.

The SDT adjourned at 3:45 p.m. on September 10.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

SDT 706 SEPTEMBER 9-10, 2009 MEETING SUMMARY

I. INTRODUCTIONS, AGENDA AND SDT WORK PLAN REVIEW

The Chair, Jeri Domingo-Brewer welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). The SDT adopted the August 10-11 meeting summary without comment or objection on Thursday morning.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

Mr. Langton reviewed the CIP 002 work plan between August and December, 2009 which the SDT adopted at its meeting in Vancouver, setting up subgroups and some ground rules for their work and coordination with each other. The monthly agenda planning meetings with the Chair and Vice Chair have been expanded to include a leadership coordination meeting with the leads from each of the five subgroups. He noted the five subgroups have about two months to finish their work of developing the CIP 002 draft to be finalized by the SDT in November and December, and released for posting and industry comment in December 2009. He noted by the conclusion of the October 2009 SDT meeting, the goal is to have a single draft CIP 002 that can be debated and refined in November and adopted in December.

Member Comments on SDT Workplan

- Due to increased workload in terms of response to CIP-002 industry comments and the development of CIP-003-009 requirements in 2010, the SDT will be convening 3-day meetings
- The SDT will continue to use phone and telephone conference calls to enhance effectiveness.
- As an alternative, NERC staff brought up the possibility of meeting 1 to 2 weeks at a time to improve schedule effectiveness.
- The current proposed game plan- is to set SDT meetings using 3-day schedules with a back-up strategy of spending a 1-week chunk somewhere, if needed.
- At first blush this appears shocking. However, when you factor in the day traveling/to and from it might not be more onerous than the current meeting schedule.
- The hosts for the remaining 2009 SDT meetings are checking to see if they can add a 3rd day to each of their meetings.

Jackie Collett & Phil Huff & Jeri Domingo Brewer provided the SDT with a review of the recent Webinar (held on August 25) on the working concept paper that was posted to promote information exchange with the industry. The Webinar participation was estimated at over 650 with more than 800 registered. The SDT leaders indicated the session went well and Joe Bucciero agreed to get the Webinar summary notes out to the Team. Questions were raised surrounding the security controls which underlined the importance of work ahead. There were process questions of what version would be implemented when? NERC staff didn't jump in to answer questions as this was designed as an SDT Webinar. Those questions were referred to NERC for responses.

Member comments on the Webinar Presentation

- In terms of questions dealing with process and NERC standards, communications with the industry is needed. We need to do a better job of telling the industry what they should be doing. There is significant confusion currently.
- The Chair proposed and the SDT agreed to do another Webinar in the December time frame with the Subgroup leaders participating. NERC will need to flesh out with the industry the process area questions.

II. UPDATES

A. Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure

Jeri Domingo Brewer and Scott Mix jointly presented an update on the TFE process. The Chair noted that at the conclusion of the August meeting, she had agreed to follow up with the Standards Committee regarding the SDT support for addressing TFE issues as an urgent matter. She indicated she will be presenting these to the Committee soon. The Chair noted that Kevin Perry is prepared to move forward with an urgent action SAR that was reviewed and discussed at the August SDT meeting and is looking for a proxy to submit.

Scott Mix noted that on the Rules of Procedure side the NERC 2nd draft posting is in comment process now and the Comment period has been extended to Sept 11. They have received 5 sets of comments which NERC staff is reviewing.

In the context of interim guidance issues for those entities in compliant phase, regions are in process of figuring out how to handle these. NERC is trying to get the interim process running ASAP while the formality of approving the final process takes place.

Member Comments on SDT

- Has a decision been made on the matrix for the SAR? In August Mr. Perry noted it was "vetted" it with regional group representatives on the CCWG group and the chair of the Version 1 CIP.
- Where do we go to get guidance for entities coming up on an audit and the status of TFEs? The interim guidance document on NERC website--which NERC drafted and regions have

agreed to. Updated interim guidance is under development to make interim more consistent with final if approved.

- What if a region has no facility for accepting TFEs? Rely on your own legal council.
- Last posting of TOP is one we should expect to be implemented. Section A- by September 17, 2009. The assumption is that the implementation proposed is best we know right now.
- In July 2008 there were 13 requirements compliance by July 2009, there were 41 requirements. The regions are hanging in the wind on this. One entity represented on the SDT is 5 weeks from a NERC audit. Members are confused. Need to make things easier.
- The MPCC in discussing the ROP has pointed out FERC hasn't approved version 2 yet. Version 1 of standard only? Will we have to change again?

B. Update on VSLs/VRFs

Scott Mix provided a brief update on Version 2 VRF and VSLs noting that the pre-ballot comment period will close September 10 with a 10-day ballot period following with recirculation a high probability if there is a single comment from an entity voting no. In the future, the SDT 706 will be responsible for Version 3 VSLs and VRFs and will need to accomplish this in its 2010 workplan.

C. Update on other related cyber security initiatives- *SDT Members*

Keith Stouffer noted that in the past week a meeting was convened of over 100 experts in La Jolla, California to update DOE Control Systems Security Roadmap which was initially developed 3 years ago. They addressed activities and initiatives over 3 years, e.g. smart grid and SDT 706. Energetics provided facilitators to manage a number of break-outs. They are under contract to produce an update to the road map in the next few months. The website is: http://www.PublicIERoadmap.com

There is a NIST working Control Center ETG focused on smart grid issues that is meeting today and tomorrow. They are collecting interface security requirements and are looking at FERC's four areas of focus. They will be consolidating inputs into 1 document. For each interface, they will propose security controls. The NIST site has documents posted.

The NERC Planning Committee has established a small working group and is soliciting applications for membership in the working group that will focus on cyber security of smart grid components. They understand they need enough of a cyber security perspective on the working group and the Planning and Operating committees don't typically have that perspective. They are looking at the electric grid reliability impacts of smart grid(s). You can't do smart grid without high speed communication. A fundamental tenet of this is requiring good cyber security.

III. REVIEW OF INDUSTRY COMMENTS ON THE CONCEPT PAPER

A. Overview of Industry Comments

Scott Mix presented an overview of the industry comments noting that 49 comments were submitted by the deadline with three additional sets following the deadline for a total of 52 comments consisting of over 140 pages. He suggested the comments were "all over the map." Few of the commenters, if any, expressed general agreement with the approach. Many struggled to understand of the process and either didn't understand or didn't agree with process. Some took exception to the breadth and scope of the concept suggesting it may exceed the authority of 215 Fed Power Act. Responses to Question 5 are typical of the diversity of perspectives: some believed 3 levels is the right number, others suggested higher and lower numbers, including 2 levels of critical and non critical and others suggested leaving it as it is currently.

B. Overview of Member Comments

1. Overall Themes of SDT Reflections on Industry Comments

- Clarify the SDT philosophy and approach in terms of the degree of flexibility vs. prescription provided in the standards. Trying to get away from the current wide latitude and flexibility. How much less latitude? How much room for judgment? If give latitude. If entity can provide an alternative approach through an analysis, this will increase the complexity of the standard if you have to outline what will be an acceptable analysis.
- Seek simplification in the final standard but engage in complex hard issues in getting there. Achieve some simplification: workable, clear and doable. Engineering analysis needs to support any thresholds. SDT should do this as part of setting the standard.

2. Vision of SDT Success

The SDT reviewed the comments and discussed what the SDT's vision for success in putting these pieces together to do? Below are elements of the vision of success suggested by members:

- Standards that will assure the reliability of the BES.
- Multiple groups of people running through the process with same inputs/requirements will reach the same conclusion.
- The end result passes the "smell test"- engineering analysis would agree with the results.
- Industry recognition that reliability functions are important and understanding why protection is needed and beneficial. Focus on reliability functions can demonstrate reliability of BES.
- A clear enforceable standard that doesn't create an unnecessary hardship on entities.
- Get requirements on paper that are simple for entities to follow but may be complex in their development.

3. SDT Identification of Issues from Industry Comments on Concept Paper

   a. Complexity. Is the concept too complex as presented?

b. CIP OO2 Not Yet Tested. Haven't run with existing CIP 002 long enough- consider staying with it longer?
c. Augment existing CIP with elements of SDT concept paper. Recommend to take valuable elements of new approach to augment legacy CIP 002-009 framework.
d. Should the SDT take on CIP 003-009 sooner? Is there another way to deal with "dodgers"- can we take another look at what we need to deal with CIP 003-009. E.g. grading high medium and low. Significant concurrence with moving in direction with identifying controls. Should we look at how to improve 3-9 and then back to 002? Hunt down dodgers.
e. Value of a walk through example for the SDT and industry. Help the SDT and the industry to walk through process CIP 002 start to finish with some mythical power plant, control center or sub station. How to go from defining system, to applying controls to assets. "Systems" is the new concept and how to help the industry make this leap. Walk through as a team. We would better tell our story and let people understand it. Haven't stepped all the way through this process.
f. Role of ALR in Concept. What was missed in responses is that the concept of ALR is not going to appear in the CIP 002 standard. It is a framework for deriving the functions. The functions will be included, not the ALR. They only served as a guide for drafting team to derive functions that are relevant. They served as principles for getting at the scope for 002. If you ignore principle 6, the other 5 principles are in line with Federal Power Act at a high level. ALR defines adequate levels of reliability.
g. Pilot the Concept Paper approach. May need a pilot for the concept similar to how this is done in the nuclear side to test how it works in practice.
h. CIP 002 as Cornerstone. The SDT made a strategic decision to develop CIP 002 as the cornerstone. It is ugly and difficult work. We can't drop this, we have to finish it even though it is hard.
i. Concern about Scope. Industry concern is that no one knows how big this will be—there is a "paranoia about scope". Concern also of the possible loss of invested effort (time and $$). Is there a way of taking what has been done and map it to the CIP Version 1 and 2 to see what happens to the critical cyber assets. Industry is asking how much more will we have to do than what we do now. If the under Verion 1 and 2 represents 10% of critical assets. Will I have to spend 10 times as much under version 3?
j. Thresholds and Engineering Analysis to Support. If this drafting team puts out hard threshold numbers it need solid engineering analysis behind it.

4. Member Review of Industry Input on Concept Paper

a. Wednesday Member Discussion Notes
   - Some suggested we didn't provide enough detail for them to respond, even though this was presented as a concept paper. A few entities didn't understand the concept.

- Overall, it appears many didn't understand what the rationale was for changing the existing process changes believing the existing didn't have a chance to prove itself.
- Lots of discussions among drafting team over last 6 months. Going forward, we need to lay out more clearly why we are moving in this direction. Set forth why this sea-change is being proposed in identifying and categorizing?
- Industry may be upset because we are perceived as a moving away from compliance and trying to address security. What we do currently is compliance oriented.
- If the SDT and industry do this right, both security and compliance can be achieved. This is a new way of looking at security that is trying to do just that.
- My take is different. I believe we should take the critique of concept complexity seriously. It is mentioned 40 times in the comments. Confusing is mentioned 31 times and complicated is referenced 12 times.
- SDT has to be aware of and trying to not making this more complicated than is needed.
- Some are suggesting we should not start with ALR- which is suggested to be too broad a starting point. Instead consider starting with Federal Power Act definition of reliability and build on basic approach.
- The concern with ALR may be directed at principle 6. The other 5 are more in support of the Federal Power Act reliability definition. Enough generation to serve load.
- Written by Operation and Planning Committees- wrote this on reliability. Is this service reliability vs. bulk electric reliability.
- Yes it is a complex process- we started with 3 levels. Created a complex process that overloaded the front-end analysis. Entities not sure of how to implement. Hard #s would make it easier and simpler. Higher impact- easy to understand. Push back is that engineering analysis may find that is quite right. Are we painting the house with a small brush in order to keep the paint off?
- We may have gotten so few comments because of the complexity and the other things out there.
- Compliance vs. security discussions- compliance is overwhelmed with evidence they must provide. Reluctant to introduce additional documentation/evidence requirements.
- Should we focus on 003-009 where we have problems and come back to 002? FERC order 706 had many issues with 003-009.
- If we provided some relief and flexibility in that area? Easier to expand later.
- There is a concern with putting out 002 in a vacuum- CIP 003-009 most concerned with. What do I have to do? We need to post a sample with 002.
- In the current paperwork drill and compliance we are forgetting security. Is there a possibility of a quick hit on something helpful in 003-009? If this is another paperwork nightmare, could get voted down. How are we going to get

there from here? Don't have a vision for success that we can articulate to the industry.

- Is the concept too far reaching on CIP 002 aspect? One comment suggested it is too complex and should run with existing CIP 002 long enough to judge its effectiveness.
- Another way to deal with "dodgers"- can we take another look at what we need to deal with CIP 003-009. E.g. grading high medium and low. Significant concurrence with moving in direction with identifying control.
- Should we look at how to improve 3-9 and then come back to 002? Hunt down dodgers.
- We need to help industry to walk through process CIP 002 from start to finish with some mythical power plant, control center or sub station. How will this go from defining the system to applying controls to assets?
- "Systems"- how to make this leap. Walk through as a team. We would better tell our story and let people understand it. Haven't stepped all the way through this process.
- Paper work drill. Can't repeat with new standards. Seeing future audits of standards being more operational vs. paper work. If we are going to get this security- test operations to see if secure. Operational audit only way to do this in a hands on way. Don't know how this will happen. Need to think about. Pie in the sky? E.g. "Penetration test"
- Audits will do more of this in the future.
- Agree with today's SDT comments. We still have a focus on paperwork for audits.
- The industry is hesitant to walk away from the compliance investment.
- Recommend valuable elements of new approach that can augment the legacy framework of CIP 002-009.
- Should ALR be the beginning point? Does ALR need to be removed?
- ALRs- if we ignore principle 6 right now, the other 5 principles are in line with the Federal Power Act at a high level. Back up protection schemes were presented in Phoenix. Where in the system are these systems required? How to determine this? ALR defines adequate levels of reliability. Maybe we should have 2 levels. High impact and low impact? Low impact- difference with Version 1 or 2- got to do something more than the current model requires. E.g. issues with password managing, patching. Different levels of e.g. patch management. Comes into requirements section is where that belongs.
- Support for using the current CIP as basis and augmenting with new things.
- What was missed in the industry responses is that the concept of ALR is not going to appear in the standard. It is a framework for deriving the functions. The functions will be included not the ALR. It serves as a guide for the drafting team to derive functions that are relevant. They are just principles for getting at scope.

- If we stick with a multi level approach in 003-009, we will need to know what we are devising requirements for. OO2 does this. Put out an example. Categorizing system. Medium or high system show applying security controls. Show that not every single asset will have a requirement. Will be more complicated as a compliance exercise.
- The regions seemed to be suggesting that the concept appears good but there is a suggestion that what may be needed now is a pilot. Similar things done on nuclear side to see how it works. We don't know how it is working but we invested lots of $$. Audits- going on now. Think right now of a case study or pilot.
- Critical assets, non-critical assets and de-minimus assets?
- The concept seeks to provide strategic decision- CIP 002 is the cornerstone, albeit, ugly and difficult for the SDT. We can't drop it and say this is too hard yet.
- What is desperately needed is what is low is? That's why getting this. Everything will be protected. Give both high and low.
- There is a concern that no one knows how big this will be—i.e. a "paranoia about scope". Concern of loss of invested effort (time and $$).
- SDT should consider a way of taking what has been done, providing a mapping of what has been done- a critical asset- critical cyber asset- show that mapping and what happens if you apply the concept paper. Critical assets and critical cyber assets- question is the middle ground. Industry wants to know how much more will we have to do than what we do now?
- If I currently devote 10% to facilitating critical assets, will I have to spend 10 times as much under the concept?
- Routable vs. non-routable- trying to be a physical security standard while calling itself a cyber security standard. Can we address this? CIP 10- physical security. Big disconnect- something important but not protecting.

b. Thursday Member Discussion Notes

At the beginning of the discussion on Thursday of the Industry input, the facilitators summarized several key questions raised in Wednesday's discussion including:

- Are there systems we unequivocally expect to be protected? Basic SCADA systems shouldn't have a minimum set of auditable controls. Even isolated generation. This might take some complexity out
- On the cyber side, if the cyber is impactful, then it inherits the impact level/ function of the BES assets it is supporting. Anything not impactful is not in scope. This could be one way to simplify the process.
- Do we agree we want to have multiple levels of impacts on function so we can connect the controls to those? In end multiple levels of cyber systems impact on function.

- Define what it means for a BES cyber system to support a reliability function. Is it info for situational awareness, control to generation, etc?

Member Comments

- Clarification and simplicity to make this a more manageable change process.
- Didn't hear industry rejection of fundamental assumptions and model.
- Threshold model approach?
- Upon reflection there might not as much confusion as we initially thought.
- Our team need to develop more on the cyber analysis side.
- We haven't decided whether there will be a one-to-one mapping. Can't promise that yet. Lots of overlapping functions. Level of functions we have is higher in the criteria than the functions we have from Subgroup 1.
- Subgroup 1 functions- BES assets list- covered all functions rather than a 1-1 mapping.
- Supporting documentation will be critical to communicate to the industry how we got there.
- Is there existing mapping of any generation sub system? Building on work already done and look for thoroughness.
- Matrix- started in middle of concept. 2 sides of matrix. Decoupled approach then use matrix to combine. Laid out some general thresholds. Supporter of thresholds.
- Generation subsystems
- The 19 criteria John Lim's group identified covering high/medium and low- may not be enough. Raw megawatt output, Constraint mitigation, radial vs. non radial etc.
- The SDT should consider applying watermarking on that generation.
- Based on around 10 generation criteria
- Then Cyber impact- may not have hard number- describing impact of cyber system to the BES subsystem generator. Impact is same whether big or small. Combination of cyber and BES impact accommodated in the final result. Feed into CIP 003-009. Below was is an example to illustrate the concept that Scott Mix shared with the SDT:

	High	*Med.*	*Low*	*Null*
BES impact e.g.	<2001	<1001	<400	Less than 400

	High	*Med.*	*Low*	*Null*
Cyber impact:				

- Is this per unit or per plant? One row for per plant and another row per unit? Need to determine this as well. Per unit on cyber side and per plant on BES side. E.g. a plant wide scope of control?
- Degree of simplification- detailed work. Should this team take this one on?. Assume it should be done. Punt to somebody else?
- Don't know its been done to this level. Is that a scope of work for a cyber security person. If we don't do it, no one else will.

- Subgroup understanding. Making marriage of two impact assessments. Way to move forward to define the cyber impact criteria. What does it mean for BES cyber system to support the reliability functions. May not have H/M/L levels.
- Proposal on evaluation of cyber system- proposing a H/M/L on its impact on the function? Most functions map to BES subsystem.
- Analyze the Impact to the system.
- Impacts to the reliability function are de-coupled. This is not how it impacts the BES systems.
- We may be counting the impact twice on each side.
- In the federal context, the White House defined criteria for defining cyber system impact on a business function level. Marrying top-down and bottoms-up approach. Painful process to begin with. Interpreting top down approach. Has become easier to develop what controls apply.
- E.g., boiler flame control system- what cyber- reliability function of generation. Not counting twice. Make sure clear on what a BES cyber system is. Define it on a functional level—i.e. what it means for cyber system to support at reliability function.
- What happens if the cyber system isn't there. Only defined cyber system as supporting a reliability function.
- High =loss or compromise of confidentiality, integrity and accessibility. Medium= there are effects, not expected to effect.
- The size of a generator does not play into cyber analysis.
- The cyber system inherits the rating of the BES asset. Like to consider a cyber analysis as binary. Cyber systems not associated with "big iron."
- It is an issue of scope of control.
- Now that you know the function- e.g. EMS what cyber systems are and they inherit EMS. E.g. historian functions, offline logging system probably low.
- Assets essential to perform that scope of control are inherited. Bottom out at low.
- Point out that here are the filters that help place these in the buckets.
- The cyber impact doesn't trump the BES impacts.
- We are assuming inputs of categorized reliability functions. We can define them for reliability. Don't have a list of cyber functions.
- The SDT needs to get the requirements down. Take this opportunity to know what we need to do in writing.
- Numbers- is there a threshold number assumed that can be applied? Risk based methodology (guideline 27). "Bright line"- categorization of what constitutes a BES.
- Are we coordinating with other regional entities? SDT represents all the regions. NPCC doing this? Bring to everyone else? NPCC aversion to "bright lines" (A 10 as methodology for id critical assets for CIPs standards)
- NPCC- only region that has used the NERC definition of bulk power. Issued a performance-based methodology to determine what is bulk power with backup studies. Guideline 27 is a regional guideline.

- We may need something talks about constraints- relieve IRLs or SOLs. VAR support and voltage support. We will need a number of yardsticks to determine criticality.
- Control center- simpler map back to transmission and generation? Numbers of links and lines? Relationship to elements underlying that.
- Are there other reliability standards under draft- similar process determining applicability to BES elements. Rationalize with them and make it the same? E.g. disturbance reporting standard.
- NERC attempted to do that in Version 1 but fell short. Criteria for disturbance reporting is an early warning gray area. (warning track).
- Determination of bright lines. Focus on cyber security side. Are we in danger of going down rabbit holes?

C. Exemption for Non-Routable Protocols

Scott Mix brought a request from Mike Assante at NERC to the SDT. He asked whether the SDT could confirm that existing exemption for non-routable protocols will not be carried forward into Version 3? Or in the alternative, can the SDT confirm it will be considering the removal of the non-routable exception for future systems and any modifications to current systems? He noted that the impact of a device not a function of communication protocols- better covered in list of requirements on how to secure the device.

Member Comments on the Request

- Non-routable protocols may be as susceptible to attack as routable, e.g. electronic security perimeters are not feasible, patch management and other things, incidence management. Attach those requirements to other cyber devices.
- What was the logic behind non-routable exception? Why did we do this?
- Primarily around electronic protection- firewall kind of device. Because we cant do ESPS, ended as a blanket exemption.
- Wouldn't have a problem supporting this. However there is no implementation plan under CIP Version 1 yet. Can we allot sufficient time for compliance?
- Newly identified critical assets- Version 1 / 2 may take from 6 to 24 months to implement.
- Under version 1- physical security on nuclear sites? This won't happen. Can we accomplish this within the time limits?
- Intent question= CIP 2 version 1- exclusions were deliberate- initial starting point. Couldn't deal with the serial devices issues and left it out at that time. Too much for industry to start with and swallow. Has anything changed?
- Need to address effective security for those devices. Some measure of physical security.
- Implementation plan- version 2- different implementation plan.

- Michael Assante's request- appropriate for Team to respond with a position- our task is to improve the overall cyber security stance of the industry. We will consider what is appropriate for modern and legacy serial devices and risk/vulnerabilities associated with this.
- Many took prudent measures to provide some level of security for those devices serial in nature.
- The SDT will need to do thorough analysis of the implications before we take a stand on this. We shouldn't address now unless we fix everything else.
- assuming that exclusion is on the table to be lifted in version 3, assuming that we appropriately address requirements for serial devices. Ok with assumptions.
- Assuming you mean the future CIP standards instead of system the Team is considering the need for exceptions to the standards.
- This question has nothing to do with version 3 of the standard.
- Grandfathering the non routable as it is
- He is asking if regardless of version 3 of standards, are we going to do something to stop people from changing or replacing systems.
- There is a difference between exemption and exception. Are we talking about an exemption? We need clarification of what he's asking.

Draft Statement

In light of the discussion above, later in the afternoon Scott Mix brought the following statement to the SDT for its consideration:

> Concerning the elimination of the blanket exemption for non-routable protocol connected serial devices as being considered for inclusion in the scope of the CIP Cyber Security Standards:
>
> Assuming the following:
>
> 1. The removal of the exemption will <u>not</u> be applicable to the ~~next version of the standards (Version 3), but not to the~~ existing approved Version 1 or Version 2), <u>but will be considered in future versions of the standards.</u>
> 2. The specific security requirements for serially connected devices will be contained in the "catalog of security requirements" (currently CIP-003 through CIP-009), properly accounting for the threat and vulnerability components to the risk to the device.
> 3. An appropriate implementation plan will need to be adopted recognizing that the number of devices brought into scope by this change
>
> The SDT will recommend that the blanket exemption not continue into Version 3, such that communications to a device will not be a consideration for the impact to reliability of the device.

	4=acceptable	*3= minor reservations*	*2=major reservations*	*1= not acceptable*
SDT Rating	**7**	**9**	**1**	**1**

Comments before the Rating

- Concerns with stating it will be removed. JDB
- "will be applicable.
- Assumptions imply this is the position of the team as a whole. Discussed exceptions but hadn't concluded that Version 3 will need exceptions.
- We haven't made that conclusion.
- The SDT does not intend to include a similar clause in CIP 002 differentiating between routable and non-routable protocols.
- We haven't walked up and touched the elephant.
- Impatient-consider this reasonable- we will consider it in the future. No objection.
- The issue of non-routable protocols will be addressed in…. implying this in the 002 concept. Target of protection may lead you to communications that are routable.
- The SDT hasn't discussed this. Needs to be vetted.
- We don't know yet whether you keep them in or take them out.
- Yes we will look at this in version 3.
- If version 3 is targeted at something else, want to make sure that any decisions incorporate sufficient time for implementation.
- Keep it simple. Eliminating it? Not for Version 1 or 2.
- This is an apple and oranges issue. "Critical cyber asset" What we are doing has nothing to do with this. Different ball game. No idea how connectivity will play into categorization.
- This doesn't belong in 002 but in the individual controls.
- Appropriate to respond- that impact is not related to communications connectivity.
- We don't know how we are handling connectivity.
- If Mike Assante wants the SDT to consider this further, he should provide a statement in advance of a meeting so the SDT can understand the intent. E.g. was it to prevent routable communications from being ripped out of service and replaced with non routable to not have critical cyber assets to apply security controls?
- Interpretation cannot modify standards.
- Scott Mix will provide Mr. Assante with a sense of the team's position on this issue.

IV. SDT CONCEPT PAPER WALK THROUGH

A. Walking CIP 002 Through an Example- Restoration Functional

Jackie Collett, SDT member, agreed to conduct an informal concept walk-through the proposed conceptual approach to CIP 002 with the SDT with an example that starts with identification of the functions. She started by noting that the SDT needs to develop a vision of

what this is going to look like comparing it to designing a vehicle when you are not sure if it's a bike, truck, car, van.

Using restoration as a function, she suggested that a list of generating units, transformers, station busses, transmission lines, and associated loads for balancing as the BES subsystems supporting this function.

Member Walk-Through Key Questions

- One of the industry's question was how much flexibility will we give the entities in determining the applicable BES subsystems. If no flexibility in identification and categorizing, then you don't need to put a methodology in standard.
- Do the supporting pieces together create the BES subsystem?
- How much flexibility should there be for the entity? Should there be pre-determined criteria?
- Will there be consistent outcomes going through the restoration functional analysis first or going through the cyber analysis first.
- If same generator does both restoration and other reliability functions, how to address aggregation in terms of its categorization?
- How to deal with multiple reliability functions from multiple entities?
- Do you need reliability functions mentioned in the standards? This might be part of the development of the standards but would reduce complexity if functions not included in the standards.
- Should there be a "none" under this function as part of the BES list?
- What are the subsystems we need to do BES mapping for?
- Is redundancy protection aimed at failure vs. compromise?
- Should we apply controls at cyber system level, or a methodology to a device level?
- What do we apply controls to: system or components of the system?
- How can we address interconnected systems and systems we are dependent?
- What about interconnectivity with other systems that are ranked differently?
- What is the SDT philosophy and approach- i.e. degree of flexibility vs. prescriptive, guide or impose? How to go about this? What is our strategy?
- Who can determine impact to the reliability of BES? Owner of asset has to even if they have no way to. Is this the right way to go. Who has wide enough view and capable of doing this?

Member Discussion Comments

- One of the industry's question was how much flexibility will we give the entities in determining the applicable BES subsystems.
- There will be an EOP- works for restoration? Assume for this example that there isn't an EOP- assets work together
- Do we expect every registered entity to perform restoration?
- Do these supporting pieces together create the BES subsystem?
- Today it is asset based. Generation as critical asset without transmission being critical?

- List of BES subsystem stuff.
- Do we apply the criteria to BES subsystems or parts?
- Before we apply, do we need to make sure the list of assets is impactful to the BES? If not it shouldn't go into categorization system.
- How much flexibility should there be for the entity? Should there be pre-determined criteria?
- Entities should apply criteria to BES sub system to determine whether the subsystem is in scope.
- Is it the low threshold?
- When we started work of categorization, we assumed that the things have some impact, high, medium and rest is low. Should we define low? And everything else is out of scope.
- 1 for generation and 1 for transmission.
- High impact- part of regional restoration plan.
- Apply the criteria to generation and this is medium.
- High impact- transmission sub system- comprising 2 or more paths.
- When we reference the regional blackstart plan we should acknowledge the potential for gaming.
- Assume that this vehicle has to drive properly. How will this work?
- Is the level a binary evaluation? Are you are either part of it or you are not? You are high or low?
- This may not be in keeping with the way we are trying to look at this as a whole.
- Should transmission and generation be in the same class?
- Compliance- generation operator/owner and transmission owner/operator.
- Consistent outcomes? Go thru restoration functional analysis and have one categorization and through another analysis and come up with another. Does this create extra work? Some pieces will likely do another function. Joe Doetzl agreed to do a walk through the other side of the optional concept approach.
- Once you hit high- you are high.
- Aggregation issue :If same generator does restoration and other functions. Supports multiple reliability functions does that change its categorization?
- Will this introduce too much subjectivity and complexity
- Flexibility=complexity. How much flexibility will entities be provided? If no flexibility in identification and categorizing, then you don't need to put a methodology in standard. Would greatly simplify by giving marching orders.
- Multiple functions from multiple entities. E.g. situational awareness for 2 entities, and control and operations for another. Substation monitored by control center. Another entity with control center does control from station.
- This is part of agreement and oversight. BES subsystem side and the same issue will be there for cyber systems.
- What are the cyber systems associated with "big iron" system that is ranked high? Associated with the big iron system and its function.

- BES subsystem- just supporting the big iron stuff ranked as a high.
- What are the cyber systems associated with big iron?
- Impact categorization. Developing criteria- mentioning the function and the BES subsystem. All within the criteria. Do you need reliability functions mentioned in the standards?
- This would be part of the development of the standards- would reduce complexity if functions not in standards.
- From a compliance point of view this might be an issue. The reason for first list is so you can know they are all categorized.
- BES sub system based on reliability function with no H/M/L criteria- where would that place.
- Will we define the low threshold or will this be done by the development of the list of BES subsystems that are in scope.
- Lows are now a "catch hold." Criteria for high and medium are specified and if it is not in those then it is placed in a low category functioning as a default category.
- If we introduce a "none" category, then we need a low impact. Could be a "none" under this function. Would the "none" be part of the BES list?
- We developed a list of functions and BES mapping. Are all essential functions represented by one of the BES mapping criteria? Do we need to start with functions? Make sure all essential functions are represented in the mapping.
- Need a way to check that all are included in a bucket.
- You would have a restoration criteria? Yes. Ensure all functions are captured in the mapping criteria.
- From impact categorization, it is easier to think of generation, transmission etc. vs. functions.
- If we do the BES mapping of functions into the criteria, we need to make sure we have covered all the functions at appropriate level in the criteria.
- How does BES subsystem fit into this?
- Is the entity going to determine what sub systems are or will a table be provided.
- What they would like to see, if you are a generator and you perform this function and above this many megawatts, you are a high.
- Start with the asset not the function. Risk is you will miss systems supporting functions that are not part of the asset.
- Mapping BES subsystems to reliability functions. Current assumption- impact criteria would reference some finite set of BES subsystems.
- Stayed away from generating stations. Stating the impact criteria in terms of BES sub systems? Yes.
- Would have minimal set of subsystems- if you have these kinds, performing these functions, have to be evaluated as a generation subsystem.
- We need to define the reliability functions in terms the industry can understand.
- Reliability functions- every asset involved in situational awareness or balancing load and generation.

- What are the subsystems we need to do BES mapping for?
- How do we work in those doing engineering studies now to do ranking of assets? Has the universe been covered in these reliability functions?
- Jeff Gillen ATC noted that the industry has done a lot of work already. There may be an industry problem if ALR and existing planning standards aren't tied to this. Things should be done with existing methodologies if possible. Planning criteria for category A, B, C etc. Category C event is looking from a common mode failure of a cyber attack.
- Industry understands the current methodology. Consider building on it. Analysis looking at cascading.
- This is one of the inputs for coming up with the list by the Mapping Group.
- We have identified a major stumbling block on identification of BES sub systems. However an alternative appears available for building on what exists today.
- Categorizing cyber systems. It is not until Step 5 of methodology and finally talk about cyber systems.
- BES subsystems and categorized and now identify BES cyber systems. Look at BES cyber systems (SCADA, control system). Look at all of BES systems/
- Assume we identify BES cyber systems that support reliability functions of the BES.
- Identified- to the asset which supports the functions. Generating stations- remote RTU, SCADA, master, blackstart, local in plant controls. How do you then apply the controls. Do an analysis of your cyber systems.
- Which subgroup is looking at defining or describing a cyber system? Here's its cyber system- in house plant controls. Apply appropriate/adequate controls.
- If compromised cyber system (integrity, confidentiality, reliability) how would it impact reliability of BES.
- None not low. Cyber standard. If no cyber stuff, it doesn't apply.
- Functional impact analysis. What would it mean to impact restoration? E.g. metering in the station provides situational awareness, but not highly required. If start/stop controls rely on meters. Meters then part of a start/stop system.
- What is the basis of being low?
- General criteria h/m/l. If it is compromised can you continue to perform your function.
- Blackstart relying on remote communication. Regional restoration plan is a way-documented.
- Final step is to combine the assessment to the look up table. How many systems are you protecting for?
- Redundancy is another complexity issue. Identify the primary preferred blackstart paths. Three primary blackstart cranking paths. Protect all the same. Need to protect any of them. What are you protecting for.
- Redundancy is protection for failure not for compromise. Issue of redundancy- dealt with at identification of BES subsystem.
- How should we deal with redundant cyber sub-systems? Should redundant equal same?

- Planners might argue that redundancy has an impact- might not solve all but most.
- Standards today- generators- engineered the utility grid so that nothing is critical?
- On the cyber side- even if you have four redundant systems, if one gets the virus, all may have it depending on connectivity. Have to plan that way.
- Issue is if you don't protect those 2 systems, all could be compromised through cyber means. Often don't know when compromised.
- Set of cyber systems, applied an impact category on it. How do we apply our controls? Local control system in a generating plant.
- Can we have a meaningful discussion of controls?
- Is a cyber system a DCS? Targeted protection. What is a DCS? 1000s of cyber systems or one system with an impact rating.
- How much flexibility should there be for the entity?
- If you apply single category to that is is clear what you need to do, but it takes long time to get done.
- Multiple levels of granularity- don't know what to do and we risk spending all your time figuring out what to do.
- Simplicity vs. complexity. You need the analysis so to apply security controls.
- Currently defining down to a CCA level. It may be the DCS and a subcomponent brings along the baggage of the DCS.
- Define target of protection- several controls will be common across
- Risk management- and address TFE.
- How does this work within a FISMA framework. DCS at Hoover. Microprocessor devices. Expectation from NIST?
- The understanding in NIST is that you analyze the security engineering process on your system. Go through and determine if it is a moderate impact system. Here are security controls I need to comply to the system.
- In order meet this requirement, you need to meet this access control by applying to central access control management.
- E.g. measurement of flow on spillway.
- "Scoping and Tailoring"- is the NIST term. Scope it out. Provide rationale as to why not. Oversight on process? As long as you can argue and win with your IGs. Puts lots on the auditor for quality types of assessment.
- Should we apply controls at cyber system level, or a methodology to a device level?
- As a team should we think about a different path?
- You may need to go down to the equipment level not stopping at systems.
- Go further down from DCS system level to the component level to effectively apply the controls.
- Scoping the target of protection- you need to tailor it? Do we further subdivide? TOP-DCS.
- DCS: 1 or 2 primary processors/computers, operating work stations, engineering work stations, HMI, slave components, data acquisition components, interfaces to business system.

- TOP universe of systems you need to protect.
- What do we apply controls to: system or components of the system? It will depends on the control. No cut and dry answer.
- Risk management framework uses compensating controls. You can meet the intent of control on component by doing other things.
- How have the federal agencies implemented 800-53 to field devices. Apply to individual level?
- Use a 'Control inheritance' concept and use the "tailoring and scoping" exercise. Come up with Compensating controls. All of this is documented in the security plan appropriately. Acceptance of risk is not allowed by FERC. How can we develop a hybrid approach?
- Puzzle pieces are fitting together better through this discussion.
- One-to-one mapping between reliability functions and BES subsystem may not be possible.
- How can we address interconnected systems and systems we are dependent?
- Identified cyber system focusing on and components making up system.
- What we haven't done is defining target of protection.
- Determine interconnected cyber systems that support the BES functions. E.g. DCS- in the model is control equipment- interconnected cyber system? It depends. On how you connect workstations to them. Network design is important to note.
- Once BES system is in scope. We need to determine how the system resides in the architecture and what are the components within system.
- Does ranking of components consider the factor of functions or connectivity?
- Connectivity defines controls or high/medium/low.
- Distributed control systems- plant controls- generator.
- What about interconnectivity with other systems that are ranked differently?
- Typical DCS may not communicate off campus.
- Assumption that identified TOP- done the methodology- interconnected systems inherit the rankings. TOP – assumes BES cyber system is a single element? Drawings suggest already part of system.
- E.g. Conflicker worm- hooked up to internet- through dumb workstations.
- Difference in understanding and perception- of a system from an operations side or a data side. This is the old model- look forward to new model.
- Target of protection model value- what is my realm of influence if compromised?
- Access control is key to security- network, operating, application and facility layer.
- TOP- e.g. email server. High impact. TOP control center- Rules and what applies- need to distinguish- unique target areas. TOP- showed how when you got to BES cyber system- interconnected nature- won't know where to place your control. Email server- negligent case of putting on same network at DCS switch.
- Inheritance of levels into collateral systems- apply same analysis on these systems as we apply to other. Impact on mission- each cyber system impact/support mission- calling that reliability functions.

- TOP- apply the same analysis to these. Some may rely on email systems more than others in terms of impact – fulfillment of mission. We learned they needed redundancy of email systems.
- When federal organizations categorize their systems- they consider the potential impact to missions, assets or individuals. Consider potential impact to other organizations they are connected with.
- The lowest level needs some level of security.
- The reason systems outside of BES cyber system. In TOP collateral- could be compromised and could compromise. Required for operation of BES cyber system. Impact on BES cyber- leads to categorization. This is not because of their inherent effect on reliability function itself.
- Concept paper does good job of explaining in TOP- have to secure because they could be a entry point for compromise.
- Identifying Cyber system and TOP. Does TOP just scope how you hare defined your system. Helps you determine what you need to protection.
- Collateral systems- if there are no requirements- won't make it into a standard.
- TOP- 3 in paper- prototypes- 3 environments we built them for. Shouldn't be hard fast rules of what should be where. Auditor should look for this.
- Higher level steps in the process. Concerned about value added.

Concluding Comments- Functional Approach Walk-Through

- What we defined the bicycle- reaction on the whole step through
- First steps- some were confused about the value adding of the step. Think about eliminating and moving on to important steps.
- Last step- TOP passionate about.
- Any candidates for eliminating or simplifying?
- 1st part is more conceptual and complicated. Latter part is more grounded.
- 1st part is new where applying security controls is not new.
- This can be can be simplified. The complexity may be more evident in the development process, where the final standard may be simpler to present.
- TOP- Subgroup 4. Will come out in the controls section. Put a boundary of some sort around the system and protect it.
- We are moving away from perimeter protection and move towards influence control.
- There remain fundamental gaps between 2 groups approaches.
- Need to address how much flexibility. How will we present this to industry? We need a simpler recipe.
- This remains Confusing. How do we expect the industry to understand this? Too complex and confusing. Industry won't buy. Congress will ask whether you have secured the system and they feel that the industry not being forthcoming in their comments regarding money.
- We should seek to integrate the pieces or simplify the entire model.

- It this predicated on the maturity of industry? Cyber security-maturity models are still 3-5 years out.
- What is the SDT's understanding of the maturity level of the industry in terms of security? Don't have a good feel for where the industry is in thinking and acting on this.
- Simplifying CIP 002 is going to be imperative.
- We should develop a strawman set of thresholds to test drive among us. Today's exercise helped show implications of the concept and we learned a lot. What do we need to do to move the level of maturity in the industry along. More proscriptive may be justified today. Not traditional reliability.
- What is the SDT philosophy and approach- i.e. degree of flexibility vs. prescriptive, guide or impose. How to go about this? What is our strategy.
- Give the industry some flexibility to make some of their own decisions? Trying to get away from the current scheme? How much less latitude. If we offer room for judgment, we will give latitude.
- Are we blending the two? Hard limits, low water mark. Entity could provide alternative through analysis. Implication is the complication in the standards?
- Low water mark- opt in and add to it- increase their compliance footprint.
- Engineering analysis needs to support any thresholds. Do this as part of setting the standard.
- Seek simplification with how to go about this. Achieve some simplification: workable, clear and doable.
- Readiness assessment- was eliminated – had some excellence of operation.
- Compliance audit- immature organization. Some organization do betters than others.
- Audit- prohibited from going and making kinds of recommendations.
- Review existing and trying to develop more performance based standards?
- Should lay out what you need to do vs. how to do it.
- The problem with CIP 002 may be 003-009
- What would happen if left risk methodology in CIP 002. If fixed 003-009 would every one say.
- Response to industry from the drafting team should convey that we have read comments and we are considering things.
- De we make time to try another model? Model is in the concept paper. It identifies for us things we could keep in mind.
- Who can determine impact to the reliability of BES? Owner of asset has to even if they have no way to. Is this the right way to go. Who has wide enough view and is willing to do this.
- Consider the Abeline paradox regarding the impact of group think.

B. Walk-through- Cyber Approach

On day two, Joe Doetzl reminded the SDT that the concept paper offered entities the choice of an alternative approach that started with the cyber systems and map those. The concept suggested that the different starting points should result in the same ending point. The

complexity comes from the BES mapping and reliability functions and different levels of impacts on each of those systems. The question is whether if you start with the cyber system it will be a simpler approach to cyber security than starting with the reliability functions.

Member Walk-Through Key Questions

- What would a responsible entity do in determining what should be in the scope to protect?
- On cyber side, if the cyber is deemed impactful does it inherit the impact level/ of the function supporting the BES assets? Is anything not impactful not in scope?
- For the assessment of functions or on asset supporting reliability function, do you need an intermediate step?
- Do we agree we want to have multiple levels of impacts on function so we can connect the controls to those?
- Can the assets mapping be capable of translation to a systems approach?
- Any way to diminish the impact of the audit process on low impact sites?
- What does it mean for a BES cyber system to support a reliability function. Is it info for situational awareness, control to generation, etc?
- Are there systems we unequivocally expect to be protected? Basic SCADA systems shouldn't have a minimum set of auditable controls. Even isolated generation. This might take some complexity out.

Step 1- Inventory Cyber systems Involved

At the entity level, for this example, assume a complete inventory of cyber systems. A list of cyber systems you may find in a typical utility could include:

- Customer info and billing systems
- Financial info systems
- HR system
- EMS system
- Blackburn generating unit (2) and associated control system. (black start system)
- Load Master Units 1-8-single control system for all units
- Distribution automation system.
- Protection system (relays)

Member Comments

- 1000s of systems that won't fall into list. Monitoring, desktop systems, Corporate info security vs. power. Guidance will be needed to industry help understand what should be included on list. For example, what is the process for ruling out the HR system?
- Assume multiple security officers and do this more than once.
- What would a responsible entity do in determining what should be in the scope to protect? If start with cyber system need all cyber systems in inventory.
- Assume separate corp. systems from control? Manageable group of systems.

- At some point make an analysis that it isn't connected with reliability- impact categorization?

Step 2- BES Mapping for These Systems

Joe Doetzl suggested the key question here was do these systems directly support the reliability of BES?

- Customer info and billing systems NO
- Financial info systems NO
- HR system NO
- EMS system YES
- Blackburn generating unit (2) and associated control system. (black start system) YES
- Great Big Coal Burner Units 1-8-single control system for all units (big enough) YES (based on functions-
- Distribution automation system. ?? Depends- YES
- Protective system (relays) YES
- Smart grid (maybe, depends)

Member Comments

- AMI unit?
- Will distribution be covered? No, Federal Power Act- excludes distribution.

Step 3. Perform Impact assessment to determine what level of impact cyber systems on reliability of the BES.

BES Mapping Subgroup will be helping to address this through their mapping. In the alternative, any connection must put control on. We should give industry flexibility in choosing which controls will get them to baseline security for their assets. Ask the question, what is your worst-case scenario if this cyber system goes bad do the assessment.

Member Comment

- Assessment of functions or on asset supporting reliability function. Need an intermediate step.
- EMS will be easy case to tie to BES.
- In our BES mapping document we provide a methodology for saying H/M/L. Maybe there is a way to translate John Lim's work to get to H/M/L buckets.
- Complexity lies in that mapping.
- Alternative is if there is any level of impact- that dictates what you need to do.
- When do you look at inputs to the system to determine whether in scope? TOP approach?
- Step 4- look at this in examining security of each system. If our EMS system has a connection into HR system, brings it back in. Running on same server you are back in.

- Need to add a lot of detail to bring this together. We haven't done what this implies.

Step 4. Apply controls appropriate to the level of impact each cyber system needs to have.

Member Comment

- How will the level of impact be done?
- Should we do away with the impact of the cyber system itself? If the cyber system falls into category because it falls within one of the BES functions- That system automatically falls in the high. Have to make assessment of what is the effect of the cyber system if compromised, on the BES subsystem and make a determination then of what category would fall in.
- Confidentiality, integrity and availability of the system lost- resulting a categorization at H/M/L. Assessing the EMS system and go to functions mapped to- go to table being developed by John Lim vs. a matrix. It will have the BES cyber system and will help determine what the impacts would be using the impact "look up tables." Alternatively, no flexibility, this is set in advance.
- Choose in standard development process. Does your cyber system support reliability? If yes, apply baseline set of controls.
- SM: how do you do #3.
- Look at impact- generator- load support and system stability, ability to provide megawatt, loss of mw in short period of time. In restoration it doesn't. Depends on which impact you are looking at.
- Do we agree we want to have multiple levels of impacts on function so we can connect the controls to those? In end multiple levels of cyber systems impact on function.
- Categorization of cyber assets- if impactful, all or nothing, similar to CIP today.
- By starting with ALR, have we caused confusion? This e.g.- pp 17, entities may choose to use an alternative approach. Alternative method- straw dog.
- While the industry is not necessarily that familiar with the ALR, start with systems that are essential to the tenets in the ALR- e.g. to restoration. All the systems that support these things. Cut down the confusion about inventory.
- Mapping that John Lim has done has been on assets not systems. Maybe able to translate it to a systems approach. Customized to provide tool for systems not assets.
- Don't think this departs from 3 levels of impacts. Binary on cyber analysis side. Still have mapping to subsystems with H/M/L. You just look at whether it supports.
- 2 levels of impact analysis. BES asset and cyber impact analysis on assets/functions. Simplifying either one into binary step. Simplifying both would be drastic and less palatable.
- Complexity of impact assessments is large. In the end you have appropriate controls, are we better served than by picking a set of controls. Put on everything. Don't know yet in terms of controls.
- MITRE study that Jason Marshall talked about CIP 3-9 didn't meet the NIST moderate baseline.
- Would get industry documenting controls.

- Are we taking steps backwards? Not taking account levels. Check everything and add controls. Trying to do too much on cyber stuff and not worrying about BES first.

C. Lessons learned from the Walk-Throughs

SDT members discussed what was learned through the walk through of the functional and cyber approaches. Below are a summary of their comments:

- The two walk-throughs indicated there is a similarity in complexity in both approaches.
- The issue is how do we eliminate complexity not on which side we start the analysis. For example in the cyber approach the complexity is contained in Step 3 whereas in the functional approach it appeared in Step 2.
- Neither is more complex that the other as it will depend on the environment and context. Large number of BES and small number assets may start on cyber side. Small number BES and lots of cyber may want to start on the BES functional side. Neither is wrong.
- The categorization process for government systems is not cut-and-dried with ambiguity in it. Organization provides enough evidence to bosses that this is a correct categorization. Need something more cut and dried. Possibly thresholds. More consistent and cut and dry.
- Rather than dwell on 1 method that identifies 5K vs. 50K then big issues, we should be getting the same generally from both.
- Confusion about this in terms of what it would mean in changes. Simplification comments came. Simplify by saying you have to do a lot to everything. Flexibility in what we do to them. The latter is what we have today. Here is everything you have to do.
- If you simplify step 3- broad brush- not in the paper. Option #1- broad swath doing something to lots of things, you figure out what you want to do.
- The SDT should put in a lot of work in reducing complexity of the process. Make it clearer on where we are heading. On cyber side, is the cyber impactful, then it inherits the impact level/ function it supporting of the BES assets. Anything not impactful is not in scope. Could be one way to simplify the process.
- Eliminating cyber h/m/l.
- This is simpler than yesterday- fewer steps. Took less time. In support of simplifying the process. 2 impact assessment one for assets and one for systems.
- One is binary and the other is 3 levels.
- Is the team in support to simplifying the approach?
- Reducing the assessment to one that is binary vs. 3 levels to simplify?
- Assumed the BES subsystem impacts. Had the same complexity. Still have to look at BES subsystems.
- Performing impact on reliability functions.
- Define what it means for a BES cyber system to support a reliability function. Is it info for situational awareness, control to generation, etc?

- What does success look like for us at a Team? Do we get consistent and good answer going on both approaches. Part of problem in evaluating 2 different approaches. When everyone applies, do we get the same answer and does it provide BES reliability.
- Success=
  1. multiple groups of people running through the process with same inputs and requirements reach the same conclusion.
  2. End result passes the smell test- engineering analysis would agree with the results.
- Having too much is not as dangerous as not enough of the right thing.
- Success= a clear enforceable standard that doesn't create an unnecessary hardship on entities.
- Reliability functions important- protecting something and knowing why this is beneficial.
- E.g. generators- size, time and connectivity are considered. Focus on reliability functions can demonstrate reliability of BES.
- What will be the ultimate impact on entity?
- Complexity- current standard- complexity at the entity. Take complexity into the standard, doesn't go away.
- Are there systems we unequivocally expect to be protected. Basic scada systems shouldn't have a minimum set of auditable controls. Even isolated generation. This might take some complexity out
- SM: hide complexity behind the scenes in supporting documents and have some thresholds that are not arbitrary and capricious. Some threshold number a basis in power system engineering. Generation transmission and control centers.
- Simple- multiple step. Spend time figuring out the buckets.
- 4 Interconnections- transmissions characteristics within and between. 19 # in JLs document. Publish paper that justifies thresholds.
- Sacrilege to the planning and operating group.
- Simplifying what the expectations and obligations of what industry have to do.
- Rod: H- depends on what controls you are talking about. No explanation of what is happening downstream. Make decisions to place assets in too high a category. Costing a fortune for daily maintenance.
- More heavily weighted toward a high impact because of implications in implementing controls.
- Set of criteria- you have some high, more in medium and a heck a lot in low category. More rational and justifiable methodology.
- What will be the bucket sizes 10% less high, 40% less medium, 50% low. If we that many high assets something is wrong with the criteria.
- Yes we could come up with some numbers. New CIP 005 controls. 1000 RTUs and downstream devices with user management on them.
- Come up with classification levels and set of controls. Look at how applies to field distributed devices, substations, etc. This is where the push back comes from.
- Supports when you look at control system. what are the components of that system? Focus on impact and the function of device. This helps to set up boundaries.

- Impact analysis of cyber system: determine what is it's span of control? A relay on a single line is a small span of control. How much control with a single cyber system.
- Does low not mean zero? Baseline everywhere.
- Address cyber systems that have no impacts.
- Do we have a good handle on what is industry security posture? Significant number of entities avoiding audit world. Is there another way- certain auditable levels with high. Any way to diminish the impact of the audit process on low impact sites?
- ERCOT implemented for all systems- technical security framework. Figured out 1 set of rules. Biggest headache is documentation of compliance especially doesn't contribute to security baselines. Things in the "high" bucket auditable compliance. In reliability business, key to reliability is change control. Integration testing etc. Concerned about federal model and the volumes of documentation that may be required.
- How should we treat aggregated BES systems- 30 generators. In the categorization we should give consideration to aggregate assets with their own impact assessment performed vs. based on asset.
- Bringing up concept Jackie Collett brought up yesterday on a subsystem basis. Meeting multiple criteria at medium. Does it bump up from medium to high?
- When compound a bunch of functions- have to look whether it magnifies the impact? Is there any consideration for some kinds of redundancy?
- On the cyber side- span of control- from one plant to lots of plants. Do you factor in redundancy? Master control center and remote units. Are each as important as the Master?
- Control Center- doing something for one generation station. Cyber high. 1 low BES vs. 30 low BES.
- Span of control of asset that has overview over multiple.
- Didn't expect that system would get down to that granular level.
- Evaluating device as a control system. Cyber system has a common impact to multiple BES system- analyzed under a span of control.
- If I have connectivity to systems what is the scope of influence. Address a field system and a breaker on in terms of scope of influence? Span of control? Can you impact a high enough level e.g. of mw.?
- If on the same network- can I impact multiple units? Other considerations that are not covered.
- Work through these issues on a case study basis.
- BES subsystems- stretched thin when you deal with these sorts of things, e.g. high pressure oil lift system.
- We need flexibility so that standards lead you to the right conclusion.
- Area impacts. The control center is where the impact is assessed.

V. SUBGROUP REPORTS TO THE SDT

On the first day the SDT heard and discussed reports from each of the subgroups. The subgroups then met on second day to review and respond to the comments and suggestions of the SDT.

A. Reliability Functions Subgroup Reports, *Rich Kinas*

1. Day One Report

On the first day Rich Kinas reported, on behalf of John Varnell, on the Reliability Subgroup's work since the last meeting covering the following points:

- Defining Functions Critical to reliable operation of the BES
- 9 functions initially but after making some changes up to #5 there are probably only 8 functions
- "Balancing Load part of controlling frequency"? Leave it stand alone to make more sense to the industry
- Not planning to go further than 3 levels down.
- Tried to identify the functional subsystems that would have to be addressed.
- At which step of the process, do entities fall out of the flow? Consider within each of the 4 subgroups
- The BES Mapping subgroup (John Lim et al) is setting up thresholds.
- The SDT needs to be thinking of the subsystems and pieces of sub systems that will perform these functions.
- Address and protect everything in subsystem whether you own it or not.

Member Comments

- The Subgroup got feedback from John Lim's Mapping Subgroup.
- At the highest level- look at ALR and refine what this means in the world? All the current reliability standards are direct descendants of the ALR.
- Burning question- what do we do with this list? Input to scope the BES subsystems and cyber systems. Or are we defining impact? Where do we go from this list?
- The Subgroup wrestled with this. The sooner we define impact, the better. Do we do this before addressing subsystems?
- Impact criteria table-of several pages long- Will industry want this? Understand this?
- Create a list of questions that each entity had to answer, result would determine whether they meet the criteria or not? And at what level?
- At what level do you ask those questions. For every function? Take it to level that is feasible by December. Cant go to 3rd level.
- Look at individual functions vs. very generic criteria
- A question at top under dynamic response-
- BES Mapping subgroup – not going to go towards an increased granularity of functions. Define the scope of what subsystems should we apply the impact categorizations to. List of what must be included and categorized
- Impact criteria- high level only is the focus. List will help entities come up with list of subsystems that are required to be impact categorized.
- E.g. control and operation function-

- Would it be more beneficial- Should the mapping subgroup requirements fall under these? May not map to the functions.
- Some mapping criteria for every functions? Perhaps but extremely cumbersome and obtuse.
- Invested lots of effort in these functions to center the standards around. If we use these functions to get the subsystems it will move the complexity to Jackie's subgroup.
- This 3rd level of detail looks like BES sub systems. E.g. protection systems down to detail, sounds like a BES subsystem.
- Used these to trigger what we were thinking.
- This has been good work but the SDT is struggling with where are we going with this? What is the vision we are trying to put these pieces together to do?
- Take first one and flow all the way through. See how it might work.
- Keep looking for the integration of the problems/challenges.

2. Day Two Report

- The subgroup has redistributed its members into other subgroups.
- We will continue to try to put more definitions around what was meant by different functions.

Member Comments

- What we have from the subgroup is a list of functions. It would be helpful to have a brief paragraph on each and what is meant for benefit of and guidance to the other subgroups.

B. List of BES Subsystems/BES Cyber systems Subgroup Report and Reflections on Industry Comments, *Jackie Collett*

1. Day One Report

Jackie Collett noted the subgroup had no further meetings since the August Charlotte meeting. She noted that Jim Case and Matt Greek from Operating Committee are now participating on the subgroup.

2. Day Two Report

Jackie Collett presented the Subgroup's report on day two noting that they still need to put time and effort in defining what these BES subsystems are and move into drafting requirements.

Member Comments

- Consider some of these things for simplification on part of this? Requirements based on reliability functions- identify things they are doing that are more important. Maybe on the cyber assets.
- Agree- 2 modes of impact on BES assets and systems. Are we going to continue along both modes of analysis? If not, are we going to utilize impact assessment of both cyber assets and systems? Simplify the two impact analysis.
- BES identification of assets and impact analysis of BES assets.
- Streamline one of those impact analysis. Impact analysis of the cyber system. Will be utilize the output. So they get appropriate direction from the meeting.
- Concern about removing a necessary part of what we are doing.
- Simplify the process. Need to fill in a few more gaps. Look at some of these issues. Don't have all the pieces. This won't be simple. Need to have something that ultimately looks simple.
- Some gaps that need to be filled in. BES subsystem side work. Look at JL's work has done in detail.
- Try to determine where you get any simpler.
- May be an issue that we need to explain how we got to where we are.
- A lot of the complexity in the process is work the SDT has to do. Not necessarily what gets into the standard. Concept paper was similar to this as well. Get requirements on paper that are simple for entities to follow.
- Agree. Identified an ideal vision- down to a "cable driven" methodology. Team still has to go through the exercise. The gaps need to be identified since they will guide the empirical thresholds we need to establish.

Jackie concluded noting they would not say no to volunteers joining them on the work ahead.

C. BES Mapping Subgroup Report and Reflections on Industry Comments, *John Lim*

1. Day One Report

The Subgroup met September 3, 2009 to continue its work in developing the BES Mapping draft markup. The Subgroup was joined by members from the Functions subgroup. John noted two major issues the subgroup is dealing with:

- How do we validate an engineering study? Approval by regional reliability assurer? TFE type process? Need to look at this more. Not a lot of entities currently performing the role of reliability assurer.
- "Misuse"- need to describe this term. What is meant by this? Candidate for NERC Glossary

2.1.6- This addresses how transmission operators or owners classify as high if servicing a generation owner. Currently doesn't have to notify owners of the impact status of their BES systems. This might be an overall point or spread throughout. Thresholds- we can use as long as they are based on some method for the entity. Needs to be the possibility of a challenge of validity through engineering study. Use the numbers with some caveats?

Member comments

- Validation of engineering studies? A number of places reference this. How is this done?
- 3rd party approval is probably not the right approach. Big issue in terms of quality control.
- Can't have "fill in the blank" standards according to FERC. E.g. Regions will develop something everyone in region will have to follow. What we can do, NERC wide standard with different thresholds for different regions or interconnections.
- One of the changes in this version- Eastern and Western and other interconnections might have different thresholds.
- Criteria combines identification of functions and subsystems? Make the process less complex. Would it make sense to do a gap analysis on this criteria? Would reduce complexity.
- Welcome the reduction of complexity. 19 different criteria for this piece alone. How can we compress and simplify? If gap analysis can do this we should explore.
- Concerned that this drafting team puts out hard numbers without engineering analysis behind it. Somehow we need to address this head on.
- These numbers will have to have an engineering basis.

2. Day Two Report

John Lim reported following the Subgroup's meeting on day two. The Subgroup is drafting a set of requirements for High, Medium, Low. There are still questions on how to handle industry studies. In terms of generation sub systems, we are using terms that are not very well defined. E.g. subsystems in generating stations. The terminology we are using must be precise and consistent. We need to get together with Jackie Collett's subgroup. We don't believe there should be an expectation of a 1-to-1 mapping for every function. The rest of the subgroup's work will need to be coordinated with Jackie's subgroup and include input from John Varnell's functions subgroup and from the OC and PCs get something in a better form. Subgroup 1 has participated in past meetings.

D. Cyber Analysis Subgroup Report, and Reflections on Industry Comments, *Phil Huff*

1. Day One Report

Phil Huff delivered the initial report noting his confusion about how the subgroup should go forward. BES impact categorization as the black box is a failed assumption. Our team could reduce some of the complexity in the process. We assumed each function mapped would have an impact categorization so we could combine through a "look-up table."

Member Comments

- External cyber system- address that as a control?
- Target of protection- no requirement just trying to get definition down.

- Our problem is that we are dependent on how the pieces fit together.
- We should focus on impact subsystem.
- Need to determine what we are going to do with the reliability functions.
- Our team's confusion results from the fact that we don't have a clear vision as to how this fits together.

2. Day Two Report

Phil Huff noted that his subgroup would huddle when the SDT breaks. He noted that there may not be as much confusion as we stated yesterday. Impact criteria that are involved in John Lim's one-to-one mapping. Our team needs to develop on the cyber analysis side.

E. Definition and Selection of Controls Subgroup Report and Reflections on Industry Comments, *Keith Stouffer*

1. Day One Report

Keith Stoffer presented the subgroup's report. He noted that during Charlotte meeting the subgroup developed and presented an example based access control. We pulled together into one location the access control referenced in many places. Keith mentioned that the format is new and the subgroup doesn't know if this is acceptable. Need to nail down as soon as possible what is an acceptable format.

Member Comments

- Scott Mix noted an informal discussion with Gerry Adamski at NERC who indicated an openness to doing something to meet requirements. Front of each. Note the categorizations that it applies to.
- Have a table and checkmarks for those that apply.
- Use e.g. re-format.
- Access control- come up with sample sets, won't be meaningful until related to.

2. Day Two Report

The Subgroup will seek to nail the format decision down with NERC. E.g. exemptions. How we deal with conditional requirements? How do we deal with "Requirement"- H/M/L Critical path. What if we run into a brick wall? This is challenging as it is a moving target. Joe Buchiero will send latest work in progress of the Subgroup to all group leaders.

Member Comment

- Select an e.g. that has differences between high, medium and low.

VI. NEXT STEPS AND CLOSING

A. Industry Comments Review and SDT Response

- We will need to take regional differences into account in the standards.
- We haven't yet determined whether there is a null set or just H/M/L. Big issue we need to come to consensus on early.
- Concerns around increasing scope of what we are doing. Have to address this.

Gerry Freese agreed to draft a statement on behalf of the SDT for publication in NERC's newsletter thanking the industry for their input on the concept.

The Chair reviewed with the SDT the schedule for the next couple of meetings reminding members that at the conclusion of the October meeting in Kansas City we hope to have a single text of CIP 002 which we can refine in November and December. She thanked the members for their hard work together and in the Subgroups and encouraged them to continue working to make headway on each of their charges.

She noted that she would draft up the letter to the Standards Committee Chair based on the SDT's discussion of the TFE and Urgent Action approach at the August meeting.

Members completed an onsite meeting evaluation form *(See, Appendix #3).*

The SDT adjourned at 3:45 p.m. on September 10.

Appendix # 1— Meeting Agenda
Project 2008-06 Cyber Security Order 706 SDT
14th Meeting Agenda
September 9, 2009, Wednesday - 8 AM to 5 PM PDT
September 10, 2009, Thursday - 8 AM to 5 PM PDT
Western Area Power Administration, Sierra Nevada Regional Office
114 Parkshore Drive
Folsom, California
(916-353-4416)
NOTE: Subgroup Meetings May Not Have Access to Telephones and WebEx

Proposed Meeting Objectives/Outcomes

- Review the CIP 002 Workplan going forward
- Receive updates on TFE, VSL/VRF and related cyber security efforts
- Receive an overview of industry comments on the SDT concept paper
- Receive and discuss reports from CIP 002 Subgroups identifying key issues and coordination points
- Convene CIP 002 Subgroup meetings
- Receive and discuss Subgroup reports on progress made and responses to industry comments
- Agree on Workplan, next steps and assignments

Draft Agenda

Wednesday September 9, 2009

8:00 a.m.	Welcome and Opening Remarks- *Jeri Domingo-Brewer* Roll Call; NERC Antitrust Compliance Guidelines Facilitator review of August 20-21 Charlotte meeting summary and adoption
8:20	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Jeri Domingo Brewer and Bob Jones*
8:30	Review of CIP 002 Workplan and CIP 002 Subgroup Process- *Stu Langton*
8:40	Webinar Report- *Jackie Collett & Phil Huff & Jeri Domingo Brewer*
8:45	Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure – *Jeri Domingo Brewer and Scott Mix*
9:15	Update on VSLs/VRFs- *David Taylor or Scott Mix*
9:20	Update on other related cyber security initiatives- *SDT Members*
9:30	Overview of the Industry Comments on the Concept Paper- *Scott Mix*
10:00	Subgroup Reports to the SDT 1. Reliability Functions Subgroup Report and Reflections on Industry Comments, *John Varnell,* Q & A
10:40	*Break*
10:55	2. List of BES Subsystems/BES Cyber systems Subgroup Report and Reflections on Industry Comments, *Jackie Collett*, Q & A

11:35	3. BES Mapping Subgroup Report and Reflections on Industry Comments, *John Lim* Q & A
12:15	*Lunch*
1:00	4. Cyber Analysis Subgroup Report, and Reflections on Industry Comments, *Joe Doetzl*, Q & A
1:40	5. Definition and Selection of Controls Subgroup Report and Reflections on Industry Comments, *Keith Stouffer*, Q & A
2:20	Coordination Discussions and Plans among Sub Groups
2:45	Subgroup Meetings *(at various locations)*
5:00	*Recess*

Thursday **September 10, 2009**

8:00	Subgroup Meetings
11:00	Welcome and Agenda Review- *Jeri Domingo-Brewer*
11:05	Subgroup Reports – *Plenary Session* 1. Reliability Functions Subgroup Report and Reflection on Industry Comments, Q & A
11:50	2. List of BES Subsystems/BES Cyber Systems Subgroup Report and Reflection on Industry Comments, Q & A
12:35	*Working Lunch*
1:00	3. BES Mapping Subgroup Report and Reflection on Industry Comments, Q & A
1:45	4. Cyber Analysis Subgroup Report and Reflection on Industry Comments, Q & A
2:30	5. Definition and Selection of Controls Subgroup Report, Q & A
3:15	Discussion of and Agreement on Subgroup Coordination Strategies
3:30	Review Work Plan- • Review Next Steps for Subgroups and SDT and the creation of a single CIP 002 text
3:50	Review Proposed 2010 Meeting Schedule
4:00	Review October Kansas City, Missouri Meeting Objectives
4:10	Meeting Evaluation
4:30	*Adjourn*

Appendix # 2 Attendees List
September 9-10, 2009 Folsom, CA

Attending in Person — SDT Members

1. Rob Antonishen	Ontario Power Generation (Friday)
2. Jeri Domingo-Brewer, Chr.	U.S. Bureau of Reclamation
3. Jim Breton	ERCOT
4. Jackie Collett	Manitoba Hydro
5. Jay S. Cribb	Information Security Analyst, Southern Company Services
6. Joe Doetzl	Manager, Information Security, Kansas City Pwr. & Light Co.
7. Sharon Edwards	Duke Energy
8. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
9. John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
10. Frank Kim	Ontario Hydro
11. Christopher A. Peters	ICF International
12. Scott Rosenberger	Luminant Energy
13. David S. Revill	Georgia Transmission Corporation
14. Kevin Sherlin	Sacramento Municipal Utility District
15.Keith Stouffer	National Institute of Standards & Technology
1. Roger Lampilla	*NERC*
2. Scott Mix	*NERC*
3. Joe Bucciero	*NERC/Bucciero Assoc.*
4. Robert Jones	*FSU/FCRC Consensus Center (Wed. & Thursday)*
5. Stuart Langton	*FSU/FCRC Consensus Center*

SDT Members Attending via WebEx and Phone

1. Phillip Huff	Arkansas Electric Coop Corporation
2. Rich Kinas	Orlando Utilities Commission
3. Jonathan Stanford	Bonneville Power Administration
4.William Winters	Arizona Public Service, Inc.

SDT Members Unable to Attend

1. David Norton	Entergy
2. Kevin B. Perry, Vice Ch.	Director Critical Infrastructure Protection, Southwest Power Pool
3. John D. Varnell	Technology Director, Tenaska Power Services Co.

Others Attending in Person

Sam Merrill	CERT/SEI
Michael Toecker	BMcD
Peter Schneider	Subnet Solutions

Others Attending via WebEx and Phone

James Bassett	Lafayette
Matt Greek	
Rob Hardiman	
Doug Johnson	ConEd
Bill Johnson	TDI 9-9
Peter Schneider	
Jeff Gillan	ATC
Sam Merrill	9-10

Appendix # 3 — Meeting Evaluation Feedback Summary

CYBER SECURITY ORDER 706 SDT
SEPTEMBER 9-10, 2009, FOLSOM CA
MEETING EVALUATION FEEDBACK FOR INCLUSION IN FACILITATOR'S REPORT

Members used the following 0 to 10 scale in evaluating the meeting: 0 means totally disagree and 10 means totally agree.

1. Please assess the overall meeting.

7.78 The agenda packet was very useful.
6.83 The Webex document display and the audio were effective
8.50 The quality of the meeting facility was good.
7.40 The objectives for the meeting were stated at the outset.
8.30 Overall, the objectives of the meeting were fully achieved.

Were each of the following meeting objectives fully achieved:
7.90 Review the workplan going forward and assess "Version 2.5" possibilities.
8.10 Receive MRC presentation and Leadership Coordination Meeting summary.
7.13 Receive updates on TFE, VSL/VRF and related cyber security efforts;
8.50 Receive and discuss reports from CIP 002 Subroups identifying key issues and coordination points;
9.00 Convene CIP 002 Subroup meetings;
9.20 Receive and discuss Subroup reports on progress made; and
8.80 Agree on Workplan, next steps and assignments.

2. Please tell us how well you believe the Team engaged in the meeting.
8.70 The Chair and Vice Chair provided leadership and direction to Team and Facilitators
9.20 The Facilitators made sure the concerns of all members were heard.
8.30 The Facilitators helped clarify and summarize issues.
7.63 The Facilitators helped members build consensus.
9.10 The Facilitators made sure the concerns of all participants were heard.
8.10 The Facilitators helped us arrange our time well.

3. What is your level of satisfaction with what was achieved at the meeting?

8.11 Overall, I am very satisfied with the results of the meeting.
8.13 Overall, the design of the meeting agenda was effective.
8.22 I was very satisfied with the services provided by the Facilitators.
7.89 I am satisfied with the outcome of the meeting.
7.25 I am satisfied with the progress we are making as a Team.
8.75 I know what the next steps following this meeting will be.

8.75 I know who is responsible for the next steps.

See other side

4. Other comments (use other side)

- Small groups good!
- I'd like the sub-teams to do most work offline rather than taking most of our time in sub-team meetings. We need more time together as a group reviewing each other's work and integrating it.
- The inclusion of additional personnel with operating experience was helpful.
- No space on the other side! Until everyone sees responses from the paper we are doing make-work. I believe our over all direction will change when we see the replays. I am a lemming running over the cliff because the facilitators don't know the subject and history. Jerry, Kevin, Jon D, Philip only know normal IT processes.

What did we achieve?

- Make work
- Concrete work on CIP 002

What are our biggest challenges going forward?

- Finishing the amount of work within time parameters.
- Teaching history.
- A coherent/consistent and clear CIP 002.

What suggestions do you have for making our group more productive?

- Sub-team meetings are difficult without projectors.
- Much work is being done in sub-team Silos. This approach created some of the issues with CIP v1. More coordination is required among the various teams to ensure all issues are addressed but NOT addressed by multiple teams.

Appendix # 4 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost
- information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Subroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and Subroups)

should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on
- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

APPENDIX # 5
Meeting Schedule
October 2008–December 2010
Development of CIP Version 2 and Version 3 Framework
October 2008–July 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.
2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development
3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 Version 3 process reviewed.
4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white papers assigned.
5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed Version 3 white papers.
January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.
7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.
8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals
March 2–April 1, 2009 — 30-day Pre Ballot
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment
March 30, 2009 — WebEx meeting(s) White Paper Drafting Team
April 1–10 — NERC Balloting on Version 2 Products
April 6, 2009 — WebEx meeting — White Paper Drafting Team
April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call
April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments-
9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.
April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx
April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%
May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.
10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.
June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx
11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.
June — WebEx meeting(s)

- Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria

CIP-002 Development of Requirements, Measures, Etc. July-December 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada

- SDT plenary session to review, refine, and adopt SDT Working Paper
- Adopt SDT response to NERC for Interpretation of CIP-006-1
- Review and adopt proposal for CIP-002 Subgroups and Deliverables
- Convene subgroup organizational meetings to develop work plans
- Adopt 2010 Meeting Schedule

July–August Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)
- CIP-002 Coordination Team meeting (as needed)

August 3–5, 2009 in Winnipeg, Manitoba **NERC Member Representative Committee**
Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.

13. August 20–21, 2009 in Charlotte, NC

- SDT Plenary session to review and respond to MRC input on Working Paper/CIP-002 Concepts
- SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper
NERC Webinar
August–September Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)
- CIP-002 Coordination Team meeting

14. September 9–10, 2009 in Folsom, CA

- SDT plenary session to review and respond to any additional industry comments on Working Paper and CIP-002 Concepts
- SDT subgroup drafting meetings- consider industry comments, draft requirements and "proof of concept" control (s).
- SDT plenary session(s) Subgroup reports on requirements
- Review of CIP-002 Standards, Requirements, Measures, and Outline
- Address coordinating issues.
- Establish SDT meeting dates and proposed locations for January–December 2010

September–October Interim WebEx meeting(s)

- CIP-002 Subgroup meetings (as needed)
- CIP-002 Coordination Team meeting

15. October 20–22, 2009 in Kansas City, MI

- SDT Subgroup drafting meetings — day one
- SDT Plenary Session(s) — day two subgroup reports on CIP-002 requirements
- Review and refine initial draft of CIP-002 single text

October–November Interim WebEx meeting(s)

- CIP-002 Coordination Team meeting

16. November 17–19, 2009 in Orlando, FL

- SDT plenary session(s) — to review and refine CIP-002 standard, requirements, measures and controls.

November–December Interim WebEx meeting(s)

- Drafting teams as needed to finalize drafts
- CIP-002 Coordination Team meeting

17. December 15–16, 2009 in Little Rock AK

- SDT plenary session(s) to review, refine, and agree on and adopt CIP-002 standard, requirements, measures and controls.
- Agree on initial posting of draft CIP-002 for industry review and comment.

Refinement of CIP-002 and Development of Other CIP Standards
January–December 2010

(12 SDT monthly meetings and subgroup WebEx meetings as needed)

- SDT responds to industry comments on initial and subsequent postings of CIP-002, Version 3 (may be multiple comment periods, as required)
- Refine the CIP-002 through the comment period and submit new CIP-002 Version 3 Standard for Balloting along with the catalogue of controls (i.e. CIP-003-CIP-009 or its successor) OR
- Ballot CIP-002 while permitting industry to rely on CIP 003-CIP-009 until the full suite of controls (i.e. CIP-003-CIP-009 or its successor) is reviewed and presented for balloting.
- Submit the full suite of CIP Reliability Standards on Cyber Security for Industry Comment
- Refine and Submit the full suite of CIP standards for industry ballot
- NERC Board of Trustees adoption of the full suite of standards
- FERC approves and NERC Implements the full suite of CIP standards

Proposed 2010 Meeting Schedule

January 20–21 — Wednesday–Thursday, Atlanta GA	July 14–15, Wednesday–Thursday
February 18–19 —Thursday –Friday, Austin TX	August 11–12, Wednesday–Thursday
March 9–11 — Tuesday–Thursday, Phoenix, AZ	September 8–9, Wednesday–Thursday
April 14–15 — Wednesday–Thursday, Atlanta GA	Oct. 13–14, Wednesday–Thursday or Oct.12–14
May 12–13 — Wednesday–Thursday, Dallas TX	November 17–18, Wednesday–Thursday
June 9–10 — Wednesday–Thursday, Sacramento CA	December 15–16, Wednesday–Thursday

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Draft Meeting Executive Summary

Cyber Security Order 706 SDT — Project 2008-06

October 20, 2009 | 8 a.m.–5 p.m. CDT
October 21, 2009 | 8 a.m.–5 p.m. CDT
October 22, 2009 | 8 a.m.–3 p.m. CDT
Town Pavilion
1111 Main St.
Kansas City, MO 64105

Meeting Summary Contents

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

EXECUTIVE SUMMARY

Jeri Domingo-Brewer, Chair, welcomed everyone and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda. Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines and also reminded the group of the sensitive nature of the information under discussion. The SDT adopted the August 10–11 and September 9–10, 2009 meeting summaries without changes or objection.

On Thursday morning, Jeri Domingo Brewer, on behalf of the SDT, thanked Kevin Perry for his service and contributions in building consensus and helping the team decode the cyber security puzzle as Vice Chair and presented him with a small plaque as a token of the team's esteem and appreciation for Kevin's dedicated service.

Scott Mix provided the team with an update on the TFE posting noting that all the regions have portals for accepting filings. He then reviewed Version 2 VSLs and VRFs noting it looks like it will be approved, which will close that group's work. The CSO706 SDT will be responsible for the VSLs and VRFs for Version 4.

Scott Mix provided an overview of the FERC Order on CIP version 2 and the procedural steps. He agreed to create a checklist of the over 200 charges from FERC Order 706 to help the SDT keep track of the milestones.

Mr. Bucciero summarized the effort to bring the team together in the interim to develop a rapid response process. The members discussed both the substantive issues with the interpretation of the term "auditably compliant" and with the SDT process for reviewing and voting on the response to the FERC Order. It was agreed that in the future the expectations should be made clear as to what the team is being asked to do and the communication process should be improved.

Scott Mix reported on the Standards Committee meeting and decisions regarding the response to the FERC Order and the CIP Version 3 next steps. Later in the meeting the SDT agreed on the following Version 3 steps and schedule:

1. *Post for Industry Comment 10-13-09 to 11-12-09*
2. **November 13 Conference Call — Review of Industry Comments and Response**
3. **November 16 (5 p.m. through dinner) Meeting in Orlando — Response Document to Industry Comments**
4. **November 17 Meeting in Orlando — Complete and Adopt Industry Response Document**
5. *November 20 — Post Response Document and Start Initial Ballot*
6. **November 30 — Close Initial Ballot**
7. **December 1 Conference Call — Finalize Industry Consideration of Comments document**

8. *December 2–14 — Recirculation Ballot*
9. *December 16 — BOT Approval*
10. *December 29 — FERC Filing*

Scott Mix presented the "strawman" CIP-002-4 template format for the SDT's consideration. He noted that he incorporated the work done to-date by the subgroups into the document, and that the SDT and others should consider this very much a 'work in progress' subject to many changes between now and December 2009.

The subgroups provided progress reports to the SDT. John Varnell reported on the Reliability Functions Subgroup noting that they have not finished the definitions but hope to do so in the coming weeks. The members of this subgroup are also participating on three of the other subgroups.

Jackie Collett reported on the BES Subsystems/BES Cyber Systems Subgroup noting that they require more time to work and that in their last discussion the subgroup was stuck on "generation." She suggested that the SDT needs to think about all the components that are needed for each function. The subgroup was focused on multiple definitions of a BES Subsystem, and it has been using drawings to illustrate questions and guide discussion. Ownership of equipment has been another challenging question, along with who is responsible for paying to protect the equipment because it is critical. The subgroup hopes to resolve the first challenge during this meeting, but the second challenge may take more time.

John Lim reported on the BES Mapping Subgroup's progress noting that three subsystems were identified to map (generation, transmission, control center), but there was disagreement on this point. The subgroup spent time discussing scenarios related to high-medium-low impact levels and may need more than a high-medium-low in terms of effort and expense.

Phil Huff presented the report on the Cyber Analysis subgroup noting that they have all but eliminated the "target of protection" concept and centered discussion on BES cyber systems. The subgroup is exploring what potential functional impact the BES cyber system has on each of the associated BES operations and reliability functions. He noted that several definitions require additional work.

Keith Stouffer provided the report of the Definition and Selection of Controls Subgroup highlighting the control "template" format he has worked on with Scott Mix.

The SDT then had a full group discussion of the following topics:

- Number of impact categories and what that concept means — where to apply the reliability functions
- Linkage between functions and where BES mapping is headed

- High-medium-low definitions plus review of the two scenarios presented by Scott Rosenberger that focused on the amount of effort or number of controls required for each impact level
- Number of BES subsystems — how do you map the functions into physical assets you can assess and measure

The SDT discussion was wide ranging and touched on the following questions and topics, among others:

- As we develop formal requirements be careful not to simply create lists without a purpose — may be the first requirement is mapping of criteria and thresholds — allows for measurable standards for audit purposes
- Did we conclude how we would map cyber assets or categorize them into h-m-l based on functions? Level of combinations would be at the subsystem level — assign an impact level to the subsystem
- Trying to identify "juicy" targets — defining those is something we have to discuss and work out — do two mediums using the same asset raise it to a high or "juicy" level
- Any system supporting reliability should be part of the assessment process
- Expect the group to discuss and bring back a full set of requirements that take you from identifying cyber assets to full categorization
- What is "prescriptive" is in the eye of the holder — some need more detail to comply while others want more leeway to meet the standard
- Keep in mind how the entities would meet the requirement for an audit. May need to write the VSLs while writing the requirements

Following this discussion the SDT agreed to break into two "meta groups" that combined subgroups. One meta group combined the first three subgroups (reliability functions, BES subsystems/BES cyber systems, and BES mapping) and proceeded by moving through examples of generation and transmission, addressing the challenge of multiple owners, and working through the task of mapping functions. A second meta-group addressed the cyber analysis tasks focusing first on definitions, and then looking at reliability functions and impacts from the loss of integrity perspective, going back to the requirements language, and creating applicable guideline language.

The Chair presented and reviewed the schedule of activities for CIP version 4 and the FERC Order 706. The team discussed and tested a variety of options in terms of the pace of the schedule for producing the CIP Cyber Security standards and ultimately reached agreement on the following schedule:

CIP-002-4 Key Deliverables, Steps, Schedule (October-December 2009)

The SDT agreed that the CIP-002-4 deliverables for posting for industry comment in December 2009 include the following documents: CIP-002-4 requirements and measures; related VSLs and VRFs; guidance document attachment to CIP-002-4; "Proof of Concept" controls (2-3 examples) illustrating the High/Medium/Low concept and the conceptual approach to replacing CIP-003-009; comment form with questions; and cover letter. The steps included:

1. November 1: Jackie Collett, Phil Huff, John Lim and John Varnell, the chairs of the 4 CIP-002 subgroups will form the CIP-002 Strawman Drafting Group (SDG).
2. November 1: All CIP-002 "meta groups" and the first four subgroups will forward to the SDG their drafts for the standards text, including any guidance language and the subgroups and meta-groups will be dissolved.
3. Joe Doetzl will coordinate the work of the Cyber Security Controls Catalog Drafting Group (CSCC) consisting of: Jay Cribb, Jim Brenton, Keith Stouffer, Bill Winters, and Jon Stanford. They will produce at least two examples to illustrate high/medium/low impact concepts as defined in the draft requirements of CIP-002-4, as well as recommendations on whether the SDT should request guidance from the Standards Committee on referencing a catalogue of controls. These deliverables will be prepared for circulation to the SDT by Friday, November 13, 2009.
4. The SDG will prepare a strawman draft of the standard requirements and circulate it to the SDT by November 13, 2009 for their review.
5. The SDT will utilize the strawman draft to organize its November 16–19 meeting and reaffirm at the conclusion of the meeting if the SDT will continue to aim for the December 16th adoption of the initial CIP-002 draft requirements for posting for to the industry for comment.
6. The SDG and the CSCC will present their revised standards drafts during a SDT conference call the first week in December.
7. The SDT will refine and circulate a strawman draft following the December conference call but prior to the December 15–16 SDT meeting in Little Rock.
8. December 15–16, 2009, the SDT will refine, finalize, and adopt the initial draft CIP-002-4 standard text for posting to the industry for comment.

CIP Version 4 Key Deliverables, Steps, Schedule (January 2010-July 2011)

The SDT agreed that the CIP version 4 deliverables for initial posting in July 2010 include the following documents: initial draft of all the CIP Reliability Standards requirements and measures; VSLs and VRFs; guidance document attachment to the CIP version 4 standards; catalogue of security requirements; implementation plan; comment form with questions; and cover letter. The steps needed include the following with targeted completion dates:

1. January–June 2010: Develop 'catalogue of security requirements' as part of CIP Version 4

2. February–April 2010: Respond to industry comments on new CIP-002
3. July 2010: Initial draft of all CIP cyber security reliability standards prepared and ready for posting for industry comment as part of work plan, addressing all relevant Order 706 directives in a CIP Version 4
4. July 2011: Complete 3 Rounds of Drafts and Comments plus a final draft and implementation plan for balloting

On Thursday afternoon, the SDT identified and then discussed key open issues:

1. Better identification of reliability functions (BES cyber system identification based on reliability functions) — Meta Group 1 and 2
2. Better definition of terms used in BES mapping document: control centers/systems, generation systems, etc. — Meta Group 1
3. Cyber impact analysis alternative approaches and implications – avoid unintended consequences — Meta Group 2
4. Better sense of how all parts of the new standards fit together and how the entities will use it — reliability functions, where do they fit and how do you come up with cyber systems that apply — Meta Group 1 and 2

The Chair reviewed the next steps including the schedule for the version 3 response document and the CIP-002-4 effort. She thanked Joe Doetzl and Kansas City Power & Light for hosting the meeting and providing excellent catering and facilities.

The SDT adjourned at 2:45 p.m. on October 22, 2009.

MEETING SUMMARY

I. Introductions, Agenda, and SDT Work plan Review

Jeri Domingo-Brewer, Chair, welcomed everyone and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*).

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The SDT approved the September 9–10, 2009 meeting summary without changes or objections. On Thursday morning Jeri Domingo Brewer, on behalf of the SDT, thanked Kevin Perry for his service and contributions in building consensus and helping the team decode the cyber security puzzle as Vice Chair and presented him with a small plaque with the following inscription: "Breakfast at Epiphanies — Leadership in Cyber Consensus — Kevin Perry, Vice Chair, CSO706 SDT, October 2008-October 2009."

Scott Mix provided the team with an update on the TFE posting which generated the following comments:

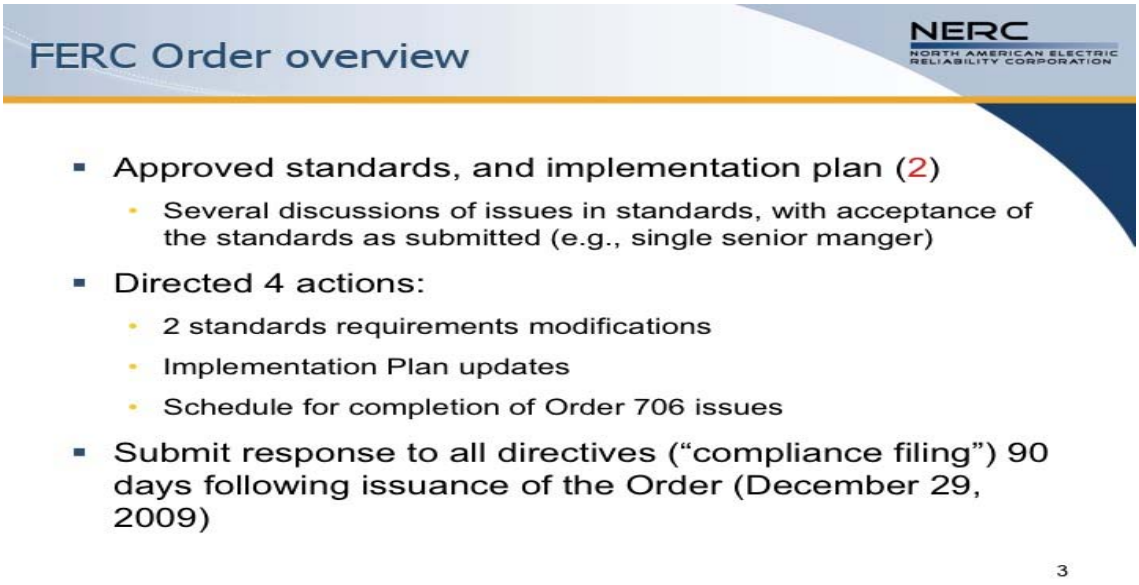
- Did FERC order say the TFEs did not need to be pre-approved? Yes, but they need to be pre-noticed.
- Will there be class based TFEs? Still debate about when it will appear and what it will mean — does not yet exist — still being discussed that may allow some form of pre-approval — question is what you will do to protect or mitigate and that cannot be pre-approved.
- All of the regions have portals for accepting filings.

In terms of the version 2 VSLs and VRFs Mr. Mix indicated that there will have to be a correction for a technical error but that it looks like it will be approved which will close that group's work. The SDT will be responsible for the VSLs and VRFs for version 4. The SDT VSL and VRF Chair will talk with the CSO706 SDT about their experience early next year to help us take on the task later in 2010.

II. FERC Order on CIP Version 2

A. Overview

Scott Mix provided an overview of the FERC order on CIP Version 2.



Member Comments on the Overview:

- When do we have to make the filing? (90 days — December 29th)
- Will they provide us with an attorney? Not clear
- Do we need to make the rule for Canada— not sure I can answer for Canada — NERC is required to file a response to the FERC directive by December 29th.

- Some of our work obviates some of the 200 but can we tell them we will not be done by December? The Order said "consider" not "adopt" the NIST standard — if adoption allows us to say we addressed the intent of the original order even if off in a different direction.
- Do we need legal assistance from NERC as part of this process to review? Do we need to integrate legal into the process? NERC is prohibited from developing the standard — does a legal representative blur that line?
- Mr. Huff addressed the time line not specifics of the order — a lot of details in how items are addressed over course of time – significant number of items to address – look at the 10,000 foot level first then zoom down as develop what the plan looks like.
- Concerned about legal input delaying the process – we debate the wording, legal would make that worse – Concerned with including legal in the standard development process — let NERC, FERC and industry legal review once the team has developed its response — let us develop the standards for protecting the system
- Maybe we need some substance expertise otherwise we may end up guessing in a limited time frame/
- In the past we had an electrical engineer/lawyer who helped with the wording — run the danger of letting them put in weasel words that dilute the product
- High level schedule discussed with NERC — (no, pulled from CIPC) — NERC is looking for this in formal form with more detail — (want to see a punch list for each item – this is an initial high level work plan — even this is very aggressive for developing consensus in the industry — need to discuss what is a realistic schedule because FERC will hold us to it)
- We need to do more to communicate to the industry on what we are thinking especially if we are accelerating our work — need to prepare the industry — make our meetings more efficient with substantive results — look into whether can we shorten the comment periods – communicate our direction early on
- For ballot period — ten days? How do we handle registration? (Not sure)
- Different team or us? (us – we will have to continue multi tasking)
- Looking for a spreadsheet punch list? We may not have an answer for every single one of the 200 items. What is required for the schedule response? What level of detail? What are the expectations?
- Mr. Huff offered a technical personal take — go through by subject area and group by subject — way to develop plan by subject areas with targets by areas — provides to industry and team the timeline for the plan)
- Some of our accounting may be that it no longer applies because of the approach taken — is that acceptable (it may be, given the approach you are taking)
- FERC Order punch list? Put on "parking lot". Is that useful for keeping track of progress. Scott Mix offered to try to produce.
- Useful if we send out to the SDT (we have two that Scott developed – one takes the order and extracts out issues on what did FERC decided with several colors – the pieces were then put into a spreadsheet to follow how and when each dealt with, also included a high-medium-low value to the industry – basis for earlier suggestion for how to schedule

approach to responding to the items – low hanging first, then the 15 or so highest most important then the bulk of the medium neither easy or complex items)

B. SDT Rapid Response Process — Special Meetings and Electronic Voting — Joe Bucciero

Mr. Bucciero summarized the effort to bring the Team together in the interim to develop a rapid response process. The members discussed both the substantive issues with the interpretation of the term "auditably compliant" and with the SDT process for reviewing and voting on the response to the FERC order. It was agreed that in the future the expectations should be made clear as to what the Team is being asked to do and the communication process should be improved.

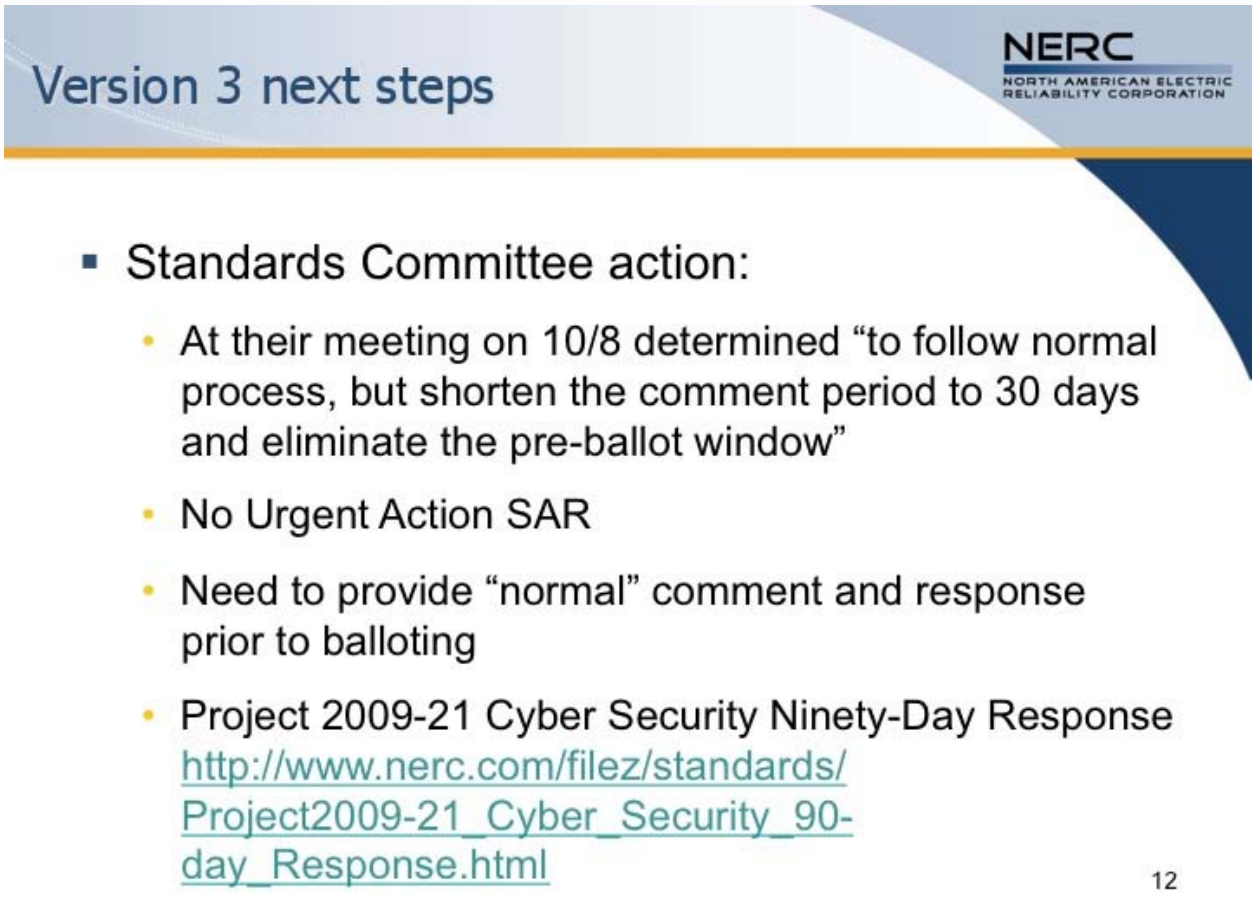
Workgroup Comments:

- We could/should have had a more transparent discussion than the last time – lesson learned, we need to communicate the discussion to the full group and the issues to be addressed
- We should have had a longer discussion to develop consensus before voting, especially the changes incorporated
- Many of the suggestions and additional change came after initial vote. Because of the rushed timeframe it was difficult to discuss those proposed changes and then revote.
- "Auditably compliant" has caused much confusion in the industry – many think it gives them an additional year contrary to what auditors think – compliant with full intent of the requirement and showing evidence of coming into compliance versus a year of data to show in full compliance – need to clarify the expectation going forward – this is important to Table 4 entities going forward and 2 and 3s carrying into a new year – to be fully compliant with intent you must conduct training – intent is that you do the action, not just periodically – collect logs for rolling last 90 days, maintain ongoing – if an incident (C date) then maintain for the past three years – you are compliant if you have the past 90 days – most disagreement centers around the periodic activity
- Did not get involved early enough – and then continued the discussion in the smaller group – question of what auditors are looking for – also difficult to get a full group together on such short notice, need sufficient lead time to include all – this was suppose to address the few issues FERC asked for - my concern was over the changes made after the team's discussion, changes the industry might not agree with – that is a compliance issue that may belong somewhere else – industry balloted and approved, thus looking at a few changes and now asked to look at significant changes without sufficient opportunity to discuss – I disagree on the compliance interpretation and we will not have consensus – My real concern was how the process was handled
- What are the concerns about the interpretation?
- I think you have the year to come into compliance – access log check prior to compliance date? Moving up compliance actions before the compliance date – many on the team and industry have this concern – also sending something out to industry that changes something they already approved.
- "Auditably compliant" means you have a full year of data to support –

- I concur that we were codifying at the last minute a new interpretation of "auditably compliant" – many entities have a different view – need to put the issue over in the compliance interpretation section – this was not the time to codify especially on such a short discussion time frame.
- Three years ago tried to educate on the three levels of compliance in a series of workshops across the country – there is confusion on this issue – this issue clouds moving forward rapidly as required – need to be pulled out and dealt with separately – we are now exposed to negative responses – agree with Kevin's interpretation and with Jackie's view that it should have been dealt with differently and separately.
- Disagree with Kevin's interpretation – requiring logs before the compliance date does not make sense.
- Our discussion should center around Table 2 compliance for new asset implementation
- There is no definition of "annual" from NERC
- The process and discussion could have and should have been handled better
- We can pull out the section from the ballot and NERC can put it out separately for comment since it is not under an urgent action order
- Compliance dates are based on when you wrote the procedures and when you started it
- Process lessons that we can apply going forward?
- Time to absorb and discuss, transparency of issues
- Decision on holding meeting on short notice was not taken lightly, but had no choice, only way to involve available members – it needed more time
- Even the limited opportunity for discussion improved the initial draft

C. Process and Schedule Going Forward

Scott Mix reported on the Standards Committee meeting and decisions regarding the response to the FERC Order and the CIP Version 3 next steps:



Later in the meeting the SDT agreed on the following Version 3 steps and schedule:

Version 3 Key Steps and Schedule

1. *Post for Industry Comment 10-13-09 to 11-12-09*
2. **November 13 Conference Call — Review of Industry Comments and Response**
3. **November 16 (5 p.m. through dinner) Meeting in Orlando — Response Document to Industry Comments**
4. **November 17 Meeting in Orlando — Complete and Adopt Industry Response Document**
5. *November 20 — Post Response Document and Start Initial Ballot*
6. **November 30 — Close Initial Ballot**
7. **December 1 Conference Call — Finalize Industry Consideration of Comments document**
8. *December 2–14 — Recirculation Ballot*
9. *December 16 — BOT Approval*
10. *December 29 — FERC Filing*

III. CIP 002 Strawman

A. Overview of CIP 002 Strawman Template

Scott Mix presented the "strawman" CIP-002 template format for the SDT's consideration. He noted that he incorporated the work to date of the subgroups into it and that the SDT and others should consider this very much a work in progress subject to many changes between now and December, 2009 (See Appendix # 5)

Member Comments

- Regional entity is a statutory requirement
- RRO does not exist anymore
- Because it was confused with RRE – that needs to be fixed
- New entity – RRA – we could break new ground and include
- In the narrative spell out interconnection variances – are they regional or should they be up in the standards (there is a number for the east, the west, etc., it is in the language of the requirement)
- For the interconnection is there a designation for the authority separate from the region? (East is a split authority)
- Good value added with the template

B. Subgroup Reports to the SDT

1. Reliability Functions Subgroup Report and Key Issues and Draft CIP 002 Language

John Varnell reported for the subgroup noted they have not finished the definitions but that should not hold the rest of the team up in moving forward. They have shared their initial work with other teams and the members are participating on the other 3 teams.

Member Comments

- Time frame for finishing the definitions? A couple of weeks
- Will this be published with the standards?
- Definitions do not affect what is being done on the other teams but how people will interpret so may be part of the filing, maybe as a FAQ or guidance document.
- This is an area where group may blaze new ground – may want to make part of standard to give it more weight than just a FAQ – consider a guidance document.
- Reliability functions – make those the basis for guidance to the functions

2. List of BES Subsystems/BES Cyber systems Subgroup Report Key Issues and Draft CIP 002 Language

Jackie Collett reported on the group's progress noted they require more time to work and that in their last discussion the subgroup got stuck on "generation" – we need to think about all the components that are needed for each function. Next conversation focused on multiple definitions of what a BES system is and they have been using drawings to

illustrate questions and guide discussion. Ownership of equipment has been another challenging question and who is responsible for and paying to cover them because they are critical. The subgroup hopes to resolve the first element while here but the second element may take more time

SDT Member Comments

- Group 1 and 2 need some in depth discussion together. They will meet together this afternoon.

3. BES Mapping Subgroup Report and Key Issues and Draft CIP 002 Language,

John Lim noted there were three subsystems to map and there was disagreement on this point. The subgroup spent time discussing scenarios related to high-medium-low impact levels – may need more than a high-medium-low in terms of effort/expense.

Member Comments

- We need to communicate together as a single group this afternoon rather than as subgroups- need to be sure we are on the same page rather than four or five groups doing distinct things
- May be premature to consider until we finish the sub team reports – will revisit after lunch and the rest of the reports

4. Cyber Analysis Subgroup Report, and Key Issues and Draft CIP 002 Language

Phil Huff presented the report on the Cyber Analysis subgroup noting that they have all but eliminated targeted protection – and centered discussion on BES cyber systems – reliability function assessment assesses the potential function impact the BES cyber system has on each of the associated BES operations. He noted that several definitions require additional work and more eyes (review) from others – protection of the system relies on the definitions and reliability functions. He also noted that they need more time as a sub group on definitions and for input form other groups too

5. Definition and Selection of Controls Subgroup Report, Key Issues and Draft CIP 002 Language

Keith Stouffer provided the report of the subgroup, noting the control "template" he has worked with Scott Mix on in terms of an acceptable format.

Member Comments

- How do we break this into l-m-h and for different systems? –generation, control and transmission?
- Estimated time needed? Maybe four or five years or within the time we have available.
- We will need more time to build common consensus in the group as a whole.
- Also need to run this format by the NERC staff
- This is just one requirement as an example – we will divide the group up to deal with the rest of the requirements.

- Need to be sure we are not continuing on the path where we are split up just to support and continue the process – we need to get back together as a whole to deal with key issues sooner rather than later
- This can be posted as an example of applicability – we will need to do a good job of communicating to the industry that this is an example and not asking for their comments in detail

C. Key Issues Going Forward.

The Chair and Vice Chairs tested whether to break into small groups or stay together to identify and document the several key outstanding issues to be addressed. The group suggested a full group discussion of the following topics:

- Number of impact categories and what that means – where to apply the reliability functions
- Linkage between functions and where BES mapping is headed
- High-medium-low definitions (first)
- Number of BES subsystems – how do you map the functions into physical assets you can assess and measure

1. High-medium-low definitions

Member Comments

- Do members have a notion how big each category is? – does low represent 50% of the assets? More or less than that? Is high equal 5 or 10 % of the assets? That may drive some of the criteria thresholds.
- Will have to meet the low standard for everything – the medium and high will require more.
- Do we need a category below low, such as none?
- No need for something below low – prefer scenario 1 with some adjustment of the percentages.

Conceptual discussions related to High, Med, Low Impact Levels (Scott Rosenberger)
There were many comments related to the adequacy of 3 levels of impact presented in our concept paper. Some of the need to suggest the possibility for the need for additional levels of impact stems, in my opinion, from the lack of clarity as to what the amount of effort or relative number of controls are associated with each level.

Scenario 1

Impact Level	Low	Med	High
Amount of effort/Number of controls (compared to High)	60%	80%	100%

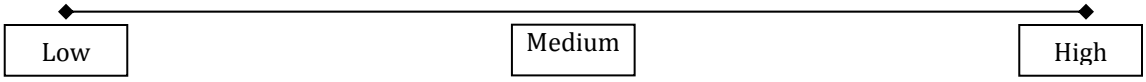
In this scenario, it is arguable that a Lower than Low is necessary as Low requires significant effort to accomplish (Low is not Low Effort). In this scenario, Lower than Low then turns into

0% (or no impact, no controls) and this scenario looks conceptually like the all or nothing environment that we are in today.

Scenario 2

Impact Level	Low	Med	High
Amount of effort/number of controls (compared to High)	10%	50%	100%

In this scenario, there is a significant difference in the effort/expense required for the three impact levels. A case could be made that most if not everything would at least fit into the low category. With the major focus being re-directed to the identification of Medium and High impact areas.



A significant benefit of Scenario 2 is that more Security work would be done on more assets and there would be few (if any) that have nothing done and would make the effort/expense required (Low) commensurate with the risk (Low). The industry could then focus on protecting those BES Subsystems that have a more significant impact to the BES

- Scenario 2 concerns me – the compliance load on the entities – requires documentation on every element of the system – 75% in the low would still require 90% of the compliance effort – prefer recognizing some will need little or no effort for compliance
- Need to determine how much is in each category – need something less arbitrary – how much is in each bucket?
- John Lim's group on the BES mapping only came up with the high and medium, everything else was put in low – the point here is determining what is low
- Scenario 1 allows for none
- Can reliability requirements deal with issues in generation
- Feedback form concept paper asked why we were going to this categorization of h-m-l – the high and medium were easy, low was everything else – low should be a low amount of work even if the largest category
- The concept reflects a cost perspective? Will groups simply assume everything should get a high level of protection to avoid liabilities?
- How big is the compliance requirement for those in the low category? Are there parts of the system that require little or no protection and thus lower than low?
- Every entity still has assets that have nothing to do with BES but will need to categorize them for auditors – they may have their own protection systems – you have assets that do not need cyber protection
- Careful that even the most remote part of the system if connected leaves the system vulnerable

- Prefer numbering rather than h=m=l which would require putting something in the buckets – industry might be more open to level 1, 2, or 3 of impact – there are assets out there that do not need anything because they do not have an attack vector
- Focused on BES elements or cyber assets? Does it matter? It does in my world
- NERC has statutory authority only over bulk electric system assets – not distribution or marketing systems
- But how do I group the assets and their functions in a control center?
- In the federal system, every single system has to have minimum level of security
- Few assists in the high, some in medium with the bulk in the low categories of impact – don't need many controls to protect the low, concern should be for protecting the high and then the medium – the three levels help direct the limited resources to ensure the most bang for the buck
- Functions define what you look at first for coverage – this is a penalty standard, a list of what you will be penalized for
- Yes, focus on the areas of the most risk – prefer scenario 2 because it allows focus on the highest risk and not on the lowest
- We are trying to minimize the risk to our company – we need to keep the focus on the security of the system in the most cost effective way possible – need to work on security, rather than on compliance
- Are we protecting all BES systems?
- Different systems balance the functions – how important is a subsystem to a function?

2. BES Subsystems

- Use an example of generation subsystem – for purposes of discussion – individual units may not be high – but may be as part of the larger system – look at it from a reliability requirement from different perspectives.
- How would requirement do that? How many steps would it take to cover all of the possible scenarios or related systems?
- You have to have the flexibility to address different subsystem configurations. The configurations could be in the hundreds
- Take them all in common, not necessary to figure out all the possible configurations – because you have the flexibility, the more reason to consider them collectively
- We have to determine the common elements. Need to work from the big down, not from the subsystem up – should not have to work through all the possibilities – the intent should not be to determine what is a requirement and how to avoid it but how to protect the highest priorities.
- Focus on the facility – don't have to focus on the whole facility just because it has one black start.
- Concerned about this slicing and dicing approach – what is the total generation from the facility and the functions – I don't see value in grouping elements.
- It is a requirement to look at it in multiple ways – analyze as a unit and a facility?
- Need definitions to be flexible.

- It is not flexible but rather prescriptive
- Industry needs an analytical approach with criteria for impact levels
- Need to focus on the facility as a whole and the subparts only as needed – suggest moving discussion toward functions
- Reading too much into the diagram

3. Reliability Functions:

- Need to look at how the functions impact the other groups.
- Look at where to apply the reliability functions as a basis for cyber security impact identification.
- Use as a basis for defining or identifying BES subsystems; the components that need to be defined -
- The performance of these functions is what has impact – have to protect the function rather than the asset.
- Define subsystems based on the reliability function they perform or support.
- We protect assets because they perform reliability functions – we protect transmission because it moves power from generation to consumption – which ones and how much depends on importance to the reliability of the system. That's why we split this up by function.
- I like the approach that looks at what we think the answer should be – start with the end in mind.
- If we start with the BES subsystems, we are starting in the middle – we need to start at the top, most important and work down.
- The control center is the physical building. Not everything in that center is essential to the function you are trying to protect.
- The control center is not a subsystem - we need to be careful how we use the words.
- Control center as a building is less important – talking about two different things – cannot possibly define everything into three subsystems.

4. General Discussion of CIP 002 Issues and Strategy Going Forward

- Need to determine what we need from groups to go into the requirements – first get list of BES systems, take that list and define its impact – what are we looking for? A requirement that says entity list their BES systems or say what kind of subsystems they are – guideline for determining function of the subsystem?
- Apparent yesterday we are not coordinating on BES subsystem versus subsystem – function or component to complete the task – each entity creates list of subsystems of items needed to perform a function or task.
- In categories we have special category for special subsystems – include subsystems that are not related to specific pieces of hardware but perform a BES function

- As we develop formal requirements be careful not to simply create lists without a purpose – may be the first requirement is mapping of criteria and thresholds – allows for measurable standards for audit purposes –
- Cyber Analysis subgroup might begin developing language this afternoon for full group to look at.
- Did we conclude how we would map cyber assets or categorize into h-m-l based on functions?
- Level of combinations would be at subsystem level – assign an impact level to the subsystem
- Trying to identify "juicy" targets – defining those is something we have to discuss and work out – do two mediums using the same asset raise it to a high or "juicy" level
- Still thinking electric grid not security – can kill a "juicy" target from a non-juicy source – control system is an overlay from a different plane than reliability of the electric grid
- Any system supporting reliability should be part of the assessment process.
- John Lim noted that what we have needs to be vetted by the full group – be sure we are on the right track – but how do we apply, either as a standard or second document – do we need a list for requirements guys or is the functions the categorization the list
- Three groups need to get together to determine what is in the standard – what are we asking the entities to do?
- Still confusion on what each needs to bring back for the standard and the support document
- Do the groups need additional input from the whole team as to what is expected?
- Expect our group to discuss and bring back a full set of requirements that take you from identifying cyber assets to full categorization
- Rich reviewed a rewrite of the language for the functions list and the impact value
- As we break to write requirements – keep in mind, 65% of requirements were prescriptive or administrative – stick to what's not the how's
- What is "prescriptive" is in the eye of the holder – some need more detail to comply will others want more leeway to meet the standard
- Keep in mind how your entity would meet the requirement for an audit
- May need to write the VSLs while writing the requirements

D. "Meta Groups" Meetings and Reports

Following this discussion the SDT agreed to break into two "meta groups" that combined subgroups.

1. Meta-Group #1 (Subgroups 1, 2, and 3 jointly met)

Scott Rosenberger suggested taking one of the functions and run through an example of how it would be implemented in the BES Mapping and BES Subsystem subgroups. Below are comments both in plenary and the meta subgroup:

- **Working through Examples.** Spent time identifying which reliability functions went with which mapping criteria – need more time to work through examples. Thought I would take

generator than met one of four then look at cyber functions identified for protection. Too many "can't be done" answers at the end – not sure what are the next steps/

- I learned the value of an example – thought we had agreement but then differences arose when we tried out an example.
- A few things came out – we made certain assumptions, taking into account the functions in looking at mapping criteria – We brought Phil in for some clarifications, found he was working based on clarifications of functions – pointed out the need to reconnect the criteria to the functions to begin bridging efforts – good start toward bridging in the future –
- Also, if you have a high on two different criteria, what happens then?
- We tend to bog down in the weeds – this prevents us from trying some things – eventually we may need to press through and ask for industry comments to help identify where clarifications are needed.
- Do we need a broad general definition?
- **Multiple Owners.**
- Different owners in the same subsystem – how do we tie them together?
- Multiple owners of subsystem is still concern.
- Some of the categories in the mapping we have to be able to say what is the generation subsystem – focus on what makes sense for generation subsystem rather than the ownership

- Concerned about using terms "transmission" or "control center" – change latter to control and operate function?
- **Generation**
- Look first at generation and transmission – have some drawings we can talk from – what is a generation subsystem? How does it relate to the BES function and or mapping?
- Those are filters to determine its impact on the system – if it is taken away what is the impact on the function
- Some of that is built into the criteria – some of the criteria addresses some of the functions
- Your list has seven functions related to the generator
- Those operating the transmission system don't care about most of these functions.
- How does BES cyber system affect the reliability function? The matrix tells you how the reliability function impacts.
- High impact generator – do any cyber systems affect that generator? It is on my BES mapping and is "high" – how do I determine what to protect?
- Impact based on security criteria not on impact on the BES
- **Functions and Mapping**
- Do we need to describe what the BES subsystem looks like for each of these functions?
- Same components for each of these functions? Many may be the same.
- The way you use the function is based on the criteria used to determine impact.
- Are we going to have a generation mapping and one based on reliability? Reliability overshadows all of the mapping pieces.
- Does mapping we already do that?

- There is not a direct mapping between reliability functions and subsystems. Instead functions are the underlying information for the impact criteria.
- This is an exercise to be sure reliability is mapped and accounted for
- Phil's group should come up with criteria related to reliability of cyber system
- He is looking at which application, not the same as BES big iron things
- Functions are used to define impacts – three definitions
- Subsystems are building blocks for criteria
- Phil Huff suggested that you assess cyber systems based on reliability functions – combine impact criteria.
- How does cyber system impact or perform reliability function? Can I do the function without that system?
- Come up with matrix to be sure the correct relative rating and appropriate controls
- Incredible amount of minutia to document and lots of "phrasing" of the considerations.
- Are we making this overly complicated? Today, we determine if you have a critical asset then look for all the systems that impact that asset, analyze it for all the criteria, look at the critical aspects for protection/
- Trying to write the CIP standard(s) less prescriptively
- A BES subsystem is not just big iron.
- Phil's group is going through the cyber system side and others are trying to go through the BES subsystem mapping – later work together to reconcile the two sides.
- If not defined by NERC reliability standard as criteria.
- Can have a "high" on the mapping side but a medium on the cyber side. The "High" water mark makes it high for both.
- Have to list the cyber systems that support the BES system function.
- Use the blue side (cyber asset) for those without the bulk electric generation assets.
- Generation, transmission, control and special systems – four areas for definition.
- Next: review functions first, then look for how mapping ties to functions
- In terms of function – what's missing?
- Talking about an automated real time response – "dynamic" response
- We walked through this as a group and added which function applied to BES mapping criteria

2. Meta Group #2 – Cyber Analysis and Controls Subgroup

Phil Huff noted they would be working on definitions and looking at reliability functions and look at impacts from loss of integrity. The may need to go back to the requirements language – and create guideline language – Are the standards ready to be combined by the end of this meeting? Concern with the BES mapping and what is in the standard or not.

Comments

- How should the list of functions from Varnell's group be handled and how they relate to the BES subsystems? Went back and looked at definitions of what is a cyber system and what is BES system. Then looked at the cyber analysis piece

- No true consensus yet on approach
- Map out the BES systems before doing a cyber analysis.
- Phil reviewed language changes in the draft document.
- Challenge to marrying things together in the lookup table
- Requirement 5B an alternative solution – using the BES mapping table – we need feedback from the full group – how do we get to the final picture? Is this an easier way to go?
  - Walk us through 5A?
  - Identify BEX subsystems through which the cyber system supports or has potential to impact reliability functions
  - Then assess the potential function impact the cyber system has on each of the BES subsystems – under Reliability function assessment
  - BES system mapping just associates or relates the cyber systems to the BES system
  - Does the scale of the generator play into the analysis?
  - No
  - Then you are double loading the cyber analysis process – the cyber impact is the same for big or small generator, but the BES analysis is different for each – will end up doubling the work
  - When you look at cyber system it is done once for the BES system
  - As an auditor I may expect to see what is the impact of each cyber system on any associated BES systems
  - Have not considered different BES cyber system categories
  - But the auditor is going to ask for a unique identifier for each cyber asset
  - Map device to specific BES subsystem and look up the impact – puts it into a sequential process rather than two parallel process that meet at the end
  - Should be able to take advantage of commonality of systems to do one analysis for economy of scale
  - The pieces may not be high but the system as a whole is high
  - How do you handle systems that talk IP up one system but not others?
  - That is a separate issue – just because data is exchanged or talking by IP does not mean it is attackable
  - BES mapping – 5B means is there anyway to make the cyber system cause high impact (3.1.1-4) then it is high – puts a big onus on defining your subsystems.
  - We should only care about systems that affect the BES not minor subsystems – suggest you check BES system first before checking the cyber system.
  - The only difference is that the medium and low are taken out of the analysis.
  - Look at BES systems first – they are going to look at the generator first, the control system, because they have the tools to do that.
  - Tighten up what we mean by a system – no single relay works by itself – do we need to qualify a system by the fact it communicates.
  - You may have to both – look at it from both perspectives – neither the green or blue side is correct alone – don't spend our time deciding which is right but work through examples.
  - Difficult to come up with something demonstrable and repeatable for an auditor – trying to do analysis once, not repeat it for both sides.

- If do BES system you knock out most and only do analysis of cyber systems related to those identified the BES system side.
- Doing separate analysis then trying to bring together is unnecessarily complicated
- As a company that cannot control the other end then I need to protect myself and my partners
- We have to look for the solution that covers the lowest common denominator
- Our group concluded that whatever h-m-l rating comes out we will apply – concerned about integrated systems that may be vulnerable to entry from the low side
- The highs are easy to identify but more difficult to identify lows that may allow access to the high or critical systems – but I can only control my equipment, I have to limit the attack vector by how I set up my "high" equipment
- The focus needs to be on what affects the BES
- Even the low may need some substantial protection if it talks up line
- The 5B approach captures the current gap which is aggregated BES subsystems where they were identified as low – still needs protection
- Look at potential span of control – what is the scope or range of control – iterative analysis or process–
- How do you write a requirement that allows for a high to change to medium where appropriate? If possible that would address much of my angst
- Getting into the weeds again – in terms of definition of boundaries

IV. CIP Review Milestones and Schedule

A. CIP Version 3 Key Steps and Schedule

The Chair presented and reviewed with the SDT the schedule for Version 3 and the FERC order discussed and agreed to on the first day (Tuesday):

1. Post for Industry Comment 10-13-09 to 11-12-09
2. **November 13 Conference Call — Review of Industry Comments and Response**
3. **November 16 (5 p.m. through dinner) Meeting in Orlando — Response Document to Industry Comments**
4. **November 17 Meeting in Orlando — Complete and Adopt Industry Response Document**
5. November 20 — Post Response Document and Start Initial Ballot
6. **November 30 — Close Initial Ballot**
7. **December 1 Conference Call — Finalize Industry Consideration of Comments document**
8. December 2–14 — Recirculation Ballot
9. December 16 — BOT Approval
10. December 29 — FERC Filing

B. CIP Version 4 Key Steps and Schedule

The team discussed and tested a variety of options in terms of the pace of the schedule for producing the final CIP 002-009 and ultimately reached agreement on the following schedule:

1. CIP 002-4 KEY STEPS/SCHEDULE (OCTOBER-DECEMBER, 2009)

The SDT agreed that the CIP-002-4 deliverables for posting to the industry for comment in December 2009 include the following documents: CIP-002-4 requirements and measures; related VSLs and VRFs; Guidance document attachment to CIP-002-4; "Proof of Concept" controls (2-3 examples) illustrating the High/Medium/Low concept and the conceptual approach to replacing CIP 003-009; Industry Comment Form with questions; and Cover letter. The steps included:

1. **November 1:** Jackie Collett, Phil Huff, John Lim and John Varnell, the chairs of the 4 CIP-002 Subgroups will form the CIP-002 Strawman Drafting Group (SDG).
2. **November 1:** All CIP-002 "meta groups" and the first four subgroups will forward to the SDG their drafts for the standards text, including any guidance language and the subgroups and meta-groups will be dissolved.
3. Joe Doetzl will coordinate the work of the Cyber Security Controls Catalog Drafting Group (CSCC) consisting of: Jay Cribb, Jim Brenton, Keith Stouffer, Bill Winters, and Jon Stanford. They will produce at least two examples to illustrate high/medium/low impact concepts as defined in the draft requirements of CIP-002-4, as well as recommendations on whether the SDT should request guidance from the Standards Committee on referencing a catalogue of controls. These deliverables will be prepared for circulation to the SDT **by Friday, November 13, 2009**.
4. The SDG will prepare a strawman draft of the standard requirements and circulate it to the SDT by **November 13, 2009** for their review.
5. The SDT will utilize the strawman draft to organize its **November 16-19 meeting** and reaffirm at the conclusion of the meeting if the SDT will continue to aim for the December 16th adoption of the initial CIP-002 draft requirements for posting for to the industry for comment.
6. The SDG and the CSCC will present their revised standards drafts during a SDT conference call the first week in December.
7. The SDT will refine and circulate a strawman draft following the December conference call but prior to the December 15-16 CSO706 SDT meeting in Little Rock.
8. **December 15-16**, **2009**, the SDT will refine, finalize, and adopt the initial draft CIP-002-4 standard text for posting to the industry for comment.

2. CIP VERSION 4 KEY STEPS/SCHEDULE (JANUARY, 2010-JULY 2011)

The SDT agreed that the CIP Version 4 deliverables for initial posting in July 2010 include the following documents: initial draft of all the CIP cyber security reliability standards requirements and measures; VSLs and VRFs; Guidance document attachment to the CIP Version 4 standards; catalogue of security requirements; Implementation Plan; Industry Comment Form with questions; and Cover letter. The steps needed include the following with targeted completion dates:

1. **January - June 2010**: Develop 'catalogue of security requirements' as part of CIP Version 4
2. **February- April 2010**: Respond to industry comments on new CIP-002
3. **July 2010**: Initial draft of all CIP cyber security reliability standards prepared and ready

for posting for industry comment as part of workplan, addressing all relevant Order 706 directives in a CIP Version 4.

4. **July 2011**: Complete 3 Rounds of Drafts and Comments plus a final draft and implementation plan for balloting.

Member Comments on the Schedule

- Unless team changes the current schedule, CIP Version 4 will have to be completed in 13 ½ months.
- Complete generation of catalogue controls is a huge task. Even reaching agreement among the SDT, we won't get industry to agree by balloting. Current draft schedule only has 2 rounds of comments built in to it. With 45 days for each.
- For Version 1- the SDT had conference calls every day for months. What is a reasonable number of rounds of member comments?
- Process vs. calendar base. Set a calendar and modify process? Can't do both.
- Need to say more than just four rounds without giving some times certain.
- We need to guard against rushing it out and not having a good product – schedule should be industry approval plus one or two months – if that is not good enough, let them give us a deadline – As much as I would like to, I am not optimistic we can get in done by Dec. 2010 – we cannot control industry comments and the number of ballots needed for approval.
- Here is what we think it would take to address issues – if industry says more work is needed then schedule could go out additional months.
- The critical date is draft one – does our current process allows us to get it out by Dec 2010?
- We have a defined process for Dec 2010 and the final approval but the middle is squishy
- Assume two cycle schedule and industry may require more – we can agree how long a cycle will take but not how many cycles will be necessary – two cycles is a good WAG
- Two cycles is optimistic given the changes we are suggesting to the regulatory environment – past efforts needed four cycles without the regulatory element – here we need four cycle minimum.
- Clarify ballot versus comment cycles – we are talking about post/comment cycles before sending to ballot.
- FERC says okay to our suggestion but do they leave a disclaimer to modify their order if needed?
- I would like to think we could file an amendment to add cycles based on industry comments as documentation.
- Concerned we will file a schedule with best estimate and it will not be politically acceptable – FERC will say accept but shorten time period.
- There is a perception or concern we are already late – the industry is just frittering away time – also depends on quality of comments – go as far as we think we can get away with, that may be first quarter of 2011 – what can we get without tipping it over – intuition says three cycles and first quarter 2011
- Others have taken five revisions over five years – precedent with standards that are not as complicated.

- Markey has hearings next Tuesday and plan to talk about how fast we are moving – high visibility issue.
- We are responsible for producing under the issues – function in the environment we are in –
- Do not believe Dec 2010 is achievable, question if Dec 2011 is achievable – have we addressed requirements put forth by the FERC? Do we quickly address the order, throw it over as version 4, then take time to address broken standards – this might get FERC off our back, may defer Congressional action too.
- Willing to think FERC is thinking about how we address the 706 requests – political reality will say get it done.
- Anything interim may help with FERC but not the politics – anything that hints at a redo or makeup will not sit well.
- The cantankerous Canadian view – impression from up north, we are doing a lot of second guessing – do what we think we need to do, a realistic schedule – band-aids will not serve the industry well – band-aids will not work with the industry, they want a fix – our role is to support the reliability of the BES
- Concern is founded in CIP8 where we thought we were doing what they asked and they did not approve – can we address all the issues within the proposed timeline? Would like to think all the issues will be addressed in the complete rewrite – how much are we going to have to do to address confusion in the industry? Does paragraph 25 require three levels of control? Applicable features of the NIST framework? We have to do our best to find door out of the dark hallway – this is the only process we have to get it done as quickly as possible – these standards were never designed for "smart grid" – not our job to address it now – focus on "addressing" the NIST framework.
- Focus on what is it we have control over? Some issues FERC will come back and clarify for us – cannot focus on what we think they want – do the best we can to give an estimate what we need to get the job done, caveat with maybe issues out of comments that may need more time – best estimate given what we know now.
- Number of issues up for interpretation – more issues are clear, don't need clarification and must be addressed even if concern is no longer applicable because of other changes suggested – have a good answer for each item
- Sent out matrix Scott and the Chair worked on with magnitude column – VH are the very high that may not fit in Version 4 – items that may require a V5.
- Now for the wake up call – testimony for Congress next week – NERC general counsel saying we will be done middle of next year, not even Dec. 2010
- We have the attention of the industry – shorten review cycles to 30 days – helps buy some time?
- All choices assume draft by April? Just a matter of how many cycles? Still need to discuss getting draft by April 2010
- Assume draft ready by April 2010? If so, then choice is between how many cycles
- Suggest when we think full package ready for post – beyond that why vote on how many cycles it will take?
- Because FERC asked – and NERC wants/needs to know what the estimate is.
- Nailed down realistic time frame for complete package for posting rather than ballot – currently April 2010.

- Optional dates for posting draft
- Realistically we will need time to respond to CIP 002 comments – amount of work putting together catalogue represents a shift in the industry paradigm.
- However we have resources and we are not reinventing the wheel.
- Did not consider the cycle of comments when I suggested July
- Should we put in cycles?
- This is a draft of the whole CIP 002-009?

Straw Poll- Date for First Full Draft of CIP 002-009

Date	April	July	October	January 2011
Member Votes	3 votes	10 votes	3 votes	3 votes

Member Discussion of Straw Poll
Comments of those favoring April 2010

- I was trying to keep us on schedule for NERC and Congress
- Feel the controls catalogue piece will go faster than you think
- Need to draw line in sand to shoot for

Comments of those favoring July 2010

- The line in the sand is when we will be done with CIP002 – how soon will we get there?
- JB: more realistic – April is not realistic given the way we have been working - do think catalogue will go quickly but still need enough time to reshape the wheel

Comments of those favoring October 2010 and January 2011

- SDT will need time to rewrite controls carefully and will need time to respond to industry comments
- We can make April 2010 if we restructure the SDT effort – want to discuss restructure to make that date – only voted October as realistic for how we operate now
- Does this proposed schedule include what Scott Mix calls the very high “uglies”?
- Some of those “ugly” issues are not addressed by this group.
- If the issues are in the 706 order to be considered and relate to CIP – can’t ignore it.
- Directives in 706 presupposed no radical changes to standards – as we radically change standards then many of FERC concerns may no longer be applicable – the current standards are fatally flawed and need more than band-aids – but a new set thrown over the wall, FERC may say did not respond to directives.
- Need to make sure that if there are FERC 706 issues not even addressed by the new approach, we know that sooner than later.
- Need to address serious issues that are not covered – also, we can claim meet 18 months if draft ready by July 2010 – look at two tracks: 1) control or data center and 2) field sites – more pain in the latter, but may address some of this with a separate additional effort looking at physical security.

C. SDT Structure and Deliverables Challenges

The SDT CIP-002-4 deliverables for posting in December include:

- CIP 002 requirements and measures,
- VSLs and VFRs
- Guidance document attachment – CIP-002-4
- "Proof of Concept" controls (2-3) illustrating the High/Medium/Low concept and the conceptual approach to CIP 003-009.
- Industry Comment Form with questions
- Cover letter

The SDT considered the following proposal:

By November 1 the current 5 subgroups will produce final thoughts for the new drafting teams, and then dissolve. A lead drafting team would be formed from current chairs. A catalogue of controls group would work on the 2-3 controls. In January, 2010 may need to re-divide to conquer on parallel paths: 1) Need more eyes on the controls for development of the controls language volunteers: Joe Doetzel, Jay Crib, Bill Winters(re-volunteering), Jim Brenton

Member Comments on the Proposal:

- Instead of four groups continue with the two groups formed yesterday to conclude by November 1?
- Concerned with what Keith Stouffer is doing – like to revisit – need to rationalize the 15 issues across the standards
- Still talking about creating an example of CIP5 – access control
- Looking at it from a functional model using other standards as potential entry points – and working with Scott on an acceptable format.
- One structure doesn't fit all – cannot design this with one entity in mind.
- January meeting will feature another discussion on basic points of all the controls? – Dec 2009 is just coming up with examples – Keith is still in the NERC standards format
- Maybe everything can be considered low.
- If just "low" then significantly broadening what security is applied to – Keith is shoehorning the standards into an example control – may need to look at how the federal government works under NIST with FSMA – you get a system of controls that are auditable
- The subgroup is tailoring statements to the current standards in response to NERC requirements for phrasing – yes, spending a lot of time trying to shoe horn it together – if that is not the way to go then let us know before we have created the wrong example.
- My understanding based on discussions with NERC staff –is that unless that statement that auditor is looking at is in a standard with an "Requirement" and been approved as a requirement, it cannot be audited – approval is a process question rather than content – cannot simply just borrow from NIST and run with it.
- Interested in finding out if we can offer it as an example
- Should this group make a formal request through Dave Taylor and Gerry Adamski to Standards Committee to ask for approval for the approach? If we ask now we maybe able to get an answer in 4-6 weeks assuming they do not consider it a change to the standards process
- Does the group want to pursue that option?

- They can authorize the executive committee to act quickly – get on the December docket of the Standards Committee – suggesting creating one bucket with three levels rather than three separate classes to apply NIST to CIP?
- Next standards committee meeting is in Phoenix in January
- Ask permission to put NIST standards out for review to let us go forward and use them?
- No, not the NIST catalogue but agreement that SDT can establish a controls catalogue – the concept, not a specific list.
- Can we produce a lot of controls from the SDT?
- Yes, asking permission to do so since it is not part of the typical standards process.
- This is much more of a risk management concept.
- Have to get a catalogue that goes through the process
- Suggesting a catalogue drawn from NIST and other sources that is appropriate for our industry then do some applicability mapping with h-m-l impact – vast majority of the list will not apply to any one system.
- Scoping and tailoring – not enthusiastic about taking NIST catalogue as a whole to modify.
- Agree to create our own catalogue – NIST just provides a starting point
- And a one size will not fit all
- We have an example of scoping and tailoring effort – careful not to scope and tailor all of the hard stuff out – the current NIST 853 is much more of a "how" than a "what" list – will need to tailor it to fit and also avoid the detail of how.
- Take this discussion into the group of volunteers identified earlier.
- Question- looking at separate document outside CIP-002 – still has to be FERC approved?
- We still need to determine the form and tools needed.
- Will default to be included in the standard anyway?
- Will need to determine what we are asking the Standards Committee – frame the question
- Why are we asking for permission? Don't standards have appendices? Why not go that route?
- Having a catalogue of controls relative to the level of rating to be applied and make it auditable – it may be an appendix – we don't not have a current model and need the Committee's concurrence in developing those controls.
- Question is do we want flexibility?
- 853 is the guidelines – NERC doesn't allow enforcement of guidelines – Keith is rewriting to make it an enforceable standard – catalogues have not been allowed in standards before so we need an okay from Standards Committee for the new model, whether it is in appendix or not.
- IS99 created a technical what standard – non-binding – but was run through their process – we are proposing something similar
- Still want to know why we can't develop as an appendix and simply appraise the committee for their approval – don't want to be distracted given the limited time – declare what we are doing, let them know, and keep moving.
- We can do this in parallel – move forward and create example and also ask Standards Committee for approval of the approach
- Doesn't matter where we put it – makes the standards more readable to put into appendix
- Agree if allowed under current structure

- We are getting wrapped up in format – what are we asking the Standards Committee? How is the catalogue applied? Give flexibility to the entity or have to apply catalogue?
- Catalogue needs to be developed to be dynamic, flexibility to adjust to changes and new attack vectors we can't anticipate
- That will not be acceptable to FERC, NERC or industry – the commission says only those things adopted through their process and made a mandatory reliability standard are enforceable
- We need to refocus on what needs to be accomplished today and going forward.
- Motion/2nd: Draft 1 should be ready by July 2010 for industry comment as part of workplan, addressing all of 706: Yes=11, No=3, Abstain=1.
- More comfortable offering October – we would have to do something different to get there by July – as much as I would like to say and get there in July, it is not realistic.
- Observation -- October is within the 24-month window.
- If deliver before then, all the better.
- Any in July willing to accept October?
- October may be more realistic – other factors mean we should shot for July – expectation is to show progress.
- When will there be a filing with FERC? That is the date that is valid – best possible date for that would be middle of 2011, maybe the end of 2011 to thrown over to FERC.
- Question: it will take a minimum two rounds of comments and minimum one calendar year after the Draft 1 posting to achieve consensus and go to ballot? Wants something formal that talks about the end game
- Question: in the best opinion of the standard drafting team, it will take four rounds of comments and eighteen months after the Draft 1 posting (July 2010) to achieve consensus and go to ballot? Yea=12; Nay=2; Abstain=0

D. SDT Agreements on Structure and Schedule

1. Strawman drafting team (made up of John, Jackie, Phil and John) – with current subgroups completion today or by Nov. 1? Deliverable - can we test what issues that group will tackle? Agreed.

2. Team of Catalogue of Controls volunteers (Joe Doetzl, Bill Winters, Keith Stouffer, Jon Stanford, Jim Breton, Jay Cribb) – address issue of appendix and approval from Standards Committee and report back in Orlando. Given discussion today – Keith's question of format is no longer relevant. Agreed.

3. In the best opinion of the standard drafting team, it will take four rounds of comments and eighteen months after the Draft 1 posting in July 2010 to achieve consensus and go to ballot. (Yes, 12; No 2, Abstain 0)

V. Guidance on issues and questions for the Straw Drafting Team

The SDT identified and then discussed key open issues:

5. Better identification of reliability functions (BES cyber system identification based on reliability functions) – MetaGroup 1 & 2
6. Better definition of terms used in BES mapping document: control centers/systems, generation systems, etc. – MetaGroup 1
7. Cyber impact analysis alternative approaches and implications – avoid unintended consequences – Group 2
8. Better sense of how the pieces fit together and how an entities will use it – reliability functions, where do they fit and how do you come up with cyber systems that apply – Meta Group 1 & 2

Following lunch, members discussed guidance on issues and questions for the Straw Drafting Team to consider including:

A. Better identification of reliability functions (BES cyber system identification based on reliability functions) – Meta Group 1 & 2

Member Comments:

- More than just operating systems.
- Original scope based on functions.
- Look at the definition in the template – changed during the SDT discussion yesterday.
- It appears more restrictive than what we have now you don't operate with a relay further down the system – is this "operate" in the right context?
- Cyber system which supports or performs?
- Strike "reliably" from this.
- Want it to tie into the reliability standards
- "Direct or indirect impact on the reliable operation of" – drawn from the old but has the key phrases
- We will still need good guidance
- Target of protection is a hard item to define.
- I like what is here because it is more the distributive element.
- But never referenced in the standards.
- Access control for connected systems
- Seems like a useful definition that may need to be moved to guidance
- Does the definition cover all the situations? How would control system be treated in terms of data? This is still missing something – this is an IT-centric definition – most people do not think of a relay as processing data.
- Cyber system can be a single device or several – "a discrete set of one or more" – industry sees an out they will take it – a minor add to clarify
- Should you add administration? – a hub is an administration point –
- I think administration is already encompassed here
- And/or display data? Does it add anything?
- Reliability Functions- need to make sure they are defined

- Get back to a brief description – Varnell's group had a list – use that to create definitions – Varnell and Kinas will work on and get to group by Nov. 1.

B. Better definition of terms used in BES mapping document: control centers/systems, generation systems, etc. – Meta Group 1

Member Comments:

- Better definition of BES subsystems?
- May need to use a different term for control center
- Also items that do not fall into the "control center" category – Jackie, John L. and others – will schedule time in the next week or so

C. Cyber impact analysis alternative approaches and implications – avoid unintended consequences – Meta Group 2

Member Comments:

- Are there medium or low cyber systems within BES subsystems?
- If interconnected with high impact systems, does it matter? Are they not high?
- Depends on how cyber system is structured
- Bigger the cyber system becomes the harder it is to manage the security – have to scope to maximum efficiency
- Look at RTUs independently? They are part of the system – some are higher impact than others – don't have to treat them like a control system
- Do all the pieces that make up the system default to high if any one part is high? If RTU is connected it is connected
- For some RTUs it would not matter if they go away
- This is why you need criteria to determine what is high or low impact on cyber impact side
- Can't make assumptions that those things in an integrated entity are all high – may not be in a non-integrated entity
- Reliability coordinator – everyone feeding the system becomes high
- Define the boundaries of the system – where does one begin and another end

D. How can we get a better sense of how the pieces fit together and how entities will use it? This includes where the reliability functions fit and how you come up with cyber systems that apply – Meta Group 1 and 2

VI. Next Steps and closing

The Chair reviewed the next steps including the schedule for the Version 3 response document and the CIP 002-4 effort. She thanked Joe Doetzl for hosting the meeting and providing excellent food and facilities.

The SDT adjourned at 2:45 p.m. on October 22.

Appendix # 1— October 20–22, 2009 Meeting Agenda

NOTE:
1. Agenda times may be adjusted as needed during the meeting
2. Subgroup meetings may not have access to telephones and WebEx

Proposed Meeting Objectives and Outcomes

- Welcome new members and outline SDT leadership transition
- Review FERC Order and Discussion of SDT response and industry comment process
- Review the CIP-002 work plan going forward
- Receive updates on TFE, VSLs, VRFs, and related cyber security efforts
- Receive and discuss reports from CIP-002 subgroups identifying key issues and coordination points
- Convene CIP-002 subgroup meetings
- Review and refine a draft outline for CIP-002
- Receive and discuss subgroup reports and draft CIP-002 language
- Agree on work plan, next steps and assignments

October 20, 2009

8:00 Welcome and Opening Remarks — Jeri Domingo-Brewer and Kevin Perry
Roll Call; NERC Antitrust Compliance Guidelines
Review of September 9-10 meeting summary and acceptance
8:20 Review of Meeting Objectives, Agenda and Meeting Guidelines — Bob Jones
8:25 Welcome New Members and Leadership Transition — Jeri Domingo-Brewer and Kevin Perry
8:40 Overview of FERC Order on CIP Version 2 — Scott Mix
8:45 Rapid Response Process — Special Meetings and Electronic Voting — Joe Bucciero
8:50 Review and Discussion of Response to FERC Order and Issues with Implementation Plan
10:15 Next Steps and Plan for mid-November Response Document
10:45 Review of CIP 002 Work plan and CIP 002 Subgroup Process — Stu Langton
11:15 Overview of CIP 002 Strawman Template — Joe Bucciero
11:30 Subgroup Reports to the SDT

1. Reliability Functions Subgroup Report and Key Issues and Draft CIP-002 Language — John Varnell
2. List of BES Subsystems/BES Cyber Systems Subgroup Report Key Issues and Draft CIP 002 Language — Jackie Collett
3. BES Mapping Subgroup Report and Key Issues and Draft CIP 002 Language — John Lim
4. Cyber Analysis Subgroup Report, and Key Issues and Draft CIP 002 Language — Phil Huff
5. Definition and Selection of Controls Subgroup Report, Key Issues and Draft CIP 002 Language — Keith Stouffer

3:25 Proposal for Subgroup Meetings — Jeri Domingo-Brewer and Kevin Perry
3:30 Subgroup Drafting Meetings (may be joint subgroups meetings at various locations)

October 21, 2009

8:00 Subgroup Drafting Meetings (at various locations)
10:30 Welcome and Agenda Review — Jeri Domingo-Brewer
10:35 Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure — Jeri Domingo Brewer, Kevin Perry and Scott Mix
10:50 Update on VSLs/VRFs — Scott Mix
10:55 Update on other related cyber security initiatives — SDT Members
11:00 Subgroup Reports — Plenary Session

1. Reliability Functions Subgroup Report, Key Issues and Draft CIP 002 Language
2. List of BES Subsystems/BES Cyber Systems Subgroup Report, Key Issues and Draft CIP 002 Language
3. BES Mapping Subgroup Report Subgroup Report, Key Issues and Draft CIP 002 Language
4. Cyber Analysis Subgroup Report, Key Issues and Draft CIP 002 Language
5. Definition and Selection of Controls Subgroup Report, Key Issues and Draft CIP 002 Language

1:00 Continue Discussion of Key Issues from Subgroup Reports
3:15 Subgroup Drafting Meetings (may be joint subgroups meetings at various locations)

October 22, 2009

8:00 Subgroup Drafting Meetings (at various locations)
9:30 Welcome and Agenda Review — Jeri Domingo-Brewer
9:35 Review of CIP 002 Strawman and Subgroup Reports — Plenary Session

1. Reliability Functions Subgroup Report- Draft CIP 002 Language, Q & A
2. List of BES Subsystems/BES Cyber Systems Subgroup Report, Draft CIP 002 Language
3. BES Mapping Subgroup Report Subgroup Report, Key Issues and Draft CIP 002 Language
4. Cyber Analysis Subgroup Report, Key Issues and Draft CIP 002 Language
5. Definition and Selection of Controls Subgroup Report, Key Issues and Draft CIP-002 Language

1:15 Key Issues from Subgroup Reports and Drafting Assignments Going Forward
2:30 Review Work Plan

- Next Steps for Subgroups and SDT and the creation of a single CIP 002 text
- Review November Version 3 Response
- Meeting Evaluation

3:00 Adjourn

Appendix # 2 Attendees List

Attending in Person — SDT Members

1.	Rob Antonishen	Ontario Power Generation (Friday)
2.	Jeri Domingo-Brewer, Chair	U.S. Bureau of Reclamation
3.	Jim Breton	ERCOT
4.	Jay S. Cribb	Information Security Analyst, Southern Company Services
5.	Joe Doetzl Manager,	Information Security, Kansas City Pwr. & Light Co.
6.	Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
7.	Phillip Huff	Arkansas Electric Coop Corporation
8.	Doug Johnson	Exelon Corporation - Commonwealth Edison
9.	Frank Kim	Ontario Hydro
10.	Rich Kinas	Orlando Utilities Commission
11.	John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
12.	David Norton	Entergy
13.	Kevin B. Perry, Vice Ch.	Director Critical Infrastructure Protection, SPP
14.	Christopher A. Peters	ICF International
15.	Scott Rosenberger	Luminant Energy
16.	David S. Revill	Georgia Transmission Corporation
17.	Kevin Sherlin	Sacramento Municipal Utility District
18.	Keith Stouffer	National Institute of Standards & Technology
19.	John D. Varnell	Technology Director, Tenaska Power Services Co.
20.	William Winters	Arizona Public Service, Inc.
21.	Scott Mix	NERC
22.	Joe Bucciero	NERC/Bucciero Assoc.
23.	Hal Beardall	FSU/FCRC
24.	Robert Jones	FSU/FCRC Consensus Center
25.	Stuart Langton	FSU/FCRC Consensus Center

SDT Members Attending via WebEx and Phone

26.	Brian McKay	Xcel
27.	Jackie Collett	Manitoba Hydro
28.	Tom Hofstetter	NERC

SDT Members Unable to Attend

29.	Jonathan Stanford	Bonneville Power Administration
30.	Sharon Edwards	Duke Energy

Others Attending in Person

31.	Bill Glynn	Westar Energy
32.	Rick Terrell	Luminant
33.	Chris Wright	Burns and MacDonald Engineering

Others Attending via WebEx and Phone

34.	Rob Hardiman	Southern Company Transmission (10-20, 21, 22)
35.	David Huff	FERC (10-20, 22)_
36.	Justin Kelly	FERC 10-21, 22)
37.	Hoang Neg	RRI Energy (10-20_
38.	Jon Stitzel	Burns and MacDonald Engineering

Appendix # 3 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Subroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and Subroups)

should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

Appendix # 4 Meeting Schedule
October 2008–December 2010

Development of CIP Version 2 and Version 3 Framework
October 2008–July 2009
1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.
2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development
3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 Version 3 process reviewed.
4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white papers assigned.
5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed Version 3 white papers.
January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.
7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.
8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals
March 2–April 1, 2009 — 30-day Pre Ballot
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment
March 30, 2009 — WebEx meeting(s) White Paper Drafting Team
April 1–10 — NERC Balloting on Version 2 Products
April 6, 2009 — WebEx meeting — White Paper Drafting Team
April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call
April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments-
9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.
April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx
April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%
May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.
10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.
June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx

11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.
June **—** WebEx meeting(s)
Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria

CIP-002 Development of Requirements, Measures, Etc. July-December 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada
SDT reviewed, refined, and adopted SDT Working Paper. SDT adopted its response to NERC for Interpretation of CIP-006-1. SDT reviewed and adopted a proposal for CIP-002 Subgroups and Deliverables and convened subgroup organizational meetings to develop work plans. SDT adopted 2010 Meeting Schedule.

- July–August Interim Conference call meeting(s)
- CIP-002 Subgroup meetings
- CIP-002 Coordination Team meeting
- August 3**–**5, 2009 in Winnipeg, Manitoba **NERC Member Representative Committee**. Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.

13. August 20–21, 2009 in Charlotte, NC. SDT reviewed and responded to MRC input on Working Paper/CIP-002 Concepts and convened SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).
July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper
NERC Webinar- August–September Interim Conference Call meeting(s)

- CIP-002 Subgroup meetings (as ne
- CIP-002 Coordination Team meeting

14. September 9–10, 2009 in Folsom, CA. SDT reviewed and considered industry comments on the Working Paper and CIP-002 concepts and their application to the subgroup work and addressed coordinating issues through joint subgroup meetings. SDT agreed on meeting dates and proposed locations for January–December 2010
September–October Interim WebEx meeting(s)

- CIP-002 Subgroup meetings
- CIP-002 Coordination Team meeting

15. October 20–22, 2009 in Kansas City, MI

- SDT Subgroup drafting meetings — day one
- SDT Plenary Session(s) — day two subgroup reports on CIP-002 requirements
- Review and refine initial draft of CIP-002 single text

October–November Interim WebEx meeting(s)

- CIP-002 Coordination Team meeting

16. November 17–19, 2009 in Orlando, FL

- SDT plenary session(s) — to review and refine CIP-002 standard, requirements, measures and controls.
- November–December Interim WebEx meeting(s)
- Drafting teams as needed to finalize drafts

- CIP-002 Coordination Team meeting

17. December 15–16, 2009 in Little Rock AK

- SDT plenary session(s) to review, refine, and agree on and adopt CIP-002 standard, requirements, measures and controls.
- Agree on initial posting of draft CIP-002 for industry review and comment.

Refinement of CIP-002 and Development of Other CIP Standards
January–December 2010
(12 SDT monthly meetings and subgroup WebEx meetings as needed)

- SDT responds to industry comments on initial and subsequent postings of CIP-002, Version 3 (may be multiple comment periods, as required)
- Refine the CIP-002 through the comment period and submit new CIP-002 Version 3 Standard for Balloting along with the catalogue of controls (i.e. CIP-003-CIP-009 or its successor) OR
- Ballot CIP-002 while permitting industry to rely on CIP 003-CIP-009 until the full suite of controls (i.e. CIP-003-CIP-009 or its successor) is reviewed and presented for balloting.
- Submit the full suite of CIP Reliability Standards on Cyber Security for Industry Comment
- Refine and Submit the full suite of CIP standards for industry ballot
- NERC Board of Trustees adoption of the full suite of standards
- FERC approves and NERC Implements the full suite of CIP standards

Proposed 2010 Meeting Schedule

January 19–21 — Wednesday–Thursday, Atlanta GA	July 14–15, Wednesday–Thursday
February 17–19 —Thursday–Friday, Austin TX	August 11–12, Wednesday–Thursday
March 9–11 — Tuesday–Thursday, Phoenix, AZ	September 8–9, Wednesday–Thursday
April 14–15 — Wednesday–Thursday, Atlanta GA	Oct. 13–14, Wednesday–Thursday or Oct.12–14
May 12–13 — Wednesday–Thursday, Dallas TX	November 17–18, Wednesday–Thursday
June 9–10 — Wednesday–Thursday, Sacramento CA	December 15–16, Wednesday–Thursday

Appendix #5 CIP-002-4 Template

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (insert dates of posting period).
2. Revised SAR and response to comments posted (insert dates of posting period).
3. Revised SAR and response to comments approved by SC (insert date of approval).
4. SDT appointed on (insert date).
5. First draft of proposed standard posted (insert dates of posting period).
6. Second draft of revised standard posted (insert dates of posting period).
7. Third draft of revised standard posted (insert dates of posting period).

Proposed Action Plan and Description of Current Draft:

This is the initial draft of the proposed standard and is being submitted to the Standards Committee with a request to authorize moving the standard forward to the next stage of the standards process.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Post for 30-day pre-ballot review.	(insert dates)
2. Conduct initial ballot.	(insert dates)
3. Post response to comments on initial ballot.	(insert date)
4. Conduct recirculation ballot.	(insert dates)
5. Submit standard to BOT for adoption.	(insert date)
6. File standard with regulatory authorities.	To be determined.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

1. **Cyber System —** A discrete set of one or more programmable electronic devices organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition or display of data.

2. **BES Cyber System —** A Cyber System which has direct or indirect impact on the reliable operation of the Bulk Electric System.

3. **Target of Cyber Protection (Term may not be necessary) —** of the Target of Protection is (1) a set of BES Cyber Systems, (2) the components supporting their confidentiality, integrity, and availability requirements and (3) any other components needing protection based on their network or physical location within the BES Cyber System operating environment.

4. **Cyber System Confidentiality —**Preserving authorized restrictions on information access and disclosure.

5. **Cyber System Integrity —** Guarding against improper modification or destruction of Cyber System settings, presentation and/or data points. This includes ensuring the non-repudiation and authenticity of data.

6. **Cyber System Availability —** Ensuring timely and reliable access to and use of Cyber Systems.

7. **Generation Subsystem**

8. **Transmission Subsystem**

9. **Control Center**

Terms to be retired from the *Reliability Standards Glossary of Terms* once the standards that use those terms are replaced:

1. **Critical Assets**

2. **Critical Cyber Assets**

3. **Cyber Assets**

Appendix # 5

ROUGH DRAFT TEMPLATE FOR INITIAL CONSIDERATION OF CSO706 SDT

Introduction

Title: Cyber Security — BES Cyber System Identification and Classification

Number: CIP-002-4

Purpose: NERC Standards CIP-002-4 through CIP-xxx-4 provide a cyber security framework for the identification and protection of BES Cyber Systems to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-4 requires the identification, classification and documentation of the BES Cyber Systems associated with the BES Systems that support the reliability functions of the Bulk Electric System.

Applicability:

Within the text of Standard CIP-002-4, "Responsible Entity" shall mean:

Reliability Coordinator.

Balancing Authority.

Interchange Authority.

Transmission Service Provider.

Transmission Owner.

Transmission Operator.

Generator Owner.

Generator Operator.

Load Serving Entity.

NERC.

Regional Entity.

Structures, components, equipment and systems of facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission that are determined to be associated with Balance of Plant.

Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

(Proposed) Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

Requirements

Determine Functions *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

Text, text, text

Text, text, text

Additional paragraphs.

Map Functions to BES Systems

Determine Classification of BES Systems

Responsible Entities shall apply the following criteria to map the list of BES Subsystems supporting the functions described in R1 to High, Medium and Low BES impact categories as follows:

3.1. High Impact (H)

3.1.1. Any Generation Subsystem whose loss results in a frequency deviation exceeding step A of the regional UFLS as calculated using the BA frequency bias setting. (Note BAL-003-0 R5) *(DHS Tier I)*

3.1.2. Any Generation Subsystem that, if lost or misused, results in an Interconnection Reliability Operating Limit (IROL) violation, as determined by an engineering evaluation or other assessment method. *(Critical Asset Guideline)*

3.1.3. Any Generation Subsystem pre-designated, long-term as Reliability “must run” units beyond the local utility area by the Balancing Authority, Reliability Coordinator, or Regional Reliability Assurer. *(Critical Asset Guideline)*

3.1.4. Any Generation Subsystem that has been determined to be essential to the reliability of the BES through an engineering evaluation or other assessment method approved by the Regional Reliability Assurer, for voltage stability beyond the local utility area. *(Critical Asset Guideline)*

3.1.5. Transmission Subsystems that contain switching stations 300 KV or higher with an aggregate rated switched capacity flow of 5000 MW or higher in the Eastern and Western Interconnections, or 200 KV or higher with an aggregate rated switched capacity flow of 3000 MW or higher in other Interconnections, unless they have been determined not to be essential to the reliability of the BES through an engineering evaluation or other assessment method approved by the Regional Reliability Assurer, either for voltage or frequency stability support. *(DHS Tier I)*

3.1.6. Transmission Subsystems that, if lost or misused, will result in an Interconnection Reliability Operating Limit (IROL) violation, as determined by an engineering evaluation or other assessment method. *(Critical Asset Guideline)*

3.1.7. Transmission Subsystems that, if lost or compromised, will result in the loss of a Generation Subsystem defined in this subsection 2.1, High Impact Subsystems. *(Critical Asset Guideline)*

3.1.8. Transmission Subsystems identified as essential to meeting Nuclear Plant Interface Requirements as per NUC-001 standard for high impact Nuclear facilities.*(Critical Asset Guideline)*

3.1.9. Transmission Subsystems that, if destroyed, degraded or otherwise rendered unavailable, may result in voltage collapse as determined through an engineering evaluation or other assessment method. *(Critical Asset Guideline)*

3.1.10. Transmission Subsystems that, if destroyed, degraded or otherwise rendered unavailable, may result in electric system collapse due to frequency related instability as determined through an engineering evaluation or other assessment method. *(Critical Asset Guideline)*

3.1.11. Transmission Subsystems that, if destroyed, degraded or otherwise rendered unavailable, may result in complete operational failure of the transmission system or separation or Cascading outages. *(Critical Asset Guideline)*

3.1.12. Special Protection System (SPS) or Remedial Action Schemes (RAS) Subsystems on 300 KV and above in the Eastern and Western Interconnections, or 200 KV and above in other Interconnections, that have an Adverse Reliability Impact. *(DHS Tier I)*

3.1.13. BES Subsystems that perform automatic load shedding of 300 MW or more.*(Critical Asset Guideline)*

3.1.14. Control Centers and backup Control Centers defined by the transmission assets they monitor or control with a threshold of 300,000 MW total transmission capability.

3.1.15. Control Centers and backup Control Centers defined by the generation assets they monitor or control with a threshold of 10,000 MW or more of total generation.

3.1.16. Control Centers and backup Control Centers defined by the total load they monitor or control with a threshold of 10,000 MW.

3.1.17. Control Centers and backup Control Centers performing Reliability Coordinator functions. .

3.2. Medium Impact (M)

3.2.1. High is: Any Generation Subsystem whose loss results in a frequency deviation exceeding step A of the regional UFLS as calculated using the BA frequency bias setting. (Note BAL-003-0 R5)

Low is: Any Generation Subsystem whose loss results in a frequency deviation up to .05 Hz as calculated using the BA frequency bias setting. (Note BAL-003-0 R5)

Need **"MEDIUM**"

3.2.2. Blackstart Generation Subsystems that have been included in the regional blackstart capability plan as described in EOP 007. *(DHS Tier I)*

3.2.3. Generation Subsystems which, if lost or misused, result in a System Operating Limit (SOL) violation, as determined by an engineering evaluation or other assessment method as explained in FAC-010 and FAC-011. *(Critical Asset Guideline)*

3.2.4. Any Generation Subsystem that has been determined to be essential to the reliability of the BES through an engineering evaluation or other assessment method, either for voltage stability within the local utility area. *(Critical Asset Guideline)*

3.2.5. Transmission Subsystems with 200 KV or higher with an aggregate switched capacity flow of 2,000 MW or higher in the Eastern and Western Interconnections, or with 100 KV or higher with an aggregate switched capacity flow of 1,000 MW or higher in other Interconnections, that have not been included in Section 2.1 above, that have been determined to be essential to the reliability of the BES through an engineering evaluation or other assessment method, either for voltage or frequency support. *(DHS Tier II)*

3.2.6. Transmission Subsystems comprising the Cranking Paths identified in EOP 005-2 R1.5. Transmission Subsystems that, if lost or misus*ed, results in a System Operating Lim*it (SOL) violation, as determined by an engineering evaluation or other assessment method. *(Critical Asset Guideline)*

3.2.7. Transmission Subsystems that, if lost or compromised, will result in the loss of a Generation Subsystem defined in this subsection 2.2, Medium Impact Subsystems. *(Critical Asset Guideline)*

3.2.8. Transmission Subsystems identified as essential to meeting Nuclear Plant Interface Requirements as per NUC-001-1 for Medium Impact Nuclear facilities.

3.2.9. Transmission Subsystems that, if destroyed, degraded or otherwise rendered unavailable, results in cascading outages that affect areas of the BES system within the local utility area, as determined through an engineering evaluation or other assessment method.

3.2.10. Transmission Subsystems that, if destroyed, degraded or otherwise rendered unavailable, may result in voltage going below the under-voltage load-shed points, as determined through an engineering evaluation or other assessment method. *(Critical Asset Guideline)*

3.2.11. Transmission Subsystems that, if destroyed, degraded or otherwise rendered unavailable, may result in frequency going below the under-frequency load-shed points, as determined through an engineering evaluation or other assessment method. *(Critical Asset Guideline)*

3.2.12. Special Protection Systems (SPS) or Remedial Action Scheme (RAS) Subsystems on less than 300 KV in the Eastern and Western Interconnections, or on less than 200 KV in other Interconnections that have an Adverse Reliability Impact. *)*

3.2.13. Control Centers and backup Control Centers defined by the transmission assets they monitor or control with a threshold of 100,000 MW or higher total transmission capability, not already included in Section 2.1 above.

3.2.14. Control Centers and backup Control Centers defined by the generation assets they monitor or control with a threshold of 5,000 MW or more of total generation, not already included in Section 2.1 above.

3.2.15. Control Centers and backup Control Centers defined by the total load they monitor or control with a threshold of 5,000 MW, not already included in Section 2.1 above.

3.3. Low Impact (L)
Everything else??

Determine BES Cyber Systems that support the BES Systems

(R5a) Determine Classification of BES Cyber Systems

The Responsible Entity shall identify and categorize its BES Cyber Systems using the following steps for each BES Cyber System:

- **BES Subsystem Mapping —** Identify all BES Subsystems through which the BES Cyber System supports or has the potential to impact one or more Reliability Functions.

- **Reliability Function Assessment —** Assess the potential function impact the BES Cyber System has on each of the associated BES Subsystems given the loss of Confidentiality, Integrity, or Availability within the BES Cyber System. Assign one of the following function impact categories for each BES Subsystem the BES Cyber System supports.

  - **High —** Severe degradation or loss of control of the BES Subsystem to an extent and duration that the Responsible Entity cannot perform one or more of its Reliability Functions.

  - **Medium —** Significant degradation or loss of control of the BES Subsystem to an extent or duration that the Responsible Entity can perform its Reliability Function, but the effectiveness is reduced.

  - **Low —** Degradation or loss of control of the BES Subsystem to an extent or duration that the Responsible Entity can perform its Reliability Function, but the effectiveness is noticeably reduced.

R5b. The Responsible Entity shall identify its BES Cyber Systems and determine the potential impact on the BES based on the loss, misuse or compromise of the BES Cyber System (according to [BES Mapping Table]). *(** Need to develop the reliability impact definition and the impact criteria definition for High, Med, and Low. Aggregation of BES subsystems and BES cyber systems versus the impact criteria needs to be defined. **)*

Merge Classification of BES Systems and BES Cyber Systems

Provisional Impact Categorization — Assign a provisional impact category to each BES Subsystem associated with the BES Cyber System using the following look-up table as a relation of both the potential function impact and BES impact mapping.

Function Impact \ BES Impact	High	Medium	Low
High	**High**	**Medium**	**Low**
Medium	**Medium**	**Medium**	**Low**
Low	**Low**	**Low**	**Low**

Final Categorization — Assign the resultant impact categorization of the BES Cyber System as the maximum provisional impact category from its associated reliability

functions. Once the Responsible Entity has determined a provisional impact of High, then they need not perform additional impact analysis.

- Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.
- ERO for Regional Entity.
- Third-party monitor without vested interest in the outcome for NERC.

Compliance Monitoring Period and Reset Time Frame

Not applicable.

Data Retention

- The Responsible Entity shall keep documentation required by Standard CIP-002-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.
- The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

Compliance Monitoring and Assessment Processes

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

Agenda
Cyber Security Order 706 SDT — Project 2008-06

October 20, 2009 | 8 a.m. – 5 p.m. CDT
October 21, 2009| 8 a.m. – 5 p.m. CDT
October 22, 2009| 8 a.m. – 3 p.m. CDT
Town Pavilion, 1111 Main St – *(cross street is 12th)*
Kansas City, MO 64105

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Subgroup Meetings May Not Have Access to Telephones and WebEx

Tuesday, October 20, 2009

- Antitrust Compliance Guidelines
- Welcome new members and outline SDT leadership transition
- Review FERC Order and Discussion of SDT Response and Industry Comment Process
- Review the CIP 002 workplan going forward
- Receive and discuss reports from CIP 002 Subgroups identifying key issues and coordination points
- Convene CIP 002 Subgroup meetings

Wednesday, October 21, 2009

- *Subgroup Drafting Meetings (may be joint subgroups meetings at various locations)*
- Receive updates on TFE, VSL/VRF, and related cyber security efforts
- Review and refine a draft outline for CIP 002.
- Receive and discuss Subgroup reports and draft CIP 002 language
- *Subgroup Drafting Meetings (may be joint subgroups meetings at various locations)*

Thursday, October 22, 2009

- Review and refine a draft outline for CIP 002.
- Receive and discuss Subgroup reports and draft CIP 002 language
- Agree on work plan, next steps, and assignments

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.

Agenda
Cyber Security Order 706 SDT — Project 2008-06

November 16, 2009 | 5:00 p.m. – 9:00 p.m. EST
November 17, 2009 | 8:00 a.m. – 5:00 p.m. EST
November 18, 2009 | 8:00 a.m. – 5:00 p.m. EST
November 19, 2009 | 8:00 a.m. – 3:00 p.m. EST
Orlando Utilities Commission
6003 Pershing Ave.
Orlando, Florida 32822

NOTE:
1. Agenda times may be adjusted as needed during the meeting
2. Drafting group Meetings may not have access to telephones

Proposed Meeting Objectives and Outcomes

- Welcome new members and outline SDT leadership transition
- Review, Discuss, and Adopt SDT Response Document to Industry Comments on CIP Version 3
- Review the CIP-002-4 and CIP-002 through CIP-009-4 work plan going forward
- Receive updates on TFE, VSL, VRF, and related cyber security efforts
- Review CIP-002-4 Key Issues and Provide Guidance to Documents Drafting Groups
- Convene CIP-002-4 Document Drafting Groups
- Review and refine a draft CIP-002-4 strawman and related documents
- Agree on next steps and assignments

November 16, 2009
1. Consideration of FERC Version 3 Response Document Review

November 17, 2009
1. Review work plan decisions in October 2009 and feedback from NERC
2. Updates on Technical Feasibility Exception (TFE) NERC Rules of Procedure, VSLs, VRFs, and other related cyber security initiatives
3. Consideration and adoption of FERC Version 3 response document review — motion to adopt the CIP Version 3 response document *(when ready).*
4. Overview of CIP-002-4 and CIP-002 through CIP-009-4 work plan
5. Overview of CIP-002-4 strawman draft documents, format, and key remaining issues and challenges

November 18, 2009

1. Review of key remaining issues, challenges, and guidance to drafting groups
2. Convene SDT CIP-002-4 Document Drafting Groups
3. CIP-002-4 Document Drafting Group Reports and additional SDT guidance
4. Reconvene SDT CIP 002-4 Document Drafting Groups

November 19, 2009

1. Review, refinement, and consensus testing of CIP-002-4 strawman documents from Drafting Groups
2. Review of CIP-002-4 next steps for SDT Drafting Groups

- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.
- Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation, Bylaws, and Rules of Procedure are followed in conducting NERC business.

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

CSO706 SDT November 16-19, 2009 Meeting Summary Contents

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CSO706 SDT NOVEMBER 16-19, 2009 MEETING

EXECUTIVE SUMMARY

On Monday evening the Chair, Jeri Domingo-Brewer welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda. Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines.

Mr. Mix reminded the SDT of the FERC Order and 90-day response presented at the Kansas City meeting in October and provided an overview of the industry comments received the proposed revisions of CIP-002-2 through CIP-009-2, the Implementation Plan for Version 3 of the Cyber Security Standards, and the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities, developed by the standard drafting team as part of Project 2009-21 Cyber Security Ninety-day Response. Mr. Mix noted that There were 29 sets of comments, including comments from more than 60 different people from approximately 40 companies representing 8 of the 10 Industry Segments.

The SDT reviewed, discussed and refined an initial strawman draft response document for CIP Version 3 prepared by Scott Mix for the 29 sets of comments received. At the end of Monday evening's meeting drafting assignments were reviewed. The SDT followed up on Tuesday morning and early afternoon and reviewed a refined document that included some new draft language for the consideration of comments document. The SDT reviewed a final draft with several revisions on Wednesday morning and unanimously adopted it for posting.

On Tuesday morning, Mr. Bucciero conducted a roll call of members and participants in the room and on the conference call and reviewed the need to comply with NERC's Antitrust Guidelines as he did on each of the following meeting days.

On Wednesday morning Scott Mix provided an Update on VSLs/VRFs noting that ballot had closed last Thursday with a high level of industry support. This would be approved by the NERC Board of Trustees and submitted to FERC. He noted the chair of the VSL/VRF SDT has volunteered to come in and give an update to the Team in January. In terms of the Version 2 VSL/VRF Mr. Mix indicated that there will have to be a correction for a technical error but that it looks like it will be approved which will close that group's work. The CSO706 SDT will be responsible for the VSLs/VRFs for Version 4. The SDT VSL/VRF chair will talk with the CSO706 SDT about their experience early next year to help us take on the task later in 2010.

SDT member discussed the updates on work related to the "smart grid" and its relation to the CIP development including the smart grid efforts and the need for coordinating this with the SDT's work.

Mr. Mix provided an update on the TFE process indicating that NERC is not expecting further actions by FERC – but will have to wait and see. He noted a compliance bulletin has been issued which directs industry to prepare for compliance – regions and NERC having discussions for a uniform system of compliance, should benefit those with coverage into different regions – have not seen a backlog of TFEs. The members discussed class based TFEs, mitigation plans, compliance schedules, and application to CAs and CCAs.

On Tuesday, facilitator Mr. Langton reviewed the workplan suggesting the SDT complete its initial draft of CIP-002-4 for posting by the conclusion of the December, 2009 meeting and launch the effort to develop the suite of controls (CIP 003-009) in early 2010. This will be a challenging parallel process with the SDT responding to industry comments and refining CIP 002-4 while simultaneously developing CIP 003-009. He noted that in January the SDT will review and agree on how best to organize to deliver on the milestones in the accelerated workplan.

At the end of the session on Tuesday afternoon, the SDT, at the request of NERC, engaged in a "blue sky" brainstorming session on ways to streamline the development process. The Team identified 36 suggestions in the following six categories: Changing ANSI Standards Procedures (3 options); Meeting Changes- Efficiency, Location, Tools (5 options); Commitment, Communication and Support (9 options); Team Structure (3 options); Substantive Changes in Approach/Scope to Standard Development (10 options); and More Talent and Expertise to Support SDT (6 options).

The Team agreed to engage in an exercise on Thursday to prioritize these options in terms of the highest priority and most helpful in facilitating the CIP standards development process. The results of the survey completed by 15 SDT members produced the following 5 options that received higher than a 4 rating on a 5-point scale *(from most helpful to don't do it):*

1. (4.46) Technical writer support (more writers like Scott Mix) (NERC) (11-5's & 4's and 2 -1's & 2's)
2. (4.43) Improve industry communications in getting the word out on the SDT and its progress? Webinars, workshops, etc. (NERC in Coordination with SDT) (11-5's & 4's and 0 -1's & 2's)
3. (4.36) Make the best use of our time. Start meetings on time and get the technology operational early(SDT)(8-5's & 4's and 0 -1's & 2's)
4. (4.21) Receive permission to use informal comment processes for the development of the CIP with a final 45-day comment period consistent with the ANSI process. (NERC) (7-5's & 4's and 1 -1's & 2's)
5. (4.00) Engage technical writers (NERC) (8-5's & 4's and 3 -1's & 2's)

On Thursday morning, the Chair and Vice Chairs participated on behalf of the SDT in a conference call with Mike Assante and Gerry Adamski at NERC and Alan Moser the Vice Chair of the NERC Standards Committee to discuss NERC's guidance to the Team on the schedule the Team reviewed and revised at their Kansas meeting in October. The NERC representatives

provided background in what is driving their schedule concerns noting in particular a perception from FERC and some on Capitol Hill that progress on Order 706 directives has been too slow which was underscored with the NERC survey back in the Spring. They noted that they believed that at least the CIP 002-4 (the asset categorization piece) needs to be filed with FERC by midyear and the CIP 003-009 by the end of the year. They offered commitment to providing the Team with whatever is need in terms of resources and communication with industry. The Team discussed the schedule and expressed concerns that: CIP 002-4 should not be watered down to fit today's CIP 003-009; that it might be difficult for the industry to adopt CIP 002-4 without seeing the controls in CIP 003-009; and the NERC conversation wasn't with the full team.

The Chair reviewed with the SDT the deliverables needed for posting in December, 2009 including: CIP-002-4 Requirements and measures; Sample controls (2-4 examples); Comment form with questions; Guidance document; Intro or cover letter; Related VSLs/VRFs: and Definitions.

John Lim provided an overview of Version 4 CIP 002 Strawman Draft Documents noting the current draft was still missing some definitions for the BES, generation and transmission subsystems and control centers. He noted that Jackie Collett and a sub-team (Scott Rosenberger, Gerry Freese, Jay Cribb) are tackling the definitions. He suggested that the critical assets guideline has started to create a definition that may serve as a starting point. Finally he pointed out that all of the generation assets in this draft has been moved from high to the medium level and that no unit by itself is considered high, but generation system could be in high. High also includes the major transmission facilities.

On Wednesday morning after reviewing and finalizing and adopting version 3 considerations document, the SDT broke into the following drafting groups for CIP 002-4: BES subsystem description/definition (led by Jackie Collett); Reliability functions definitions (led by John Varnell); Control Samples (Led by Keith Stouffer); and Guidance Document (led by Phil Huff). The facilitators noted that the SDT had to balance: getting it right; with getting enough consensus for acceptance; with getting it done in a timely manner. The SDT needs to optimize the three together.

Jackie Collett reported on the BES Subsystems Descriptions small group's results noting that they had a good start on a definition. John Varnell report that his group had developed 9 definitions for reliability functions and they had added definitions for each of the functions and included the examples which will be an attachment at end of CIP 002-4 standard and serve as a foundation for later sections.

Keith Stouffer noted that his group had developed two samples. He noted that the tables are designed to help the industry to understand the categorization process. The drafting group took two standards 009 and 006 to show how the categorization process might apply and their related requirements and asked the question: what is in the standard now is a "high" baseline. He suggested that even though we are adding categories, if you are low impact, there will be fewer requirements levied upon you.

Phil Huff noted that the Guidance Document group had found a way to simplify and the revised draft represented a major shift in name of simplicity. The proposal is to use the reliability functions for determining your BES cyber systems.

On Thursday, the drafting groups reported to the SDT. Keith Stouffer mentioned that in terms of the controls table format, the next big step to develop the information paragraph at the outset of each of the tables. Phil Huff noted that the Guidance Document would be developed further and circulated to the SDT in advance of the Little Rock meeting. The Chair noted she would circulate a draft of the "Comment Form". John Lim agreed to revise the CIP 002-4 draft for a preview in early December and then refine it and send it out to the SDT prior to the Little Rock meeting. Jackie Collett asked for time on the Little Rock agenda to go through a "walk through" of the CIP 002-4. She agreed to work with several SDT members to prepare materials for the walk through. NERC Staff (Maureen Long, Dave Taylor and Joel De Jesus) joined the SDT on Thursday morning and offered guidance in drafting the CIP 002-4.

The SDT Chair and Vice Chairs reviewed with the Team the updated agreed upon schedule for both the CSO 706 SDT Version 3 CIP and the Version 4 CIP 002 Process as follows:

CIP Version 3 Key Steps/Schedule

1. November 30, Monday *(after Thanksgiving)* Deadline for Votes and Industry Comments
2. December 2, Wednesday, CSO 706 SDT - Conference Call- finalize Response document to Industry Comments
3. December 3- 13, Recirculation Ballot
4. December 16, BoT Approval
5. December 29, 2009, FERC Filing

CIP 002-4 Key Steps/Schedule (October-December 2009)

1. December 7, 3:00-4:30 p.m. est. Previews of reviewed CIP 002 and related document drafts at a SDT conference call.
2. Other drafting groups will organize and schedule meetings prior to Little Rock.
3. The SDT will refine and circulate a revised strawman Draft by Monday, December 14, 2009 for review at the December 15-16 CSO706 SDT meeting in Little Rock
4. December 15-16 will refine, finalize and adopt draft CIP 002-4 for posting to the industry for informal comments.

The Chair reviewed the next steps including the schedule for the Version 3 response document and the CIP 002-4 effort. She thanked Rich Kinas for hosting the meeting and providing excellent food and facilities.

The SDT adjourned at 2:00 p.m. on November 19, 2009.

CSO706 SDT NOVEMBER 16-19, 2009 MEETING SUMMARY

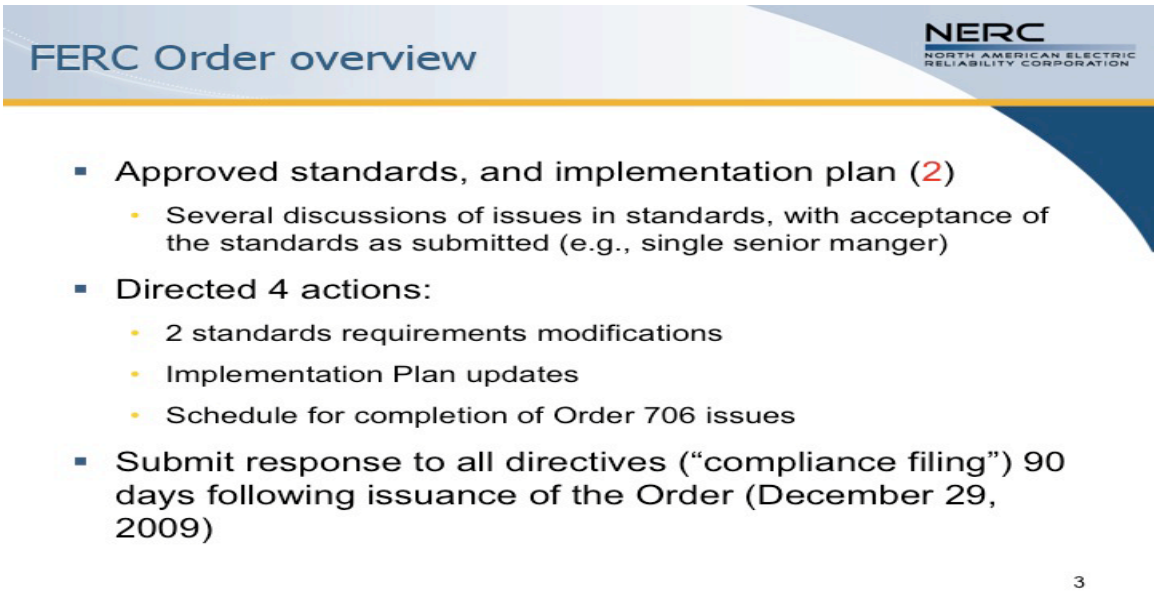
I. FERC ORDER ON CIP VERSION 2 AND VERSION 3 COMMENT RESPONSE DOCUMENT

A. Introduction

On Monday evening the Chair, Jeri Domingo-Brewer welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3)* and repeated this the beginning of each day of the meeting. He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

B. CIP Version 3 90-day Comment Response Document

Mr. Mix reminded the SDT of the FERC Order and 90-day response presented at the Kansas City meeting in October:



He provided an overview of the industry comments received the proposed revisions of CIP-002-2 through CIP-009-2, the Implementation Plan for Version 3 of the Cyber Security Standards, and the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities, developed by the standard drafting team as part of Project 2009-21 Cyber Security Ninety-day Response. These standards were posted for a 30-day public comment period from October 13, 2009 through November 12, 2009. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form that included the following questions:

1. In its order approving CIP-002-2 through CIP-009-2, the Commission directed NERC to make changes to CIP-006-2 and CIP-008-2 as well as the implementation plan for newly identified critical cyber assets and file those changes within 90 days of the order. Do you agree that the SAR accurately addresses the scope of these directives? If not, please identify what you feel is missing in the SAR.
2. Do you agree that the proposed modifications to CIP-006-2, CIP-008-2, and the implementation plans meet the intent of the Commission's directives? If not, please identify what changes you feel are needed to meet the intent of these directives.
3. Do you have any additional comments associated with the proposed SAR for Project 2009-21: Cyber Security Ninety-day Response? If yes, please explain.
4. Do you have any additional comments associated with the proposed CIP-006-2, CIP-008-2, and the implementation plans? If yes, please explain.

Mr. Mix noted that There were 29 sets of comments, including comments from more than 60 different people from approximately 40 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/standards/Project2009-21_Cyber_Security_90-day_Response.html

The SDT reviewed, discussed and refined an initial strawman draft response document for CIP Version 3 prepared by Scott Mix for the 29 sets of comments received. At the end of Monday evening's meeting drafting assignments were reviewed. The SDT followed up on Tuesday morning and early afternoon and reviewed a refined document that included some new draft language for the consideration of comments document. The SDT reviewed a final draft with several revisions on Wednesday morning and unanimously adopted it for posting as show on the following pages:
http://www.nerc.com/docs/standards/sar/C-of-C_Cyber_90day_Response_Initial_Ballot_2009Dec3.pdf

A. AGENDA REVIEW AND UPDATES

A. Agenda Review

On Tuesday morning, the Chair, Jeri Domingo-Brewer welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference

call *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*).

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

B. Updates

VSLs/VFRs. On Wednesday morning Scott Mix provided an Update on VSLs/VRFs noting that ballot had closed last Thursday with a high level of industry support. This would be approved by the NERC Board of Trustees and submitted to FERC. He noted the chair of the VSL/VRF SDT has volunteered to come in and give an update to the Team in January.

In terms of the Version 2 VSL/VRF Mr. Mix indicated that there will have to be a correction for a technical error but that it looks like it will be approved which will close that group's work. The CSO706 SDT will be responsible for the VSLs/VRFs for Version 4. The SDT VSL/VRF chair will talk with the CSO706 SDT about their experience early next year to help us take on the task later in 2010.

Other Cyber Security Initaitives. SDT member discussed the updates on work related to the "smart grid" and its relation to the CIP development.

SDT Comments on Related Cyber Security Initiatives

- Don't hear us talking much about smart grid or smart grid people talking much about the CIP standards – seem to have a gap in communication
- NERC standards only apply to the BES assets – not small production – smart grid is looking at everything from production, transmission all the way into the home –
- NIST is getting lots of pressure to roll things out.
- Who is supposed to be making the link? There is a group that is supposed to coordinate security across all the groups. But key issues haven't been raised to date such as: do we really want a system that is fully inter-operative? Do we want millions of smart meters running through the same system as our control systems? If it works really well in AMI how do you make sure it is good for transmission or is complimentary – also note it is another security system to be aware of and prepared for.
- A Wisconsin study commissioned by FERC was briefly discussed.

Technical Feasibility Exceptions. Mr. Mix provided an update on the TFE process indicating that NERC is not expecting further actions by FERC – but will have to wait and see. He noted a

compliance bulletin has been issued which directs industry to prepare for compliance – regions and NERC having discussions for a uniform system of compliance, should benefit those with coverage into different regions – have not seen a backlog of TFEs

Member Comments on TFE Update

- What is going on with class based TFEs?
- Personal view – list is an after the fact addition to the list once we see what is out there rather than trying to come up with a complete omniscient list to start with
- Mitigation plans? Personal opinion – do not give examples because too many will rely on example as to how to comply, rather leave it up to individuals to determine what to do with TFEs initially
- Do not see class will give companies much help in defining mitigating measures – not buy you much time
- Why January cut off if you can retroactively identify and add to the list?
- Does the device you are requesting TFE on have to be a CA or CCA? May not identify if there is disagreement within an organization or may identify only to cover potential.
- Standards only apply to CCAs. Sounds like you are creating a significant workload for approval for something you will not be held accountable for. No harm waiting until it is on the CCA list.

A. WORKPLAN REVIEW AND STREAMLINING THE CIP DEVELOPMENT PROCESS

A. Workplan Review

Mr. Langton reviewed the workplan suggesting the SDT complete its initial draft of CIP-002-4 for posting by the conclusion of the December, 2009 meeting and launch the effort to develop the suite of controls (CIP 003-009) in early 2010. This will be a challenging parallel process with the SDT responding to industry comments and refining CIP 002-4 while simultaneously developing CIP 003-009. He noted that in January the SDT will review and agree on how best to organize to deliver on the milestones in the accelerated workplan.

B. Considerations in Streamlining the CIP Development Process

At the end of the session on Tuesday afternoon, the SDT, at the request of NERC, engaged in a "blue sky" brainstorming session on ways to streamline the development process. The Team identified 36 suggestions in the following six categories:

A. CHANGING ANSI STANDARDS PROCEDURES (3 options)
B. MEETING CHANGES- EFFICIENCY, LOCATION, TOOLS (5 options)
C. COMMITMENT, COMMUNICATION AND SUPPORT (9 options)
D. TEAM STRUCTURE (3 options)
E. SUBSTANTIVE CHANGES IN APPROACH/SCOPE TO STANDARD DEVELOPMENT (10 options)
F. MORE TALENT AND EXPERTISE TO SUPPORT SDT (6 options)

The Team agreed to engage in an exercise on Thursday to prioritize these options in terms of the highest priority and most helpful in facilitating the CIP standards development process. The results of the survey (See Appendix # 6) completed by 15 SDT members produced the following 5 options that received higher than a 4 rating on a 5-point scale (from most helpful to don't do it):

1. (4.46) Technical writer support (more writers like Scott Mix) *(NERC) (11-5's & 4's and 2 -1's & 2's)*
2.(4.43) Improve industry communications in getting the word out on the SDT and its progress? Webinars, workshops, etc. *(NERC in Coordination with SDT)* ***(11-5's & 4's and 0 -1's & 2's)***
3.(4.36) Make the best use of our time. Start meetings on time and get the technology operational early*(SDT)*(8-5's & 4's and 0 -1's & 2's)
4. (4.21) Receive permission to use informal comment processes for the development of the CIP with a final 45-day comment period consistent with the ANSI process. ***(NERC) (7-5's & 4's and 1 -1's & 2's)***
5. (4.00) Engage technical writers *(NERC (8-5's & 4's and 3 -1's & 2's)*

In terms of possible substantive changes to the SDT approach or scope the ranked the following 10 strategies on the 5-point scale:

E. SUBSTANTIVE CHANGES IN APPROACH/SCOPE TO STANDARD DEVELOPMENT

Avg. Ranking	*Streamlining Strategy*	*# of 5's & 4's*	*# of 1's & 2's*
3.62	Refocus on security issues and less on compliance *(SDT)*	**8**	**3**
3.54	Remove penalty base requirements (you get what you measure) *(NERC, FERC, Congress)*	**6**	**4**
3.46	Simplify the approach and strategy to the standards to reduce com *(SDT)*	**7**	**3**
3.08	Adapt 800-82 (targeted for industrial control systems) *(NERC & S*	**3**	**7**
2.92	Adopt 800-53 Rev 3 for control centers and data centers *(NERC & SDT)*	**4**	**6**
2.92	Review Order 706 and remove items included that should be give	**4**	**5**

	another group, challenged or deferred. *(NERC & SDT)*		
2.46	Throw in with CSCTG from NIST *(NERC)*	**2**	**8**
2.38	Go back to the 'original, original' standards for cyber security as a basis for the new CIP (see NERC Website archive) *(SDT)*	**2**	**7**
2.08	Skip BES Mapping and install minimum security controls for all a after establishing clear cut agreed upon objectives on what we are securing. *(SDT)*	**2**	**10**
1.85	Abandon the NIST based approach and improve existing standards framework. *(SDT)*	**0**	**13**

On Thursday morning, the Chair and Vice Chairs participated in a conference call with Mike Assante and Gerry Adamski at NERC and Alan Moser the Vice Chair of the NERC Standards Committee to discuss NERC's guidance to the Team on the schedule the Team reviewed and revised at their Kansas meeting in October. The NERC representative provided background in what is driving their schedule concerns noting in particular a perception from FERC and some on Capitol Hill that progress on Order 706 directives has been too slow which was underscored with the NERC survey back in the Spring. They noted that they believed that at least the CIP 002-4 (the asset categorization piece) needs to be filed with FERC by midyear and the CIP 003-009 by the end of the year. They offered commitment to providing the Team with whatever is need in terms of resources and communication with industry.

SDT Member Comments on the Schedule

- NERC wants to know what we need to do the job. Getting the asset categorization issue fixed and filed.
- Exercise with language in CIP requirements- SDT does a cut these existing requirements apply to H/M/L.
- Impact level piece of CIP out there. Could be a transition point and is familiar for industry.
- Addressing directives and FERC order and problems identified in CIP requirements.
- May need a Version 5 or more.
- NERC Acknowledged the concept paper and suggested the Team is on the right path.
- Nervous about writing the new 002 and apply 3-9 beneath it. 3-9 as they are now only apply to the high.
- Don't water down the new 2 to fit with the 3-9 today. Get 002 right and then tweak 003-009.
- Concern of pushing 002 to ballot ahead of 003-009?
- How to handle the critical/non critical.

- If we do this on version 2- don't leave pieces in that will cause problems in just changing CIP 002.
- Not just changing categorization of only BES assets. Could be dangers down this path.
- We have to finish this job.
- How is the industry going to feel about being thrown a different set of requirements- then another change.
- Will the industry have to do anything with the controls? Especially mentioned an implementation plan.
- This would be expected to be done?
- If go H/M/L on existing requirements? Industry will have to apply to more stuff. But the plan is to have all of the CIPs done in 2010.
- June 2010- CIP 002 balloted. Current requirements should be at least applicable to all the highs.
- Will entities identify additional high assets that were not critical?
- The implementation plan should address how much time you give the entities to apply the controls to meet the requirements for the newly identified high impact facilities.
- Medium and low? Take current requirements and determine which are applicable to medium resulting in another implementation schedule.
- Main concern is to put something out there to push industry to stop "gaming" the system. You are going apply 3-9 to the high level categories at a minimum and then file your TFEs
- For part of the Order 706 directives, we are showing progress.
- Interim measures may not a good value.
- 2 issues on urgency raised by NERC- perceived deficiencies. FERC and Congress believe there are a lot of facilities that should be critical but are not. Second the all or nothing approach of the current standards.
- Our concept paper laid out the proposition that everything needs some level of protection- i.e. "all in."
- Concerned that NERC didn't open up this discussion to the whole team. Would have been less disruptive and more efficient.
- Another way: going with formal comments- implementation plan change.
- Going to ballot on Friday for the implementation plan. We are about to ballot something that will have impact which will change all that. This comes along with V2 as part packet.

- June for just CIP 002? Another 7 months?
- This is not a surprise. 6 months/ another 6 months. We have ignored the growing concerns and this has happened. Doesn't see a problem with 3-9. We can do a better job.
- New CIP 002 would introduce new categories. Connectivity issue was to be addressed later by controls. i.d. by CAs without CCAs. Big count.
- Would the existing 3-9 given H/M/L on each requirements meet the Order 706 requirements? Probably not. The industry may not vote yes if you don't know what you are going to have to do in 003-009.
- If we are going to get this done, the SDT needs NERC at every meeting with their attention solely on this meeting. They need to answer questions at the moment they come up so we will need someone with authority and expertise.
- I am not surprised about time crunch. Direction doesn't surprise. 002 doesn't surprise. What is the proposal for 003-009 requirements?
- Is the expectation of industry approval of 002 without knowing exactly what this means. What do I do now? This was something to do with the 3 lists.
- We should seek to get a fairly solid CIP 002 in December and stick with that.
- Likes this approach of providing some relief of participating team members and their organization from CIP audit schedule.
- Congressman Langevin asked Jon Stanford about progress being made by the SDT. Congress recognizes the hard work and challenges we have. Mr. Stanford asked what he should bring back to the Team from him. He said to tell the Team to continue the hard work and try to work towards a NIST like model with impact levels for assets. Our current path could receive a lot of support from congressional side. We know that if we don't change the standards, there will be legislation. There are at least several draft bills pending. Need to think about our priorities for cyber security and no so much about the ballot body.

IV. CIP 002 VERSION 4 STRAWMAN

A. Introduction

The Chair reviewed with the SDT the deliverables needed for posting in December, 2009 including: CIP-002-4 Requirements and measures; Sample controls (2-4 examples); Comment form with questions; Guidance document; Intro or cover letter; Related VSLs/VRFs: and Definitions

B. Overview of CIP 002-4 Strawman

John Lim provided an overview of Version 4 CIP 002 Strawman Draft Documents noting the current draft was still missing some definitions for the BES, generation and transmission subsystems and control centers. He noted that Jackie Collett and a sub-team (Scott Rosenberger, Gerry Freese, Jay Cribb) are tackling the definitions. He suggested that the critical assets guideline has started to create a definition that may serve as a starting point. Finally he pointed out that all of the generation assets in this draft has been moved from high to the medium level and that no unit by itself is considered high, but generation system could be in high. High also includes the major transmission facilities.

SDT Comments on Strawman Draft

- Some others have already set markers as to what they think is high – do we need to socialize those with ours? What happens if our list is less? Is that politically acceptable?
- We may eventually be told what to include and need to focus on the controls.
- Still having trouble understanding if intent of step 2 is to categorize by impact and step 3 is to assess impact on the BES – where are we in syncing these pieces?
- Two separate assessments, but have to do both assessments to understand the related impact on each other.
- R2 feeds into R3 – not completely separate assessments.
- Want to be sure we keep going down the path we are headed regardless of whether or not we think they may come in and take it away from us
- Want to be sure we produce a polished product the industry can understand and use
- How the two pieces come together may be addressed in the Guidance document.
- Uncertain whether we need to include a reliability function assessment – brought it down from three to two level system of high/low
- The current strawman takes a low water mark approach rather than the high water mark approach.
- Detection starts with who “owns and operate” – should it be “owns or operates it”? Big difference
- Like the definition of high and low but still begs question of “none”
- “None” may falls out of the definition of BES cyber system
- In case of a generator – if I have just one and my role ends there, do I have to make an assessment? Can they get the information they need from the generation system to make the assessment?

- You can get pricing data but not much else
- Reviewed tables/matrix in response to "none"
- Reliability coordinators can decide this.
- R3.2 in the matrix – from "optics" perspective difficult to explain why it drops from high to low
- Are assets being assigned to the BES system or the subsystems?
- It is not the concept but the wording that causes confusion. Change to "assigning the reliability impact to the BES cyber system that supports the subsystem" (wording from Jackie Collett)
- R2.4.2 vs. R4: separate requirement in each or just one time?
- Problem is with initial list – explicitly calls each out to avoid question of whether I must have a list before compliance assessment.
- Senior manager signs off on original and annual.
- Matrix – function impact correlates to cyber systems – may need to adjust the high BES impact and function impact from low to medium.
- Just because there is connectivity doesn't mean something will go through.
- Concerned about the level of complexity we are creating – more words give more opportunity to vector off course.
- There are a lot more words but a simpler system to use than what we have currently – we will probably make mistakes, but also progress.
- We were told last week by NERC not to use the measures in an assessment. Measures are included in the requirements here for that reason.
- In our recent NERC audit they did not use measures, only looked at requirements
- Intent is to include it in an appendix to the standard.
- We need examples to illustrate the tables –
- We will have descriptions of the functions in the next day or so as well as the definitions.
- Keep in mind the comment form questions too
- Existing single control example shows little gradation
- Hope to have a second example with more gradation drafted tomorrow (Keith, Bill and Joe will work on)

C. CIP 002-4 Small Group Discussions

On Wednesday morning after reviewing and finalizing and adopting version 3 considerations document, the facilitators reviewed the proposal for the SDT breaking into the following drafting groups for CIP 002-4: BES subsystem description/definition (led by Jackie Collett); Reliability functions definitions (led by John Varnell); Control Samples (Led by Keith Stouffer); and Guidance Document (led by Phil Huff).

SDT Comments on the Proposal:

- What are we doing with brainstormed list of ideas? The Chair noted she contacted Mike Assante by email last night and he agreed to call in later today to discuss then full group can discuss ways to accelerate the work plan.
- I have a concern that we spend time today and tomorrow going down the wrong way if we are going to entertain a new direction?
- We have made a commitment to NERC, industry and congress to get the CIP 002 review document out in December 2009 and we are close. If the SDT revisits our decisions it may derail the progress we have made on the December deliverable.
- Would be a disservice to put something out that will not work or is not understood.
- If put something out it has to be credible – good start but not enough time to vet decisions we are making – recommend starting a small subgroup to work in parallel to look at modifying current CIP standard to see how much of the FERC order can be incorporated – it stands the best chance of getting approval by the June time frame.
- When we put the concept paper out in July, we thought we would get more push back – it was more accepted than expected – commitment as a group to take a certain approach and have invested a year – have not heard negative comment from the industry for the approach we are taking – underestimating it would take to modify current standard – just as much effort as the approach we are taking – rehashing the same issue over again would be a step backward and impede us from focusing on our objectives and charge.
- The facilitator noted that the SDT is balancing three values:
  - 1. Getting it right;
  - 2. Getting enough consensus for acceptance;
  - 3. Getting it done in a timely manner. The SDT needs to optimize the three together – yesterday was an opportunity to put ideas on table, need to hear back from NERC before we discuss the issues further.
- Going back into 706? One big issue was criteria for selection, could be a show stopper if Regions refuse to do it – looking at order is a good idea but on this point could be arguing for a year without resolution.
- Modifying current CIP 2 would not be derailed by consideration of external reviews

- Issue is not about philosophy but rather one of resources and liability. Regions are very concerned.
- Lack of industry response may not be acceptance – could be a lack of understanding or commitment to engage until they get a final version. This needs to be crisper more easily understood --complexity is a problem.
- NERC has many balls in the air for industry to consider and respond to at the same time

On Wednesday the facilitators reviewed the proposal for the SDT breaking into the following drafting groups for CIP 002-4:

1. BES subsystem description/definition (Jackie Collett, Scott Rosenberger, Gerry Freese)
2. Reliability functions definitions (John Varnell, Rick Kinas, John Lim, Doug Johnson)
3. Control Samples (Keith Stouffer, Bill Winters, Jeri Brewer Domingo, John Stanford, Sharon Edwards and Jim Breton)
4. Guidance Document (Phil Huff, Dave Revill and Rob Antonishen) – needs help to review for accuracy of process, and the generation, transmission and control

Following small group meetings, the leaders of each group presented a report to the full SDT.

1. BES Subsystems Descriptions

Jackie Collett reported on the small group's results noting that they had a good start on a definition. The group is looking at basic building blocks for each.

SDT Member Comments and Guidance

- Generation- "Big Iron" side. Cyber system treated as a subsystem? Yes.
- BES Subsystem not defined as a single thing. Combinations of units that create an impact. Words intended to drive towards identifying combinations.
- Transmission subsystems.
- Control Centers- CIPSE critical asset guideline.
- How did you determine how a subsystem? Is there a common BES transmission bus(s) connecting generation units?
- Collection of units supported by a shared cyber system.
- From BES side and from the Cyber side- separated in documents.

2. Reliability Functions

John Varnell noted that they had developed 9 definitions for reliability functions and they had added definitions for each of the functions and included the examples. This will be an attachment at end of CIP 002-4 standard and serve as a foundation for later sections

SDT Member Comments and Guidance

- Is there anything in reliability in functions not included in BES mapping functions?

3. Control Samples

Keith Stouffer noted that his group had "kicked some CIP ass" and described two samples they have developed. He noted that the table are designed to help the industry to understand the categorization process. The drafting group took two standards 009 and 006 to show how the categorization process might apply and their related requirements and asked the question: what is in the standard now is a "high" baseline. Pare back for medium and low systems. Should note that even though we are adding categories, if you are low impact, there will be fewer requirements levied upon you. They will put this into new standard format and displaying same content in table or requirement formats. Stuck to low moderate and high. Not ready yet.

SDT Member comments

- Assumption is current CIP are all high? Because they apply to critical assets?
- Careful we don't get boxed in.
- Make clear that this is only showing an existing standard not what the 009-4 standard will look like.
- Took declaratives from FERC order? E.g. Firewalls from multiple vendors.
- Concerned with adding complexity by getting into the particulars/standards at this point.
- Give a before and after example. Mapping before and after. Access control requirement.
- How much complexity are in these examples?
- We told industry that we have been building upon work already being done. Shows a transition to a future- where you will have impact levels. Ability to target resources.
- This is not time to introduce something complicated- don't use the access control requirement.
- How does this relates to currently existing to show where we are heading? We need to be clear that requirements will be changes, moved around, added as we add a full suite of standards.
- Unlike other attachments, this will be an addition separate from the standard.
- This connects the dots to work going on now to future proposals.
- Everyone now doing the high and that these things will get simpler?

- Assets under consideration will be expanded to apply security protection- but not as onerous as the current critical assets now.
- Assume 10% classified as critical. Applying all controls to that 10%. Other 90% have to do something, but it will be less.
- Is this a roadmap as to how to do nothing?
- Reservations- this looks like the medium and lows don't have to do much. Careful with chart.
- Problem is with the presentation- summary at beginning and format.
- 800-53 families- similar- something required if low moderate high. Others little required is a low.

4. Guidance Document

Phil Huff noted that the group had found a way to simplify and the revised draft represented a major shift in name of simplicity. The group understood that the reliability function impact married together in the "hook up table" is confusing. If the team doesn't understand, won't communicate well in the industry. The proposal is to use the reliability functions for determining your BES cyber systems. Then back to impact criteria for BES system. No mapping will be needed. Simplifies significantly and reduces complexity.

SDT Member comments

- Does this negate everything we have done? No, this is not a major shift- build on reliability functions.
- Single row look up table.
- Same scoping exercise- Take BES cyber systems only in look up table. We are here for BES.
- Starting either with cyber or BES subsystems is valid in scoping your cyber systems.
- Once you scope your cyber systems. You inherit the impact level of whatever the BES subsystem supporting happens to be.
- H/M/L- if you have a cyber system supporting BES subsystem- cyber subsystem inherits.
- An entity has to do both parts. Unless both parts are done won't be right. Who merges the two pieces. IT more capable of merging the two? Can't do one and make assumptions about the other.
- This is not a IT/engineering fight. Still have to look at reach of cyber system.
- Will this be doomed for failure? Assume IT reach of the system. Won't be Bulk Power people. They will make assumptions that will be wrong.

- Energy management system (e.g. servers, routers, firewalls), before that applications data, in terms of IT people- individual components. They identify all components. Need to go to applications and see what the functions are. We assess the impact of the functions. Then we map. We are done. Box now becomes the AGC mapping. Automatically rolls to the BES impact mapping. IT and Operations- automatically maps to the function. IT not making an objective judgment.
- The problem is we can't say how this all is going to work.
- I can give these criteria to our people and get the work done.
- Operations people in the field. What are the important things we have to do. Started with the applications. What do they talk with etc. They came up with where the data stored. Understood reach of critical reliability functions. You know the reach of the app and where the data is flowing to, you can determine criticality.
- We are here to do cyber security- not BES. What are we trying to secure?
- We need a matrix- BES and cyber piece. Started with functions. What does it take to do on cyber side. Take BES pieces.
- We are not throwing out matrix, rather we have reduced it to single row. If cyber subsystem has impact to the BES, this is based on the BES impact.
- Started with functions, applications.
- Start with the "terminals"- in the field-? Need the feeds from the field- need to turn on/ off.
- Understating the stuff out there? Looking at BES in very narrow areas. Control centers are easy.
- It is a 1 by 3. We need to simply the process
- 3 by 3. Why don't we need it anymore?
- Focus on what are you performing an impact assessment on? Cyber Impacts reliability functions. Criteria for reliability.
- Cyber asset that affects multiple functions.
- We are still trying to map to subsystems- will try to show this visually.
- If you start with BES items, you may not have to look at so many cyber assets.
- Data flow modeling? Need to use this as a tool to help with determining what is critical. Enterprise architecture modeling tools would have value. E.g. have a relay as a cyber device. Low medium high for that device. It's the BES thing that matters?
- Are we confusing connectivity and communication vs. the focus on the device?
- BES high-impact to BES reliability function. First identify the reliability functions.

- Have a list of cyber systems- this may be a big assumption that is not incorrect.
- The SDT should treat as an ongoing process which will be designed to reduce that gap as you go forward. It is a change management strategy.
- Is that path too risky?
- In terms of the 3-3 game. When you do it. Fill in with examples.
- How to tell the difference between the rows and the columns?
- Hypothetical- switchyard is a low medium high. Cyber assets within switchyard. L/M/H. High= loss or compromise would immediately cause. What is the function- of switch yard. 500 KV line. Operation of a single break?
- Look at high impacts to the BES function. Lost, compromised. What about connectivity?
- Is this dealt with by controls?
- If no on connectivity, makes it lower.
- E.g. two identical physical devices one is connected the other is not. Have a different cyber impact?
- Why are you dealing with physical?
- If not connected, are they out?
- Looking at cyber asset- what's the cyber impact of this connected relay. The one not connected fall off the list.
- Separating BES analysis and a cyber analysis-
- Cyber perspective the impact may be higher.
- Impact analysis is separate from the cyber assessment.
- Is cyber about connectivity? Wouldn't have physical requirements.
- Impact to a function- walk into yard.
- Game is not helping very much.
- Struggling with a way to explain to the industry to show how we fit together.
- If we can't express it. Modify.
- When I say connectivity, it is a difference- but it is discounted by others.
- Communication and impact- Sweitzer relay on a line without connectivity. I can trip that line. If the relay has connectivity- I could get to it and fake it out. Can factor into a bigger impact. Connectivity adds another/extra layers of potential impacts that has to be factored in.

- Relay engineers- "Aurora" thing- if you get into a relays set low or high. Micro processor. BES impact with a non processor.
- Withdrawn game. Raised point- 2 different interpretations about what impact is. Difference between impact and risk. "Impact assessment" has to include potential risk or not? Need to determine this.
- This is not designed to for physical security. Threat exists of a terrorist states controlling from a remote. Connectivity is the key /core to this threat.
- Appreciates connectivity- how do you define the cyber system? Framework was about systems in a management ways including interconnection component. Define the impacts to the function. Examine what risks are at play whether interconnected or not. Some protections are physical. Look at procedural controls. Impact assessment vs. risk analysis—
- Are we talking about "systems" in an appropriate way?
- Someone gets into cyber relay and changes setting, Control center would not know. Can happen on any device in that substation.
- We should consider the MRC (Jerry Cauley) results based performance methodology. Would be helpful to understand what he's looking for.
- The performance methodology has no official standing as yet. Won't have in front of Standards- committee or this team by the time we finish our work.

5. CIP 002-4 Revisions

John Lim and Phil Huff presented revisions to the CIP 002-4 strawman.

SDT Comments on CIP 002-4

- Removed "senior leadership"- not BES impact categorization issue.
- If standards not viewed as a complete set. Audits 1 at a time. Must have senior manager sign off.
- Senior manager sign off in every standard?
- Consider a standard that everyone complies with that deals with governance issue. Then move into technical controls. Clear focus on soft issues. XX vs. 002.
- This should be explained in the cover letter that the Team is soliciting comments on technical area, while organization of standards has yet to be determined.
- R2: each BES subsystem associated with. Take the system high. E.g. associated with 1 BES, same as today. If you have multiple, take the highest category of those.

- Sub-requirements? VRF issue made. Break out 1,2,3. These are listed. May be clearer to see.
- If sub requirements, must be clearly written for future audits. Numbers do each.
- R3 redone. Combined R4 with R3.
- R1.4.2 eliminate-
- R1. R2 talks about BES cyber system. "For each"- need to identify and list.
- R1- copy and place categorizing list.
- Have to keep in mind how NERC audits- reported on a requirement level not sub-requirement level.
- Take requirement numbers off- bullets or options?
- Have to be numbered apply the "following criteria," not requirements.
- Writing of violations based on how writing the VSL? No. Only looked at once violation confirmed, what is the sanction or penalty.
- Are these standards for compliance?
- If posting like this? Don't want to accept but have to. But it is wrong.
- Are these criteria? Go through each one to apply criteria applicable to them? That is the way it is written.
- Only Rs will be in front of major requirements. Not requirements but under numbered lists. A violation of one thing way down, is a violation of the requirement?
- Each of the sub-requirements become requirements?
- A true violation is you didn't do the mapping, vs. 1 of the 16 things.
- Double jeopardy- single instance leading to a violation of 2 requirements.
- This could be tighter with fewer words. Reduce to a phrase. Considerations that should go into analysis. If you don't consider, maybe should be dinged. This is how to set up mappings- these are filters not requirements.
- Need to map and follow through with the mapping- in Version 2- "and implement"
- R1- is requirement. Rest of list is numbered list containing criteria in order to do the mapping and assign levels.
- Audit question- and fine requirements.
- This has the applicability right in the front.
- New template? E.g. VRF and VSL at R. 1.1.1 and each one.
- Remove the R- and you are in violation-

- One option would be to make R1-"identify and categorize impact levels", apply criteria in an appendix to identify the impact levels. If in an appendix not mandatory.
- Does this leave us where we are now in terms of making up your own?
- Remove R1 as a statement and have instead an "Introduction."
- Intro paragraph are outside of a requirement. Template doesn't have a provision for introduction on a requirement lists.
- SDT needs to work within the boundaries.
- Make each sub/sub a requirement on its own? Each has to reference the requirement or category.
- Same amount of work you have to do.
- Need to level set – reframe the standards within the CIP structure. Look at this approach to categorization. Making everything a requirement? Have to do or deliver something. Requirement is to provide a process. Deliverable under R1- sub-requirements. If we do this, really a strange number of standards.
- Post something as a draft standard- or we post another concept paper that looks like a draft standard but doesn't meet the format. More important to get a revised concept out to industry?
- Conceptually how you do categorization, this is what you do with this when you get it done.
- Revised detailed concept that will lead to a standard. Make it an outline.
- Have to worry about these things as doing process. Going to miss if we don't.
- Support this approach.
- What of the discussion- BES subsystems not yet in?
- We will call this a working draft- post- of the mapping and categorization of BES cyber systems. Put something out that is close to a standard format. Putting out another concept paper won't generate industry comments and input.
- Put this out- this is as far as we could get. How does this help us look at this in the future?
- NERC format- we need editors in the room. We are guessing at what they want. Dave Taylor. Maureen need to be at our next meeting.
- Commitment to draft standards in December. Problems with putting out in this format. Not a bad thing. Makes more apparent problems with current template that NERC has. Hard to explain to outsiders if we are doing a "concept".
- The SDT needs to meet expectations for a standard. Don't call a concept, instead call it a preliminary draft.

- The SDT has to agree on the concept of what we want people doing. Need to make it through- get the flow right- worry about the formatting later. We don't yet have the flow.
- Walk through the process and see if there is consensus.
- Scoping BES cyber system can be done from either direction- should come up with the same cyber systems.
- R2- "as determined in R1
- R2- any BES cyber system associated with any BES subsystems. If you go back to definition, some things are not BES cyber systems (e.g. revenue metering device, thermal data logger in generation system). Ascertaining a BES cyber system. Be clear- rewrite R1 as R2.
- Say it all over again just to be clear?
- Good with BES cyber system. But problems with Cyber system: "disposition of information"?
- Requirement – identify all your BES cyber system.
- We need to go through this from top to bottom.
- Use the tables as a starting point.
- Maureen Long and Joel De Jesus from NERC can help the SDT.
- NERC is trying to minimize the use of sub-requirements.
- Requirement a separate piece of work with some reliability benefit by itself. Removed R from sub requirements. Refer to as parts. If subject to liability itself.
- If a sub-requirement is embedded within a requirement- it will be treated and audits as a violation.

6. Summary of Discussion Points with NERC Staff

NERC Staff (Maureen Long, Dave Taylor and Joel De Jesus) joined the SDT on Thursday morning and offered the following guidance to the SDT:

1. Define in the Glossary: High Impact; Medium Impact; and Low Impact.
2. Remove the sub/sub requirements (R1.1.1., R1.1.2., R1.2.3, R1.2.4. etc.) from the draft standard and put them into a separate numbered list attachment document.
3. State in the attachment document that the Responsible Entity (TO, GO, BA, etc) has to comply with only the applicable items, i.e., TO does not have to include generation if it does not apply. They did not think this distinction of what items applied to TO or GO only was clear using the currently proposed draft standard format which was displayed on the Webex they were looking at.
4. Add to the main requirement what the impact is to reliability. Maureen stated that under

the new NERC template each requirement is to include how it contributes to reliability.

5. Use the existing latitude available in establishing violation severity levels (VSL's). Consider using percentages ,i.e.:
   - (Entity missed either <10% of items (or perhaps 4 items) = low,
   - Entity missed >10% but < 25% = Medium, etc.)
6. If the proposed standard remains in the format that is current proposed, as shown on the Webex, then any missed item will result in a finding of non-compliance by the auditor. As an example of how severe this could be, in the current draft standard format, auditing of a TO entity who did not have generation listed in their R1 analysis would result in a finding of non-compliance sent to compliance staff for further investigation.

V. NEXT STEPS

The SDT Chair and Vice Chairs reviewed with the Team the updated agreed upon schedule for both the CSO 706 SDT Version 3 CIP and the Version 4 CIP 002 Process as follows:

CIP Version 3 Key Steps/Schedule

1. *Post for Industry Comment 10-13-09 to 11-12-09*
2. **November 13 SDT Conference Call- Review of Industry Comments and Response**
3. **November 16, CSO 706 SDT Meeting in Orlando, Monday, 5:00 p.m.- through dinner- Response Document to Industry Comments**
4. **November 17**, Tuesday, CSO 706 SDT Meeting, Orlando, Complete and Adopt Response Document to Industry Comments
5. **November 20**, Wednesday, Post Response Document and Initiate Ballot
6. **November 30**, Monday *(after Thanksgiving)* Deadline for Votes and Industry Comments
7. **December 2, Wednesday, CSO 706 SDT - Conference Call- finalize Response document to Industry Comments**
8. **December 3- 13,** Recirculation Ballot
9. **December 16,** BoT Approval
10. **December 29, 2009,** FERC Filing

CIP 002-4 Key Steps/Schedule (October-December 2009)

1. **November 1:** Jackie Collett, Phil Huff, John Lim and John Varnell, the chairs of the 4 CIP 002 Subgroups will form the CIP 002 Strawman Drafting Group (SDG).
2. **November 1:** All CIP 002 "meta groups" and subgroups will forward to the Strawman Drafting Group their standards text drafts including any guidance language**.**
3. Joe Doetzl will coordinate the work of the Controls Drafting Group (CDG) members: Jim Brenton, Keith Stouffer, Bill Winters, Jon Stanford. They will produce several recommended sample controls to illustrate high/medium/low concepts in CIP 002 as well as recommendations on whether the SDT should request guidance from the

Standards Committee on referencing a 'catalogue of security requirements', for circulation to the SDT **by Friday, November 13, 2009**

4. The SDG will prepare a strawman draft by **November 13, 2009** for review by the SDT in advance of November 16-19, 2009 SDT meeting
5. The SDT will utilize the strawman draft to organize its **November 16-19 meeting** and determine at the conclusion of the meeting if the SDT will continue to aim for the December 16th adoption of CIP 002 draft for posting for industry comment
6. **December 7, 3:00-4:30 p.m. est**. Previews of reviewed CIP 002 and related document drafts at a SDT conference call.
7. The SDT will refine and circulate a revised strawman Draft by Monday, December 14, 2009 for review at the **December 15-16** CSO706 SDT meeting in Little Rock
8. **December 15-16** will refine, finalize and adopt draft CIP 002-4 for posting to the industry for informal comments.

Keith Stouffer mentioned that in terms of the table format the next big step to develop the information paragraph at the outset of each of the tables. Phil Huff noted that the guidance document would be developed further and circulated to the SDT in advance of the Little Rock meeting. The Chair noted she would circulate a draft of the "comment form" and cover letter. Jackie Collett asked for time on the Little Rock agenda to go through a "walk through" of the CIP 002-4. She agreed to work with several SDT members to prepare materials for the walk through.

The Chair reviewed the next steps including the schedule for the Version 3 response document and the CIP 002-4 effort. She thanked Rich Kinas for hosting the meeting and providing excellent food and facilities.

The SDT adjourned at 2:45 p.m. on November 19, 2009.

Appendix # 1— Meeting Agenda

NERC SDT Order 706 November 16-19, 2009 Meeting Agenda Packet

Project 2008-06 Cyber Security Order 706 SDT
Draft 16th Meeting Agenda
November 16, 2009, Monday - 5 PM to 9 PM EST
November 17, 2009, Tuesday - 8 AM to 5 PM EST
November 18, 2009, Wednesday - 8 AM to 5 PM EST
November 19, 2009, Thursday - 8 AM to 3 PM EST
Orlando Utilities Commission, 6003 Pershing Ave.
Orlando, Florida 32822

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Group Meetings May Not Have Access to Telephones and

Proposed Meeting Objectives/Outcomes

- Welcome new members and outline SDT leadership transition
- Review, Discuss and Adopt SDT Response Document to Industry Comments on CIP Version 3
- Review the CIP 002-4 and CIP 002-009-4 workplan going forward
- Receive updates on TFE, VSL/VRF and related cyber security efforts
- Review CIP 002-4 Key Issues and Provide Guidance to Documents Drafting Groups
- Convene CIP 002-4 Document Drafting Groups
- Review and refine a draft CIP 002-4 strawman and related documents
- Agree on next steps and assignments

Draft Agenda

Monday November 16, 2009

5:00 p.m. &	Welcome and Opening Remarks and Review of Evening Agenda- *Jeri Domingo-Brewer* *Phil Huff* Roll Call; NERC Antitrust Compliance Guidelines
5:10	Overview of FERC Order on CIP Version 2 and Version 3 Procedural Steps - *Scott Mix*
5:15	Consideration of Full Group/Small Group Format for Response Document Review--*Jeri Domingo-Brewer*
5:20	Review of Strawman SDT Industry Response Document on FERC Order, CIP Version 3
7:00	*Working Dinner*

7:30 Continue Review of Strawman SDT Industry Response Document on FERC Order, CIP Version 3
9:00 *Recess*

Tuesday November 17, 2009

8:00 a.m. Welcome and Opening Remarks- *Jeri Domingo-Brewer & Phil Huff*
Roll Call; NERC Antitrust Compliance Guidelines
Facilitator review and SDT acceptance of October 20-22 Kansas City SDT meeting summary
8:20 Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
8:25 Welcome and SDT Leadership Transition- *Jeri Domingo-Brewer & Phil Huff*
8:30 Current Membership Changes and Call for New Members - *Jeri Domingo-Brewer & Phil Huff*
8:35 Review of SDT 706 Workplan Decisions in October, 2009 and Feedback from NERC
9:00 Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure –*Scott Mix*
9:05 Update on VSLs/VRFs- *Scott Mix*
9:10 Update on other related cyber security initiatives- *SDT Members*
9:15 Review and Refinement of CIP Version 3 Strawman Response Document
10:00 *Break*
10:15 Review and Refinement of CIP Version 3 Strawman Response Document
12:00 Motion to Adopt the SDT 706 CIP Version 3 Response Document *(when ready).*
12:30 *Lunch*
1:30 Overview of CIP 002-4 and CIP 002-009-4 Workplan - *Stu Langton*
1:40 Overview of list of CIP 002-4 Documents for posting in December.
1:45 Overview of CIP 002-4 Strawman Draft Documents, Format and Key Remaining Issues and
Challenges- *John Lim et al. (e.g. Defining BES Subsystems; Descriptions of reliability functions; 2-3 examples of controls; and categorization of cyber systems in guidance documents).*
3:30 *Break*
3:45 Review and Refinement of CIP 002-4 Key Remaining Issues and Guidance for Drafting Groups
5:15 Organizing SDT Document Drafting Groups for Wednesday
5:30 *Recess*

Wednesday November 18, 2009

8:00 Welcome and Agenda Review- *Jeri Domingo-Brewer & Phil Huff*
8:10 Review of Key Remaining Issues and Challenges and Guidance to Drafting Groups
8:30 Convene SDT CIP 002-4 Document Drafting Groups
12:00 *Working Lunch*
12:45 CIP 002-4 Document Drafting Group Reports and Additional SDT Guidance
3:00 *Break*

3:15	Reconvene SDT CIP 002-4 Document Drafting Groups
5:30	*Recess*

Thursday November 19, 2009

8:00	Welcome and Agenda Review- *Jeri Domingo-Brewer & Phil Huff*
8:15	Review and Refinement and Consensus Testing of CIP 002-4 Strawman Documents from Drafting Groups
10:00	*Break*
10:15	Review and Refinement and Consensus Testing of CIP 002-4 Strawman Documents from Drafting Groups
12:15	*Working Lunch*
1:00	Review and Refinement and Consensus Testing of CIP 002-4 Strawman Documents from Drafting Groups
2:45	Review and Agree on CIP 002-4 Next Steps for SDT Drafting Group(s) Meeting Evaluation
3:00	*Adjourn*

Appendix # 2 Attendees List
November 16-19, 2009 Orlando, Florida

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation (Friday)
2. Jeri Domingo-Brewer, Chr.	U.S. Bureau of Reclamation
3. Jackie Collett	Manitoba Hydro
4. Sharon Edwards	Duke Energy
5. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
6. Phillip Huff	Arkansas Electric Coop Corporation
7. Doug Johnson	Exelon Corporation - Commonwealth Edison
8. Frank Kim	Ontario Hydro *(Mon. & Tuesday)*
9. Rich Kinas	Orlando Utilities Commission
10.John Lim	CISSP, Department Manager, Consolidated Edison Co. NY
11. David Norton	Entergy
12. Scott Rosenberger	Luminant Energy
13. David S. Revill	Georgia Transmission Corporation
14.Keith Stouffer	National Institute of Standards & Technology
15. John D. Varnell	Technology Director, Tenaska Power Services Co.
16. William Winters	Arizona Public Service, Inc. (Mon., Tues, Thurs)
1. Scott Mix	*NERC*
2. Joe Bucciero	*NERC/Bucciero Assoc.*
3.Hal Beardall	*FSU/FCRC*
4. Robert Jones	*FSU/FCRC Consensus Center*
5. Stuart Langton	*FSU/FCRC Consensus Center*

SDT Members Attending via WebEx and Phone

17. Jim Breton	ERCOT
18. Jonathan Stanford	Bonneville Power Administration
19. Kevin Sherlin	Sacramento Municipal Utility District (Mon., Tues, Wed)
Maureen Long,	NERC (Thurs)

SDT Members Unable to Attend

Jay S. Cribb	Information Security Analyst, Southern Company Services
Joe Doetzl	Manager, Information Security, Kansas City Pwr. & Light Co.
Christopher A. Peters	ICF International

Others Attending in Person

Bill Glynn	Westar Energy
Rick Terrell	Luminant
Chris Wright	Burns and MacDonald Engineering

Others Attending via WebEx and Phone

Rob Hardiman	Southern Company Transmission (10-20, 21, 22)
David Huff	FERC (10-20, 22)_
Justin Kelly	FERC 10-21, 22)
Hoang Neg	RRI Energy (10-20_
Jon Stitzel	Burns and MacDonald Engineering

Appendix # 3 Meeting Evaluation Summary

CYBER SECURITY ORDER 706 SDT
NOVEMBER 16-19, 2009, ORLANDO, FLORIDA
MEETING EVALUATION SUMMARY

Members used the following 0 to 10 scale in evaluating the meeting: 0= totally disagree and 10= totally agree. The results below represent the average rankings and include 12 SDT member evaluations.

1. Please assess the overall meeting.

7.27 The agenda packet was very useful.
7.75 The Webex document display and the audio were effective
8.90 The quality of the meeting facility was good.
7.45 The objectives for the meeting were stated at the outset.
7.20 Overall, the objectives of the meeting were fully achieved.

Were each of the following meeting objectives fully achieved:
9.18 Welcome new members and outline SDT leadership transition
9.36 Review, Discuss and Adopt SDT Response Document to Industry Comments on CIP Version 3
6.73 Review the CIP 002-4 and CIP 002-009-4 workplan going forward
7.73 Receive updates on TFE, VSL/VRF and related cyber security efforts
6.91 Review CIP 002-4 Key Issues and Provide Guidance to Documents Drafting Groups
7.50 Convene CIP 002-4 Document Drafting Groups
6.55 Review and refine a draft CIP 002-4 strawman and related documents
7.00 Agree on next steps and assignments

2. Please tell us how well you believe the Team engaged in the meeting.
7.09 The Chair and Vice Chair provided leadership and direction to Team and Facilitators
8.82 The Facilitators made sure the concerns of all members were heard.
8.82 The Facilitators made sure the concerns of all participants were heard.
7.36 The Facilitators helped clarify and summarize issues.
7.18 The Facilitators helped members build consensus.
7.18 The Facilitators helped us arrange our time well.

3. What is your level of satisfaction with what was achieved at the meeting?

6.82 Overall, I am very satisfied with the results of the meeting.
7.45 Overall, the design of the meeting agenda was effective.
7.73 I was very satisfied with the services provided by the Facilitators.
6.60 I am satisfied with the outcome of the meeting.
6.18 I am satisfied with the progress we are making as a Team.
7.09 I know what the next steps following this meeting will be.

7.18 I know who is responsible for the next steps.

4. Other comments

What did we achieve?

- Version 3 ready for posting.
- CIP002 now makes sense but more work is needed on the format.
- Comments were answered and package proposed.
- The NIST only people still don't understand about penalty's.

What are our biggest challenges going forward?

- Wasting time. The call with NERC leadership should have included the whole team. We ended up spending up extra time going over what was said and the team didn't get first hand information.
- Clean direction on CIP002.
- Format 002 so that our intent is followed.
- Develop and publish corresponding counts for high, medium and low.
- Separation of team lead and others.

What suggestions do you have for making our group more productive?

- More rigid structure. Make sure concepts are understood. Use parking lot.
- Greater use of small groups.
- The group as a whole is too large to make progress.
- Too much time is devoted in the large group to discussion and too little time to actual progress.
- Have meeting at an airport hotel only!!! That is a HUB DFW, Saint Louis, Chicago (Mid. States).

Appendix # 4 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost
- information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Subroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and Subroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on
- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

APPENDIX # 5 CSO 706 SDT Meeting Schedule

CSO 706 SDT MEETING SCHEDULE
OCTOBER 2008–DECEMBER 2010

DEVELOPMENT OF CIP VERSION 2 AND NEW VERSION FRAMEWORK
OCTOBER 2008–JULY 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.
2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development
3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 New Version process reviewed.
4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white "working" papers assigned, Technical Feasibility Exceptions white paper reviewed and refined.
5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed New Version white "working" papers.
January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.
7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.
8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals
March 2–April 1, 2009 — 30-day Pre Ballot
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment
March 30, 2009 — WebEx meeting(s) White Paper Drafting Team
April 1–10 — NERC Balloting on Version 2 Products
April 6, 2009 — WebEx meeting — White Paper Drafting Team
April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call
April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments
9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.
April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx
April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%
May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.
10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.
June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx

11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.

- *June — WebEx meeting(s)*
- *Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria*

CIP-002 DEVELOPMENT OF REQUIREMENTS, MEASURES, ETC. JULY-DECEMBER 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada
SDT reviewed, refined, and adopted SDT Working Paper. SDT adopted its response to NERC for Interpretation of CIP-006-1. SDT reviewed and adopted a proposal for CIP-002 Subgroups and Deliverables and convened subgroup organizational meetings to develop work plans. SDT adopted 2010 Meeting Schedule.

- *July–August Interim Conference call meeting(s)*
- *CIP-002 Subgroup meetings*
- *CIP-002 Coordination Team meeting*
- *August 3–5, 2009 in Winnipeg, Manitoba **NERC Member Representative Committee**. Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.*

13. August 20–21, 2009 in Charlotte, NC. SDT reviewed and responded to MRC input on Working Paper/CIP-002 Concepts and convened SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

- *July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper*
- *NERC Webinar- August–September Interim Conference Call meeting(s)*
- *CIP-002 Subgroup meetings (as ne*
- *CIP-002 Coordination Team meeting*

14. September 9–10, 2009 in Folsom, CA. SDT reviewed and considered industry comments on the Working Paper and CIP-002 concepts and their application to the subgroup work and addressed coordinating issues through joint subgroup meetings. SDT agreed on meeting dates and proposed locations for January–December 2010
September–October Interim WebEx meeting(s)

- *FERC Version 3 Urgent Action SDT conference call meetings*
- *CIP-002 Coordination Team meeting*

CIP VERSION 3 RESPONSE TO FERC ORDER, OCTOBER-DECEMBER, 2009

15. October 20–22, 2009 in Kansas City, MI. Reviewed new FERC Order and urgent action CIP Version 3 process; discussed key issues raised by SDT CIP 002 Subgroups, small group meetings and agreement on refinements to the CIP 002-009 schedule and drafting process for CIP 002-4.

- *October–November Drafting Team meeting(s)*
- *CIP-002 Coordination Team meeting*

16. November 16–19, 2009 in Orlando, FL

- SDT review, refine and adopt Version 3 "industry response" document.
- SDT plenary and drafting group session(s) — to draft, review and refine CIP-002-4 standard, requirements, measures and controls and related documents.
- November–December Interim Conference call meeting(s)

- Drafting teams as needed to finalize draft CIP 002-4 documents
- CIP-002 Coordination Team meeting
- *CIP 002-4 Drafting Team produces next draft based on Orlando Meeting input.*
- *December 2 CSO 706 SDT Version 3 Consideration of Comments Draft Conference Call*
- *December X, CSO 706 SDT CIP 002-4 Preview Conference Call*

17. December 15–16, 2009 in Little Rock AK

- SDT scenario "walk through" to test flow of CIP 002-4.
- SDT plenary and drafting group session(s) to review, refine, and agree on and adopt CIP-002 standard, requirements, measures and controls and related documents.
- Agree on initial posting of draft CIP-002 for industry review and comment.
- Agree on next steps and 2010 Workplan and schedule

REFINEMENT AND ADOPTION OF CIP-002 VERSION 4 AND DEVELOPMENT AND ADOPTION OF CIP STANDARDS (003-009)
JANUARY 2010–DECEMBER 2010

18. January 19-20–21-22 — Tue-PM- to Friday AM, Tucker, GA (GTC)

- SDT Work on Developing CIP 003-009 Strawman Drafts

19. February 17-18–19 —Wed--Thursday –Friday, Austin TX (ERCOT)

- SDT Reviews Industry Comments and Refines CIP 002 for posting for 45-day industry formal comment period.
- SDT continues CIP 003-009 Strawman Drafts

20. March 9–10-11 — Tuesday–Thursday, Phoenix, AZ (APS)

- SDT continues CIP 003-009 Strawman Drafts

21. April 13-14–15 — Tue-Wednesday–Thursday, Atlanta GA (Southern Co)

- SDT Reviews and Responds to Industry Comments, Refines and Adopts CIP 002 for balloting
- SDT posts a draft CIP 003-009 for informal industry comment.

22. May 11-12–13 — Tue-Wednesday–Thursday, Dallas TX (Luminant)

- SDT reviews Industry 1st Ballot Comments and Drafts Responses
- SDT reviews CIP 003-009 informal industry comments and refines the draft.

23. June 8-10- Tues, Wed. Thursday- (Sacramento)

- SDT refines CIP 003-009 and posts for 2nd round of informal industry comments and refines the draft.

24. July 13-14–15, Tue-Wednesday–Thursday, Pittsburgh, PA (CERT)

- SDT reviews CIP 003-009 informal industry comments and refines the draft.

25. August 10-11–12, Tue-Wednesday–Thursday- TBD

- SDT refines CIP 003-009 and posts for formal 45 day industry comment

26. September 7,8,9, Tues-Thurs. TBD (if needed)

27. Oct. 12-13–14, Tue-Wednesday–Thursday- TBD

- SDT Reviews and Responds to Industry Comments, Refines and Adopts CIP 002 for balloting

28. November 16-17–18, Tue-Wednesday–Thursday- TBD

- SDT reviews Industry 1st Ballot Comments and Drafts Responses

29. December 14-15–16, Tue-Wednesday–Thursday- TBD

Appendix # 6 Prioritizing Streamlining Options

CONSIDERING STRATEGIES FOR STREAMLINING THE SDT 706 WORKPLAN MEMBER SURVEY FORM RESULTS-PRIORITY RANKING

(15 SDT Respondents: Jeri Brewer, Jim Brenton, Jackie Collett, Sharon Edwards, Phil Huff, Doug Johnson, Rich Kinas, John Lim, Dave Norton, Dave Revill, Scott Rosenberger, Jon Stanford, Keith Stouffer, John Varnell & Bill Winters)

SDT Members "brainstormed" SDT streamlining ideas on 11-17-09 and completed this survey during lunch on 11-19-09 using the following scale in ranking the strategies:

5= highest priority/most helpful; 4= priority/helpful; 3= important/somewhat helpful; 2= less important and helpful; 1=don't do it-unacceptable.

SURVEY CATEGORIES

A. CHANGING ANSI STANDARDS PROCEDURES
B. MEETING CHANGES- EFFICIENCY, LOCATION, TOOLS
C. COMMITMENT, COMMUNICATION AND SUPPORT
D. TEAM STRUCTURE
E. SUBSTANTIVE CHANGES IN APPROACH/SCOPE TO STANDARD DEVELOPMENT
F. MORE TALENT AND EXPERTISE TO SUPPORT SDT

1.	**(4.46)**	**Technical writer support (more writers like Scott Mix)** *(NERC)* *(***11-*5's & 4's and* 2 *-1's & 2's)*
2.	**(4.43)**	**Improve industry communications in getting the word out on the SDT and its progress? Webinars, workshops, etc.** *(NERC in Coordination with SDT)* *(***11-*5's & 4's and* 0 *-1's & 2's)*
3.	**(4.36)**	**Make the best use of our time. Start meetings on time and get the technology operational early** *(SDT)* *(***8-*5's & 4's and* 0 *-1's & 2's)*
4.	**(4.21)**	**Receive permission to use informal comment processes for the development of the CIP with a final 45-day comment period consistent with the ANSI process.** *(NERC)* *(***7-*5's & 4's and* 1 *-1's & 2's)*
5.	**(4.00)**	**Engage technical writers** *(NERC)* *(***8-*5's & 4's and* 3 *-1's & 2's)*
6.	(3.93)	Meet in central US locations minimizing travel time and maximizing Team productivity and time. *(SDT and NERC)* *(***5-*5's & 4's and* **1** *-1's & 2's)*
7.	(3.86)	No audits for drafting team member organizations *(NERC).* *(***8-*5's & 4's and* **2** *-1's & 2's)*
8.	(3.62)	Refocus on security issues and less on compliance *(SDT)* *(***8-*5's & 4's and* **3** *-1's & 2's)*
9.	(3.54)	Breakup the SDT into many small drafting groups--divide the work and focus on specific tasks. *(SDT)* *(***7-*5's & 4's and* **3** *-1's & 2's)*
10.	(3.54)	Remove penalty base requirements (you get what you measure) *(NERC, FERC, Congress)* *(***6-*5's & 4's and* **4** *-1's & 2's)*
11.	(3.46)	Simplify the approach and strategy to the standards to reduce complexity *(SDT)* *(***7-*5's & 4's and* **3** *-1's & 2's)*
12.	(3.38)	NERC support funding member expenses (1/2 of costs) for meetings. *(NERC)* *(***5-*5's & 4's and* **5** *-1's & 2's)*
13.	(3.36)	Longer, extended intensive meetings of the SDT (2-3 weeks at a time) *(SDT and NERC)* *(***8-*5's & 4's and* **7**-*1's & 2's)*
14.	(3.29)	Charge the SDT to complete CIP by April 1, 2010 – working outside the constraints of the current ANSI process. *(NERC)* *(***5-*5's & 4's and* **4** *-1's & 2's)*
15.	(3.15)	NERC letter to CEOs acknowledging the contributions of members and appreciation of work done so far (as requested by members) *(NERC)* *(***6-*5's & 4's and* **5**-*1's & 2's)*
16.	(3.15)	Station engineers *(NERC)* *(***6-*5's & 4's and* **6**-*1's & 2's)*
17.	(3.15)	Bring generating station engineers onto the SDT. *(NERC)* *(***4-*5's & 4's and* **5** *-1's & 2's)*
18.	(3.08)	Establish a small core SDT drafting group that will commit to meeting frequently between SDT meetings to prepare materials and drafts for full group consideration at meetings. *(SDT)* *(***5-*5's & 4's and* **7** *-1's & 2's)*
19.	(3.08)	Divide the standards deliverables and organize the SDT to develop drafts for each. *(SDT)* *(***5-*5's & 4's and* **5** *-1's & 2's)*

20. (3.08) Adapt 800-82 (targeted for industrial control systems) *(NERC & SDT)* *(***7***-5's & 4's and* **3** *-1's & 2's)*
21. (3.08) Legal support for the SDT *(NERC)* *(***4***-5's & 4's and* **6** *-1's & 2's)*
22. (3.07) Establish idea sharing center on the NERC Website *(NERC)* *(***4***-5's & 4's and* **7** *-1's & 2's)*
23. (2.93) Revise the work plan to produce interim CIP deliverables prior to the final CIP deliverable that can be implemented more rapidly with less onerous comment response process required. *(NERC and SDT)* *(***1***-5's & 4's and* **2** *-1's & 2's)*
24. (2.92) Full Commitment and support of members from their organizations extending down to include managers and lower level executives, not just pay lip service. *(SDT Members)* *(***2***-5's & 4's and* **7***-1's & 2's)*
24. (2.92) Adopt 800-53 Rev 3 for control centers and data centers *(NERC & SDT)* *(***4***-5's & 4's and* **6** *-1's & 2's)*
25. (2.92) Review Order 706 and remove items included that should be given to another group, challenged or deferred. *(NERC & SDT)* *(***7***-5's & 4's and* **1** *-1's & 2's*
26. (2.86) Bring Team together for as long as it takes to get the job done (somewhere nice) *(SDT and NERC)* *(***4***-5's & 4's and* **6***-1's & 2's*
27. (2.85) Support outside expert presentations on security issues and standards in other industries. *(NERC)* *(***3***-5's & 4's and* **5***-1's & 2's)*
28. (2.79) Support the use of video technology for SDT meetings(e.g., Cisco Telepresence) *(NERC)* *(***4***-5's & 4's and* **5** *-1's & 2's)*
29. (2.50) NERC letters to CEO's to secure full commitments from CEOs of member organizations. *(NERC)* *(***2***-5's & 4's and* **6***-1's & 2's*
30. *(2.50)* Leverage FERC Power (influence) for immediate needs *(NERC)* *(***2***-5's & 4's and* **8***-1's & 2's)*
31. (2.46) Throw in with CSCTG from NIST *(NERC)* *(***2***-5's & 4's and* **8***-1's & 2's)*
32. (2.38) Go back to the 'original, original' standards for cyber security as a basis for the new CIP (see NERC Website archive) *(SDT)* *(***2***-5's & 4's and* **7***-1's & 2's)*
33. *(*2.36) Open up the discussions beyond our electric industry *(NERC)* *(***1***-5's & 4's and* **10***-1's & 2's)*
34. (2.08) Skip BES Mapping and install minimum security controls for all assets after establishing clear cut agreed upon objectives on what we are securing. *(SDT)* *(***2***-5's & 4's and* **10** *-1's & 2's)*
35. (1.85) Abandon the NIST based approach and improve existing standards framework. *(SDT)* *(***0***-5's & 4's and]* **13***-1's & 2's)*

List any other strategies or comments:

NERC Team Support and Expertise

- NERC establish a location for meetings with all the needed support and technology.
- Compliance input during team meetings.
- NERC Standards Development process resource to provide guidance on process questions.
- NERC provide someone to create and organize webinars.

Outside Pressure and Changes in Workplan Objectives

- Consistent objectives; less reactionary pressure from NERC and FERC on schedule.

Communication with Industry

- Communications plan needs to be a priority with NERC.

Team Structure

- All open meeting!!! Not lead team communicating with others.
- Small group meet for a longer separate session to produce strawman specific documents created for use at larger group meetings.
- I think greater use of small groups for creation of a strawdog to be brought back to the group for adoption would be a model for everyone.

CONSIDERING STRATEGIES FOR STREAMLINING THE SDT 706 WORK-PLAN MEMBER SURVEY RESPONSES BY CATEGORY (11-19-09)

(15 SDT Respondents: Jeri Brewer, Jim Brenton, Jackie Collett, Sharon Edwards, Phil Huff, Doug Johnson, Rich Kinas, John Lim, Dave Norton, Dave Revill, Scott Rosenberger, Jon Stanford, Keith Stoffer, John Varnell & Bill Winters)

SDT Members "brainstormed" SDT streamlining ideas on 11-17-09 and completed this survey during lunch on 11-19-09 using the following scale in ranking the strategies:
5= highest priority/most helpful; 4= priority/helpful; 3= important/somewhat helpful;
2= less important and helpful; 1=don't do it-unacceptable.

A. CHANGING ANSI STANDARDS PROCEDURES

Avg. Ranking	*Streamlining Strategy*	*# of 5's & 4's*	*# of 1's & 2's*
4.21	Receive permission to use informal comment processes for the development of the CIP with a final 45-day comment period consistent with the ANSI process. *(NERC)*	**7**	**1**
3.29	Charge the SDT to complete CIP by April 1, 2010 – working outside the constraints of the current ANSI process. *(NERC)*	**5**	**4**
2.93	Revise the work plan to produce interim CIP deliverables prior to the final CIP deliverable that can be implemented more rapidly with less onerous comment response required. *(NERC and SDT)*	**1**	**2**

B. MEETING CHANGES- EFFICIENCY, LOCATION, TOOLS

Avg. Ranking	*Streamlining Strategy*	*# of 5's & 4's*	*# of 1's & 2's*
4.36	Make the best use of our time. Start meetings on time and get the technology operational early *(SDT)*	**8**	**0**
3.93	Meet in central US locations minimizing travel time and maximizing Team productivity and time. *(SDT and NERC)*	**5**	**1**
3.36	Longer, extended intensive meetings of the SDT (2-3 weeks at a time) *(SDT and NERC)*	**8**	**7**
2.86	Bring Team together for as long as it takes to get the job done (somewher *(SDT and NERC)*	**4**	**6**
2.79	Support the use of video technology for SDT meetings (e.g., Cisco Telepresence) *(NERC)*	**4**	**5**

C. COMMITMENT COMMUNICATION AND SUPPORT

Avg. Ranking	*Streamlining Strategy*	*# of 5's & 4's*	*# of 1's & 2's*
4.43	Improve industry communications in getting the word out on the SDT and its progress? Webinars, workshops, etc. *(NERC with SDT help)*	**11**	**0**
3.86	No audits for drafting team member organizations *(NERC).*	**8**	**2**
3.38	NERC support funding member expenses (1/2 of costs) for meetings. *(NERC)*	**5**	**5**
3.15	NERC letter to CEOs acknowledge the contributions of members and appreciation of work done so far (as requested by members) *(NERC)*	**6**	**5**
3.07	Establish idea sharing center on the NERC Website *(NERC)*	**4**	**7**
2.92	Full Commitment and support of members from their organizations extending down to include mgrs and lower level executives, not just pay lip service. *(SDT Members)*	**2**	**7**
2.50	NERC letters to CEO's to secure full commitments from CEOs of member organizations. *(NERC)*	**2**	**6**

2.50	Leverage FERC Power (influence) for immediate needs *(NERC)*	2	8
2.36	Open up the discussions beyond our electric industry *(NERC)*	1	10

D. TEAM STRUCTURE

Avg. Ranking	*Streamlining Strategy*	*# of 5's & 4's*	*# of 1's & 2's*
3.54	Break up the SDT into many small drafting groups--divide the work and focus on specific tasks. *(SDT)*	7	3
3.08	Establish a small core SDT drafting group that will commit to meeting frequently between SDT meetings to prepare materials and drafts for full group consideration at meetings. *(SDT)*	5	7
3.08	Divide the standards deliverables and organize the SDT to develop drafts for each. *(SDT)*	5	5

E. SUBSTANTIVE CHANGES IN APPROACH/SCOPE TO STANDARD DEVELOPMENT

Avg. Ranking	*Streamlining Strategy*	*# of 5's & 4's*	*# of 1's & 2's*
3.62	Refocus on security issues and less on compliance *(SDT)*	8	3
3.54	Remove penalty base requirements (you get what you measure) *(NERC, FERC, Congress)*	6	4
3.46	Simplify the approach and strategy to the standards to reduce complexity *(SDT)*	7	3
3.08	Adapt 800-82 (targeted for industrial control systems) *(NERC & SDT)*	3	7
2.92	Adopt 800-53 Rev 3 for control centers and data centers *(NERC & SDT)*	4	6
2.92	Review Order 706 and remove items included that should be given to ano group, challenged or deferred. *(NERC & SDT)*	4	5
2.46	Throw in with CSCTG from NIST *(NERC)*	2	8
2.38	Go back to the 'original, original' standards for cyber security as a basis for the new CIP (see NERC Website archive) *(SDT)*	2	7
2.08	Skip BES Mapping and install minimum security controls for all assets aft establishing clear cut agreed upon objectives on what we are securing. *(SD*	2	10
1.85	Abandon the NIST based approach and improve existing standards framework. *(SDT)*	0	13

F. MORE TALENT AND EXPERTISE TO SUPPORT SDT

Avg. Ranking	*Streamlining Strategy*	*# of 5's & 4's*	*# of 1's & 2's*
4.46	Technical writer support (More like Scott Mix) *(NERC)*	11	2
4.00	Engage technical writers *(NERC)*	8	3
3.15	Station engineers *(NERC)*	6	6
3.15	Legal support for the SDT *(NERC)*	4	6
3.08	Bring generating station engineers onto the SDT. *(NERC)*	4	5
2.85	Support outside expert presentations on security issues and standards in o industries. *(NERC)*	3	5

Appendix #7 CIP-002-4 Template

FERC Specific directives from order 706:

Compiled by Scott Mix, NERC

The following table contains the status of all issues raised in the order that were either "direct"ed, specifically in the order, or "adopt"ed from the NOPR..

Note: Given the confusion over the SDT's inclusion of the change in CIP-008 ("Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test") that the commission did not "direct", even though p 687 states: "In light of the comments received, the Commission clarifies that, with respect to full operational testing under CIP-008-1, such testing need not require a responsible entity to remove any systems from service," I did not include any issue that was not actively directed for change, such as those designated "should consider" or similar.

Issue #	Paragraph #	Text	Phase[1]
1	13	NERC is directed to develop a timetable for development of the modifications to the CIP Reliability Standards and, if warranted, to develop and file with the Commission for approval, a second implementation plan.	This compliance filing; and an implementation plan is filed with each submitted version of the standards
2	25	we direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of	Version 4

[1] Schedule phases in this column mean one or more of the following:
- "Version 2" – complete in filed version 2
- "Version 4" – planned for next major version (12-18 months plus)
- "Guideline" – stand alone guidance started after corresponding requirement is determined
- "TFE Filing" – 2009 filing on TFE proposal and Appendix 4D to RoP
- "not scheduled" – beyond Version 4
- "CMEP" – part of an existing or ongoing compliance audit, self-report or other process
- "VRF Filing(s)" – one of several already-filed (or very soon to be filed in the case of Version 2) VRF and/or VSL filings

Phase may also be self-explanatory if not one of these entries

		the NIST framework.	
3	47	The Commission adopts the CIP NOPR approach regarding NERC and Regional Entity compliance with the CIP Reliability Standards.	Rules of Procedure statement
4	49	The Commission also adopts its CIP NOPR approach and concludes that reliance on the NERC registration process at this time is an appropriate means of identifying the entities that must comply with the CIP Reliability Standards	Compliance registry process
5	72	We adopt our proposal in the CIP NOPR that responsible entities must comply with the substance of a Requirement.	CMEP
6	75	we direct the ERO to develop modifications to the CIP Reliability Standards that require a responsible entity to implement plans, policies and procedure that it must develop pursuant to the CIP Reliability Standards	Version 2
7	86	The Commission adopts its CIP NOPR proposal and approves NERC's implementation plan and time frames for responsible entities to achieve auditable compliance.	CMEP
8	89	we direct the ERO to submit a work plan for Commission approval for developing and filing for approval the modifications to the CIP Reliability Standards that we are directing in this Final Rule	This compliance filing; and an implementation plan is filed with each submitted version of the standards
9	90	We direct the ERO, in its development of a work plan, to consider developing modifications to CIP-002-1 and the provisions regarding technical feasibility exceptions as a first priority, before developing other modifications required by the Final Rule.	TFE Filing

10	96	we direct the ERO to require more frequent, semiannual, self-certifications prior to the date by which full compliance is required	CMEP program and self-certifications
11	97	we adopt our CIP NOPR proposals that, while an entity should not be subject to a monetary penalty if it is unable to certify that it is on schedule, such an entity should explain to the ERO the reason it is unable to self-certify	CMEP, self-certification process
12	106	the Commission adopts the CIP NOPR proposals and directs NERC to modify the CIP Reliability Standards through the Reliability Standards development process to remove the first two Terms ["reasonable business judgment," and "acceptance of risk"], and develop specific conditions that a responsible entity must satisfy to invoke the "technical feasibility" exception	Version 2 and TFE Filing
13	128	the Commission directs the ERO to develop modifications to the CIP Reliability Standards that do not include this term. We note that many commenters, including NERC, agree that the reasonable business judgment language should be removed based largely on the rationale articulated by the Commission in the CIP NOPR.	Version 2
14	138	the Commission directs the ERO to modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin.	Version 2
15	150	The Commission, therefore, directs the ERO to remove acceptance of risk language from the CIP Reliability Standards.	Version 2
16	156	the Commission directs the ERO to develop through its Reliability Standards development process revised CIP Reliability Standards that eliminate references to acceptance of risk.	Version 2

17	178	directs the ERO to develop a set of conditions or criteria that a responsible entity must follow when relying on the technical feasibility exception contained in specific Requirements of the CIP Reliability Standards	TFE Filing
18	186	the Commission adopts its proposal in the CIP NOPR that technical feasibility exceptions may be permitted if appropriate conditions are in place.	TFE Filing
19	192	the Commission adopts the CIP NOPR proposal for a three step structure to require accountability when a responsible entity relies on technical feasibility as the basis for an exception. We address mitigation and remediation in this section and direct the ERO to develop: (1) a requirement that the responsible entity must develop, document and implement a mitigation plan that achieves a comparable level of security to the Requirement; and (2) a requirement that use of the technical feasibility exception by a responsible entity must be accompanied by a remediation plan and timeline for elimination the use of the technical feasibility exception.	TFE Filing
20	209	The Commission thus adopts its CIP NOPR proposal that use and implementation of technical feasibility exceptions must be governed by a clear set of criteria.	TFE Filing
21	211	direct the ERO to include approval of the mitigation and remediation steps by the senior manager (identified pursuant to CIP-003-1) in the course of developing this framework of accountability.	TFE Filing
22	212	the practical considerations pointed out by a number of the comments have convinced us to adopt an approach to the issue of external oversight different from the one originally	TFE Filing

		proposed.	
23	218	we direct the ERO to design and conduct an approval process through the Regional Entities and the compliance audit process.	TFE Filing
24	219	we direct NERC, in developing the accountability structure for the technical feasibility exception, to include appropriate provisions to assure that governmental entities that are subject to Reliability Standards as users, owners or operators of the Bulk-Power System can safeguard sensitive information.	TFE Filing
25	220	We direct the ERO to submit an annual report to the Commission that provides a wide-area analysis regarding use of the technical feasibility exception and the effect on Bulk-Power System reliability.	TFE Filing
26	221	we direct the ERO to control and protect the data analysis to the extent necessary to ensure that sensitive information is not jeopardized by the act of submitting the report to the Commission.	TFE Filing
27	222	we direct the ERO to develop a set of criteria to provide accountability when a responsible entity relies on the technical feasibility exceptions in specific Requirements of the CIP Reliability Standards.	TFE Filing
28	222	We direct the ERO to develop appropriate modifications, as discussed above.	TFE Filing
29	233	we direct the ERO to consult with federal entities that are required to comply with both CIP Reliability Standards and NIST standards on the effectiveness of the NIST standards and on implementation issues and report these findings to the Commission.	Ongoing discussions with Drafting Team Members from USBR, BPA, NIST; Development of Version 4
30	253	While we adopt our CIP NOPR proposal, we recognize that the ERO has already initiated	Guideline / Version 4

		a process to develop such guidance … leave to the EO's discretion whether to incorporate such guidance into the CIP Reliability Standard, develop it as a separate guidance document, or some combination of the two.	
31	254	direct the ERO to consider these commenter concerns [how to assess whether a generator or a blackstart unit is "critical" to Bulk-Power System reliability, the proper quantification of risk and frequency, facilities that are relied on to operate or shut down nuclear generating stations, and the consequences of asset failure and asset misuse by an adversary]when developing the guidance.	Guideline / Version 4
32	255	we direct either the ERO or its designees to provide reasonable technical support to assist entities in determining whether their assets are critical to the Bulk-Power System.	Unscheduled
33	257	we direct the ERO to consider this clarification [the meaning of the phrase "used for initial system restoration," in CIP-002-1, Requirement R1.2.4] in its Reliability Standards development process.	Guideline / Version 4
34	272	the Commission directs the ERO, in developing the guidance discussed above regarding the identification of critical assets, to consider the designation of various types of data as a critical asset or critical cyber asset.	Guideline / Version 4
35	272	The Commission directs the ERO to develop guidance on the steps that would be required to apply the CIP Reliability Standards to such data and to consider whether this also covers the computer systems that produce the data.	Guideline / Version 4
36	282	the Commission directs the ERO, through the Reliability Standards development	Guideline / Version 4

		process, to specifically require the consideration of misuse of control centers and control systems in the determination of critical assets	
37	285	we direct the ERO to consider the comment from ISA99 Team [ISA99 Team objects to the exclusion of communications links from CIP-002-1 and non-routable protocols from critical cyber assets, arguing that both are key elements of associated control systems, essential to proper operation of the critical cyber assets, and have been shown to be vulnerable – by testing and experience].	Version 4
38	294	The Commission adopts its CIP NOPR proposal and directs the ERO to develop, pursuant to its Reliability Standards development process, a modification to CIP-002-1 to explicitly require that a senior manager annually review and approve the risk-based assessment methodology.	Version 2
39	294	the Commission directs the ERO to develop a modification to CIP-002-1 to explicitly require that a senior manager annually review and approve the risk-based assessment methodology.	Version 2
40	322	The Commission adopts its CIP NOPR proposal to direct that the ERO develop through its Reliability Standards development process a mechanism for external review and approval of critical asset lists.	Version 4 (Note: proposed version 4 methodology obviates the need for external review0
41	329	the Commission directs the ERO, using its Reliability Standards development process, to develop a process of external review and approval of critical asset lists based on a regional perspective.	Version 4 (Note: proposed version 4 methodology obviates the need for

			external review0
42	333	we direct the ERO, in developing the accountability structure for the technical feasibility exception, to include appropriate provisions to assure that governmental entities can safeguard sensitive information	TFE Filing
43	355	the Commission directs the ERO to provide additional guidance for the topics and processes that the required cyber security policy should address.	Guideline
44	376	the Commission adopts its CIP NOPR proposal and directs the ERO to clarify that the exceptions mentioned in Requirements R2.3 and R3 of CIP-003-1 do not except responsible entities from the Requirements of the CIP Reliability Standards.	Version 4
45	381	The Commission adopts its CIP NOPR interpretation that Requirement R2 of CIP-003-1 requires the designation of a single manager who has direct and comprehensive responsibility and accountability for implementation and ongoing compliance with the CIP Reliability Standards	Version 2
46	386	The Commission adopts its CIP NOPR proposal and directs the ERO to develop modifications to Reliability Standards CIP-003-1, CIP-004-1, and/or CIP-007-1, to ensure and make clear that, when access to protected information is revoked, it is done so promptly.	Version 4
47	397	The Commission directs the ERO to develop modifications to Requirement R6 of CIP-003-1 to provide an express acknowledgment of the need for the change control and configuration management process to consider accidental consequences and malicious actions along with intentional changes.	Version 4 / Guideline

48	412	The Commission therefore directs the ERO to provide guidance, regarding the issues and concerns that a mutual distrust posture must address in order to protect a responsible entity's control system from the outside world.	Guideline
49	431	The Commission adopts the CIP NOPR's proposal and directs the ERO to develop a modification to CIP-004-1 that would require affected personnel to receive required training before obtaining access to critical cyber assets (rather than within 90 days of access authorization), but allowing limited exceptions, such as during emergencies, subject to documentation and mitigation.	Version 2
50	433	we direct the ERO to consider, in developing modifications to CIP-004-1, whether identification of core training elements would be beneficial and, if so, develop an appropriate modification to the Reliability Standard.	Version 4
51	434	The Commission adopts the CIP NOPR's proposal to direct the ERO to modify Requirement R2 of CIP-004-1 to clarify that cyber security training programs are intended to encompass training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of critical cyber assets.	Version 4
52	435	Consistent with the CIP NOPR, the Commission directs the ERO to determine what, if any, modifications to CIP-004-1 should be made to assure that security trainers are adequately trained themselves.	Version 4
53	443	The Commission adopts with modifications the proposal to direct the ERO to modify Requirement R3 of CIP-004-1 to provide	Version 2

		that newly-hired personnel and vendors should not have access to critical cyber assets prior to the satisfactory completion of a personnel risk assessment, except in specified circumstances such as an emergency.	
54	443	We also direct the ERO to identify the parameters of such exceptional circumstances through the Reliability Standards development process	Version 4
55	460	The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset for any reason (including disciplinary action, transfer, retirement, or termination).	Version 4
56	464	We also adopt our proposal to direct the ERO to modify Requirement R4 to make clear that unescorted physical access should be denied to individuals that are not identified on the authorization list, with clarification.	Version 4
57	473	The Commission adopts its proposals in the CIP NOPR with a clarification. As a general matter, all joint owners of a critical cyber asset are responsible to protect that asset under the CIP Reliability Standards. The owners of joint use facilities which have been designated as critical cyber assets are responsible to see that contractual obligations include provisions that allow the responsible entity to comply with the CIP Reliability Standards. This is similar to a responsible entity's obligations regarding vendors with access to critical cyber assets.	Version 4

58	476	we direct the ERO to modify CIP-004-1, and other CIP Reliability Standards as appropriate, through the Reliability Standards development process to address critical cyber assets that are jointly owned or jointly used, consistent	Version 4
59	496	The Commission adopts the CIP NOPR's proposal to direct the ERO to develop a requirement that each responsible entity must implement a defensive security approach including two or more defensive measures in a defense in depth posture when constructing an electronic security perimeter	Not scheduled
60	502	The Commission directs that a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process.	Not scheduled
61	502	The Commission also directs the ERO to consider, based on the content of the modified CIP-005-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.	Not scheduled / Guideline
62	503	The Commission is directing the ERO to revise the Reliability Standard to require two or more defensive measures.	Not scheduled
63	511	The Commission adopts the CIP NOPR's proposal to direct the ERO to identify examples of specific verification technologies that would satisfy Requirement R2.4, while also allowing compliance pursuant to other technically equivalent measures or technologies.	Version 4
64	525	The Commission adopts the CIP NOPR proposal to require the ERO to modify CIP-	Version 4

		005-1 to require logs to be reviewed more frequently than 90 days	
65	526	the Commission directs the ERO to modify CIP-005-1 through the Reliability Standards development process to require manual review of those logs without alerts in shorter than 90 day increments.	Version 4
66	526	The Commission directs the ERO to modify CIP-005-1 to require some manual review of logs, consistent with our discussion of log sampling below, to improve automated detection settings, even if alerts are employed on the logs.	Version 4
67	528	the Commission clarifies its direction with regard to reviewing logs. In directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the ERO could provide, through the Reliability Standards development process, clarification that a responsible entity should perform the manual review of a sampling of log entries or sorted or filtered logs.	Version 4
68	541	we adopt the ERO's proposal to provide for active vulnerability assessments rather than full live vulnerability assessments.	Version 4
69	542	the Commission adopts the ERO's recommendation of requiring active vulnerability assessments of test systems.	Version 4
70	544	the Commission directs the ERO to revise the Reliability Standard so that annual vulnerability assessments are sufficient, unless a significant change is made to the electronic security perimeter or defense in depth measure, rather than with every modification.	Version 4
71	544	we are directing the ERO to determine, through the Reliability Standards development process, what would	Version 4

		constitute a modification that would require an active vulnerability assessment	
72	547	we direct the ERO to modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years	Version 4
73	560	the Commission directs the ERO to treat any alternative measures for Requirement R1.1 of CIP-006-1 as a technical feasibility exception to Requirement R1.1, subject to the conditions on technical feasibility exceptions.	TFE Filing / CMEP
74	572	The Commission adopts the CIP NOPR proposal to direct the ERO to modify this CIP Reliability Standard to state that a responsible entity must, at a minimum, implement two or more different security procedures when establishing a physical security perimeter around critical cyber assets.	Not scheduled
75	575	The Commission also directs the ERO to consider, based on the content of the modified CIP-006-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.	Not scheduled / Guideline
76	581	The Commission adopts the CIP NOPR proposal and directs the ERO to develop a modification to CIP-006-1 to require a responsible entity to test the physical security measures on critical cyber assets more frequently than every three years,	Version 4
77	597	Therefore, the Commission directs the ERO to eliminate the acceptance of risk language from Requirements R2.3 and R3.2.	Version 2
78	600	Commission therefore directs the ERO to revise Requirement R3 to remove the	Version 2 / TFE Filing

		acceptance of risk language and to impose the same conditions and reporting requirements as imposed elsewhere in the Final Rule regarding technical feasibility.	
79	609	We therefore direct the ERO to develop requirements addressing what constitutes a "representative system" and to modify CIP-007-1 accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document.	Version 4 / Guideline
80	610	we direct the ERO to revise the Reliability Standard to require each responsible entity to document differences between testing and production environments in a manner consistent with the discussion above.	Version 4
81	611	the Commission cautions that certain changes to a production or test environment might make the differences between the two greater and directs the ERO to take this into account when developing guidance on when to require updated documentation to ensure that there are no significant gaps between what is tested and what is in production.	Version 4
82	619	The Commission adopts the CIP NOPR proposal with regard to CIP-007-1, Requirement R4. [The Commission proposed to direct the ERO to eliminate the acceptance of risk language from Requirement R4.2, and also attach the same documentation and reporting requirements to the use of technical feasibility in Requirement R4, pertaining to malicious software prevention, as elsewhere. The Commission discussed the issues of defense in depth, technical feasibility, and risk acceptance elsewhere in the CIP NOPR and applied those conclusions here. The Commission further proposed to direct the	Version 4 / not scheduled

		ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means]	
83	622	Therefore, the Commission directs the ERO to eliminate the acceptance of risk language from Requirement R4.2	Version 2
84	622	The Commission also directs the ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means, consistent with our discussion above	Version 4 / not scheduled
85	628	The Commission continues to believe that, in general, logs should be reviewed at least weekly and therefore adopts the CIP NOPR proposal to require the ERO to modify CIP-007-1 to require logs to be reviewed more frequently than 90 days, but leaves it to the Reliability Standards development process to determine the appropriate frequency, given our clarification below, similar to our action with respect to CIP-005-1	Version 4
86	629	The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document.	Version 4 / guideline
87	633	The Commission adopts the CIP NOPR proposal to direct the ERO to clarify what it means to prevent unauthorized retrieval of	Version 4

		data from a cyber asset prior to discarding it or redeploying it.	
88	635	the Commission directs the ERO to revise Requirement R7 of CIP-007-1 to clarify, consistent with this discussion, what it means to prevent unauthorized retrieval of data.	Version 4
89	643	The Commission adopts its proposal to direct the ERO to provide more direction on what features, functionality, and vulnerabilities the responsible entities should address when conducting the vulnerability assessments, and to revise Requirement R8.4 to require an entity-imposed timeline for completion of the already-required action plan.	Not scheduled
90	651	We direct the ERO to revise Requirement R9 to state that the changes resulting from modifications to the system or controls shall be documented quicker than 90 calendar days.	Version 2
91	660	The Commission adopts the CIP NOPR proposal to direct the ERO to provide guidance regarding what should be included in the term reportable incident. … we direct the ERO to develop and provide guidance on the term reportable incident.	Guideline
92	661	the Commission directs the ERO to develop a modification to CIP-008-1 to: (1) include language that takes into account a breach that may occur through cyber or physical means; (2) harmonize, but not necessarily limit, the meaning of the term reportable incident with other reporting mechanisms, such as DOE Form OE 417; (3) recognize that the term should not be triggered by ineffectual and untargeted attacks that proliferate on the internet; and (4) ensure that the guidance language that is developed	Version 4 / Guideline

		results in a Reliability Standard that can be audited and enforced	
93	673	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.	Version 4 / Guideline
94	676	the Commission directs the ERO to modify CIP-008-1 to require a responsible entity to, at a minimum, notify the ESISAC and appropriate government authorities of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.	Version 4 /. Guideline
95	686	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1, Requirement R2 to require responsible entities to maintain documentation of paper drills, full operational drills, and responses to actual incidents, all of which must include lessons learned.	Version 4
96	686	The Commission further directs the ERO to include language in CIP-008-1 to require revisions to the incident response plan to address these lessons learned.	Version 4
97	694	For the reasons discussed in the CIP NOPR, the Commission adopts the proposal to direct the ERO to modify CIP-009-1 to include a specific requirement to implement a recovery plan.	Version 4
98	694	We further adopt the proposal to enforce this Reliability Standard such that, if an entity has the required recovery plan but does not implement it when the anticipated event or conditions occur, the entity will not	Version 4

		be in compliance with this Reliability Standard.	
99	706	The Commission adopts, with clarification, the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to incorporate use of good forensic data collection practices and procedures into this CIP Reliability Standard.	Not scheduled
100	710	Therefore, we direct the ERO to revise CIP-009-1 to require data collection, as provided in the Blackout Report.	Not scheduled
101	725	The Commission adopts, with modifications, the CIP NOPR proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years.	Not scheduled
102	731	The Commission adopts the CIP NOPR proposal to direct the ERO to modify Requirement R3 of CIP-009-1 to shorten the timeline for updating recovery plans.	Version 2
103	739	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to incorporate guidance that the backup and restoration processes and procedures required by Requirement R4 should include, at least with regard to significant changes made to the operational control system, verification that they are operational before the backups are stored or relied upon for recovery purposes	Version 4
104	748	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to provide direction that backup practices include regular procedures to ensure verification that backups are	Version 4

		successful and backup failures are addressed, so that backups are available for future use.	
105	757	Therefore, we will not allow NERC to reconsider the Violation Risk Factor designations in this instance but, rather, direct below that NERC make specific modifications to its designations.	VRF Filing(s)
106	759	Consistent with the Violation Risk Factor Order, the Commission directs NERC to submit a complete Violation Risk Factor matrix encompassing each Commission approved CIP Reliability Standard.	VRF Filing(s)
107	767	The Commission adopts the CIP NOPR proposal to direct the ERO to revise 43 Violation Risk Factors.	VRF Filing(s)

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 SDT — Project 2008-06

December 15, 2009 | 8:00 AM to 5:30 PM EST
December 16, 2009| 8:00 AM to 5:00 PM EST

Arkansas Electric Cooperative Corporation
1 Cooperative Way
Little Rock, AR,

NOTE:
1. Agenda Times May be Adjusted as needed during the Meeting
2. Document Drafting Group Meetings May Not Have Access to Telephones and Ready-Talk

Proposed Meeting Objectives/Outcomes

- Receive an overview the CIP 002-4 document drafting progress;
- Review the NERC's proposed FERC Order workplan filing and milestones;
- Conduct a walk-through of the CIP 002-4 and identify lessons learned and any changes needed in the document(s) including: Cover memo, Comment Form, CIP 002, Guidance Document, and Controls Description and Sample;
- Identify remaining CIP 002-4 key issues and provide guidance to document drafting groups;
- Convene CIP 002-4 Document Drafting Groups;
- Review and refine Document Drafting Group products;
- Compile, review and refine the draft CIP 002-4 and related documents;
- Adopt the CIP-002-4 Documents for posting;
- Review CSO 706 SDT leadership transition and changes; and
- Review the 2010 Schedule and agree on next steps and assignments.

Draft Agenda

Tuesday	**December 15, 2009**
8:00 a.m.	Welcome and Opening Remarks- *Jeri Domingo Brewer, Phil Huff & John Lim* Roll Call; NERC Antitrust Compliance Guidelines
8:10	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
8:15	Overview of CSO 706 SDT Workplan- December 2009 to June, 2010- *Jeri Domingo Brewer*
8:20	Review of NERC Actions in Support of CSO 706 SDT and NERC Workplan Filing with FERC- *Gerry Adamski, NERC*

	SDT Discussion of Proposed Workplan
9:20	Overview of CIP 002-4 Strawman Draft Documents- *John Lim et al.*
9:30	Walk Through of CIP 002-4 Strawman Scenario-*Jackie Collett et al.*
10:30	*Break*
10:45	Reflections and Lessons Learned from Walk Through and Implications for the CIP 002 Draft
11:00	Run-through and Flag Key Remaining Issues in CIP Version 4 Strawman Documents
12:15	*Lunch*
12:45	Review of Remaining Issues and Proposal for Key Issues/Documents Drafting Groups
1:00	Key Issues/Documents Drafting Sub-Group Meetings
4:00	Drafting Sub-Group Reports and Identification of any Outstanding Issues and Drafting Assignments
5:30	*Recess (possible after dinner drafting assignments)*

Wednesday	**December 16, 2009**
8:00	Welcome, Agenda Review and Antitrust Guidelines- *Jeri Domingo-Brewer, Phil Huff, John Lim & Joe Bucierro* Facilitator review and SDT acceptance of November 16-19, 2009 Orlando SDT meeting summary
8:10	Update on Status of Version 3 CIP Standards, Implementation Plans, etc–*Scott Mix*
8:20	Update on other related cyber security initiatives- *SDT Members*
8:30	Reconvene SDT CIP 002-4 Document Drafting Sub-Groups *(as needed)*
10:30	*Break*
10:45	Draft Document Review and Consensus Testing on Any Key Remaining Issues *(as needed)*
12:00	*Working Lunch (compilation of refined inputs to CIP 002-4 documents)*
12:45	Review of CSO 706 SDT Leadership Changes
1:00	Draft CIP-002-4 and Guidance Document Review
3:00	*Break*
3:15	**Motion to Adopt Draft CIP-002-4 and Guidance Documents for Industry Posting**
3:45	Review and Agree on CIP 002-4 Next Steps and January- June 2010 Workplan and Schedule Preparation and Assignments for CIP 003-009 January Meeting
4:30	Discussion of 2010 Meeting Logistics and Locations, and SDT Membership • Meeting Evaluation
5:00	*Adjourn*

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

PROJECT 2008-06 CYBER SECURITY ORDER 706 SDT MEMBERS

1. Rob Antonishen	Ontario Power Generation
2**. Jeri Domingo-Brewer, Chair**	U.S. Bureau of Reclamation
3. Jim Brenton	ERCOT
4. Jackie Collett	Manitoba Hydro
5. Jay S. Cribb	Information Security Analyst, Southern Company Services
6. Joe Doetzl	Manager, Information Security, Kansas City Pwr. & Light Co.
7. Sharon Edwards	Duke Energy
8. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
9**. Phillip Huff, Vice Chair**	Arkansas Electric Coop Corporation
10. Doug Johnson	Exelon Corporation – Commonwealth Edison
11. Frank Kim	Ontario Hydro
12. Rich Kinas	Orlando Utilities Commission
13. John Lim, Vice Chair	CISSP, Department Manager, Consolidated Edison Co. NY
14. David Norton	Entergy
15. Christopher A. Peters	ICF International
16. David S. Revill	Georgia Transmission Corporation
17. Scott Rosenberger	Luminant Energy
18. Kevin Sherlin	Sacramento Municipal Utility District
19. Jonathan Stanford	Bonneville Power Administration
20.Keith Stouffer	National Institute of Standards & Technology
21. John D. Varnell	Technology Director, Tenaska Power Services Co.
22.William Winters	Arizona Public Service, Inc.
Roger Lampilla	NERC
Scott Mix	NERC
Dave Taylor	NERC
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Hal Beardal	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CSO 706 SDT VERSION 3 CIP AND VERSION 4 CIP 002 PROCESS

CIP Version 3 Key Steps/Schedule

1. *Post for Industry Comment 10-13-09 to 11-12-09*
2. **November 13 SDT Conference Call- Review of Industry Comments and Response**
3. **November 16, CSO 706 SDT Meeting in Orlando, Monday, 5:00 p.m.- through dinner- Response Document to Industry Comments**
4. **November 17**, Tuesday, CSO 706 SDT Meeting, Orlando, Complete and Adopt Response Document to Industry Comments
5. **November 20**, Wednesday, Post Response Document and Initiate Ballot
6. **November 30**, Monday *(after Thanksgiving)* Deadline for Votes and Industry Comments
7. **December 2, Wednesday, CSO 706 SDT - Conference Call- finalize Response document to Industry Comments**
8. **December 3- 13,** Recirculation Ballot
9. **December 16,** BoT Approval
10. **December 29, 2009,** FERC Filing

CIP 002-4 Key Steps/Schedule (October-December 2009)

1. **November 1:** Jackie Collett, Phil Huff, John Lim and John Varnell, the chairs of the 4 CIP 002 Subgroups will form the CIP 002 Strawman Drafting Group (SDG).
2. **November 1:** All CIP 002 "meta groups" and subgroups will forward to the Strawman Drafting Group their standards text drafts including any guidance language**.**
3. Joe Doetzl will coordinate the work of the Controls Drafting Group (CDG) members: Jim Brenton, Keith Stouffer, Bill Winters, Jon Stanford. They will produce several recommended sample controls to illustrate high/medium/low concepts in CIP 002 as well as recommendations on whether the SDT should request guidance from the Standards Committee on referencing a 'catalogue of security requirements', for circulation to the SDT **by Friday, November 13, 2009**
4. The SDG will prepare a strawman draft by **November 13, 2009** for review by the SDT in advance of November 16-19, 2009 SDT meeting
5. The SDT will utilize the strawman draft to organize its **November 16-19 meeting** and determine at the conclusion of the meeting if the SDT will continue to aim for the December 16th adoption of CIP 002 draft for posting for industry comment
6. **December 7, 3:00-4:30 p.m. est**. Previews of reviewed CIP 002 and related document drafts at a SDT conference call.
7. The SDT will refine and circulate a revised strawman Draft by Monday, December 14, 2009 for review at the **December 15-16** CSO706 SDT meeting in Little Rock
8. **December 15-16** will refine, finalize and adopt draft CIP 002-4 for posting to the industry for informal comments.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CSO 706 SDT MEETING SCHEDULE
OCTOBER 2008–DECEMBER 2010
DEVELOPMENT OF CIP VERSION 2 AND NEW VERSION FRAMEWORK
OCTOBER 2008–JULY 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.
2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development
3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 New Version process reviewed.
4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white "working" papers assigned, Technical Feasibility Exceptions white paper reviewed and refined.
5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed New Version white "working" papers.
January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.
7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.
8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals
March 2–April 1, 2009 — 30-day Pre Ballot
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment
March 30, 2009 — WebEx meeting(s) White Paper Drafting Team
April 1–10 — NERC Balloting on Version 2 Products
April 6, 2009 — WebEx meeting — White Paper Drafting Team
April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call
April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments
9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.
April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx
April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%
May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.
10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.
June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx

11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.

- *June — WebEx meeting(s)*
- *Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria*

CIP-002 DEVELOPMENT OF REQUIREMENTS, MEASURES, ETC. JULY-DECEMBER 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada
SDT reviewed, refined, and adopted SDT Working Paper. SDT adopted its response to NERC for Interpretation of CIP-006-1. SDT reviewed and adopted a proposal for CIP-002 Subgroups and Deliverables and convened subgroup organizational meetings to develop work plans. SDT adopted 2010 Meeting Schedule.

- *July–August Interim Conference call meeting(s)*
- *CIP-002 Subgroup meetings*
- *CIP-002 Coordination Team meeting*
- *August 3–5, 2009 in Winnipeg, Manitoba* ***NERC Member Representative Committee****. Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.*

13. August 20–21, 2009 in Charlotte, NC. SDT reviewed and responded to MRC input on Working Paper/CIP-002 Concepts and convened SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

- *July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper*
- *NERC Webinar- August–September Interim Conference Call meeting(s)*
- *CIP-002 Subgroup meetings (as ne*
- *CIP-002 Coordination Team meeting*

14. September 9–10, 2009 in Folsom, CA. SDT reviewed and considered industry comments on the Working Paper and CIP-002 concepts and their application to the subgroup work and addressed coordinating issues through joint subgroup meetings. SDT agreed on meeting dates and proposed locations for January–December 2010 September–October Interim WebEx meeting(s)

- *FERC Version 3 Urgent Action SDT conference call meetings*
- *CIP-002 Coordination Team meeting*

CIP VERSION 3 RESPONSE TO FERC ORDER, OCTOBER-DECEMBER, 2009

15. October 20–22, 2009 in Kansas City, MI. Reviewed new FERC Order and urgent action CIP Version 3 process; discussed key issues raised by SDT CIP 002 Subgroups, small group meetings and agreement on refinements to the CIP 002-009 schedule and drafting process for CIP 002-4.

- *October–November Drafting Team meeting(s)*
- *CIP-002 Coordination Team meeting*

16. November 16–19, 2009 in Orlando, FL

- SDT review, refine and adopt Version 3 "industry response" document.
- SDT plenary and drafting group session(s) — to draft, review and refine CIP-002-4 standard, requirements, measures and controls and related documents.
- November–December Interim Conference call meeting(s)
- Drafting teams as needed to finalize draft CIP 002-4 documents
- CIP-002 Coordination Team meeting
- *CIP 002-4 Drafting Team produces next draft based on Orlando Meeting input.*
- *December 2 CSO 706 SDT Version 3 Consideration of Comments Draft Conference Call*
- *December X, CSO 706 SDT CIP 002-4 Preview Conference Call*

17. December 15–16, 2009 in Little Rock AK

- SDT scenario "walk through" to test flow of CIP 002-4.
- SDT plenary and drafting group session(s) to review, refine, and agree on and adopt CIP-002 standard, requirements, measures and controls and related documents.
- Agree on initial posting of draft CIP-002 for industry review and comment.
- Agree on next steps and 2010 Workplan and schedule

REFINEMENT AND ADOPTION OF CIP-002 VERSION 4 AND DEVELOPMENT AND ADOPTION OF CIP STANDARDS (003-009)
JANUARY 2010–DECEMBER 2010

18. January 19-20–21-22 — Tue-PM- to Friday AM, Tucker, GA (GTC)

- SDT Work on Developing CIP 003-009 Strawman Drafts

19. February 17-18–19 —Wed--Thursday –Friday, Austin TX (ERCOT)

- SDT Reviews Industry Comments and Refines CIP 002 for posting for 45-day industry formal comment period.
- SDT continues CIP 003-009 Strawman Drafts

20. March 9–10-11 — Tuesday–Thursday, Phoenix, AZ (APS)

- SDT continues CIP 003-009 Strawman Drafts

21. April 13-14–15 — Tue-Wednesday–Thursday, Atlanta GA (Southern Co)

- SDT Reviews and Responds to Industry Comments, Refines and Adopts CIP 002 for balloting
- SDT posts a draft CIP 003-009 for informal industry comment.

22. May 11-12–13 — Tue-Wednesday–Thursday, Dallas TX (Luminant)

- SDT reviews Industry 1st Ballot Comments and Drafts Responses
- SDT reviews CIP 003-009 informal industry comments and refines the draft.

23. June 8-10- Tues, Wed. Thursday- (Sacramento)

- SDT refines CIP 003-009 and posts for 2nd round of informal industry comments and refines the draft.

24. July 13-14–15, Tue-Wednesday–Thursday, Pittsburgh, PA (CERT)

- SDT reviews CIP 003-009 informal industry comments and refines the draft.

25. August 10-11–12, Tue-Wednesday–Thursday- TBD

- SDT refines CIP 003-009 and posts for formal 45 day industry comment

26. September 7,8,9, Tues-Thurs. TBD (if needed)

27. Oct. 12-13–14, Tue-Wednesday–Thursday- TBD

- SDT Reviews and Responds to Industry Comments, Refines and Adopts CIP 002 for balloting

28. November 16-17–18, Tue-Wednesday–Thursday- TBD

- SDT reviews Industry 1st Ballot Comments and Drafts Responses

29. December 14-15–16, Tue-Wednesday–Thursday- TBD

SDT Consensus Guidelines
Adopted Unanimously, November 13, 2008, Little Rock AR
Cyber Security for Order 706 Standard Drafting Team

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.
General consensus is a participatory process whereby, on matters of substance, the members strive for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for the final package of recommended CIP revisions, and the Team finds that 100% acceptance or support of the members present is not achievable, final consensus recommendations will require at least 75% favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing consensus throughout the process on substantive issues with the participation of all members. In instances where the Team finds that even 75% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team.

The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, consensus testing through rating and prioritizing approaches will be utilized. The Team's deliberation process will be conducted as a facilitated consensus-building process. Team members, NERC staff and facilitators will be the only participants seated at the table. Only Team members may participate in consensus rating or votes on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Facilitator and all written comments submitted on the comment forms will be included in the Team and facilitators' summary reports.

The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 2/3's of the appointed members being present. The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure)*, as modified by the Team's adopted procedural guidelines, to make and approve motions; however, the 75% supermajority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision making on substantive motions and amendments to motions. In addition, the Council will utilize their adopted meeting guidelines for conduct during meetings. The Council will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.
The presiding chair and/or facilitators for the SDT, in general, should use parliamentary procedures set forth in Robert's Rules of Order, as modified by Team's adopted procedural guidelines.

To enhance the possibility of constructive discussions as members educate themselves on the issues and engage in consensus-building, members agree to refrain from public statements that may prejudge the outcome of the Team's consensus process. In discussing the Team process with the media, members agree to be careful to present only their own views and not the views or statements of other participants and/or may direct such inquiries to the Team Chair and Vice Chair or the NERC Director of Standards. In addition, in order to provide balance to the Team process, members agree to represent and consult with appropriate industry interest groups.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Summary Contents

EXECUTIVE SUMMARY

On Wednesday morning, the Chair welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. After the Chair reviewed the meeting objectives, Mr. Bucciero reviewed with members the need to comply with NERC's Antitrust Guidelines. On Thursday morning, the SDT approved, without objection, the meeting summary for the November meeting in Orlando. Following lunch on Thursday, the SDT congratulated and applauded Jeri Domingo Brewer on her leadership role in chairing the team for the past 15 months and Phil Huff and John Lim presented her a plaque on behalf of the SDT in recognition of her leadership by example.

Gerry Adamski, NERC Director of Standards, reviewed with the team the NERC efforts to provide support for the team as they confront the challenge of completing the CIP in 2010. He offered that the new President of NERC has indicated that this is one of its most critical projects in the coming year.

He recounted that NERC had projected a two-year time frame for the project which will be realized if the SDT can complete its work by December 2010. He suggested that the SDT must demonstrate that CIP 002 Version 4 and the controls in CIP 003-009 will improve the current critical asset identification process and this has both technical requirements and political overtones.

Since the SDT November meeting in Orlando, NERC has identified a critical path to accomplish two things: a quality CIP 002-4 revision by June 2010 and the related set of security controls/requirements by the end of 2010. NERC has been working on how to put an optimal framework in place to allow the delivery on the expectations for the SDT. He noted a couple offline meetings with industry leaders and the SDT leadership have led to identifying NERC actions that can assist the Team. NERC met with trade associations collectively on November 30, 2009 to solicit their support and to build a mutual understanding of the technical and political complexity involved in the updating the CIP. In support of the SDT's meeting process, NERC has committed to implementing a comprehensive communication campaign and has secured additional support with Roger Lampila from Compliance and Dave Taylor and Howard Gugel from NERC Standards, in addition to Scott Mix's expertise, and introduced Lauren Koller from NERC who will assist and help Joe Bucciero on the ready talk and document displays. He noted that the Standards Committee met earlier in December and approved the use of an informal comment period followed by a formal 45-day comment period. He asked the Team to continue to help NERC understand what is needed to get the job done.

The Chair welcomed and introduced Barry Lawson with the National Rural Electric Cooperative Association (NRECA) and current chair of NERC's Critical Infrastructure Protection Committee (CIPC) and Allen Mosher representing the American Public Power Association (APPA) and vice chair of the NERC Standards Committee**.** They reviewed the letter sent to the Team by five trade associations including NRECA, the Edison Electric Institute, the American Public Power Association, the Electric Consumers Resource Council and the Electric Power Supply Association. They offered to provide any support that the trade association could in support of the industry's self regulatory model and industry developed standards. They asked the SDT to let them know what they can do to help. The Trade Associations agreed that:

- The Industry must seek to eliminate subjectivity as much as possible from both a technical and political standpoint.
- The SDT should identify the "brightest lines you can come up with".
- Trade associations are not suggesting how to do this. The current draft has made huge steps in the right direction.

- If we don't get the CIP standards right there will be real consequences for the Industry including a potentially reduced role in the development of these standards.
- The SDT's framework for the CIP appears sound and makes intuitive sense. Develop an asset classification approach that will make sense to the industry.
- The trade associations pledge to try to get our respective members to give early, responsive and constructive comments to the SDT on its drafts.

On behalf of the SDT, the chair noted appreciation for the work and efforts of NERC and the Trade Associations in assisting the SDT in its efforts to draw up a new CIP.

John Lim then provided an overview of the work undertaken and the changes made to the CIP 002-4 draft documents between Orlando and Little Rock by a drafting group comprised of John Lim, Jackie Collett, Phil Huff and John Varnell. These included the CIP 002, the Guidance Document, the Introduction and Comment Form and the Control examples. Dave Taylor noted that Howard Gugel from NERC will help the SDT get next products up to speed and be able to work with the SDT to answer any questions regarding format.

Jackie Collett provided an overview of the Pinecone Power "walk through" exercise. The SDT broke into two small groups and engaged in a "walk through" exercise. Following the break outs, the SDT reviewed reflections on lessons learned from the walk through in terms of implications for improving or clarifying the CIP 002 draft, including:

- Clarify how to define BES sub system in requirements and/or guidance
- Determine Appendix 2 requirement in standard
- Clarify blackstart units that change: How to address this in requirements? "blackstart capable"
- In terms of generating subsystems — define "Plant" — Units, combinations.
- R1 — "Identify + Categorize"? vs. Categorize.
- Keep cyber for R3? Not in R1 — rely on applying criteria.
- How to address "combinations" in the subsystems? Start with cyber systems first?
- Appendix #2 "Must Identify" a requirement with appendix.
- Careful we do not oversimplify categorization which may result in over protection — too many shortcuts could lead to incorrect conclusions.
- Need a full assessment without requiring more work than is necessary.
- We want to be sure nothing is missed — doesn't matter how it is defined if it is covered — then can choose to make it a subsystem but are not required to
- Give entities flexibility but careful don't leave an opportunity to game system by breaking systems into parts that stay below threshold for "high"
- Clarify something in R3 — identify and categorize all BES subsystems ….. that means identify every part of cyber system that has anything to do with awareness function — is that what we meant?

Following the Walk Through, the SDT reviewed the remaining issues and agreed to work in the following Drafting Groups on Wednesday afternoon to address issues raised in the "Walk-Through" and bring back clarifications and refinements for consideration by the SDT.

- Group #1 addressed Requirement #1and reviewed and produced agreement on how to address the R1 and appendix issues that had been raised in the walk through.
- Group #2 addressed Requirements #3 reviewed and produced agreement on how to address the R3 and appendix issues that had been raised in the walk through.

At the end of the day, the SDT reviewed progress and noted the following assignments:

- Issues of reliability functions— Phil Huff noted a plan to meet for dinner and resolve these issues and bring suggestions back tomorrow first thing tomorrow.
- Break into groups for document drafting (introduction and comment form; CIP 002-4; Guidance Document; Appendices; and Sample Controls.

Chair reminded the SDT that the goal is to ensure posting for informal industry review and the SDT should expect many suggestions back from industry. She also checked with the SDT to see if there were any red flags on proposed list of FERC specific directives in 706 since it will be part of the NERC filing at the end of December. The SDT concurred with the list.

On the second day John Lim reviewed with the SDT the revised definitions of terms used in standard and the SDT thoroughly discussed and reached consensus on issues in the definitions section.

Phil Huff led the SDT through a discussion of the changes to the standards sections R1, R2, R3 and R4. The SDT polled support for a couple of propositions including:

- **R-1. —** TPO requirements call for "annual" evaluation. SDT Poll support for reinstating the term "annual" in the standard for CIP-002-4 draft for industry comment: Yes — 8, No — 10. Won't reinstate "annual" for CIP 002-4 draft.
- **R4**.— Is the senior manager the right one for this role? If not, then does this requirement do much? The members ranked acceptability of the following options (multiple votes were permitted):
  - Remove it, address it elsewhere: 10 votes
  - Keep in R2 but with fuller definition: 9 votes
  - Keep it here as is: 7 votes
  - Remove here and keep in the comment form: 1 vote

  Members then offered the following preference polling *(only one vote for one of the 3 options)*
  - Remove it, address it elsewhere: 8
  - Keep in R2 but with fuller definition: 5
  - Keep it here as is: 1
- There is consensus of the importance of the issue and inclusion of the senior manager but less clear how best to do it.

The SDT then reviewed and refined the Compliance Section, the VSLs section and the Attachment documents.

On Thursday afternoon a motion was made and seconded to approve CIP 002-4 with identified and agreed upon changes. 16 members voted in favor, 0 members opposed and 1 member abstained.

Following a break, the SDT broke into separate "document" groups to harmonize the comment form and guidance document with the adopted CIP 002-4 (e.g. the Introduction and Comment Form and the Guidance Document). At the conclusion of the small group refinements to these documents the SDT reviewed the following key issues for the future (i.e. "parking lot")

- More detail on reliability functions to make operational — address "over protection" issues — map Requirement Function to thresholds
- "Controls" — "secure" defined — address in 003-009
- "BES Subsystem Impacts" define going forward (high/medium/low)
- 1.7, 1.11 & 1.15 — control center function issues)

The SDT Chair and Vice Chairs reviewed with the Team the work plan going forward including the need to make progress on the security controls (CIP 003-009) at the SDT's January meeting in Tucker, Georgia. The chair thanked Phil Huff for hosting the meeting and providing excellent food and facilities.

The SDT adjourned at 3:30 p.m. on December 16, 2009.

I. AGENDA REVIEW AND UPDATES

A. Agenda Review

On Tuesday morning, the Chair, Jeri Domingo-Brewer welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). On the second day the SDT approved without objection the meeting summary for the November meeting in Orlando.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

Following lunch on Thursday, The SDT congratulated and applauded Jeri Domingo Brewer on her leadership role in chairing the Team for the past 15 months and Phil Huff and John Lim presented her a plaque on behalf of the SDT in recognition of her leadership by example. The Chair thanked the members for the acknowledgement and encouraged them to build on their work to date to get the job done by the end of 2010.

B. Review of NERC and Trade Association Actions in Support of CSO 706 SDT

Gerry Adamski, NERC Director of Standards, reviewed with the Team the NERC efforts to provide support for the team. He noted his admiration and appreciation for SDT commitment and dedication to this challenging task and that he believed it was Evident that all members are making a difference. He expressed his hope that the

Team could continue to move forward expeditiously with the task in the coming year. He offered that the new President of NERC has indicated that this is one of its most critical projects in the coming year.

He suggested that the Team will be challenged in addressing and finalizing CIP 002-4 while simultaneously developing CIP 003-009 addressing a significant portion of Order 706 directives. He reported that the Recirculation Ballot for Version 3 received 85.6% approval and that the NERC Board of Trustees was set on December 16 to approve version 3 and send on to FERC.

He recounted the "whirlwind of activities" over the past year and half and the call to action with respect to delivery of critical infrastructure standards. NERC had projected a two year time frame for the project which will be realized if the SDT can complete its work by December 2010. The SDT must demonstrate that CIP 002 Version 4 and the controls in CIP 003-009 will improve the current critical asset identification process and this has both technical requirements and political overtones.

Since the SDT November meeting in Orlando, NERC has identified a critical path to accomplish two things: a quality CIP 002-4 revision by June 2010 and the related set of security controls/requirements by the end of 2010. NERC has been working on how to put an optimal framework in place to allow the delivery on the expectations for the SDT. He noted a couple offline meetings with industry leaders and the SDT leadership have led to identifying NERC actions that can assist the Team. NERC met with trade associations collectively on November 30, 2009 to solicit their support and to build a mutual understanding of the technical and political complexity involved in the updating the CIP.

The Trade Associations are hoping the new CIP will provide clearer delineations in categorizing critical assets, i.e. "more bright line" determinations. The hope for is for producing a standard that is more objective than subjective and that provides an entity the understanding of which category their assets fall into.

In support of the SDT's meeting process, NERC has secured additional support with Roger Lampila from Compliance and Dave Taylor and Howard Gugel from NERC Standards, in addition to Scott Mix's expertise. Mr. Adamski noted that he has collected internal NERC comments on the current CIP 002-4 draft and will provide feedback to the SDT later at this meeting. He also introduced Lauren Koller from NERC who will assist and help Joe Bucciero on the ready talk and document displays.

The Standards Committee met earlier in December and approved the use of an informal comment period followed by a formal 45 day comment period. While comments are underway, NERC will be assembling the ballot pool.

NERC understands the new CIP will represent a sea-change and paradigm shift for the Industry and will require a comprehensive communication campaign. NERC will develop more formalized campaign. This was started in early December, 2009 by presenting to and working with the Operations and Planning Committee and CIPSE at their meetings. NERC will be holding a webinar- in early February 2010 with industry and will need the Team's help on this. In terms of the CIP 003-009, security controls framework for development, NERC is hoping to have a better sense following the January SDT meeting in Tucker. NERC wants to give adequate support so the SDT can get this job done with a quality product. He asked the Team to continue to help NERC understand what is needed and NERC will seek to put tools in your tool box to help you.

The Chair welcomed and introduced Barry Lawson with the National Rural Electric Cooperative Association (NRECA) and current chair of NERC's Critical Infrastructure Protection Committee (CIPC). He noted the five trade associations that signed the letter to the SDT including NRECA, the Edison Electric Institute, the American Public Power Association, the Electric Consumers Resource Council and

the Electric Power Supply Association. He addressed the SDT not as CIPCE chair but with his NRECA trade association hat. He made remarks to Operations Committee, Planning Committee and to CIPSE last week. He offered to provide any support that the trade association could in support of the industry's self regulatory model and industry developed standards. He noted that the work of SDT is being closely watched by FERC and Congress and that it is getting more attention than a normal SDT usually gets.

NERC has reached out to trade groups to help the SDT. He asked the SDT to let them know what they can do to help. He believes the Industry has to demonstrate that we can develop the CIP on expedited basis resulting in a clear and objective way that is easily auditable for both entities and the auditor. He offered the following points:

- We must seek to eliminate subjectivity as much as possible from both a technical and political standpoint.
- The SDT should identify the "brightest lines you can come up with".
- Trade associations are not suggesting how to do this. The current draft has made huge steps in the right direction.
- If we don't get the CIP standards right there will be real consequences for the Industry including a potentially reduced role in the development of these standards. More is at stake than simply a ballot that doesn't pass with sufficient Industry support. Draft legislation is already out there that points in this direction and we have to show that the Industry can get the job done with our self-regulatory model which may not always the prettiest, but it promises to produce the best results for reliability and security.
- Please continue your efforts- this team has put much time and effort into this so far. Getting CIP 002 right is critically important. Bold steps are needed.

The Chair then welcomed and introduced Allen Mosher representing the American Public Power Association (APPA)**.** Mr. Mosher noted he was wearing two hats in addressing the SDT: one as a national trade association representative; and another as vice chair of the NERC Standards Committee. He recounted the NERC Standards Committee's review and discussion regarding the SDT process modifications for an expedited schedule and noted they came to consensus in support of this approach because of the shared understanding that the Industry needs to move expeditiously in revising the CIP. Hopefully we will get to consensus with industry on the new CIP and the industry is confident that you are listening to their concerns and you have a plan of action to address them. The joint Trade Association letter demonstrates this. He then offered the following points:

- The SDT's framework for the CIP appears sound and makes intuitive sense. Develop asset classification that will make sense to the industry.
- The Standards Committee stands ready to help the SDT in this important effort.
- In terms of the trade associations, we pledge to try to get our respective members to give early, responsive and constructive comments to the SDT on its drafts. We can also help to get subject matter experts focused on this project. Both in January for reviewing the CIP 002-4 and further on in terms of security controls (CIP 003-009)
- Need to know up front of problems. Will motivate members to get those to the SDT as early as possible. Let's get the right solution for the CIP suite of standards.

On behalf of the SDT, the chair noted appreciation for the work and efforts of NERC and the Trade Associations in assisting the SDT in its efforts to draw up a new CIP.

SDT Member Comments:

- How much preparation will it take for industry to understand this new approach? Is leadership preparing the industry for added expenses these changes will require?
- Mr. Lawson responded that he was reaching out to electric cooperative leaders- explaining the reality of the situation, i.e. that more and stricter standards will require greater costs and investments. While they are not offering the SDT a blank check, they do want to see the connection with costs and increasing effectiveness. Will reach out to NREECA members to provide them with context about draft and encourage them submit comments (both pro and con) early.
- Mr. Mosher noted that the APPA envisions similar efforts with its members. There will undoubtedly be push back on increasing costs as budgets everywhere are tight. However, capital expenditures are needed as the status quo is not sustainable. Now it is not whether, rather what changes are needed.
- Concerned within industry- undercurrent of members- any increase in compliance risk no matter how good it may be for security is a tough issue. Concerned the industry may vote against a new CIP because of cost implications. We need an outreach effort to National Public Utilities Commissions- by NERC. Mitigating security risks should also minimize "compliance risks" This will cost more money.
- As a result of recent NERC spot checks, the industry and the SDT are gaining a new appreciation for importance of words and their interpretation in the standards.
- Concerned industry will throw this back on us.
- Mr. Mosher noted that Gerry Cauley new CEO for NERC has championed an ad hoc committee on results-based standards and may be interested in developing a new format for how standards are developed and presented. Moving away from the compliance focus on the "right document" to real security issues. The test should be does the effort accomplish the underlying goal and intent of requirements. That should suffice.
- Probably not bringing the results-based effort into this project. This will be an ongoing effort. It will be a cultural change in NERC and the Regions that this is sensible way to process.
- State commissions are important outreach audience for NERC.
- The Trade Associations will do their best to provide context and the consequences as well as the big picture to their members. Each entity will ultimately decide where they are on this. We can't tell them how to vote, but we can provide information to inform their vote.
- Emphasis on getting it right this time? How will you know if you met this goal? How will you convince the skeptic in DC if you meet this?
- What about trials or pilots with entities? Is this still an idea in play? Having some since you've hit target.
- No exact way to know if you have it right. If you address some of these concepts- more objective, clear, deterministic and auditable, that will get us there.
- A substantial list of "wrongs" can help focus on the right thing to do.

- Concern that Industry won't accept the CIP as proposed. The industry needs to understand the consequences. We will have only one shot at this. More true now than before.
- Mr. Adamski noted that NERC President, Gerry Cauley has said this is among the top 3 things NERC needs to do.
- Spot check experiences suggest that there may be an unreasonable level of detail applied to enforcing current standards.
- Approve an increase in scope while compliance level of detail currently applied.
- We have seen an undue level of detail in policy documentation for CIP 003-R1- policy must support the requirements. Regional auditor went through every R looking for that. "All" does not appear in the requirement. Auditor used that tact.
- CIP 002- R3- critical cyber assets- e.g. given assets used in access control.
- CIP 004 issue- haven't provided in format the auditor wanted to see. Spreadsheet wasn't completed. Had all the info. This is an e.g. of audit and compliance out of control.
- Consider challenging finding of the audit? We have that process. One way to bring to attention of regional entity, NERC and FERC. Maybe indicate a problem with a standard.
- Can change to focus of the audit and how performed through the Version 4. As rest of standards become auditably compliant. Been on 14 CIP spot checks. In some suggested entities should do a better job of correlating.
- Trade association could help show that industry has valuable assets and they are trying to protect them.
- Trade associations are working together. 12 associations are marching together, educating various committees, various senators. Meeting weekly in Washington.
- Our focus should be on drafting standards- making them better- not on managing compliance risk. Focus on where we can make standards as clear as possible.
- Thanks for the help given. And support provided.

II. CIP 002-4 STRAWMAN DRAFT DOCUMENTS

A. Overview of CIP 002-4 Strawman Draft Documents

John Lim provided an overview of the work undertaken and the changes made to the CIP 002-4 draft documents between Orlando and Little Rock by a drafting group comprised of John Lim, Jackie Collett, Phil Huff and John Varnell. These included the CIP 002, the Guidance Document, the Introduction and Comment Form and the Control examples.

Dave Taylor noted that Howard Gugel from NERC will help the SDT get next products up to speed and be able to work with the SDT to answer any questions regarding format.

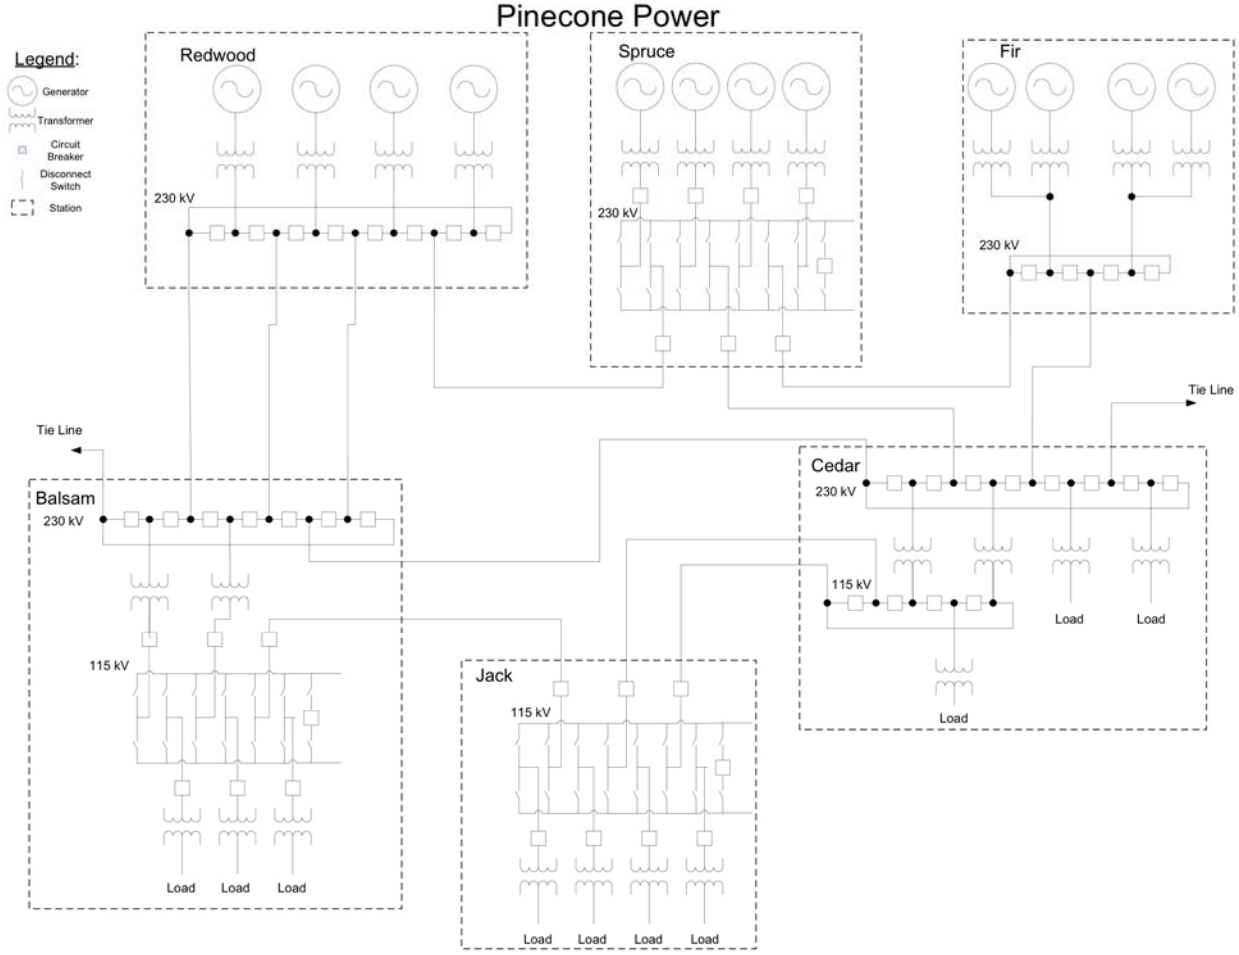
John summarized the following changes:

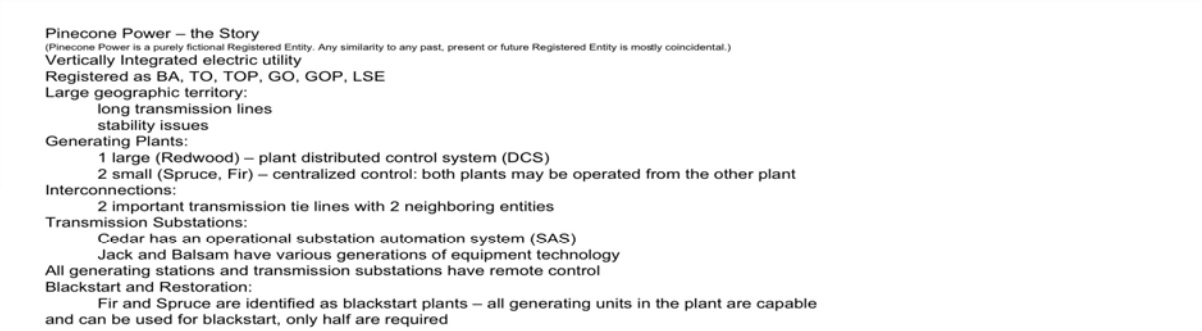
- A BES subsystem definition-
- Changed order of appendices. Harmonized- consistent use of terms.
- The list of the VSLs updated and some were put back in.

- The Guidance document has been refined and simplified with a 5-step process.
- We continue to need guidance in first two steps in categorizing BES subsystems.
- Agreed we will post as an "appendix" if ready.
- Highlights requirement. Tells the path to the development of the standards.
- Keith will be refining and cleaning up some examples for security controls as a stand alone document.

B. Walk-Through of CIP 002-4 Strawman Scenario

Jackie Collett provided an overview of the Pinecone Power "walk through" exercise.





Pinecone Power – the Story
(Pinecone Power is a purely fictional Registered Entity. Any similarity to any past, present or future Registered Entity is mostly coincidental.)
Vertically Integrated electric utility
Registered as BA, TO, TOP, GO, GOP, LSE
Large geographic territory:
long transmission lines
stability issues
Generating Plants:
1 large (Redwood) – plant distributed control system (DCS)
2 small (Spruce, Fir) – centralized control: both plants may be operated from the other plant
Interconnections:
2 important transmission tie lines with 2 neighboring entities
Transmission Substations:
Cedar has an operational substation automation system (SAS)
Jack and Balsam have various generations of equipment technology
All generating stations and transmission substations have remote control
Blackstart and Restoration:
Fir and Spruce are identified as blackstart plants – all generating units in the plant are capable and can be used for blackstart, only half are required

The SDT broke into two small groups and engaged in a "walk through" exercise that has been prepared by Jackie Collett, Dave Revill and other members. Following the breakouts, the SDT reviewed reflections on lessons learned from the walk through in terms of implications for improving or clarifying the CIP 002 draft.

1. **Possible Refinements to CIP-002-4**

- BES sub system definition - limitations <-> Reliability
- Clarify how to define BES sub system in requirements and/or guidance
- Determine Appendix 2 requirement in standard
- Clarify blackstart units that change - How to address this in requirements? "blackstart capable"
- Generating subsystems — define "Plant" — Units, combinations
- R1 — "Identify + Categorize"? vs. Categorize
- Keep cyber for R3? Not in R1 — rely on applying criteria
- How to address "combinations" in the subsystems? Start with cyber systems first?
- Appendix #2 "Must Identify" a requirement with appendix

2. **Key Issues — "Parking Lot" for Future Review**

- More detail on reliability functions to make operational — Address "Over Protection" issues — Map reliability functions to thresholds
- More specificity in reliability functions to allow entity to move description down in their operations — a cyber system may impact reliability but not the threshold — example a system

addressing operation awareness — make sure systems functions appropriately mapped to thresholds.

3. SDT Discussion Points from "Walk-Through"

- Did you identify the 7 generation subsystems? Some only came up with 6 but got to the right point. Will missing an interim step result in a severe impact?
- Goal is to categorize the cyber subsystems
- Careful we do not oversimplify categorization which may result in over protection — too many shortcuts could lead to incorrect conclusions
- Here is a cyber system — how many units does it impact - Look at megawatt total to set threshold of high-medium-low
- Think looking at units is the wrong path
- Break down to level of criteria you are evaluating — aggregation of megawatts at subsystem level— blackstarts would be at the unit level.
- Need a full assessment without requiring more work than is necessary
- Using generation subsystem across the board in the criteria — instead we may want to spell out generation subsystem or blackstart unit to make it clearer on to apply the criteria
- If pin down what we are talking about then replacing undefined subsystem with other terms that are undefined — new set of work to properly define and make sure each term properly used.
- We want to be sure nothing is missed — doesn't matter how it is defined if it is covered — then can choose to make it a subsystem but are not required to
- Give entities flexibility but careful don't leave an opportunity to game system by breaking systems into parts that stay below threshold for "high"
- No individual generator can determine full impact on system — that may require RC to determine but they will not want to do that task
- Clarify something in R3 — identify and categorize all BES subsystems ….. that means identify every part of cyber system that has anything to do with awareness function — is that what we meant?
- Every cyber system that performs that function should fall into one of the three categories, each with its own threshold
- How do you start — where do you get the list? Situational awareness is the universe of all cyber systems
- My take, we are saying you have to do the functions — which are BES cyber systems — every BES cyber system is at least a low based on the words we use here
- Maybe by extending the logic, you get around identifying subsystems — any system that can trigger specific levels
- Instead of starting with every cyber system — identify every cyber system that supports this BES subsystem

4. SDT Discussion of Next Steps in Drafting CIP 002-4

- Next steps in drafting?
- Build into R3 concept discussed in terms of the function of the BES subsystem
- Unclear where discussion of generation subsystem ended up — did not discuss transmission subsystems
- In criteria we can try to be more specific
- We may need to have very formal definitions we can put into the NERC glossary
- What is missing is what is the objective — should we try to introduce each requirement with the objective to help focus comments on what we are trying to do
- Can put that into the purpose statement to help clarify intent — that puts it into the standard — NERC has used those statements in the past to help in interpreting intent
- For the comment period, can we use statements as annotations to introduce a requirement?
- Scott read Maureen's revised purpose statement
- Members thought it sounded like she is trying to move to performance based standards, but this group may not be ready to do that given the limited time
- Adding more material may just draw comments on statements that will not be included in the end (relates to introducing requirement with intent comment)
- Suggesting a one-sentence introduction to clarify the intent and context of each requirement
- Could something be added to the comment form to set up the questions?
- Need more drafting input on appendix 2 — review the wording of the initial paragraph to avoid requirement language in the appendix

C. Remaining Issues

1. Small Group Work on Requirements # 1 and # 3.

Following the Walk Through, the SDT reviewed the remaining issues and agreed to work in the following Drafting Groups on Wednesday afternoon to address issues raised in the "Walk-Through" and bring back clarifications and refinements for consideration by the SDT.

- Group #1 Requirement #1 (*Jim Brenton, Jackie Collett, Keith Stouffer, Doug Johnson, Jeri Domingo Brewer, John Lim)* which reviewed and produced agreement on how to address the R1 and appendix issues raised in the walk through.
- Group #2: Requirement #3 drafting group (*Phil Huff, Jay Cribb, Frank Kim, Jon Stanford, Gerry Freese & Jeri Domingo Brewer)* How will this be understood- i.e. smaller unit is more secure than securing with a larger quantity. We are not trying to avoid protection; rather we are trying to determine how it affects the BES. Collectively assets may have a higher impact than one large asset.

At the end of the day, the SDT reviewed progress and noted the following assignments:

- Issues of reliability functions— Phil Huff noted a plan to meet for dinner and resolve these issues and bring suggestions back tomorrow first thing tomorrow.
- Break into groups for document drafting (introduction and comment form; CIP 002-4; Guidance Document; Appendices; and Sample Controls.

Chair reminded the SDT that the goal is to ensure posting for informal industry review and the SDT should expect many suggestions back from industry. She also checked with the SDT to see if there were any red flags on proposed list of FERC specific directives in 706 since it will be part of the NERC filing at the end of December. The SDT concurred with the list.

2. Definition of Terms

On the second day John Lim reviewed with the SDT the revised definitions of terms used in standard noting:

- #3 Bulk Electric System spelled out.
- generation subsystem turned from a bulleted list into a paragraph.
- transmission subsystem defined more specifically
- control system, second bullet added the qualifier "for the support of real-time operations"
- 7, 8 & 9 — changed to "BES" to be consistent — 9 adds Low BES impact

SDT Discussion of Proposed Changes to Definitions

- All the other bulleted lists turned into paragraphs — Is #9 the only bulleted list?
- #8 — does "medium" capture everything?
- High, medium and low are not intended to be used to capture categories but criteria — pulled from risk factors — be sure not to use definitions to apply categorization — does defining a term here make it apply in the standards?
- If leave it in then indicate how they are to assess the high, medium and low.
- Do we want them here in definitions versus in the attachment?
- Let the attachment determine rather than define them?
- Inclined to take it out of the definitions — this issue is even fluid at NERC — leave it in the attachment.
- Define here and reference the attachment? If put in to the standard, once adopted it goes into the glossary.
- Bring definition up to a higher level with the detail in the attachment?
- Is there an inconsistency between this and the mapping? What is wrong with this definition? Conflicts with the mapping, according to the definition here everything is high or medium, and nothing is low — everything affects the BES.
- Cannot read the bullets alone — have to read in context of lead-in language.
- All of them affect the system — the question is only how much they affect the system.

- Define BES impact — then categorize that with high, medium and low as degrees for measuring the impact.
- Suggestion changing "direct" to "adversely" in each bullet.
- Either simplify this or do not make missing one a high VSL — too complex to make it a high VSL if you miss one.
- High VSL is related to the importance of missing one rather than the complexity of the standard.
- Make sure we have the detail in each thing we are doing — make it too simple then people will complain it is ambiguous.
- Last sentence of Generation subsystem — confusing with a transmission issue — consider adding "... shared generation element …"
- What is a "generation element" — both generation and element are separate defined items — is this just the generator?
- Non-capital "generation" simply describes "Element" — the latter is a defined item, the former is not.
- Elements at a generation yard, etc. — clarify that we are not talking about something that doesn't spin.
- Is the last "or…" clause intended to capture something not already captured in the cyber system definition?
- Jackie Collett's revised definitions of Generation and Transmission Subsystems — review — it is a little wordy but it is more specific — included transmission substations in the later definition
- "Combinations of generation systems"? — not clear what that covers — could be more open than needed — need a qualifier for "combinations"
- Strike the last section of the first sentence — add "or" — should read "Generation plants or individual generation units … a transmission system."
- I don't understand the second sentence — how would it be applied?
- Combine the last two sections into a final separate sentence?
- Does generation plant mean everything inside the fence? Thought we had dropped that?
- Put in as part of the walk through review yesterday — the "or" gives the entity a choice
- Are elements in the second sentence already covered in the first? Or do we need the first sentence if the elements are covered in the second?
- In terms of the definition, is it redundant? Start with the second sentence?
- Concerned we may miss something if we take the first sentence out — would rather be redundant than miss something
- Transmission definition is closely parallel with generation — same issues — consider issues for both, move on for now and come back to this one.

3. Review of Changes to Standards Section

Phil Huff led the SDT through a discussion of the changes to the standards section.

- **R-1.** Purpose statement — shorter, more focused
- Identifying cyber security framework or the devices that require security?
- Consider just using the last paragraph of the previous definition version
- Up in the title — strike "identification and" — just categorizing, not identifying — remove "identification" in the purpose too
- Add "functions critical to the reliable operation" to the Purpose to be consistent
- Strike first set of words and start with "categorization" to make it a purpose statement rather than a requirement statement — start with "To categorize and document the BES …"
- #3 Applicability
- #4 Physical Facilities

  Insert "and are not under NRC cyber security regulations" at the end?
- Suggest not adding yet due to ongoing discussion of jurisdiction — balance of plant is still under NERC — following comment period the jurisdiction issue may be clarified — may get comments form nuclear guys.
- R1- Drop "serves" in first sentence "…BES subsystems provides a measure …"
- Add "...potential impact that its …"
- "Approved engineering evaluation" required? (in middle sentence) Method has to be approved but not every yearly evaluation is approved.
- Second sentence is long and wordy tighten up, along with the third sentence — if we can get agreement on the elements.
- Fiscal responsibility is with the owner — some facilities have multiple owners (by percentages) asking all owners to make the assessment?
- Who signs compliance? Operator not always the one who can ensure compliance — some plants have a contract operator — need to include "operators and owners" Owners should "ensure" — put them on the hook to make it happen.
- Reduce wording by striking "categorize all BES subsystems they own: and own …"
- The responsibility issue is a registration issue.
- Joint ownership issue is not new — how do we do this in the other standards? What is the language we used? We used to have a definition of "responsible entity" but stripped it out — the idea is be clearer about responsibility — spell out the entities in each requirement — some requirements may not be mapped to entities (?) — may have to go back through and clarify responsibilities
- R1 final sentence: "could affect" is too mushy, too uncertain
- Some want to put the "annual" requirement back in and some who want to take it out.

- TPO requirements call for "annual" evaluation. Need to make clear what we mean by "annual." The issue of "annual" appears in multiple places and on multiple projects. Need to be sure it is applied as part of review process — may want to wait for comments.
- **SDT Poll support for reinstating "annual" term in the standard for draft for comment: Yes — 8, No — 10. Won't reinstate for CIP 002-4 draft.**
- **R2-** Notification from generation to transmission side of the house a "high"?
- How does generation subsystem owner learn he has a high or medium? By definition or someone (reliability coordinator) tells him?
- Needs to be a clearer delineation of notice, and should be a "high" responsibility
- The owner has to determine through criteria, not the reliability coordinator who do not have any special ability in this area
- Look at attachment 1 — there are instances when owner operator will be notified — it is not just one or the other
- This is one of the places that industry has a problem — not enough of a bright line — owner/operator may not have enough data to assess
- "adjacent"? Replace with "connected to"? And specify the within 30 days is from R4?
- Adjacent is physical proximity — connected is the better word
- Add "…within 30 days of the approval date of the categorization …"
- Change "connected" to "directly interconnected"
- Why include "Senior Manager"? Addressed FERC directive. Need to look at the order — careful not to do more than is requested in the order.
- Is there a definition of "Senior Manager"?
- Why thirty days? Seems lengthy and arbitrary
- R4 already has the language of who approves — drop it here
- Is R4 necessary if we are dropping Senior Manager? Address when review that section.
- Suggest "within 30 days of the categorization" - 30 days is not too long to get ducks in a row.
- Violation risk factor should be "high".
- In R2 can we make it a "secured notification"? Define "secured"?
- Back to R1 to review revisions
- Do we have to list them all to add clarity to the definition? Add load serving entity and reliability coordinator.
- Need to go back and see what the functional model says — or post all and ask which entities do not belong — alternatively list all entities in 4.1 except NERC and Regional Entities
- Requiring reliability coordinator to assess others systems — goes back to ownership — reliability coordinator has no special skills to assess cyber security systems
- Can we change to cover own and operate?

- Is the control center considered a subsystem? If yes, as part of the BES subsystem, it is not clear hear where it is covered
- Put into the definition of control center that it may be a part of the BES subsystem
- In definition of BES Subsystem include "BES Facilities (i.e., Generation Subsystem, Transmission Subsystem, and Control Center)…"
- **R3**. Phil Huff reviewed revisions with the SDT
- 2nd sentence — do we need the final clause?
- Is our intent to identify or to categorize? Intentionally pulled "identify" out of R1 — are we being consistent?
- Remove "as those …" replace with "associated with" — also "Responsible Entities shall categorize" and put "… categorized in R1..."
- Planning function is both and internal and external — copy "… as part of the planning, including coordination with neighbors," from the R1 revision and use here too.
- Not requiring notification of our neighbors?
- Delete the final sentence? Not part of the security but better as part of control.
- Are we overloading the meaning of the term "planning" — we used it in sentence above with the normal NERC definition.
- Beginning of second sentence — Functional Entities and again in third and fourth sentences rather than Responsible Entities —
- Functional doesn't work here — need to go back to responsible.
- Need to capture changes in BES subsystems as well as BES cyber subsystems
- **R4**. Is the senior manager the right one for this role? If not, then does this requirement do much? Support removing.
- If remove, are we removing responsibility for person knowing what was happening.
- Despite the language in the FERC order paragraph 294, I think FERC would still want senior manager here explicitly because we have changed the process since their original request — I suggest leaving R4 in.
- Change "shall approve by written and dated signature" to match order "shall annually review and approve"
- The point was to establish a fiduciary duty to take responsibility and make a knowing effort to establish what was and what was not covered — now we have said everything is covered, but at three different levels.
- Approving additions or improvements to the system or annually reviewing the whole system?
- Ask in the comment form whether we need this requirement?
- Here we have prescribed the methodology — we responded to the order by changing the methodology.
- If we put it out as a question we need to get a response from FERC too

- FERC asked us to address regardless of the industry comment
- Leave it for industry comment and pose question for clarification with FERC
- Does senior manager necessary mean corporate office?
- This section is about categorizing assets, not putting in weak controls better addressed in 003-009
- My advice from other standards — if remove, better be sure you have a clear rational and suggestion of how it will be dealt with
- We need to be rethinking here and my concern is the senior manager shall is a weak control in the wrong place
- Intent of pulling senior manager into the process is to give it the attention it needs — establishes accountability as to what needs to be protected to big with — controls will be addressed next year
- This says the right thing, maybe in the wrong place, but pulling it out of here now will result in perception we are not addressing the issue
- Violent agreement on importance — question is where? It magically appears in R2 as a capitalized item without definition in R1.
- Three thoughts: any of these acceptable? (rather than one or the other).

  Members offer the following responses (multiple votes were permitted):

  - Remove it, address it elsewhere: 10 votes
  - Keep in R2 but with fuller definition: 9 votes
  - Keep it here as is: 7 votes
  - Remove here and keep in the comment form: 1 vote

  Members then offered the following preference polling *(only one vote of one of 3 options)*

  - **Remove it, address it elsewhere: 8**
  - **Keep in R2 but with fuller definition: 5**
  - **Keep it here as is: 1**
- There is consensus of the importance of the issue and inclusion of the senior manager but less clear how best to do it.
- Since removing it here now, need to clarify why
- Back up in R3- Strike "responsible entity shall" and rest of the last sentence. Still needs a tie back to R1 —

4. Review of the Revised Definitions for BES, Generation and Transmission Subsystems

- Still questions about discussions by nuclear industry and the impact on these definitions
- Definitions 7, 8 & 9 — High, Medium & Low
- Consider reorganizing the criteria based on H-M-L and by generation/transmission
- Remove "details provided in appendix 1" — put in above #7 — re-label as "attachment"

- Don't put that language in the definitions — it will be lost once adopted and moved into the glossary — each will stand alone in the glossary
- Not meant to be a part of the definition but rather to help clarify and explain for purposes of the comment period
- May need to consider for the next round given our time constraint today
- This doesn't include malicious use of the equipment, not just lost
- Doesn't matter if loss is by natural or malicious means — source of loss doesn't matter
- Perhaps include "misused"
- Need a more clear cut, declarative sentence
- These terms will be used independent of CIP 002
- Rewrite to be declarative: "BES Subsystems, that if destroyed….would have a severe….change #8 and #9 accordingly
- Concerned about "destroyed", etc. — concerned about availability — remove adjectives — doesn't matter how they are rendered unavailable — simply substitute "rendered unavailable"
- It is more than just availability — integrity matters too in cyber security
- Just looking at BES, not cyber security yet
- Need "misuse" — adds more than just availability — "that if misused, degraded or otherwise rendered unavailable…"
- Need to be describing the impact to the BES
- For now go with suggestion to go with previously adopted language — put the issue into the parking lot for future work

5. Compliance

- No changes were made to this section.

6. VSLs

- #1
- Made consist or conformed with discussions and changes made earlier today
- Still concerned with high impact given a severe VSL for not having categorized or mis-categorized
- Whole point in attachment and drawing bright lines is to limit auditor opinions on categorization
- Concern is with definition of subsystems
- We are only left with categorization — only have to categorize rather than identify subsystems
- In severe VSL — kill the phrase after "or" and put a period after "categorized" in all four levels?
- Just eliminate "identify" — retain the rest
- Should say has failed to start the process

- If you missed any single one by saying there are six subsystems and someone else says there are seven — am I then in severe VSL?
- Alternative: "The responsible entity has not categorized any BES subsystems it owns". Support for this language — Yes/13, No/1
- **#2**
- Too wordy — repeat high and medium impact at the beginnings and ends — could strike first half of each.
- Only two ways to miss — not notify or notify late
- **#4** — already removed

7. Attachments

- 1.3 — ok
- 1.8 — ok
- 1.15- Interchange coordinator, transmission service provider, load service provider, selling entity, etc. all have real time function responsibilities — none of them will be caught by 1.15?
- Can we expand 1.7, 1.10 or 1.11 to cover that omission — put control center functions into those three

8. Other Changes?

- What did we do with the requirement for VSL 2? Everyone agreed with concept just need appropriate language

D. Motion to approve CIP 002-4 with identified and agreed upon changes
Gerry Freese moved, John Varnell seconded

All in favor: **16** *(Frank Kim, Doug Johnson, Sharon Edwards, Gerry Freese, Jay Cribb, Keith Stouffer, Jon Stanford, Jim Brenton, John Lim, Jeri Domingo-Brewer, Phil Huff, Joe Doetzl, Rob Antonishen, John Varnell, Jackie Collett and Kevin Sherlin)*
Opposed: **0**
Abstain: **1** (Dave Norton)

E. Harmonizing the Comment Form and Guidance Documents

Following a break, the SDT broke into separate "document" groups to harmonize the comment form and guidance document with the adopted CIP 002-4:

- **Introduction and Comment Form**: (Frank Kim, Jay Cribb, Jon Stanford, Jim Brenton, Jeri Domingo-Brewer, John Lim, and Keith Stouffer, Jackie Collett, Dave Norton, John Varnell and Rob Antonishen)
- **Guidance Document**: (Phil Huff, Gerry Freese and Doug Johnson).

At the conclusion of the small group refinements to these documents the SDT reviewed the following key issues for the future (i.e. "parking lot")

- More detail on reliability functions to make operational — address "over protection" issues — map Requirement Function to thresholds
- "Controls" — "secure" defined — address in 003-009
- "BES Subsystem Impacts" define going forward (high/medium/low)
- 1.7, 1.11 & 1.15 — control center function issues)

IV. NEXT STEPS

The SDT Chair and Vice Chairs reviewed with the Team the work plan going forward including the need to make progress on the security controls (CIP 003-009) at the SDT's January meeting in Tucker, Georgia. The chair thanked Phil Huff for hosting the meeting and providing excellent food and facilities.

The SDT adjourned at 3:30 p.m. on December 16, 2009.

Appendix # 1— Meeting Agenda

NOTE:

1. Agenda Times May be Adjusted as Needed during the Meeting
2. Document Drafting Group Meetings May Not Have Access to Telephones and Ready-Talk

Proposed Meeting Objectives and Outcomes

- Receive an overview the CIP 002-4 document drafting progress
- Conduct a walk-through of the CIP 002-4 and identify lessons learned and any changes needed in the document(s).
- Review CIP 002-4 Key Issues and Provide Guidance to Document Drafting Groups
- Convene CIP 002-4 Document Drafting Groups
- Review and refine Document Drafting Group products
- Compile, review and refine the draft CIP 002-4 and related documents
- Adopt the CIP-002-4 Documents for Posting
- Review CSO 706 SDT leadership changes
- Review the 2010 Schedule and agree on next steps and assignments

Tuesday	**December 15, 2009**
8:00 a.m.	Welcome and Opening Remarks- *Jeri Domingo Brewer, Phil Huff & John Lim* Roll Call; NERC Antitrust Compliance Guidelines Facilitator review and SDT acceptance of November 16-19 Orlando SDT meeting summary
8:15	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
8:20	Review of SDT 706 Work plan- December- June, 2009- *Jeri Domingo Brewer*
8:50	Overview of CIP 002-4 Strawman Draft Documents, Format and Key Remaining Issues and Challenges- *John Lim et al.*
9:15	Walk Through of CIP 002-4 Strawman Scenario-*Jackie Collett, Dave Revill et al.*
10:30	*Break*
10:45	Reflections and Lessons Learned from Walk Through and Implications for the Draft
11:15	Run-through and Flag Key Remaining Issues in CIP Version 4 Strawman Documents
12:15	*Lunch*
12:45	Review of Remaining Issues and Proposal for Drafting Groups
1:00	Drafting Group Meetings
4:00	Drafting Group Reports and Identification of any Outstanding Issues and Drafting Assignments
5:30	*Recess*

Wednesday	**December 16, 2009**
8:00	Welcome and Agenda Review- *Jeri Domingo-Brewer, Phil Huff & John Lim*
8:10	Update on Status of Version 3 CIP—*Scott Mix*
8:15	Update on Technical Feasibility Exception (TFE) NERC Rules of Procedure —*Scott Mix*
8:20	Update on VSLs/VRFs- *Scott Mix*
8:25	Update on other related cyber security initiatives- *SDT Members*
8:30	Reconvene SDT CIP 002-4 Document Drafting Groups *(as needed)*

10:30	Break
10:45	Final Document Review and Consensus Testing on Resolution Key Remaining Issues
12:00	*Working Lunch (compilation of refined CIP 002 documents)*
12:45	Review of CSO 706 SDT Leadership Changes
1:00	Final Document Review and Consensus Testing on Resolution Key Remaining Issues
3:00	*Break*
3:15	Final Document Review and Motion to Adopt as Refined for Industry Posting
4:30	Review and Agree on CIP 002-4 Next Steps and January- June Work plan and Schedule • Meeting Evaluation
5:00	*Adjourn*

Appendix # 2 Attendees List

Attending in Person — SDT Members and Staff

1. Jeri Domingo-Brewer, Chair	U.S. Bureau of Reclamation
2. Jim Brenton	ERCOT
3. Jay S. Cribb	Information Security Analyst, Southern Company Services
4. Sharon Edwards	Duke Energy
5. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
6. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
7. Doug Johnson	Exelon Corporation — Commonwealth Edison
8. Frank Kim	Ontario Hydro
9. Rich Kinas	Orlando Utilities Commission (Wed)
10. John Lim, Vice Chair	CISSP, Department Manager, Consolidated Edison Co. NY
11. Jonathan Stanford	Bonneville Power Administration
12.Keith Stouffer	National Institute of Standards & Technology
Roger Lampila	NERC
Scott Mix	NERC
Dave Taylor	NERC
Howard Gugel	NERC
Lauren Koller	
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Hal Beardal	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center
Gerry Adamski	NERC (Wed.)

SDT Members Attending via Ready Talk and Phone

13. Rob Antonishen	Ontario Power Generation (Thurs)
14. Jackie Collett	Manitoba Hydro (Wed/Thurs)
15. Joe Doetzl	Manager, Information Security, Kansas City Pwr. & Light Co. (Thurs.)
16. Rich Kinas	Orlando Utilities Commission (Wed.)
17. David Norton	Entergy (Wed. Thurs)
18. Kevin Sherlin	Sacramento Municipal Utility District (Wed. Thurs.)
19. John D. Varnell	Technology Director, Tenaska Power Services Co. (Wed. Thurs)

SDT Members Unable to Attend

Christopher A. Peters	ICF International
Scott Rosenberger	Luminant Energy
David S. Revill	Georgia Transmission Corporation
William Winters	Arizona Public Service, Inc. (Mon., Tues, Thurs)

Others Attending in Person

Alan Mosher	APPA
Barry Lawson	NRECA

Others Attending via WebEx and Phone

Rob Hardiman	Southern Company Transmission
Joseph Baxter	AECI
Justin Kelly	FERC
Justin Kelly	FERC
Michael Toecker	Burns and MacDonald Engineering
Bill Glynn	Westar Energy
Sam Merrell	Cert
Rob Wotherspoon	Orlando Utility Commission
Michael Fischette	LBWL
Laurel Moll	Orlando Utility Commission

Appendix # 4 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and Subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees

- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

APPENDIX # 4 Meeting Schedule

OCTOBER 2008—DECEMBER 2010

DEVELOPMENT OF CIP VERSION 2 AND NEW VERSION FRAMEWORK
OCTOBER 2008—JULY 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.

2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development

3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 New Version process reviewed.

4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white "working" papers assigned, Technical Feasibility Exceptions white paper reviewed and refined.

5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed New Version white "working" papers.

- January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
- January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.

6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.

7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.

8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals

- *March 2–April 1, 2009 — 30-day Pre Ballot*
- *Mid-March — NERC posts TFE draft Rules of Procedure for industry comment*
- *March 30, 2009 — WebEx meeting(s) White Paper Drafting Team*
- ***April 1–10 — NERC Balloting on Version 2 Products***

CIP VERSION 3 RESPONSE TO FERC ORDER, OCTOBER-DECEMBER, 2009

15. October 20–22, 2009 in Kansas City, MI. Reviewed new FERC Order and urgent action CIP Version 3 process; discussed key issues raised by SDT CIP 002 Subgroups, small group meetings and agreement on refinements to the CIP 002-009 schedule and drafting process for CIP 002-4.

- *October–November Drafting Team meeting(s)*
- *CIP-002 Coordination Team meeting*

16. November 16–19, 2009 in Orlando, FL

- SDT review, refine and adopt Version 3 "industry response" document.
- SDT plenary and drafting group session(s) — to draft, review and refine CIP-002-4 standard, requirements, measures and controls and related documents.
- November–December Interim Conference call meeting(s)
- Drafting teams as needed to finalize draft CIP 002-4 documents
- CIP-002 Coordination Team meeting
- *CIP 002-4 Drafting Team produces next draft based on Orlando Meeting input.*
- *December 2 CSO 706 SDT Version 3 Consideration of Comments Draft Conference Call*
- *December X, CSO 706 SDT CIP 002-4 Preview Conference Call*

17. December 15–16, 2009 in Little Rock AK

- SDT scenario "walk through" to test flow of CIP 002-4.
- SDT plenary and drafting group session(s) to review, refine, and agree on and adopt CIP-002 standard, requirements, measures and controls and related documents.
- Agree on initial posting of draft CIP-002 for industry review and comment.
- Agree on next steps and 2010 Work plan and schedule

Refinement and Adoption of CIP-002 Version 4 and Development and Adoption of CIP Standards (003-009)
January 2010–December 2010

18. January 19-20–21-22 — Tue-PM- to Friday AM, Tucker, GA (GTC)

- SDT Work on Developing CIP 003-009 Strawman Drafts

19. February 17-18–19 —Wed--Thursday –Friday, Austin TX (ERCOT)

- SDT Reviews Industry Comments and Refines CIP 002 for posting for 45-day industry formal comment period.
- SDT continues CIP 003-009 Strawman Drafts

20. March 9–10-11 — Tuesday–Thursday, Phoenix, AZ (APS)

- SDT continues CIP 003-009 Strawman Drafts

21. April 13-14–15 — Tue-Wednesday–Thursday, Atlanta GA (Southern Co)

- SDT Reviews and Responds to Industry Comments, Refines and Adopts CIP 002 for balloting
- SDT posts a draft CIP 003-009 for informal industry comment.

22. May 11-12–13 — Tue-Wednesday–Thursday, Dallas TX (Luminant)

- SDT reviews Industry 1st Ballot Comments and Drafts Responses
- SDT reviews CIP 003-009 informal industry comments and refines the draft.

23. June 8-10- Tues, Wed. Thursday- (Sacramento)

- SDT refines CIP 003-009 and posts for 2nd round of informal industry comments and refines the draft.

24. July 13-14–15, Tue-Wednesday–Thursday, Pittsburgh, PA (CERT)

- SDT reviews CIP 003-009 informal industry comments and refines the draft.

25. August 10-11–12, Tue-Wednesday–Thursday- TBD

- SDT refines CIP 003-009 and posts for formal 45 day industry comment

26. September 7,8,9, Tues-Thurs. TBD (if needed)

27. Oct. 12-13–14, Tue-Wednesday–Thursday- TBD

- SDT Reviews and Responds to Industry Comments, Refines and Adopts CIP 002 for balloting

28. November 16-17–18, Tue-Wednesday–Thursday- TBD

- SDT reviews Industry 1st Ballot Comments and Drafts Responses

29. December 14-15–16, Tue-Wednesday–Thursday- TBD

Appendix # 6 Trade Association Memorandum to SDT

December 10, 2009

TO: NERC CSO706 Critical Infrastructure Protection Standard Drafting Team

FROM: American Public Power Association, Edison Electric Institute, Electricity Consumers Resource Council, Electric Power Supply Association, and National Rural Electric Cooperative Association (the "Associations")

SUBJECT: Support for Expedited Revision of NERC Cyber-Security Standards

On behalf of our Associations, we want to express our support of efforts now under way by the CSO706 Standard Drafting Team to expedite development of a revised set of cyber-security reliability standards, including consideration of a tiered approach to the identification of bulk electric system ("BES") assets under CIP-002-4. We understand that assets within each BES tier will in turn be subject to a new suite of cyber-security controls developed under reliability standards CIP-003-4 through CIP-009-4.

As you know, Congress and the Executive Branch have identified cyber-security of the nation's critical infrastructures as essential to the protection of the public welfare, national security and national economic security. Therefore, NERC and the industry now have the opportunity to demonstrate the value of industry expert participation and the effectiveness of industry self-regulation by delivering a timely set of consensus critical asset identification parameters. The Associations believe a new, more systematic approach to asset classification will best ensure that BES assets are subject to the appropriate cyber-security protection controls that are commensurate with their importance to reliable operations and their vulnerability to cyber-security threats.

The Associations are committed to working with their members' executives and managers, to ensure that industry subject matter experts provide timely and constructive comments on the scheduled December 28, 2009 posting of Version 4 of CIP-002, and subsequent balloting. We recognize the difficulty of drafting during the holiday season, the tight time frame for conducting a thorough revision on matters involving complex technical issues, and the prospect that this process could invoke considerable tension and disagreement on a broad range of issues. However, we offer our support because we believe it is important that the industry reach consensus on CIP-002-4 during the next six months and deliver a full suite of cyber-security

standards for approval by the NERC Board of Trustees by the end of 2010. Consequently, it is imperative that the identification piece of the process starts well, and remains on track.

The Associations recognize that there may be several alternative approaches for defining applicability of the standards. If approved as reflected in the conceptual framework, the tiered approach to BES asset identification would be a significant departure from the current approach to critical asset and critical cyber-security asset identification. Reaching an industry consensus in support of a new conceptual framework and developing a clear, complete and enforceable set of reliability requirements on an aggressive timeline will be difficult at best. Implementing a new framework raises significant cost implications that must be addressed as well. However, given the importance of the role cyber-security plays in ensuring a safe and reliable electric system, the work of your drafting team is in our view a crucial NERC project.

Therefore, we offer our strong support for the expedited timeline and consideration of the tiered approach and to provide our encouragement for completing by the end of next year the critically important tasks you are performing. We are committed to providing whatever personnel and other resources and support needed to accomplish this goal.

Appendix #7 CIP-002-4 Template
FERC Specific directives from order 706:

Compiled by Scott Mix, NERC

The following table contains the status of all issues raised in the order that were either "direct"ed, specifically in the order, or "adopt"ed from the NOPR.

Note: Given the confusion over the SDT's inclusion of the change in CIP-008 ("Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test") that the commission did not "direct", even though p 687 states: "In light of the comments received, the Commission clarifies that, with respect to full operational testing under CIP-008-1, such testing need not require a responsible entity to remove any systems from service," I did not include any issue that was not actively directed for change, such as those designated "should consider" or similar.

Issue #	Paragraph #	Text	Phase[1]
1	13	NERC is directed to develop a timetable for development of the modifications to the CIP Reliability Standards and, if warranted, to develop and file with the Commission for approval, a second implementation plan.	This compliance filing; and an implementation plan is filed with each submitted version of the standards
2	25	we direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of the NIST framework.	Version 4
3	47	The Commission adopts the CIP NOPR approach regarding NERC and Regional Entity compliance with the CIP Reliability Standards.	Rules of Procedure statement
4	49	The Commission also adopts its CIP NOPR approach and concludes that reliance on the NERC registration process at this time is an appropriate means of identifying the entities that must comply with the CIP Reliability Standards	Compliance registry process
5	72	We adopt our proposal in the CIP NOPR that responsible entities must comply with the substance of a Requirement.	CMEP
6	75	we direct the ERO to develop modifications to the CIP Reliability Standards that require a responsible entity to implement plans, policies and procedure that it must develop pursuant to the CIP Reliability Standards	Version 2
7	86	The Commission adopts its CIP NOPR proposal and approves NERC's implementation plan and time frames for responsible entities	CMEP

[1] Schedule phases in this column mean one or more of the following:
- "Version 2" – complete in filed version 2
- "Version 4" – planned for next major version (12-18 months plus)
- "Guideline" – stand alone guidance started after corresponding requirement is determined
- "TFE Filing" – 2009 filing on TFE proposal and Appendix 4D to RoP
- "not scheduled" – beyond Version 4
- "CMEP" – part of an existing or ongoing compliance audit, self-report or other process
- "VRF Filing(s)" – one of several already-filed (or very soon to be filed in the case of Version 2) VRF and/or VSL filings

Phase may also be self-explanatory if not one of these entries

Issue #	Paragraph #	Text	Phase[1]
		to achieve auditable compliance.	
8	89	we direct the ERO to submit a work plan for Commission approval for developing and filing for approval the modifications to the CIP Reliability Standards that we are directing in this Final Rule	This compliance filing; and an implementation plan is filed with each submitted version of the standards
9	90	We direct the ERO, in its development of a work plan, to consider developing modifications to CIP-002-1 and the provisions regarding technical feasibility exceptions as a first priority, before developing other modifications required by the Final Rule.	TFE Filing
10	96	we direct the ERO to require more frequent, semiannual, self-certifications prior to the date by which full compliance is required	CMEP program and self-certifications
11	97	we adopt our CIP NOPR proposals that, while an entity should not be subject to a monetary penalty if it is unable to certify that it is on schedule, such an entity should explain to the ERO the reason it is unable to self-certify	CMEP, self-certification process
12	106	the Commission adopts the CIP NOPR proposals and directs NERC to modify the CIP Reliability Standards through the Reliability Standards development process to remove the first two Terms ["reasonable business judgment," and "acceptance of risk"], and develop specific conditions that a responsible entity must satisfy to invoke the "technical feasibility" exception	Version 2 and TFE Filing
13	128	the Commission directs the ERO to develop modifications to the CIP Reliability Standards that do not include this term. We note that many commenters, including NERC, agree that the reasonable business judgment language should be removed based largely on the rationale articulated by the Commission in the CIP NOPR.	Version 2
14	138	the Commission directs the ERO to modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin.	Version 2
15	150	The Commission, therefore, directs the ERO to remove acceptance of risk language from the CIP Reliability Standards.	Version 2
16	156	the Commission directs the ERO to develop through its Reliability Standards development process revised CIP Reliability Standards that eliminate references to acceptance of risk.	Version 2
17	178	directs the ERO to develop a set of conditions or criteria that a responsible entity must follow when relying on the technical feasibility exception contained in specific Requirements of the CIP Reliability Standards	TFE Filing
18	186	the Commission adopts its proposal in the CIP NOPR that technical feasibility exceptions may be permitted if appropriate conditions are in place.	TFE Filing
19	192	the Commission adopts the CIP NOPR proposal for a three step structure to require accountability when a responsible entity relies on technical feasibility as the basis for an exception. We address	TFE Filing

Issue #	Paragraph #	Text	Phase[1]
		mitigation and remediation in this section and direct the ERO to develop: (1) a requirement that the responsible entity must develop, document and implement a mitigation plan that achieves a comparable level of security to the Requirement; and (2) a requirement that use of the technical feasibility exception by a responsible entity must be accompanied by a remediation plan and timeline for elimination the use of the technical feasibility exception.	
20	209	The Commission thus adopts its CIP NOPR proposal that use and implementation of technical feasibility exceptions must be governed by a clear set of criteria.	TFE Filing
21	211	direct the ERO to include approval of the mitigation and remediation steps by the senior manager (identified pursuant to CIP-003-1) in the course of developing this framework of accountability.	TFE Filing
22	212	the practical considerations pointed out by a number of the comments have convinced us to adopt an approach to the issue of external oversight different from the one originally proposed.	TFE Filing
23	218	we direct the ERO to design and conduct an approval process through the Regional Entities and the compliance audit process.	TFE Filing
24	219	we direct NERC, in developing the accountability structure for the technical feasibility exception, to include appropriate provisions to assure that governmental entities that are subject to Reliability Standards as users, owners or operators of the Bulk-Power System can safeguard sensitive information.	TFE Filing
25	220	We direct the ERO to submit an annual report to the Commission that provides a wide-area analysis regarding use of the technical feasibility exception and the effect on Bulk-Power System reliability.	TFE Filing
26	221	we direct the ERO to control and protect the data analysis to the extent necessary to ensure that sensitive information is not jeopardized by the act of submitting the report to the Commission.	TFE Filing
27	222	we direct the ERO to develop a set of criteria to provide accountability when a responsible entity relies on the technical feasibility exceptions in specific Requirements of the CIP Reliability Standards.	TFE Filing
28	222	We direct the ERO to develop appropriate modifications, as discussed above.	TFE Filing
29	233	we direct the ERO to consult with federal entities that are required to comply with both CIP Reliability Standards and NIST standards on the effectiveness of the NIST standards and on implementation issues and report these findings to the Commission.	Ongoing discussions with Drafting Team Members from USBR, BPA, NIST; Development of Version 4
30	253	While we adopt our CIP NOPR proposal, we recognize that the ERO has already initiated a process to develop such guidance … leave to the EO's discretion whether to incorporate such guidance into the CIP Reliability Standard, develop it as a separate guidance document, or some combination of the two.	Guideline / Version 4
31	254	direct the ERO to consider these commenter concerns [how to assess whether a generator or a blackstart unit is "critical" to Bulk-	Guideline / Version 4

Issue #	Paragraph #	Text	Phase[1]
		Power System reliability, the proper quantification of risk and frequency, facilities that are relied on to operate or shut down nuclear generating stations, and the consequences of asset failure and asset misuse by an adversary]when developing the guidance.	
32	255	we direct either the ERO or its designees to provide reasonable technical support to assist entities in determining whether their assets are critical to the Bulk-Power System.	Unscheduled
33	257	we direct the ERO to consider this clarification [the meaning of the phrase "used for initial system restoration," in CIP-002-1, Requirement R1.2.4] in its Reliability Standards development process.	Guideline / Version 4
34	272	the Commission directs the ERO, in developing the guidance discussed above regarding the identification of critical assets, to consider the designation of various types of data as a critical asset or critical cyber asset.	Guideline / Version 4
35	272	The Commission directs the ERO to develop guidance on the steps that would be required to apply the CIP Reliability Standards to such data and to consider whether this also covers the computer systems that produce the data.	Guideline / Version 4
36	282	the Commission directs the ERO, through the Reliability Standards development process, to specifically require the consideration of misuse of control centers and control systems in the determination of critical assets	Guideline / Version 4
37	285	we direct the ERO to consider the comment from ISA99 Team [ISA99 Team objects to the exclusion of communications links from CIP-002-1 and non-routable protocols from critical cyber assets, arguing that both are key elements of associated control systems, essential to proper operation of the critical cyber assets, and have been shown to be vulnerable — by testing and experience].	Version 4
38	294	The Commission adopts its CIP NOPR proposal and directs the ERO to develop, pursuant to its Reliability Standards development process, a modification to CIP-002-1 to explicitly require that a senior manager annually review and approve the risk-based assessment methodology.	Version 2
39	294	the Commission directs the ERO to develop a modification to CIP-002-1 to explicitly require that a senior manager annually review and approve the risk-based assessment methodology.	Version 2
40	322	The Commission adopts its CIP NOPR proposal to direct that the ERO develop through its Reliability Standards development process a mechanism for external review and approval of critical asset lists.	Version 4 (Note: proposed version 4 methodology obviates the need for external review0
41	329	the Commission directs the ERO, using its Reliability Standards development process, to develop a process of external review and approval of critical asset lists based on a regional perspective.	Version 4 (Note: proposed version 4 methodology obviates the need for external review0
42	333	we direct the ERO, in developing the accountability structure for the	TFE Filing

Issue #	Paragraph #	Text	Phase[1]
		technical feasibility exception, to include appropriate provisions to assure that governmental entities can safeguard sensitive information	
43	355	the Commission directs the ERO to provide additional guidance for the topics and processes that the required cyber security policy should address.	Guideline
44	376	the Commission adopts its CIP NOPR proposal and directs the ERO to clarify that the exceptions mentioned in Requirements R2.3 and R3 of CIP-003-1 do not except responsible entities from the Requirements of the CIP Reliability Standards.	Version 4
45	381	The Commission adopts its CIP NOPR interpretation that Requirement R2 of CIP-003-1 requires the designation of a single manager who has direct and comprehensive responsibility and accountability for implementation and ongoing compliance with the CIP Reliability Standards	Version 2
46	386	The Commission adopts its CIP NOPR proposal and directs the ERO to develop modifications to Reliability Standards CIP-003-1, CIP-004-1, and/or CIP-007-1, to ensure and make clear that, when access to protected information is revoked, it is done so promptly.	Version 4
47	397	The Commission directs the ERO to develop modifications to Requirement R6 of CIP-003-1 to provide an express acknowledgment of the need for the change control and configuration management process to consider accidental consequences and malicious actions along with intentional changes.	Version 4 / Guideline
48	412	The Commission therefore directs the ERO to provide guidance, regarding the issues and concerns that a mutual distrust posture must address in order to protect a responsible entity's control system from the outside world.	Guideline
49	431	The Commission adopts the CIP NOPR's proposal and directs the ERO to develop a modification to CIP-004-1 that would require affected personnel to receive required training before obtaining access to critical cyber assets (rather than within 90 days of access authorization), but allowing limited exceptions, such as during emergencies, subject to documentation and mitigation.	Version 2
50	433	we direct the ERO to consider, in developing modifications to CIP-004-1, whether identification of core training elements would be beneficial and, if so, develop an appropriate modification to the Reliability Standard.	Version 4
51	434	The Commission adopts the CIP NOPR's proposal to direct the ERO to modify Requirement R2 of CIP-004-1 to clarify that cyber security training programs are intended to encompass training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of critical cyber assets.	Version 4
52	435	Consistent with the CIP NOPR, the Commission directs the ERO to determine what, if any, modifications to CIP-004-1 should be made	Version 4

Issue #	Paragraph #	Text	Phase[1]
		to assure that security trainers are adequately trained themselves.	
53	443	The Commission adopts with modifications the proposal to direct the ERO to modify Requirement R3 of CIP-004-1 to provide that newly-hired personnel and vendors should not have access to critical cyber assets prior to the satisfactory completion of a personnel risk assessment, except in specified circumstances such as an emergency.	Version 2
54	443	We also direct the ERO to identify the parameters of such exceptional circumstances through the Reliability Standards development process	Version 4
55	460	The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset for any reason (including disciplinary action, transfer, retirement, or termination).	Version 4
56	464	We also adopt our proposal to direct the ERO to modify Requirement R4 to make clear that unescorted physical access should be denied to individuals that are not identified on the authorization list, with clarification.	Version 4
57	473	The Commission adopts its proposals in the CIP NOPR with a clarification. As a general matter, all joint owners of a critical cyber asset are responsible to protect that asset under the CIP Reliability Standards. The owners of joint use facilities which have been designated as critical cyber assets are responsible to see that contractual obligations include provisions that allow the responsible entity to comply with the CIP Reliability Standards. This is similar to a responsible entity's obligations regarding vendors with access to critical cyber assets.	Version 4
58	476	we direct the ERO to modify CIP-004-1, and other CIP Reliability Standards as appropriate, through the Reliability Standards development process to address critical cyber assets that are jointly owned or jointly used, consistent	Version 4
59	496	The Commission adopts the CIP NOPR's proposal to direct the ERO to develop a requirement that each responsible entity must implement a defensive security approach including two or more defensive measures in a defense in depth posture when constructing an electronic security perimeter	Not scheduled
60	502	The Commission directs that a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process.	Not scheduled
61	502	The Commission also directs the ERO to consider, based on the content of the modified CIP-005-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.	Not scheduled / Guideline

Issue #	Paragraph #	Text	Phase[1]
62	503	The Commission is directing the ERO to revise the Reliability Standard to require two or more defensive measures.	Not scheduled
63	511	The Commission adopts the CIP NOPR's proposal to direct the ERO to identify examples of specific verification technologies that would satisfy Requirement R2.4, while also allowing compliance pursuant to other technically equivalent measures or technologies.	Version 4
64	525	The Commission adopts the CIP NOPR proposal to require the ERO to modify CIP-005-1 to require logs to be reviewed more frequently than 90 days	Version 4
65	526	the Commission directs the ERO to modify CIP-005-1 through the Reliability Standards development process to require manual review of those logs without alerts in shorter than 90 day increments.	Version 4
66	526	The Commission directs the ERO to modify CIP-005-1 to require some manual review of logs, consistent with our discussion of log sampling below, to improve automated detection settings, even if alerts are employed on the logs.	Version 4
67	528	the Commission clarifies its direction with regard to reviewing logs. In directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the ERO could provide, through the Reliability Standards development process, clarification that a responsible entity should perform the manual review of a sampling of log entries or sorted or filtered logs.	Version 4
68	541	we adopt the ERO's proposal to provide for active vulnerability assessments rather than full live vulnerability assessments.	Version 4
69	542	the Commission adopts the ERO's recommendation of requiring active vulnerability assessments of test systems.	Version 4
70	544	the Commission directs the ERO to revise the Reliability Standard so that annual vulnerability assessments are sufficient, unless a significant change is made to the electronic security perimeter or defense in depth measure, rather than with every modification.	Version 4
71	544	we are directing the ERO to determine, through the Reliability Standards development process, what would constitute a modification that would require an active vulnerability assessment	Version 4
72	547	we direct the ERO to modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years	Version 4
73	560	the Commission directs the ERO to treat any alternative measures for Requirement R1.1 of CIP-006-1 as a technical feasibility exception to Requirement R1.1, subject to the conditions on technical feasibility exceptions.	TFE Filing / CMEP
74	572	The Commission adopts the CIP NOPR proposal to direct the ERO to modify this CIP Reliability Standard to state that a responsible entity must, at a minimum, implement two or more different security procedures when establishing a physical security perimeter around	Not scheduled

Issue #	Paragraph #	Text	Phase[1]
		critical cyber assets.	
75	575	The Commission also directs the ERO to consider, based on the content of the modified CIP-006-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.	Not scheduled / Guideline
76	581	The Commission adopts the CIP NOPR proposal and directs the ERO to develop a modification to CIP-006-1 to require a responsible entity to test the physical security measures on critical cyber assets more frequently than every three years,	Version 4
77	597	Therefore, the Commission directs the ERO to eliminate the acceptance of risk language from Requirements R2.3 and R3.2.	Version 2
78	600	Commission therefore directs the ERO to revise Requirement R3 to remove the acceptance of risk language and to impose the same conditions and reporting requirements as imposed elsewhere in the Final Rule regarding technical feasibility.	Version 2 / TFE Filing
79	609	We therefore direct the ERO to develop requirements addressing what constitutes a "representative system" and to modify CIP-007-1 accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document.	Version 4 / Guideline
80	610	we direct the ERO to revise the Reliability Standard to require each responsible entity to document differences between testing and production environments in a manner consistent with the discussion above.	Version 4
81	611	the Commission cautions that certain changes to a production or test environment might make the differences between the two greater and directs the ERO to take this into account when developing guidance on when to require updated documentation to ensure that there are no significant gaps between what is tested and what is in production.	Version 4
82	619	The Commission adopts the CIP NOPR proposal with regard to CIP-007-1, Requirement R4. [The Commission proposed to direct the ERO to eliminate the acceptance of risk language from Requirement R4.2, and also attach the same documentation and reporting requirements to the use of technical feasibility in Requirement R4, pertaining to malicious software prevention, as elsewhere. The Commission discussed the issues of defense in depth, technical feasibility, and risk acceptance elsewhere in the CIP NOPR and applied those conclusions here. The Commission further proposed to direct the ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means]	Version 4 / not scheduled
83	622	Therefore, the Commission directs the ERO to eliminate the acceptance of risk language from Requirement R4.2	Version 2
84	622	The Commission also directs the ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously	Version 4 / not scheduled

Issue #	Paragraph #	Text	Phase[1]
		or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means, consistent with our discussion above	
85	628	The Commission continues to believe that, in general, logs should be reviewed at least weekly and therefore adopts the CIP NOPR proposal to require the ERO to modify CIP-007-1 to require logs to be reviewed more frequently than 90 days, but leaves it to the Reliability Standards development process to determine the appropriate frequency, given our clarification below, similar to our action with respect to CIP-005-1	Version 4
86	629	The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document.	Version 4 / guideline
87	633	The Commission adopts the CIP NOPR proposal to direct the ERO to clarify what it means to prevent unauthorized retrieval of data from a cyber asset prior to discarding it or redeploying it.	Version 4
88	635	the Commission directs the ERO to revise Requirement R7 of CIP-007-1 to clarify, consistent with this discussion, what it means to prevent unauthorized retrieval of data.	Version 4
89	643	The Commission adopts its proposal to direct the ERO to provide more direction on what features, functionality, and vulnerabilities the responsible entities should address when conducting the vulnerability assessments, and to revise Requirement R8.4 to require an entity-imposed timeline for completion of the already-required action plan.	Not scheduled
90	651	We direct the ERO to revise Requirement R9 to state that the changes resulting from modifications to the system or controls shall be documented quicker than 90 calendar days.	Version 2
91	660	The Commission adopts the CIP NOPR proposal to direct the ERO to provide guidance regarding what should be included in the term reportable incident. … we direct the ERO to develop and provide guidance on the term reportable incident.	Guideline
92	661	the Commission directs the ERO to develop a modification to CIP-008-1 to: (1) include language that takes into account a breach that may occur through cyber or physical means; (2) harmonize, but not necessarily limit, the meaning of the term reportable incident with other reporting mechanisms, such as DOE Form OE 417; (3) recognize that the term should not be triggered by ineffectual and untargeted attacks that proliferate on the internet; and (4) ensure that the guidance language that is developed results in a Reliability Standard that can be audited and enforced	Version 4 / Guideline
93	673	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1 to require each responsible entity to contact appropriate government authorities and industry participants in the	Version 4 / Guideline

Issue #	Paragraph #	Text	Phase[1]
		event of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.	
94	676	the Commission directs the ERO to modify CIP-008-1 to require a responsible entity to, at a minimum, notify the ESISAC and appropriate government authorities of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.	Version 4 /. Guideline
95	686	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1, Requirement R2 to require responsible entities to maintain documentation of paper drills, full operational drills, and responses to actual incidents, all of which must include lessons learned.	Version 4
96	686	The Commission further directs the ERO to include language in CIP-008-1 to require revisions to the incident response plan to address these lessons learned.	Version 4
97	694	For the reasons discussed in the CIP NOPR, the Commission adopts the proposal to direct the ERO to modify CIP-009-1 to include a specific requirement to implement a recovery plan.	Version 4
98	694	We further adopt the proposal to enforce this Reliability Standard such that, if an entity has the required recovery plan but does not implement it when the anticipated event or conditions occur, the entity will not be in compliance with this Reliability Standard.	Version 4
99	706	The Commission adopts, with clarification, the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to incorporate use of good forensic data collection practices and procedures into this CIP Reliability Standard.	Not scheduled
100	710	Therefore, we direct the ERO to revise CIP-009-1 to require data collection, as provided in the Blackout Report.	Not scheduled
101	725	The Commission adopts, with modifications, the CIP NOPR proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years.	Not scheduled
102	731	The Commission adopts the CIP NOPR proposal to direct the ERO to modify Requirement R3 of CIP-009-1 to shorten the timeline for updating recovery plans.	Version 2
103	739	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP- 009-1 to incorporate guidance that the backup and restoration processes and procedures required by Requirement R4 should include, at least with regard to significant changes made to the operational control system, verification that they are operational before the backups are stored or relied upon for recovery purposes	Version 4
104	748	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to provide direction that backup practices include regular procedures to ensure verification that backups are	Version 4

Issue #	Paragraph #	Text	Phase[1]
		successful and backup failures are addressed, so that backups are available for future use.	
105	757	Therefore, we will not allow NERC to reconsider the Violation Risk Factor designations in this instance but, rather, direct below that NERC make specific modifications to its designations.	VRF Filing(s)
106	759	Consistent with the Violation Risk Factor Order, the Commission directs NERC to submit a complete Violation Risk Factor matrix encompassing each Commission approved CIP Reliability Standard.	VRF Filing(s)
107	767	The Commission adopts the CIP NOPR proposal to direct the ERO to revise 43 Violation Risk Factors.	VRF Filing(s)

Agenda
Cyber Security Order 706 SDT — Project 2008-06

January 19, 2010 | 1:00 PM to 5:00 PM EST
January 20, 2010 | 8:00 AM to 5:00 PM EST
January 21, 2010 | 8:00 AM to 5:00 PM EST
January 22, 2010 | 8:00 AM to 3:00 PM EST

Georgia Transmission Corporation
2100 East Exchange Place
Tucker, GA

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Group Meetings May Not Have Access to Telephones and

Proposed Meeting Objectives/Outcomes

- Review the CSO 706 SDT 2010 Workplan
- Receive update on the CIP 002-4 filing and review process lessons learned
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan
- Review, discuss and test consensus for CIP guiding principles
- Review strawman documents, discuss and test consensus for CIP security controls approach, guidance, scope and applicability.
- Convene CIP Security Controls Drafting Groups
- Review Drafting Group Reports and Provide Feedback
- Agree on next steps and assignments

Draft Agenda

Tuesday	**January 19, 2009**
1:00 p.m.	Welcome and Opening Remarks- *Jeri Domingo-Brewer & Phil Huff* Roll Call; NERC Antitrust Compliance Guidelines Facilitator review and SDT acceptance of December 15-16, 2009 Little Rock SDT meeting summary
1:15	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
1:20	Review of CSO 706 SDT Workplan- January-June, 2010- *Stu Langton*
1:40	Update on CIP 002 Filing- Process Lessons Learned- *Joe Bucciero*

2:00	Other Updates on other related cyber security initiatives- *NERC Staff and SDT Members*
2:15	NERC Update on Implementing the CIP Communication Plan
2:30	Overview of Security Controls Strawman Documents and Drafting Group Process
2:	*Break*
3:00	Review, Rating and Consensus Testing of Principles
4:00	Review Strawman Security Controls Categories and Proposed Drafting Sub-Teams
4:30	Review and Consensus Testing of Sources for Controls
5:00	Review of Required Elements for Each Security Control
5:15	Member Drafting Sub-Teams Preference Survey
5:25	Review of Proposal for Wednesday Agenda and Drafting Groups
5:30	*Recess*

Wednesday	**January 20, 2010**
8:00	Welcome and Agenda Review- *Jeri Domingo-Brewer & Phil Huff*
8:10	Review of CIP Security Controls Drafting Template- *Scott Mix and Howard Gugel, NERC*
8:45	Review and Agree on Proposal for Drafting Security Controls and Sub Team Members
10:00	Convene Organizational Meetings of SDT Cyber Security Controls Sub Teams
12:00	*Working Lunch*
12:45	Reconvene SDT Cyber Security Controls Sub Teams
3:15 5	*Break*
3:0	Sub Team Organizational Reports, Requests and Needs and Full Team Feedback
4:50	Review Assignments and Thursday Agenda
5:00	*Recess*

Thursday	**January 21, 2010**
8:00	Welcome and Agenda Review- *Jeri Domingo-Brewer & Phil Huff*
8:15	Review any Drafting Group Requests/Needs
8:30	Reconvene SDT Cyber Security Controls Sub Teams
12:00	*Lunch*
	Reconvene SDT Cyber Security Controls Sub Teams
2:45	*Break*
3:00	Sub Team Reports and Full Team Feedback
4:50	Review Assignments and Friday Agenda
5:00	*Recess*

Friday	**January 22, 2010**
8:00	Welcome and Agenda Review- *Jeri Domingo-Brewer & Phil Huff*
8:15	Review any Drafting Group Requests/Needs
8:30	Reconvene SDT Cyber Security Controls Sub Teams
12:00	*Lunch*
12:30	Sub Team Reports and Full Team Feedback
2:30	Review and Agree on Next Steps for Developing Security Controls (CIP 003-009) and Work plan for February 2010 Meeting on CIP 002-4 Industry Comments
	Meeting Evaluation
3:00	*Adjourn*

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

PROJECT 2008-06 CYBER SECURITY ORDER 706 SDT MEMBERS

1. Rob Antonishen	Ontario Power Generation
2. Jeri Domingo-Brewer, Chair	U.S. Bureau of Reclamation
3. Jim Brenton	ERCOT
4. Jackie Collett	Manitoba Hydro
5. Jay S. Cribb	Information Security Analyst, Southern Company Services
6. Joe Doetzl	Manager, Information Security, Kansas City Pwr. & Light Co.
7. Sharon Edwards	Duke Energy
8. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
9. **Phillip Huff, Vice Chair**	Arkansas Electric Coop Corporation
10. Doug Johnson	Exelon Corporation – Commonwealth Edison
11. Frank Kim	Ontario Hydro
12. Rich Kinas	Orlando Utilities Commission
13. John Lim, Chair	CISSP, Department Manager, Consolidated Edison Co. NY
14. David Norton	Entergy
15. Christopher A. Peters	ICF International
16. David S. Revill	Georgia Transmission Corporation
17. Scott Rosenberger	Luminant Energy
18. Kevin Sherlin	Sacramento Municipal Utility District
19. Jonathan Stanford	Bonneville Power Administration
20.Keith Stouffer	National Institute of Standards & Technology
21. John D. Varnell	Technology Director, Tenaska Power Services Co.
22.William Winters	Arizona Public Service, Inc.
Roger Lampilla	NERC
Scott Mix	NERC
Dave Taylor	NERC
Howard Gugel	NERC
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Hal Beardal	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center

CSO 706 SDT MEETING SCHEDULE
JANUARY –DECEMBER 2010

REFINEMENT AND ADOPTION OF CIP-002 VERSION 4 AND DEVELOPMENT AND ADOPTION OF CIP STANDARDS (003-009)
JANUARY 2010–DECEMBER 2010

- ***SDT Security Controls Member Survey- December 30-January 6, 2010.***
- January 6- SDT Conference Call to Review Survey Results and Strawman Drafting Group
- January 11- SDT Strawman Drafting Group Conference Call
- January 14- SDT Strawman Drafting Group Conference Call

18. January 19-20–21-22 — Tues-1 PM- to Friday 3 PM, Tucker, GA (GTC)

- SDT reviews and refines security control drafting principles, strawman approach and subteams.
- SDT Security Controls Sub Teams begin drafting.

Interim Security Control Sub Team Conference Call Drafting Meetings

19. February 16, 17, 18 &19 —Tues-1 PM to –Friday 3 PM, Austin TX (ERCOT)

- SDT Reviews Industry Comments and Refines CIP 002-4 for posting for 45-day industry formal comment period.
- SDT Sub Team Progress Reports

Interim Security Control Sub Team Conference Call Drafting Meetings

20. March 9, 10, 11 & 12 — Tues-1 PM –Friday 3 PM, Phoenix, AZ (APS)

- SDT Security Control Sub Teams continue strawman drafts
- Review, Compile and Agree on an initial draft Security Controls Text

Interim Security Control Sub Team Conference Call Drafting Meetings

21. April 13, 14, 15 & 16 — Tues.-1 PM- Friday 3 PM, Atlanta GA (Southern Co)

- SDT Reviews and Responds to Industry Comments, Refines and Adopts CIP 002 for balloting
- SDT review and reach consensus on a draft CIP 003-009 for informal industry comment.

Interim Security Control Sub Team Conference Call Drafting Meetings

22. May 11-12–13 & 14 — Tues 1 PM- 3 PM Friday, Dallas TX (Luminant)

- SDT reviews Industry 1st Ballot Comments and Drafts Responses
- SDT reviews CIP Security Controls informal industry comments and refines the draft.

Interim Security Control Sub Team Conference Call Drafting Meetings

23. June 8-11- Tues- Fri. (Sacramento)

- SDT refines CIP Security Controls and posts for 2nd round of informal industry comments and refines the draft.

Interim Security Control Sub Team Conference Call Drafting Meetings

24. July 13-16, Tues-Fri., Pittsburgh, PA (CERT)

- SDT reviews CIP Security Controls informal industry comments and refines the draft.

Interim Security Control Sub Team Conference Call Drafting Meetings

25. August 10–13, Tues-Fri TBD

- SDT refines CIP 003-009 and posts for formal 45 day industry comment

Interim Security Control Sub Team Conference Call Drafting Meetings

26. September 7,8,9, Tues-Fri. TBD (if needed)

27. Oct. 12–15, Tues–Friday- TBD

- SDT Reviews and Responds to Industry Comments, Refines and Adopts CIP Security Controls for balloting

28. November 16–19, Tues-Fri - TBD

- SDT reviews Industry 1st Ballot Comments and Drafts Responses

29. December 14–17, Tues-Fri.- TBD

DEVELOPMENT OF CIP VERSION 2 AND NEW VERSION FRAMEWORK
OCTOBER 2008–JULY 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.

2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development

3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 New Version process reviewed.

4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white "working" papers assigned, Technical Feasibility Exceptions white paper reviewed and refined.

5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed New Version white "working" papers.

January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.

January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.

6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.

7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.

8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals

March 2–April 1, 2009 — 30-day Pre Ballot

Mid-March — NERC posts TFE draft Rules of Procedure for industry comment

March 30, 2009 — WebEx meeting(s) White Paper Drafting Team

April 1–10 — NERC Balloting on Version 2 Products

April 6, 2009 — WebEx meeting — White Paper Drafting Team

April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call

April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments

9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.

April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx

April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%

May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.

10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.

June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx

11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.

- *June — WebEx meeting(s)*
- *Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria*

CIP-002 DEVELOPMENT OF REQUIREMENTS, MEASURES, ETC. JULY-DECEMBER 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada

SDT reviewed, refined, and adopted SDT Working Paper. SDT adopted its response to NERC for Interpretation of CIP-006-1. SDT reviewed and adopted a proposal for CIP-002 Subgroups and Deliverables and convened subgroup organizational meetings to develop work plans. SDT adopted 2010 Meeting Schedule.

- *July–August Interim Conference call meeting(s)*
- *CIP-002 Subgroup meetings*
- *CIP-002 Coordination Team meeting*
- *August 3–5, 2009 in Winnipeg, Manitoba **NERC Member Representative Committee**. Progress Report and presentation on new CIP Version 3 Working Paper-Concept-Reliability Standards on Cyber Security for MRC input.*

13. August 20–21, 2009 in Charlotte, NC. SDT reviewed and responded to MRC input on Working Paper/CIP-002 Concepts and convened SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

- *July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper*
- *NERC Webinar- August–September Interim Conference Call meeting(s)*
- *CIP-002 Subgroup meetings (as ne*
- *CIP-002 Coordination Team meeting*

14. September 9–10, 2009 in Folsom, CA. SDT reviewed and considered industry comments on the Working Paper and CIP-002 concepts and their application to the subgroup work and addressed coordinating issues through joint subgroup meetings. SDT agreed on meeting dates and proposed locations for January–December 2010

September–October Interim WebEx meeting(s)

- *FERC Version 3 Urgent Action SDT conference call meetings*
- *CIP-002 Coordination Team meeting*

CIP VERSION 3 RESPONSE TO FERC ORDER, OCTOBER-DECEMBER, 2009

15. October 20–22, 2009 in Kansas City, MI. Reviewed new FERC Order and urgent action CIP Version 3 process; discussed key issues raised by SDT CIP 002 Subgroups, small group meetings and agreement on refinements to the CIP 002-009 schedule and drafting process for CIP 002-4.

- *October–November Drafting Team meeting(s)*
- *CIP-002 Coordination Team meeting*

16. November 16–19, 2009 in Orlando, FL

- SDT review, refine and adopt Version 3 "industry response" document.
- SDT plenary and drafting group session(s) — to draft, review and refine CIP-002-4 standard, requirements, measures and controls and related documents.
- November–December Interim Conference call meeting(s)

- Drafting teams as needed to finalize draft CIP 002-4 documents
- CIP-002 Coordination Team meeting
- *CIP 002-4 Drafting Team produces next draft based on Orlando Meeting input.*
- *December 2 CSO 706 SDT Version 3 Consideration of Comments Draft Conference Call*
- *December X, CSO 706 SDT CIP 002-4 Preview Conference Call*

17. December 15–16, 2009 in Little Rock AK

- SDT scenario "walk through" to test flow of CIP 002-4.
- SDT plenary and drafting group session(s) to review, refine, and agree on and adopt CIP-002-4 standard, requirements, measures and controls and related documents.
- Agree on initial posting of draft CIP-002-4 for industry review and comment.
- Agree on next steps and 2010 Workplan and schedule

- December 28, 2009 SDT Conference Call on CIP 002-4
- December 30, 2009 SDT Leadership Call- Security Controls Survey Draft

Meeting Summary Contents

EXECUTIVE SUMMARY

On Tuesday afternoon, the Chair, Jeri Domingo-Brewer welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines. The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda. On Thursday morning the SDT approved without objection the meeting summary for the December, 2009 meeting in Little Rock.

The Chair thanked members for their diligence, dedication and participation through the holidays to prepare the finalized draft of Version 3 of the CIP-002 to 009 Standards for balloting. Stuart Langton reviewed the SDT work plan, in particular the parallel effort of developing security controls while preparing Version 4 of the CIP-002 standard for posting for an informal comment period. The Chair noted this was her last meeting on the Team and that Jeff Hoffman from the Denver Office of the U.S. Bureau of Reclamation was being recommended to the NERC Standards Committee to serve as a member on the SDT. Joe Bucciero noted that Christopher Peters has submitted his resignation from the Team, and that Patrick Leon (Patricio Leon Alvarado) from Southern California Edison is also being recommended to serve as a member of the SDT. Mr. Bucciero noted there are two remaining open SDT member positions and invited members to talk with potential candidates and have them submit membership nomination forms.

Joe Bucciero provided an update on CIP 002 filing process and some reflections on lessons learned. He recounted that the NERC standards managers reviewed and discussed format and other changes to the standards following the SDT adoption of the CIP002-4 draft in Little Rock. Due to the press of the holidays and the FERC imposed deadline for posting, there was little time available to communicate with the SDT leadership and team members regarding the rationale for the NERC proposed changes. NERC agreed to withdraw many of the proposed text changes and submit them as comments during the informal comment period. Going forward, NERC has assigned Howard Gugel to the Team so he can improve coordination with NERC standards managers and provide direct format assistance in the Team's drafting process.

The Chair noted that yesterday Dave Norton circulated to the Team the release of a preliminary draft of the NIST Interagency Report (NISTIR) regarding the work of the Cyber Security Coordination Task Group (CSCTG) established to help define the cyber security requirements for the smart grid. The NISTIR document is planned to be finalized later this Spring. Keith Stouffer noted that there are over 300 people with seven working groups involved in the CSCTG. It will become a standing committee that is part of the Smart Grid Interoperability Panel (SGIP) that has been created by NIST as part of their work in response to EISA 2007. Keith also noted the draft NIST interoperability roadmap was recently released on January 19.

Gerry Adamski, director of NERC Standards noted he is working with the new NERC Communications Director, Carl Dombek and will share a draft plan with the Team later in the week. The Chair suggested that Carl Dombek be able to come to a future SDT meeting to brief the SDT and provide an update on the progress with implementing the communication plan. The Team agreed that the industry webinar addressing the draft CIP-002-4 standard should take place on February 3 from 1:00-3:00 p.m. EST to allow for industry feedback and questions on the new approach to this standard. SDT Vice-Chair, Phil Huff, agreed to serve as the contact for the Team's effort in developing the webinar materials, and Sharon Edwards and Jay Cribb will be the SDT presenters for the webinar.

On Tuesday morning, Scott Mix and Howard Gugel from NERC briefed the Team on the development of a security controls drafting template.

Phil Huff provided an overview of the SDT effort since Little Rock to develop a draft strawman including development of a security controls member survey created by the SDT leadership; a summary of the responses to the survey by 16 members compiled by the staff; a SDT conference call on January 6, 2010 to consider the member survey results and create and charge a drafting group; and two strawman drafting team meetings were assigned to develop a strawman document. The strawman document contained: Security Control Drafting Principles to provide guidance in drafting security controls and ensure more consistent outcomes among sub-teams; Security Control Groups having the relevant CIP 003-009 and NIST SP 800-53 families mapped including: Security Governance; Personnel and Training; Communication Protection; Physical Security; Systems Management; Incident Response; Recovery Plans; Access Control (Technical); Audit and Accountability; Configuration Management and System Lifecycle; Information Management; and Security Assessments.

Phil Huff noted that the first ten principles are drawn from NERC rules of procedure. The Team reviewed principles 11-15 and offered suggestions for refinements.

Phil Huff outlined the control group categories in the strawman draft. The Team reviewed the proposed six sub-teams in the strawman document including: Security Governance; Personnel and Physical Security; Operations Security; Recovery and Response; Access Control and Auditing; and Change Management, System Lifecycle and Information Management. On Tuesday morning sub-team preference forms were distributed to the members in the room and electronically to those participating via the Ready Talk conference facilities. Based on the preference form, the Sub-Teams were created.

Phil Huff reviewed the strawman guidance for the sub-groups. Following the initial Sub-Team reports on Wednesday, the Team discussed the implications for the ultimate standards/control format and for the further development of security controls in the context of CIP-002-4. On Thursday morning, the Team discussed whether the proposed "control group" format should be the organization for revising the current CIP 003-009 or just a starting point for the Team's work on security controls. The Team discussed the strengths and weaknesses of three choices going forward: using the current CIP Standards, the NIST SP 800-53 format, or the DHS security controls structure. Following the discussion, the Team considered and tested a fourth option of preparing the requirements first then determining the format going forward. Using the following 4-point acceptability scale, the Team decided to proceed first to create the requirements and controls and defer the format options review until having completed that task.

Prepare Requirements First, then Decide on Format

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	9	**6**	**0**	**1**	**3.3 of 4**

The Sub-Teams met on Wednesday morning and early afternoon and then reported their initial results on the review of selecting candidate controls from the DHS catalogue. The Sub-Teams met for a second time on Thursday morning and early afternoon to review security controls and begin exploring the drafting of requirements.

Prior to the second sub-team break-outs on Thursday morning, the Team agreed on a sub-team format for collecting information with the following columns:

1. SDT Team Name
2. Section #
3. Title
4. NERC Security Guidance
5. NERC CIP-2
6. NIST SP 800-53
7. CSO 706 SDT Applicable
8. SDT Comments
9. Validated 706 SDT Applicable (Yes/No)
10. Existing CIP Requirement Cross Reference
11. FERC Order 706 References (Paragraph #s)
12. Requirement Definition
13. Controls- High
14. Controls- Medium
15. Controls- Low
16. Applicability- Transmission
17. Applicability- Generation
18. Applicability- Control Centers

Over the three days the sub-teams met first to identify candidate DHS Security Controls and then to identify controls and draft requirements. The sub-teams and their members included:

1. Security Governance and Assessments *(Gerry Freese, Jon Stanford, Rich Kinas)*
2. Personnel and Physical Security. *(Doug Johnson, Rob Antonishen, Kevin Sherlin).*
3. Operations Security *(Jay Cribb, John Varnell, Jackie Collett & Jim Brenton)*
4. Recovery and Response *(Jeri Domingo Brewer, Jason Marshall, Joe Doetzl, Scott Rosenberger)*
5. Access Control and Auditing *(Sharon Edwards, Phil Huff and Jeff Hoffman)*
6. Change Management System Lifecycle and Information Management. *(Dave Revill, Keith Stouffer and Bill Winters)*

On Friday morning, following the sub-team reports, the Team offered reflections on the sub-team exercise. Following the sub-team reports, the facilitators presented and the Team reviewed and refined the next steps and assignments emerging from the meeting including steps for the Team as a whole, security control sub-team assignments, and steps in the CIP-002-4 review and refinement process.

Scott Mix presented a revised proposed schedule for CIP 002 and the security controls requirements *(See Appendix #5).* The Team liked the presentation in which the two efforts are put in parallel columns and shows the amount of work ahead.

Vice-Chair, Phil Huff reviewed some questions that the Team discussed for FERC/NERC meeting on January 28, 2010, including:

1) What expectations are there regarding coordination with the Smart Grid CSCTG (Cyber Security Coordination Task Group) product and how we use NIST SP 800-53/DHS Catalogue?
2) NIST SP 800-53 is an organizational risk management framework, which allows for tailoring and compensating controls. However, FERC Order 706 calls for extensive oversight for any exceptions. What are their thoughts on reconciling these seemingly conflicting objectives?
3) The process to make modifications to the Standards through a FERC Order is very resource intensive. Conversely, changes made prior to industry balloting are done with relative ease. Is it possible to have a process where the team can receive feedback from FERC prior to ballot?
4) To what degree can we remove or lessen prescriptive elements in the current CIP Standards where the risk reduction does not justify the consumption of industry resources?
5) Have we captured all of the directives from Order 706 in the filing made in December 2009?

He noted this was a working list which will be circulated for members to suggest additions in advance of the January 28 FERC/NERC meeting.

The facilitators noted that each sub-team should plan on meeting in the interim (between meetings) and on preparing and presenting at the February 2010 meeting in Austin a short progress report including key questions for presentation. The Austin meeting will primarily focus on refining CIP-002-4 in response to industry comments received from the informal comment period (ending February 12). NERC will try to have Maureen Long attend a portion of the Austin meeting (preferably on Thursday) to address the response and refinements of the CIP-002-4. The primary objective of the Austin Meeting is to have the Team reach agreement on CIP 002 as revised for posting for 45 day formal comment period.

On behalf of the SDT, Phil Huff thanked Jeri Domingo Brewer for her leadership over the past 16 months. Ms. Brewer acknowledged the opportunity to get to know the SDT members and noted the honor of having worked with them to produce excellent and timely outcomes. She urged the Team to continue to build on the foundation of trust and collegiality to complete the task assigned by December 2010.

Mr. Huff then thanked Dave Revill for hosting the meeting and providing excellent support for this critical meeting.

The SDT adjourned at 12:30 p.m. on January 22, 2010. Several sub-teams continued to meet following lunch on Friday afternoon.

MEETING SUMMARY

I. AGENDA REVIEW, WORKPLAN, UPDATES AND COMMUNICATION PLAN

A. Agenda Review

On Tuesday afternoon, the Chair, Jeri Domingo-Brewer welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). On Thursday morning the SDT approved without objection the meeting summary for the December, 2009 meeting in Little Rock.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The Chair thanked members for their diligence, dedication and participation through the holidays to get the draft finalized and ready for balloting. Stuart Langton reviewed the SDT work plan (*See Appendix # 5)* in particular the parallel effort of developing security controls while finalizing the CIP-002 draft for balloting.

The Chair noted this was her last meeting on the Team and that the Standards Committee was going to appoint Jeff Hoffman from the Denver Office of the U.S. Bureau of Reclamation to serve in her stead. Joe Bucciero noted that Christopher Peters had submitted his resignation from the Team. The Standards Committee has appointed Patrick Leon (Patricio Leon Alvarado) to the SDT from Southern California Edison, who has the lead for CIP NERC compliance in terms of their substations and also has considerable substation planning experience. He will join the Team at its Austin meeting. Mr. Bucciero noted there were two open spots and invited members to submit potential candidates.

B. Lessons Learned- CIP-002-4 Posting

Joe Bucciero provided an update on CIP 002 Filing process and some reflections on lessons learned. He noted that much has been learned since this Team was formed in the Fall of 2008. He recounted that the NERC standards managers following the SDT adoption of the CIP002-4 draft in Little Rock reviewed and discussed format and other changes to the standards but due to the press of the holidays and the deadline for posting did not adequately communicate to the SDT leadership and team members the rationale for proposed changes. NERC agreed to withdraw many of the proposed text changes and submit them as comments in the informal comment period.

Going forward, NERC has assigned Howard Gugel to the Team so he can improve coordination with NERC standards managers and provide direct format assistance in the Team's drafting process. Joe Bucciero agreed to circulate to the Team documents that lay out the new approach for standards drafting. Mr. Bucciero noted that NERC's leadership change with a new President stepping in was a factor.

Member Comments

- Going forward the Team will be struggling to get the documents to a point we can agree on them as a group – there may not be enough time for NERC staff review – may need to change the

process to allow for staff review and then committee review and agreement before it goes to ballot.
- We should not face this in the future since Howard will to help coordinate the issue to reduce the problem in the future

C. Cyber Security Initiatives Updates
The Chair noted that yesterday Dave Norton circulated to the Team the release of an intermediate draft smart grid work of the Cyber security coordination task group to be finalized later this Spring. Keith Stouffer noted that there are over 300 people with seven working groups. It specifies security standards at multiple points and is a list of requirements rather than baselines. Keith also noted the NIST roadmap for operability was also just released on January 19.

Member Comments
- Need to continue to coordinate between our group and theirs to be sure not developing incompatible requirements
- The Team may want to consider forming a task group looking specifically at the Smart Grid work to be sure our work is compatible and not at odds or creating issues.
- Add agenda item for Wed. or Thurs. for discussing how we can interact or interface with that group?
- Can we feed our work back to that task force as we move forward?
- Another item – critical cyber security identification guideline is now out for formal comment. This is a formal guideline development process, not a standards development process despite the similarities.
- U.S. nuclear plants – NERC needs to file version 2 implementation plan – how version 2 and 3 will be applied to nuclear plants – Commission says implement on same time line as version 1 – The order says future orders must include how nuclear plants are expected to apply

D. NERC Update on Implementing the CIP Communication Plan
Gerry Adamski, director of NERC Standards noted he is working with the new NERC Communications Director, Carl Dombek and will have a plan to share with the Team later in the week (*See Appendix #9)*. He noted the need to set a date for a CIP 002-4 webinar in early February. He noted that NERC is not expecting this Team can take the lead in developing and implementing a communications plan. The Chair suggested that Carl Dombek may be able to come to a future SDT meeting to brief and provide an update on progress with implementing the communication plan. The Team agreed the webinar should take place on February 3 from 1:00-3:00 p.m. EST to allow for industry questions. SDT Vice Chair, Phil Huff, agreed to serve as the contact for the Team's effort in developing the webinar materials. Sharon Edwards and Jay Cribb will be the SDT presenters.

E. Review of NERC's CIP Security Controls Drafting Template
On Tuesday morning, Scott Mix and Howard Gugel from NERC briefed the Team on the development of a security controls drafting template. Mr. Gugel noted that one key is for the Team to decide how much granularity they want to work with and suggested it will be easier to start with the broader high-medium-low categories. He also pointed to using a table format that would be referenced by each requirement. Other points made included:

- Requirement statements can be very short and simple: e.g. you shall implement passwords subject to attachment # 1. The entity looks in the attachment to determine if you are high, medium or low, then look at details for compliance. There remains a question as to whether compliance is assigned to a column or row versus to an individual cell in the table.
- Requirement could speak to applicability and the attachment would catalogue the controls.
- The example is divided just to indicate whether or not you need different types of controls for transmission, control centers, generation, etc. It also breaks it down to look at whether it is manned or not which may affect the mapping of controls needed.
- Third example is just "high BES impact" with granular of physical access, monitor physical access or logging physical access
- Control centers have a lot more for virus protection than a remote center – then break it down into transmission, production or control – don't need virus protection of a relay (though those with windows platform may need some)
- The Team should consider the VSLs as you are writing requirements – if not, there is a disconnect and you may find you did not write the requirements as clearly as you should have
- The proposed concept will work best for this Team and this is the direction overall NERC and the industry needs to be headed in. In addition it is easier to follow.

Member Comments

- Suggesting just one VSL level for each of the h-m-l categories? No – associated with each requirement is a set of VSLs
- Each violation has a risk factor – but this is not a one-to-one relationship.
- Do you have a prototype we can look at? Not yet.
- We need to look at the violation severity and have clear cut controls. 90% of the effort should then be aimed at highest level impact.
- If it is a high impact it needs to be protected. It should not be important to determine whether it is transmission or control center or other. It is the impact on the BES that is important.
- I like idea of doing the VSLs at the same time to allow us to fine tune the requirements and be sure they are auditable.
- This just shows how to map each requirement – may not have a direct tie to a VSL
- Are these several different models to use together or are we choosing one over the other?
- The concept is good – this might be useful once we decide which controls are in the buckets of h-m-l. Your suggestion makes implementation simpler.
- If you have a table do you still have just one requirement or does the table represent Sub-Requirements? This is an open question at this point
- Is there a NERC style guide for VSLs we should reference? There is but it does not assume the complexities of what we are looking at here.
- I think the VSLs need to be more granular than the requirements. VRFs should be easier to assign to impact levels than VSLs.

- We should consider creating a litmus test to use as we move forward.
- Should we count one miss the same as multiple misses of the requirement?

II. SECURITY CONTROLS AND THE STRAWMAN DOCUMENTS

A. Overview of Security Controls Strawman Document and Drafting Group Process

Phil Huff provided overview of the SDT effort since Little Rock to develop a draft strawman. This included a:

- Security controls member survey developed by the leadership in December, 2009;
- Summary of the responses by 16 SDT members compiled by staff, *(See Appendix # 6),*
- Full Team conference call on January 6, 2010 to consider the member survey results and create and charge a drafting group, and
- Strawman drafting team which met twice on January 11 and 14, 2010 to develop and bring a strawman document to this meeting for the Team's consideration.

He thanked the Team and the drafting team members for their responsiveness in completing the survey and developing a strawman document (*See Appendix #8).* The strawman document contains:

1. Security Control Drafting Principles to provide guidance in drafting security controls and ensure more consistent outcomes among sub-teams;
2. Security Control Groups having the relevant CIP 003-009 and NIST SP 800-53 families mapped including: Security Governance; Personnel and Training; Communication Protection; Physical Security; Systems Management; Incident Response; Recovery Plans; Access Control (Technical); Audit and Accountability; Configuration Management and System Lifecycle; Information Management; and Security Assessments
3. Drafting Sub-Teams based on the control families:

Team	Control Families
Security Governance	(1) Security Governance
Personnel and Physical Security Operations Security	(2) Personnel and Training, (4) Physical Security (3) Communication Protection, (5) Systems Management
Recovery and Response Access Control and Auditing	(6) Incident Response, (7) Recovery Plans , (12) Security Assessments (8) Access Control, (9) Audit and Accountability
Change Management, System Lifecycle and Information Management	(10) Configuration Management and System Lifecycle, (11) Information Management

4. Team assignments to determine the security controls within their assigned control families necessary to mitigate risk to the BES. Begin by taking the set of applicable Requirements from version 3 CIP Cyber Security Standards and reconcile with applicable NIST SP 800-53 security controls. Then incorporate additional sources where applicable to mitigate unacceptable risk to the BES functions. The initial work product should be a set of security controls with applicability to high, medium and low impact Cyber Systems and how specific FERC directives have been

addressed *(as indicated in Appendix A: FERC Directives from Order 706).* Additionally, for each security control:

- State how the security control reduces risk appropriate to the impact categorization *[Drafting principle 11]*
- State how an objective third party with knowledge or expertise in security can measure the control *[Drafting principle 4]*
- State the rationale for making changes from previous versions [*Drafting principle 12]*
- Denote the applicability to (1) Generation Subsystems, (2) Transmission Subsystems, and (3) Control Centers. Provide clarifications or enhancements where necessary to meet the security control objective in that environment *[3.2 acceptability among survey respondents]*.
- Denote the priority for the security control relative to the risk it mitigates (i.e. P1, P2, P3, None). *[SP800-53 introduced this in version 3, and it could help in developing VRFs and implementation plans]*
- Denote applicability for differing vulnerability and threat profiles.
- Write controls based on risk profile (as well as impact categorization)
- Denote applicability for general purpose vs. proprietary operating systems.

5. Security Controls for Impact Categories with basic premise that the cost to implement security controls should reflect the reduction of risk to the BES commensurate with the impact category. The industry as a whole should first focus on mitigating the greatest amount of risk.
6. NERC CIP/NIST SP 800-53 will serve as the baseline and SANS, ISO, DHS, and ISA-99 provide supplemental or amplifying guidance.

B. Drafting Principles

Phil Huff noted that the first ten principles are drawn from NERC rules of procedure. The Team reviewed 11-5 and offered the following suggestions.

11. Reduce Risk [**3.5 acceptability among survey respondents**] **–** Security controls reduce risk appropriately for applicable BES impact categories.

Member Comments and Suggestions

- Depend on an entities implementation? Yes, but assume that we will be making risk decision of what is minimum acceptable for reducing risk as we develop the standards.
- This one deals again with what is high, medium and low.
- Throwing around "risk" a lot – There is a complaint that we use "risk" but cannot qualify it, nothing to document what we are doing reduces "risk" – show me how it is a "risk"? How do we justify using the word if we cannot quantify it
- Same problem with #11 – current standards assume a positive benefit from any effort to reduce risk – in federal model you perform risk assessment and decide whether what you are doing is acceptable.
- Need to clarify the level of organizational risk that applies – but have to have an industry baseline and justification that this is appropriate and reduces risk as we understand it in the industry.
- What are the threats we trying to counter so we know what to put into place to address it
- As we identify a control, we must assume controls reduce risks?

- We cannot do a risk assessment for the whole industry.
- Discussing the outcomes of having controls – this may be the overarching goal, rather than a principle.
- May need to define "reduce risk" – what is the intent of the controls? Reducing risk may be an outcome
- The list is intended as measure of review of the draft products of each group.
- Under the survey the question asked if it would be appropriate to document how the controls reduces risk. That is covered in the next section
- Cannot prescribe controls and quantify specific results – it is the controls as a whole?
- My concern is with the word "reduce." Reducing from what? Have to have a starting point.
- Talking about overarching principles which is fine but on page 4 asking each group to begin with a statement of the risk and we may get back into the circular argument – need to establish and clarify why we are offering a control. We will need to have some reason why requiring the industry to do this.
- If we do this for every control, we may get bogged down given the 200+ items listed – may simply need the justification for a category of controls rather for than each individual control.
- We need sound reasoning for why we are or not including a security control.
- We need to be sure we are not expecting a control to reduce a high risk impact is also applicable to a low impact item too.
- Need a principle that we need appropriate controls that are applicable to a category – controls that are appropriate and applicable – rephrase the principle so as not to lose that thought?
- Is #11 the same as #14? Not the same, as #14 is intended to avoid all of the compliance effort being aimed at low levels.
- "Security controls shall be appropriate for applicable BES impact categories."
- "Security controls shall be commensurate with identified level of BES impact categories."
- As a guiding principle this is fine – the Team understands the intent of this principle.

12. **Change Documentation** [**3.3 acceptability among survey respondents**] – Changes from prior versions of CIP Standards have clear rationale. These include the following types of changes:
    a. Above and beyond the current standards
    b. Removal of requirements
    c. Major formatting changes.

Member Comments

- We cannot pass anything that doesn't give a roadmap from how to get from version 2 to 3 to 4 – if we drop something along the way we need to justify it.
- May want to test and get validation from NERC staff before finalizing – make this part of the communication plan? Note that staff cannot speak for the commission
- Industry will want to know why it appears we have gone from asking them to do 40+ things to 200+ things – may be the same or less total work even if more items.

13. **Reduce Administrative Overhead** [**Suggested principle**] **–** Administrative documentation kept to the minimum that is necessary to verify acceptable risk.

Member Comments

- How do you measure compliance? If you reduce documentation? NERC and regions may make up what you need. We should be all for reducing documentation, but we have to show compliance.
- Currently, you are out of compliance unless through documentation you can prove you are in compliance.
- Documentation needs to be rational but we probably cannot completely eliminate documentation.
- No matter how much documentation we have, it seems it is never enough to completely prove compliance – documentation is always subject to interpretation. We must make this more precise
- As worded the principle is what you want – have to have adequate documentation but not more than needed.
- Cut off the principle after "necessary"?
- Also federal performance audits actually improve security.

14. **Priority [Suggested Principle] –** Implementation and compliance with the Standards are prioritized according to BES risk. The industry should focus on mitigating the greatest risk (i.e. not spend the majority of our resources on the low-impact Cyber Systems).

Member Comments

- We can't just bite off little parts – adding priorities may be done differently depending on your processes.
- Priority built in already – is this going after impact levels rather than risk? Prioritize based on BES impact. Prioritizing could be handled through the implementation plan followed by a compliance plan.
- Need to just remove – already categorizing into high, medium, low – that set priorities, still have to get to the low too.
- Replace "risk" with "impact" – how do we focus on "high impact" to get most bang for the buck. It may important enough to do, but perhaps not important enough to test? Simply remove "and compliance" from the sentence?
- *(*Parking Lot item)* Can small entities leverage the work of others? Should we allow them to? Ballot body may be more amenable if we do this.
- What is the mechanism that allows them to do that since audits cannot be shared?
- These are principles for the Team to use moving forward, and are not for the industry: strike the second sentence?

15. **Minimize TFEs** [**Suggested principle**] **–** Security controls should minimize the need for TFEs

Member Comments

- What is the principle or goal? To eliminate TFEs? It is clear that the TFE process is broken – should be striving to eliminate the need for TFEs.
- TFEs were an end run on the requirements – reword standards to eliminate the need for an "end run."
- Allow for controls to mitigate and document for older equipment that cannot meet all the requirements – call it whatever you want.
- TFE is an existing term and process – eliminate the need for TFEs – replace with an effective exception process. We will still have a need for exceptions. Add compensating controls?
- TFE grants safe harbor from retroactive sanctions – can we write any exception without such retroactive protection? Are we constrained by the current process? This is a question for NERC.
- "Mitigating controls" vs. "Compensating controls" are very different terms.
- There may be a place for exceptions, but not the current TFE system that has been misused.
- Reasonable to expect there will need to be some exceptions – we cannot write a standard that will cover all possibilities.
- Issue is over the word "exception" rather than the concept or need for them. We know there will be instances where an entity cannot meet the letter of the standard – remember these standards are mandatory.

C. Control Group Categories

Phil Huff outlined the control group categories that the strawman draft proposed depicted below:

ID	Control Group	NERC Standard	NIST SP 800-53 Family
1	Security Governance	CIP-003 – R1, R2, R3;	Planning, Risk Assessment, Program Management
2	Personnel and Training	CIP-004 – R1, R2, R3	Awareness and Training, Personnel Security
3	Communication Protection	CIP-005 R1, R3	System and Communication Protection
4	Physical Security	CIP-006 R1 through R6	Physical and Environmental Protection
5	Systems Management	CIP-007 R2, R3, R4, R6	System and Information Integrity
6	Incident Response	CIP-008 R1 & R2	Incident Response
7	Recovery Plans	CIP-009 R1 through R5	Contingency Planning
8	Access Control (Technical)	CIP-003 R5; CIP-005 R2; CIP-007 R5; CIP 004 R4	Access Control, Identification and Authentication
9	Audit and Accountability	CIP-005 R5, CIP-007 R9	Audit and Accountability
10	Configuration Management and System Lifecycle	CIP-003 R6; CIP-007 R1, R7	Configuration Management, Maintenance, Media Protection, System and Services Acquisition
11	Information Management	CIP-003 R4	Access Control, Media Protection
12	Security Assessments	CIP-005 R4, CIP-007 R8	Security Assessment and Authorization

Member Comments

- Number 12, Security Assessment should be moved up as part of Security Governance (#1)? Yes.
- Access control in #11 different from that in #8? Access to information versus access to systems. Remove access control from #11 as both uses of term covered under CIP 003 R5 in #8.

D. Proposed Sub-Teams

The Team reviewed the proposed six sub-teams in the strawman document including: Security Governance; Personnel and Physical Security; Operations Security; Recovery and Response; Access Control and Auditing; and Change Management, System Lifecycle and Information Management. On Tuesday morning sub-team preference forms were distributed to the members in the room and electronically to those participating on ready-talk. *(See Appendix # 7 Preference Form results).*

Member Comments

- Recognize that the six categories may leave only a couple members per team among members physically present
- Consider combining access controls and operations security?
- Consider having members serve on more than one group? Especially any categories that may need coordination?
- How can we account for those with time available for the group and those who don't? Careful we don't end up with a group of three but none have sufficient time to complete the task.
- Several mappings or cross walks exist already.
- May need to review mapping together as a team to start, then break off to deal with sub-questions
- Would it be beneficial to go through DHS(?) catalogue rather than NIST SP 800-53?
- Mapping exercise? Pull up a control and ask if it is applicable?
- Should we be working toward identifying the plan or approach first?
- Would discussion of High/Medium/Low happen with the mapping discussion?
- What is in the CIP now generally is the high – pare down from there to identify medium – then low.
- We need to draw on varied experiences in the Team to draw conclusions and map the controls. We also need to develop a common understanding by drawing on the groups experience
- Why are we defending against any standard? We were asked to consider NIST, not defend from it?
- Trying to identify gaps and explain why we did not include a particular control or standard
- Simply need to explain why we did not include a type or group of controls
- NIST is a different way of doing things, not directly comparable with existing CIP standards.
- I agree they are different – but looking at different references for ideas that may improve coverage. We should not be looking to make wholesale changes if we don't have to.

E. Review of Required Elements for Each Security Control
Phil Huff reviewed with the Team the strawman guidance for the sub-groups.

Member Comments

- The strawman guidance on high/medium/low was intended to simply offer an example, and is not trying to write the control
- Use high category and pare down from there?
- High/Medium/Low may mean different things when looking at control center versus a transmission subsystem.
- Medium will be a tough category to define.

- E.g. Passwords. May want shorter passwords changed less often for low than for high. The requirement is to use passwords for authentication – do you define the complexity for the level of impact?
- Consider establishing a short succinct requirement and then look to the column and row in the attachment tied to the level of impact.

III. SECURITY CONTROLS FORMAT AND SUB-GROUPS

Following a mid-morning break on Wednesday, the Team reviewed sub-team assignments and then broke out into sub-teams to initially review the DHS catalogue of controls to determine the applicability of these controls to their sub-group categories. On Wednesday afternoon the sub-groups provided initial reports.

A. Initial Format Discussion

Following the reports the Team discussed the implications for the ultimate standards/control format and for the further development of security controls in the context of CIP-002-4.

Overall Comments following Initial Sub-Group Reports on Wednesday

- No equivalency requirements in this one. Looked at requirement and supplemental guidance.
- With a CIP requirement- take side by side. Look for what is different
- JS: FAQ- "access point" defines ESP. Providing traffic control in/out of ESP. Have to have fire wall. Access control-
- Access control and monitoring- on DHS- access control pp 93. Identification authentification of a use etc. for granting access to user. Combine and you have access, authorized access. 3 stages of the process.
- How IT/cyber security- access control. Without a NERC definition of "access control"
- "Network perimeter protection"- visuals upper management. "Guards, gates and guns"- physical and virtual perimeters to explain without jargon.
- Identification and authentification- problematic do not exist in any legacy or modern in any SCADA, ill defined. There will be lots of discussion around this issue. It is possible to authenticate and identify?
- Why no "access control" definition? Disappointed with small number of defined terms.
- Parking Lot issue: Access control.
- Remote access through an ESP. After spot audit. This is an important issue. We need to deal with universally understood concepts, understood the same way. Get away from concepts understood only by a drafting team.
- The problem may be who accepted it?
- NERC defined terms- if we put them in a reference document, they will not be part of the standard.
- Different approach – said yes to good ideas but recognize may be difficult to write a requirement – we did not look to see if already in the CIP, just whether it should be considered "high."

- Go back and agree on the criteria for high, medium, low and then repeat the review to categorize the ones identified by the sub teams.
- Should we have a first draft of the total bucket and then refine the issues? We can then use a standard template to redact high, medium, low.
- Take work done today through a next step to look at words surrounding the possible requirement
- Need to talk about format – how are we going to structure the requirements moving forward?
- Make a change to one standard it ripples through the others – can we make these stand alone? I need more information on how we are going to structure the standard to avoid tripping over each other in sub teams.
- Take one family – a smaller one – and develop a "proof of concept" for putting into a table to establish a template for the other larger families
- Collapsing to smaller number of requirements? Caution, the smaller the number of standards, the more likely we will be out of compliance with a standard.
- Out of compliance with a requirement, not just a standard?
- Agree we should work on one to establish the standard.
- Which one should we utilize?
- The Team should take the .1 in each DHS family as policy to be addressed in the Governance
- We will need to address when a control family crosses over multiple areas
- Need to work on getting requirements into a new format or framework – but collectively need to discuss how to construct the bucket. I.e. what is the control framework? What is preference and what builds clarity and understanding?
- If keeping CIP 003-009, do we keep the policies spread through each or pulled out into a separate stand alone
- May depend on who the target user of the document is – target to field, management, others?
- How do we address generation, transmission or control centers? One size does not fit all – they each have unique requirements – need to make it easy to look up transmission requirements for example.
- Think about the NERC development process and that you need to sell this to through the ballot process to the industry – start with existing and refine and modify from there – otherwise much more difficult to sell to industry
- Our drafting principles call for keeping it close to current structure.
- Page 3 of strawman has a suggested structure in the chart – current CIP003-009 into control groups.
- Small group meet after we adjourn to discuss and develop a starting point for tomorrow's discussion
- Also need to compile the "yes" and "maybe" from the sub teams
- Not suggesting throw the whole structure out but collect common policies together first – shouldn't worry about whether they map one-to-one with current structure – putting policies

together will help us sell to industry the changes – elevate policy and bucket the rest of the controls into appropriate sections

B. Consideration of Security Controls Format Options

On Thursday morning following the sub-groups' first round of meetings on Wednesday afternoon, the Team discussed whether the proposed "control group" format was being proposed as an organization for revising the current CIP 003-009 format or just a starting point for the Team's work. The Team discussed the choices going forward, initially identifying three: using the current CIP, the NIST SP 800-53 format or the DHS security controls structure.

Member comments

- Do we need to have some motion or vote to determine the form we are moving forward
- Need a good strong framework to build on – need to determine today what we will use as the structure – move the pieces around using the structure we have or create a new structure – we struggle with the existing structure – don't like the idea of just moving the deck chairs around – need to resolve and get it behind us
- Need to discuss strengths and weaknesses of each and may need to recognize that option that is not favored may still have an element we want to incorporate
- The Team was called together to fix problems identified by FERC. We need to fix those with the tools available including NIST – order did not call for a change in structure – people are familiar with it and likely to vote in favor – go recognize and go to the relevant R and then the table to understand how to comply – logical layout that is familiar to the industry.
- All of our programs are written in the format to comply with this format.
- Look at existing documentation and how it relates to current model – may be a burden to many to adjust to a new model without any clear payback.
- There will be a significant impact on documentation for any of the options. Yes, have an investment of time and resources in the existing CIP, but we should look at the next 3-5 year result. All of the models under consideration will require a major rewrite.
- Whatever we come up with needs to better than what we have no matter what the format – concern is that the substance is easy to understand and follow regardless of the format
- Are we going to stick with the h-m-l format? Be prepared if comments are universally against that format.
- Expect, like the past, that comments will be across the spectrum of support-nonsupport
- What is "better"? Building a house before we know what type of house we want.
- "Better" means concise, easy to understand and to implement.
- We identified about 90 security controls yesterday – if we have a new access control will we will have to add it in several places producing duplication?
- I assumed the twelve control groups were to be used to help distribute the new items into the current format – this would fix problems without creating new ones
- Stay with current structure or move to a functional model –satisfied with current model or ready to move on to something else?

- Discussed this issue before – writing the standards more like NIST is just one option – rewriting the current standards is not off the table.
- The issue is not NIST versus the current CIP structure. The question is does the current structure work or not. If not, what can we do to improve it? There may be resistance to change, but our task is to make the process better – "we can not keep the system as is and just move the deck chairs around."
- Difference between structure and organization – keep the current structure and the topical references? Same titles and thought processes?
- Yes the topics stay the same but the meat within may change – make the changes fit within that
- With CIP002 not sure fits with the old structures organization
- Where does the functional strawman fit? A new CIP-010 or in the existing CIP 003-009 structure?
- Preferably the latter

Option #1- Current CIP-003-009

Strengths

- Current structure allows industry to meet their respective needs.
- Industry understands system.
- Some industry concerned that proposed CIP002 is turning the world upside down – may need a hybrid to get the industry buy-in and acceptance

Weaknesses

- The current policy mixes enterprise wide policies and technical controls – confusion in implementation
- Number of TFEs and interpretation requests are indicative of some of the issues/problems with the current CIP.
- Focus on compliance versus performance assurance – some are focused solely on compliance and documentation, not measurable improvement in security.
- Core problem with current organization – topics are okay – but cannot understand and implement because we have moved away from commonly understood industry terms – key is in CIP005 and concept of perimeter and security enforcement mechanism.

Member Comments

- Are we here to fix the system or to change the terms of art?
- Keep the discussion on the structure – if task is to reword the current structure we could have done that long ago – are we tasked with redeveloping the standards for the industry or not
- Here to write a new standard or not?
- Not advocating keeping current structure as is – suggesting start with CIP 003-009 and reorganize as needed while keeping basic structure, can still have new Requirements – functional controls would fall into a table pointed to

- For existing structure option, will this allow us to still move things around? Yes, in particular to adjust for CIP 002. The table(s) still have to be tied to a standard.

Option #2- DHS standard

Strengths
- DHS leverages the work already done by the industry.

Weaknesses
- If move away from current structure, logistic issue of retiring all the current standards and start with CIP010 – for a couple of years there is potential for confusion – can keep current system and cross reference.

Member Comments
- Do we need to move away for question of documentation and talk about the technical difficulties of implementation?
- Where does electronic perimeter for a system begin and end? Left with an organization-by-organization determination of what and how to implement and hope you pass the audit – equipment out in the field what type of protection does it need – have to create things that do not exist today in order to comply for an audit.
- Cannot measure art – just because a group creates a strawman does not mean it is the right structure or just a pile of hay – security perimeter was created in 2002 at the request of FERC – our CIP-002 changes focus and sets the basis for h-m-l standard to bring focus of resources on the high.

Option #3- Strawman Approach

Strengths
- The strawman doesn't completely abandon the system understood by the industry – we identified 53 more controls yesterday – the strawman will accommodate the large number of new additions.
- The strawman offers a more logical grouping – not necessarily the final format –
- Group should not lose sight of the fact the strawman drafting group proposed and eleven-group structure.
- Talking about structure only, not content – the change shouldn't matter if it is easier to understand and implement – it is the substance not the structure that should matter.
- This format does leverage industries work and is not a radical change.

Weaknesses
- The more cross referencing you have, the greater opportunity for confusion – get caught in a repeating loop or circular logic –

Option #4- Prepare Requirements First, then Determine Format

The facilitators suggested an acceptability ranking of the three options. Several members suggested a fourth option which the Team tested.

Member Comments

- Can we right the requirements first, then find the model that fits them – I don't know what the right model is until I know what the parts are – a fourth option?
- Core issue is whether we stick with current structure or look for something different
- Prepare Requirements first?
- Don't know enough yet to know what structure we need
- Still too much unknown at this point – hopefully out of the drafting effort to develop requirements and controls will give us better idea of which format works best.
- Defer the format question until after drafting requirements. The Team will return to this by the end of March meeting

Prepare Requirements First, then Decide on Format

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	9	**6**	**0**	**1**	**3.3 of 4**

As a result of strong support for preparing the requirements first, the Team decided not to rank the acceptability of three options.

C. Subgroup Meetings and Reports

The Sub-groups met on Wednesday morning and early afternoon and then reported their initial results on the review of selecting candidate controls from the DHS catalogue. The Sub-groups met for a second time on Thursday morning and early afternoon to review security controls and begin exploring the drafting of requirements.

Prior to the second sub-team break-outs, the Team agreed on a sub-team format for collecting information with the following columns:

19. SDT Team Name
20. Section #
21. Title
22. NERC Security Guidance
23. NERC CIP-2
24. NIST SP 800-53
25. CSO 706 SDT Applicable
26. SDT Comments
27. Validated 706 SDT Applicable (Yes/No)
28. Existing CIP Requirement Cross Reference
29. FERC Order 706 References (Paragraph #s)
30. Requirement Definition

31. Controls- High
32. Controls- Medium
33. Controls- Low
34. Applicability- Transmission
35. Applicability- Generation
36. Applicability- Control Centers

1. Security Governance and Assessments *(Gerry Freese, Jon Stanford, Rich Kinas)*

a. First Break Out- Identifying Candidate DHS Security Controls

- Note that the DHS doesn't call out "document" something such as CIP does
- Does in other areas
- In this area we may need to add "document" where appropriate
- Either cover globally as an opening statement or try to address where needed
- Cannot have implied documentation – must be called for in specific requirements – but should call for documentation where needed
- Do you have to document how you plan to document compliance?
- Assurance frameworks – federal standards referenced
- Excluded 2.2.5 and 2.2.6 – why?
- This has a federal slant to it – not that you shouldn't cover third parties but it is covered earlier in the standard – if write correctly then you can cover the third party situations in other areas
- DHS catalogue has a federal flavor and context
- Under NERC policy you cannot enforce on a third party except contractually
- Statute disallows you requiring a third party compliance – NERC cannot come in and obligate a vendor to follow requirements – NERC can only audit the registered entity
- Question mark by 2.7.1 – hard to put into CIP context and put into a requirement – the planning requirement in DIP is only implied –
- Concept of planning is good but coordinating between physical security and cyber security is very difficult
- Good placeholder item about how to deal with this one
- Know what is wrong but not sure how to fix it – strategic planning for security is a good idea, especially at a regional level – but need to be realistic, logical and not burdensome to individual entities – may fall outside these standards
- Can't write a standard to a functional model that does not exist yet – maybe CIP 10 is regional security coordination – make sure we are not creating work to create work – how do you craft requirement so they can be measured and audited for compliance? – but this idea into the parking lot for later consideration
- 2.17.4 – no? may want to parking lot "best practices" as a guidance document – agree it is not a requirement question

- If something is in the standards today then we were suppose to be reluctant to pull it out – is that true across the board – appears here that we may be pulling out items already in the standards
- Second to last column in the appendix has the CIP standards reference – need to gut check whether a few of these are included as topics rather than in intent of the requirement – needs a critical eye with as needed explanation as to why it is pulled out
- Vulnerability assessments included in several places – wording may not be the same – some of these no's should not be completely discounted – example is 2.17.2 and 2.18.4
- 2.18.11 and 2.1812 cover the issue
- risk management? Can only protect 90% - not writing controls to defeat your adversary – are we doing it justice if we throw it out
- reducing risk to an acceptable level to manage
- security control someone is looking for new threats and addressing them in a different way than we do today.
- That is part of risk management and risk decisions
- Is there a way to address risk management through the requirements? Put into the parking lot: a way to role risk management framework into the CIP requirements
- 2.18.6-10 are out
- 2.19.1??
- creating a whole new entity or beauracracy? – federal entities already have this – can we address this outside the federal context – parking lot: entity controls or common controls across entities
- there is a role for a forward looking plan – not sure how you audit or measure it
- can this be part of the assessment phase?
- 2.19.3??
- federal context this is identified – seems like a good idea – not sure how it applies to the private context; how it would look
- may have issues of measurement and enforcement – may be a good business practice but not in the requirements – same may be true of 2.19.2 –
- push back on "senior manager" from industry and this is even more prescriptive
- 2.19.5 already captured in CIP 002 – so it is a "no" here – it is here but only as a federal mandated response to specific legislation –

b. 2nd Break Out- Identifying Controls and Drafting Requirements

- Went through controls again but did not cross walk with CIP – will look back through CIP once have initial set
- Kept "organization" rather than "responsible entity"
- Reviewed requirement definitions – may have to adjust language to fit CIP

- 2.2.1-.3 pulled up into 2.1.1 language
- 2.2.4 belongs in the response section
- 2.7.1 – said no as is – 2.7.2 develop a security plan – not much changed from DHS – if we keep ESP then need to go back and reference here
- Did not include change to BES cyber system.
- Enterprise architecture? May not want that concept – the concept was a response to Federal law – left here until we determine if and how we want to address across other areas too
- the controls in this case are the requirements
- 2.7.10 – plan update
- May need to be prescriptive here using the table
- 2.17.1 – changed to NO and removed as too cumbersome – noted as a "?" in the first pass – not much benefit and anticipate huge push back from industry – difficult to monitor or test
- 2.18.5 – control system connections – difficult to take federal concept into the CIP/BES mind set – many vendors require a connection into your system to service their equipment – may need some assurance at both ends – should at a minimum document the relationship exists
- This is a mutual distrust, defend against friend and foe – that is where the concept of ESP comes in
- Opening a hole to a vendor
- Discussed as a team and pushed the issue over to security operations.
- 2.18.2 moved up above
- 2.191 captured in global policy
- 2.19.2 removed as too directive – may damage most organizations in terms of accountability
- 2.19.3 removed
- Figured out the first requirement – looked primarily at the DHS catalogue but making adjustments to language as needed
- Policy that addresses issues out of CIP002
- Assuming .1 requirements are being put into a policy section of CIP 003 – went through 2.1 and listed the policy and the sub-policy under it
- Also reviewed NIST language to see if it works in CIP context
- Illustrative example in 2.7.1 – document to explain a document? A policy that points to a program that may not exist?
- Thinking we may need to take this out – current words has a federal only context
- Do we change the CIP requirement?
- Look at 2.2.2 – high level policy set out in 2.2.1 – if leave this one in as a requirement may be adding layers of bureaucracy – this may be an opportunity to clarify, simplify and make it more implementable

- Eliminated some sub areas identified yesterday
- Tidy up and scope DHS language. Go back later and look at existing CIP- and drafts and lift all the ".1"s up.
- Instead of "Organization" will use Registered Entity (RE) consistently.
- The Sub-Team requested that Dave Norton join their team. Chair and Vice Chair also suggest checking with John Lim to see if he might join when he returns.

2. Personnel and Physical Security. *(Doug Johnson, Rob Antonishen, Kevin Sherlin).*

a. First Break Out- Identifying Candidate DHS Security Controls

- Covering DHS 2.8 Operations Security; 2.11 awareness training; 2.4 Physical security; 2.10 system maintenance; and 2.14 System integrity
- How should we pick up current CIP requirements that have no equivalency in this section? "Leadership" e.g. doesn't belong in CIP 003. How to ensure these get captured.
- "The designated manager" is a generic reference.
- Exceptions- CIP requirements- no explicit treatment of this in the DHS.
- Does this go in governance?
- 706 order- define- "parameters of exceptional circumstances" needs to go somewhere? Back in Governance?
- Factor in outstanding interpretations for current CIP standards.
- Reassessed the validity of the DHS judgment on CIP- couple dropped, with a couple back in.
- Some in other groups? E.g. ".1" policies
- Got to one requirement- personal screening. Looking to draft less on the how and more on the what.
- Principle: Wording of standards- similar wording in both- conceptually equivalent. Stick with old CIP wording where possible unless 706 requires otherwise.
- Principle- keep the detail level of the current CIP.
- Consistent with Access Control.
- Shortening up requirements.
- 2 ways to write requirement. The responsible entity shall have a program …consistent with state, federal. (consisting of placed somewhere else).
- Howard G:
- All go in the requirement, unless there are going to be differences between H/M/L and environments.
- FERC says improve the reliability standards.

- By adopting the standards, we said this is acceptable for reliability. For making less restrictive.
- E.g. if we were to scrap 7-year refresh. Or change to 10 years, we would need a compelling reason. Change to 5, i.e. strengthen it and you will be fine.
- FERC just approved TFE filing but requires a compliance filing. Within 90 days. Put those 2

b. 2nd Break Out- Identifying Controls and Drafting Requirements

- Started working on personnel security and training (2.3 DHS). Started with CIP and noted where changes made and suggested additions.
- They have some of the FERC order items in the mix.
- We will need to go into the determination high/med/low ahead.
- Need to get into the Physical security side. (2.4 DHS).
- 2.11- awareness training and training before access.
- Sub-team will get with the Access Control and Auditing Sub-Team.

3. Operations Security *(Jay Cribb, John Varnell, Jackie Collett & Jim Brenton)*

a. First Break Out- Identifying Candidate DHS Security Controls

The sub-team started with the following example to see what requirement drafting might entail (*E.g.*2.8.7)

1. The RE shall insure that all BES Cyber System component are within an Electronic Security Perimeter.
2. The RE shall manage the ESP gozintas and gozoutas (insert table to define "manage" at the different impact levels/environments).

E.g.

Ports /services enumation	H	M X	L X	CC/Gen/Tran
Strong Auth. For Remote Interactive Access	H	M X	L	

- Boundary protection 2.8.7
- 2 requirements. make sure everything in boundary and manage that boundary.
- What does "manage" mean at that level? Take sub Rs in 005 and put down left side of table.

Member Comments

- PH Defined ESP around crucial cyber assets- in CIP 002- boundary access control into and out of the cyber system.
- Why define a boundary? Need to know what is coming in going out.
- **2.8.7** talks about identifying a boundary.

- **I**s there a need of providing a glossary of new terms we should use as we write these requirements?
- If concepts roughly the same, use the "term"- Re-define to take out the CCA.
- CIP is tied around CCAs? Do CCAs have to be inside it? Boundary at DHS is generic. It isn't tied to asset, category or definition.
- If not ESP, (or use electronic security boundary) looking at this as more of a concept.
- Boundary "protection" is a function- critical cyber assets and a boundary around them, or perimeter.
- CIP tied to assets vs. federal concept of compliance. Problem with "electronic boundary" is that it constrains compliance.
- Think of "network boundaries"
- There is no standard in industry as to what an ESP is. Industry grappled with this one.

b. 2nd Break Out- Identifying Controls and Drafting Requirements

- The Sub-team met with the Access Control and Auditing group to coordinate and clarify which sub-team would deal with the access control issues in security operations.
- R1 and R3. Controls 2.87
- Drafted 5 requirements and added rows to the chart.
- High level –general ideas for requirements.
- Sub-requirements in R1 are definitional matters. Sub-team started a list of definitions, e.g. access points defined.
- #2- needs to scope this one as it represents a whole new concept.
- Sub-team is reworking R1, 4 and 5. They are a mess today. The Sub-team will make more succinct.
- Security systems- access control, monitoring. Some are monitoring more than 1 system.
- Are there auditing issues in R4 and R5?
- Went through R1 and R3 in CIP 005 and came up with five requirements with all components within the ESP and all Access Points are identified
- Need much more definition to Electronic Security Perimeter
- Also Remote Interactive Access
- Systems within the ESP are part of the Cyber System (R1.4 and 1.5)
- Monitor and log all access through an ESP Access Point
- Caution – security monitoring systems may monitor or protect more than one BES cyber system
- 1.4 and 1.5 look like monitoring systems – may need to coordinate with Auditing sub team
- Add summary description to document proposed changes

- May want to build a related glossary – be sure we are using the terms consistently across all the sections

4. Recovery and Response *(Jeri Domingo Brewer, Jason Marshall, Joe Doetzl, Scott Rosenberger)*

a. First Break Out- Identifying Candidate DHS Security Controls

- Validation of CIP and cross-reference and evaluate 706 whether there were paragraphs directed changes to these standards/requirements.
- "Continuity of operations" DHS- much broader.
- CIP- recovery and incidence of response. Overlap with other reliability standards.
- Clarify who and what this applies to
- Training in CIP 004 may take care of this training.
- Incident handling-look to FERC 706 paragraph.
- Looking at requirements next.

b. 2nd Break Out- Identifying Controls and Drafting Requirements

- Continuity of operations – part of critical business function practice –
- CIP 008 and 009 are straightforward
- Incident response: there are some elements regarding training, those pieces may need to remain in personnel training but overlap we need to discuss
- In the physical section there was a section on location of physical assets – does that fit more in your section?
- Much of the requirements are straightforward and will not require significant rewrites
- High impact- to low impact
- Federal government concept of "vital records" relates to continuity of service/operations. Requires more comprehensive planning than CIP.
- Incident response
- Training requirements- regarding recovery and response. Not clear whether these stay in this section vs. group responsible for training
- Physical section addresses choice of physical location of assets.
- Scott Rosenburger will take the lead from here on this section along with Joe Doetzl.

5. Access Control and Auditing *(Sharon Edwards, Phil Huff and Jeff Hoffman)*

a. First Break Out- Identifying Candidate DHS Security Controls

- Assumed the table and decisions apply to high impact only
- "Yes" means we will look at it further, not necessarily adopt in whole
- Account Management- 2.15.3- side-by-side CIP and DHS comparison.
- E.g. deleted #9 DHS side.

- Cross-referenced to existing CIP language.
- This should be incorporated into CIP #7 "specifically authorizing and monitoring the use of guest/anonymous accounts.
- Helpful to see what Jay's team did.
- E.g. periodic review- line items that could be put into a table format.
- Got through 1 out of 15 controls on our plate. Time is needed for this.
- Separation of duties? Cannot be done in some cases
- Looking at separating administrative from security duties
- That is a best practice, and should not be a requirement subject to possible fines
- Original intent was to have two people to verify an action by separating or limiting the scope of respective roles, Turn into a recommended practice, not a requirement
- Need to go back through the items in gray – assumed they were already in the CIP, but need to review them further

b. 2nd Break Out- Identifying Controls and Drafting Requirements

- Sub-Team focused on understanding the process and walked through one in detail – then divided up the rest for further work
- Identified changes to CIP
- Concerned that the current language allows organizational approval rather than specific individual. However, that allows for different organizational structures.
- CIP says "designate" rather than "authorized" – the former is more rigorous
- If CIP is the master language – having trouble putting into a master spreadsheet designed to address DHS requirements
- Need to modify the table to note CIP language not covered by DHS catalogue – add a row to each family
- End of presentation-- governance question.
- Clarify the meaning of "appropriate approvals."
- This is hard issue in terms of DHS and CIP.
- In the Federal context, this is shown by testing. It is built into the system as a performance framework and life cycle maturity.
- CIP- granular language- is this a weak compensation for a more mature control?
- What happens to a documentation step?
- Approval by "Designated personnel"
- Separately requires a list of who are the authorizing individuals.

6. **Change Management System Lifecycle and Information Management.** *(Dave Revill, Keith Stouffer and Bill Winters)*

a. First Break Out- Identifying Candidate DHS Security Controls

- Didn't get to 706 yet. Next task after cracking requirements language.
- Got through 1 family. 3 requirements left in. Removed 2-3 had yes on yesterday but on further review.
- 2.5.1 punted to the governance group.
- Requirement- policy 1.2.5.1, 2.5. 4, Acquisitions (dropped 252 and 253).
- E.g. 2.5.4 The organization develops security functional requirements specifications and documentation requirements for the BES cyber system acquisitions.

b. 2nd Break Out- Identifying Controls and Drafting Requirements

- 5 families (12-15 in each family)
- Sub-team has got through 1st family.
- First 3 controls of 2nd family (maybe an overlap with maintenance)
- When equivalency- the harmonization exercise takes more time.
- Configuration and change management
- System life cycle (not much overlap)
- Information mgt.- tough family regardless-
- 2.5.7 User installed software. Said yes initially. Really turned out more about authorizing to install. Since this is already managed through configuration change management process approval, we changed this to No.
- DHS-less concern about saying things multiple times unlike CIP.
- 2.6.1-policy will be handled by the Governance Sub-Team.
- Baseline configuration. - Mitre report and mapping from DHS catalogue. Suggested including in CIPS. Sub-Team didn't agree with that.
- Control written.

D. Final Reflections on the Sub-Team Output

On Friday morning, following the sub-team reports, the Team offered reflections on the sub-team exercise.

- Where does spreadsheet end up – is it proof we considered or is it just and internal document – may need to be careful in the comments
- Initially this should be just an internal documentation of the Team's discussion and agreements.

- Suggest more is better since we do not know its future – unlikely to be filed with a regulator but not sure how much justification we need in a text formatted future filing – also may be circulated as email to + list which makes it virtually public
- Don't think I need to justify why a DHS does not fit in CIP – "considered" as requested.
- May want a little more detail than just "too cumbersome" for our own use a few months down the road.
- Denote and label this document as a "working draft."

IV. NEXT STEPS

On Friday morning following the Sub-Team reports, the facilitators presented and the Team reviewed and refined the next steps and assignments emerging from the meeting:

A. Next Steps- SDT

1. Revise the Strawman based on Tucker outcomes- Phil and circulate to SDT
2. Get the overall SDT schedule/work plan out ASAP consistent with adopted NERC schedule (Scott Mix and Bob Jones)
3. Members provide comments early next week on draft Webinar materials to Jay/Sharon(by Tuesday/Wed)
4. Members provide questions to Joe B for FERC/NERC consideration at Jan 28 meeting by Jan 26. Joe will send around info on phone link up etc. Members consider participating.
5. Feb 3 Webinar- members encouraged to participate. Jay and Sharon lead.
6. Draft Tucker Summary circulated to SDT by end of Jan.

B. Sub-Team Assignments

1. Sub-teams will request today or ASAP assistance from Howard, Scott or Joe in their meetings and set their meetings and coordinate with Joe
2. Get the sub team master schedule from next week to Austin out ASAP. NERC will help resource these in terms of ready talk. (Joe B coordinates)
3. Recovery and Response- Jeri will send to Scott R. draft and join the first conference call meeting.
4. Prepare progress reports and any key questions for presentation in Austin on Friday morning.

C. CIP 002-4 Review

1. 'Ugly Dump" of raw comments from Industry on February 9th or 10th to be sent to the team (Scott Mix).
2. Informal Industry Comments due by Close of Business Friday February 12, 2010.
3. Meeting in Phoenix. 1 p.m. Tues- Feb 16 (15 is holiday) through noon on Friday February 19.
4. Draft Compilation and organization of comments and to be sent out over weekend. Feb 13 or 14 (John Lim and Scott Mix).
5. Full and small group review of comments and consideration of changes to CIP 002-4.
6. Agreement on CIP 002 as revised for posting for 45 day at conclusion of Austin meeting.

D. Work plan and Schedule Review

Scott Mix presented a revised proposed schedule for CIP 002 and the security controls requirements *(See Appendix #5).* The Team liked the presentation in which the two efforts are put in parallel columns and shows the amount of work ahead.

E. FERC/NERC Workshop Questions
Phil Huff reviewed some questions that the Team discussed for FERC meeting next week including:

1) What expectations are there regarding coordination with the Smart Grid CSCTG (Cyber Security Coordination Task Group) product and how we use NIST SP 800-53/DHS Catalogue?
2) NIST SP 800-53 is an organizational risk management framework, which allows for tailoring and compensating controls. However, FERC Order 706 calls for extensive oversight for any exceptions. What are their thoughts on reconciling these seemingly conflicting objectives?
3) The process to make modifications to the Standards through a FERC Order is very resource intensive. Conversely, changes made prior to industry balloting are relatively cheap. Is it possible to have a process where the team can receive feedback from FERC prior to ballot?
4) To what degree can we remove or lessen prescriptive elements in the current CIP Standard where the risk reduction does not justify the consumption of industry resources?
5) Have we captured all of the directives from order 706 in the filing from December?

He noted this was a working list which will be circulated for members to suggest additions to in advance of the January 28 FERC/NERC workshop.

F. Sub-Team Organization and Next Steps
Joe Bucciero will be soliciting from each Sub-Team their meeting schedules to produce a master Sub-Team schedule from this meeting to Austin. He noted that Ready talk will be made available to the Sub-Teams so they can review and share documents.

The facilitators noted that each Sub-Team should plan on preparing and presenting short progress reports and key questions for presentation at the Austin meeting which will primarily focus on refining CIP-002-4 in response to industry comments. NERC will try to get Maureen Long to the Austin meeting on Thursday to be available to address the response and refinements of the CIP-002-4. The Team needs to reach agreement on CIP 002 as revised for posting for 45 day period.

Phil Huff on behalf of the SDT thanked Jeri Domingo Brewer for her leadership over the past 16 months. Ms. Brewer acknowledged the opportunity to get to know the SDT members and noted the honor of having worked with them to produce excellent and timely outcomes. She urged the Team to continue to build on the foundation of trust and collegiality to complete the task assigned by December 2010.

Mr. Huff then thanked Dave Revill for hosting the meeting and providing excellent support for this critical meeting.

The SDT adjourned at 12:30 p.m. on January 22, 2010. Several Sub-Teams continued to meet following lunch on Friday afternoon.

Appendix # 1— Meeting Agenda

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Group Meetings May Not Have Access to Telephones and

Proposed Meeting Objectives/Outcomes

- Review the CSO 706 SDT 2010 Work plan
- Receive update on the CIP 002-4 filing and review process lessons learned
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan
- Review, discuss and test consensus for CIP guiding principles
- Review strawman documents, discuss and test consensus for CIP security controls approach, guidance, scope and applicability.
- Convene CIP Security Controls Drafting Groups
- Review Drafting Group Reports and Provide Feedback
- Agree on next steps and assignments

Draft Agenda

Tuesday **January 19, 2009**

1:00 p.m. Welcome and Opening Remarks- *Jeri Domingo-Brewer & Phil Huff*
Roll Call; NERC Antitrust Compliance Guidelines
Facilitator review and SDT acceptance of December 15-16, 2009 Little Rock SDT meeting summary
1:15 Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
1:20 Review of CSO 706 SDT Work plan- January-June, 2010- *Stu Langton*
1:40 Update on CIP 002 Filing- Process Lessons Learned- *Joe Bucciero*
2:00 Other Updates on other related cyber security initiatives- *NERC Staff and SDT Members*
2:15 NERC Update on Implementing the CIP Communication Plan
2:30 Overview of Security Controls Strawman Documents and Drafting Group Process
3:00 Review, Rating and Consensus Testing of Principles
4:00 Review Strawman Security Controls Categories and Proposed Drafting Sub-Teams
4:30 Review and Consensus Testing of Sources for Controls
5:00 Review of Required Elements for Each Security Control
5:15 Member Drafting Sub-Teams Preference Survey
5:25 Review of Proposal for Wednesday Agenda and Drafting Groups
5:30 *Recess*

Wednesday **January 20, 2010**

8:00 Welcome and Agenda Review- *Jeri Domingo-Brewer & Phil Huff*
8:10 Review of CIP Security Controls Drafting Template- *Scott Mix and Howard Gugel, NERC*
8:45 Review and Agree on Proposal for Drafting Security Controls and Sub Team Members

10:00	Convene Organizational Meetings of SDT Cyber Security Controls Sub Teams
12:45	Reconvene SDT Cyber Security Controls Sub Teams
3:0	Sub Team Organizational Reports, Requests and Needs and Full Team Feedback
4:50	Review Assignments and Thursday Agenda
5:00	*Recess*

Thursday	**January 21, 2010**
8:00	Welcome and Agenda Review- *Jeri Domingo-Brewer & Phil Huff*
8:15	Review any Drafting Group Requests/Needs
8:30	Reconvene SDT Cyber Security Controls Sub Teams
	Reconvene SDT Cyber Security Controls Sub Teams
3:00	Sub Team Reports and Full Team Feedback
4:50	Review Assignments and Friday Agenda
5:00	*Recess*

Friday	**January 22, 2010**
8:00	Welcome and Agenda Review- *Jeri Domingo-Brewer & Phil Huff*
8:15	Review any Drafting Group Requests/Needs
8:30	Reconvene SDT Cyber Security Controls Sub Teams
12:30	Sub Team Reports and Full Team Feedback
2:30	Review and Agree on Next Steps for Developing Security Controls (CIP 003-009) and Work plan for February 2010 Meeting on CIP 002-4 Industry Comments
	Meeting Evaluation
3:00	*Adjourn*

Appendix # 2 Attendees List

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation (Thurs)
2. Jeri Domingo-Brewer, Chair	U.S. Bureau of Reclamation
3. Jim Brenton (Wed-Fri.)	ERCOT
4. Jackie Collett	Manitoba Hydro (Wed/Thurs)
5. Jay S. Cribb	Information Security Analyst, Southern Company Services
6. Sharon Edwards	Duke Energy
7. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
8. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
9. Doug Johnson	Exelon Corporation – Commonwealth Edison
10. David S. Revill	Georgia Transmission Corporation
11. Jonathan Stanford	Bonneville Power Administration
12.Keith Stouffer	National Institute of Standards & Technology
13. John D. Varnell	Technology Director, Tenaska Power Services Co. (Wed. Thurs)
Roger Lampilla	NERC
Scott Mix	NERC
Howard Gugel	NERC
Gerry Adamski (Tues)	NERC
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Hal Beardal	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center

SDT Members Attending via Ready Talk and Phone

14. Joe Doetzl (Wed)	Manager, Information Security, Kansas City Pwr. & Light Co. (Thurs.)
15. Frank Kim (Thurs)	Ontario Hydro
16. Rich Kinas (Wed/Thurs)	Orlando Utilities Commission (Wed.)
17. David Norton	Entergy (Wed.
18. Scott Rosenberger (Wed)	Luminant Energy
19. Kevin Sherlin (Tues-Fri)	Sacramento Municipal Utility District (Wed. Thurs.)
20. William Winters (Wed-Thurs)	Arizona Public Service, Inc.

SDT Members Unable to Attend

1. John Lim, Chair	CISSP, Department Manager, Consolidated Edison Co. NY

Others Attending in Person

Jeff Hoffman	USBR
John Falsey	EMMT
Jason Marshall	Midwest ISO

David Van Winkle	GTC

Others Attending via WebEx and Phone

Rob Hardiman	Southern Company Transmission
Joseph Baxter	AECI
Justin Kelly	FERC
Justin Kelly	FERC
Michael Toecker	Burns and MacDonald Engineering
Bill Glynn	Westar Energy
Sam Merrell	Cert
Rob Wotherspoon	Orlando Utility Commission
Michael Fischette	LBWL
Laurel Moll	Orlando Utility Commission

Appendix #3

Meeting Evaluation Feedback for Inclusion in Team Meeting Summary

The SDT members used the following 0-to-10 scale in evaluating the meeting: 0 means totally disagree and 10 means totally agree. This reflects 12 member responses.

1. Please assess the overall meeting.

8.00 The agenda packet was very useful.
8.14 The Ready Talk document display and the audio were effective
9.40 The quality of the meeting facility was good.
8.50 The objectives for the meeting were stated at the outset.
8.33 Overall, the objectives of the meeting were fully achieved.

Was each of the following meeting objectives fully achieved?

8.50 Review the CSO 706 SDT 2010 Work plan
7.88 Receive update on the CIP 002-4 filing and review process lessons learned
8.71 Receive updates on other related cyber security initiatives
8.00 Receive a NERC update on implementing the CIP Communication Plan
8.63 Review, discuss and test consensus for CIP drafting principles
8.50 Review straw man documents, discuss and test consensus for CIP security controls approach, including drafting sub-teams, sources for controls and required elements for each security control.
9.50 Convene CIP Security Controls Sub-Teams
9.43 Review Sub-Team Reports and Provide Feedback
8.75 Agree on next steps and assignments

2. Please tell us how well you believe the Team engaged in the meeting.

7.63 The Chair and Vice Chair provided leadership and direction to Team and Facilitators
8.89 The Facilitators made sure the concerns of all members were heard.
8.63 The Facilitators made sure the concerns of all participants were heard.
7.63 The Facilitators helped clarify and summarize issues.
7.25 The Facilitators helped members build consensus.
7.63 The Facilitators helped us arrange our time well.

3. What is your level of satisfaction with what was achieved at the meeting?

7.44 Overall, I am very satisfied with the results of the meeting.
7.80 Overall, the design of the meeting agenda was effective.
8.70 I was very satisfied with the services provided by the Facilitators.
7.90 I am satisfied with the outcome of the meeting.
6.89 I am satisfied with the progress we are making as a Team.
8.80 I know what the next steps following this meeting will be.
8.80 I know who is responsible for the next steps.

4. Other comments (use other side)

What did we achieve?

- We decided not to meet the schedule by not saying we will do other stuff besides fix existing structure.

What are our biggest challenges going forward?

- Timetable.
- Time/resources.

What suggestions do you have for making the Team more productive?

- Get the members to express their concerns in a more productive manner.
- Read out loud FERC ORDER 706!

Appendix # 4 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost
- information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and Subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on
- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

APPENDIX # 5
MEETING SCHEDULE
JANUARY –DECEMBER 2010

Preliminary, Draft, Unofficial Schedule for CIP-002-4

CIP-002 Task	CIP 2 Milestone Date	Week-of	Date	CIP-003 -- CIP-009 Task
		1/18/10		SDT Meeting - Work on requirement language
		1/25/10		sub-team meetings
		2/1/10		sub-team meetings
Informal Comment Period closes	2/12/10	2/8/10		sub-team meetings
SDT Meeting - React to comments		2/15/10		
Post for 45-day formal comment; form ballot pool	2/25/10	2/22/10		sub-team meetings
		3/1/10		sub-team meetings
		3/8/10		SDT Meeting - Work on requirements
		3/15/10		post initial unofficial draft (aid in CIP-002 ballot process)
		3/22/10		sub-team meetings
Initial Ballot start	4/2/10	3/29/10		sub-team meetings
		4/5/10		sub-team meetings
Initial ballot close; SDT Meeting - respond to comments	4/12/10	4/12/10		
		4/19/10		sub-team meetings
Recirc Ballot start	4/30/10	4/26/10		sub-team meetings
		5/3/10		sub-team meetings
Recirc ballot close; SDT meeting - respond to comments	5/10/10	5/10/10		
Re-recirc ballot start	5/16/10	5/17/10		sub-team meetings
Re-recirc ballot close; BoT Approval	5/25/10	5/24/10		sub-team meetings
File with Regulators	5/31/10	5/31/10		sub-team meetings
		6/7/10		SDT Meeting - Work on requirements
		6/14/10		
		6/21/10		
		6/28/10		
		7/5/10		
		7/12/10		SDT Meeting
		7/19/10		
		7/26/10		
		8/2/10		

OCTOBER 2008–JULY 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.

2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development

3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 New Version process reviewed.

4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white "working" papers assigned, Technical Feasibility Exceptions white paper reviewed and refined.

5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed New Version white "working" papers.

- January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
- January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.

6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.

7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.

8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals

March 2–April 1, 2009 — 30-day Pre Ballot

Mid-March — NERC posts TFE draft Rules of Procedure for industry comment

March 30, 2009 — WebEx meeting(s) White Paper Drafting Team

April 1–10 — NERC Balloting on Version 2 Products

April 6, 2009 — WebEx meeting — White Paper Drafting Team

April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call

April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments

9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.

April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx

April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%

May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.

10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.

June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx

11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.

- *June — WebEx meeting(s)*
- *Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria*

CIP-002 DEVELOPMENT OF REQUIREMENTS, MEASURES, ETC. JULY-DECEMBER 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada
SDT reviewed, refined, and adopted SDT Working Paper. SDT adopted its response to NERC for Interpretation of CIP-006-1. SDT reviewed and adopted a proposal for CIP-002 Subgroups and Deliverables and convened subgroup organizational meetings to develop work plans. SDT adopted 2010 Meeting Schedule.

- *July–August Interim Conference call meeting(s)*
- *CIP-002 Subgroup meetings*
- *CIP-002 Coordination Team meeting*
- *August 3–5, 2009 in Winnipeg, Manitoba **NERC Member Representative Committee**. Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.*

13. August 20–21, 2009 in Charlotte, NC. SDT reviewed and responded to MRC input on Working Paper/CIP-002 Concepts and convened SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

- *July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper*
- *NERC Webinar- August–September Interim Conference Call meeting(s)*
- *CIP-002 Subgroup meetings (as ne*
- *CIP-002 Coordination Team meeting*

14. September 9–10, 2009 in Folsom, CA. SDT reviewed and considered industry comments on the Working Paper and CIP-002 concepts and their application to the subgroup work and addressed coordinating issues through joint subgroup meetings. SDT agreed on meeting dates and proposed locations for January–December 2010
September–October Interim WebEx meeting(s)

- *FERC Version 3 Urgent Action SDT conference call meetings*
- *CIP-002 Coordination Team meeting*

CIP VERSION 3 RESPONSE TO FERC ORDER, OCTOBER-DECEMBER, 2009

15. October 20–22, 2009 in Kansas City, MI. Reviewed new FERC Order and urgent action CIP Version 3 process; discussed key issues raised by SDT CIP 002 Subgroups, small group meetings and agreement on refinements to the CIP 002-009 schedule and drafting process for CIP 002-4.

- *October–November Drafting Team meeting(s)*
- *CIP-002 Coordination Team meeting*

16. November 16–19, 2009 in Orlando, FL

- SDT review, refine and adopt Version 3 "industry response" document.
- SDT plenary and drafting group session(s) — to draft, review and refine CIP-002-4 standard, requirements, measures and controls and related documents.
- November–December Interim Conference call meeting(s)
- Drafting teams as needed to finalize draft CIP 002-4 documents
- CIP-002 Coordination Team meeting
- *CIP 002-4 Drafting Team produces next draft based on Orlando Meeting input.*
- *December 2 CSO 706 SDT Version 3 Consideration of Comments Draft Conference Call*
- *December X, CSO 706 SDT CIP 002-4 Preview Conference Call*

17. December 15–16, 2009 in Little Rock AK

- SDT scenario "walk through" to test flow of CIP 002-4.
- SDT plenary and drafting group session(s) to review, refine, and agree on and adopt CIP-002-4 standard, requirements, measures and controls and related documents.
- Agree on initial posting of draft CIP-002-4 for industry review and comment.
- Agree on next steps and 2010 Work plan and schedule
- December 28, 2009 SDT Conference Call on CIP 002-4
- December 30, 2009 SDT Leadership Call- Security Controls Survey Draft

Appendix #6
MASTER SDT SURVEY RESPONSES FOR DEVELOPMENT OF CYBER SECURITY CONTROLS
(Updated Jan 12 2010)

16 SDT Member Respondents: **Rob Antonishen, Jim Brenton, Jackie Collett, Jay Cribb, Joe Doetzl, Sharon Edwards, Phil Huff, Doug Johnson, John Lim, Dave Norton, Chris Peters, Dave Revill, Scott Rosenberger, Kevin Sherlin, John Varnell, William Winters**

SDT Members Unable/No Response: Jeri Domingo-Brewer, Gerald Freese, Frank Kim, Rich Kina; Jonathan Stanford, Keith Stouffer
Industry Respondents: Thomas M. Overman, Boeing

NOTES:
1. This survey, developed by the SDT Chair and Vice Chairs over the holidays, is divided into 4 sections: Guiding Principles; Security Control Approaches; Security Control Guidance; and Security Control Scope/Documents and Applicability. It was sent to the Team on Wednesday, December 30 with a deadline of noon, January 5.
2. Within each section the statements/proposals are listed from "most acceptable" to "less acceptable based on an averaging of the member "acceptability ranks for each statement. Member comments and pros/cons are also included.
3. A SDT Sub-Team, made up of interested SDT member volunteers, will take these survey results following the January 6 SDT conference call and create a strawman document for review by the full team in advance of the in advance of the Jan 19-22 SDT meeting in Tucker, Georgia.

Interest in participating in a temporary SDT drafting group and able to commit to drafting documents and participating in up to two conference call meetings between January 6 and January 15 to produce draft strawman proposals for the development of security controls that will be reviewed by the SDT in Tucker?

Yes: **Jim Brenton, Jay Cribb, Joe Doetzl, Sharon Edwards, Phil Huff, Doug Johnson, Kevin Sherlin, John Varnell,**

No: John Lim *(Not available most of January)* Dave Revill, *(I would like to, but I can't make the time commitment necessary during those 2 weeks. I would like to participate as some sort of alternate when time allows if possible.)* Rob Antonishen (*Sorry – just don't have the time…I'm even getting pushback to 4 day meetings…)* Chris Peters, Scott Rosenberger (Team, I am interested but am sorry that I will not be able to dedicate the additional time with the current job requirements. I am working to get the appropriate staff added to lighten this load but that will take some time. Thanks**),** Jackie Collett, Dave Norton, William Winters

Yes- Thomas M. Overman, Boeing

SECTION 1: DRAFT STRAWMAN GUIDING PRINCIPLES FOR THE DEVELOPMENT OF SECURITY CONTROLS

A. **In developing security controls, the SDT will seek to minimize overlap, duplication, and reduce complexity of the requirements and controls.**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***Average Rank***
	12	**3**	**0**	**0**	**3.8**

Comments:

- Common sense.
- **It may be necessary to duplicate some items/sections to provide simplicity.**
- Who can argue against that? It's a source of much confusion in the current set of standards where all sorts of related things are split across standards and have different implementation plans and timeframes. We've got to stay away from that.

B. **In developing security controls, the SDT will document the security objective to be achieved for each security control to aid in future interpretations.**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***Average Rank***
	10	**6**	**0**	**0**	**3.6**

Comments:

- The emphasis should be on documenting the appropriate controls. If the SDT is diverting into documenting all of these items, it may take time away from the primary objective of documenting the controls. Some of these, i.e., reduction of risk to the BES functions, if done, may be follow-up items. Care should be taken to ensure that identifying and documenting appropriate controls is the priority.
- I don't disagree with this. However, I believe that if the security objective isn't already clear from the language in the requirement, then perhaps we didn't do a very good job writing the requirement.
- *THIS WILL ALSO HELP THE TEAM TO MEASURE THE VALIDITY OF THE OBJECTIVE AND WHETHER OR NOT THE SECURITY CONTROL ACHIEVES IT.*
- *This would be very nice to have though not essential. We should use a standardized framework if pursued to aid in standardized objectives (such as ISO,NIST)*
- If we are too narrow in defining our security objectives, we may not be able to provide enough flexibility for the future security landscape.
- This seems mandatory – isn't this what a requirement is all about? If we are doing 'what' and now 'how' standards then this is basic. It seems that ALL we would state is the security objective to be achieved and going beyond that means we have dropped into 'how' standards.

C. **In developing security controls, the SDT will document how each security control (and enhancement) reduces the risk to the BES functions appropriate to the impact categorization.**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***Average Rank***
	9	**5**	**1**	**0**	**3.5**

Comments:

- The emphasis should be on documenting the appropriate controls. If the SDT is diverting into documenting all of these items, it may take time away from the primary objective of documenting the controls. Some of these, i.e., reduction of risk to the BES functions, if done, may be follow-up items. Care should be taken to ensure that identifying and documenting appropriate controls is the priority.
- I am not sure how this will benefit us in the long run. I think our time would be better spent writing guidance for controls.
- Again, I have the same reservations as for question A. Any such documentation will have to exist outside the standard as (it is my understanding) that standards should not provide the rationalization, only the requirements and measures.
- *THIS MAY BE DIFFICULT TO DOCUMENT, BUT WE SHOULD AT LEAST AVOID INCORPORATING CONTROLS SIMPLY BECAUSE THEY ARE LISTED SOMEWHERE ELSE.*
- *Another nice to have and should be tied to standardized objectives*
- Not sure how we will do this and what value it will provide, while not releasing potential sensitive information.
- I think this goes to Gerry Cauley's remarks that he's made several times recently – how every requirement ought to be tied back to how it improves or preserves BES reliability. If we can't do this, then we have no business making it a requirement in a mandatory BES Reliability standard. If we can't do this, then we are doing security for security's sake and we've taken our eyes off the goal.

D. **In developing security controls, the SDT will consider how compliance can be demonstrated.**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***Average Rank***
	11	**2**	**3**	**0**	**3.5**

Comments:

- I agree that we should "consider" how compliance can be demonstrated, but that is not our primary goal. This is only acceptable if time allows. We may not have time to document compliance measurement. Some other items such as ensuring that appropriate controls are identified are more important as a responsibility of the drafting team.
- The purpose of the standard is to provide better reliability through proper cyber security posture. I am strongly opposed with any type of standard/controls that will eventually lead to a "checkbox" audit mentality. A proper understanding of the intent of the controls should lead to an adequate understanding on how to achieve compliance, while still providing the flexibility necessary in the IT security field to keep the standard in line with current technologies and practices.
- *I AGREE COMPLIANCE SHOULD BE CONSIDERED, BUT A FRAMEWORK THAT ALLOWS COST-EFFECTIVE RISK-REDUCTION IS MORE IMPORTANT THAN ONE THAT EASILY DEMONSTRATES COMPLIANCE.*
- *How will this be addressed in light of reports of auditors not using the measures section of the standard?*
- Since these are mandatory and enforceable standards, this is mandatory for us. We MUST have it clear in the standard with bright lines how an entity knows they are compliant with the requirement and how they will be measured. Anything less is unacceptable in this environment. These are not 'suggestions' or 'good ideas', these are mandatory, auditable, and enforceable. They must have clarity in this area.

E. **In developing security controls, the SDT will set forth and document clear rationales for changes made to the current Version 3 CIP 003-009 and how it protects current investments in security.**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***Average Rank***
	7	**8**	**1**	**0**	**3.4**

Comments:

- The emphasis should be on documenting the appropriate controls. If the SDT is diverting into documenting all of these items, it may take time away from the primary objective of documenting the controls. Some of these, i.e., reduction of risk to the BES functions, if done, may be follow-up items. Care should be taken to ensure that identifying and documenting appropriate controls is the priority.
- I don't disagree with doing this. However, I believe that it is not our burden to provide rationalization for every change that is made to the standards. I believe that it is already well documented that changes are necessary
- Pertaining to the development of security controls any revised CIP 003-009 will, in my opinion, be a significant rewrite of the current (version 3) standard. I am concerned about the effort that will be incurred by any direction that requires either rationalization or justification of any changes or deviations from the current standard.
- *We will have to address the requirements of order 706 as well and should seek to clarify when a change is driven from this order vs. our attempt to make things better*
- While I agree that the industry needs to understand how their previous efforts are not wasted, this effort should not significantly consume our time and effort to get the standards finished.
- If timeframe is such a crucial issue, we may not have time for this. I expect that the changes to current requirements would either provide needed flexibility based on environment (field vs. data center, etc) or go beyond a current weak requirement – neither of which would need a lot of documentation of how it protects current investments in security. I don't see us doing anything that tears down the 'Security 101' that has been built with the current CIP standards.

SDT MEMBER COMMENTS

- I agree with many of the items above, but I'm not sure we should really focus on those as being our *principles*. Several of them seem to be more task-oriented than truly fundamental principles that we should fall back on in the drafting of our security controls.
- *Fundamentally I believe these principles should be in place for the development of CIP3-CIP9V4+, though I am not sure there is time to include all this in the draft strawman if the time target is for the Jan meeting,*

OTHER SUGGESTED DRAFT GUIDING PRINCIPLES

- In developing security controls, the SDT will seek to eliminate the necessity for Technical Feasibility Exceptions (TFE's) though proper development of controls and defining appropriate applicability of those controls.
- In developing security controls, the SDT will seek to eliminate or at least GREATLY reduce the need for a TFE process.

  Comments: We should never write a technically infeasible requirement. That is an oxymoron. They should all be scoped to feasible situations only.
- In developing security controls, the SDT will seek to reduce the compliance documentation and audit burden on the lower impact systems.

  Comments: If the industry has to focus much if not most of its resources on tracking and documenting compliance on the vastly higher quantity lower impact assets, we will have harmed security and BES reliability. The entire point of CIP-002 and classifying impact is so that we can FOCUS on the higher impact systems.

OTHER COMMENTS

Thomas M. Overman, Boeing

First make a distinction between Requirements and Controls. Some overlapping controls are OK (even good), but conflicting requirements are not good. The CIP is likely to remain the only Cyber Security Standard with regulatory authority. Therefore it may be necessary for the CIP to take a lead, or possibly to have requirements contrary to Cyber Security documents which do not have the same regulatory authority. The CIP must address known conflicts if any must remain.

Additional Principles

- In developing security controls, the SDT must draft threat vectors against which certification and accreditation must be judged.
- The SDT seek to minimize overlap, duplication, and reduce complexity of the requirements and controls.
- There may have to be a classified annex to address threat scenarios from a national perspective.

SECTION 2: DRAFT STRAWMAN SECURITY CONTROL APPROACHES

This section lists possible approaches in starting to develop the security controls. This will guide the team's decisions on how to divide into sub-teams and which security control catalogue to begin with.

A. Begin with the current CIP-003 to 009 requirements review and document the applicable Order 706 directives and review any new ways to combine and select those NIST SP 800-53 controls that should be used in a new CIP set of controls.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Industry is familiar with current organization	• Requirements may require significant overhaul.
• Preserves investment in compliance management frameworks (significant)	• We may end up with a product similar to past CIP.
• Preserves investment in investments in current controls	• 800-53 not measurable for penalties
• Utilizes industry effort to date.	• Highly defined controls give a black hat a list of things not to do.
• Leverages existing approved standards	• Very time consuming with little value
• Meet objectives of FERC Order 706	• Possibility of missing areas that are currently not addressed.
• Finite target	• **Personally, I'd like to see 006 be removed from the "cyber" set and migrated to a new (CIP-010?) standard that would address requirements for ALL BES assets, regardless of their cyber nature. This is not**
• Addresses the Order 706 in a concrete, easy to demonstrate method.	
• Maintaining the current structure provides a clear path for	

utilities to migrate to a new standard. • Potentially allows for maximum reuse of efforts by the industry • Will be seen as evolutionary rather than revolutionary. • Aligns with 706 intent • Simplifies CIP document structure • Organized CIP Standards into Control families • *Preserves current investment possibly* • *Identified changes as required by FERC* • Starts with something the entire team is familiar with (CIP Standards). • Order 706 directives apply directly to CIPs • Meets overall principle of preserving CIP V1-3 investment • Industry familiarity • Provides a roadmap for the industry from the current controls to the new controls • Provides a cross reference to Order 706 to ensure everything is addressed • Builds on previous work • Helps focus on Order 706	**inconsistent as the current CIP-001 in Sabotage Reporting is not cyber in nature.** • Significant time and resource commitments • *May not provide a holistic and new approach* • *Easier for industry to understand* • Many current requirements need major overhaul. • May be limited by NIST 800-53 • May be seen as more of the same

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	7	**7**	**2**	**0**

Avg. =3.3

Other Comments- Thomas M. Overman, Boeing

- Pros- Strengths= Good starting approach to phase into the more rigorous controls. Allows evolving and refining requirements rather than taking an entirely new approach (which would cause unnecessary industry churn.
  Cons- Weaknesses=CIP should also reference and synchronize with NIST 800-82 (Industrial Control System Security)
  In general, NERC CIP should address not only security processes/procedures, but also high-level technical requirements (without dictating technical solutions).

B. Begin with the current CIP-003 to 009 requirements divided into the security functions presented by the NERC Cyber Security Standards Education Team in 2006[1], review and document the applicable Order 706 directives, and review any new ways to combine and select those NIST SP 800-53 controls that should be used in a new CIP set of controls.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Used as a training concept. • N/A • This is going to occur somewhat anyway as we compare the current requirements to the NIST control families. • I am familiar with SET functions and support • Grouped into logical security functions similar to NIST 800-53, but in a way that the industry is familiar with. • Easier to incorporate 800-53 controls and prevent cross-references between Standards (or control families) • *I'm sure there are some* • Starts with something the entire team is familiar with (CIP Standards). • Could help eliminate overlap of requirements • Could better group requirements	• Security functions in training has no industry vetting • Not a recognized standard framework • Significant overlap with more recognized standards • I am not specifically familiar with the "security functions presented by the NERC CS Education Team in 2006…" • Would take some education for the team to understand exactly what rely on this NERC material means. • 800-53 not measurable for penalties • Highly defined controls give a black hat a list of things not to do • Time? • Can not comment as I am not familiar with this material • Don't understand the difference between A and B • *More difficult for the industry to understand*

[1] 2006 Cyber Security Standards Workshop Training Materials (Not Available on the NERC Website)

			• Unable to comment on the security function model – not available • Document not available. Can't rank this one • I do not personally know what the security functions presented were and do not have a copy to work from • Lack of familiarity with referenced work	
Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	2	**6**	**6**(Education)	**0**

Avg. =2.7

C. Begin with the current NIST 800-53 publication, incorporate the current CIP-003 to 009 Standard, and review and document the applicable Order 706 directives.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Comprehensive (though not entirely applicable) • Familiar to Federal agencies • Satisfies congressional agenda to utilize NIST approach • Best solution to meet FERC Order 706 • Current NIST 800-53 would provide a solid template to develop the standard from. • Will provide a mature model that should ensure covering all required areas • *Standards based* • Existing set of security controls • NIST controls written at what seems an appropriate level for broad applicability • Politically correct answer (Congress, etc) • Based on a known (800-53) body of work	• A large number of non-applicable requirements • Too general for application to Control Systems • Not enforceable in the current compliance model • This implies that everything in NIST 800-53 will become part of future NERC Cyber Security standards. I did not think the team had agreed to this concept. • 800-53 not measurable for penalties • Highly defined controls give a black hat a list of things not to do • May end up requiring the most amount of modifications to entities existing CIP programs • Deviating from the current structure of the CIP standards will make it difficult, timely and costly for utilities to migrate to a new standard. • May be seen as "throwing out the baby with the bath water" by the Industry, • While this effort would demonstrate adherence to the 706 Order, a significant restructure will undoubtedly introduce NEW areas that FERC will have issue with, and may result in a new Order as significant as the current 706 Order. • The NIST standard is not designed as an audit/enforcement standard, and as such may not be the best style to use for a reliability standard • This is a massive undertaking that the SDT is not organized to achieve. • Several controls assume an enterprise security architecture which would be difficult to demonstrate in the NERC compliance program. • *Does not preserve current investment* • Not all team members are familiar with 800-53 (learning curve) • Industry unfamiliar with 800-53 • Would make it more complicated for the industry to follow the changes • Might not be as clear how we could leverage existing security implementations

			• Applicability to industrial control systems	
Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	4	**3**	**6**	**2**

Avg. =2.6

Other

- As the Lead for the "Controls" sub group and a person familiar with NIST, does Keith have a recommended approach?
- The controls like in 800-53 should be a guideline not in the stander. This will make it where the auditors will allow new technology. NIST 800-53 ties us to today's technology only.
- *I find any of these approaches acceptable. I can't identify any pros/cons that have not already been submitted. I believe that A and B should be done in combination ensure that in the development of controls we have taken in to account what the ramifications are with respect to what the industry has already been taught and developed and ensure the documented 706 issues are all addressed.*
- *As we extend beyond the initial strawman, in addition to 800-53, I believe we should use the controls based standards referenced in section 3 as additional reference material since these may provide better verbiage and/or insight in the development of CIP Controls which need to be crafted as measurable standards.*

Other Approaches- Thomas M. Overman, Boeing

A. Defense Information Assurance Certification and Accreditation Process (DIACAP) provides a robust C&A guideline. As the Grid is a national asset, subject to attack by sophisticated state-sponsored adversaries, grid security should reference guidelines designed for such an environment. DIACAP is one such example.

B. Assess the risks (insiders, and external attackers, script kiddies to terrorists to organized crime to state-sponsored intelligence services). Two phases: Near term risk mitigation (procedural, some technical) vs. long term architectural and systemic approach.

SECTION 3: DRAFT STRAWMAN SECURITY CONTROL GUIDANCE

This section lists documents for the team to consider when drafting security controls (in addition to previous versions of CIP, FERC Order 706 and NIST 800-53). Although individuals or sub-teams may consider any guidance when drafting controls, the proposal would be to use these documents as a major influence and reference them in communication from the team.

A. Consider the DHS Catalog of Control Systems Security Recommendations for Standards Developers[2] in the development of security controls.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Control system centric • Is a good source for testing of completeness • Considering all of these documents may lead to a broad approach that considers different perspectives. • We should consider all guidance available • Comprehensive set of requirements • Supplemental Guidance wording provides useful wordage that would be used in explaining/justifying controls…but • This is being used to develop the Smart Grid Cyber Security Standards. We will immediately be compared with this effort anyway.	• Not meant for compliance monitoring • Time consuming – Do we have time and resources to research all of these documents • Too specific and will give a black hat a road map. • Too comprehensive – goes well beyond the existing CIP standard, in areas such as environmental control, supply chain requirements and strategic planning. • Supplemental guidance wording is necessary for understanding, but does not fit with the current NERC standard framework. • *Not as familiar*

[2] http://www.us-cert.gov/control_systems/pdf/Catalog_of_Control_Systems_Security_Recommendations.pdf

• Control System specific • Focused on control systems • Very detailed			• Many controls are more appropriately directed at control system vendors, not end users of purchased turnkey systems. • Has a lot of good ideas, but things that should not be mandatory requirements (honey pots, etc)	
Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	5	**6**	**4**	**0**

Avg. =3.1

B. Consider the SANS 20 Critical Security Controls[3] in the development of security controls.

+++++ Pros- Strengths +++++			------- Cons- Weaknesses --------	
• Well known in cyber security circles • Considering all of these documents may lead to a broad approach that considers different perspectives. • We should consider all guidance available • Common sense and needed • As reasonable list as any (based on a cursory review) • Technical focused • Offensive in nature • This is aimed directly at addressing system security. It provides a starting point to prioritizing controls on the basis of risk. • A review wouldn't hurt to make sure we have them covered at the end. • Good starting point			• Too general • Not control system specific • Not intended for compliance • Time consuming – Do we have time and resources to research all of these documents? • Not specific enough to control systems • Somewhat motherhood (based on a cursory review) • New Standard that some may not have had experience implementing • *Not as familiar* • Not control system specific, general IT specific • No surprises in a 'Top 20' – covers the basics. • Should already be included in other larger control frameworks. • High level document • Not focused on industrial control systems	
Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	5	**5**	**4**	

Avg. =3.0

C. Consider the ISO/IEC 27001 & 27002[4] Standards in the development of security controls.

+++++ Pros- Strengths +++++			------- Cons- Weaknesses --------	
• Well known and comprehensive framework and controls • Recognized international standards organization • Internationally accepted • Better suited to be used as a reference for completeness • Considering all of these documents may lead to a broad approach that considers different perspectives. • We should consider all guidance available • Common sense • Mature Standard • Concise • Internationally recognized			• Not specific to control systems • Not structured for compliance monitoring, more structured for certification • Time consuming – Do we have time and resources to research all of these documents • Have not read! • No access, will not comment or rank • Non-open, proprietary, for purchase only standards. • Generic IT security standard, not control system specific • If we are going to base on generic standards, let's just do NIST and be done with it. Our goal is to write BES Reliability focused standards, not reinvent yet another generic IT Security standard.	
Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*

[3] http://www.sans.org/critical-security-controls/cag.pdf
[4] http://www.27000.org/ (for purchase)

	4	**5**	**4**	**0**

Avg. =3.0

D. Consider the ISA 99[5] Standard in the development of security controls.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Industrial systems centric • ISA well accepted in industrial environments • Considering all of these documents may lead to a broad approach that considers different perspectives. • We should consider all guidance available • Mature Standard • *Matches my corporate program* • *Familiar to many*	• Not well defined • In development • Not structured for enforcement • Time consuming – Do we have time and resources to research all of these documents • Too specific and will give a black hat a road map. • No access, will not comment or rank • Could be too technical • Non-open, proprietary, for purchase only standards

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	2	**8**	**3**	**0**

Avg. =2.9

GUIDANCE DOCUMENTS COMMENTS

- In order to develop a complete set of controls, all of the aforementioned Standards should be considered with the caveat that NERC CIP/NIST 800-53 serve as the baseline and SANS, ISO, DHS, and ISA-99 provide supplemental or amplifying guidance.
- Does the team have enough time to consider many other security controls guidance?

SECTION 4: DRAFT STRAWMAN SECURITY CONTROL SCOPE AND APPLICABILITY

This section lists several methods for applying reasonable and appropriate security controls.

A. Consider applicability of requirements for differing environments for Generation, Transmission and Control Centers.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Significant increase in clarity of application and relevance of requirement • Support from stakeholders • Better compliance monitoring • We need targeted controls. • The lack of applicable requirements is one of the industry's major criticisms of existing CIP. • This is crucial to the success of our standards. • Takes into account operational realities • Is the only real justification for writing our own controls versus wholesale adoption of other control frameworks? • We need separate controls of each of the three environment • Might be simple for participants. • Value in a separation for "Control Centers" for entities that don't actually control any "big iron", NOT SCADA master type control centers. • Each environment is distinctly unique • Could reduce ambiguity for industry • *Addresses the differences specifically*	• Increases complexity of the requirement set as a whole • Increases the volume of requirements • Requires specific expertise in targeted environments of generation, transmission and control centers. • Targeting the approach will probably take longer. • It will make the quasi-governmental utilities mad. • Time consuming • This separation is a red herring. Of more value is the nature of the cyber environment and equipment (i.e. embedded single purpose microprocessor based devices vs. PC's versus severs, etc). • Significant level of effort • Requires in depth knowledge of each environment that may not be present on the SDT • Difficult to maintain • Need to examine further to determine if the controls we develop truly apply differently to different operating environments. • *More complex*

[5] http://www.isa.org/MSTemplate.cfm?MicrositeID=988&CommitteeID=6821 (for purchase)

• *Allows greater focus on more critical areas* • Addresses 'one size fits all' flaw • Allows entities to do what makes sense in varying risk environments • Could help provide real examples for the industry	• May need a rename; 'Transmission' is not descriptive of what we're really talking about – we are talking about substation environments, or plant environments, or data center environments.

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	6	**5**	**2**	**0**

Avg. =3.2

A1. Establish the applicability of each environment (generation, transmission, and control centers) within each requirement.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Single catalog • All in one place • Allows an entity to focus on what is applicable to them. • Only if we use the existing 003 through 009 structure • This may save the SDT some time in writing the requirements. • May ultimately reduce documentation required by the entity. • Easier to maintain • Simplifies the management of the standard. • Easier for entities with more than one type of facility. • Easier to maintain by having a consolidated standard • This would be easier for the industry to read and comprehend. • *Simpler.* • A requirement is stated once in the standard	• Makes requirements complex • Difficult to draft • May require drastically different requirement formatting • May be confusing • Difficult to follow applicability for a specific entity of a certain type • *May not address specific differences* • Could make for huge, confusing requirements with numerous caveats. • All entities will have to search to find what applies to them • Could be out of date very quickly and lack flexibility with the ever changing cyber world • Difficult to follow •

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	3	**8**	**3**	**1**

Avg. =3.0

A2. Group all requirements for each environment of generation, transmission, and control centers, separately.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Clear set of requirements for each group • Ease of application for functional entities • Each set is simpler (i.e. requirements in each set are simpler) • May provide greater clarity. • Allows one entity to focus on the types of assets they own • Typically, different departments will be handling implementation at substations vs. plants vs. control centers, so this may ultimately improve readability of the requirements. • We need separate controls of each of the three environment • Simpler to follow • Lets entities focus on just what they need to do rather than having their requirements strung out and hard to find over an	• Increases overall volume of the standards • Duplication of requirements in each set • Increase work for responsible entities which are integrated. • Creates redundancy. • May create additional work for SDT. • This should be by functional model and BES function. • Have to make three updates for common items • Redundancy in the standard itself. • In the future, a single change could require multiple edits. • Difficult to maintain • The same requirement could appear in multiple places. • Might cause some redundancy for entities having more than one environment

entire catalog of controls. • Matches most organizational structures so each can be given their piece to implement. • Separated by function	• Would probably cause redundancy in the standards which could confuse the industry and auditors • May miss opportunity for common solutions

Acceptability Ranking Scale	***4** = acceptable**,** I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	4	**8**	**2**	**0**

Avg. =3.1

B. Consider differing vulnerability and threat (risks) in the design of requirements. Use differing levels of application (e.g. basic, enhanced).

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Reflect practical realities • Great philosophy • Proper risk assessments are the cornerstone of a sound security policy. • *Not sure (no rank)* • I think this is mandatory. A completely standalone non-networked system vs. a networked system should have differing requirements • This could be used to limit controls applied to cyber devices that have no external connectivity •	• Increases complexity • May change over time • Confusing to write. • The approach lacks clarity and may change rapidly. • Cyber vulnerability and threat is not risk to the BES • Not sure we can make this paradigm shift with our current schedule. • FERC may not accept any acceptance of risk, especially given the current national security posture. • If we consider different vulnerabilities and threats as a basis for applicability, then we assume a demonstrable risk management framework. • *Not sure (no rank)* • We have to figure out how to handle inherited security via compensating controls, but this is a must do anyway. • Requires significant detail and is complex

Acceptability Ranking Scale	***4** = acceptable**,** I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	5	**3**	**5**	**0**

Avg. =3.0

C. Consider differing applications of requirements for general purpose software operating environments and proprietary software operating environments.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Considers practical applicability • Considers risk/vulnerability • Would be able to isolate cyber security requirements for control systems vs. other systems. • Definitely the way utilities see things. • Would allow for sane application of controls to equipment (not more inane requirements for mal-ware on a network switch!) • Would eliminate the need for TFE's • *Protection based on actual risks* • Yes, requirements MUST take into account the system they are being required on. • Focuses on specific types of software •	• Introduces (necessary?) complexity • May require updates as "proprietary" become general purpose • Definition of proprietary somewhat problematic • I think this will be confusing and complex for the drafting team to figure out. • I feel these two categories are too vague to separate. For instance, many devices run on some type of Linux distro without the end users knowledge. • Ultimately, we must work toward improving the overall security of all applications, whether they are general purpose or custom built • Future changes to environments may require entities to significantly change their security. • May introduce blind spots to security holes. • May trigger equipment changes to avoid implementing requirements (while this may be seen as "gaming", if it does not decrease or possibly improves the security posture, what is wrong with it?) • "General purpose" and "Proprietary" are problematic terms to define. • These apply mainly to technical controls, and I'm not sure there would be any difference in applicability for many of the controls. • *Possibly more complex* • Requires enumeration of these OS'es in the standard • Not clear why this is needed

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	4	**3**	**6**	**1**

Avg. =2.8

D. Consider a process for allowing entities to apply compensating security controls on the basis of a risk management program and approval process.

+++++ Pros- Strengths +++++	------- Cons- Weaknesses --------
• Practical and flexible • Details are important • More Flexibility for entities. • We have tried "reasonable business judgment" and TFEs because we acknowledge the need to apply appropriate controls on the basis of risk and the limitation of the SDT to draft perfect controls. In other words, we have to have something, and I don't think TFEs are it. • *Allows security risks to be managed differently* • If scope = all systems, this is essential. Meets the NIST framework, which is something we've been ordered to incorporate • Helps apply reasonability	• Subject to "gaming" • Difficult to monitor and enforce compliance • Has been tried before with adverse public perception • Not sufficiently specific. • Will result in some of the same problems we have today concerning leaving the interpretation up to the individual company. • At face value, this appears difficult to audit consistently. • The age old problem of who can ultimately provide approval. • Sounds suspiciously like TFE's, to me…and I'd rather get rid of them… • Who approves? • Risk management is hard or impossible to assess. • *More complex* • *Approval, by whom?* • A non-bright line, but I think it's necessary. • Danger that 'approval processes could turn into TFE on steroids nightmare.

			• Not sure industry would want to share the required sensitive details with an approving entity • Who would be the approver and what criteria would they use to say what is acceptable • Approval by whom?	
Acceptability Ranking Scale	***4** = acceptable**,** I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*
	2	**2**	**8**	**0**

Avg. =2.5

OTHER SCOPE AND APPLICABILITY PROPOSALS *(list below)*

SDT Member Comments

- We should refer to requirements (as opposed to controls).
- If I did not answer these questions right (the way you want this to go) will I still be allowed on the straw man team?
- We need to lay out security/reliability goals for each of the environments and then draft requirements/controls that meet those goals. For example, we need to have in mind what level of security needs to be in place at a high impact substation and what needs to be in place at a low impact substation. We need to lay out the nine possibilities (Gen/Trans/Control Center and an L/M/H of each) and determine what we are shooting for in each. Only then, with these agreed upon goals in mind, can we split off into different teams looking at different areas of controls. The old "Begin with the end in mind" thing.

Other Approaches-

Thomas M. Overman, Boeing

The grid will be either integrated or stove-piped. Subjecting Generation, Transmission & Distribution to separate requirements will limit the desired integration of the Smart Grid.

Consider another approach:

- Safety of life (protection of line crews, public{primarily from hydro ops}, mechanics, operators, etc)
- System stability (national, regional, local)
- Equipment protection (Major affecting national capabilities (large generating plant and equipment, NW-SW Intertie, 4C sub, etc), medium affecting regional or large municipal supplies, local affecting city/county)
- Business operations (IT, metering, etc)

Appendix #8 Security Controls Strawman Document

SECURITY CONTROL DRAFTING PRINCIPLES

GUIDANCE IN DRAFTING SECURITY CONTROLS TO ENSURE A CONSISTENT OUTCOME AMONG SUB-TEAMS

Drafting Principles

16. **Applicability [NERC Rules of Procedure[6]] –** Each reliability standard shall clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted. Such functional classes include: reliability coordinators, balancing authorities, transmission operators, transmission owners, generator operators, generator owners, interchange authorities, transmission service providers, market operators, planning authorities, transmission planners, resource planners, load-serving entities, purchasing-selling entities, and distribution providers. Each reliability standard shall also identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area. A standard may also identify any limitations on the applicability of the standard based on electric facility characteristics.
17. **Reliability Objective [NERC Rules of Procedure] –** Each reliability standard shall have a clear statement of purpose that shall describe how the standard contributes to the reliability of the bulk power system. The following general objectives for the bulk power system provide a foundation for determining the specific objective(s) of each reliability standard:
    a. **Security** – Bulk power systems shall be protected from malicious physical or cyber attacks.
18. **Performance Requirement or Outcome [NERC Rules of Procedure]** – Each reliability standard shall state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest. Each requirement is not a "lowest common denominator" compromise, but instead achieves an objective that is the best approach for bulk power system reliability, taking account of the costs and benefits of implementing the proposal
19. **Measurability [NERC Rules of Procedure] –** Each performance requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement. Each performance requirement shall have one or more associated measures used to objectively evaluate compliance with the requirement. If performance can be practically measured quantitatively, metrics shall be provided to determine satisfactory performance.
20. **Technical Basis in Engineering and Operations [NERC Rules of Procedure] –** Each reliability standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.
21. **Completeness [NERC Rules of Procedure] –** Reliability standards shall be complete and self-contained. The standards shall not depend on external information to determine the required level of performance.
22. **Consequences for Non-Compliance[NERC Rules of Procedure] –** In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, the consequences of violating a standard are clearly presented to the entities responsible for complying with the standards.
23. **Clear Language [NERC Rules of Procedure] –** Each reliability standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.

[6] *Rules of Procedure of the NERC*, June, 16th, 2009, pp. 6, 7

24. **Practicality [NERC Rules of Procedure] –** Each reliability standard shall establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.
25. **Consistent Terminology [NERC Rules of Procedure] –** To the extent possible, reliability standards shall use a set of standard terms and definitions that are approved through the NERC reliability standards development process.
26. **Reduce Risk** [**3.5 acceptability among survey respondents**] **–** Security controls reduce risk appropriately for applicable BES impact categories
27. **Change Documentation** [**3.3 acceptability among survey respondents**] – Changes from prior versions of CIP Standards have clear rationale. These include the following types of changes:
    a. Above and beyond the current standards
    b. Removal of requirements
    c. Major formatting changes
28. **Reduce Administrative Overhead** [**Suggested principle**] **–** Administrative documentation kept to the minimum that is necessary to verify acceptable risk
29. **Priority [Suggested Principle] –** Implementation and compliance with the Standards are prioritized according to BES risk. The industry should focus on mitigating the greatest risk (i.e. not spend the majority of our resources on the low-impact Cyber Systems).
30. **Minimize TFEs** [**Suggested principle**] **–** Security controls should minimize the need for TFEs

Security Control Groups

Control groups are split initially by the CIP Standards, and additional control groups (8-13) are pulled out to prevent cross-Standard references. Each control group has the relevant CIP and 800-53 families mapped. This approach should reflect the team's consensus to:

> *"Begin with the current CIP-003 to 009 requirements review and document the applicable Order 706 directives and review any new ways to combine and select those NIST SP 800-53 controls that should be used in a new CIP set of controls."*

ID	Control Group	NERC Standard	NIST 800-53 Family
1	Security Governance	CIP-003 – R1, R2, R3;	Planning, Risk Assessment, Program Management
2	Personnel and Training	CIP-004 – R1, R2, R3	Awareness and Training, Personnel Security
3	Communication Protection	CIP-005 R1, R3	System and Communication Protection
4	Physical Security	CIP-006 R1 through R6	Physical and Environmental Protection
5	Systems Management	CIP-007 R2, R3, R4, R6	System and Information Integrity
6	Incident Response	CIP-008 R1 & R2	Incident Response
7	Recovery Plans	CIP-009 R1 through R5	Contingency Planning
8	Access Control (Technical)	CIP-003 R5; CIP-005 R2; CIP-007 R5; CIP 004 R4	Access Control, Identification and Authentication
9	Audit and Accountability	CIP-005 R5, CIP-007 R9	Audit and Accountability
10	Configuration Management and System Lifecycle	CIP-003 R6; CIP-007 R1, R7	Configuration Management, Maintenance, Media Protection, System and Services Acquisition
11	Information Management	CIP-003 R4	Access Control, Media Protection
12	Security Assessments	CIP-005 R4, CIP-007 R8	Security Assessment and Authorization

Drafting Sub-Teams
Additional members may be necessary for teams that have a large number of requirements or FERC directives allocated.

Team	Control Families
Security Governance	(1) Security Governance
Personnel and Physical Security	(2) Personnel and Training, (4) Physical Security
Operations Security	(3) Communication Protection, (5) Systems Management
Recovery and Response	(6) Incident Response, (7) Recovery Plans , (12) Security Assessments
Access Control and Auditing	(8) Access Control, (9) Audit and Accountability
Change Management, System Lifecycle and Information Management	(10) Configuration Management and System Lifecycle, (11) Information Management

Team Assignments

Each team shall assemble the following documentation as part of their drafting assignments. The additional documentation should assist in (1) maintaining consistency across the teams and (2) presenting the purpose and background of the security controls to the industry.

Each team should begin by determining the security controls within their assigned control families necessary to mitigate risk to the BES. Begin by taking the set of applicable Requirements from version 3 CIP Cyber Security Standards and reconcile with applicable NIST 800-53 security controls. Then incorporate additional sources where applicable to mitigate unacceptable risk to the BES functions.

The initial work product should be a set of security controls with applicability to high, medium and low impact Cyber Systems and how specific FERC directives have been addressed (as indicated in Appendix A: FERC Directives from Order 706).

Additionally, for each security control[7]:

7. **Statement of Risk –** State how the security control reduces risk appropriate to the impact categorization [**Drafting principle 11**]
8. **Measures –** State how an objective third party with knowledge or expertise in security can measure the control [**Drafting principle 4**]
9. **Change Documentation –** State the rationale for making changes from previous versions [**Drafting principle 12**]
10. Denote the applicability to (1) Generation Subsystems, (2) Transmission Subsystems, and (3) Control Centers. Provide clarifications or enhancements where necessary to meet the security control objective in that environment [**3.2 acceptability among survey respondents**].
11. Denote the priority for the security control relative to the risk it mitigates (i.e. P1, P2, P3, None). [**SP800-53 introduced this in version 3, and it could help in developing VRFs and implementation plans**]
12. *Team needs to discuss the following scoping exercise to determine how to accomplish these goals of applying appropriate security controls:*
    a. Denote applicability for differing vulnerability and threat profiles. Write controls based on risk profile (as well as impact categorization) [**2.9 acceptability among survey respondents**].
    b. Denote applicability for general purpose vs. proprietary operating systems [**2.8 acceptability among survey respondents**].

Security Controls for Impact Categories

This section provides guidance in the types of controls applicable to High, Medium and Low impact categories. The basic premise is that the cost to implement security controls should reflect the reduction of risk to the BES commensurate with the impact category. The industry as a whole should first focus on mitigating the greatest amount of risk.

Cost to Implement and Maintain / Risk Reduction (Benefit)	Significant	Moderate	Minimal
Signficant	Hi/Med	All	All
Moderate	Hi	Hi/Med	All
Minimal	N/A	Hi	Hi/Med

Figure 1: Applicability to Impact Categories based on Cost vs. Risk Reduction

CIP Security Profiles (Examples For Discussion Only)

Transmission Subsystems (aka substations. Environment = remote, unmanned locations)

[7] This section calls for specific documentation of only a few *Drafting Principles.* Other *Drafting Principles* provide evaluation criteria for security controls.

- **Low** *Primary Concern:* Attackers using it as a launching point to higher impact assets.
  - Controlled access to upstream networks
  - All passwords must be changed from manufacturer defaults on all devices that support a password.
  - No physical security requirements
- **Medium**
  - Same as low for subs??
- **High** *Primary Concern:* The substation is itself a target or a launching point.
  - Physical access control and logging.
  - Electronic access control and logging for all remote access. Strong authentication for remote access.
  - Little to no systems management in substation environment since it consists mostly of dedicated devices (IEDs). Make it mostly about strong access control both electronically and physically with notifications of unauthorized access.

Generation Subsystems (aka plants. Environment = Campus with widely distributed cyber components)

- **Low** *Primary Concern:* Upstream attacks
  - Controlled access to upstream networks (limit use as a launching point for attacks)
  - All passwords must be changed from manufacturer defaults on all devices that support a password.
- **Medium** *Primary Concern:* Attackers gaining control of multiple units within the plant.
  - Good segmentation with access control between individual generating units or groups of smaller units
- **High** *Primary Concern:* Attackers gaining control of multiple units within the plant or across several plants.
  - Strong, highly controlled segmentation between individual generating units.
  - Strong authentication required for all remote electronic access
  - Good systems management, change mgt, vulnerability mgt on control system servers, HMIs.

Control Centers (Environment = centralized data centers)

- **Low** *Primary Concern:* Attacks over their connectivity to higher impact control centers
  - Controlled access to other control networks.
  - Controlled physical access.
  - Vulnerability management on all systems that communicate outside ESP
- **Medium** *Primary Concern*: Same as low (only < 2000 MW centers)
  -
- **High** *Primary Concern:* The ultimate target – gaining control of numerous assets.
  - All the current requirements plus Order 706 changes plus what makes sense out of 800-53.
  - The strongest perimeters (physical and electronic)
  - Stringent systems management, change mgt, vulnerability mgt.
  - Strong personnel controls.

Sources

In order to develop a complete set of controls, all of the aforementioned Standards should be considered with the caveat that NERC CIP/NIST 800-53 serve as the baseline and SANS, ISO, DHS, and ISA-99 provide supplemental or amplifying guidance.

- DHS of Control Systems Security Recommendations for Standards Developers[8]
- Federal Information System Controls Audit Manual (FISCAM) Mapping to CIP Requirements[9]
- ISA 99[10]
- ISO/IEC 27001 & 27002[11]
- SANS 20 Critical Security Controls[12]

Appendix A: FERC Directives from Order 706

Paragraph	Text	Phase[13]	Team
25	we direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of the NIST framework.	Version 4	ALL
253	While we adopt our CIP NOPR proposal, we recognize that the ERO has already initiated a process to develop such guidance … leave to the ERO's discretion whether to incorporate such guidance into the CIP Reliability Standard, develop it as a separate guidance document, or some combination of the two.	Guideline / Version 4	CIP-002
254	direct the ERO to consider these commenter concerns [how to assess whether a generator or a blackstart unit is "critical" to Bulk-Power System reliability, the proper quantification of risk and frequency, facilities that are relied on to operate or shut down nuclear generating stations, and the consequences of asset failure and asset misuse by an adversary]when developing the guidance.	Guideline / Version 4	CIP-002
257	we direct the ERO to consider this clarification [the meaning of the phrase "used for initial system restoration," in CIP-002-1, Requirement R1.2.4] in its Reliability Standards development process.	Guideline / Version 4	CIP-002
272	the Commission directs the ERO, in developing the guidance discussed above regarding the identification of critical assets, to consider the designation of various types of data as a critical asset or critical cyber asset.	Guideline / Version 4	CIP-002
272	The Commission directs the ERO to develop guidance on the steps that	Guideline /	CIP-002

[13] Schedule phases in this column mean one or more of the following:

- "Version 2" – complete in filed version 2
- "Version 4" – planned for next major version (12-18 months plus)
- "Guideline" – stand alone guidance started after corresponding requirement is determined
- "TFE Filing" – 2009 filing on TFE proposal and Appendix 4D to RoP
- "not scheduled" – beyond Version 4
- "CMEP" – part of an existing or ongoing compliance audit, self-report or other process
- "VRF Filing(s)" – one of several already-filed (or very soon to be filed in the case of Version 2) VRF and/or VSL filings

Phase may also be self-explanatory if not one of these entries

Paragraph	Text	Phase[13]	Team
	would be required to apply the CIP Reliability Standards to such data and to consider whether this also covers the computer systems that produce the data.	Version 4	
282	the Commission directs the ERO, through the Reliability Standards development process, to specifically require the consideration of misuse of control centers and control systems in the determination of critical assets	Guideline / Version 4	CIP-002
285	we direct the ERO to consider the comment from ISA99 Team [ISA99 Team objects to the exclusion of communications links from CIP-002-1 and non-routable protocols from critical cyber assets, arguing that both are key elements of associated control systems, essential to proper operation of the critical cyber assets, and have been shown to be vulnerable – by testing and experience].	Version 4	ALL
322	The Commission adopts its CIP NOPR proposal to direct that the ERO develop through its Reliability Standards development process a mechanism for external review and approval of critical asset lists.	Version 4 (Note: proposed version 4 methodology obviates the need for external review0	CIP-002
329	the Commission directs the ERO, using its Reliability Standards development process, to develop a process of external review and approval of critical asset lists based on a regional perspective.	Version 4 (Note: proposed version 4 methodology obviates the need for external review0	CIP-002
376	the Commission adopts its CIP NOPR proposal and directs the ERO to clarify that the exceptions mentioned in Requirements R2.3 and R3 of CIP-003-1 do not except responsible entities from the Requirements of the CIP Reliability Standards.	Version 4	CIP-002
386	The Commission adopts its CIP NOPR proposal and directs the ERO to develop modifications to Reliability Standards CIP-003-1, CIP-004-1, and/or CIP-007-1, to ensure and make clear that, when access to protected information is revoked, it is done so promptly.	Version 4	Access Control and Auditing
397	The Commission directs the ERO to develop modifications to Requirement R6 of CIP-003-1 to provide an express acknowledgment of the need for the change control and configuration management process to consider accidental consequences and malicious actions along with intentional changes.	Version 4 / Guideline	Change Management, System Lifecycle and Information Management
433	we direct the ERO to consider, in developing modifications to CIP-004-1, whether identification of core training elements would be beneficial and, if so, develop an appropriate modification to the Reliability Standard.	Version 4	Personnel and Physical Security
434	The Commission adopts the CIP NOPR's proposal to direct the ERO to modify Requirement R2 of CIP-004-1 to clarify that cyber security training programs are intended to encompass training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of critical cyber assets.	Version 4	Personnel and Physical Security
435	Consistent with the CIP NOPR, the Commission directs the ERO to determine what, if any, modifications to CIP-004-1 should be made to	Version 4	Personnel and Physical

Paragraph	Text	Phase[13]	Team
	assure that security trainers are adequately trained themselves.		Security
443	We also direct the ERO to identify the parameters of such exceptional circumstances through the Reliability Standards development process	Version 4	Security Governance
460	The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset for any reason (including disciplinary action, transfer, retirement, or termination).	Version 4	Personnel and Physical Security
464	We also adopt our proposal to direct the ERO to modify Requirement R4 to make clear that unescorted physical access should be denied to individuals that are not identified on the authorization list, with clarification.	Version 4	Personnel and Physical Security
473	The Commission adopts its proposals in the CIP NOPR with a clarification. As a general matter, all joint owners of a critical cyber asset are responsible to protect that asset under the CIP Reliability Standards. The owners of joint use facilities which have been designated as critical cyber assets are responsible to see that contractual obligations include provisions that allow the responsible entity to comply with the CIP Reliability Standards. This is similar to a responsible entity's obligations regarding vendors with access to critical cyber assets.	Version 4	Security Governance
476	we direct the ERO to modify CIP-004-1, and other CIP Reliability Standards as appropriate, through the Reliability Standards development process to address critical cyber assets that are jointly owned or jointly used, consistent	Version 4	Security Governance
511	The Commission adopts the CIP NOPR's proposal to direct the ERO to identify examples of specific verification technologies that would satisfy Requirement R2.4, while also allowing compliance pursuant to other technically equivalent measures or technologies.	Version 4	Operations Security
525	The Commission adopts the CIP NOPR proposal to require the ERO to modify CIP-005-1 to require logs to be reviewed more frequently than 90 days	Version 4	Access Control and Auditing
526	the Commission directs the ERO to modify CIP-005-1 through the Reliability Standards development process to require manual review of those logs without alerts in shorter than 90 day increments.	Version 4	Access Control and Auditing
526	The Commission directs the ERO to modify CIP-005-1 to require some manual review of logs, consistent with our discussion of log sampling below, to improve automated detection settings, even if alerts are employed on the logs.	Version 4	Access Control and Auditing
528	the Commission clarifies its direction with regard to reviewing logs. In directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the ERO could provide, through the Reliability Standards development process, clarification that a responsible entity should perform the manual review of a sampling of log entries or sorted or filtered logs.	Version 4	Access Control and Auditing
541	we adopt the ERO's proposal to provide for active vulnerability assessments rather than full live vulnerability assessments.	Version 4	Recovery and Response
542	the Commission adopts the ERO's recommendation of requiring active vulnerability assessments of test systems.	Version 4	Recovery and Response
544	the Commission directs the ERO to revise the Reliability Standard so that annual vulnerability assessments are sufficient, unless a significant	Version 4	Recovery and Response

Paragraph	Text	Phase[13]	Team
	change is made to the electronic security perimeter or defense in depth measure, rather than with every modification.		
544	we are directing the ERO to determine, through the Reliability Standards development process, what would constitute a modification that would require an active vulnerability assessment	Version 4	Recovery and Response
547	we direct the ERO to modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years	Version 4	Recovery and Response
581	The Commission adopts the CIP NOPR proposal and directs the ERO to develop a modification to CIP-006-1 to require a responsible entity to test the physical security measures on critical cyber assets more frequently than every three years,	Version 4	Recovery and Response
609	We therefore direct the ERO to develop requirements addressing what constitutes a "representative system" and to modify CIP-007-1 accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document.	Version 4 / Guideline	Change Management, System Lifecycle and Information Management
610	we direct the ERO to revise the Reliability Standard to require each responsible entity to document differences between testing and production environments in a manner consistent with the discussion above.	Version 4	Change Management, System Lifecycle and Information Management
611	the Commission cautions that certain changes to a production or test environment might make the differences between the two greater and directs the ERO to take this into account when developing guidance on when to require updated documentation to ensure that there are no significant gaps between what is tested and what is in production.	Version 4	Change Management, System Lifecycle and Information Management
619	The Commission adopts the CIP NOPR proposal with regard to CIP-007-1, Requirement R4. [The Commission proposed to direct the ERO to eliminate the acceptance of risk language from Requirement R4.2, and also attach the same documentation and reporting requirements to the use of technical feasibility in Requirement R4, pertaining to malicious software prevention, as elsewhere. The Commission discussed the issues of defense in depth, technical feasibility, and risk acceptance elsewhere in the CIP NOPR and applied those conclusions here. The Commission further proposed to direct the ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means]	Version 4 / not scheduled	Operations Security
622	The Commission also directs the ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means, consistent with our discussion above	Version 4 / not scheduled	Operations Security
628	The Commission continues to believe that, in general, logs should be reviewed at least weekly and therefore adopts the CIP NOPR proposal to require the ERO to modify CIP-007-1 to require logs to be reviewed	Version 4	Access Control and Auditing

Paragraph	Text	Phase[13]	Team
	more frequently than 90 days, but leaves it to the Reliability Standards development process to determine the appropriate frequency, given our clarification below, similar to our action with respect to CIP-005-1		
629	The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document.	Version 4 / guideline	Access Control and Auditing
633	The Commission adopts the CIP NOPR proposal to direct the ERO to clarify what it means to prevent unauthorized retrieval of data from a cyber asset prior to discarding it or redeploying it.	Version 4	Change Management, System Lifecycle and Information Management
635	the Commission directs the ERO to revise Requirement R7 of CIP-007-1 to clarify, consistent with this discussion, what it means to prevent unauthorized retrieval of data.	Version 4	Change Management, System Lifecycle and Information Management
661	the Commission directs the ERO to develop a modification to CIP-008-1 to: (1) include language that takes into account a breach that may occur through cyber or physical means; (2) harmonize, but not necessarily limit, the meaning of the term reportable incident with other reporting mechanisms, such as DOE Form OE 417; (3) recognize that the term should not be triggered by ineffectual and untargeted attacks that proliferate on the internet; and (4) ensure that the guidance language that is developed results in a Reliability Standard that can be audited and enforced	Version 4 / Guideline	Recovery and Response
673	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.	Version 4 / Guideline	Recovery and Response
676	the Commission directs the ERO to modify CIP-008-1 to require a responsible entity to, at a minimum, notify the ESISAC and appropriate government authorities of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.	Version 4 /. Guideline	Recovery and Response
686	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1, Requirement R2 to require responsible entities to maintain documentation of paper drills, full operational drills, and responses to actual incidents, all of which must include lessons learned.	Version 4	Recovery and Response
686	The Commission further directs the ERO to include language in CIP-008-1 to require revisions to the incident response plan to address these lessons learned.	Version 4	Recovery and Response
694	For the reasons discussed in the CIP NOPR, the Commission adopts the proposal to direct the ERO to modify CIP-009-1 to include a specific requirement to implement a recovery plan.	Version 4	Recovery and Response
694	We further adopt the proposal to enforce this Reliability Standard such that, if an entity has the required recovery plan but does not implement it when the anticipated event or conditions occur, the entity will not be in	Version 4	Recovery and Response

Paragraph	Text	Phase[13]	Team
	compliance with this Reliability Standard.		
739	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP- 009-1 to incorporate guidance that the backup and restoration processes and procedures required by Requirement R4 should include, at least with regard to significant changes made to the operational control system, verification that they are operational before the backups are stored or relied upon for recovery purposes	Version 4	Recovery and Response
748	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to provide direction that backup practices include regular procedures to ensure verification that backups are successful and backup failures are addressed, so that backups are available for future use.	Version 4	Recovery and Response

Appendix #9 Communication Plan

Communications Plan for Cyber Security Order 706 Project – Version 4

Background

On January 18, 2008, the Federal Energy Regulatory Commission (FERC) issued Order No. 706 that approved Version 1 of the Critical Infrastructure Protection standards (CIP-002-1 through CIP-009-2). In the Order, FERC also directed numerous modifications to the standards. NERC initiated Project 2008-06 – Cyber Security Order 706, whose scope includes addressing the FERC directives in Order No. 706. The drafting team assembled for this project segmented the scope of work into multiple phases: Versions 2 and 3 of the CIP standards addressed timely FERC directives regarding reasonable business judgment and other non-controversial issues. The bulk of the Order No, 706 directives are to be addressed in Version 4 of the standards. NERC's objective is to produce an approved revision to CIP-002 by June, 2010 and revisions to CIP-003 through CIP-009 by the end of 2010.

NERC and especially the drafting team recognizes that effective communications regarding the ongoing work of the team is crucial to the success of the project and is vital to achieving the consensus necessary for passage in the balloting process.

Mission

Inform and educate reliability stakeholders about Version 4 of the Project 2008-06 — Cyber Security Order 706 standards project, and promote input and participation from stakeholders and regulators.

Scope/Objectives

1. Obtain stakeholder (industry and government) buy-in by communicating importance of Version 4 of the CIP-002 through CIP-009 reliability standards:
    a. communicate paradigm shift in approach to Version 4 relative to prior versions
    b. communicate benefits to reliability
    c. justify commitment of resources
    d. justify aggressive schedule for completion in 2010
2. Ensure key audiences (FERC, trade groups, NERC committees) are kept abreast of the drafting team's plans, successes, and challenges
3. Prepare industry stakeholders, in particular the Registered Ballot Body, to respond promptly and fully to requests for comment and ballots by providing adequate information about drafting team discussions and decisions as they occur
4. Create a feedback clearinghouse to determine information gaps and develop FAQ, where necessary

Audience

- All NERC registered entities held to compliance with NERC CIP-002 through CIP-009 reliability standards
- NERC standards, compliance, and other relevant staff (ex. Standard Coordinators, Compliance Registry, Enforcement, etc)
- NERC Member Representatives Committee
- NERC Standing Committees and relevant taskforces, ad hoc groups, subcommittees, and contractors (ex. Operating Committee, Planning Committee, Critical Infrastructure Protection Committee)
- Regional Entity staff and committees (ex. equivalent of NERC Standards Committee)
- Regional Entity management group
- FERC Commissioners, Office of Electric Reliability staff, and Office of Enforcement staff

- Industry executives (senior managers and CEOs)
- Line employees, subject matter experts, and members of standard drafting teams
- Trade associations (EEI, APPA, NRECA, EPSA, ELCON, NARUC)
- Public Utility Commissions

Topics

Concepts	• Core aspects of CIP-002-4: categorizing cyber systems based on BES reliability functions; • Core aspects of CIP security controls (requirements) based on cyber system categorization (CIP-003-4 through CIP-009-4)
Benefits and importance	• demonstrate the criticality of project success in 2010 to NERC's overall success • improve the overall quality and robustness of the NERC critical infrastructure protection standards • more objective determination (bright line thresholds) of asset categorization for applying security controls • positive impact on overall reliability of the grid • benefits to stakeholders by demonstrating ability to produce good standards timely • obtain CEO-level support for project that is communicated throughout organizations
Resources	• what resources are needed to support the drafting team in producing Version 4 technically and administratively • when and for how long
Timeline	• CIP-002-4 ballot completed by end of May, 2010 • CIP-003-4 through CIP-009-4 ballot completed by end of 2010
Impact on process	• what will be different in the drafting, reviewing, and balloting process for these Version 4 CIP standards as opposed to other typical standards projects • import of external support to facilitate drafting team efficiency, e.g. facilitation, technical writing, etc. • impact of resource commitment to Project 2008-06 may impact support for other active projects
Information sources	• where stakeholders can get further information as project proceeds in 2010 • provide access to message packages as they are available (especially for trade groups)

Delivery Methods

e-mail	• use distribution lists to ensure full coverage (NERC, Regional Entities, etc.) • use Regional Entity distribution lists to reach targeted personnel
Webinars	• associated with each posting of the standards for comment; o conduct for each significant proposal/modification for which comment is requested • record and "distribute/make available" for those who cannot attend

	• include feedback option (on demand after structured presentation/Webinar)
Committee meetings (NERC, Regional)	• attend meetings and communicate message • request special call if necessary for briefing
NERC Web site	• centralized place; linked from Regional Entity sites • headline news, big button on home page (similar to "Renewables"), pop-up page, project page, standards under development, and other frequently hit pages
Structured conference call and/or meeting	for standards drafting team representatives and NERC coordinators, including contractors;
Face-to-face outreach	• e.g. trade groups, FERC commissioners and staff, Regional Entities, committees • high-level involvement from NERC • goal: discuss Version 4 standards project with each trade organization, and at each Regional Entity general meeting at least once in spring and once in Fall, 2010.
"Canned message"	• slides and presentations (project information – overview, etc.) • files accessible via Web site and possible in-person delivery of recorded message
Press releases	As significant milestones are achieved – e.g. ballot approval, NERC Board approval, regulatory approval.
Newsletters	Monthly NERC News updates; Regional Entity newsletters
Workshops	• Include as agenda item on regional workshops • Special Cyber Workshop (?) • NERC Standards workshop (Fall 2010)
Regional Entity management group meetings/calls	Group holds weekly (Friday) conference calls and meets face-to-face prior to certain high-level meetings – standing committees, BOT Ask Regional Entity Mangers to discuss the initiative at various conferences they attend to relay the message and gain additional support from stakeholders

Delivery Plan/Timeline

Planned Tactics:

Date	Tactic	Audience	Content Developer(s)	Presenter/Delivery
January 22, 2010	Announce NERC-sponsored Webinar	Industry	Carl Dombek, Gerry Adamski	Carl Dombek, Gerry Adamski
January 25, 2010	Submit communications plan to drafting team for endorsement	Drafting team	Gerry Adamski	Gerry Adamski
End of January 2010	Review and revise web page for high-level updates (with links from home page and standards pages)	Industry/FERC	Gerry Adamski, Carl Dombek,	Gerry Adamski
Periodically	Provide custom NERC cyber newsletter on development efforts	Industry	Joe Bucciero	Joe Bucciero
February 2010	Develop a frequently asked questions document for Web page	All	Drafting team	Drafting team
February 3, 2010, 1 PM EST	Conduct industry webinar to discuss CIP-002-4 draft	Industry	Standard Drafting Team	Philip Huff, et al.
February 15, 2010	Provide status update	MRC and NERC Board	Gerry Adamski/Mike Assante in concert with drafting team	Gerry Adamski/Mike Assante
February 19 2010	Develop talking points and core messages that would be used in various levels of detail for all communications for CIP-002-4 posting and for CIP-003-4 through CIP-009-4 development.	All	Standard Drafting Team members TBD, NERC staff (Carl Dombek), NERC regional communications group	TBD
February - December 2010	Provide individual briefings on anticipated process and schedule	Electric trade associations, regional entity member meetings, FERC Reliability	Gerry Adamski, Mike Assante, Drafting Team leaders	Gerry Adamski, Mike Assante, Drafting Team leaders

Date	Tactic	Audience	Content Developer(s)	Presenter/Delivery
	Obtain feedback	Office		
March 16-18, 2010	Provide status update	Standing Committees	Gerry Adamski/Mike Assante in concert with drafting team	TBD
Early April 2010	Conduct (and record) Webinar held on CIP-003-4 through CIP-009-4. Solicit feedback during Webinar	Industry	Drafting team, NERC staff	Drafting team members TBD
April, 2010	Issue Cauley letter to executive leadership of organizations sponsoring drafting team members expressing appreciation for commitment	Drafting team executive organizational leadership	Carl Dombek, Gerry Adamski	Gerry Cauley
April 2010	Announce NERC-sponsored CIP-003-4 through CIP-009-4 in-person technical conference	Industry	Carl Dombek, Gerry Adamski	Carl Dombek, Gerry Adamski
May 11, 2010	Provide drafting team status report to NERC MRC at May meeting (include assessment of ability to meet targets)	NERC MRC and Board	Gerry Adamski/Mike Assante in concert with drafting team	Gerry Adamski/Mike Assante
May. 2010	Issue news release on positive ballot results for CIP-002-4	All	Gerry Adamski, Carl Dombek	Carl Dombek
May 2010	Issue Cauley letter to stakeholders expressing appreciation for support	Stakeholders	Gerry Adamski; Carl Dombek	Gerry Cauley
June/July 2010	Conduct NERC-sponsored CIP-003-4 through CIP-009-4 in-person technical conference Solicit feedback during Webinar	Industry	Drafting team	Drafting team
June/July 2010	Review efforts conducted through June and draft plan for remainder of year	Communications team	Carl Dombek, Gerry Adamski, Drafting Team leadership	Carl Dombek

Date	Tactic	Audience	Content Developer(s)	Presenter/Delivery
June 15-17, 2010	Provide status update	Standing Committees	Gerry Adamski/Mike Assante in concert with drafting team	TBD
August 4, 2010	Provide status update	MRC and NERC Board	Gerry Adamski/Mike Assante in concert with drafting team	Gerry Adamski/Mike Assante
August, 2010	Announce webinar in support of CIP-003-4 through CIP-009-4	Industry	Carl Dombek, Gerry Adamski	Carl Dombek, Gerry Adamski
August 2010	Conduct webinar in support of CIP-003-4 through CIP-009-4	Industry	Standard Drafting Team	Philip Huff, et al.
September 14-17, 2010	Provide status update	Standing Committees	Gerry Adamski/Mike Assante in concert with drafting team	TBD
November 3, 2010	Provide status update	MRC and NERC Board	Gerry Adamski/Mike Assante in concert with drafting team	Gerry Adamski/Mike Assante
December 7-9, 2010	Provide status update	Standing Committees	Gerry Adamski/Mike Assante in concert with drafting team	TBD
December. 2010	Issue news release on positive ballot results for CIP-003-4 through CIP-009-4	All	Gerry Adamski, Carl Dombek	Carl Dombek
December 2010	Issue Cauley letter to stakeholders expressing appreciation for support	Stakeholders	Gerry Adamski; Carl Dombek	Gerry Cauley

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 SDT Meeting with FERC

January 28, 2010 | 10:30 am – 4:00 pm EST
Dial in: 1-866-740-1260 | Access Code: 6517897

1. **Administrative Items**
    a. Introductions — All
    b. NERC Antitrust Compliance Guidelines — Howard Gugel
    c. Agenda and Objectives — Phil Huff/Howard Gugel

2. **Brief Status of CIP-002 Standard Development —** Phil Huff/Howard Gugel
    a. Current Posting for Informal Industry Comment
    b. Industry Webinar and Outreach
    c. Consideration of Comments by SDT
    d. Schedule for Formal Posting, Ballot, and BOT Approval

3. **Brief Status of Security Controls Standard Development —** Phil Huff/Howard Gugel
    a. Security Controls Drafting Principles
    b. SDT Subteam Process
    c. Schedule

4. **FERC Staff Questions for Standard Drafting Team**

5. **Standard Drafting Team Questions to FERC Staff**

6. **Next Steps —** Phil Huff/Howard Gugel

7. **Action Items —** Howard Gugel

8. **Adjourn**

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

Notes
Cyber Security Order 706 SDT — Project 2008-06

Thursday, January 28, 2010 from 10:30 am – 4:00 pm Eastern
Conference Number: 1-866-740-1260
Conference Code: 6517897

1. **Administrative Items**
   a. Introductions — All
   b. NERC Antitrust Compliance Guidelines — Howard Gugel
   c. Agenda and Objectives — Phil Huff/Howard Gugel

2. **Brief Status of CIP-002 Standard Development — Phil Huff/Howard Gugel**
   a. Current Posting for Informal Industry Comment
   b. Industry Webinar and Outreach
   c. Consideration of Comments by SDT
   d. Schedule for Formal Posting, Ballot, and BOT Approval

3. **Brief Status of Security Controls Standard Development — Phil Huff/Howard Gugel**
   a. Security Controls Drafting Principles
   b. SDT Subteam Process
   c. Schedule

4. **FERC Staff Questions for Standard Drafting Team**

5. **Standard Drafting Team Questions to FERC Staff**

6. **Next Steps — Phil Huff/Howard Gugel**

7. **Action Items — Howard Gugel**

8. **Adjourn**

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

Action Items

- FERC to provide feedback to the team as necessary while observing team meetings.
- Regis Binder to look into commission staff providing informal feedback in regard to technical content prior to the formal comment period closing on CIP-002-4.
- FERC and NERC staff to explore policy options in providing formal feedback from the commission.
- FERC and NERC staff to explore options in developing a better approach for allowing entities to apply more appropriate controls while still meeting the compliance objective.

Introduction

Howard Gugel read the NERC Anti-trust guidelines.

Dave Taylor provided a brief introduction of the meeting objectives. The primary meeting objective was to begin a dialogue between the FERC and the SDT on efforts to address directives from Order 706.

Regis Binder provided opening remarks, stating that FERC has followed the SDT cyber security standards development process within constraints of their limited resources. He also indicated that FERC staff cannot speak on behalf of the commission and they cannot discuss matters related to pending orders by the commission.

Status of CIP-002 Standard Development

Philip Huff opened by stating that the purpose of the meeting was to foster ongoing communications between the team and FERC staff. He expressed that the project has a tight schedule, and it will be imperative that there is open dialogue throughout the process if the schedule is to be met.

CIP-002-4 was developed to identify and categorize cyber systems related to Bulk Electric Systems (BES) in North America. The standard is posted for an informal industry comment period that ends February 12. Various team members have attended trade organization meetings in order to open a dialogue and encourage participation during the comment period. The team expects to post the standard for a formal comment period toward the end of February. The project schedule calls for the standard to be filed with FERC by June 1.

Philip further stated that the focus of CIP-002-3 was to protect critical cyber systems. In the new version CIP-002-4, the focus is on protecting the reliability of the BES, not necessarily all cyber systems. This idea was presented in a concept paper published to the industry in July, 2009, which was well received. A critical aspect of this process is the development of security controls, which are under development and are expected to be posted in draft form prior to the ballot on CIP-002-4. Additionally, the team had a few targets in mind. The first was to address direction given to NERC in FERC Order 706. The team also wanted to write the standard to minimize the necessity of TFEs.

At this point, the concept of using a cost vs. benefit for risk analysis was discussed. Previously, a "cafeteria" approach (pick what you like and dislike) was used to develop priorities. The team intends to develop justifications for priorities.

The team members have been split into 6 small groups in order to develop the security controls. The teams will finalize their drafts at the March Standard Drafting Team meeting in Phoenix, in order to post drafts in April.

FERC Questions to SDT

1) They expressed concern about upstream attacks from low impact targets and how the SDT planned to address these in the Standards. They want to ensure that everything would have at least some minimal baseline of security.

- D. Batz - How do we not treat the low assets differently than the very high impact assets?
- Dave Norton - Need to preclude the damage a device could do upstream. Protection needs to prevent navigability to higher impact assets.
- Mike Peters – One of the directives in Order 706 dealt with a mutual distrust architecture in the system. Need to create a true mutual distrust where access to a single facility or system does not translate to full access.
- Norton - Need more rigor about how we apply controls to the "weakest link". Prevent upstream attacks to low impact asset.

2) How is the team using NIST 800-53 with the current compliance program? How do you measure compliance within the NIST Framework?

Refer to question #1 of SDT to FERC. The team had also posed this question to the commission staff.

3) Order 706 directed regional oversight for the identification of Critical Assets. How do you obtain Regional Oversight in the proposed CIP-002-4?

- Jim Brenton - We accomplish this through bright-line, objective criteria.
- R. Binder and M. Peters - On their reading, they would agree this meets the directive of oversight.

4) Regarding the approval of engineering studies by the Reliability Coordinator, do RC's have problems with taking on that responsibility? [Not a concern as much as a question]

Brenton - A lot of concerns on compliance risk and safe-harbor for RCs

SDT Questions to FERC

1) 800-53 is an organizational risk management framework, which allows for tailoring, compensating controls and organizationally defined criteria. However, FERC Order 706 calls for extensive oversight for any exceptions. What are their thoughts on reconciling these seemingly conflicting objectives?

- R. Binder – Cost/benefit principle is difficult to implement in compliance.
- Scott Wartz – Is this a repackaging of Reasonable Business Judgement?
- Philip Huff – No. Compensating controls still achieve the desired objective. It's not a blanket statement.
- M. Peters – Need to identify the control objective and demonstrate how you meet it.

Separate discussion

- M. Peters – Paragraph 152 of Order 706: TFEs is not just technically feasible but also operationally reasonable.
- D. Batz - Uncomfortable with the term "cost". Need to determine the appropriateness and prioritization. Not appropriate to apply same level of protection across every single asset.
- M. Peters - Need to have a minimal level of protection for all of your assets.
- Norton - Brought up "culture of compliance" and difference between "culture of security". It takes auditors that are highly effective.
- Allen Mosher - Fundamentally, this encompasses the approach of results-based standard.

2) The process to make modifications to the Standards through a FERC Order is very resource intensive. Conversely, changes made prior to industry balloting are relatively cheap. Is it possible to have a process where the team can receive feedback from FERC prior to ballot?

FERC staff will investigate options for formal input. In addition, FERC staff will attempt to attend future meetings as schedules allow. They have concerns about providing comments about filings that are pending before the commission.

3) What expectations are there regarding coordination with the Smart Grid CSCTG (Cyber Security Coordination Task Group) product and how we use 800-53/DHS Catalogue?

- Mike Peters – Look at those interface use-cases they are building. You don't have to match exactly what SG does, but the team should consider participating in the process and provide mutual feedback.

4) Have we captured all of the directives from order 706 in the filing from December?

- R. Binder – I don't believe we can comment on this matter since it concerns a pending order.

5) What are their thoughts about filing CIP-002 separate from the remaining security controls?

- R. Binder – There are concerns with filing separately
- P. Huff – This shouldn't be a problem because CIP-002-4 does not reference the Security Controls
- D. Taylor – Yes, but they are a suite of Standards. CIP-002-3 would need to be retired.
- D. Batz – The industry would find it difficult doing technical work for a standard [CIP-002-4] that has no effect.
- J. Brenton – At least the industry can begin work on an approved standard in preparation for the security controls.
- M. Peters – This approach is similar to 800-53, right? Are you looking at eliminating CIP-003 through -009?
- J. Brenton – We don't know how it is going to break out. We'll definitely include what's in the current CIP Standards.
- Allen Mosher – Will there be a mapping of changes?
- J. Brenton – Yes
- H. Gugel – We haven't made decisions on format as a team yet.

[*Later discussion: during SDT question period*]

- R. Binder - Conceptually filing separately provides problems. He just wasn't sure what to do with that.
- Dave Taylor – The security controls would follow soon after
- Jan Bargain – You would be posting the security controls informally, right?
- D. Taylor - Yes
- J. Bargain - As long as the plan to marry the two standards, it shouldn't be a problem.
- R. Binder – Not sure that we can approve CIP-002-4 ahead of the security controls.

6) To what degree can we remove, lessen, or make substitution for prescriptive elements in the current CIP Standard where the risk reduction does not justify the consumption of industry resources in administrative overhead?

- R. Binder – There would need to be a justification for doing so.
- M. Peters - pg.233 of Order 706 reads that any provisions that would better protect the BES, the Standards Dev. Process has the freedom to so. If the administrative elements actually lessen the reliability of the BES, then we can use that provision.
- Dave Taylor - Requires the SDT to have the type of mapping to demonstrate changes and provide justification anyway.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 — Project 2008-06

February 16, 2010, Tuesday- 1 PM to 5 PM CST
February 17, 2010 Wednesday- 8 AM to 5 PM CST
February 18, 2010 Thursday- 8 AM to 5 PM CST
February 19, 2010 Friday- 8 AM to 2 PM CST
ERCOT Austin MET Cente
7620 Metro Center Dr.
Austin, Texas 78744

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Group Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes

- Review the CSO 706 SDT 2010 Work plan
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan
- Review, discuss industry comments and identify issues raised to be addressed in refinements;
- Review, refine and adopt a revised CIP 002-4 for posting
- Receive progress reports and review assignments for Security Control Sub-Teams
- Agree on next steps and assignments

Draft Agenda

Tuesday February 16, 2009
1:00 p.m. Welcome and Opening Remarks- *John Lim, Chair & Phil Huff, Vice Chair*
Roll Call; NERC Antitrust Compliance Guidelines
Facilitator review and SDT acceptance of January 19-22, 2010 Tucker SDT meeting summary
1:10 Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
1:15 Review of CSO 706 SDT Workplan- February-December, 2010- *Stu Langton*
1:20 Updates on other related cyber security initiatives- *NERC Staff and SDT Members*
1:30 Update on CIP Communication Plan, including Webinar Report
1:45 Review of needed CIP-002-4 Documents for posting: Introduction, Comment Form,

Requirements, Attachments, Implementation Plan.
2:00 Overview of the Industry Comments on the CIP-002-4 *John Lim and Phil Huff*
2:45 Break
3:00 Identification of Key CIP 002-4 Issues Raised by Industry Responses to Comment form
Questions (1-13)
4:30 Review and Initial Discussion of Other Proposed Approaches to CIP-002-4 *(Dave Norton*
etc.)
5:25 Review of Proposal for Wednesday's Agenda
5:30 *Recess*

Wednesday February 17, 2010
8:00 Welcome and Agenda Review- *John Lim & Phil Huff*
8:10 Discussion and Consensus Testing of Concepts and Responses to Industry Comments and
Critiques
10:15 Break
10:30 Discussion and Consensus Testing of Concepts and Responses to Industry Comments and
Critiques
12:00 *Working Lunch*
12:45 Review and Agree on How to Refine CIP 002-4 *(Full Group or Drafting Sub-Groups)*
1:15 Clarify Issues and Begin Draft Possible CIP 002-4 Refinements *(Full Group or Drafting*
Sub-Groups)
4:00 If Sub Team Formed- Initial Reports and Flagging Issues Needing Full Team Guidance
4:55 Review Assignments and Thursday Agenda
5:30 Recess

Thursday February 18, 2010
8:00 Welcome and Agenda Review- *John Lim & Phil Huff*
8:15 Review any Drafting Group Requests/Needs Full Team Feedback
10:00 Break
10:15 Reconvene Drafting Groups to Complete CIP-002-4 Refinements
12:00 *Working Lunch*
1:30 Drafting Group Reports and Full Team Consideration and Consensus Testing of CIP-
002-4 Refinements and Changes.
3:00 Break
4:45 Review Any Final Drafting CIP 002-4 Assignments and Friday's Agenda
5:00 Recess

Friday February 19, 2010
8:00 Welcome and Agenda Review- *John Lim & Phil Huff*
8:05 Review and Adopt Final CIP 002-4 for 45-Day Formal Comment Posting
8:50 *Stretch Break*
9:00 Security Control Sub Teams (6) Progress Reports and key format and substantive issues
for Full Team Guidance to Sub Teams.
12:00 *Working Lunch*- Review and Agree on Next Steps for Developing Security Controls (CIP
003-009) and Work plan for March 2010 Meeting on Security Controls.
Meeting Evaluation
1:00 Adjourn

CSO 706 SDT MEETING SCHEDULE

JANUARY –DECEMBER 2010

CSO 706 SDT Meeting Agenda Packet, February 16-19, 2010, Austin TX 5

CSO 706 SDT WORKPLAN TO DATE

OCTOBER, 2008 –DECEMBER 2009

DEVELOPMENT OF CIP VERSION 2 AND NEW VERSION FRAMEWORK
OCTOBER 2008–JULY 2009

1. **October 6–7, 2008 — Gaithersburg, MD** Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.
2. **October 20–21 —Sacramento, CA** CIP-002-CIP-009 Version 2 development
3. **November 12–14, 2008 — Little Rock, AR** CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 New Version process reviewed.
4. **December 4–5, 2008 — Washington D.C.** CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white "working" papers assigned, Technical Feasibility Exceptions white paper reviewed and refined.
5. **January 7–9 — Phoenix, AZ,** Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed New Version white "working" papers.
6. January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
7. January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
8. **February 2–4, 2009 — Phoenix, AZ** Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.
9. **February 18–19, 2009 — Fairfax, VA** Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.
10. **March 10–11, 2009 — Orlando, FL** Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals
    - *March 2–April 1, 2009 — 30-day Pre Ballot*
    - *Mid-March — NERC posts TFE draft Rules of Procedure for industry comment*
    - *March 30, 2009 — WebEx meeting(s) White Paper Drafting Team*
    - ***April 1–10 — NERC Balloting on Version 2 Products***
    - *April 6, 2009 — WebEx meeting — White Paper Drafting Team*
    - *April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call*
    - *April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments*
11. **April 14–16, 2009 — Charlotte NC** Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.

- *April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx*
- *April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%*
- *May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.*

12. **May 13–14, 2009 — Boulder City NV** Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.
    - June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx
13. **June 17–18, 2009 — Portland OR** Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.
    - *June — WebEx meeting(s)*
    - *Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria*

CIP-002 DEVELOPMENT OF REQUIREMENTS, MEASURES, ETC. JULY-DECEMBER 2009

14. **July 13–14, 2009 in Vancouver, B.C., Canada**

SDT reviewed, refined, and adopted SDT Working Paper. SDT adopted its response to NERC for Interpretation of CIP-006-1. SDT reviewed and adopted a proposal for CIP-002 Subgroups and Deliverables and convened subgroup organizational meetings to develop work plans. SDT =adopted 2010 Meeting Schedule.

- *July–August Interim Conference call meeting(s)*
- *CIP-002 Subgroup meetings*
- *CIP-002 Coordination Team meeting*

CSO706 SDT February 16-19, 2010 Meeting Summary Contents

CSO706 SDT FEBRUARY 16-19, 2010 MEETING
EXECUTIVE SUMMARY

On Tuesday afternoon, the Chair, John Lim welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines. The host Jim Brenton, a SDT member, welcomed everyone to the ERCOT facilities and covered logistics. The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda. On Thursday morning the SDT approved without objection the meeting summary for the January 19-22, 2010 SDT session in Tucker, Georgia.

Bob Jones reviewed the SDT workplan and schedule and provided an overview of an alternative schedule that Chair John Lim developed for the SDT's consideration. Mr. Lim noted that Gerry Adamski, NERC's standards director, contacted him and the Vice Chair late last week to discuss the schedule in light of industry concerns with going to ballot with CIP-002-4 separately from the balloting of the controls requirements standard. Following the meeting, the Chair put together a draft alternative schedule to address this concern which was cited by over 75% of industry comments and was raised in the February 9 SDT conference call to review trade association and regional meetings that discussed CIP-002-4. The new schedule is designed to give the SDT more time to address comments and prepare a better, more complete draft for formal posting later in the year. On Thursday, the revised schedule with a memo and Gant chart to be drafted for the Standards Committee's review was unanimously adopted by the SDT.

Mike Gent, former President of NERC and Vice Chair of the ERCOT Board, thanked SDT members for their work and noted that with at least three bills in Congress giving FERC more authority, we know we have to act even though there may be different visions of what doing the right thing means.

On Friday, Gerry Adamski, Director of Standards provided an overview of the Communication Plan that was circulated to the SDT at the conclusion of the Tucker meeting and after discussion with the SDT agreed to begin planning for an industry workshop in late Spring after the new CIP 002 and the controls requirements standards are out for review.

NERC Staff and members provided brief updates on related cyber security efforts relating to the Critical Asset and Cyber Asset Identification Process, a presentation on the Team's work at the ARC World Forum, a NERC bulk system policy statement, and NIST's release of a second draft of their report and a Cyber Shock Wave cyber attack exercise
The SDT reviewed industry responses to the Comment Form Questions provided with the preliminary draft CIP-002-4 standard for industry comment and discussed refinements of CIP 002-4. The Chair and Vice Chair proposed using the "points of agreement/disagreement/confusion table" that was started on Tuesday and asked members to

add any additional concerns as the Team reviewed the industry responses to Comment Form questions. The Industry Comment Form featured 13 questions and the Team received over 500 pages in comments. For most of the questions, there was a relatively low level of industry agreement with the proposals (between 20-40%). In preparation for the meeting, John Lim, Phil Huff, Howard Gugel and Scott Mix agreed to review the industry comments received in response to the Comment Form questions and provide the SDT with a review of the themes and a summary of the industry's comments. The full SDT reviewed the summary of industry comments, and later split into the following sub-teams to review and propose revisions to the CIP 002-4 standard based on the comments received: Definitions; Attachment #1; VSLs; Standards Requirements; and External Oversight.

CSO 706 SDT Points of Agreement, Disagreement and Confusion in Terms of CIP 002-4

Points of Agreement *regarding Industry Comments on CIP 002-4*	**Points of Disagreement *regarding Industry Comments on CIP 002-4***	**Industry Points of Confusion *regarding CIP 002-4***
1. Flexibility is needed but may or may not be included in today's language	1. What is the CIP standard trying to protect against?	1. Do you start with R1 and work through R3 or is there more flexibility possible in CIP 002-4?
2. Functions of BES need to be considered, but may not be clear in today's standard language	2. Should it be connectivity vs. impact assessment	
3.Some form of inventory will be needed regardless of approach	3. How extensive should the inventory be for each approach	
4. Any approach needs to result in a categorized list of cyber systems	4. The cyber system should inherit the categorization of the BES asset (indirect impact mapping) vs. basing the categorization on an assessment of the external and internal threats (direct impact mapping)	
5. The SDT is addressing a range of cyber systems at play in the real-time control and operation of the BES	5. There should be flexibility and third party oversight as to what equipment has a reliability impact on the BES	
6. Bright lines will help to simplify the implementation and compliance with the standards	6. Categorization should be based on threat/ reach/ connectivity	
7. Where ever possible, the SDT should seek to combine steps and simplify the approach	7. If we are using a compliance framework, we should stick with a CIP 003-009 structure	
8. We function in a compliance vs. a performance assurance framework.		
9. The standard should be designed so those implementing it know why they are protecting assets and systems.		

10.We are designing a compliance not a performance assurance framework		

The SDT Reviewed Alternative Approaches to CIP 002-4 including a categorization of BES cyber systems based on use of routable protocols. Dave Norton had circulated in advance of the meeting a proposal which suggested the categorization of BES cyber systems should be primarily based on use of routable protocols (threat/reach/connectivity). The following proposal was presented for the Team's consideration:

Categorizations of BES cyber systems based on the potential impact of their compromise through the use of routable protocols as attack vectors.

- **Control center routable protocol = high**
- **Generation plant/transmission substation = medium**
- **All else = low**

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	6	**4**	**9**	**2**	**2.7 of 4**

Jay Cribb offered the following concept for ranking:

Cyber System Impact on BES →	high	medium	low
Connectivity ↓			
Routable	high		
Non-Routable	high		
Stand Alone	medium		

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	4	**13**	**3**	**0**	**3.1 of 4**

Stu Langton reviewed with the Team the difficult nature and complexity of the task at hand and reminded them that we will continue to have disagreements. He noted that the SDT has met all previous deadlines and will continue to work together to meet the upcoming deadlines. Consensus doesn't mean we have to all agree and that we can disagree sometimes – differences are okay – if 75% want to move on, then we will – we need the minority on different issues to hang in there and keep working with us.

Scott Rosenberger presented a revised proposal on Wednesday and spoke about risks presented by connectivity and the challenges in defining terms accurately.

"Include connectivity as a factor in the BES Cyber System categorization"
Revised Proposal: Matrix for Levels of Controls to Be Applied

BES (attachment #1 of CIP 002-4)	High	Med.	Low
Connectivity-Routable/Dial-up	High	High	Med.
Non-Routable	Med.	Low	Low
Not Connected	Low	Low	Low

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	12	**4**	**2**	**0**	**3.6 of 4**

Phil Huff offered the following successive proposals for testing acceptability related to combining Attachment #1 & #2 for the SDT to rank. The SDT reviewed and ranked three versions of the proposal, as follows:

1st Version Proposed by Phil Huff
Attachment 2 and Attachment 1 should be combined into a single set of criteria. The subject of each criterion is the BES Cyber System and the verb would be the function being performed (the Criteria is the Span of Control).

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	2	**9**	**9**	**0**	**2.65 of 4**

2nd Version Proposed by Phil Huff
Attachment 2 and Attachment 1 should be combined into a single set of criteria. The subject of each criterion is the BES Cyber System and the verb would be the function being performed. ~~(the Criteria is the Span of Control).~~

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	1	**11**	**6**	**1**	**2.6 of 4**

Revised Concept of Combining Attachment #1 and #2

On Friday morning, Dave Revill presented a concept of combining Attachment 1 & 2 that was discussed overnight by a group including John Lim, Phil Huff, Dave Revill, Rich Kinas, Patrick Leon, Joe Doetzl, and Dave Norton. He noted that under this proposal:

- Attachment 2 becomes more of a guidance document
- REs shall categorize the BES cyber systems by applying criteria in CIP 002 Attachment 1
- Changed ~~BES Subsystems~~ to BES Cyber Systems
- Changed Generation ~~Subsystem~~ in Attachment 1 to Generation facility.
- Move Attachment 2 to a guidance document to identifying what immediate affect on real-time operations means

This proposal combines Attachment 1 and Attachment 2 by tying the criteria in Attachment 1 to BES Cyber Systems that immediately (i.e., 15 minutes or less) affect real-

time operation. Attachment 2 is moved to a guidance document for identifying Cyber Systems that immediately affect real-time operations. (including the connectivity matrix)

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	8	**10**	**1**	**0**	**3.4 of 4**

The SDT reviewed and ranked the following related to the proposal above:

R1. As a step in identifying appropriate security controls for its assets, each Responsible Entity shall categorize its BES ~~Subsystems~~ Cyber Systems ~~under its ownership~~ by applying the criteria in *CIP-002-Attachment 1 – Criteria for BES Impact Categorization of BES* ~~Subsystems.~~ *Cyber Systems*. (*Violation Risk Factor: High*)

Attachment 1: Criteria for BES Impact Categorization of BES Cyber Systems
Cyber Systems that would immediately affect real-time operations for:

- Generation ~~subsystem facilities~~ with aggregate rated name-plate generation of 2,000 MVA or more.
- Etc.

Move Attachment 2 to a guidance document to identifying what *Immediate affect on real-time operations* means.

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	15	**6**	**1**	**0**	**3.6 of 4**

On Friday morning, the SDT discussed next steps regarding refinements to CIP-002-4 and the development of a response document for the industry's consideration. The Chair proposed and the members agreed that a subteam of 4-6 members would be formed to work on refining CIP-002-4 between now and the March meeting in Phoenix, where they would present a new draft standard back to the full SDT as well as a response document. The team may also continue after the March meeting to finalize these tasks.

On Friday, the Security Controls Requirements Sub-Teams (including Personnel and Physical Security, Security Governance, Recovery and Response, Access, Control and Auditing, Change Management, System Lifecycle and Information Management and Security Operations) reported on progress made since the Tucker meeting, reviewed a set of threshold questions and drafting guidance statements, and met in Sub-teams to work further on their efforts and agreement on next steps. The questions included:

1) How we are going to handle writing requirements that apply to 'BES Cyber Systems' rather than 'Critical Cyber Assets'?
2) At what level are we to write the requirements?
3) We've got to have some kind of ruling on the topic of compensating controls in a NERC

CMEP world.

4) We need a standard way to not only handle the difference in impact and environment (CC/Gen/Tran), but the difference in cyber system/device class.

Based on the SDT discussion, the following guidance statements were proposed to be added to those developed at the Tucker meeting:

- Requirements should apply to either (1) the BES Cyber System as a whole, or (2) components of the BES Cyber System. When a requirement only applies to specific types of components, describe those types of components to determine where component classes exist. Requirements specific to boundary protection or ESP can be written to the interface of the BES Cyber System.
- Sub-Teams should start with the CIP words and tweak if needed to include some DHS language. However, the "level" of the requirements text should be raised, if needed. Be specific, not prescriptive.
- Compensating Controls are not allowed. Need to write a "what" requirement, not a "how" requirement.
- As guidance, the focus should be on setting the level of controls at a level to avoid applying it to a device class, or explain why a control is being applied to a device class (e.g., general purpose platform vs. purpose built platform also, Part A of the TFE for a set of classes)

The Chair reviewed the progress made at the meeting and the need for the sub-teams to continue to meet between Austin and the Phoenix meeting to prepare draft language for the security controls for review by the full SDT. He also noted the agreement on a revised schedule by the SDT and the formation of a subteam to take the CIP-002-4 draft and make refinements and develop a response document to the industry's comments.

The Vice Chair agreed to work with the facilitators to revise the Sub-team drafting guidance statements based on this discussion and circulate them in advance of the March meeting.

The meeting adjourned at 12:15 p.m.

_____

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CSO 706 SDT JANUARY 19-22, 2010
AUSTIN, TEXAS

MEETING SUMMARY

I. AGENDA REVIEW, WORKPLAN, UPDATES AND COMMUNICATION PLAN

A. Agenda Review

On Tuesday afternoon, the Chair, John Lim welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The host Jim Brenton, a SDT member, welcomed everyone to the ERCOT facilities and covered logistics. The Chair reviewed the meeting objectives noting that focus of this meeting will be reviewing the industry comments received and discussing schedule forward – start drafting responses to comments following review and discussion of the schedule in response to comments and concerns from industry about addressing 002-4 separately from the rest of the standards. Phil Huff noted the intention was to consider the summary and full set of comments in small groups related to the questions posed in the comment form in order to develop general responses. He reminded the SDT that these are "informal comments" and we want to be responsive and keep the dialogue with industry going. Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). On Thursday morning the SDT approved without objection the meeting summary for the January 19-22, 2010 SDT session in Tucker, Georgia.

B. SDT Workplan and Schedule

Bob Jones reviewed the SDT workplan and schedule and provided an overview of an alternative schedule that Chair John Lim developed for the SDT's consideration. (*See Appendix #5).* Mr. Lim noted that Gerry Adamski, NERC's standards director, contacted him and the Vice Chair late last week to discuss the schedule in light of industry concerns with going to ballot with CIP-002-4 in late Spring and then separately later in 2010 balloting CIP 003-009. Following the meeting, the Chair put together a draft alternative schedule to address this concern which was cited by over 75% of industry comments and was raised in the February 9 SDT conference call to review trade association and regional meetings that discussed CIP-002-4 *(See Appendix #)*

Mr. Lim noted that this issue could put at risk the CIP 002-4 ballot without the remaining pieces being out for simultaneous industry review. The new schedule is designed to give the SDT more time to address comments and prepare a better, more complete draft for formal posting later in the Spring. It calls for informally posting an revised CIP-002-4 draft in March and by April begin to bring the security controls together with the CIP-002 governance standards.

SDT Discussion comments on the Schedule:

- Would a formal request for a second informal comment period need to be approved by the Standards Committee? Probably yes.
- The SDT needs to show progress but also be responsive to concerns from industry to see everything before agreeing to almost anything even in the informal comment period.
- Confused as to what is being proposed regarding the second informal comment period of CIP 002 and 003-009 controls schedule?
- Option to put 002 out for additional informal comment period or wait until other pieces are ready for combined informal comment period
- Posting for standards drafting team review by end of March (or April meeting?)
- CIP 003-009 ready for team review by March and finalized draft of CIP 002 – full package informal posting by April 19th
- The SDT is counting on time in March to prepare the security controls
- This is a slipped schedule – has FERC bought off on this? At the FERC/NERC meeting FERC staff acknowledged it might be problematic to put 002 out early and thought a combined posting made sense.
- CIP 002 is intended to determine bright lines of what to protect, not the how to protect it. Not sure we should say to people can wait until they see the how. This could lead to more gaming the system, what we are trying to get away from.
- People need the 003-009 security controls to understand the intent of CIP-002. Are we rushing to quickly through CIP 002 to get to CIP 003-009? Our schedule makes the assumption members have enough time to do this.
- Concerned about how the controls will match up with CIP-002 – the industry push back means they do not understand how the high/medium/low will work and fear that too much will be put in the high category. The schedule may be quick but not sure how else to do it.
- Early March post revised CIP 002 draft for comment to the SDT – remove “informal” to avoid confusion – FERC is going to wait until the whole package is ready to review. In order to meet end of the year deadline there is not much we can pull out of this proposed schedule – open to ideas for changes that would improve the product.
- Change “post” to circulate to avoid confusion
- The SDT members should be careful and avoid using “gaming the system.” The reality is that people are not sure what high/medium/low means and how controls will help define and be applied to each.
- We will not be ready to present the first draft of security controls at the March SDT meeting. Can present progress to review with full committee – this meeting we could focus and getting CIP-002 closer to completion.

- Taking CIP-002 off the table by June may help us to polish CIP002 but may take time away from preparing security controls. CIP- 002 is the most important piece to get right.
- It will be difficult to meet this proposed schedule– to have prayer of doing this we need to clarify common understanding of threshold questions across the sub-teams.
- Question for NERC standards committee? Communication with FERC regarding changes in the schedule?
- Be sure to look at the July period on – posting for three comment periods will require a lot of time for responding to those questions
- People are confused by the multiple sources requesting comments – series of rapid turnarounds may further confuse the industry
- Need to approve a new schedule? Review highlights and check on questions:
- In Austin – react to comments and develop consensus on 002 – start redrafting 002
- Sub-team meetings in next two weeks to refine 002 – by beginning of March have draft for full team review.
- Phoenix – finalize CIP 002 draft by end of first meeting day for posting/review but not comments – focus on sub team drafting of 003-009 controls.
- April 5th– have all control groups to have drafts for circulation to the rest of the SDT team as a package
- March in Phoenix: First draft of what? The controls? Should say draft CIP 002 for full team comment in Phoenix followed by team review of sub-team progress and drafts of sub team drafts of controls requirements.
- Present controls draft requirements for full team review and comment week of 4/12 followed by Sub-team refinements as needed in response.
- Posting of full package in May for informal comment
- May time period for a technical conference (face-to-face) or webinar with industry for review and comments?
- Should we think of a thirty day comment period allowing us to post May 1 with comments by May 31 – gives us time to work in sub teams through April – deal with comments/responses at the June meeting – everything following June stays the same
- Consider the mid-May meeting dates in Dallas for preparing for a technical conference to follow a week or two later.
- June SDT respond to comments.
- Series of ballot/comment periods in subsequent SDT meetings – formal comment periods require responses to each comment.
- Schedule allows for three comment periods if needed – can make changes to the draft based on the comments – allowed to keep the same ballot pool and deviate from required process to shorten periods required for re-balloting
- Need to verify assumptions in schedule with the Standards committee – Chair will take this forward.
- May need more time at the end to be sure prepared to file
- If make significant changes to the standard may impact those who need to be in the ballot pool

- Attach a draft schedule with a memo for the Standards Committee – put into a gant chart to show alignment?
- Review on Friday for adoption
- Schedule needed to meet requests is aggressive and will require people at this table to devote time and resources to make it happen – once approved we will be stuck with it

On Thursday the Revised schedule with a memo and Gant chart to be drafted for the Standards Committee's review was unanimously adopted by the SDT.

Mike Gent, former President of NERC and Vice Chair of the ERCOT Board, thanked SDT members for their work and noted the Team should blame him for some of this work. He also noted the facilitation team helped NERC in working with the Blue Ribbon Group in 1997-98 that lead the creation of the ERO. We wanted to be sure that the industry were effective without being too burdensome because doing nothing is unacceptable. While there may be different visions of doing the right thing and we are still not sure what we have to do, but know we have to do it. There are presently at least three bills in Congress giving FERC more authority.

C. NERC Update on Implementing the CIP Communication Plan

On Friday, Gerry Adamski, Director of Standards provided an overview of the Communication Plan that was circulated to the SDT at the conclusion of the Tucker meeting.

- Begin work on implementation in terms of industry outreach.
- NERC may produce a newsletter of which this would be a part as well as a maintained frequently asked questions list. For example the new concept of connecting CIP 002 with CIP 003-009 for industry review would be a good example.
- NERC also convened a meeting with FERC in January to review SDT progress.
- Need to hear more about the communication plan at a meeting soon
- The SDT Webinar on CIP 002-4 in late January was a helpful effort that had 475 registered and that members Jay Cribb and Sharon Edwards moderated and John and Phil joined in as well. There were many thoughtful questions – many of the concerns in the industry comments came out during the Webinar discussions
- Spent a lot of time explaining why the changes were needed
- The most heard comment involved the need to see CIP 003-009 before approving CIP 002
- They expressed they were used to the current system and hoped the SDT would build on it . They did not say it was necessarily the best system.

SDT Questions and Comments

- The team's adopted revised schedule will impact our communication plan.

- We need to communicate with a summary document our work on and with the informal comments – "post" the revised CIP-002 on website without soliciting industry comment and wait to marry this with the rest of the package of security controls.
- Consider an industry conference call to lay out the new strategy and schedule.
- Also consider an in-person face-to-face technical conference/workshop later in the Spring (Late May). This would take a lot of work and communication on NERC's part.
- Use the mid-May SDT Meeting to work on preparation for the workshop.
- Consider marrying the workshop up with the June team meeting in Sacramento?
- Need to get an updated copy of the communication plan to members so they can review and offer comments or suggestions.
- What would be the preferred location for the workshop? Connected to a SDT meeting? Near a central major airport?

D. Related Cyber Security Efforts:

NERC Staff and members provided the follow brief updates on related cyber security efforts:

- Scott Mix noted that the Critical Asset and Cyber Asset Identification Process comment period closes at the end of February. He noted there has been some confusion regarding these overlapping but distinct efforts and the closing of this process should help in that regard.

- Keith Stouffer reported on a presentation on the Team's work at the ARC World Forum much of the audience familiar with what is going on – aware of proposed expansion of scope of the standards – some worried it would seep down into distribution – anxious to see the final product.

- NERC is also coming out with a bulk system policy statement. It would be helpful to the Team to have someone from NERC provide clarification – may expand our understanding of the bulk electric system.

- Joe Bucierro noted that NIST has released a second copy of their report. He suggested that individual Team members may want to review and comment as appropriate. There also may be some point of coordination that the Team may want to consider going forward. Several Team members have been participating in the development of the report.

- Cyber Shock Wave was a bi-partisan policy group running an cyber attack exercise. Jay Cribb and other Team members were involved in helping write the scenarios.

II. SDT REVIEW OF INDUSTRY COMMENTS ON CIP-002-4

A. Reviewing Industry Responses to Comment Form Questions and Discussion of Refinements

The Chair and Vice Chair proposed to use the points of agreement/disagreement/confusion table (*see B.2 Below*) started on Tuesday and asked members to add any additional concerns as the Team reviewed the industry responses to Comment Form questions.

The Industry Comment Form featured 13 questions and the Team received over 500 pages in comments. In preparation for the meeting, John Lim, Phil Huff, Howard Gugel and Scott Mix agreed to review the industry comments responding to the questions and provide a review of the themes and a summary of the industry's response to CIP 002-4.

1. Comment Form Question #1 – Definitions

Scott Mix provided the overall summary for Question #1 from the industry responses for definitions of new or revised terms for possible inclusion in the NERC Glossary. These included: Cyber System, BES Cyber System, Bulk Electric System Subsystem (BES Subsystem), Generation Subsystem, Transmission Subsystem, Control Center, High BES Impact, Medium BES Impact, and Low BES Impact.

1. Do you agree with the definitions and adoption of the following new or revised terms for inclusion in the NERC Glossary: Cyber System, BES Cyber System, Bulk Electric System Subsystem (BES Subsystem), Generation Subsystem, Transmission Subsystem, Control Center, High BES Impact, Medium BES Impact, and Low BES Impact? If not, please supply and explain your proposed modification.

Overview of Industry Responses to Question #1 Definitions

General Responses.

- CIP 002-4 is still too complex / no clarity / ambiguous / vague
- Retain existing definitions – with clarification, don't reinvent the wheel.
- "BES" vs. "BPS" discussion – consistent across regions – 100kV bright line
- Proper use existing NERC Glossary definitions such as "Element", "Facility", "Adverse Reliability Impact", etc
- Need to see CIP-003 – CIP-009 to assess definitions.

Specific Responses

1.a. Cyber System Definition

1.a. Cyber System — A discrete set of one or more programmable electronic devices organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data.

Option	Count	Percent
Agree with proposed definition	30	29.1

Disagree with proposed definition	63	61.2
Total:	**93**	**100.0**

Overview of Industry Responses to Cyber System Definition

- "Subsystem" adds unneeded step and confusion
- More clearly define "Subsystem" / "one or more"
- How do we determine what a "subsystem" is
- Routable and dial-able protocols – accessibility?
- Overly broad definition?
- What does "programmable" mean and where does it come in?
- Cyber "system" term may be unnecessary
- Add phrase "all components necessary to make BES function"
- Is this too vague?

SDT Discussion of Cyber System Definition

- Focus on Routable protocols, dial-up assets / connectivity / accessibility
- Mandate "testing" and "recovery"
- Why include "maintenance", "sharing", "communications", "disposing"
- This is an overly broad definition
- "Programmable" not defined – where programmed (factory or end-user?)
- This may be an unnecessary term – Consider using "Cyber Assets"
- Focus on real-time applications
- Does address "Non-cyber" cyber systems?
- Would encompass every cell phone, etc as a cyber system?

1.b. BES Cyber System Definition

1.b. BES Cyber System — A Cyber System which if rendered unavailable, degraded, or compromised has the potential to adversely impact functions critical to the reliable operation of the Bulk Electric System.

Question 1.b. (99 Responses)

Option	Count	Percent
Agree with proposed definition	27	26.2
Disagree with proposed definition	72	69.9
Total:	**99**	**100.0**

Overview of Industry Responses to BES Cyber System Definition

- Add “also includes all components necessary to ensure the protection of the reliability functions being performed”
- Should refer to Attachment 2
- “Has the potential” is to vague
- Define “critical”, “adverse”, “degrade”, “compromise”, “critical functions”, etc
- Use “Adverse Reliability Impact” which is a defined term
- Use concept of risk
- No benefit over use of Critical Cyber Asset – use Critical Cyber Asset
- Remote accessibility
- Define the term, not the impact
- Capture “misuse”
- Change term to “Critical Cyber System”
- Change “has potential” to “has significant potential” – or change to “will”
- Accessibility issue (wired and wireless)
- Availability of asset impacts “potential to adversely impact” – is this what the SDT wants?
- Add “essential to operations” and “routable protocol”
- Relationship to NRC (nuclear) definitions
- Exclude market systems
- Change to “Cyber Systems controlling BES Facilities”

SDT Discussion Points of BES Cyber System Definition

- Need definitions of compromised, misuse, etc.
- No concept of risk or vulnerability?
- Retain CCA definition
- Change to critical cyber system
- Wired and wireless accessibility
- What about the concept of risk?
- Add essential to operations.
- Note the terms being used here versus those in use in nuclear industry
- Exclude market systems if that is what you want.

1.c BES Subsystem Definition

1.c. Bulk Electric System Subsystem (BES Subsystem) — A group of one or more BES Facilities (i.e., Generation Subsystem, Transmission Subsystem, and Control Center) used to generate energy, transport energy or ensure the ability to generate or transport energy.

Question 1.c. (95 Responses)

Option	Count	Percent
Agree with proposed definition	30	29.1
Disagree with proposed definition	65	63.1

Total:	**95**	**100.0**

Overview of Industry Responses to BES Subsystem Definition

- Define "BES Functions"
- Change to "Generic term for Generation Subsystem, Transmission Subsystem, and Control Center"
- Include "Protection Systems", "SPS', "RAS", "Automatic Load Shedding"
- Change "transport energy" to "transport electricity" -- or drop phrase
- Unnecessary – can use individual terms without loosing any meaning
- Define "shared element"
- We need to better define "BES facility." Break down into transmission, generation and control systems?
- "Transmit" electricity not transport energy
- Shared cyber and subsystems in generation subsystem
- We shouldn't' introduce the ability to decertify to meet compliance.
- Clarify "control system" versus "control room" concept – lack of definition causes confusion.
- Don't include the impact
- Misuse and decoupling causes bad behavior
- It is a open question as to where does generation ends and transmission begins.
- Change "output" to capacity
- Is "capable of" is overreaching?
- Change to "alarm processing"

SDT Comments on Question #1 First Round Responses, 1c. BES Subsystem Definition

- Potential agreement – h/m/l definition should be removed vs. tied to criteria –
- This misunderstanding cascades through the rest of the document.
- **BES Impact.** Support for a BES impact definition? – We need something in the glossary or in the text – but we should leave it at a very high level.
- Consider a BES impact clarification language in the preamble to this.
- Many comments refer to adverse reliability impact? Should we tie to that?
- Keep in mind that we will reference h/m/l in the controls too.
- Does defining BES impact add anything to common use or dictionary definition?
- Do we need BES impact? Already have adverse reliability impact and it covers the need (as read)
- There appears to be a lot of confusion in industry responses between BES cyber systems and cyber systems.
- Move into one definition – remove cyber system definition and collapse into single term of BES cyber system.

- Many of the respondents appear concerned with the subsystem definition and want it removed.
- **How Broad should the "Subsystems" Definition Be?** We have to be careful in responding to the comments– some may be understanding "subsystem" as a unit in a plant. Consider defining it better rather than removing it.
- Confusing topic – The SDT itself could not agree on how many subsystems there are in a plant.
- We do need a better definition – no one knows where this begins or ends – may need to get rid of it?
- Alternatively, we need to be more specific as to what we mean in the criteria.
- Need to better define rather than get rid of it – don't know how to clearly look at our assets as now written. It may be tempting to decouple systems which is not our intent.
- Perhaps use generation and transmission in distinguishing subsystems.
- If the SDT redefines this, we can not leave as a choice. We have to make it clear what a subsystem is.
- Need clarity, not throwing it out.
- If we create new definitions then we need to be clear what we mean – adding new layers doesn't serve anyone.
- Has to be clear for purposes of compliance – be clear or stay away from it.
- Security guidelines define common mode of impact – shared elements have cyber controls – has to be something we can make a difference on cyber security, otherwise we should not group together.
- If we cannot describe it sufficiently, then we need to drop it.
- Many of the comments indicate the subsystems definition was overly broad – can we all agree it should be more limited?
- BES cyber system is an effort to limit it to those impacting the BES system.
- Cannot look at transmission, generation and control systems without the other – can't start with just cyber system.
- Do we want to add back in the distinctions between routable protocol and dial up?
- Want protections over all cyber systems that may impact reliability and connectivity – but careful how we word this. Routable protocols may be easier to access and need higher level of control – but in the end it is about the controls we apply.
- What are we protecting? You can take out a substation and the BES will still function.
- Have not talked about the concept of protecting "data in motion" and how you that can be done.
- **Role of Controls in Handling Vulnerability.** Many industry comments on how to handle vulnerability, connectivity, accessibility to the system – do we handle it in the controls – is it a h/m/l or does it need to be addressed in the requirements?
- You don't put in either.
- Comments suggest we need to handle it – question is where do we best handle it?

- Industry concerned about removal of "routable" – are these critical infrastructure protection standards or cyber security standards? Cyber exists because of routable protocols – clarify which we are focusing on
- **Connectivity.** Putting protection on cyber system in a substation that does not have connectivity is not necessary.
- If BES is high then any cyber system associated with it may be swept in as high as well. We need a separate "if- then" determination of whether the related cyber system is high or not.
- **Categories vs. Risk Categorization.** Categories are impact only – they are not a risk categorization – we haven't come up with a risk categorization that can be audited -
- **N-1.** Propose adding into "disagreement" for discussion the N-1 concept
- "Individual field assets have intrinsically lower impact, on the basis of N-1 (planning?) engineering, than do control systems."
- Does N-1 matter?
- Intrinsically control centers are more important due to the manner we operate – to real time operations
- N-1 refers to credible contingency. There are many items not consider "credible" under N-1 that may still need to be considered in cyber security, e.g. transmission corridor failure is not considered "credible" –
- N-1 is important to planning but may not be to security of the cyber system.
- N-1 doesn't address intentional misuse. Instead is it about handling the largest single contingency?
- Is the 002 concept more succinct than N-1?
- Remove 'on the basis of N-1 engineering" – also change to "control centers" –Now move this up to points of agreement?
- BES is planned to a much higher standard than N-1 – if a transmission corridor is a common one, then contingencies are planned for – we are concerned with multiple external threats – if planning is not considered then you cannot identify the systems that need protection ahead of time.
- Cyber security for N-1 requires understanding the scope and reach of the hacker. This is not an apples-to-apples comparison.
- The way we engineer and operate the current system works. Thatmore accurately captures what I was trying to say than looking at it as N-1.
- Cannot build and design transmission systems for every contingency.
- Removed routable language at the direction of NERC to avoid perception of "gaming." Confusion in industry as to why this was removed is understandable.
- Careful about creating unintended consequences: e.g. airlines are now cancelling flights rather than risk fines for letting passengers sit in the plane on tarmacs too long.
- Need to look at mitigating risk from interconnectivity and from physical access.
- Make sure focus is on power system alarms.

SDT 2nd Round Discussion of Definitions- BES Subsystem Definition

- Need to clarify on the SDT as to what we are trying to protect against. E.g. protect against cyber attack that will impact the BES.
- However that leaves broad areas still open. We need to establish bright lines of potential threats and assure "graceful degradation" under a cyber attack.
- But how can it be measured in a compliance context rather than in a performance-based process?
- We can't prevent an attack, but we can design this so as to slow the attack.
- Cyber security – potential for hackers to attack and infiltrate bulk power system control and operations systems, such that assets could be damaged or misused in sufficient scale as to cause unacceptable outcomes for the BES.
- We need to design not just to address the attack potential, but also so we can avoid impacts due to negligence from within – not just attack vectors from outside.
- "Graceful degradation" as concept, how would it be measured?
- NERC definition– protect against rather than prevent.
- Minimize the impact of a cyber incident – including attack or misuse. We are trying to minimize the negative impacts regardless of internal or external, intentional or not. "Hackers" are not limited to external threats
- It is a term of art widely seen in industry as external and intentional – we need to protect from internal and unintentional too.
- Note the NERC definition includes the language in the paragraph before "cyber security" – includes minimize the risk.
- Still unnecessarily constrains the definition to outsiders with intentions. This does not even include current standards?
- Homeland Security definition? "Use sound risk management principles to implement physical and cyber protective measures that enhance preparedness, security and resiliency." (DHS)
- Maintain/preserve/assure reliability of the BES through implementation of generally accepted information system security practices (GASSP or GAISSP)

1.d. – Generation Subsystem Definition

1.d. Generation Subsystem — Generation plants, or generation units including the Facilities required to connect them to a transmission system, singularly or in combination, including generation units whose combined output could become unavailable due to loss or compromise of a shared element or shared Cyber System.

Question 1.d. (89 Responses)

Option	Count	Percent
Agree with proposed definition	21	20.4
Disagree with proposed definition	68	66.0
Total:	**89**	**100.0**

Overview of Industry Responses

- Remove “shared element”, “shared cyber system”
- See glossary term- “Common Mode”
- Add “misuse”
- Opportunities to decouple systems as artificial behavior
- Define “Generating Plant”, “Generating Unit”, “Transmission System”, “Shared Element”, “Shared Cyber Asset”
- Clarify “Control room” vs. “Control Center”

1.e. – Transmission Subsystem Definition

1.e. Transmission Subsystem — Transmission substations, transmission busses, or transmission lines including the Facilities required to connect them to Elements, singularly or in combination, including transmission lines or busses whose combined output could become unavailable due to loss or compromise of a shared element or shared Cyber System.

Question 1.e. (89 Responses)

Option	Count	Percent
Agree with proposed definition	20	19.4
Disagree with proposed definition	69	67.0
Total:	**89**	**100.0**

Overview of Industry Responses

- Remove “shared element”
- Does “element” refer to glossary term?
- Don’t include impact
- Loss of multiple Elements may not impact reliability
- Add “misuse”
- Opportunities to decouple systems as artificial behavior
- Tie to registration requirements
- No bright line in the generation switch yard
- Add “one or more”
- “singular or in combination” – brings significant uncertainty
- Change “output:” to “capacity”

1.f. – Control Center Definition

1.f. Control Center — A Control Center is capable of performing one or more of the functions listed below for multiple (i.e., two or more) BES assets, such as generation plants or transmission substations. Functions that support real-time operations of a Control Center typically include one or more of the following:

- Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems

- Acquisition, aggregation, processing, inter-utility exchange, or display of BES reliability or operability data for the support of real-time operations
- BES and system status monitoring and processing for reliability and asset management purposes (e.g., providing information used by Responsible Entities to make operational decisions regarding reliability and operability of the BPS)
- Alarm monitoring and processing
- Coordination of BES restoration activities.

Question 1.f. (92 Responses)

Option	Count	Percent
Agree with proposed definition	22	21.4
Disagree with proposed definition	70	68.0
Total:	**92**	**100.0**

Overview of Industry Responses

- Control room in a plant vs control center (or in a substation)
- "BES Asset" too vague
- Asset management includes commercial and market systems
- Change "of the" to "such as"
- "Capable of" is overreaching
- Change "alarm monitoring and processing" to "alarm processing"
- Define "BES Assets – or change to "BES Functions"
- Would include laptops and PDAs w/ SCADA client software – should only be fixed server locations and not remote clients
- Use actual configuration, not theoretical capability
- Define alarm to be "power system alarm", not fire alarm, etc
- Would bring into scope NERC RCIS, TLR, MISO outage scheduler, OATI, etc
- Data acquisition, aggregation, processing, etc too broad

1.g. – HIGH BES Impact Definition

1.g. High BES Impact — BES Subsystems have High BES Impact if, when destroyed, degraded or otherwise rendered unavailable:

- they could directly cause, contribute to, or create an unacceptable risk of-
  - BES instability; and/or
  - BES separation; and/or
  - a cascading sequence of failures.

  or
- in a planning time frame, they could, under emergency, abnormal, or restorative conditions, directly cause, contribute to, or create an unacceptable risk of-
  - instability; and/or
  - separation; and/or
  - a cascading sequence of failures;

or

- could hinder restoration to a normal condition.

Question 1.g. (94 Responses)

Option	Count	Percent
Agree with proposed definition	8	7.8
Disagree with proposed definition	86	83.5
Total:	**94**	**100.0**

Overview of Industry Responses

- 1st bullet – change to "that could directly and immediately cause"
- Add "unacceptable risk to IROL"
- Don't support 3 levels – add "no impact" – too complex or confusing
- Planning is not operations
- Does not match attachment 1
- Need to quantify "risk" – or remove "risk"
- Use "Adverse Reliability Impact"
- "prevent restoration" vs. "hinder restoration"
- Cranking path discussion
- Change "name plate rating" to MOD-024 requirements
- Don't need H / M / L definitions – use Attachment 1 instead
- "Unacceptable risk", "contribute to", "hinder", "planning timeframe" "degrade" is undefined
- Generation – use concept of capacity and time; differentiate base load units from peak units
- Not tied to mitigate vulnerabilities
- Restoration from blackout is not the same as causing / preventing blackout
- High impact Control Centers different than high impact transmission substations (transmission probably not high)
- Replace with "BES Impact" definition
- Use NERC event categories

1.h. Medium BES Impact Definition

1.h. Medium BES Impact — BES Subsystems have Medium BES Impact if, when destroyed, degraded or otherwise rendered unavailable, they could:

- directly affect the electrical state or the capability of the BES;
- directly affect the ability to effectively monitor and control the BES; or
- in a planning time frame, under emergency, abnormal, or restorative conditions,
  - directly affect the electrical state or the capability of the BES; or
  - directly affect the ability to effectively monitor and control the BES.

Question 1.h. (95 Responses)

Option	Count	Percent
Agree with proposed definition	11	10.7
Disagree with proposed definition	84	81.6
Total:	**95**	**100.0**

Overview of Industry Comments

- Refer to "High" definition comments
- Move 3 definitions to attachment 1 as a preface / corollary
- "affect the electrical state" too broad

1.i. Low BES Impact Definition

1.i. Low BES Impact — BES Subsystems have Low BES Impact if, when destroyed, degraded or otherwise rendered unavailable, they could not**:**

- directly cause, contribute to, or create an unacceptable risk of BES instability; or BES separation; or a cascading sequence of failures.
- hinder restoration to a normal condition.
- directly affect the electrical state or the capability of the BES;
- directly affect the ability to effectively monitor and control the BES;

Question 1.i. (98 Responses)

Option	Count	Percent
Agree with proposed definition	15	14.6
Disagree with proposed definition	83	80.6
Total:	**98**	**100.0**

Overview of Industry Comments

- Reference back to High / Medium comments
- Change to "no impact"
- Add "no impact"

2. Comment Form Question # 2- Purpose of CIP-002-4

2. The Purpose of draft CIP-002-4 states, "To identify and categorize the BES Cyber Systems that support the functions critical to the reliable operation of the Bulk Electric System (BES) as a basis for applying security controls commensurate with the potential impact those BES Cyber Systems have on the reliability of the BES." Do you agree that CIP-002-4 accomplishes this objective? If not, please explain why and provide specific suggestions for improvement.

Question 2 (96 Responses)

Option	Count	Percent

Agree	27	26.2
Disagree	69	67.0
Total:	**96**	**100.0**

Overview of Industry Responses

- Only address real time operations
- Does not consider level or risk, e.g., remote access
- Need to consider CIP-002 – CIP-009 together; need to see CIP-003 – CIP-009
- Network connectivity
- Need a "no impact" category
- Effective date of standard toed to other standards (CIP-003 – CIP-009)
- Still a one-size-fits-all for cyber systems (inheritance issue)

SDT Discussion of Purpose

- Idea between 2 (asset based) and 3 (security based) are approaches to consider as either/or choice

3. Comment Form Question # 3-- Method of Categorizing BES Cyber Systems

3. The proposed method of categorizing BES Cyber Systems is to categorize BES Subsystems based on the criteria in Attachment 1, then determining the BES Cyber Systems that have the potential to adversly impact the functions in Attachment 2 performed by those BES Subsystems. An alternative method could consist of inventorying all BES Cyber Systems that can affect the reliability functions in Attachment 2 and determining their impact on BES Subsystems using the criteria in Attachment 1. Do you prefer the method proposed in the standard? If not, please provide specific suggestions for a preferred alternative method.

Question 3 (82 Responses)

Option	Count	Percent
Prefer method proposed in the standard	46	44.7
Prefer alternative method of inventorying all BES Cyber Systems that can affect the reliability functions in Attachment 2 and determining their impact on BES Subsystems using the criteria in Attachment 1.	36	35.0
Total:	**82**	**100.0**

Overview of Industry Responses on Method of Categorizing BES Cyber Systems

- Need simplified criteria
- Flexibility to use either approach
- Must look at it both ways anyway for comprehensive approach
- Does not understand the question: standard does not say which way

- Use CIP-002-3 base, expand to BES assets instead of critical assets, apply R1.2 (list of asset types)
- "Cyber first approach" (using connectivity for categorizing): 8 entities support this approach.
- Need to know impact of CIP-003-009.
- "We believe that regardless of the method chosen, it will be so complex to implement that its costs will far outweigh its benefits."
- Hybrid approach: BES Engineering to filter out low impact subsystems and their BES cyber systems. For remainder, switch to cyber system approach and classify per "span of control" of BES assets.
- 2 dimensions of risk: BES subsystems and cyber systems (matrix approach)

SDT Discussion of Method of Categorizing BES Cyber Systems

- Not all the comments/responses are related to the question asked.
- Not intended to be a strict interpretation and not clear what is or is not captured in each – just a rough showing of confusion in the industry
- The question did not include "cyber first" as an option for consideration so we shouldn't give much weight to these industry preferences– again may just show there is no consensus for any one approach
- Merit to both approaches but each tackles a different aspect of what is needed – asset approach is appealing to get filter up front but may not capture all of the potential vulnerabilities – cyber first captures many of the vulnerabilities but without tying back to the assets.
- Hybrid approach – getting an inventory of every asset is immense and perhaps not necessary. The cyber impact was never intended to override the asset impact. If you have a high cyber impact but on a low impact asset, then it should still be a low category.
- Many utilities using CIP 002 to determine if they are meeting CIP 003-009 – Industry is worried about meeting CIP 002-4 process in terms of money and time only to find out they do not need to do much in CIP 003-009. We should provide entities an opportunity to understand up front as to whether they need to go through the whole process or not.
- Need to focus on the real attack vectors. For example, how many sites do we need to deal with because of routable protocols?
- **Combine Attachment #1 and #2.** Phil's proposed hybrid takes Attachment #1 and #2 and combines them to create a more bright line approach. The approach assumes it is criteria-based rather than the asset or cyber first approach – it also simplifies the current approach.
- The functions talk about what we are doing with the computers –may need to put this into the "disagreement" category because I am not sure I am comfortable yet with cutting out Attachment #2.
- Not sure there are not some unintended consequences with some of the terms used.

- This hybrid was intended as an example or starting point for further discussion and refinement.
- Still concerned about looking at cyber systems first before looking at assets. You would apply the same criteria. We need more detail added before adopting this as an alternative approach.
- This would simplify to a single requirement – makes audits simpler – impact based criteria – requirement is to list cyber systems that impact your high level assets (?)
- Inherited impact is addressed too
- Affects the risk rather than the impact
- Industry comments to the concept paper in the Fall were concerned with the complexity – so we removed the h/m/l of impact.
- Taking a leap that h/m/l of asset identification will identify the key cyber systems that need to protect the BES system.
- We cannot make the assumption but need to be careful in the scoping to mitigate the problem.
- Making the cyber system the subject of the sentence addresses the bulk of the comments from the industry – everything becomes high because of the physical asset – changing the subject here fixed that.

4. Comment Form Question # 4 Requirement-1 Responsible Entity Categorizes BES Subsystems

4. Requirement R1 of draft CIP-002-4 states "As a step in identifying appropriate security controls for its assets, each Responsible Entity shall categorize the BES Subsystems under its ownership by applying the criteria in *CIP-002-Attachment 1 – Criteria for BES Impact Categorization of BES Subsystems*.
1.1 The Responsible Entity shall update its categorized list of BES Subsystems, if applicable, as a result of the commissioning of any new BES Subsystem, decommissioning of any existing BES Subsystem or any other change in the electric system that coulsd affect the impact of BES Subsystems on the Bulk Electric System, within 30 calendar days of the completion of the change.
1.2 The Responsible Entity shall document any engineering evaluation or other assessment method(s) approved by its Reliability Coordinator or Reliability Assurer to support the categorization of BES Subsystems where required by Attachment 1."
Do you agree with this requirement? If not, please explain why and provide specific suggestions for improvement.

Option	Count	Percent
Agree	18	17.5
Disagree	75	72.8
Total:	**93**	**100.0**

5. Overview of Industry Responses to Requirement-1 Responsible Entity Categorizes BES Subsystems

- Need to know impact of CIP-003-009
- RCs should be removed from approval of engineering analyses
- Suggest Planning Coordinator for approval of engineering analyses
- Change within 30 days alternatives included: change to 30 days of being aware; change to 90 days; prefer annual reviews for changes; and any other change too broad: need better definition of this criteria
- Engineering analysis: need criteria for approval and consistency
- RCs and RAs should be required to publish approved engineering analyses
- General comments on vagueness of "subsystems"
- Blanket statement on engineering analysis (at front end of attachment 1)
- Subsystems it operates instead of owns. (joint ownership).
- Need explicit requirement for total list of subsystems.

SDT Discussion of Requirement #1- 1st Round

- Many people say they "disagree" even if they agree in order to get their comment read and considered
- **Owner/operator issue** – operating assets you don't own or own assets but don't operate them.
- Devices in the Texas interconnection system are owned by utilities by operated by regional entity
- The issue is who owns the cyber asset – they are responsible for the controls.
- Asset on site may be owned by the utility but operated by someone off site
- Need guidance from the NERC Compliance Group
- Add owner/operator issue to the agreement list for further discussion
- Even those who "agreed" often added suggestions for refinement or voiced concern
- Reviewed all the comments whether they "agreed" or "disagreed"
- **"Engineering assessment"?** How will we address those comments? Need a bright line approach.
- Draw bright lines but allow an option of an engineering assessment approach?
- FERC is not against exceptions, but must have appropriate controls and oversight of exceptions to ensure they are not misused.
- An engineering analysis could be used to either opt out as an exception or to opt in for units that are deemed to be critical.
- Need a way to allow an entity to declare something for a higher level protection without requiring a full analysis.
- What we are protecting against may need to be clarified for any review of the underlying analysis. Are we protecting against a single point or multiple point of attack?
- NERC was concerned with opt out, not with opt in

SDT Discussion, Requirement #1 - 2nd Round

- Needs more discussion – I think cyber approach takes more – I don't believe this discussion is worthwhile
- Is this a disagreement we need to reach a conclusion on now? Remove from list?

5. Comment Form Question # 5 -Requirement-2 Notification Proposal and Approach

5. Requirement R2 of draft CIP-002-4 states, "To support the proper categorization of BES Subsystems as identified in Requirement R1, and to ensure that Transmission Subsystem owners have accurate information concerning any directly interconnected Generation Subsystem for use in identifying appropriate security controls for their assets, each Responsible Entity that owns any Generation Subsystem categorized as High or Medium BES Impact shall, within 30 calendar days of developing or updating its BES impact categorization of that Generation Subsystem, provide the following information to those Transmission Subsystem owners directly interconnected to that Generation Subsystem:

2.1 Description of the Generation Subsystem that includes Facility designation(s), or name(s), location,
and other identifiers needed to identify the Facility(ies)

2.2 The Responsible Entity name

2.3 The BES impact categorization level"

Do you agree with this notification proposal and approach? If not, please explain why and provide specific suggestions for improvement.

Question 5 (86 Responses)

Option	Count	Percent
Agree	39	37.9
Disagree	47	45.6
Total:	**86**	**100.0**

Overview of Industry Responses- Requirement-2 Notification Proposal and Approach

- Define directly interconnected
- Change Transmission subsystem owners to transmission owners and operators
- Include method of notification and date of notification
- The same burden for information sharing should be placed on the Transmission Operators/Owners
- How does the GO/GOP know who his transmission owner/operator is? (He must connect to it?).
- Must be signed by Senior Manager
- Purpose of requirement not generally understood, must clarify and be more direct.
- Information protection issues

- Prefer annual requirement
- Address jointly owned facilities with different assessments (in attachment 1?)
- Several comments where allusions are made to the Transmission Subsystem owners categorize the Generation Subsystems.
- Modify CIP-002-3 approach
- RCs should categorize Generation subsystems – wide area view

SDT Discussion Requirement-2 Notification Proposal and Approach - 1st Round

- Annual requirement – if impact is changing frequently and have to continually reassess then put in the requirements – For audits do we have to determine or fix the point in time? Otherwise trying to do it in real time?
- Who doesn't know who their interconnect agreements are with? Have to have an interconnect agreement – how can you not know who the transmission owner/operator is?
- If you have joint ownership and they assess it at different levels, which applies? The higher assessment? Need to clarify

SDT Discussion of Requirement-2 Notification Proposal and Approach 2nd Round

- General agreement, but need to work on this as a team activity to see if it is possible. The language here is offered as an example.
- Adding "controlling/monitoring/alerting/protecting" is the key addition to the existing language
- "Unless it has been determined … {by} engineering evaluation…" are the opt out or weasel words that FERC is trying to get rid of – first part of the sentence is the bright line with the second part suggesting that you don't really have to meet the bright line. This paragraph is at cross purposes with itself.
- And RC/RAs don't want to do this.
- However there is no science behind the number offered here as the bright line.
- Alternative criteria for categorizing these?
- There should be no opt-out from a high but there could be an opt-up from medium or low approach – determined by an engineering assessment to be a high?
- May need to have a way to opt-down but not opt out .
- Assuming we are trying to drive issue to something the SDT can rank or shape for small groups to work with?
- I heard this as a suggested compromise approach to simplify R1 and R3.
- We cannot assure the bright line is correct and need to offer a way to address if it is not right for all entities in all situations.

- Change from "BES subsystems" to change the subject of the sentence to be "BES cyber subsystems."
- No bright line can cover all situations – must have an exceptions process available.

6. Comment Form Question # 6- Requirement-3 --Assigning Highest Impact Level of Associated BES Subsystems.

6. Requirement R3 of draft CIP-002-4 states, "As a step in assigning appropriate security controls for its assets, each Responsible Entity shall categorize and document BES Cyber Systems as follows:

3.1. Each Responsible Entity shall list each BES Cyber System associated with a BES Subsystem categorized in Requirement R1 that has the potential to adversely impact any of the functions identified in CIP-002 - Attachment 2 - Functions Critical to the Reliable Operation of the Bulk Electric System.

3.2. For each BES Cyber System the Responsible Entity shall assign the same BES impact to the BES Cyber System as is assigned to the associated BES Subsystem. Where a BES Cyber System is associated with more than one BES Subsystem and the BES Subsystems have different BES impacts, the responsible entity shall assign the BES impact of the BES Cyber System to be the highest BES impact categorization level assigned to the associated BES Subsystems."

Do you agree with this requirement of assigning the highest impact level of the associated BES Subsystems? If not, please explain why and provide specific suggestions for improvement.

Question 6 (90 Responses)

Option	Count	Percent
Agree	36	35.0
Disagree	54	52.4
Total:	**90**	**100.0**

Overview of Industry Responses Requirement-3 --Assigning Highest Impact Level of Associated BES Subsystems.

- Attachment 2 is overly broad in scope or worse, open-ended.
- Specifically, situational awareness can incorporate just about any cyber system. The SDT should review each Reliability Function to determine what is in/out of scope.
- The focus should be on real-time systems or those that can cause an Adverse Reliability Impact as a result of compromise (as opposed to those cyber systems that provide a maintenance, planning, or other non-essential function).
- The focus of Attachment 2 should NOT be on what can compromise these functions but the adverse impact if these functions are compromised (i.e. Attachment 1). Rename the attachment to "Activities Performed to Maintain the Reliable Operation of the BES."
- The size/rating of a "BES Subsystem" (whatever that is – say, for sake of discussion, a substation) has no logically valid correlation with the degree of potential severity of adverse impact on BES reliability resulting from compromise of its associated cyber assets. The impact of the Cyber System should be taken into account first. A system

may pose LOW impact to its associated BES Subsystem but HIGH impact to a control system on the basis of being connected using a routable protocol.

- Categorization should take into account both the functions and BES Subsystem impact to determine the true impact category (i.e. bring back the categorization lookup-table that combines BES Subsystem and BES Cyber System impact categories). BES Cyber Systems associated and having the potential to impact BES Subsystems could create a "race to the top" and make everything High impact. Not all associated Cyber Systems will have High impact. For example, the pH monitor or ambient air sensor for a Generation Control System should not inherit the same category as the Generation Subsystem. Other factors to consider include:
  - the role of the BES cyber system within the broader context of the operation of the BES subsystem (Is this the only mode of failure of the BES subsystem?);
  - the technical capabilities of the cyber system (Does it provide information sensing capability or interactive control?)
  - the nature of the network that the interconnected BES cyber system is using (IP or serial); and
  - the connectivity if any outside a BES sub-system (Is remote access allowed?); are examples of the factors to consider.
- Redundancy (often mandatory requirements in other reliability standards) should be considered as it may reduce the impact of an individual BES Cyber System component. Redundant systems with different architecture or modes may require a lesser degree of security controls due to an inherent robustness, determined through a vulnerability assessment. Master ends of BES Cyber Systems may be categorized higher than the individual remote ends of the BES Cyber Systems, but no higher than the associated BES Subsystem.
- The categorization should take risk into account instead of just impact. Many comments equated this to taking remote accessibility into account when assigning a category. Others cited non-routable protocols as part of the risk equation. Still others called for a broader risk assessment.
- It is sufficient that the BES systems are assessed to have an impact. The degree of an impact is superfluous.
- Categorization should be addressed as part of the Security Controls.
- Need some guidance on identifying Cyber System components.
- Only High and Medium impact Cyber Systems should be identified since Low impact Cyber Systems do not have impact to the reliability of the BES; or since BES Cyber Systems would default to Low, there is no reason to specifically categorize them as such.
- We believe an appropriate path forward is to focus Attachment 1 solely on High BES Impact items and create an Attachment 2 H/M/L categorization based on the cyber technology in use.
- It should be clear that an entity cannot be found in violation of R3 given an omission of BES Subsystems in R1.

- Recommend that additional asset categories be addressed as well (i.e.: PSP, ESP, non-critical cyber assets, access control, monitoring, etc.)
- Attachment 2 should be placed in a guidance document.
- Why move away from Critical/non-critical? If the Cyber Systems pose little risk to the BES, then why spend significant resources protecting them?
- Need a timeframe for adding Cyber Systems to the list after identifying or recategorizing BES Subsystems. The CEMP could require an immediate change to the BES Cyber System as listed.
- It is not clear how firewalls, routers, HVAC and other supporting systems would be classified.
- Remove the explanatory text at the beginning of Requirement 3. It does not add anything.
- There should be a 4th, *no impact*, category.
- In order to support compliance activities, add the following and update the Measures section appropriately: R3: add text to require that the documentation created when categorizing and subsequent documentation called for in R3.1 & R3.2 to be signed and dated (by proper personnel identified per CIP-003 / R2).

SDT Discussion of Requirement-3 --Assigning Highest Impact Level of Associated BES Subsystems- 1st Round

- Possibly grouping the controls for organizational (process and procedure issues) or better definition of the low level of controls
- Or are they included in the low impact level – trying to address concerns regarding the burden of inventory
- A category of 'no impact" and do I have to then have to have a spreadsheet that documents everything else? Concerned how auditors will treat such a category
- Low by definition could include the "no impact" assets – like having criteria that better defines the "low" category
- Auditors should focus on the high and medium categories – the low left to the entity to secure as they see fit

SDT Discussion- 2nd Round

- Is it the data/information sharing or the network? What is the scope of the comment?
- Revisit later – in the scheme of issues, it is not vital at this point
- It is a possible attack vector – if not included, then it becomes the attack vector

7. Comment Form Question # 7 Proposed Violation Risk Factors and Violation Severity Levels

7. Do you agree with the proposed Violation Risk Factors and Violation Severity Levels? If not, please provide suggested improvements on the proposed VRFs and VSLs.

Question 7 VRF (66 Responses)

Option	Count	Percent
Agree with VRFs	32	31.1
Disagree with VRFs	34	33.0
Total:	**66**	**100.0**

Question 7 VSL (68 Responses)

Option	Count	Percent
Agree with VSLs	20	19.4
Disagree with VSLs	48	46.6
Total:	**68**	**100.0**

Overview of Industry Responses on VSLs and VRFs

Broad VSL Responses

- Concerning VSLs, we recommend replacing zero-based quality prescriptions in the requirements, measures and violation severity levels with based performance targets that correspond to the vulnerability of concerted, well-planned attacks against multiple points. For example, requirements and measures should focus on performance objectives as follows: program implemented, program and security controls in place reviewed periodically (for example, every 12 months not to exceed 15 or every 90 days not to exceed 120) and correcting items found in the reviews timely (for example, within 30 days not to exceed 45). When an entity consistently performs, the security control objectives will be achieved. Violation severity levels should correspond, for example: severe-program not implemented, high-controls not implemented, moderate-reviews not completed, lower-corrections from reviews not completed. These should replace zero-defect quality prescriptions as perfection is not essential to achieving the objective of vastly reducing the risk of concerted, well-planned attacks against multiple points.
- We feel it is excessive for all three requirements to have a High Violation Risk Factor. This reflects a position that virtually all violations result in High classification determination which is not the case. Categorization of BES cyber systems and subsystems are an administrative process and do not present a high risk to the BES. Therefore it should have a low VRF; however, improper application of security controls might increase the risk to the BES.
- There needs to be VRFs for Transmission Operators and Reliability Coordinators not providing information to Generator Operators as required in Attachment 1 Sections 1.1, 1.2, 1.3, 1.4, 1.6 and 1.13.
- The requirements must be made much clearer in order to make the assessment of the appropriate level of VRFs.

- We suggest that the Violation Risk Factors and Violation Severity Levels in version 3 of CIP-002 be used as a pattern for version 4.
- Moving from a Moderate to a High to a Severe due to a set period of time passing (10 days) is not consistent with the current implementation of VSLs and VRFs. The penalty matrix already assesses fines based on VSL / VRF and time. It seems like a double penalty to receive an increased VSL due to time and to receive a higher penalty due to the length of time a violation existed.
- VSLs should be tied to the Measures, which are supposed to indicate whether or not the Requirements were sufficiently met. Various degrees of failing to "measure up" would equal the various severity levels. For example, what would be the VSL for a failure to have the evidence required for M1.2? That doesn't seem to be addressed here.
- Paradoxically, un-categorized BES subsystems or cyber systems must be categorized prior to VSL determination. Once they are categorized, the violation has been fully mitigated.
- Disagrees with the VSL level determinations due to the ambiguity associated with the high, medium and low categories.
- How will the number of "true" categorization or number of subsystems be determined as the basis of measuring what missed or mis-categorized? This severity level determination is far too reliant on an external judgment. The measurement needs to be absolute an unambiguous.
- Low impact BES subsystems have no effect on the BES and should not be in the violation security levels.
- Given the degree of subjective judgment that is involved with the categorization, it seems inappropriate to assess such a severe violation level for what could amount to a disagreement between the Entity and the Auditor on the Impact of a particular BES subsystem. Perhaps the VSL's should be based upon the completion or failure to complete a categorization exercise itself.
- The VSLs refer repeatedly to not categorizing a BES Subsystem of some impact level. Yet, without the categorization having taken place, how can the impact level have been determined? Also, the VSL refers to mis-categorized Subsystems. Who determines that the Subsystem was mis-categorized? Will the Regional Entities be performing their own independent categorization?
- Utilizing numeric values to change the VSL seems inappropriate when there may be wide variances in the quantity of BES Subsystems.

Specific VSL Responses

- R1 – Should be governed not only by the impact of the affected BES Subsystems, but also their number. VSLs for failure to update the BES Subsystem list should start at the Lower level, not the Moderate level. The numbers seem to be arbitrary and would have vastly different impacts on entities of different sizes.
- R1 – Moderate VSL should specify 31 to 60 days, and high VSL should specify 61 to 90 days, and Severe VSL should specify greater than 90 days to remain consistent with R2.
- R1 – Failure to update documentation should not carry the same weight as not categorizing any BES Subsystems.

- R1 - We suggest “One to three Medium Impact BES Subsystems have not been categorized or have been mis-categorized as Low Impact.” Then updating Moderate VSL to “Three or more Medium Impact BES Subsystems have not been categorized or have been mis-categorized as Low Impact.”
- R2 – make the timeframes consistent with the expectations in R1. 30-40, 41-50, 51-60. We require the Responsible Entity to update the list in these timeframes but do not require the Generator Subsystem owner to report the change in like timeframes
- R3 – the VSLs have gaps. For example in the Lower level, there is no violation if 1-4 BES Cyber Systems have not been categorized. There needs to be full coverage for all violations of the requirement to be consistent with NERC and FERC obligations. The other levels have similar issues. A remedy could be to assign impact levels based on the number of BES Cyber Systems not categorized (1 for Lower, 2 for Moderate, 3 for High, More than 3 for Severe)
- R3 (Moderate) – should reference BES Cyber Systems, not BES Subsystems.
- R3 – if a non-affiliated BES subsystem owner fails to correctly categorize its BES subsystem leading the Transmission Subsystem owner to assign too low a categorization to its cyber systems, then it may lead the Transmission Subsystem owner to incorrectly categorize its associated cyber system. Assigning a severe VSL to the Transmission Subsystem owner under these circumstances is inequitable.
- R3 – Moderate VSL: Add “Cyber” after “BES.” Per the current R3 VSLs miscategorizing 1 or 2 Medium Impact BES Cyber Subsystems will NOT result in a violation. The suggested change to R3, Lower VSL above will solve this issue. Severe VSL: The last sentence states “The Responsible Entity does not have a list of ALL its BES Cyber Systems.” Technically this means if the entity misses listing even one of its Low Impact BES Cyber Systems they would have committed a severe violation. Suggest changing “all” to “any.”
- The Violation Severity Levels appear inconsistent by equating a missed deadline for updating the categorized BES Subsystem list, with not categorizing any BES Subsystems under the Severe Violation Severity Level. All the deadlines for the VSLs should be 30 days, with differences based on impact level categorization. R1 Lower VSL should include “The Responsible Entity has failed to update its categorized list of Low BES Impact BES Subsystems in accordance with Requirement R1, Part 1.1 for more than 30 days of the completion of the change.” The time component of the Moderate VSL should be changed to “The Responsible Entity has failed to update its categorized list of Medium BES Impact BES Subsystems in accordance with Requirement R1, Part 1.1 for more than 30 days of the completion of the change.” The time component of the High VSL should be changed to “The Responsible Entity has failed to update its categorized list of High BES Impact BES Subsystems in accordance with Requirement R1, Part 1.1 for more than 30 days of the completion of the change.” The time component of the R1 Severe VSL should be removed.
- The quantity thresholds used in the Violation Severity Level table should be a a weighted score of an entity’s subsystems, where multiple Low BES Impact Subsystems

or BES Cyber Systems are considered equivalent to single High Impact BES Subsystem or BES Cyber System, respectively.

SDT Discussion VSLs and VRFs

- Comment suggesting a different path for VSLs?
- EEI representative clarified concern – the bar should be a little higher and performance based.
- Add a more succinct version of the comment to the list.
- Consciously chose not to penalize entity for one-time violation of requirements in drafting the VSLs.
- True for medium but not high which is seen as severe.
- May push entities to high to address audits?
- Revisit the low level of VSLs with regard to zero based quality instead of zero based defect (see, EEI comment)
- Absolute perfection is the low bar –that is how the compliance system works – 99 out of 100 still fails

8. Question # 8 Attachment 1 Proposed Criteria-High, Medium, Low BES Impact Categories

8. Attachment 1 to draft CIP-002-4 contains criteria for High, Medium, and Low BES Impact categories developed in collaboration with representatives of the NERC Operating and Planning Committees. Do you have any suggestions that would improve the proposed criteria? Suggestions for improving proposed criteria:

Overview of Industry Responses- Proposed Criteria-High, Medium, Low BES Impact Categories

- What is the basis for the bright line criteria (e.g. 2000 MVA/1000 MVA)?
- Must run: that have wide area impact
- Definition of Medium Impact is too vague
- More precise terms
- Criteria for the classification of Facilities for High, Medium or Low BES Impact should be based on the risk (probability and consequence) of one or more events that may cause an Adverse Reliability Impact, such as an event that may cause an IROL to be exceeded or cause a supply / demand mismatch greater than a certain metric such as the Contingency Reserves of a reserve sharing group (or another metric determined by study in the region).
- Bright line thresholds (such as 2000 MVA or 2000 MW) are useful default values that should be used in the absence of a particular BES design value used in a region for planning studies and real-time operations.

- The entire Attachment 1 can be boiled down to two metrics: supply / demand mismatch and IROLs.
- The categorization of black start units and transmission cranking paths between the black start units and the units to be started should be those identified under EOP-005-2 and based on approved region-wide restoration plans developed under EOP-006-2. As discussed earlier, "High Impact" from a restoration perspective should focus on preventing restoration efforts and "Medium Impact" should focus on hindering restoration in accordance with the regional plan. Hence, High Impact should be for a Cyber System that, maliciously used, could prevent black start efforts from multiple black start units and their cranking paths in the regional plan. Medium Impact should be for Cyber System that, maliciously used, could hinder black start efforts from a single black start unit or cranking path in the regional plan. Black start capable units that are not in the regional plan should be Low Impact.
- Reliability standards should be based on net demonstrated capability testing results as determined by the requirements specified in MOD-024-1. (Generation?)
- Request clarification on the wording "leaving" in 1.5. Alternatively, suggest 1.5 be made to read: Each Transmission Subsystem that contains switching stations operated at 300 kV or higher in the Eastern and Western Interconnections, 550 kV or higher for the Quebec Interconnection, or operated at 200 KV or higher in other Interconnections, with 3 or more transmission lines connected to the station…
- Restoration paths and UFLS: distribution facilities in scope?
- Request clarification on 2.5, which SPS 300 kV threshold, sensing, action or both?
- Remove Engineering Analyses.
- Blanket Engineering analysis opt-out in Attachment 1
- Exceeding an IROL does not cause instability if recovered within the timeframe allowed by the current standards requirements, and therefore should not be a H or M criterion

SDT Discussion = Round 1 Proposed Criteria-High, Medium, Low BES Impact Categories

- Role of transmission planning – industry wants it in and NERC is saying do not put it in
- Should we have engineering assessment opt outs?
- As applied to attachment one, struggled with the target number – agree we need to put it in even in the face of the directions from NERC
- Need to have it in there – up to the team, not NERC
- Seems clear to me that NERC does not expect to allow opt outs
- Moving to bright line gives a different framework than Commission considered when giving us guidance
- If there are exceptions to the requirements then need to be sure there is an accountability process
- May need an external party to review whether or not the rationale for the exception is appropriate

- Engineering assessment needs oversight – question would be who is willing to accept the responsibility?
- Still waiting for RAs to be designated – needs to be some entity to perform independent evaluations – may need to hold harmless from liability
- RAs are a renaming of RROs – version 4 document was approved a year ago December but the document was never brought to the Trustees for approval – version 5 is now on track to go before the Trustees – thus RA still not an official or legal standing and so no one has signed up yet
- 706 gives same protection that is granted to NERC –
- this is for telling you what assets need to be under the standards – can't just mark everything as high without documentation
- Should be discussing the validity of engineering assessments rather than who should do it – should we allow and if so, then discuss who and how
- We disagreed with having the engineering assessment as adding a layer of complexity – we are comfortable with the process we already have
- Opt out option seems to be contrary to the grouping of assets into the h/m/l buckets without adding value – create bright lines, but they don't really matter
- If we do not allow then saying bright line is absolutely correct for every entity across the country – irresponsible not to include
- The requirement is for "impact analysis" – throwing a number out there is not a true impact analysis – without exception then consider changing to "wild guess analysis"
- There is no right answer as to where to put the stake for analysis – what are we protecting against?
- Need to lock in what criteria will be used by a third party – not looking to except specific assets
- Have to have someway, with rules around it, to address changes – you can choose the bright line or if you choose an alternative then show us why and how
- Engineering analysis is use in two ways in the requirement
- Do we need a study to help set the criteria for the bright line?
- Can't possibly study all the possible situations across the country – put the burden on the entity seeking the exception to prove it is entitled
- NERC has bright lines in other standards without definitive analysis
- Who is the right organization to further study the issue?
- Leaving unspecified in the standard leaves it open to allowing anyone to do that – need to designate

SDT Discussion Round #2- Proposed Criteria-High, Medium, Low BES Impact Categories

- Added to the list for further discussion

9. Comment Form Question # 9 Attachment 1 High, Medium, Low BES Impact Categories for Load-Serving Entities, Transmission Providers and Interchange Coordinators.

9. Do you have suggested criteria for high, medium, or low impact categories for Load-Serving Entities, Transmission Service Providers, and Interchange Coordinators?

- Suggested Criteria for Load Serving Entities:
- Suggested Criteria for Transmission Service Providers:
- Suggested Criteria for Interchange Coordinators:

Overview of Industry Comments- Attachment 1 High, Medium, Low BES Impact Categories for Load-Serving Entities, Transmission Providers and Interchange Coordinators.

- The vast majority of responders had no suggested criteria for these entities.
- In fact, most felt that these entities should not be included as responsible entities in this standard.
- Those that felt that they should be included added that it depended on whether they had BES Cyber Systems.
- Some expressed that the systems were covered under other REs (Distribution Providers, TOPs, BAs)

SDT Discussion – Round #1 Attachment 1 High, Medium, Low BES Impact Categories for Load-Serving Entities, Transmission Providers and Interchange Coordinators.

- Does the definition even apply to the commenter?
- Possibly – may need to modify the language to clarify who it applies to.
- Demonstrates the folly of this approach – all of us are interconnected through the NERC net.
- Proper controls deal with that issue.
- DOD cannot fully protect its system, how can we?
- If we can't think of an instance where an entity should be included then it probably shouldn't be
- Review the registration criteria for including LSEs, TSPs and ICs under the CIP standards (if any)? If no criteria, then remove.

10. Comment Form Question # 10 Attachment 1 Proposed Criteria-High, Medium, Low BES Impact Categories for NERC and Regional Entities

10. Do you have suggested criteria for high, medium, or low impact categories for NERC and Regional Entities?

- Suggested criteria for NERC and Regional Entities:

Overview of Industry Responses Attachment 1 Proposed Criteria-High, Medium, Low BES Impact Categories for NERC and Regional Entities

- The only responders that felt these entities should be included said that NERC Net was probably the only concern.
- Several felt that even NERC Net would not affect the BES.

SDT Discussion Round #1 Attachment 1 Proposed Criteria-High, Medium, Low BES Impact Categories for NERC and Regional Entities

- NERC Net could be an Achilles heel if not properly protected
- We can't protect against the whole world – then every cell phone is an attack vector.
- The requirements around NERC and the regional entities are more stringent than the standards – and a better venue for addressing the information security issue – different audit regime by an outside third party entity
- NERC and regional entities were included in the CIP 002-4 draft – should they be? If you can create criteria, then yes. If cannot create criteria, then no.
- NERC alerts could affect the BES.

11. Comment Form Question # 11 Functional Entities- Distribution Provider and Reliability Assurer.

11. The SDT is considering including Distribution Provider and Reliability Assurer in the list of applicable Functional Entities. Do you have any comments regarding whether or not the CIP-002-4 Standard should apply to these Functional Entities?
    - Comments on adding Distribution Provider:
    - Comments on adding Reliability Assurer:

Overview of Industry Responses- Functional Entities- Distribution Provider and Reliability Assurer.

- Most responders felt that the Reliability Assurer could be excluded (pointing to the fact that the RA is not included in the NERC Glossary, and confusion over how compliance for NERC and Regional Entities could be measured).
- Results for the DP were mixed. Some felt that the DP could be excluded, since they did not involve facilities >= 100kV.
- Some felt that the DP should be substituted for the LSE.
- Some were unsure how load shedding and Smart Grid would affect this standard.
- Some were very opposed, feeling this opened distribution up to FERC regulation.

SDT Discussion Points Functional Entities- Distribution Provider and Reliability Assurer

- RA could be excluded – what BES can they be connected to?
- Careful about distribution provider based on registration criteria – includes the wires company, most of whom are not registered – be cognizant of what the registration criteria calls for and who is actually registered

- Term bulk power system – reviewed language – does not include local distribution of electricity
- Under frequency load shedding – applicability – may need a long list of applicability to be sure capture entities we want to see in and not those we do not
- Do RAs have cyber systems that should fall under this standard?
- Frequency load shedding is a design standard, not a performance standard

12. Comment Form Question # 12 Attachment 2 Functions Critical to Reliable Operation of BES

12. Attachment 2 to draft CIP-002-4 contains functions critical to the reliable operation of the Bulk Electric System that serve as a basis for categorization criteria and the definition of BES Cyber Systems. Do you have any suggestions that would improve the proposed functions?

- Suggestions for improving proposed functions:

Overview of Industry Comments Functional Entities- Distribution Provider and Reliability Assurer.

Broad Comments- Attachment #2

- The focus for these proposed functions should be cyber systems that support real-time operations.
- How are Attachment 2 functions different than the functional model? The standard already covers the assignment of applicability to functional entities and restating the tasks performed by the functional entities seems redundant.
- Does not indicate the varying levels of impact for the defined functions. This is a one-size-fits-all model for Cyber Systems associated with BES Subsystems.
- Attachment 2 is not careful as to whether it applies only to BES Elements. If it is taken to apply to any Element then it becomes a definition of the BES Subsystem.
- Make the list complete. The “include, but are not limited to” open ended function list leaves too much room for disagreement. Clearly identify if for each function if you need all of the elements below it or just one, to be considered having that function. For example if all you have is power system stabilizers, do you have the Dynamic Response function?
- Attachment 2 only adds confusion and should be eliminated.
- Attachment 2 supports the identification of cyber systems that support critical BES functions but seems to suggest by the title of the attachment that all functions being critical are also high impact and therefore does not assist with the categorization of assets that could potentially be medium or low impact.
- There are several places where the proposed standard could have unintended consequences with negative effects on reliability. For example, the requirement that all blackstart units registered as part of the regional reliability plan be classified as high-risk could lead to Entities reducing the number of declared black start units; an exemption based on an approved engineering study should be allowed.

- It is not clear how the list in attachment 2 was created. Consider leveraging other NERC documents such as the Functional Model or the Definition of Adequate Level of Reliability.
- This standard needs to be segmented into each applicable function and not try to use a "one size fits all" approach. If this path is taken, subject matter experts can help to better define what cyber systems should be in scope and out of scope on a very specific basis. This will eliminate much of the lack of clarity and misinterpretations of the present draft standard. It will also bring the focus back to protecting the highest risk elements with the highest level of protection and not try to do this for everything.
- Attachment 2 makes no allowance for system diversity and redundancy.
- The functions should be specifically covered in Attachment 1 under the impact categories they fit.
- Proposed attachment 2 looks comprehensive and well thought out.
- Replace "Functions Critical to the Reliable Operation" with "Functions that Affect the Reliability of the Operation". This attachment describes functions that may affect BES operation reliability, but the level of impact can range from no impact for some circumstances to critical for some possible circumstances.
- Please provide the basis for including each of the functions.
- There is concern with creating a definition and then supplementing the definition with an Attachment providing additional criteria and clarification of a term, as addressed with the High BES Impact comments. If a person were to just look in the NERC glossary then they would have no idea there were additional criteria defining a BES Cyber System. If an appendix or attachment is necessary, the definition should clearly reference the additional information.
- Clarify functions that are critical to reliable operation of interconnected BES, not isolated BES Subsystems.
- If you identify a control center in attachment 2 then this is not needed. Look at comment for clarity.
- Attachment 2 has potential for wider application and does not belong in a CIP standard.
- Failure or compromise of some cyber systems may not impact the operation of the subsystem for a significant length of time, allowing for repair. These systems should be excluded from the standard. For example, a PC based coal receiving unloading system. The fuel inventory on-site will supply the plant for a number of days, weeks or months depending upon the amount in inventory." No reliability improvement would be gained from applying cyber controls to this system.
- Request a FAQ/Guideline. Recommend moving the examples in Attachment 2 into the FAQ/Guideline

Specific Responses for Attachment #2

- Tools that are used in the planning horizon are not critical to BES reliability and should be removed from the proposed functions. (e.g. Unit Commitment under Balancing Load and Generation.)
- Consider combining 2, Balancing Load and Generation and 3, Controlling Frequency into one category.

- As a suggestion for consistency and to take advantage of the thoroughness of the info in the Concept Paper, why not use the nine functions identified in Figure 1 and Table 1 which include: 1) Contingency Reserve/Peakers; 2) Load Balancing, Frequency Response/Support; 3) Voltage Support/Reactive Power Supply; 4) Constraint Management; 5) Control and Operation; 6) Situation Awareness; 7) Restoration; 8) System Stability; 9) Load Management?
- We recommend reviewing for inclusion the following critical functions:
  1. Emission systems (with indirect impacts)
  2. Remote Cyber Support
- Recommend changing from "The Situational Awareness function includes activities, actions and conditions necessary to assess the current condition of the BES and anticipate effects of planned and unplanned changes in conditions." to "The Situational Awareness function includes activities, actions and conditions necessary to monitor and make real-time operational decisions regarding the reliability and operability of the BES."
- Attachment 2 lists monitoring of spinning reserves which requires telemetry from every generating unit. This implies that every generating unit, regardless of size, falls under this standard. This would also seem to include each RTU and all the communication equipment back to the EMS. We have the same concern regarding calculation of ACE. This implies that all communication equipment back from the RTU for every input into the ACE equation.
- Definitions need to be clarified (e.g.):
  - "Governor Response" - is this movement of a governor to respond to frequency deviation?
  - "Providing Actual Reserves" - Are these systems that request additional generation in response to an event?
- 1. Dynamic Response – Disagrees with the inclusion of Spinning Reserve and Governor Response as neither of these is dependent upon a cyber system.
- 1. Dynamic Response – Spinning Reserve is listed which by itself is not an automatically triggered and not a Dynamic Response quantity. Units, or capacity so designated, is controlled by AGC. Governor Response should specifically mention AGC. Unless its control is addressable, Governor Frequency response should not be included as a part of the Cyber standard. Excitation Systems with Automatic Voltage Regulators are not listed and should be.
- 1. Dynamic Response – Under and Over Frequency Relay, Under and Over Voltage Relays are covered under Protection Systems. To call them out separately implies otherwise.
- 1. Dynamic Response - Generator governor controls may be purely mechanical or local electronic controls without connections to remotely accessible systems.
- 1. Dynamic Response – Is the bullet under number 1 that deals with under and over frequency relay protection intended for all entities that participate in under or over frequency load shedding or just the bigger entities as stated in Attachment 1 section 1.14? We feel that applicability needs to be clarified throughout the standard to ensure that it's interpreted correctly. If under or over frequency load shedding are considered critical to the

reliability of the BES, it should be clearly defined in the criteria for the impact categories of Attachment 1 what levels of load shedding fit each category like 1.14 of Attachment 1.

- 2. Balancing Load and Generation - This section should be clarified to address the balancing of electrical system load vs. electrical system "supply". It could be interpreted to apply to the pure generation unit control aspect.
- 2. Balancing Load and Generation – Disagrees that any of the listed activities is solely dependent upon a cyber system. These functions can be performed without employing a cyber system. The listed activities should only be included if they are solely dependent on computer systems, intranet or internet to allow access to multiple parties.
- 2. Balancing Load and Generation – Is "Manually Initiated Load shedding" the area of interest or the ability to identify. If "identify" this is under the scope of Situational Awareness in Item 8.
- 2. Balancing Load and Generation – These functions may be outside the Control Center. It is not clear if the intent would be to expand scope beyond the control center.
- 3. Restoration of BES – Disagrees with including this function, as most restoration plans assume the transmission operator's system has suffered a total blackout. It is extremely doubtful in this case that any cyber systems will be used, because each step of the process will have to be manually tracked. Inclusion should be determined on a case-by-case basis based upon the specific restoration plan.
- 4. Controlling Voltage – This Controlling Voltage section does not list "Transmit adjustments to individual units" (in response to a voltage schedule).
- 5. Managing Constraints – The drafting team should clarify item 5 "Managing Constraints" of Attachment 2. Could this include cyber assets used in the calculation of ATC? Tagging systems used to submit schedules?
- 5. Managing Constraints – Is the intent to pull systems such as Oasis and OATT into scope under managing constraints?
- 6. Control & Operation – Please clarify "control".
- 6. Control & Operation – Recommend adding parameterization, calibration.
- 6. Control & Operation – AGC should not be listed in the Controlling Frequency section as it is a Dynamic Response.
- 6. Control & Operation – The Control & Operation section needs to include Generator controls for AVR, and AGC.
- 6. Control & Operation – suggests the example should include "electronic" control rather than "all" control.
- 7. Restoration of BES – Cranking Path should be clearly defined for application in this Standard.
- 8. Situational Awareness – The Situational Awareness section is covered by the other sections and is not needed.
- 8. Situational Awareness - A definition or the intent of "Change management" should be included. Is this the management of change as cover in other sister standards?
- 8. Situational Awareness is too broad and needs to be better defined. In particular, the "change management" aspect of Situational Awareness is unclear.

- 8. Situational Awareness, bullet 5 – Frequency monitoring should be better defined so that the loss of a single monitoring point in a many point scheme is not a problem.
- 8 - Situational Awareness, suggest these words should be consistent with the real-time operations words for situational awareness in the Control Center definition. Recommend changing to: "The Situational Awareness function includes activities, actions and conditions necessary to monitor and make real-time operational decisions regarding the reliability and operability of the BES."
- 8. Situational Awareness: It is unclear whether Change Management applies to IT Systems or change management as it relates to other work being performed on BES subsystems, for example repairs during a unit outage, or replacement of substation equipment.
- 8 – Situational Awareness. What is the team attempting to identify with Change management, and Current Day and Next Day planning? They both could be interpreted to mean outage scheduling applications.
- 9. Recommend changing 9- Inter-Entity Coordination and Communication from "The Inter-Entity coordination and communication function includes activities, actions and conditions necessary for the coordination and communication between Responsible Entities to ensure the reliability and operability of the BES." to "only inter-utility data communications". Existing language would include voice communications.

Question 12: comments already discussed under other questions

- No additional comments offered by the SDT members

13. Comment Form Question # 13 Other Comments

13. Do you have any other comments to improve the draft standard?

Overview of Industry Responses

- Most Other Comments were already provided in response to earlier questions:

B. SDT Points of Agreement and Disagreement for Refining CIP-002-4

CSO 706 SDT Points of Agreement, Disagreement and Confusion in Terms of CIP 002-4

SDT Points of Agreement *regarding Industry Comments on CIP 002-4*	**SDT Points of Disagreement** *regarding Industry Comments on CIP 002-4*	**Industry Points of Confusion** *regarding CIP 002-4*
1. Flexibility is needed but may or may not be included in today's language	1. What is the CIP standard trying to protect against?	1. Do you start with R1 and work through R3 or is there more flexibility possible in CIP 002-4?
2. Functions of BES need to be considered, but may not be clear in today's standard language	2. Should it be connectivity vs. impact assessment	
3.Agree some form of inventory will be needed regardless of approach	3. We disagree on how extensive the inventory will be for each approach	
4. Any approach needs to result in a categorized list of cyber systems.		
5. We are addressing the range of cyber systems at play in the real time control and operation of the BES reliability	4. The Cyber system should inherit the category of the BES asset (indirect impact mapping) vs. basing it on an assessment of the external and internal threats (direct impact mapping)	
6. Bright lines will help to simplify the implementation and compliance with the standards	There should be flexibility and third party oversight.	
7. Where ever possible, the SDT should seek to combine steps and simplify the approach	5. Categorization should be based on threat/ reach/ connectivity	
8. We function in a compliance vs. a performance assurance framework.	If we are using a compliance framework we should stick with a CIP 003-009 structure.	
9. The standard should be designed so those implementing it know why they are protecting assets and systems.		
10.We are designing a compliance not a performance assurance framework"		

SDT Member Comments on Points of Agreement/Disagreement

- Is #8 a point of agreement or a desired outcome? We don't have a choice to ignore compliance.
- This is a point of agreement – to clarify, change to "we are designing a compliance not a performance assurance framework"
- Agree some form of inventory will be needed – disagree how extensive the inventory for each approach

- Are we not going to have third party oversight? Don't we have to have it to allow industry the flexibility they are requesting? Need that up there under points of agreement or disagreement
- #2 under disagreements should be deleted – redundant with #5
- Is it not best to stick with a 3-9 structure if we are using a compliance framework
- a disagreement - clarity in practice as to what a BES system is –
- #4 – change to inventory of BES cyber systems
- #1 and 4 – redundant? Get rid of #1 or #4? Strike #4
- #5 limits on scope or range of cyber systems? Yes
- #18 – revisit the severe VSLs? Change to "revisit the VSLs"
- #12 – need better definition – don't agree to remove it – okay can remove it if we cannot get a better definition – it is a task rather than agree/disagree
- #2 – overall flexibility or flexibility in approach? Flexibility in starting with R1 or R3

C. Review of Alternative Approaches to CIP 002-4

1. Categorization of BES Cyber Systems Based on Use of Routable Protocols

Dave Norton had circulated in advance of the meeting a proposal which suggested the categorization of BES cyber systems should be primarily based on use of routable protocols (threat/reach/connectivity?). The following proposal was presented for the Team's consideration:

Proposal: Categorizations of BES Cyber systems based on the potential impact of their compromise through the use of routable protocols as attack vectors.

- **Control center routable protocol = high**
- **Generation plant/transmission substation = medium**
- **All else = low**

SDT Member Comments before ranking the Proposal

- Categorization based solely on that, primarily on that, etc.?
- Categorization based on risk presented by external attack surface
- This is a test of whether categorization is based on routable protocols
- There is a baseline of things we have to do – some with more than others (medium/high)- routable protocols and intuitive obviousness
- Can live with doing an impact assessment with a second level based on connectivity – two level of assessments based on routable and non-routable
- Bright line is routable protocols – the attack surface – the impacts are variable
- Are we back to function?
- Concerned that equal focus on connectivity adds complications from a generation aspect – look at BES impact first and then connectivity

- Proposal is to scope it with primary focus on routable protocols
- How do we capture measurable criteria?
- Low is everything BES cyber – what makes it go to medium or high?
- Direct or indirect impact?
- Is this a complete substitute? Not a "primarily"? Yes
- Different definitions of "control centers"
- The three bullets are examples to illustrate the proposal

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	6	**4**	**9**	**2**	**1.5 of 4**

Comments after Ranking

- Clarification – were the bulleted items included? Yes. I don't agree with the examples
- But the examples tell me what it means.
- Can we test the current language for level of support? Or #2?
- The cyber system should inherit the category of the BES asset (indirect impact mapping)
- But this is a piece of R1 & 3 – this replaces only part of R1 and R3
- We tested the new proposal that came in after we tested the original proposal.
- We need to resolve this issue so we can move forward.
- #1 Ranking – flies in the face of what we have done up to this point of not looking at attack vectors until we addressed them in the controls
- #1 Ranking – basing the risk on the network – not a complete cyber security approach
- #2 Ranking because of the routable protocol emphasis – preferred broader view of original
- Need to make significant changes to current draft to address the comments from the industry
- Would move my #2 to a #3 if we removed the examples.
- Not an either/or decision – routable protocol may not be easy to define for many and serial is not protected from attack –
- Raises the technology up to the BES impact –
- It tells us where to put it in the controls and do not have to inventory all of your big iron – zero in on IP for more controls – two levels of rigor
- #2 Ranking – routable protocol and attack surface may be a red herring – agree with concept but need an alternative – talking about a security of connectivity – intent is connectivity but routable protocols will not get us there
- We need a categorization method to start with – then work on the controls – a categorization method we can put controls onto
- Need a modifier – the inheritance as a base with connectivity (or lack of) as a modifier to bring it off of high.
- Don't see how you can let go of the BES asset.

2. Jay Cribb Proposal- Combining Cyber System Impact on BES with Connectivity

Jay Cribb presented his proposal in which he tried to combine both the cyber system impact on BES and connectivity as shown below.

Cyber System Impact on BES →	high	medium	low
Connectivity ↓			
Routable	high		
Non-Routable	high		
Stand Alone	medium		

The SDT ranked this proposal as follows:

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	4	**13**	**3**	**0**	**3.05 of 4**

- Looking for clarifications in a sloppy system
- The SDT needs to be on board with basic concepts – we are shoehorning everything into h/m/l – may need to reconsider
- Looking at concepts at different levels and trying to merge them together.
- Are these the only criteria?
- We should remove the e.g.
- I voted on this as a model not as criteria.
- Need to review more of the Industry responses – not sure we can ever be clear as to what is medium.
- Not looking at h/m/l requirements – these are impact levels.
- FERC asked us to look at it – and it doesn't work.
- I think it does work – still works if we do not have a moderate level and we only have a high/low assessment

- Chair John Lim asked Jay Cribb, Scott Rosenberger and Dave Norton to discuss this proposal in the evening over beer and invited other members to join and bring back a revised proposal based on Tuesday's discussion.

3. Revised Hybrid Approach

Stu Langton reviewed with the Team where we are, the request to a group to work on and bring back a proposal to the full group this morning, the difficult nature and complexity of the task at hand – we will continue to have disagreements but have met our previous deadlines and will continue to work to meet the upcoming deadlines – remind members that consensus doesn't mean we have to all agree and that we cannot disagree sometime – differences are okay – if

75% want to move on, then we will – we need the minority to hang in there and keep working with us.

Scott Rosenberg presented the revised proposal and spoke about risks presented by connectivity and the challenges in defining terms accurately. The BES impact will still be h/m/l, but the proposal introduces the connectivity risk of routable versus non-routable. The matrix similar to one used before. May look like a high, high-medium, medium, medium-low and low. They were trying to avoid incredibly detailed inventories. You would like to be able to split a system into high or medium, slice and dice as needed to limit having to treat everything high – down to bus or breaker level. If we do our perimeters right, we can limit the columns for audits. We need a formula or guidelines the auditors can work with. This proposal reconciles the good work done so far on BES side and on the cyber side. Looking to see if the SDT thinks this process is agreeable and then would look at analysis.

SDT Comments

- Absent an inventory how can you say you identified everything that needs a control and if the control is adequate?
- Maybe we need to identify capacity as the starting point.
- Need to avoid mis-categorizing or not capturing
- Not taking away categorization process we already developed but we do need to refine – comments to indicate the process is not clear – on top of that, if you identify the right assets, then you prioritize and refine categorization based on connectivity. If we do it right we will protect the right assets and not over protect the wrong assets. Join the approaches together but recognize this need more refinement to clarify issues.
- BES requirement was seen as site specific – follow up with cyber system inventory and then based on connectivity determine its impact.
- This attempts to allow you to justify not having to put too much protection on assets that are not interconnected.
- Once you figure out what is protected, you then look to develop protection controls.
- Sounds like current 002 for establishing the inventory with a new layer of prioritization.
- Need to nail this down so the small groups work from the same framework.
- Connectivity? Three categories: connected to routable network (clearly in), relay with Ethernet and substation network but no wire connecting it to the switch capable of being routable (in or out?) Need to discuss further what connectivity means. Third – not connected at any point.
- Now have direct mapping of BES assets to cyber systems
- System idea – matrix for categorizing your cyber systems
- Something connected serially to a routable box? That would be connected
- If I plug my pc in through another serial connection is it connected? Maybe not.
- Is it assets or system based? Categorize the BES asset systems – think in terms of running systems through a litmus test. Can you control it or not.
- Concern is about hitting multiple sites in order to impact the grid.

- Some divergence in the sub group on this issue – control systems versus ability to control a system – needs further refinement and discussion.
- Whether rout-ability or controls needs discussion once we agree to go with proposed connectivity approach – lets not get hung up on the criteria at this point.
- Where do we spend our money to protect the system.
- How did you determine what is scoped into a system? Assessing impact level of BES asset based on its connectivity – how do you determine its level of connectivity if it has multiple connectivity methods?
- Do we need to skinny down attachment 2?
- Problem with "system" – what do you call a system? Where do you draw the boundary? Need to define better, then connectivity between sites establishes the level.
- Type of connectivity matters – category of controls you apply depends on the type of connectivity.
- Need to better define system in CIP 002 so we know we can break it up as needed.
- The details we will have work through together as a team.
- Definition in form 417 – any need to consider as part of teamwork?
- Need to see both proposals to get the full picture (second proposal from Phil to combine R1 & 2)
- Still need to address controls, what is relevant to real time control – and need to address complex issue of "connectivity"

"Include connectivity as a factor in the BES Cyber System categorization"
Revised Proposal: Matrix for Levels of Controls to Be Applied

BES (attachment #1 of CIP 002-4)	High	Med.	Low
Connectivity-Routable/Dial-up	High	High	Med.
Non-Routable	Med.	Low	Low
Not Connected	Low	Low	Low

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	12	**4**	**2**	**0**	**3.6 of 4**

Comments After Ranking

- 2 = I do not see the difference with what we put out to the industry –
- It is modified by connectivity
- 2= don't like doing the BES asset assessment first
- still need to figure out what functions are in the attachment – scope it out some more
- must address Bulk power as the first step for industry support and this let's us do that
- small group will meet this evening to review and fill in the concept with text to help clarify concept – John Lim, Phil Huff, Rich Kinas, Jay Cribb – others can join them

4. Proposals for Combining Attachment #1 and #2

Phil Huff offered the following successive proposals for testing acceptability related to combining Attachment #1 & #2 for the SDT to rank. The SDT reviewed and ranked three versions of the proposal. Before ranking members discussed the proposal:

SDT Comments on the Proposal for Combining Attachment # 1 & #2

- Direct impact on BES cyber system – what does that system do?
- Where do we draw the lines in the BES cyber system?
- Other criteria that may need to be considered – may need to modify.
- What if system only meets or controls part of the aggregate number?
- Need a comparable format for both proposals.
- Attachment 2 goes away and section A is changed to say cyber systems
- Connectivity is mentioned over 80 times in the comments – controls over 40 times – important concepts we need to address.
- By dropping the last half of section B, we would clarify and provide a bright line for compliance/
- For Medium/Low Criteria: Cyber systems controlling/monitoring/alerting/protecting a Generation Subsystem with aggregate rated name-plate generation of x000MVA or more. (drop rest of section?)
- Do we need to line up with higher numbers used by NERC?
- We assume there is a size and impact relationship – but that is not clear – VRFs are the mechanism for connecting.
- Multiple small risks can add up to a large risk – need to get back to and discuss the relationship.
- Concerned about dropping Attachment 2 – without the functions are we opening ourselves back up to including systems that do not control BES?
- Clarify BES cyber system and cyber system functions
- Develop the modification methodology for the categorization of BES cyber systems

a. 1st Version Proposed by Phil Huff

Attachment 2 and Attachment 1 should be combined into a single set of criteria. The subject of each criterion is the BES Cyber System and the verb would be the function being performed (the Criteria is the Span of Control).

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	2	**9**	**9**	**0**	**2.65 of 4**

SDT Comments after Ranking

- Cyber system inherits categorization of attachment 1 – concern is for the tie to attachment 1 rather than connectivity
- Categorization is based on what the system does
- Like the concept of merging 1 and 2 but needs to be criteria of BES system – cyber system needs to be a subsystem – remove “cyber” and remove last parenthetical for me to support
- Not sure what the parenthetical meant

- Huge effort to map the span of control back to the substation gear – we tried to map functions back to bright lines and it was too complicated
- I like idea of combining, but the criteria may be a problem
- There is a way to address criteria noted in comments from EPSA
- Too complex.
- This might be a way of reintroducing the serial exemption.
- Too many permutations.
- Is it possible to move forward without resolving this issue?
- Attachment 2 is complex in itself –
- Is it the fact there are criteria or is it what the criteria are? The latter we can work on together – if the former then we have a fundamental question.
- Comments said we need criteria – general agreement in industry that we need criteria – but not on what the criteria should be.
- Span of control concept seems to be the source of most concern here.
- Can we turn to others to establish the criteria?
- We had agreement that the type of communication needed to be included.
- Informal survey question to the industry? Given we want a bright line, what criteria should we use to set the bright line?
- Can we extend beyond our industry?
- How would survey question differ from Question 8 we already asked? Look to those comments for guidance and suggestions.

b. 2nd Version Proposed by Phil Huff

Attachment 2 and Attachment 1 should be combined into a single set of criteria. The subject of each criterion is the BES Cyber System and the verb would be the function being performed. ~~(the Criteria is the Span of Control).~~

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	1	**11**	**6**	**1**	**2.4 of 4**

Comments after Ranking

- We need to understand what we are going to do with the attachments to move forward – cannot write requirements without the attachments.

c. Revised Concept of Combining Attachment #1 #2.

On Friday morning, Dave Revill presented concept of combining Attachment 1 & 2 that was discussed overnight by a group including John Lim, Phil Huff, Dave Revill, Rich Kinas, Patrick Leon, Joe Deotzel and Dave Norton. He noted that under the proposal:

- Attachment 2 becomes more of a guidance document
- Res shall categorize its BES cyber systems by applying criteria in CIP 002 Attachment 1
- Changed ~~BES Subsystems~~ to <u>BES Cyber Systems</u>

- Changed Generation ~~Subsystem~~ in Attachment 1 to Generation facility.
- Move attachment 2 to a guidance document to identifying what immediate effect on real-time operations means

This proposal combines Attachment 1 and Attachment 2 by tying the criteria in Attachment 1 to BES Cyber Systems that immediately (i.e. 15 minutes or less) affect real-time operation. Attachment 2 is moved to a guidance document for identifying Cyber Systems that immediately affect real-time operations. (including the connectivity matrix)

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	8	**10**	**1**	**0**	**3.4 of 4**

Comments after Ranking

- Don't believe connectivity should be at the categorization level but should be at the controls level,
- 2= could vote a 3, but the "how" has a problem
- John L., Dave R, Rich K. and Jackie C will continue to work on the revisions to 002-4 and will pull themselves off of the control sub-teams to work on this in the short term.

R1. As a step in identifying appropriate security controls for its assets, each Responsible Entity shall categorize its BES ~~Subsystems~~ Cyber Systems ~~under its ownership~~ by applying the criteria in *CIP-002-Attachment 1 – Criteria for BES Impact Categorization of BES* ~~Subsystems.~~ *Cyber Systems*. (*Violation Risk Factor: High*)

Attachment 1: Criteria for BES Impact Categorization of BES Cyber System
Cyber Systems that would immediately effect real-time operations for:

- Generation ~~subsystem facilities~~ with aggregate rated name-plate generation of 2,000 MVA or more.
- Etc.

Move Attachment 2 to a guidance document to identifying what *Immediate effect on realtime operations* means.

Acceptability Ranking Scale	***4** = acceptable, I agree*	***3** = acceptable, I agree with minor reservations*	***2** = not acceptable unless major reservations addressed*	***1** = not acceptable*	***AVG.***
	15	**6**	**1**	**0**	**3.6 of 4**

SDT Discussion of the Proposal

- Doesn't matter where facility is if it is doing real time operations.
- Not vastly different than what we do today – big pro of this is that some of the vague terms like BES subsystem are gone – looking at cyber systems with real time impact.

- Now coming up with categorization based on some rating of facilities (a defined NERC term).
- Not changing anything in Attachment #1 except subsystem to facility – same criteria – still have to produce all generation, transmission, control center information for the auditor.
- R1 provides bright lines of generation of X name-plate rating – smaller entities do not have to jump through all the hoops.
- Do we trust entities to identify all the functions that impact real time operations?
- Problem with "facility" – introduces a new challenge for defining it – not just what is inside the fence.
- "facility" is not capitalized (i.e. in the NERC glossary) which is dangerous –
- It should be capitalized to be a defined term – but that presents new issues given the definition – it does not sound like a plant or substation – also nuclear industry has different definition that includes inside the fence.
- Can we say "generation facility or combination of facilities?"
- A BES cyber system that can affect more than 2000 of generation – strike the term "facility"
- Levels of categorization? What are the systems that will go into the list?
- This is meant as one example for high – others need to be included for generation, transmission, etc.
- What is the method for coming up with other criteria?
- Focused on the proposed concept – criteria the same as today
- "Real time"? Operating horizon criteria? It is a term defined in NERC glossary? We will need more detail.
- If use Attachment #1 how do we come up with things in main category if looking at cyber systems first? How do we know it impacts a high generation thing if we do not already identify high generation thing first?
- Doesn't really matter if we understand what generation is and what transmission is – how much of the generation is impacted – gets you off the hook for documenting all generation and making it subject to an audit.
- Careful to use accurate terms – have to identify a complete list of BES cyber systems and then determine high and medium base on criteria to be developed.
- Real time is a time horizon – "done within one hour"
- Like that it focuses on real time and brings in connectivity – may still need to tweak Attachment #1 language regarding cyber systems into h/m/l
- "Immediate"? Included to respond to industry comments,
- This concept removed ambiguous terms and provides a bottom – does not include everything in North America with a chip in it.
- Connectivity is implied somewhere?
- It would be in the table or matrix developed yesterday
- Connectivity could be left as an aspect of the controls – this does not start off with a huge inventory list which is a good thing.
- Not directly connected, but are collaterally connected to devices that are connected directly – how do we handle those?

- Where does a system that maintains targets on relays that can modify settings come in?
- These are real-time questions that we need to account for.
- Worried industry will not understand where the bright lines are with this concept.
- We may be cutting off options too soon – like to see us work with this and other options as sounding boards.
- Have to have a starting point for auditors can start with – 69 KRB might work.

D. Small Group Review of CIP-002-4 Industry Comments

The SDT reviewed group preferences for working in small groups to address the industry responses to CIP-002-4. The small groups agreed to meet together starting Wednesday morning to draft potential changes to draft 002-4 in addressing comments based on plenary discussion today and draft possible responses to comments then review suggested changes with the full team during the afternoon. It was agreed the SDT needed more work on the points of disagreement as guidance to the small groups looking at 003-009 controls. Group B and D need a better understanding of Questions #5 and #2/3 in order to do their job.

- **Group A- Definitions, Purpose and Other Comments** (Questions 1, 2) Review industry comments (overview) and agree/disagree/confusion items: Frank Kim(1), Jeff Hoffman(1), Scott Rosenberger(1), Sharon Edwards(1)
- **Group B Attachment 1- Criteria for Categorizing BES Cyber Systems** (Question #3,4,8 & 12) Review industry comments (overview) and agree/disagree/confusion items: Doug Johnson(1), John Varnell (1), John Lim (1) Jim Brenton
- **Group C VRFs, VSLs** (Question #7) **and Measures.** Review industry comments (overview) and agree/disagree/confusion items: Joe Doetzl, Phil Huff, Dave Revill, Dave Norton
- **Group D Standard Requirements** (Question #6) **(R1-3)** Review industry comments (overview) and agree/disagree/confusion items: Gerry Freese(1), Patricio Leon, Jay Crib (1), Jon Stanford (1), Bill Winters (1), Rich Kinas(1)
- **Group E External Oversight** (Question #8) Review industry comments (overview) and agree/disagree/confusion items: Keith Stouffer (2), Kevin Sherlin (2)

Bob Jones reviewed the breakout groups noting that each team should have a group report and that question 8 would go to Group E (Kevin and Keith). Each group would look at industry comments and the Team's discussion to draft potential changes in CIP 002-4 (for full team consideration later this afternoon).

SDT Comments on the CIP-002-4 Small Group Charges

- Not sure how we incorporate the models we just expressed support for?
- Can't write criteria at this point – Group C, once done may need to divide up among other groups
- What should group B try to address?
- Question 8 is under B and E? Should question 4 be assigned to E? Assign Group E to look over comments in Questions 1, 4 and 8

- May need to reorganize the groups and topics – Group C cannot address VRFs without clearer direction on criteria.
- Group C could develop a potential concept for how to develop VRFs based on review of the industry comments.
- Group B should look at comments on actual values and structure from the industry.
- Group D should draft or change requirements we have reviewed based on the SDT comments.
- Group A will need to struggle with possible definition of BES cyber system.
- Are we being asked to draft general responses? Assignment is not to draft summary response yet – take notes for later – assignment now is to refine CIP 002-4
- Bring back suggestions for changes to 002-4 – don't get too bogged down in refining the language or resolving all issues/questions

Small group sessions took place during the early afternoon followed by a plenary reports and reviews of their work.

1. **Group A: Definitions Report**

- Incorporate definitions into the attachment #1
- Intent to move them in as a descriptor
- Cascading is a glossary term
- Cyber system and BES cyber system combine into one definition
- with note that this is determined by the criteria in attachment #1
- do we need to scale it down to control systems? We may need to formally define control system rather than just describe it – may be very difficult to come to agreement on definition
- Can you clarify the note?
- Non-critical cyber assets inside an ESP – work in progress
- BES subsystem definition revised with separate definitions for generation, transmission and control center definitions (To be determined)
- Generation – can we reference the ad hoc NERC groups work last fall?
- May not want to reference, not exactly on point and has not yet been approved
- SAR just opened and group not yet appointed
- Need to loop in the requirement for interconnections – generation/owner question
- Add facilities needed to connect the generation to the transmission system
- Control center in control of multiple generation sites – combined units because they share the control system? May be covered by control center definition
- In effort to be consistent use generator facilities ratings, not the output
- Do we need to define generator subsystem? Is it covered by cyber system definition?

- If aggregate based on control center then each site takes on the level of the control center?
- The key is the risk
- Did not finish the control center definition – do question whether substations should be included
- Would take a few more hours to finish

2. Group B: Attachment #1 Report

- Question 8
- Reviewed action items
- Drop back to two tiers – leave open until controls work complete
- Use the nameplate or rating to prevent gaming
- Criterion should be separated into two with one for Protection System for which the voltage distinctions would apply and second for SPS and RAS for which the voltage distinction has no meaning.
- Change language to all control centers to get around issue of only Bas and TOPs required to have backup control centers
- Add requirement for engineering assessment approval
- Special protection systems – careful how we use it given the glossary definition and what it includes – may include more than we intend
- Engineering assessment – key is who gets to validate the assessment and does the model cover cyber systems – can't write your own rules to get the results you are seeking
- May be unintended consequences from alternative of just having bright lines
- Inner workings of cyber system placed on top of the generation system – expertise available in each but not necessarily both – the key in the assessment is what is the problem statement and who creates that statement
- Requiring all control centers to have backup control centers? No, simply need to clarify the language

3. **Group C: VSLs Report**

- Determined the percentage approach would be the best – current CIP version is binary, miss one and it is severe –
- Premature to develop VSLs until you determine the requirements

4. Group D: Standards Requirements Report

- Need to know impact of CIP 003-009 – added to schedule
- Need for an engineering analysisi and a regional authority should approve it
- A regional authority should approve eng. Analysis
- Change? Impact to the categorization

- Engineering analysis shall cover by CIPs information protection requirements
- There is no need for a master list of all BES subsystems. However BES subsystems definitions is required

SDT Comments and Questions?

- Who is the regional authority? What about region to region?
- RE will be responsible to comply with requirements – owns and operates will be toned down, know they have a protocol but not what cyber systems cover
- Where there are owner/operator relationships, need to work out responsibility and capture in their contracts
- The person that is operating the equipment understands capabilities and should have responsibility
- Becomes a compliance liability issue and who has to pay the fine – cannot avoid – assign to someone – may need to look to other standards for examples of how the issue is handled
- Currently compliance varies – there is not one way to do it
- Can flow down requirements to help meet responsibility but can't pass on the responsibility
- This is a legal problem for others to determine

5. Group E, External Oversight- Report

- Oversight is problematic (varied approaches and issues offered in the industry comments) – no
- RC needs to be involved in establishing the criteria for the engineering analysis or approving the assessments
- Engineering assessment is married to liability and needs to be resolved
- A 2 category approach may lessen the need for engineering analysis
- Clear bright lines for each region may lessen the need for engineering analysis
- Engineering analysis may be used to develop the bright lines

E. CIP-002-4 Next Steps

On Friday morning the SDT discussed next steps regarding refinements to CIP-002-4 and the development of a response document for the industry's consideration. The Chair proposed and the members agreed that a team of 4-6 members would be formed to work on refining 002-4 between now and the March meeting in Phoenix where they would present a new draft back to full team as well as a response document. The team may also continue after March.

SDT Comments on the Proposed Next Steps

- Are we setting sail without a rudder?
- Review two items of consensus – review of concept and the connectivity as a factor (and the combining attachment 1 & 2 without the parenthetical.

- Can we flesh out the concept model?
- Does concept model include the merging of the attachments 1 & 2?
- This also melded the communication concept into the model
- Concerned we did not fully address the concerns – feel we still have two models without fully understanding how they are melded together – danger of differing interpretations.
- May need to flesh out Jay's concept with phrases and words?
- Can we take a few of the criteria in attachment 1 and test them? Put requirement on paper.
- How you arrive at the h/m/l BES cyber system impact in terms of criteria is the key.
- Confusion on how h/m/l is used in Jay's concept versus the original proposal outlined by Scott Rosenberger. They seem different.
- Alternate ideas may offer more clarity – review as plus and minuses.
- Current attachment #1 is the top row of the original concept offered by Scott Rosenberger – an inherited model- title with "level of controls to be applied" – this is a site/facility concept.

III. CIP-003-009 SECURITY CONTROLS REQUIREMENTS

A. Security Controls Requirements Sub-teams Progress Reports

Personnel and Physical Security	CIP-004 – R1, R2, R3, CIP-006 R1 through R6 DHS 2.3 Personnel Security, DHS 2.11 Security Awareness and Training DHS 2.4 Physical and Environmental Security,	Doug Johnson(Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin

The report was delivered by Doug Johnson who noted they have reviewed 006 and 004 and that they need to coordinate with the electronic access groups going forward. He reported they did get through the DHS items.

Recovery and Response	CIP-008 R1 & R2 CIP-009 R1 through R5 Incidence Response and Contingency Planning	Scott Rosenberger (Lead), Joe Doetzl, *Observer Participants: Jason Marshall*

Scott Rosenberger reported on the Subteam's progress noting he had met with Jeri Domingo Brewer to review the efforts in Tucker and the Subteam had difficulty meeting as a team since the January meeting. They have however completed an initial shot at h/m/l and will be working forward.

Access Control and Auditing	CIP-003 R5; CIP-005 R2; CIP-007 R5; CIP 004 R4 DHS 2.15 Access Control DHS 2.16 Audit and Accountability	Sharon Edwards (Lead), Jeff Hoffman, Frank Kim *Observer Participants: Sam Merrell*

Sharon Edwards reported on the Sub-team's work. They had one interim meeting together then each member has worked on assignments which are almost complete. They met one night meeting in Austin and plan another in a week before combining into one document. They have developed a collaborative site to review documents.

SDT Questions

- Is there a format we should be using? Jay's or Rob's A. document from Tucker meeting? Want to combine the 25 separate documents they have into a common format other teams are using
- Rob's was a summary document
- Spreadsheet did not work for John Varnell's group – they put in to a different format – can't put text into Rob's spreadsheet document

Change Management, System Lifecycle and Information Management	CIP-003 R6; CIP-007 R1, R7 CIP-003 R4; CIP-005 R5.1.1, R5.1.3 DHS 2.5 System and Services Acquisition, DHS 2.6 Configuration Management and System Lifecycle, DHS 2.10 System Development and Maintenance DHS 2.9 Information and Document Management, DHS 2.13 Media Protection	Keith Stouffer, Dave Revill, Phil Huff (Lead) *Observer Participants: John Fridye*

Dave Revill provided the report noting they don't have a collaborative site to share documents but they are mapping controls to the existing CIP requirements and analyzing the difference between CIP and other standards.

Security Governance	CIP-003 – R1, R2, R3; CIP-005 R4, CIP-007 R8 DHS 2.1 Security Policy, DHS 2.2 Organizational Security, DHS 2.7 Strategic Planning, DHS 2.17 Monitoring and Reviewing Control System Security Policy, DHS 2.18 Risk Management and Assessment, DHS 2.19 Security Program Management	Jon Stanford (Lead), Jerry Freese, Dave Norton

No report was given for this subteam.

Operations Security	CIP-005 R1, R3 CIP-007 R2, R3, R4, R6 DHS 2.8 System and Communication Protection DHS 2.14 System and Information Integrity	Jay Cribb (Lead), Jim Brenton, Jackie Collette, John Varnell

Jay Cribb reported on this group's effort including one meeting where they reviewed portions of CIP 005& 007 and reviewed corresponding DHS and other catalogue of controls. Finally they developed four high level questions for additional guidance to all the groups

B. Guidance Questions for the Security Controls Requirements Sub-teams

Following the Tucker meeting, the Drafting Principles were revised by Phil Huff based on team discussion and sent back around to team members. Phil reviewed the steps in the team process and proposed deliverables (separate document) for the sub team work on the proposed control requirements, 003-009, with impact and environment applicability

Jay Cribb introduced and reviewed the four questions the Operations Security group had developed noting, in essence, the NERC CMEP and ROP have the SDT in a very constrained

box currently. We've got a CIP-002 structure that is on a path that won't fit in that box. He suggested we need some determinations on these things before we get too far down the road and hit a roadblock.

1) **How we are going to handle writing requirements that apply to 'BES Cyber Systems' rather than 'Critical Cyber Assets'?**
   The object to which requirements are applied has changed rather drastically and we need to determine how an entity takes a requirement applied to a 'cyber system' and knows what to do to what components of that system in a clear, repeatable, auditor-must-come-to-the-same-conclusion kind of way.

SDT Discussion Points

- Access control – we each have different systems that join into one organism – components of the whole.
- How do you apply virus protection to one component and not to another connected component? How do you write requirement to apply to operating systems that can be compromised without bringing in other components?
- Don't need protection on every relay or printer – may need to do a better job of writing the requirements in the future.
- Authorizing access to a cyber system? If so, is that access to every component? Authorized access to a system may not include physical access.
- Do we need to stratify for new and old systems? The latter were not designed for the current cyber system.
- How much of the details are in the guidance? Is there something between requirements and guidance? Such as specifics on password protection.
- May need to get more granular than just h/m/l to fit in the wide variety of circumstances – a risk management system.
- Have to get more granular, more prescriptive in tables – any guidance will be treated as required in practice – otherwise may need an engineering study to say why you did not follow guidance to avoid liability – may not be able to answer this question
- TFEs – address in question three.
- Talked about using tables to outline the specifics.
- Access control – the extent or reach of the controls can become expensive and time consuming as we move out to remote sites.
- At least three or four levels of access you can make work – but be clear how far the access goes.
- Controls need to be applied to the system.
- We want to go to "specific" rather than "prescriptive" – the latter is telling you how to do that – need to be specific to be clear for audits.
- Are there other documents or bodies we can reference or build on for our use?
- Moving forward apply at a high level and note where specificity may be needed
- Compliance is more difficult in virtual world where harder to separate pieces – not dealing with physical items as much as before

- How we chose to use words and what words we chose to use will matter to allow clarity for audits – struggle to write appropriate requirements and measures.
- Many different compliance methodologies for the same requirement – auditors recognize different solutions across the industry.
- We use language differently – legalese, cyberese, etc.
- Make sure requirements and measures can stand the test of time.
- Most standards are not working to a prescriptive measure.
- Helpful to know if standards development allows for more flexibility.
- Referring to other documents and tying them to the requirement will not work because those other documents could be changed outside or independently of our process – can go into guidance but not the requirements
- Want to change the NERC process for setting standards measures – why continue with a broken system.
- We can use examples as part of the guidance.
- What is our direction as a team as to the guidance and measures? How do we go about developing engineering based measures in our standards? We need a body that can certify approaches? We need to get to measurability and we do not have way to certify measures
- Staff will go back to NERC to try and figure out how we can justify the thresholds or measures we use in the standards
- Putting in bright lines in 002 but removing some of the brightness in 003-009 – currently have bright yes/no requirements but moving toward more flexibility in how we meet measures
- Can clarify the what but not the how – the how is a compliance issue

2) **At what level are we to write the requirements?**
We have some that are taking the DHS controls and tweaking based on CIP. We have some taking the CIP requirements and tweaking based on the DHS controls. But the two are written at vastly different levels. Which is it? Should we:
    - Take the DHS controls and tweak them based on CIP; or
    - Take the CIP requirements and tweak them based on the DHS controls

SDT Discussion Points
- Right at the correct level – may be the best answer to the previous questions
- Have to get to a higher level or end up writing 100 pages for every contingency in each requirement
- Requirements should apply to either 1. The BES cyber System as a whole or 2) components of the BES Cyber System. When a requirement only applies to specific types of components, describe those types of components to determine where component classes exist. Requirements specific to boundary protection or ESP can be written to the interface of the BES Cyber System
- Just meant to guide sub teams in writing requirements for review at the next meeting – drafting guidance –

- Answer to second from discussion of the first may by be the second bullet to take the CIP requirements as the base
- Taking CIP language to a higher level, changes the words and may be harder to measure
- Not all of the subject areas need the same level or amount of change – also may not be a one size fits all – some may be approached better from CIP and some from DHS
- Utilize the words that are there, change the ones we need to and start with either CIP or DHS as appropriate
- Careful about unintended consequences – everyone understood TFEs but ended up with unintended consequence
- Any base of information coming back from audit spot checks that highlights issues we need to incorporate into our rewrite?
- Can we request a summary from the regional auditors working group?
- Be sure we are not just taking one view point or opinion
- CCWG is such a regional group that would give a broader view than just a few individuals – trends, problems and issues they would like for us to be aware of as we move forward
- Asking for information on what difficulties they face, not asking for their direction

3) We've got to have some kind of ruling on the topic of compensating controls in a NERC CMEP world.

- Are we writing requirements at a detailed level with very discrete measurement and where compensating controls are not allowed (or just simply known as TFE's)? If so, are we going to add "where technically feasible" language like the current NERC ROP requires us to do on every requirement so that TFE's can even be requested?

  or

- Are we stating a control objective and how the entity meets it is up to them?

SDT Discussion Points

- Addressed in part above
- We may only be able to carefully craft the words of the requirements because that is what you will be held accountable for in an audit
- Compensating controls – NERC did not take it off the table but suggested need careful oversight methods for accountability
- May need to educate FERC that there are no guarantees in cyber protection – they want yes or write us a check –
- Definition of "within"? How do we comply if we are not sure what it means?
- This is not a SDT issue to resolve – careful how we write requirements – have to leave at level of implement a boundary protection, but not the how to do it

4) We need a standard way to not only handle the difference in impact and environment (CC/Gen/Tran), but the difference in cyber system/device class.

Control Centers, Plants, and Substations all can have Windows based HMI's for example. But plants typically have PLC's, and substations have IEDs. We need a standard way to handle the device classes so that we don't write requirements for the "IT style" cyber assets

that end up generating TFE's for every other device class.

- How should we handle the difference in impact and environment (CC/Gen/Tran)?
- How should we hand the different in cyber system/device class?

SDT Discussion Points

- Some overlap with earlier discuss
- Have to write controls to apply to the class of device
- What are the standard device classes and definition of each?
- Better off avoiding too high a level of control
- Difference in environment? Cost benefit analysis troubles me as a tool due to variables between entities and environments
- Need more than a cafeteria approach of what looks good or appealing

C. Additional Sub-Team Drafting Guidance Statements

Based on the SDT discussion the following guidance statements were proposed to be added to those developed at the Tucker meeting:

Underlined Added Guidance from February 19 SDT Discussion

For the purpose of maintaining consistency across the teams and capturing interim decisions and change documentation, each team should utilize the following development process.

1. **DHS Catalogue of Controls:** Begin by identifying applicable controls that are enumerated in the *DHS Catalog of Control System Security Recommendations* for High Impact Cyber Systems.
2. **Cross Reference CIP Version 3 Requirements/sub-Requirements:** For each security control identified in step 1, cross reference the CIP version 3 Requirement/sub-Requirement or validate previous mapping work.
3. **Specific not prescriptive:** As a general rule, be specific but not prescriptive in writing the requirements.
4. **"What" not "How":** In general, seek to draft a "what" requirements, not "how" requirements.
5. **Develop the requirement language** for each security control identified in step 1.

a. When mapping to existing CIP requirements, use language from CIP, making improvements where needed.
b. When no associated requirement from CIP exists, develop the new requirement using language from the *DHS Catalog.*

6. **Document significant changes to CIP Standards:** Document significant changes made to previous versions of the CIP Standards. Conceptual or broad changes can be captured by a single statement.
7. **Incorporate existing CIP requirements not mapped to the *DHS Catalog*.** If a requirement is no longer necessary because the intent was captured elsewhere, then include this in the change documentation.
8. **Address specific directives from FERC Order 706** that may be applicable to the requirement.

9. **Analysis and Determination of Requirements for Medium and Low Impact:** In the analysis and determination of applicability of requirements to Medium and Low Impact Cyber Systems, ~~on the basis of~~ consider the cost ~~vs.~~ in relation to the security benefits (i.e., a minimal cost requirement that significantly mitigates risk would apply to *ALL* Cyber Systems. Similarly, a significant cost requirement that minimally reduces risk or provides little additional security may apply only to *HIGH* impact Cyber Systems).
10. **Specify Applicability to Environments:** Specify applicability of a requirement to Generation, Transmission, and/or Control Center environments.
11. **Apply Requirements to BES Cyber System:** Requirements should apply to either:
    (a) The BES Cyber System as a whole, or
    (b) Components of the BES Cyber System. However, when a requirement only applies to specific types of components, Sub-Teams should describe those types of components to determine where component classes exist.
    (c) Requirements specific to boundary protection or ESP can be written to the interface of the BES Cyber System.
12: **Level of Requirements:** Sub-Teams should generally write the requirements at a high enough level to avoid applicability of specific technology. Where there are applicable CIP requirements, start with the CIP words and tweak if needed to include some DHS language/concept. However, the "level" of the requirements text should be raised, if needed.

IV. NEXT STEPS

The Chair reviewed the progress made at the meeting and the need for the sub-teams to continue to meet between Austin and the Phoenix meeting to bring draft language for the security controls for review by the full team. He also noted the agreement on a revised schedule and the formation of a Team to take the CIP-002-4 draft and make refinements and develop a response document to the industry comments.

The Vice Chair agreed to work with the facilitators to revise the Sub-team drafting guidance statements based on this discussion and circulate them in advance of the March meeting.

The meeting adjourned at 12:15 p.m.

_____

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix # 1— Meeting Agenda

Project 2008-06 Cyber Security Order 706 SDT
Draft 19th Meeting Agenda
February 16, 2010, Tuesday- 1 PM to 5 PM CST
February 17, 2010 Wednesday- 8 AM to 5 PM CST
February 18, 2010 Thursday- 8 AM to 5 PM CST
February 19, 2010 Friday- 8 AM to 2 PM CST
ERCOT Austin MET Center
7620 Metro Center Dr.
Austin, Texas 78744

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Group Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes

- Review the CSO 706 SDT 2010 Work plan
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan
- Review, discuss industry comments and identify issues raised to be addressed in refinements;
- Review, refine and adopt a revised CIP 002-4 for posting
- Receive progress reports and review assignments for Security Control Sub-Teams
- Agree on next steps and assignments

Draft Agenda

Tuesday	**February 16, 2009**
1:00 p.m.	Welcome and Opening Remarks- *John Lim, Chair & Phil Huff, Vice Chair* Roll Call; NERC Antitrust Compliance Guidelines Facilitator review and SDT acceptance of January 19-22, 2010 Tucker SDT meeting summary
1:10	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
1:15	Review of CSO 706 SDT Workplan- February-December, 2010- *Stu Langton*
1:20	Updates on other related cyber security initiatives- *NERC Staff and SDT Members*
1:30	Update on CIP Communication Plan, including Webinar Report
1:45	Review of needed CIP-002-4 Documents for posting: Introduction, Comment Form, Requirements, Attachments, Implementation Plan.
2:00	Overview of the Industry Comments on the CIP-002-4 *John Lim and Phil Huff*
2:45	*Break*
3:00	Identification of Key CIP 002-4 Issues Raised by Industry Responses to Comment form Questions (1-13)
4:30	Review and Initial Discussion of Other Proposed Approaches to CIP-002-4 *(Dave Norton etc.)*

5:25	Review of Proposal for Wednesday's Agenda
5:30	*Recess*

Wednesday	**February 17, 2010**
8:00	Welcome and Agenda Review- *John Lim & Phil Huff*
8:10	Discussion and Consensus Testing of Concepts and Responses to Industry Comments and Critiques
10:15	Break
10:30	Discussion and Consensus Testing of Concepts and Responses to Industry Comments and Critiques
12:00	*Working Lunch*
12:45	Review and Agree on How to Refine CIP 002-4 *(Full Group or Drafting Sub-Groups)*
1:15	Clarify Issues and Begin Draft Possible CIP 002-4 Refinements *(Full Group or Drafting Sub-Groups)*
4:00	If Sub Team Formed- Initial Reports and Flagging Issues Needing Full Team Guidance
4:55	Review Assignments and Thursday Agenda
5:30	*Recess*

Thursday	**February 21, 2010**
8:00	Welcome and Agenda Review- *John Lim & Phil Huff*
8:05	Approve Tucker Meeting Summary Approve Revised CSO 706 SDT Schedule
8:15	Review Proposal from Last Night's Categorization Alternatives Discussion (*Beer Brigade)Scott Rosenberger (Jon Stanford, Frank Kim, John Lim, Dave Norton Brian Newell)* Review Proposal for Combining Attachment 1 and 2 *Phill Huff*
10:00	Convene Drafting Groups to Complete CIP-002-4 Refinements
12:00	*Working Lunch*
3:15	Break
3:30	Drafting Group Reports and Full Team Consideration and Consensus Testing
5:15	Review CIP 002-4 Assignments and Friday Agenda
5:30	*Recess*

Friday	**February 22, 2010**
8:00	Welcome and Agenda Review- *John Lim & Phil Huff*
8:05	Review and Agreement on CIP 002-4 Proposal from Last Night's Drafting Group- Formation of a CIP 002-4 Drafting Team and Next Steps
9:15	Communications Plan- Gerry Adamski
9:30	Brief Security Controls Requirements Subteam Progress Reports Review of Drafting Principles and Guidance (from Tucker meeting) Review of Key Questions Security Controls 003-009- Operations Security Sub-Team and suggestions for refinements of the Principles and Guidance document
10:00	*Break*
10:15	Continue Review of Key Questions and Answers

12:00	Review and Agree on Next Steps for Developing Security Controls (CIP 003-009) and Work plan for March 2010 Meeting on Security Controls and CIP 002-4 Review Meeting Evaluation
12:15	*Adjourn*

Appendix # 2 Attendees List
February 16-19, 2010, Austin, Texas

Attending in Person — SDT Members and Staff

1. Jim Brenton (Wed-Fri.)	ERCOT
2. Jay S. Cribb	Information Security Analyst, Southern Company Services
3. Joe Doetzl (Wed)	Manager, Information Security, Kansas City Pwr. & Light Co.
4. Sharon Edwards	Duke Energy
5. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
6. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
7. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
8. Doug Johnson	Exelon Corporation – Commonwealth Edison
9. Frank Kim	Ontario Hydro
10. Rich Kinas	Orlando Utilities Commission (Wed.)
11. Patricio Leon	Southern California Edison
12. John Lim, Chair	CISSP, Department Manager, Consolidated Edison Co. NY
13. David Norton	Entergy
14. David S. Revill	Georgia Transmission Corporation
15. Scott Rosenberger	Luminant Energy
16. Kevin Sherlin	Sacramento Municipal Utility District (Wed. Thurs.)
17. Jonathan Stanford	Bonneville Power Administration
18.Keith Stouffer	National Institute of Standards & Technology
19. John D. Varnell	Technology Director, Tenaska Power Services Co. (Wed. Thurs)
20. William Winters	Arizona Public Service, Inc.
Roger Lampilla	NERC
Scott Mix	NERC
Howard Gugel	NERC
Gerry Adamski (Fri by phone)	NERC
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Hal Beardal	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center

SDT Members Attending via ReadyTalk and Phone

21. Rob Antonishen	Ontario Power Generation (Thurs)
22. Jackie Collett	Manitoba Hydro (Wed/Thurs)

Others Attending in Person

Jason Marshall	Midwest ISO

Others Attending via WebEx and Phone

Stacy	Bresler	sbresler@wecc.biz
Chuck	Coulter	ccoulter@wecc.biz
Bryn	Wilson	wilsonwb@oge.com
Rod	Hardiman	rchardim@southernco.com
Annette	Johnston	ajjohnston@midamerican.com
Bryn	Wilson	wilsonwb@oge.com
Jerome	Farquharson	jfarquharson@burnsmcd.com
Bill	Glynn	bill.glynn@westarenergy.com
Bill	Keagle	william.a.keagle.jr@constellation.com
Keith	Walters	step@eei.org
Joshua	Axelrod	jmaxelrod@gmail.com
Steve	Newman	srnewman@midamerican.com
Justin	Kelly	Justin.Kelly@ferc.gov
Don	Schopp	donald.schopp@constellation.com
Bryn	Wilson	wilsonwb@oge.com
Jack	Vranish	jack.vranish@pacificorp.com
Bob	Chambers	robert.chambers@ferc.gov
Rod	Patterson	rnpatterson@midamerican.com
Laura	Hussey	laura_hussey@selgs.com
Bob	Chambers	robert.chambers@ferc.gov
Bryn	Wilson	wilsonwb@oge.com
Keith	Walters	step@eei.org

Appendix # 3 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost
- information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and

Subroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and Subroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on
- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

APPENDIX # 4
CSO 706 SDT MEETING SCHEDULE
JANUARY –DECEMBER 2010

Preliminary, Draft, Unofficial Schedule for CIP-002-4

CIP-002 Task	CIP 2 Milestone Date	Week-of	Date	CIP-003 -- CIP-009 Task
		1/18/10		SDT Meeting - Work on requirement language
		1/25/10		sub-team meetings
		2/1/10		sub-team meetings
Informal Comment Period closes	2/12/10	2/8/10		sub-team meetings
SDT Meeting - React to comments		2/15/10		
Post for 45-day formal comment; form ballot pool	2/25/10	2/22/10		sub-team meetings
		3/1/10		sub-team meetings
		3/8/10		SDT Meeting - Work on requirements
		3/15/10		post initial unofficial draft (aid in CIP-002 ballot process)
		3/22/10		sub-team meetings
Initial Ballot start	4/2/10	3/29/10		sub-team meetings
		4/5/10		sub-team meetings
Initial ballot close; SDT Meeting - respond to comments	4/12/10	4/12/10		
		4/19/10		sub-team meetings
Recirc Ballot start	4/30/10	4/26/10		sub-team meetings
		5/3/10		sub-team meetings
Recirc ballot close; SDT meeting - respond to comments	5/10/10	5/10/10		
Re-recirc ballot start	5/16/10	5/17/10		sub-team meetings
Re-recirc ballot close; BoT Approval	5/25/10	5/24/10		sub-team meetings
File with Regulators	5/31/10	5/31/10		sub-team meetings
		6/7/10		SDT Meeting - Work on requirements
		6/14/10		
		6/21/10		
		6/28/10		
		7/5/10		
		7/12/10		SDT Meeting
		7/19/10		
		7/26/10		
		8/2/10		

CSO 706 SDT WORKPLAN TO DATE
OCTOBER, 2008 –DECEMBER 2010

DEVELOPMENT OF CIP VERSION 2 AND NEW VERSION FRAMEWORK
OCTOBER 2008–JULY 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.
2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development
3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 New Version process reviewed.
4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white "working" papers assigned, Technical Feasibility Exceptions white paper reviewed and refined.
5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed New Version white "working" papers.
January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.
7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.
8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals
March 2–April 1, 2009 — 30-day Pre Ballot
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment
March 30, 2009 — WebEx meeting(s) White Paper Drafting Team
April 1–10 — NERC Balloting on Version 2 Products
April 6, 2009 — WebEx meeting — White Paper Drafting Team
April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call
April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments
9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.
April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx
April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%
May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.
10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.
June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx
11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.

- *June — WebEx meeting(s)*
- *Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria*

CIP-002 DEVELOPMENT OF REQUIREMENTS, MEASURES, ETC. JULY-DECEMBER 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada

SDT reviewed, refined, and adopted SDT Working Paper. SDT adopted its response to NERC for Interpretation of CIP-006-1. SDT reviewed and adopted a proposal for CIP-002 Subgroups and Deliverables and convened subgroup organizational meetings to develop work plans. SDT adopted 2010 Meeting Schedule.

- *July–August Interim Conference call meeting(s)*
- *CIP-002 Subgroup meetings*
- *CIP-002 Coordination Team meeting*
- *August 3–5, 2009 in Winnipeg, Manitoba **NERC Member Representative Committee**. Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.*

13. August 20–21, 2009 in Charlotte, NC. SDT reviewed and responded to MRC input on Working Paper/CIP-002 Concepts and convened SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

- *July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper*
- *NERC Webinar- August–September Interim Conference Call meeting(s)*
- *CIP-002 Subgroup meetings (as ne*
- *CIP-002 Coordination Team meeting*

14. September 9–10, 2009 in Folsom, CA. SDT reviewed and considered industry comments on the Working Paper and CIP-002 concepts and their application to the subgroup work and addressed coordinating issues through joint subgroup meetings. SDT agreed on meeting dates and proposed locations for January–December 2010 September–October Interim WebEx meeting(s)

- *FERC Version 3 Urgent Action SDT conference call meetings*
- *CIP-002 Coordination Team meeting*

CIP VERSION 3 RESPONSE TO FERC ORDER, OCTOBER-DECEMBER, 2009

15. October 20–22, 2009 in Kansas City, MI. Reviewed new FERC Order and urgent action CIP Version 3 process; discussed key issues raised by SDT CIP 002 Subgroups, small group meetings and agreement on refinements to the CIP 002-009 schedule and drafting process for CIP 002-4.

- *October–November Drafting Team meeting(s)*
- *CIP-002 Coordination Team meeting*

16. November 16–19, 2009 in Orlando, FL

- SDT review, refine and adopt Version 3 "industry response" document.
- SDT plenary and drafting group session(s) — to draft, review and refine CIP-002-4 standard, requirements, measures and controls and related documents.
- November–December Interim Conference call meeting(s)
- Drafting teams as needed to finalize draft CIP 002-4 documents
- CIP-002 Coordination Team meeting
- *CIP 002-4 Drafting Team produces next draft based on Orlando Meeting input.*
- *December 2 CSO 706 SDT Version 3 Consideration of Comments Draft Conference Call*
- *December X, CSO 706 SDT CIP 002-4 Preview Conference Call*

17. December 15–16, 2009 in Little Rock AK

- SDT scenario "walk through" to test flow of CIP 002-4.
- SDT plenary and drafting group session(s) to review, refine, and agree on and adopt CIP-002-4 standard, requirements, measures and controls and related documents.
- Agree on initial posting of draft CIP-002-4 for industry review and comment.
- Agree on next steps and 2010 Workplan and schedule

CIP Version 3 Key Steps/Schedule

1. *Post for Industry Comment 10-13-09 to 11-12-09*
2. **November 13 SDT Conference Call- Review of Industry Comments and Response**

3. **November 16, SDT 706 Meeting in Orlando, Monday, 5:00 p.m.- through dinner- SDT 706 Response Document to Industry Comments**
4. **November 17**, Tuesday, SDT 706 Meeting, Orlando, Complete and Adopt Industry Response Document.
5. **November 18**, Wednesday, Post Response Document and Ballot
6. **November 27**, Friday *(after Thanksgiving)* Deadline for Votes and Comments
7. **November 30, Monday, SDT 706 - Conference Call- finalize Industry Response document.**
8. **December 1- 10,** Recirculation Ballot.
9. **December 11,** BoT Approval
10. **December 29, 2009,** FERC Filing

CIP 002-4 Key Steps/Schedule (October-December 2009)

1. **November 1:** Jackie Collett, Phil Huff, John Lim and John Varnell, the chairs of the 4 CIP 002 Subgroups will form the CIP 002 Strawman Drafting Group (SDG).
2. **November 1:** All CIP 002 "meta groups" and subgroups will forward to the Strawman Drafting Group their standards text drafts including any guidance language**.**
3. Joe Doetzl will coordinate the work of the Controls Drafting Group (CDG) members: Jim Brenton, Keith Stouffer, Bill Winters, Jon Stanford. They will produce several recommended sample controls to illustrate high/medium/low concepts in CIP 002 as well as recommendations on whether the SDT should request guidance from the Standards Committee on referencing a 'catalogue of security requirements', for circulation to the SDT **by Friday, November 13, 2009**.
4. The SDG will prepare a strawman draft by **November 13, 2009** for review by the SDT in advance of November 16-19, 2009 SDT meeting.
5. The SDT will utilize the strawman draft to organize its **November 16-19 meeting** and determine at the conclusion of the meeting if the SDT will continue to aim for the December adoption of CIP 002 draft on **December 16** for posting for industry comment.
6. The SDG and the CDG will present their 2nd drafts at a SDT conference call the **first week in December**.
7. The SDT will refine and circulate a strawman Draft #3 prior to the **December 15-16** SDT 706 meeting in Little Rock.
8. **December 15-16** will refine, finalize and adopt the CIP 002 posting for the industry.

- December 28, 2009 SDT Conference Call on CIP 002-4
- December 30, 2009 SDT Leadership Call- Security Controls Survey Draft
- January 6, 2010, SDT Conference Call- Review Security Controls Draft Principles and Schedule and Appoint Drafting Team to bring strawman to January SDT Meeting in Tucker.

CSO SDT 706 2010 MEETING SCHEDULE

18. January 19–22 — Tuesday-- Friday, Tucker, GA (GTC)	24. July 13–16, Tuesday-–Friday, Pittsburgh, PA (CERT)
19. February 16-19 Tuesday–Friday, Austin TX (ERCOT)	25. August 10--13, Tuesday—Friday, TBD
20. March 9–12 — Tuesday–Friday, Phoenix, AZ (APS)	26. September 7–10, Tuesday—Friday, Winnipeg, Canada
21. April 13–16 — Tuesday-Friday, Atlanta GA (SouthernCo)	27. Oct. 12–15, Tuesday-Friday, TBD
22. May 11-14 — Tuesday-Friday, Dallas TX (Luminant)	28. November 16–19, Tuesday-Friday, TBD
23. June 8–11 — Tuesday-Friday, Sacramento CA (SMUD)	29. December 14–17, Tuesday-Friday, TBD

Appendix #5

Security Controls Sub-Team
Principles and Drafting Guidance

CSO 706 SDT SECURITY CONTROLS SUB-TEAM DRAFTING PRINCIPLES

(ADOPTED BY CSO 706 SDT, JANUARY, 2010)

1. Applicability [NERC ROP] Each reliability standard shall clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted.	**9.Practicality** [NERC ROP] – Each reliability standard shall establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.
2.Reliabiliy Objective [NERC ROP] Each reliability standard shall have a clear statement of purpose that shall describe how the standard contributes to the reliability of the bulk power system.	**10. Consistent Terminology** [NERC ROP] To the extent possible, reliability standards shall use a set of standard terms and definitions that are approved through the NERC reliability standards development process.
3.Performance Requirement or Outcome (NERC ROP) Each reliability standard shall state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest.	**11. Commensurate Controls for BES Impact Categories.** Security controls shall be commensurate with the identified level of BES impact categories.
4. Measurability (ROP) Each performance requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement.	**12. Change Documentation.** Changes from prior versions of CIP Standards have clear rationale. These include the following types of changes: a. Above and beyond the current standards; b. Removal of requirements; and c. Major formatting changes.
5.Technical Basis in Engineering and Operations [NERC ROP] Each reliability standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.	**13. Reduce Administrative Overhead**. Administrative documentation shall be kept to the minimum that is necessary
6. Completeness (NERC ROP) Reliability standards shall be complete and self-contained. The standards shall not depend on external information to determine the required level of performance.	**14. Priority.** Implementation plans for the Standards are prioritized according to level of BES impact.
7. Consequences for Non-Compliance [NERC ROP] In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, the consequences of violating a standard are clearly presented to the entities responsible for complying with the standards.	**15. Eliminate or Minimize TFEs.** Security controls shall eliminate or at least minimize the need for TFEs. Allow for compensating controls to mitigate the need for a TFE.
8. Clear Language [NERC ROP] – Each reliability standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.	

SECURITY CONTROLS SUB-TEAM
PROCESS AND DRAFTING GUIDANCE AND DELIVERABLES

Guidance from the January, 2010 Tucker Meeting and the February 2010 Austin Meeting

For the purpose of maintaining consistency across the teams and capturing interim decisions and change documentation, each team should utilize the following development process:

12. **DHS Catalogue of Controls:** Begin by identifying applicable controls that are enumerated in the *DHS Catalog of Control System Security Recommendations* for High Impact Cyber Systems.
13. **Cross Reference CIP Version 3 Requirements/sub-Requirements:** For each security control identified in step 1, cross reference the CIP version 3 Requirement/sub-Requirement or validate previous mapping work.
14. **Specific not Prescriptive:** As a general rule, be specific but not prescriptive in writing the requirements.
15. **"What" not "How":** In general, seek to draft a "what" requirements, not "how" requirements.
16. **Develop the requirement language** for each security control identified in step 1.
    a. When mapping to existing CIP requirements, use language from CIP, making improvements where needed.
    b. When no associated requirement from CIP exists, develop the new requirement using language from the *DHS Catalog*.
17. **Document significant changes to CIP Standards:** Document significant changes made to previous versions of the CIP Standards. Conceptual or broad changes can be captured by a single statement.
18. **Incorporate existing CIP requirements not mapped to the *DHS Catalog*.** If a requirement is no longer necessary because the intent was captured elsewhere, then include this in the change documentation.
19. **Address specific directives from FERC Order 706** that may be applicable to the requirement.
20. **Analysis and Determination of Requirements for Medium and Low Impact:** In the analysis and determination of applicability of requirements to Medium and Low Impact Cyber Systems, consider the cost in relation to the security benefits (i.e., a minimal cost requirement that significantly mitigates risk would apply to *ALL* Cyber Systems. Similarly, a significant cost requirement that minimally reduces risk or provides little additional security may apply only to *HIGH* impact Cyber Systems).
21. **Specify Applicability to Environments:** Specify applicability of a requirement to Generation, Transmission, and/or Control Center environments.
22. **Apply Requirements to BES Cyber System:** Requirements should apply to either:
    (a) The BES Cyber System as a whole, or
    (b) Components of the BES Cyber System. However, when a requirement only applies to specific types of components, Sub-Teams should describe those types of components to determine where component classes exist.
    (c) Requirements specific to boundary protection or ESP can be written to the interface of the BES Cyber System.

12: **Level of Requirements:** Sub-Teams should generally write the requirements at a high enough level to avoid applicability of specific technology. Where there are applicable CIP requirements, start with the CIP words and tweak if needed to include some DHS language/concept. However, the "level" of the requirements text should be raised, if needed.

Appendix # 6
CSO 706 SDT DRAFTING SUB-TEAMS

Additional members may be necessary for teams that have a large number of requirements or FERC directives allocated.

Sub-Team	NERC Standards and DHS Control Families	Team Members
Security Governance	CIP-003 – R1, R2, R3; CIP-005 R4, CIP-007 R8 DHS 2.1 Security Policy, DHS 2.2 Organizational Security, DHS 2.7 Strategic Planning, DHS 2.17 Monitoring and Reviewing Control System Security Policy, DHS 2.18 Risk Management and Assessment, DHS 2.19 Security Program Management	Jon Stanford (Lead), Jerry Freese, Dave Norton
CIP 002-4	Draft revisions to CIP-002-4, and Summary of Responses to Industry comments	John Lim, Dave Revill, Rich Kinas, Jim Brenton, Jackie Collett, Bill Winters, Dave Norton *Rod Hardiman (Observer)*
Personnel and Physical Security	CIP-004 – R1, R2, R3, CIP-006 R1 through R6 DHS 2.3 Personnel Security, DHS 2.11 Security Awareness and Training DHS 2.4 Physical and Environmental Security,	Doug Johnson(Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin
Operations Security	CIP-005 R1, R3 CIP-007 R2, R3, R4, R6 DHS 2.8 System and Communication Protection DHS 2.14 System and Information Integrity	Jay Cribb (Lead), Jim Brenton, Jackie Collette, John Varnell
Recovery and Response	CIP-008 R1 & R2 CIP-009 R1 through R5 Incidence Response and Contingency Planning	Scott Rosenberger (Lead), Joe Doetzl, *Observer Participants: Jason Marshall*
Access Control and Auditing	CIP-003 R5; CIP-005 R2; CIP-007 R5; CIP 004 R4 DHS 2.15 Access Control DHS 2.16 Audit and Accountability	Sharon Edwards (Lead), Jeff Hoffman, Frank Kim *Observer Participants: Sam Merrell*
Change Management, System Lifecycle and Information Management	CIP-003 R6; CIP-007 R1, R7 CIP-003 R4; CIP-005 R5.1.1, R5.1.3 DHS 2.5 System and Services Acquisition, DHS 2.6 Configuration Management and System Lifecycle, DHS 2.10 System Development and Maintenance DHS 2.9 Information and Document Management, DHS 2.13 Media Protection	Keith Stouffer, Phil Huff (Lead) *Observer Participants: John Fridye*

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 SDT — Project 2008-06

March 9, 2010 | 1 PM to 5:30 PM MST
March 10, 2010 | 8 AM to 5 PM MST
March 11, 2010 | 8 AM to 5 PM MST
March 12, 2010 | 8 AM to 12 PM MST

Arizona Public Service CHQ
400 N. 5th St.
Phoenix, AZ 85004

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes

- Review the revised CSO 706 SDT 2010 Work plan and Convergence Schedule Proposal
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan and May 2010 Technical Workshop
- Review, discuss industry comments and identify issues raised to be addressed in revised CIP-002-4
- Review, refine and test consensus on a revised draft CIP 002-4 and Industry Response Document
- Receive progress reports for Security Controls Requirements Sub-Teams
- Develop and Test Sub-Team Security Controls Requirements
- Agree on next steps and assignments

Draft Agenda

Tuesday	**March 9, 2009**
1:00 p.m.	Welcome and Opening Remarks- *John Lim, Chair & Phil Huff, Vice Chair* Roll Call; NERC Antitrust Compliance Guidelines Facilitator review and SDT acceptance of February 16-19, 2010 Austin SDT meeting summary
1:10	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
1:15	Review and Discussion of CSO 706 SDT Workplan and Convergence Schedule - March-December, 2010- *Stu Langton*
1:45	Updates on other related cyber security initiatives- *NERC Staff and SDT Members*

1:55	Update on CIP Communication Plan and May 2010 Technical Workshop - *Carl Dombek*
2:15	Review of Revised CIP-002-4 Draft based on Industry and SDT Response to Industry Comments- *Draft CIP-002 Drafting Team, John Lim et al.*
3:00	*Break*
3:15	Continue review and discussion of revised draft CIP 002-4
5:25	Review of Proposal for Wednesday Agenda
5:30	*Recess*

- *Possible Security Controls Requirements Sub Team Meetings- Evening*
- *If needed, CIP-002 Drafting Team to meet to finalize draft and present for adoption Wednesday morning.*

Wednesday **March 10, 2010**

8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucciero*
8:10	Review and Consideration of draft CIP-002-4 as revised and the Industry Comments Response Document
9:00	Sub-team Progress Reports and SDT Discussion of Key and Any Overlapping Issues

- Security Governance
- Personnel and Physical Security
- Operations Security
- Recovery and Response
- Access Control and Auditing
- Change Management, System Lifecycle and Information Management

10:30	Break
11:00	Review of Guidance and Overall Format for Security Controls Requirements Sub-teams
10:45	Sub-team Progress Reports and SDT Discussion of Key Issues- *Continued*
11:45	Security Controls Sub-Teams
12:00	*Working Lunch*
1:00	Security Controls Sub-Teams
4:55	Review Assignments and Thursday Agenda
5:00	*Recess*

- *Possible Security Controls Requirements Sub Team Meetings- Evening*

Thursday **March 11, 2010**

8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucciero*
8:10	Security Controls Sub-Teams
10:00	Break
10:15	Security Controls Sub-Teams
12:00	*Working Lunch*
1:30	Sub-Team Reports and Full Team Consensus Testing on Refinements
3:00	Break
3:15	Sub-Team Reports and Full Team Consensus Testing on Refinements-*Continued*
4:45	Review Any Drafting Assignments and Friday Agenda

5:00	*Recess* ▪ *Possible Security Controls Requirements Sub Team Meetings- Evening*
Friday	**March 12, 2010**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucciero*
8:10	Sub-Team Reports and Full Team Consensus Testing on Refinements-*Continued*
10:15	*Break*
10:30	Sub-Teams Reconvene to Review Refinements, Schedule and Assignments
11:00	Next Steps CIP 002 Drafting Group
11:15	Review of May 2010 Technical Workshop Planning and Preparation
11:45	Review and Agree on Next Steps and Meeting Evaluation
12:00	*Adjourn & Lunch*

CSO 706 SDT MEETING SCHEDULE- CONVERGENCE PROPOSAL
APRIL –DECEMBER 2010 *(To be discussed on Tuesday)*

Schedule Convergence: Full CIP V4 Package (*Feb. 27, 2010)*		
Date	**Week of**	**CIP Task**
SDT Meeting- Atlanta (4-13-16)	4/12/2010	Present Controls draft for full team review and comment. Sub team drafting. Finalize draft for Informal Comment, Full Package
4/20/2010	4/19/2010	*Informal Comment Posting for full package starts*
~~*5/1/2010*~~ *5/3/2010*	*4/26/2010*	~~*Informal Comment Posting for full package starts*~~ *Webinar*
SDT Meeting- Dallas, (5-11-14)	5/10/2010	
	5/17/2010	Technical Workshop??
	5/24/2010	
6/4/2010	*5/31/2010*	*2nd Informal comment period ends*
SDT Meeting, Sacramento (6-8-11)	6/7/2010	SDT Meeting: Comment review, response process, drafting
	6/14/2010	Sub team meetings
	6/21/2010	Sub team meetings
	6/28/2010	Sub team meetings. SDT interim online meeting.
	7/5/2010	Candidate responses, package modifications to SDT
SDT Meeting, TBD, 7-13-16	7/12/2010	Finalize posting for 45 day formal comment period
~~*7/22/2010*~~	*7/19/2010*	~~*45 Day formal comment period starts/Ballot Pool formation*~~ *NERC Prepares Materials/Seeks SC Approval*
7/26/2010	7/26/2010	*45 Day formal comment period starts/Ballot Pool formation*
	8/2/2010	
SDT Meeting, TBD, (8-10-13)	8/9/2010	SDT Meeting

	8/16/2010	
8/24/2010	8/23/2010	*30 Ballot Preview/Initial Comment Preview ends*
8/31/2010	*8/30/2010*	~~*Formal Comment Period/Ballot ends*~~ *Initial Ballot Starts*
SDT Meeting TBD, 9-7-10	9/6/2010	Respond to comments. Drafting.
	9/9/2010	Initial Ballot Ends
	9/13/2010	Sub team meetings
	9/20/2010	Sub team meetings
	9/27/2010	Sub team meetings. Full SDT on-line meeting
	10/4/2010	Sub team meetings
SDT Meeting TBD, 10-12-15	10/11/2010	Finalize responses and 2nd ballot version (NERC staff expects to start work on posting candidate on 10/12??)
~~*10/20/2010*~~ *10/19/2010*	*10/18/2010*	*2nd ballot starts*
~~10/30/2010~~ 10/29/2010	10/25/2010	*2nd ballot ends*
	11/1/2010	Compile comments - On-line meetings
	11/8/2010	~~Compile comments - On-line meetings~~
SDT Meeting TBD, 11-16-19	11/15/2010	Respond to comments/Draft 3rd Ballot Postings
	11/22/2010	~~*Finalize Posting version for 3rd Ballot - On-line meetings*~~ *NERC finalizes ballot package*
11/24/2010		*3rd Ballot Begins*
~~*11/30/2010*~~	*11/29/2010*	~~*3rd Ballot Begins*~~
~~*12/10/2010*~~ *12/6/2010*	*12/6/2010*	*3rd Ballot Ends*
SDT Meeting TBD, 12-13-17	12/13/2010	SDT Meeting
	~~*12/20/2010*~~ *12/28/2010*	*Submit for Regulatory Approval*

CSO 706 SDT WORKPLAN TO DATE
OCTOBER, 2008 –DECEMBER 2010

DEVELOPMENT OF CIP VERSION 2 AND NEW VERSION FRAMEWORK
OCTOBER 2008–JULY 2009

1. October 6–7, 2008 — Gaithersburg, MD Reviewed CIP-002-CIP-009, Agreed on Version 2 approach.
2. October 20–21 —Sacramento, CA CIP-002-CIP-009 Version 2 development
3. November 12–14, 2008 — Little Rock, AR CIP-002-CIP-009 Version 2 adoption for comment and balloting; CIP-002-CIP-009 New Version process reviewed.
4. December 4–5, 2008 — Washington D.C. CIP-002-CIP-009 Version 3 reviewed and debated, SDT member white "working" papers assigned, Technical Feasibility Exceptions white paper reviewed and refined.
5. January 7–9 — Phoenix, AZ, Reviewed Technical Feasibility Exceptions white paper**,** reviewed industry comments on CIP-002-CIP-009 Version 2 products — established small groups to draft responses, reviewed New Version white "working" papers.
January 15 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
January 21 — WebEx meeting(s) Small group drafted responses to industry Version 2 comments.
6. February 2–4, 2009 — Phoenix, AZ Update on NERC Technical Feasibility Exceptions process**,** VSL process and SDT role**,** review of Version 3 White papers, strawman and principles**,** reviewed and adopted SDT responses to industry comments on Version 2 and Version 2 Product Revisions.
7. February 18–19, 2009 — Fairfax, VA Update on Version 2 process**,** NERC TFE process and VSL Team process; reviewed, discussed and refined Version 3 CIP-002 White papers, strawman, and principles.
8. March 10–11, 2009 — Orlando, FL Update on NERC TFE and VSL and VRF Team process and review and refine Version 3 CIP-002 Strawman Proposals
March 2–April 1, 2009 — 30-day Pre Ballot
Mid-March — NERC posts TFE draft Rules of Procedure for industry comment
March 30, 2009 — WebEx meeting(s) White Paper Drafting Team
April 1–10 — NERC Balloting on Version 2 Products
April 6, 2009 — WebEx meeting — White Paper Drafting Team
April 8, 2009 — WebEx meeting(s) — White Paper Preview- Full SDT Conference Call
April 11, 2009 — Version 2 Ballot Results (Quorum: 91.90% Approval: 84.06%) and Industry Comments
9. April 14–16, 2009 — Charlotte NC Update on NERC TFE process, VSL Team process and NERC Critical Assets Survey; agreed and adopted responses for Version 2 industry comments for recirculation ballot; reviewed and refined Version 3 whitepaper and consensus points and progress report to NERC Member Representative Committee (MRC) May meeting.
April 28 and May 6, 2009 — White Paper Drafting Team Meetings and WebEx
April 17–27, 2009 — Recirculation Results: Quorum: 94.37% Approval: 88.32%
May 5, 2009 — NERC MRC Meeting, Arlington, VA- SDT progress report.
10. May 13–14, 2009 — Boulder City NV Reviewed MRC presentation and further SDT refinement and discussion of the Version 3 White Paper.
June 8 and June 15, 2009 — Working Paper Drafting Team Meetings and WebEx
11. June 17–18, 2009 — Portland OR Further SDT refinement of the draft CIP Version 3 Working Paper(s), reviewed SDT development process for June-December 2009; discussed potential SDT subcommittee structure and deliverables.

- *June — WebEx meeting(s)*
- *Working Paper drafting group sessions including inputs from selected industry personnel to help establish BES categorization criteria*

CIP-002 DEVELOPMENT OF REQUIREMENTS, MEASURES, ETC. JULY-DECEMBER 2009

12. July 13–14, 2009 in Vancouver, B.C., Canada

SDT reviewed, refined, and adopted SDT Working Paper. SDT adopted its response to NERC for Interpretation of CIP-006-1. SDT reviewed and adopted a proposal for CIP-002 Subgroups and Deliverables and convened subgroup organizational meetings to develop work plans. SDT adopted 2010 Meeting Schedule.

- *July–August Interim Conference call meeting(s)*
- *CIP-002 Subgroup meetings*
- *CIP-002 Coordination Team meeting*
- *August 3–5, 2009 in Winnipeg, Manitoba* ***NERC Member Representative Committee****. Progress Report and presentation on new CIP Version 3 Working Paper-Concept- Reliability Standards on Cyber Security for MRC input.*

13. August 20–21, 2009 in Charlotte, NC. SDT reviewed and responded to MRC input on Working Paper/CIP-002 Concepts and convened SDT Subgroup and plenary meetings to develop CIP-002 requirements and "proof of concept" control (s).

- *July–September — 45-day Industry Comment Period on CIP-002 Concept Working Paper*
- *NERC Webinar- August–September Interim Conference Call meeting(s)*
- *CIP-002 Subgroup meetings (as ne*
- *CIP-002 Coordination Team meeting*

14. September 9–10, 2009 in Folsom, CA. SDT reviewed and considered industry comments on the Working Paper and CIP-002 concepts and their application to the subgroup work and addressed coordinating issues through joint subgroup meetings. SDT agreed on meeting dates and proposed locations for January–December 2010

September–October Interim WebEx meeting(s)

- *FERC Version 3 Urgent Action SDT conference call meetings*
- *CIP-002 Coordination Team meeting*

CIP VERSION 3 RESPONSE TO FERC ORDER, OCTOBER-DECEMBER, 2009

15. October 20–22, 2009 in Kansas City, MI. Reviewed new FERC Order and urgent action CIP Version 3 process; discussed key issues raised by SDT CIP 002 Subgroups, small group meetings and agreement on refinements to the CIP 002-009 schedule and drafting process for CIP 002-4.

- *October–November Drafting Team meeting(s)*
- *CIP-002 Coordination Team meeting*

16. November 16–19, 2009 in Orlando, FL

- SDT review, refine and adopt Version 3 "industry response" document.
- SDT plenary and drafting group session(s) — to draft, review and refine CIP-002-4 standard, requirements, measures and controls and related documents.
- November–December Interim Conference call meeting(s)
- Drafting teams as needed to finalize draft CIP 002-4 documents
- CIP-002 Coordination Team meeting
- *CIP 002-4 Drafting Team produces next draft based on Orlando Meeting input.*
- *December 2 CSO 706 SDT Version 3 Consideration of Comments Draft Conference Call*
- *December X, CSO 706 SDT CIP 002-4 Preview Conference Call*

17. December 15–16, 2009 in Little Rock AK

- SDT scenario "walk through" to test flow of CIP 002-4.
- SDT plenary and drafting group session(s) to review, refine, and agree on and adopt CIP-002-4 standard, requirements, measures and controls and related documents.
- Agree on initial posting of draft CIP-002-4 for industry review and comment.
- Agree on next steps and 2010 Workplan and schedule

CIP Version 3 Key Steps/Schedule

1. *Post for Industry Comment 10-13-09 to 11-12-09*
2. **November 13 SDT Conference Call- Review of Industry Comments and Response**

3. **November 16, SDT 706 Meeting in Orlando, Monday, 5:00 p.m.- through dinner- SDT 706 Response Document to Industry Comments**
4. **November 17**, Tuesday, SDT 706 Meeting, Orlando, Complete and Adopt Industry Response Document.
5. **November 18**, Wednesday, Post Response Document and Ballot
6. **November 27**, Friday *(after Thanksgiving)* Deadline for Votes and Comments
7. **November 30, Monday, SDT 706 - Conference Call- finalize Industry Response document.**
8. **December 1- 10,** Recirculation Ballot.
9. **December 11,** BoT Approval
10. **December 29, 2009,** FERC Filing

CIP 002-4 Key Steps/Schedule (October-December 2009)

1. **November 1:** Jackie Collett, Phil Huff, John Lim and John Varnell, the chairs of the 4 CIP 002 Subgroups will form the CIP 002 Strawman Drafting Group (SDG).
2. **November 1:** All CIP 002 "meta groups" and subgroups will forward to the Strawman Drafting Group their standards text drafts including any guidance language**.**
3. Joe Doetzl will coordinate the work of the Controls Drafting Group (CDG) members: Jim Brenton, Keith Stouffer, Bill Winters, Jon Stanford. They will produce several recommended sample controls to illustrate high/medium/low concepts in CIP 002 as well as recommendations on whether the SDT should request guidance from the Standards Committee on referencing a 'catalogue of security requirements', for circulation to the SDT **by Friday, November 13, 2009**.
4. The SDG will prepare a strawman draft by **November 13, 2009** for review by the SDT in advance of November 16-19, 2009 SDT meeting.
5. The SDT will utilize the strawman draft to organize its **November 16-19 meeting** and determine at the conclusion of the meeting if the SDT will continue to aim for the December adoption of CIP 002 draft on **December 16** for posting for industry comment.
6. The SDG and the CDG will present their 2nd drafts at a SDT conference call the **first week in December**.
7. The SDT will refine and circulate a strawman Draft #3 prior to the **December 15-16** SDT 706 meeting in Little Rock.
8. **December 15-16** will refine, finalize and adopt the CIP 002 posting for the industry.

- December 28, 2009 SDT Conference Call on CIP 002-4
- December 30, 2009 SDT Leadership Call- Security Controls Survey Draft
- January 6, 2010, SDT Conference Call- Review Security Controls Draft Principles and Schedule and Appoint Drafting Team to bring strawman to January SDT Meeting in Tucker.

CSO SDT 706 2010 MEETING SCHEDULE

18. January 19–22 — Tuesday-- Friday, Tucker, GA (GTC)	24. July 13–16, Tuesday-–Friday, Pittsburgh, PA (CERT)
19. February 16-19 Tuesday–Friday, Austin TX (ERCOT)	25. August 10--13, Tuesday—Friday, TBD
20. March 9–12 — Tuesday–Friday, Phoenix, AZ (APS)	26. September 7–10, Tuesday—Friday, Winnipeg, Canada
21. April 13–16 — Tuesday-Friday, Atlanta GA (SouthernCo)	27. Oct. 12–15, Tuesday-Friday, TBD
22. May 11-14 — Tuesday-Friday, Dallas TX (Luminant)	28. November 16–19, Tuesday-Friday, TBD
23. June 8–11 — Tuesday-Friday, Sacramento CA (SMUD)	29. December 14–17, Tuesday-Friday, TBD

CSO706 SDT March 9-12, 2010 Meeting Summary Contents

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CSO706 SDT MARCH 9-12, 2010 MEETING
EXECUTIVE SUMMARY

On Tuesday afternoon, the Chair, John Lim welcomed the members and Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. The host Bill Winters, a SDT member, welcomed everyone to the facilities and covered logistics. The Chair reviewed the meeting objectives and Bob Jones, facilitator, reviewed the proposed meeting agenda. On Friday morning the SDT approved without objection the meeting summary for the February, 2010 SDT session in Austin Texas. Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines.

He suggested the Team was at a crossroads in terms of getting some of our product out to the industry and getting beyond conceptual discussions. He noted we need to have complete draft CIP package at the end of our April Meeting for posting for informal comment in early May. He suggested the focus needed to be on getting things done and that once the SDT has agreed then it needed to move forward and not revisit previous discussions.

Stu Langton presented a proposed CSO 706 SDT schedule which was circulated within a day of the meeting and made adjustments in the process to allow for NERC reviews and formatting of materials. On day two, Stu Langton reviewed the SDT schedule sent out yesterday from Scott Mix. He noted that this is our 20th meeting over past eighteen months and the SDT has faced four core challenges:

- Over 200 items in 706;
- High visibility issue in the industry and Congress;
- Large team formed in effort to represent points of view of the industry; and
- Two different cultures addressing cyber security-- engineering/production backgrounds and engineering/cyber security backgrounds.

John Lim introduced Carl Dombek the new NERC communications director and asked him for a progress report on the communication plan for the drafting team activities and drafting of the standards.

On Wednesday, Howard Gugel, NERC, presented an overview with guidance for the Team on drafting standards and requirements which he and Maureen prepared. He noted the overall move towards performance based standards and described the general process for writing a standard. He suggested starting with the end in mind and FERC's criteria for approval:

- Achieves a specified reliability goal,
- Is applicable to all regions and entities, and

- Considers costs but not at expense of reliability.

It is important for the Team to build consensus at every step. As the Team has experienced first hand this is most difficult to develop at the concepts and assumptions level first, before addressing the drafting of requirements, then measures and compliance element.

John Lim provided a progress report on the Subteam's work since Austin noting that Dave Revill has worked on a strawman set of requirements to work with using criteria posted as a starting point. Jackie has done some more work on Attachment #2. John reviewed with the Team the following issues the CIP 002 Sub-team has been grappling with:

- Definitions
- Drafting Language
- Control room vs. control center.
- Legacy.
- Multiple facilities.
- Control system.
- Added 4.1.10 Distribution Provider (with qualification)

Dave Revill presented the concept of breaking requirements into two components:
1.1 Uniquely identify and document assets
1.2 Identify types of data communication into five technologies: routable, non-routable, dial-up, serial or not networked
- Definitions build on the attachment
- Created matrix using the five categories of communication technology including:
- And assigned high-medium-low as compared with BES impact rating

John Lim then presented an overview of the approach taken in the attachments and the SDT discussed the following issues:
- Real Time
- Audits, Standards and Guidance
- Functions.
- Disturbance to the BES.
- Addressing Industry Comments.

During the course of the first day's discussion a number of issues were noted in a "parking lot" for sub-teams to return to. Based on a review of the parking lot issues, the Team agreed to the following drafting assignments over night:
- Control System – Produce a list of examples
- Matrix Group – "connected/not connected"
- Real Time Operation/Cyber System affecting "immediate impact"

- Attachment 2 – guidance, matrix

The drafting groups then reported back to the SDT on Wednesday morning. Following their reports the SDT tested the level of support for the following guidance for the CIP 002 sub-team

1. Redraft CIP-002 to remove the connectivity options and handle them in the controls
   Y= 15 N = 5
2. Keep CIP-002 as drafted yesterday and let cip-002 sub-team handle modifications to the matrix (Austin)
   Y= 4 N= 16

The Team acknowledged they may need to revisit if in developing controls we find we cannot address the connectivity issue.

John Lim reported on Thursday the Sub-Team's efforts. On Friday the Sub-team reported on the changes made to the requirements and attachments.

- BES Cyber System definition
- Control Center
- Terms to be retired from the *Reliability Standards Glossary of Terms* once the standards that use those terms are replaced: Critical Assets; Critical Cyber Assets; Cyber Assets.
- The inclusion of Distribution Provider remains an open issue.
- "Multiple locations" definition- concerns whether it is needed?
- "Cyber security definition"?
- Distribution provider?
- R1-3. If 2 requirements
- Attachment #1 included a list of functions which the SDT reviewed and suggested refinements
- Attachment #2 provided a draft list of high, medium and low impact ratings which the SDT reviewed and suggested refinements.

On Wednesday the Sub-teams presented brief status reports before breaking into sub-team meetings. On Thursday each Sub-Team presented their draft requirements.

Personnel and Physical Security	CIP-004 – R1, R2, R3, CIP-006 R1 through R6 DHS 2.3 Personnel Security, DHS 2.11 Security Awareness and Training DHS 2.4 Physical and Environmental Security,	Doug Johnson(Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin

The Sub-Team report was delivered by Doug Johnson and covered drafting on the following areas:

- Personnel
- Awareness programs
- Training
- Personnel Risk Assessment
- Physical
- Physical Security Plan
- Physical Access Control
- Monitoring Physical Access
- Logging
- Visitor Control Program
- Maintenance and Testing
- Protection of Electronic Access Control Systems

Recovery and Response	CIP-008 R1 & R2 CIP-009 R1 through R5 Incidence Response and Contingency Planning	Scott Rosenberger (Lead), Joe Doetzl,

Scott Rosenberger reported on the Sub-team's progress reviewing draft language covering:

- Response
- Recovery Plans CIP 009
- DHS New Requirements

Access Control and Auditing	CIP-003 R5; CIP-005 R2; CIP-007 R5; CIP 004 R4 DHS 2.15 Access Control DHS 2.16 Audit and Accountability	Sharon Edwards (Lead), Jeff Hoffman, Frank Kim *Observer Participants: Sam Merrell*

Sharon Edwards reported on the Sub-team's work including update on work, future tasks for the sub-team and areas of coordination with other Sub-teams.

Change Management, System Lifecycle and Information Management	CIP-003 R6; CIP-007 R1, R7 CIP-003 R4; CIP-005 R5.1.1, R5.1.3 DHS 2.5 System and Services Acquisition, DHS 2.6 Configuration Management and System Lifecycle, DHS 2.10 System Development and Maintenance DHS 2.9 Information and Document Management, DHS 2.13 Media Protection	Keith Stouffer, Dave Revill, Phil Huff (Lead) *Observer Participants: John Fridye*

Phil Huff reported on the Sub-Team's work reviewing the Change Management requirements worksheet. He noted that the Sub-team's work focused on the language itself, not on applicability. They still have to go through FERC order review. The have modified table/worksheet to track open issues/complications. They now have drafted most of the objectives and changes to CIP language and covered:

- Baseline Configuration
- Configuration control
- Access restrictions for configuration changes.
- Configuration assets-
- Information Protection
- Protection Program.
- Maintenance
- Media protection CIP 7 R7-

Operations Security	CIP-005 R1, R3 CIP-007 R2, R3, R4, R6 DHS 2.8 System and Communication Protection DHS 2.14 System and Information Integrity	Jay Cribb (Lead), Jim Brenton, Jackie Collette, John Varnell

Jay Cribb reported on this group's effort covering:

- Boundary Protection/ESP
- Electronic Access Monitoring.
- Communications Integrity
- Remote and Accessible Services (Port and Services)
- Flaw Remediation (i.e. DHS for Patch Management)
- Malicious Software Prevention.

Security Governance	CIP-003 – R1, R2, R3; CIP-005 R4, CIP-007 R8 DHS 2.1 Security Policy, DHS 2.2 Organizational Security, DHS 2.7 Strategic Planning, DHS 2.17 Monitoring and Reviewing Control System Security Policy, DHS 2.18 Risk Management and Assessment, DHS 2.19 Security Program Management	Jon Stanford (Lead), Jerry Freese, Dave Norton

Jon Stanford reported on the Sub-Team's work reviewing the Requirements Worksheet. He noted that the right hand side includes the current CIP and covered:

- Security Policy and Procedures
- Control System Security Plan
- Security Plan Update
- Control System Connections
- Vulnerability Assessment and Awareness.

The SDT reviewed the plans for the May 2010 Technical Workshop including Gerry Adamski's email. Gerry Adamski has offered to be the "general facilitator" for the workshop.

The Chair and Vice Chair noted that the Team had made a lot of progress over the course of the meeting. They reviewed the short term schedule for the Sub-teams. They will be meeting weekly as will the Sub-Team Leads to help coordinate the development of the drafts. There is a lot of work to complete. Sub-teams may be scheduling additional working sessions and coordinating with Joe Bucierro. The SDT needs to enter its April meeting with a good draft
Sub-team should use Howard Gugel early and often.

The SDT requested that Friday sessions should clearly note if noon is the adjournment time so that members can make travel arrangements accordingly.

The Chair and Vice Chair and the SDT thanked Bill Winters for his excellent hosting and great facilities. Bill offered to host later in the year and will follow up with Joe Bucciero.

The meeting adjourned at 12:15 p.m.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CSO 706 SDT MARCH 9-12, 2010
PHOENIX, ARIZONA

MEETING SUMMARY

I. AGENDA REVIEW, WORKPLAN, UPDATES AND COMMUNICATION PLAN

A. Agenda Review

On Tuesday afternoon, the Chair, John Lim welcomed the members to the SDT's 20th meeting noting the Vice Chair Phil Huff would join the meeting on Wednesday morning. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See appendix #2*). The host Bill Winters, a SDT member, welcomed everyone to the facilities and covered logistics. The Chair reviewed the following meeting objectives:

- Review the revised CSO 706 SDT 2010 Work plan and Convergence Schedule Proposal
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan and May 2010 Technical Workshop
- Review, discuss industry comments and identify issues raised to be addressed in revised CIP-002-4
- Review, refine and test consensus on a revised draft CIP 002-4 and Industry Response Document
- Receive progress reports for Security Controls Requirements Sub-Teams
- Develop and Test Sub-Team Security Controls Requirements
- Agree on next steps and assignments

He suggested the Team was at a crossroads in terms of getting some of our product out to the industry and getting beyond conceptual discussions. He noted we need to have complete draft CIP package at the end of our April Meeting for posting for informal comment in early May. He suggested the focus needed to be on getting things done and that once the SDT has agreed then it needed to move forward and not revisit previous discussions.

Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). On Thursday morning the SDT approved without objection the meeting summary for the February 16-19, 2010 SDT session in Austin, Texas.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See*

Appendix #3). He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

B. Workplan Schedule Review

Stu Langton presented a proposed CSO 706 SDT schedule which was circulated within a day of the meeting and made adjustments in the process to allow for NERC reviews and formatting of materials. Joe Bucierro suggested the SDT might want to review this overnight and take up first thing on Wednesday morning.

On day two, Stu Langton reviewed the SDT schedule sent out yesterday from Scott Mix He noted that this is our 20th meeting over past eighteen months. The SDT has faced four core challenges:

- Over 200 items in 706;
- High visibility issue in the industry and Congress;
- Large team formed in effort to represent points of view of the industry; and
- Two different cultures addressing cyber security-- engineering/production backgrounds and engineering/cyber security backgrounds.

The SDT handled initially the TFEs. In Fall of 2009 the SDT responded to a FERC ninety day order. The SDT experienced a change in leadership and a 25% change in team membership. The SDT has experienced high pressure to shorten the schedule and work more intensely. We added an additional day to most of our 2010 meetings. The SDT has gotten CIP versions 1 and 2 out to industry and broadly accepted and have continued to meet deadlines successfully. The SDT has developed meeting protocols that let members speak and also observers which can be frustrating as we try to afford airtime for everyone. The Team recognizes that we have been asked to address potentially significant changes for the industry. The team has created straw documents which we have been able to respond to a make progress and has developed good quality products. We have used small drafting groups and polling and consensus testing to help group move forward. We get knocked off pace when members feel a the need to offer illustrative examples in order to test concepts that often are tied to particular views or narrow areas of operation. We occasionally get bogged down with disagreements and differences. The key has been to offer improvements not just challenges as we have key deadlines we must meet.

Scott Mix and Joe Bucierro reviewed a schedule Gant chart and Joe's is a matrix for comparison – both are very helpful and provide a game plan that may have to be adapted to respond to additional changes and challenges. Between now and next meeting is important challenge to getting the first draft done. The proposed process involves five key steps:

1. Informal comment period of thirty days for industry to review in May-June, 2010.
2. Formal 45 comment period from July 26 to mid-September.
3. Followed by up to three ballots of ten days each
4. A NERC board decision in December to adopt the new CIP; and
5. Send to FERC by end of December.

Our next meeting is on April 13-16 in Atlanta where we will adopt a draft for industry comment which will then be posted on May 3. We will meet 5/11-14 in Dallas to develop guidance documents and prepare for the Industry workshop the following week in Dallas. On June 8-11 we will review comments on first draft from the industry and the workshop and refine the CIP. On July 13-16 we will finalize and approve documents for posting for formal comment period. This new schedule builds in time for NERC review and work followed by drafting team approval. This schedule will be made available as part of the meeting summary – has already been sent out to the list and includes two webinars as part of communication plan to the industry. The Technical workshop is part of the process for collecting comments as part of informal comment periods. Any comments received during member presentations to key groups should be consistently requesting comments in writing so we do not have to respond to those from memory. The official record needs written comments to capture.

C. Communication Plan

John Lim introduced Carl Dombek the new NERC communications director and asked him for a progress report on the communication plan for the drafting team activities and drafting of the standards. He thanked the Chair for the introduction and noted there would be a broad spectrum of materials and opportunities to consider. They are planning to brief reporters from the various trade dailies bringing them up to speed on purpose of a performance based system. There would need to be more communication to particular groups to make them aware of webinars, perhaps more targeted advisories as opposed to general notices – impressing on them the importance of participating in the process.

SDT Member Comments

- Workshop – any planning for it? Want to do it in mid May – technical workshop to follow the filing in early May to clarify questions and develop better understanding
- Should it be in conjunction with Board of Trustees meeting? Or separate event?
- The Team is proposing a separate event the week of May 17.
- Carl will get with Gerry Adamski to review details and explore new ways of getting participation.
- Where should the workshop venue be? Washington? He suggested it may depend on the number of people attending and he offered to look into that and suggested discussing the specifics offline.

D. Standards Drafting 101

On Wednesday, Howard Gugel, NERC, presented an overview with guidance for the Team on drafting standards and requirements which he and Maureen prepared. He noted the overall move towards performance based standards and described the general process for writing a standard. He suggested starting with the end in mind and FERC's criteria for approval:

- Achieves a specified reliability goal,
- Is applicable to all regions and entities, and
- Considers costs but not at expense of reliability.

It is important for the Team to build consensus at every step. As the Team has experienced first hand this is most difficult to develop at the concepts and assumptions level first, before addressing the drafting of requirements, then measures and compliance element.

SDT Discussion

- What happened to measures – are they going away? Not yet.
- How much leeway does group have to set zero based risk factors? VSLs and VFRs are filed separately, not as part of standard itself.
- Will we have the ability to pick the thresholds? Team will draft those for industry comment, it will be part of the record but not technically part of the ballot, and will be filed separately.
- Industry does not understand that VSLs and VFRs are filed separately.
- In the example rewrite, where does updating the documentation fit? As part of R1 sub-part 3 or as R2?
- Why have update if you are required to have documentation – doesn't that include updating?
- Could we say "continually" document? Then there would have to be an interpretation of "continually"
- The less we leave room for interpretation the better off we will be for purposes of auditing.
- Careful in our requirements that we do not cross the line into the how to do it.
- The audit model we will use seems to assume we are guilty until we can prove our innocence through documentation in the audit process.

II. REVIEW OF REFINEMENTS OF CIP-002-4

A. Initial Review of CIP-002-4

John Lim provided a progress report on the Subteam's work since Austin (*Dave Revill, Rich Kinas, Jim Brenton, Jackie Collett, Bill Winters, Dave Norton) Rod Hardiman*

(Observer) They met two times last week. Dave Revill has worked on a strawman for us to use and has developed a good set of requirements to work with using criteria posted as a starting point. Jackie has done some more work on those. Rich Kinas is working on the comments – will use the discussion of the team from last meeting.

He reviewed with the Team the following issues the CIP 002 Sub-team has been grappling with:

- **Definitions**
- Definitions of BES cyber system?
- What is meant by "Misuse"? Throw it into the list of things that can cause harm to the system?
- What is compromised if not misused? Just adding to be sure the link between the two is understood by all – 706 said to put misuse into the categorization.
- Do we need a definition of what we are going to protect in order to develop criteria – if we are not going to do that, why don't we create a list of implementation scenarios and work back toward a definition as opposed to tweaking a definition by finding exceptions – work it in the opposite direction – we have a definition that does not work.
- need operations folk to take the lead because they know how it works
- if bright lines need definitions, then figure out the situations it will be applied
- letting impact of generation facility meet the definition because of the impact it has
- **Drafting Language**
- "such as" – in a standard is this inclusive, illustrative or what as a guideline? "Such as" is repetitive and redundant – suggest dropping
- **Control room vs. control center.**
- Control center concept may be going the way of the dinosaur but it is not quite there yet.
- Also control room versus control center – the latter includes the operators – we went to one room.
- Replace center with system which can be in one or multiple places?
- Trying to resolve conflict between geography and functions.
- **Legacy.** How do we deal with "legacy" and the need to move forward and assure the spectrum of needs are protected?
- This is not part of the standard.
- Currently using as an example – but what is in the glossary makes a huge difference on compliance – need to be sure we know and the auditors know what it means and agree on that definition
- **Multiple facilities.** Point to the highlighted additions as added since the last comment period: "multiple locations" and "Real Time"
- "Multiple facilities" and "multiple locations" keeps it from being limited to one site or single generation issue.

- We dropped the location concept in the requirements because it was too easy to get wrapped around the axle.
- Need to be sure we don't get caught with unintended consequences.
- **Control system.** just calling it a control system doesn't cover the need
- do we need this. If we do, should we add "digital control system"?
- it is needed because we have a bright line criteria that addresses this issue
- "binary" not just digital
- Modified guidelines on alarm monitoring to focus on power operations
- Most generator systems have a fire suppression system
- That is fire that impacts operations or restoration functions – that fits operational concept

Added 4.1.10 Distribution Provider (with qualification) –

- Need to clarify what is included in bulk provider definition
- "with BES assets" instead of "qualification" would clarify
- tie to regional reliability organization or its equivalent – existing standards already have appropriate language – see PRC-8 and PRC-10 – to replace language above

5.1

- Take out the parenthetical marks and include the language
- Disclaimer of other group working on defining what is under NERC jurisdiction
- Does "Facility" need to be capitalized? Yes, it is in the NERC Glossary
- is there a separate plan for covering nuclear facilities?
- We have to have an implementation plan for version 3 – still working on developing version 4 for filing at end of December and it must include implementation schedule for everything under NERC jurisdiction

Dave Revill presented the concept of breaking requirements into two components:

1.3 Uniquely identify and document assets

1.4 Identify types of data communication into five technologies: routable, non-routable, dial-up, serial or not networked

- Definitions build on the attachment
- Created matrix using the five categories of communication technology including:
- And assigned high-medium-low as compared with BES impact rating

SDT Discussion

- Why is serial called out specifically? Is it captured by non-routable?
- Do we consider it legacy? It is different from non-routable – actually it is included
- Do we need to call out wireless as a separate family?
- Do not apply the same controls to legacy serial as other non-routable – that is why it is called out
- Mixing topology and protocol – our attempt at creating bright lines may be in trouble –

- I am interested in protecting interconnected systems regardless of the protocols
- Routable at the top because it is the most vulnerable – what are we including in the non-routable?
- Legacy protocols were not point to point, they were multi-drop?
- We will have three sets of controls – there is another dimension for environment – is there a third dimension too?
- Original idea --across the top was if I get to it how much damage can I create and the down the side was how easy is it to reach (connectivity) – not getting into the transport
- We may be digging ourselves deeper into controls – need to keep this separate from the requirements.
- How can you use the cyber system to bring a chuck of the BES down? Industry just wants to know what they have to do – practically talking about someone from the outside patiently, persistently breaking in using routable protocol or a disgruntled insider
- Routable, non-routable and stand alone – we used these categories in Austin/
- We did build consensus on connectivity, and but not on the protocols – broke the connected into routable and dial-up - protocols should be done in the controls
- Propose we are after connectivity – color code the first four lines and discuss what if any break out needs to be included –
- Two categories of connected and not connected?
- Confusing protocols with access – it is the access that makes system vulnerable

After a break, facilitator Stu Langton pointed out the tensions the Team has experienced has been balancing three things: getting the task done on time; doing it well; and building consensus among the team to move forward. He noted in Austin the SDT seemed to have a degree of consensus on three tiers: connectivity/routable/dial-up, non-routable, and not connected. What was discussed before break is a continuance of that discussion. The Team may not need to retest the earlier agreement but simply flesh out what is included in each category. The Team agreed to ask the CIP 002 sub-team in light of the discussion to test where this would or would not work and bring back refinements or alternatives that address questions.

Final SDT Discussion Points on CIP 002 Requirements

- May need a full team approach to refining the requirements?
- Connectivity/routable/dial-up are not all inclusive, dial-up could be included in non-routable too – need various perspectives to test these categories – I am concerned about non-authorized access
- Category should just be "connectivity." But we need to clarify "connectivity"
- Maybe we need to use "accessible" – then define as remotely, local and not accessible
- It is good, we just need to move forward with it by refining it – not locking into these terms and need to refine them using the Sub-team group

- When we have an issue and we don't have a definition we can simply ask each person what the term means to them to try and build a higher degree of understanding

CIP 002 Attachments

John Lim then presented an overview of the approach taken in the attachments.

SDT Discussion

- Is "essential to the reliability of the BES" the same thing as "supporting the reliable operation of the BES system"?
- Suggest changing to "reliable operation of the BES"

Real Time

- "Real Time"? Do we need to clarify?
- Need to be sure we are using terms consistently across NERC standards.
- Is there a catch phrase we can use that captures the concern? Real time operations?
- Within a period of time?
- It means right now up to thirty minutes? Or is it an hour cutoff, the point it must be reported?
- This may have to do with how many megawatts is lost over what period of time that impacts the system
- Within fifteen minutes (or X# of minutes) would cause a disruption of the system – concern is for the condition of the system
- Default Disturbance Recovery Period is fifteen minutes – from the glossary
- Allowed thirty minutes to recover
- This is an example of two different standards we are drawing upon for two different requirements – can NERC help identify applicable comparable standards?
- Note that the thresholds for reporting something and time for correcting it may be different for the same standard.
- Looking at other standards from other teams is a novel concept for most drafting teams.
- 30 minutes for IROLs in three different requirements – supports using that time frame
- Concept of time horizons of reporting and correcting are not germane to protecting the BES.
- "Real time" captures it even if it is a fuzzy term.
- Does this mean you have to prove to an auditor that you can anticipate all the possibilities?
- IROLs are part of the reliability coordinators role.
- Part of developing standards is the need for setting time horizons for severity of violations.
- Real time is action required within one hour to prevent further damage to the BES – comes from guidance document for establishing time horizons.

- Putting in specific times may not be needed here – "real time" for purposes of auditing may be too wishy-washy.
- Should we test with a vote and move on?
- Leave as is and then when we write the requirement say "real time operations" that then refers back to the NERC guidance.
- Do we need to specifically reference here the real time operations in the requirement?
- Put in parenthesis since it is not in the requirement but in the guidance
- An ad hoc team was asked to address: including Howard Gugel, Doug Johnson, Dave Revill and John V. Boxtel.
- Issue may not be not real time operations but the definition of immediate impact

Audits, Standards and Guidance

- All this is part of the standard as an attachment? Or is this only guidance?
- If the former then I need to be prepared to address the sixty or so bullets as possible items for audits? I have to prove everything in the attachment if part of the standard.
- Thought we were moving it to guidance
- Have we switched the numbers of attachment one and attachment two from the last meeting? Yes.
- We have two attachments even though at the last meeting we agree to meld into one attachment and moving much of the old two into guidance?
- Keep the opening paragraph under dynamic response and move the bullets to guidance?
- That may be worse.
- But we have to define this somewhere.
- We are here to protect reliable bulk power not simply to make compliance clear.
- We have to identify critical functions and how we will protect those functions.

Functions.

- Functions ended up in the definitions then pulled back out as being too broad for the definitions and were put back into the attachment
- Functions have never been incorporated into what we are trying to do – our approach to reliability is to look at how much a system impacts the grid – concerned we are arguing about the same concepts as six months ago
- Functions for reliability must come first – the level of controls will come from table 1

Disturbance to the BES.

- Are we really talking about anything that can cause a Disturbance to the system? Reviewed the definition of "Disturbance" – only functions of significance are those that can cause a "Disturbance to the BES"
- But that does not include situational awareness
- Can we use an existing NERC term and build on it?
- Do we want to leave vague terms and leave it up to auditor for interpretation or drill down into the details?

- I would like to use existing terms like "Disturbance"
- Can we throw ideas out about how to address the concept of combining into one attachment and the rest to guidance?
- We have already posted a version of comments and changing based on comments not trying to rewrite the standard completely –
- There was no comment about removing functions from attachment – there were comments about removing examples – if repost radically different standard we will get a whole new set of comments.
- We do have the ability in this new CIP standards process to offer changes.
- The primary issues are the scope to be addressed – hopefully building a significant yes around this table will help build a significant yes in the industry –
- Can we spend time on BES cyber system scoping? What is the context of effect and the context of time and connectivity – I like drawing on existing definitions if possible.
- Disturbance plus: for purpose of defining the scope of applicability of SIP standards, the functions of relevance are only those which could cause a Disturbance to the BES, restrict control and operation of the BES, or affect situation awareness of the BES
- Can we just define a list of systems that do the things we want to cover such as for situational awareness and determine a list of what to protect?
- Concerned that we are not building on success but only re-discussing the same issues – the industry wants to clarity
- Anything in NIST that can be used as a starting point?
- Nobody has come up with anything that should not be in attachment 2 – IT does not know what is vital for protecting the reliability of the BES – bulk produces determine what is essential and cyber can help figure out how to protect.
- What we have here is an effort to provide clarity – this is the stuff to protect
- Lets take this and make clearer what we are trying to protect
- Situational awareness may take more effort since it is a little squishy – but much of the rest is concrete enough to work with
- Those in the control world can look at the list and see if it can be made more concrete – others can work on the connectivity box – then see if we can jell them together
- Defer where it goes until after we set what we need
- Will we end up with anything different than the list we already have?
- We are describing things by functions
- List essential functions and leave it to entity to determine which meet that and offer guidance on what you think – serves as an interim step
- I like idea of moving sub bullets out to guidance, leave in functions with a matrix
- That puts focus on each group creating the list they need then cross reference to the IT guys to help figure out how to protect it

Addressing Industry Comments.

- Need to go back and read some of the comments that were offered. What are they telling us about Attachment 2?
- Regarding Attachment 1 and 2 – industry wanted more specifics of what is to be protected so we provided the attachments – now they comment back that they don't like specifics – industry will not be happy because it will have to spend money and resources to address it
- What does the statement above mean to an auditor?
- Jay pulled out and read from a comment a draft definition that might address the issue
- The bullets added clarity while the general definition offered to cover the breadth of situations.
- We have not discussed the suggestions for refining offered in the comments – those could be part of a brainstorming effort to addressing the question.
- If we take into account all the comments offered we will end up with the standard you have now because industry doesn't want to change because it will cost them resources.
- We cannot make radical changes to the documents we have posted and expect to build consensus or broad base of support.
- Looking for members to pull forward key concepts from the comments for group consideration
- We did not do justice to the comments by only reviewing summaries and only considering them in small groups or just asking members to read them on their own.

B. CIP 002-4 "Parking Lot" Issues

During the course of the first day's discussion the following issues were noted, but not resolved, for sub-teams to return to:

1. Multiple Locations – concerns raised re: rationale
2. Cyber Security Incident Definition
3. Distribution Provider – concerns regarding inclusion
4. Presence of R1 and R2 could present double jeopardy concerns
5. Define "change in BES" (R3) Long term? Etc.
6. How does one audit R3? Is there an implied requirement of maintaining a list of changes?
7. Clarify the link between Attachment 1 (R1) and Attachment 2 (R2) and where to capture the link (Guidance? Standards?)
8. Distribution (used as stabilizing load during restoration) for Blackstart?
9. Standard in development of High impact system – reference: Project 2009-09
10. My comment agreed was that 1.11 effectively includes all BES Facilities greater than 300kV. An option might be to delete 1.11 and include something like the following in every other item (using 1.1 as an example):

11. APP #2: 1.11 effectively includes all BES Facilities greater than 300kV. An option might be to delete 1.11 and include something like the following in every other item (using 1.1 as an example):
12. APP #2: 1.1: Generation Facilities, and their associated Protection Systems, singularly or in combination...
13. BES Cyber System vs. Cyber System?
14. John Ciufo – Standard in Development – High impact system – reference Project 2009-07

Based on a review of the parking lot issues, the Team agreed to the following drafting assignments:

1. **Control System** – Produce a list of examples – Rich Kinas

On Day 2 Rich presented a draft list of examples for control systems.

SDT Discussion

- Only to the low side? This is what the industry does now – what they are thinking – we need to fit in or make clear what we are talking about to avoid confusing the industry
- Some of the industry does go further
- This is a means or tool to the end of clarifying intent
- May be part of guidance document
- May want to include other ways industry is addressing – these are not exhaustive, only initial thoughts

2. **Matrix Group – "connected/not connected**" – Jon S., Jackie, Bill, Jay, Rich, Patricio (John V. Boxtel)

Jon Stanford provided an overview of the points of agreement after the group reviewed the list of points from discussion yesterday in its discussion the night before.

- Bright line was a good idea and effort but may not work after testing several examples. It could be counter productive
- In CIP 002 it is important to get object or target of protection.
- Applying connectivity can become very complicated.
- Entity has to decide what is a BES – cannot cut systems up into small pieces – so we all should "get over it."
- The low baseline needs to be those controls/requirements that provide the highest value to mitigate risk.
- We shouldn't let "audit fears" limit our ability to develop meaningful standards, instead let auditing adapt to the new standards.

- We shouldn't' be afraid of if/then/else application of some controls/requirements as appropriate.
- The team had consensus that control work should move forward in parallel to the 002 work – i.e. we should develop catalogue in tandem not in sequence.
- The team agreed there needs to be more guidance to sub teams
- This will capitalize on work already done by sub teams in developing controls.

SDT Discussion

- Does this apply to controls not requirements? We cannot put "if then" in the requirements.
- Still to be determined in the language to be developed. Most of this discussion is about controls and writing requirements – apply focus on practicality, lot of industry comment referenced routable protocols.
- Putting "if/then/else" introductory language before the "shall" phrase may be workable and has precedent in other standards.
- Auditors will audit to what the requirement says – need to capture words in the requirement that we want them to audit to – crisp accurate language so industry knows what will be audited and auditors will know what to audit too.
- Sub group work needs to use consistent language across the standards – need a common language whether it is h-m-l or something else
- Confident if the right things coming out of 002 then we can set the right "bright lines"
- 002 is an identification exercise – current standards do not allow you to take into account how assets are deployed – this new approach does if controls written properly.
- 002 will identify the important things to protect and the assets related to those regardless of type of connection. We understand that technology will change and the standards will need to incorporate and adjust to those changes over time.
- Does this take away the connectivity piece of the evaluation? Closer to what we had before? Need to decide and start drafting controls.
- Can still include routable protocols in 002 if it would provide the best industry response and compliance if that is the way the industry thinks.
- Yes, we need to put stake in the ground –but it is not either or – can we address connectivity in the controls? Need more discussion of how many controls will be in the "low", may be a small number
- NRC guideline effort struggles with the same issue – they have an appendix B "mandatory" controls and appendix A technical security controls with an exceptions process – you would have to show auditor you do not have "connectivity"
- Good concept but a few things bother me. "Don't be afraid of audits? Not afraid, but not sure how to accomplish
- Take the language "with a grain of salt"– starting the discussion, not meant to be inflammatory.

- What I want to happen is that anything out of 002 should address making the system more secure – don't care if high or low but whether or not adequate protection is provided certain controls
- Lot more common ground than at first appears – want to consider impact on the BES, the connectivity, and how we apply controls – trying to get the same end of controls appropriate for the environment
- Common on the end result – still struggling how it is understood by the industry which sees their world changing.
- Does it make more sense to come up with complete list in 002? If industry concerned about increasing scope to non-routable you need to explain the intent to them – also addresses Congressional concern past standards did not address everything – explain to industry that not everything is high and that listing into low where appropriate helps focus efforts on the important things.
- Problem with government NIST system is that too much is low with little more in medium and little more in high.
- Too many are avoiding updates by using the non-routable as an out.
- Federal low is not there because of IP – the low is too high – and the enhancements in the high category are significant to the most focused items. This may not be good optics, but we need to educate the industry and congress on the issue.
- Entities are not moving forward and are pulling routable protocols out to take advantage of non-routable exceptions and may be impacting protection of the system.
- Setting the routable protocol as the bright line can thus be counter productive to protecting the system.
- NIST is modeled for a different system than the private sector industry - also CIPs are not written for special situations but for the majority of the industry.
- Non-routable is not a loophole and may be reducing exposure and improving security if can remove the routable protocol.
- The NIST is offered to show why it will not work and why we are offering a more tailored approach applicable to the industry.
- All still getting to the same level of security and controls to apply – the end of 002 is not a list of h-m-l impacts but identifying the appropriate level of controls to apply.
- We are not advocating applying 853 – just illustrating the approach.
- Also trying to address unintended consequences and trying to avoid spending money on things that will not improve security of the system.
- Each of us heads off in different directions to fit our world –
- Let the 002 sub-team do their work and let the other teams begin developing the base line rather than the high first, develop the universe then look at how to apply connectivity.
- This is an example of how this team struggles to make decisions without seeing details – can we draft security controls without looking at connectivity?
- Two main concerns – is non-routable in 002, if so, are they now addressed?
- If artificially in low or high will have to spend money unnecessarily to protect. We may need to figure out what is in the h-m-l first.

- Everything starts out as at least low – should connectivity be addressed in the standard or in the controls?
- I think we do have a non-applicable category too – a bottom to the standard is set by applying the real time function
- Industry is spooked about making an inventory of all assets – we are proposing an inventory of those functions impacting the reliability of the BES – that is good business practice

3. **Real Time Operation/Cyber System affecting "immediate impact"** – Dave Revill, Howard Gugel, Doug Johnson, (Jon Van Boxtel)

Howard Gugel presented the group's report making the following points:

- The group suggested that functions of relevance are those functions essential to reliability of the BES. If it affect situational awareness does it exclude anything?
- Read the definition of situational awareness. A unit, a station? That is the way it is defined if can affect reliability of the BES.
- Entities currently know what those are.
- Information that can cause a bad decision that impacts the BES reliability.

SDT Discussion

- "Restrict" control of operations? Need to clarify the term – affect or constrain?
- Every entity has a different situation they will need to be aware of – depends on who you are as to the level of awareness
- Is this a good subject for a glossary term? "situational awareness"?
- This is an effort to take the attachment one from yesterday and try to address situational awareness
- Need to make sure that if in the standard we have supporting language in guidance
- Situational awareness is organizational behavior but not necessarily BES function
- Can apply to many things beyond just functions
- The term is a major cause of problems in Florida and the 2004 blackout
- Proposed modification – display of data that could affect function – "which could adversely affect the performance of a reliability function" –
- Trying to address where "monkeyed" with
- Everything there could adversely affect yet none of them are designed to cause adverse affects

4. **Attachment 2** – guidance, matrix – Rich Kinas and John Lim.

On day 2 Rich presented a draft guidance document. He noted:

- Dynamic response example – spinning reserves might be GOP function;
- Created table to help entities figure out which functions to address.

SDT Discussion

- Is this the same as Real Time operations?

- This could be part of that group but not the intention.
- Under suggested improvements – collapse some of the categories?
- Specific requirements for TO and TOP – different roles and different companies may be addressing each
- Flushing this out should not take too much time but be sure architecturally sound
- One thing under current CIP we had to assign assets to individual functions – be sure we do not become overly proscriptive
- What do we need to document for registered entities and ties to others for assignment of functions?

C. CIP-002 Guidance

In conclusion the Chair and Vice Chair reminded members that the Team has a very tight time frame to get our work done and they need to emphasize and trust the small group work and giving them time to get products ready and test with hard breaks for moving forward. The Team recognizes that 22 members cannot collectively write the standards within the time limits

The Team tested the level of support for the following guidance to the CIP 002 sub-team:

3. **Redraft CIP-002 to remove the connectivity options and handle them in the controls**
   Y= 15 N = 5

4. **Keep cip-002 as drafted yesterday and let cip-002 sub-team handle modifications to the matrix (Austin)**
   Y= 4 N= 16

The Team acknowledged they may need to revisit if in developing controls we find we cannot address the connectivity issue.

D. CIP 002 Drafting Group Update Report

John Lim reported on Thursday the Sub-Team's efforts:

- 002 completed most of the work on the requirements.
- Attachment 1 is definitions of the functions.
- Working on attachment 2 applying functions- working on that tonight.

He suggested that on Friday the SDT should concentrate on the standard document itself.

E. CIP-002-4 Review and Consensus Testing

On Friday, John Lim presented the revisions to CIP 002. He asked the SDT to focus on the content and intent of the draft and not to engage in word-smithing noting that there were extensive and challenging discussions among the Sub-team over the past few days. Focus on content and intent of document.

- Will send to Howard for editing and review.
- New work on Attachment 2- levels.
- The Sub-team removed definitions of functions for reliability of BES and moved them to Attachment 1.

1. Definitions

- "One or more programmable electronic devices including hardware, software and data organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data, which if rendered unavailable, degraded, compromised, or misused could cause a Disturbance to the BES, restrict control and operation of the BES, or affect situational awareness of the BES."

SDT Comments

- Do we have to start with BES before cyber system?
- Definitions- should be stand alone. Context comes in the requirements.
- Clarify the purpose of standard and this definition?
- Will this be added to glossary? Control center length?
- c. Real time capitalized? b. no capitalized. Proposing to go in the NERC glossary.
- Only "Real-time" in glossary. "Present time as opposed to future time." Lower case "real time" in document.
- Would it affect definition to leave real time out?
- Might confused.
- Real space time. Some of operations- not now but 20 minute horizon.
- SM: did agree on the qualification "alarm monitoring and processing"
- Add to d. <u>specific to operation and restoration functions.</u>
- BW: is it better to use now "real time" as a qualifier.
- HG: glossary definition doesn't capture. Use lower case.
- JL will do a real time edit.
- RK: Quick search of other NERC standards.
- JC: definition developed.
- AL: why was multiple locations in the document?
- Retiring 3 terms.
- Terms to be retired from the *Reliability Standards Glossary of Terms* once the standards that use those terms are replaced:
- Critical Assets
- Critical Cyber Assets

- Cyber Assets

A. Introduction

1. Title: Cyber Security — BES Cyber System Categorization

2. Number: CIP-002-4

3. Purpose: To identify and categorize BES Cyber Systems that execute or enable functions essential to reliable operation of the BES for the application of cyber security requirements commensurate with the adverse impact that loss or compromise of those BES Cyber Systems could have on the reliability of the BES.

SDT Comments on changes?

- One issue we will have to do with it. Removing "critical cyber assets" and "electronic security perimeter." Will have to add definition for that term.

Distribution Provider

- Reference to PRC 5- distribution providing owns a transmission- this is a transmission Protection System.
- Cover in guidance document. 6-7 PRC standards talking about special protection systems, etc.
- Looked at all this. Need to put in there. Look at registration text, it includes all that information. Those standards deal with under voltage etc. It is covered by a functional definition.
- Provides for changes in regulations.
- The Sub-team didn't agree with this one. Put in the parking lot.

B. Requirements

R1. In order to identify appropriate BES Cyber Systems for the application of security requirements or controls, each Responsible Entity shall uniquely identify and document all BES Cyber Systems which execute or enable functions defined in *CIP-002 – 4 Attachment I – Functions Essential to the Reliable Operation of the BES*.

R2. In order to categorize the BES Cyber Systems identified in R1 to apply Cyber Security requirements or controls commensurate with the potential impact on the BES, each Responsible Entity shall categorize or re-categorize each BES Cyber System according to the criteria contained in *CIP-002-4 Attachment II – Impact Categorization of BES Cyber Systems.*

2.1. The Responsible Entity shall review its categorized list of BES Cyber Systems, as a result of any change in the electric system that it owns or operates that affects the categorization of the BES Cyber System, and update within 45 days of the completion of the change.

Controls standards will specify applicability to the BES Cyber Systems categorized in this standard.

SDT Discussion

- States the reliability benefit in the requirement.
- Can't have requirement that starts in the middle? Need BES before BES cyber.
- Clean up wording on requirements.
- Need BES- agree JV- Not clear these 2 requirements what have to put in BES.
- Is 2.1 is a separate requirement?
- Add "In order to maintain and keep current the list…."
- Change 45 days to 30 days to be consistent with FERC directions.
- Why 2 requirements? Is it possible identify and characterize as 1? Looks like a step to an end result.
- R1- identify all BES.
- R1- to id cyber systems based on your BES. It would be more confusing to combine.
- Howard Gugel noted that you could combine as 1 requirement or leave as 2 separate.
- Is there an issue of double jeopardy? Forgot to include one and not categorized correctly? Look to defining your VSLs.
- 2 separate lists because of 2 requirement? If expect 1 list then 1 requirement. If 2 lists then double jeopardy question may be raised.
- Change in R3- "change in the electric system"?
- The Sub-Team removed BES cyber systems from here. Assumed will be covered in Change Management group. Couldn't find mechanism for update.
- Howard Gugel suggested striking "that affects the categorization of the BES" instead. Anytime you add anything new to your BES cyber system you have to update.
- R1- likes the unique identification and document vs. make a list. Entities are using something similar to a list? R3 updating "your documentation"
- Suggest edit: ~~electric system~~ BES
- Pick up commissioning activities, changes in BES cyber system in change management. Do an annual review and update and capture changes in system 1 time a year and that will capture this.
- Need to define "changing electric system"- what does this mean?
- "Commissioning new assets"
- Don't like "any" change. What does this mean. Needs a qualifier. Updating the documentation specified to R1? Keep update the list.
- R2.1 separate? Wasn't under posted version.
- Any change? Long-term change? E.g. bringing new line on?
- Howard Gugel suggested: "When any BES ~~element~~ facilities is added to or retired from the BES that it owns or operates."
- What about "modify"?
- R3- refer to R1 documentation
- Simplify to going back to R1. Not separate

- Requirement is for reliability and not documentation.
- 45 days? FERC said 30 days. Will need justification.
- How do you audit R3?

Parking Lot
- "Multiple locations" definition- concerns whether it is needed?
- "Cyber security definition"?
- Distribution provider?
- R1-3. If 2 requirements

Data Retention
- Less than compliance time frame? Maintain as 1 year. "Keep for the compliance audit period, 3-6 years depending on what kind of entity." Global issue for every standard. SDT has to figure out whether we stick with it.
- NERC should do this.
- Full year or …… Clean up to make consistent.

Violation Severity Levels.
- Team used NERC guidelines for VSLs to make consistent.
- "Or" is for 2.1

SDT Comments
- VRFs? They will be put in. Both will be high
- First line- in terms of audit? Look at your diagrams and go through steps.
- Open to suggestions.
- Don't audit that item. Combine process.
- Comes out in an investigation and 3 level process
- The auditor looks at what you present and drafts a "potential violation". Audit process stops and goes to investigations and further analysis. Not an audit function triggering thresholds.
- That's why we left this as is.

CIP-002-4 Attachment I
Functions Essential to Reliable Operation of the Bulk Electric System

The following operating functions are defined to be Essential to Reliable Operation of the Bulk Electric System (BES):
- Dynamic response
- Balancing Load and Generation
- Controlling Frequency (real power)
- Controlling Voltage (reactive power)
- Managing Constraints
- Control & Operation
- Restoration of BES

- Situational awareness
- Inter-Entity coordination and communication

For purposes of defining the scope of applicability of CIP Standards, the functions of relevance are only those that affect real-time operation of the BES. Further qualification as to what constitutes Functions Essential to Reliable Operation of the BES can be found below.

- Will place and develop it in the guidance documents.
- Make sure consistent with "real-time" definitions and any other changes in definitions discussed.
- Actively performed functions not reactions.
- Had this under dynamic response.

Attachment II

John Lim reviewed the development of Attachment II which Jackie Collett help to develop.

1. High Impact Rating (H)

BES Cyber Systems that would immediately affect real-time operations for:

1.1. Generation Facilities, singularly or in combination, with aggregate higher of the most current and prior to the most current rated net demonstrated capability (MOD-024 and MOD-025) of 2,000 MVA or more.

1.2. Generation Facilities, singularly or in combination, whose aggregate rated net demonstrated capability, as defined in part 1.1 above, exceeds the largest value, for the 12 months preceding the categorization, of the Contingency Reserve or total of reserve sharing obligations for the Reserve Sharing Group.

1.3. Generation Facilities that are pre-designated as Reliability "must run" assigned units that have Wide Area reliability impacts.

1.4. Generation Facilities designated as blackstart resources in the regional blackstart capability plan.

1.5. Transmission Facilities operated at 300 kV or higher in the Eastern and Western Interconnections or operated at 200 KV or higher in other Interconnections. (3 or more …)

1.6. Facilities required to support a primary Cranking Path used in a Transmission Operator's restoration plan per EOP-005.

1.7. Transmission Facilities that, if destroyed, degraded or otherwise rendered unavailable, would violate one or more Interconnection Reliability Operating Limits (IROLs).

1.8. Transmission Facilities that if destroyed, degraded or otherwise rendered unavailable, would result in the loss of generation Facilities, singularly or in combination, with aggregate rated Net Demonstrated Capability (MOD-024-1) of 2,000 MVA (?? TOO LOW ??) or more

1.9. Transmission Facilities identified as essential to meeting (verify wording) Nuclear Plant Interface Requirements established in accordance with reliability standard NUC-001 for Nuclear facilities.
1.10. Transmission Facilities that, if destroyed, degraded or otherwise rendered unavailable, would result in voltage collapse, electric system collapse due to frequency related instability, or complete operational failure of the Transmission system or separation or Cascading outages. (linked to IROL criteria - wording)
1.11. Protection Systems for BES Facilities operating at 300 kV and above in the Eastern and Western Interconnections, or operating at 200 kV and above in other Interconnections. (Hardiman: establish 300 kV baseline)
1.12. Special Protection Systems (SPS), Remedial Action Schemes (RAS) or automated switching systems that operate BES Elements and that have wide-area impact.
1.13. BES Elements that perform automatic aggregate load shedding of 300 MW or more.
1.14. Primary Control Centers and any backup Control Centers performing Reliability Coordinator functions.
1.15. Primary Control Centers and any backup Control Centers performing Balancing Authority functions of Transmission Facilities or generation Facilities, singularly or in combination, of 2,000 MVA or more.
1.16. Primary Control Centers and any backup Control Centers Transmission Operator functions that remotely control 2 or more 300 kV or higher Transmission substations or switching stations.

SDT Comments

- Lead in sentence. Is the cart is before the horse-- the 1.1 piece. Say something about BES systems first.
- The Sub-Team removed all reference to systems. Now referred to "facility elements" from the NERC glossary.
- Referring to generator rating standards? MOD 24 and 25? No more "opt out" – rationale is reference to MOD 24 and 25, engineering studies already authorized. No good reason to have "authorized engineering study"
- Where do we address 2000 number? Went through event analysis category- Category 3. Talked solely about generation and supply.
- 1.1."Nameplate generation rating"- use something we already have- "current rated net demonstrated capability.
- 1.2- time limit-
- How do we link this to defining the BES functions? Where is the correlation? BES functions called out in R1- initial scoping. This is R2 piece that links- then you go through this criteria.
- Are all functions equally weighted? No weighting, just a scoping.
- The Sub-Team tried to take out anything that isn't essential to reliability.

- Operations manager of reliability center- "immediately affect real time operation" - will this place everything low?
- "Facilities"- h/m/l baskets. 3rd basket is things that are not facilities? Have to first determine what "facilities you have."
- BES is a defined term. Says that regions will define. "Generally operated ….."
- Defined by the IRO- have to go by this.
- What is the connection between Attachment 1 and 2? Functions then rating. Need to make this clearer.

1.5 Must run units.
1.6 Blackstart Capability plan.

SDT Comments

- Regional blackstart- includes distribution- used as a stabilizing load during restoration-- include in a guidance document.
- Does this bring into High lots of things not having to deal with transmission?
- Distribution SKADA systems? All? Some?
- This should be a "parking lot" issue.

1.7 "Transmission facilities"- 3 or more connected to station. Add back in.

SDT Comments

- Is 300 KV too low? This came from another document. Few if any industry comments about voltage level. People haven't thought through the impacts on the industry.
- Didn't focus on voltage. Commented on 3 lines being too low. More understanding 300 for a high? This will bring in a lot of locations and equipment.
- Optics- raise to 500 KV portions of interconnection that don't have any. Keep voltage level but adjust the number of lines.
- Consider throughput megawatt? Original draft- inappropriate measure for transmission? Use voltage.

1.8 Number of comments- clarified by referring to EOP -5
1.9 IROLs reference. Decided to stick only with IROLs.
1.10 Rewording of what it was before.

SDT Comments

- Linkage with 1.1? 1.8 is more far reaching than 1.1. 2000 MVA is too low. 2000 MVA may be good at the medium level?

1.11 "Essential to meeting"= (verify this wording)
1.12 Transmission facilities.

SDT Comments

- Without engineering analysis can you do this?
- Link to IRL- reference and work on wording.

1.13 Protection systems- now high- lot of discussion

- Comes from other standard

SDT Comments

- Part of 1.5? Every 300 KV has a protection system. Every 345 KV device that has protection device, 1.11 equivalent to 1.5.
- Inconsistencies related to actual impacts?
- SM: John Sykes- Systems Control committee- determining high impact systems. Standard isn't finished. Reference that when ready?
- Simplify and lump all together in terms of 300 KV?

1.14 Special Protection systems (SPS)

SDT Comments

- Use 1.3- language- "that have Wide Area reliability impacts."

SDT Comments

- Consider adding language: "If the BES operates at N-1 or higher, should field asset criteria indicate an inherently lower impact category than control centers.
- Aimed at T/G/CC- when have requirements that apply to G but not T. Met the criteria.

Medium

2. Medium Impact Rating (M)
   - 2.1. Generation Facilities, singularly or in combination, with aggregate higher of the most current and prior to most current rated net demonstrated capability (MOD-024 and MOD-025) of 1000 MVA or more not included in Section1 above.
   - 2.2. Generation Facilities that are pre-designated as Reliability "must run" assigned units that have local area reliability impacts.
   - 2.3. Transmission Facilities operated at 200 kV or higher in the Eastern and Western Interconnections, or 100 kV or higher in other Interconnections, not included in Section 1. (include 3 transmission lines)
   - 2.4. Transmission Facilities that if destroyed, degraded or otherwise rendered unavailable, would result in the loss of generation Facilities, singularly or in combination, with aggregate rated Net Demonstrated Capability (MOD-024-1) of 1,000 MVA (?? TOO LOW ??) or more, not included in Section 1.
   - 2.5. Protection Systems for BES Facilities operating at 200 kV and above in the Eastern and Western Interconnections, not included in Section 1, or operating at 100 kV and above in other Interconnections, not included in Section 1.
   - 2.6. Primary Control Centers and any backup Control Centers Transmission Operator functions that remotely control 2 or more 200 kV or higher Transmission substations or switching stations not included in Section 1. (generation control centers ??)

SDT Comments

- Write cyber security requirements apply to H/M/L – is there enough to make a difference in cyber security controls? "Decimal dust" difference.
- Is there a difference between moderate and low? If you draw line at moderate or at high?
- SDT members should go back home, next week a count of facilities that would meet the current criteria. How many are we talking about any of these buckets?
- Control generation? 2.6- generation control center?
- 2.6 would catch all transmission owners? Anything above 200 KV.
- Captures registration errors?
- Definition of BES Cyber Control System? Whether we do cyber system alone. Cyber system definition- to separate from BES cyber system.
- Always refer to BES cyber system.

3. Low Impact Rating (L)
   All other BES Cyber Systems on the list not mapped to Section 1 High BES Impact or Section 2 Medium BES Impact.

SDT Comments

- BES subsystems should be BES cyber systems

III. SECURITY CONTROLS REQUIREMENTS (CIP 003-009) REVIEW

A. Initial Sub-Team Progress Reports

On Wednesday the Sub-teams presented brief status reports before breaking into sub-team meetings. The chair and vice chair suggested the sub-teams should initially focus on setting the "low" for purposes of controls. Need to set a common agreement on where the low water mark is – wrestle with high and medium later.

SDT Discussion

- Do we have the buckets of lists for consideration?
- Support the idea of starting with the lows. This could be a good process and help sub-teams understand what they are addressing.
- Need to bring different perspectives to the task of identifying and establishing a common low water mark

- **Governance Sub-team.** Jon Stanford noted that the Governance Sub-team has nothing new to report but that they do have the list to review for consideration of the low water marks.

- **Access Control & Audits Sub-team**. Sharon Edwards reported on the Access Control & Audits Sub-team noting they have identified CIP requirements we are looking at as compared to DHS – some of the latter did not have a corresponding CIP requirement. They have also constructed template from individual worksheets including constructing requirement language to address missing DHS items. They have not yet distinguished h-m-l and did not yet review FERC order to be sure issues addressed. She suggested a need to coordinate some of the DHS items with the work of the other sub teams. They also added a column not in the template for all the groups – "CIP version 3 language."

- **Recovery and Response Sub-team** – Scott Rosenberger noted they had not made a complete review of DHS.

- **Personnel and Physical Security**
- Doug – have a spreadsheet and prepared down through h-m-l and initial pass through CIP, review as group today before cut and paste into the template

- **Change Management, System Lifecycle and Information Management.** Phil Huff noted they had gone through CIP language and added DHS security controls where appropriate and they determined initial applicability. They will be making an initial h-m-l determination for the controls. Putting in objectives now in at the time of writing the requirement may help in interpreting the intent later.

- **Operations Security.** Jay Cribb reported his sub-team had taken one stab at objectives but not h/m/l.

The facilitators noted the teams are at different levels of development – may want to test with those teams that are ready.

B. Sub-Team Reports on March 11, 2010

Personnel and Physical Security	CIP-004 – R1, R2, R3, CIP-006 R1 through R6 DHS 2.3 Personnel Security, DHS 2.11 Security Awareness and Training DHS 2.4 Physical and Environmental Security,	Doug Johnson(Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin

The Sub-Team report was delivered by Doug Johnson.

Personnel
Awareness programs

- Policy? Expecting the Governance group to address.
- "establish, document, implement and maintain"? continue to use this with other Team? CIP Version 3- not removing it.
- "Information protection program," develop an incidence response procedures? As long as you can test it and demonstrate it works.
- Looking at a low level. If you have BES cyber systems, you will have an awareness program.
- Inter-connective of operations control – 706

Training

- "at a minimum" vs. "appropriate to personnel roles and responsibilities"

Personnel Risk Assessment

- 706 guidance- special circumstance that allow an exception to requirement for training prior to allowing access.
- Program has to specify the exceptional circumstance-
- Anyone with access to BES cyber system. Is that everyone down to the low levels?
- Any baseline opinion- Lows? Electronic or physical.
- Degrees?- cleaning crew.
- Lows?
- If you have physical access to a low impact BES cyber system, do you have to have a personnel risk assessment?
- If there is a requirement for physical access, have to have controls in place.
- Need to be tracking to have an issue.
- We should be thinking about this in terms of risk. Authorized users, maintainers of BES cyber systems. 2 communities here. Opportunity to split and get to risk.

- Interpretation- acceptable alternatives are…… E.g. social security number for verify identity.
- Identification issued by federal, state or provincial agencies.
- Don't worry about the methodology- worry about the right people and provide the level of granularity.
- NERC Interpretation- identify verification, risk assessment. Try to make clear. E.g. Janitor in control room-

Physical

- Physical Security Perimeter- revise current Glossary definition.
- New definition proposed. Limit it to being just a "border" and control access to border. You will have to define where it is and later what's in there.
- Only if you have a defined physical security perimeter.
- "All equipment comprising a BES cyber system shall reside within a defined PSP."

SDT Comments

- "within one or more PSPs?"
- That is better. Tweak to deal with the Hoover dam issue.
- E.g. a "laser field"-
- Leave the definition at a higher level.

Physical Security Plan

- Senior manager approval in new version?

SDT Comments

- 706 requires this.
- "Authorization" = standard language? Current doesn't say who authorized or designated.
- Addressing cross references- highlighting to coming back to. Flagging for now.
- In governance- senior management- remove subordinate references to SM? Talk about what they need to do not how. Let the program set that out.

Physical Access Control

- Controls- this will go off to a guidance document.

Monitoring Physical Access

- Blue will be the "how". Saying you will have it. Go to guidance document for the how.

Logging

- Same

Visitor Control Program

- Same.

Maintenance and Testing

- Need to get with Sub-team defining the perimeters to determine physical control. Keep that in this?
- Don't put in standards in terms of how to protect.

Protection of Electronic Access Control Systems

- Should move these out of standard.
- Are these part of the BES cyber system itself? Protect the system performing the functions.
- The Team needs more discussion- what is a BES cyber system, how to draw the line around these?

SDT Comments

- SM: 706 review? Partial. More discussion.
- Training the trainers- quality and consistency among them. Part of directive.
- Web based training- no instructors.

Recovery and Response	CIP-008 R1 & R2 CIP-009 R1 through R5 Incidence Response and Contingency Planning	Scott Rosenberger (Lead), Joe Doetzl,

Scott Rosenberger reported on the Sub-team's progress noting they made it through DHS requirements.

Response

- Draft 5 requirements: incidence response you do partially in high and low.
- All will have a plan. Identify actions; roles and responsibilities, reporting, reviewing your plan annually.
- R2: additional for high impacts- review plans based on changes. Communicating updates; Testing response plans annually.

SDT Comments

- Does this requirement apply to all cyber systems?
- This only applies to high. The plans dealing with high impact- add language: "for their high impact basis"

- CIP 008 Cyber Security Incidence- still to figure out.
- CIP 008- R3- document retention- all
- CIP 008 R4 (high) and R5 (low)

SDT Comments

- Annual= once every 12 months?
- BES Cyber assets? Not a new term. BES Cyber Systems-
- In Personnel training requirement- address once every 12 months.

Recovery Plans CIP 009

- If low don't have to have a recovery plan. Only applies to high.
- R2 Recovery Plan Training
- R3 Recover Plan Testing.

SDT Comments

- Place this into table/format with changes? Yes.
- Worked with Scott/Howard re formatting.

- Important to see whole standard together. Everyone had changes.
- Valuable effort- to see how this will sort out. E.g. 1 section for every one. Then some for high, low.
- Didn't see a control- Security of the back up configuration? Current standards- not part of system. Could store elsewhere unprotected? Is this a potential attack vector? 1.3 of CIP 009- back up storage and protection will address.
- Requirement to restore whole system and make sure it still functions (no corruption, passwords, etc.). Restore to as it was.
- Need to think through whether you want the same VRF for everything in requirement. Put in 1 requirement. If you want VRF differentiated, you will need to split the requirement out. E.g. if you have high, these things need to added to you apply.
- Where do you store backups?- Falls in information protection.
- Connectivity concept? Didn't include at all. Where to add? Whether connected or not still need to be restored.

DHS New Requirements

- Control centers- back ups- alternative locations. Didn't seem to apply to generation, transmission.

Access Control and Auditing	CIP-003 R5; CIP-005 R2; CIP-007 R5; CIP 004 R4 DHS 2.15 Access Control DHS 2.16 Audit and Accountability	Sharon Edwards (Lead), Jeff Hoffman, Frank Kim *Observer Participants: Sam Merrell*

Sharon Edwards reported on the Sub-team's work as follows:

Update

- Created the proposed requirements for all assigned CIP requirements that have a corresponding DHS control
- Reviewed the proposed requirements corresponding to CIP and identified which controls should apply at the H, M & L for (C, G. T)
- Created proposed requirements (where applicable) for additional DHS controls which do not have a corresponding CIP requirement
- We have not yet reviewed those to determine if they should apply at the high, medium or low level

Future Tasks

- Group will attempt to gather all the account management requirements currently found throughout CIP 005, CIP 007 and CIP 004 into one place
- Ensure the following are done for each assigned proposed requirement:
  - Identify FERC Order 706 paragraphs & how they are resolved
  - Ensure Objective has been documented
  - Ensure CIP changes have been documented

- Group has decided to determine applicable password thresholds utilizing the NIST password tables and determine what the High, Medium, and Low targets should be – Frank
- Review for impacts of Connectivity on the proposed requirements – Team assignment

Points of Coordination

- Coordinate with Ops Security re. log monitoring and log monitoring for failed log ins based on passwords. – Sharon

SDT Questions and Comments

- Access to Information- Talked to Phil Huff's team- they handle access to information.

Account Management

- High levels- applies at high and medium levels. May be time parameters may change at medium levels. E.g. revocation of access within 6 months., Not a compliance area.
- All will apply at the high, much applies at medium with time parameters relaxed, majority will not apply at the
- Revoke "remote" requirements? 2.15.3- R4- Doesn't meet requirements of 706- revoke 'immediately'? 24 hours too long? Especially for highs.
- High and low- look at total list of being low before making a determination on this?
- Similar issues with physical access and "immediate"- are we free to challenge FERC's order if we can justify rationale. DHS controls don't require immediate revocation.
- Timeframes should be consistent with the level of risk. Removing access? Do you need 6 months to do that?
- Keep in mind FERC directives are focused on the Version 1 standards. Directed to revise standards. Timeframes should be commensurate with risk through H/M/L. If speak to "immediate" we probably mean high.
- 6 months seems excessive.

Remote Access

- Controls apply across the board (215.24) pp 5.
- Pp 12- Passwords discussion- Frank's proposal- look at NIST material for password complexity and develop targets for h/m/l.

SDT Comments

- In Florida- interpretation of that requirement is that hardware enforces the password level.
- This is not in standards. Every requirement comes down to policy. NERC will need to address in the regions.
- Ask for unique (user name) identification and authentication? Remote access for high systems- low was just authentication.
- Use table- require a certain level of entropy etc.

- Caution the SDT in general against proposing a technology solution for high impact. Consider procedural mechanisms that may be stronger.
- New requirements pp 14- have no CIP corresponding requirement, e.g. authenticating management in DHS; mobile devices; wireless access in DHS; and time stamps for each group.

Change Management, System Lifecycle and Information Management	CIP-003 R6; CIP-007 R1, R7 CIP-003 R4; CIP-005 R5.1.1, R5.1.3 DHS 2.5 System and Services Acquisition, DHS 2.6 Configuration Management and System Lifecycle, DHS 2.10 System Development and Maintenance DHS 2.9 Information and Document Management, DHS 2.13 Media Protection	Keith Stouffer, Dave Revill, Phil Huff (Lead) *Observer Participants: John Fridye*

Phil Huff reported on the Sub-Team's work reviewing the Change Management requirements worksheet. He noted that the Sub-team's work focused on the language itself, not on applicability. They still have to go through FERC order review. The have modified table/worksheet to track open issues/complications. They now have drafted most of the objectives and changes to CIP language.

Baseline Configuration
- Baseline of how configured for change control, for incidents and unauthorized

Configuration control
- Includes CIP 003 and testing

Access restrictions for configuration changes.
- Beyond access control. From DHS.
- Access control sub team may be sufficient.

Configuration assets-
- Configuration management plan- into policies and procedures.

SDT Comments
- Looked at the NISTER document? Yes, looked at NRC documents as well.

Information Protection
- CIP 003- section causing problems. Don't apply full protection program. Small subset of security controls applied to information. Chose to go that way again.
- Don't have confidentiality. Controls within requirements they are developing. Just protect your information. A bit vague, but lived with it so far and FERC hasn't commented.

Protection Program.
- Handling a new DHS procedures.

- Confidentiality agreements among entities.
- Assessment of program.

SDT Comments

- Confidential agreement protections- probably can't require. FERC doesn't have jurisdiction to require.
- Requirement can obligate the registered entity to put in place. Can't hold other side for compliance. That would be a contract relationship with a 3rd party.
- Good e.g. in other controls relating to Federal model. E.g. Inter-connected security agreement. Caution to the SDT not to bring in additional requirements grounded in federal model. Need to be sensitive to this and keep it "nice and Cippy."

Maintenance

- Periodic system maintenance- will combine with configuration management controls.
- Maintenance tools- prevent malware- detox without applying CIP controls to it.
- Maintenance personnel- authorized to perform maintenance on the cyber system (not cleaning crew).
- Remote maintenance- security controls above remote access- vendors or others performing some form of system maintenance.

SDT Comments

- Controls for when vendors log in for maintenance? Logging into sub system from main office is "remotely"
- Clarify with Sub-team on access control related to system maintenance? These are on top of control access requirements? Point of coordination.
- Remote maintenance- focus on who has access. Should be in the operations security group.

Media protection CIP 7 R7-

- Could have removable media (e.g. USB thumb drive to configure control systems). Make sure physically stored and transported securely. Disposal and secure for reuse.
- Define "media"? Field personnel to maintain accountability in terms of transportation of piece of equipment to a secure location and be wiped? Difficult to talk about security of data.
- Order 706- ability to erase media- this in direct odds with NIST- look at that.
- Make sure what is in equipment is no longer available when disposing equipment.
- E.g. Send Switzer back as it was in the failed state. Can't trouble shoot without being the same. They then send back a new one.
- Introduction of stuff into system. When take out, must do various things depending on the state laws. Stay away from info itself. Focus on info pertinent to our security. Don't worry about all information.
- Disposal- sending back to mfg.- data we want to remove vs. all other settings.
- Editorial- don't introduce programmatic requirement on entities as they apply to BES cyber system.

Operations Security	CIP-005 R1, R3 CIP-007 R2, R3, R4, R6 DHS 2.8 System and Communication Protection DHS 2.14 System and Information Integrity	Jay Cribb (Lead), Jim Brenton, Jackie Collette, John Varnell

Jay Cribb reported on this group's effort including new BES cyber system component definition.

SDT Comment

- Discount unmanaged switches devices. Yes if a switch vs. a hub.

Boundary Protection/ESP

- New concept- problem with ESP- no such thing exists. Perimeter and access points.
- Only real things are the access point.
- Call "controlled boundary access points."
- ESP goes away.
- 1st Requirement
- Define boundary access points.

SDT Comments

- Boundaries between all BES cyber systems"? "Between each cyber systems and other systems"
- "Shared with other systems"? e.g. virtualized server environment.
- Around network switches- BES cyber system can't be existing in the same boundary as another cyber system. Substation e.g. Clarify this. Between BES cyber systems and non BES cyber systems.
- Trying to deal with this issue. ESP had bad traits for operations people. Flexible enough to be able to describe things as an entire system and looking at the boundaries between this. Addresses 706 order- more than perimeter- they talked about defense in depth. Boundaries not just a perimeter.
- Nice requirement. Simplified too much?
- First Requirements duplicates what is below. After shall: then all sub bullets and 2nd Requirement on boundaries.
- In/out is problematic word, however the intent is good.
- System definition will include the concept of a boundary. Don't want to have industry create boundaries don't exist.
- Applies to physical? Came from CIP 005- electronic boundaries.
- What does this mean in the physical sense?
- Clarify difference between ESP and boundary. Something to describe difference especially for industry that has spent resources identifying ESP.
- Need more "guidance" on what we mean by boundary.
- Will entity be free to describe how big or small that will be?
- "Boundary" may be viewed as a generic use of the term.

- Challenge trying to define a boundary (logically or physically). DHS says define the "external boundaries"- maybe that is enough.
- Cause confusion unless it clearly defines these terms. E.g. "shared component". Is boundary a filtering device?
- Clarify physical vs. electronic.
- Sub-Team tried to cover things at both the micro and macro levels.
- Change or rename the definition? Make sure boundary doesn't become a synonym for perimeter. "Access control points" is the focus.

Electronic Access Monitoring.
SDT Comment
- Manual process that logs and alerts unauthorized process? Consider taking out manual

Communications Integrity
- New under DHS catalogue and problematic.
- Clarify the objective
- Working connectivity into requirement.

SDT Comment
- CIP 004 Remote Access and CIP 007Account Management
- Some overlap regarding methods of authentification- Need to coordinate with Access Control group.
- Operation Security talks about where you need authentification. Access Control and Auditing sub-team will address how you do it?
- Mainly concerned with integrity of communication.
- Types of communication covered? "Wireless" good but some clarification of types.

Remote and Accessible Services (Port and Services)
- Objective
- R1
- R2 it is what it says today.

SDT Comment
- Strike technical since there might contractual.
- Document and implement compensating measures
- Issue of pre approval of compensating measures (TFE).

Flaw Remediation (i.e. DHS for Patch Management)
R1. Its what is there today with the terms re-named.
Malicious Software Prevention.
This requirements is a what. The "hows" are up to the entity. Will address in a guidance document.
Security Status Monitoring
R1- monitoring
R2- alerting (need applicability matrix here).
R3: Logging
R4 security event response

SDT Comments

- All events? All events related to cyber security.
- May not know until after.
- "Forensic"- may have legal implications. Maybe "post event analysis"
- Overlap with last one. Incident response team?

Security Governance	CIP-003 – R1, R2, R3; CIP-005 R4, CIP-007 R8 DHS 2.1 Security Policy, DHS 2.2 Organizational Security, DHS 2.7 Strategic Planning, DHS 2.17 Monitoring and Reviewing Control System Security Policy, DHS 2.18 Risk Management and Assessment, DHS 2.19 Security Program Management	Jon Stanford (Lead), Jerry Freese, Dave Norton

Jon Stanford reported on the Sub-Team's work reviewing the Requirements Worksheet. He noted that the right hand side includes the current CIP. He reviewed the opening checklist:

- Requirements are written at a high level. In general, seek to draft "what" and NOT "how", "specific" and NOT "prescriptive"
- Requirements have been developed using CIP-003-3 through CIP-009-3 as a starting point
- Applicable controls from the DHS Catalogue have been incorporated
- Changes from CIP-003-3 through CIP-009-3 have been documented
- Applicable directives from FERC Order 706 have been addressed

Security Policy and Procedures

- Overarching requirements- formal security policy(ies). Plural- One or more policies.
- a-d
- Capture DSH Management procedures and policies.
- XXX- subject area policies. Can place any policy language here.

Control System Security Plan

- One 1R with 3 subs: (a-c). Say what it is here. Go to security operations to get the details.
- 2R annually review each bes cyber system
- 3R- revise plan.

Security Plan Update

- Captured above

Control System Connections

- 1R: two parts.
- All connections authorized and documented.

Vulnerability Assessment and Awareness.

- 2 part Requirement.

SDT Comments on Governance

- Discreet requirements? Goal is a single policy. Is this a single requirement for a policy with bullets under requirements. Attachment providing elements?
- Each topical area could be listed by name or topic.
- Important thing: get senior management official managing the implementation requirements.
- Don't require only one policy and allow for internal program structure where it make sense.
- Eliminate overlap and duplication.
- No less than annually review your security plan for each cyber system? Didn't put update in.
- Security plan? Physical and electronic? No plan is for the BES cyber system.
- Look at your requirements- assume there are policies that say that will be done.
- Don't recreate policy statement.

IV. NEXT STEPS

The SDT reviewed the plans for the May 2010 Technical Workshop including Gerry Adamski's email. Gerry Adamski has offered to be the "general facilitator" for the workshop.

- How long? 1½ days. Move on location nailed and announcement to industry at large.
- Use the workshop- to have each sub-team- panel discussion 30-minute presentation. 30-45 minutes feed back.
- 12 hours of workshop time.
- Anticipate 500-1000 showing up to participate in the workshop.
- SDT team members show up. Planning day.
- Workshop objective is to get the SDT additional informal industry comment.

The Chair and Vice Chair noted that the Team had made a lot of progress over the course of the meeting. They reviewed the short term schedule for the Sub-teams. They will be meeting weekly as will the Sub-Team Leads to help coordinate the development of the drafts.
There is a lot of work to complete. Sub-teams may be scheduling additional working sessions and coordinating with Joe Bucierro. The SDT needs to enter its April meeting with a good draft
Sub-team should use Howard Gugel early and often.

The SDT requested that Friday sessions should clearly note if noon is the adjournment time so that members can make travel arrangements accordingly.

The Chair and Vice Chair and the SDT thanked Bill Winters for his excellent hosting and great facilities. Bill offered to host later in the year and will follow up with Joe Bucciero.

The meeting adjourned at 12:15 p.m.

Appendix # 1— Meeting Agenda

Project 2008-06 Cyber Security Order 706 SDT
Draft 20th Meeting Agenda
March 9, 2010, Tuesday- 1 PM to 5:30 PM MST
March 10, 2010 Wednesday- 8 AM to 5 PM MST
March 11, 2010 Thursday- 8 AM to 5 PM MST
March 12, 2010 Friday- 8 AM to 12 PM MST
Arizona Public Service CHQ
400 N. 5th St.
Phoenix, AZ 85004

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes

- Review the revised CSO 706 SDT 2010 Work plan and Convergence Schedule Proposal
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan and May 2010 Technical Workshop
- Review, discuss industry comments and identify issues raised to be addressed in revised CIP-002-4
- Review, refine and test consensus on a revised draft CIP 002-4 and Industry Response Document
- Receive progress reports for Security Controls Requirements Sub-Teams
- Develop and Test Sub-Team Security Controls Requirements
- Agree on next steps and assignments

Draft Agenda

Tuesday	**March 9, 2009**
1:00 p.m.	Welcome and Opening Remarks- *John Lim, Chair & Phil Huff, Vice Chair* Roll Call; NERC Antitrust Compliance Guidelines Facilitator review and SDT acceptance of February 16-19, 2010 Austin SDT meeting summary
1:10	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
1:15	Review and Discussion of CSO 706 SDT Workplan and Convergence Schedule - March-December, 2010- *Stu Langton*
1:45	Updates on other related cyber security initiatives- *NERC Staff and SDT Members*
1:55	Update on CIP Communication Plan and May 2010 Technical Workshop - *Carl Dombek*
2:15	Review of Revised CIP-002-4 Draft based on Industry and SDT Response to Industry Comments- *Draft CIP-002 Drafting Team, John Lim et al.*

3:00	*Break*
3:15	Continue review and discussion of revised draft CIP 002-4
5:25	Review of Proposal for Wednesday Agenda
5:30	*Recess*

- *Possible Security Controls Requirements Sub Team Meetings- Evening*
- *If needed, CIP-002 Drafting Team to meet to finalize draft and present for adoption Wednesday morning.*

Wednesday **March 10, 2010**

8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucierro*
8:10	Review and Consideration of draft CIP-002-4 as revised and the Industry Comments Response Document
9:00	Sub-team Progress Reports and SDT Discussion of Key and Any Overlapping Issues

- Security Governance
- Personnel and Physical Security
- Operations Security
- Recovery and Response
- Access Control and Auditing
- Change Management, System Lifecycle and Information Management

10:30	Break
11:00	Review of Guidance and Overall Format for Security Controls Requirements Sub-teams
10:45	Sub-team Progress Reports and SDT Discussion of Key Issues- *Continued*
11:45	Security Controls Sub-Teams
12:00	*Working Lunch*
1:00	Security Controls Sub-Teams
4:55	Review Assignments and Thursday Agenda
5:00	*Recess*

- *Possible Security Controls Requirements Sub Team Meetings- Evening*

Thursday **March 11, 2010**

8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucierro*
8:10	Security Controls Sub-Teams
10:00	Break
10:15	Security Controls Sub-Teams
12:00	*Working Lunch*
1:00	Sub-Team Reports and Full Team Consensus Testing on Refinements
3:00	Break
3:15	Sub-Team Reports and Full Team Consensus Testing on Refinements-*Continued*
4:45	Review Any Drafting Assignments and Friday Agenda
5:00	*Recess*

- *Possible Security Controls Requirements Sub Team Meetings- Evening*

Friday	**March 12, 2010**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucierro*
8:10	Sub-Team Reports and Full Team Consensus Testing on Refinements-*Continued*
10:15	*Break*
10:30	Sub-Teams Reconvene to Review Refinements, Schedule and Assignments
11:00	Next Steps CIP 002 Drafting Group
11:15	Review of May 2010 Technical Workshop Planning and Preparation
11:45	Review and Agree on Next Steps and Meeting Evaluation
12:00	*Adjourn & Lunch*

Appendix # 2 Attendees List
March 9-12, 2010, Phoenix, Arizona

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation (Thurs)
2. Jay S. Cribb	Information Security Analyst, Southern Company Services
3. Jackie Collett	Manitoba Hydro (Wed/Thurs)
4. Sharon Edwards	Duke Energy
5. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
6. Gerald S. Freese	Director, Enterprise Info. Security America Electric Pwr.
7. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation *(March 10-12)*
8. Doug Johnson	Exelon Corporation – Commonwealth Edison
9. Frank Kim	Hydro One Networks Inc.
10. Rich Kinas	Orlando Utilities Commission
11. Patricio Leon	Southern California Edison
12. John Lim, Chair	CISSP, Department Manager, Consolidated Edison Co. NY
13. David Norton	Entergy *(March 9)*
14. David S. Revill	Georgia Transmission Corporation
15. Scott Rosenberger	Luminant Energy
16. Kevin Sherlin	Sacramento Municipal Utility District
17. Jonathan Stanford	Bonneville Power Administration
18.Keith Stouffer	National Institute of Standards & Technology
19. William Winters	Arizona Public Service, Inc.
Roger Lampilla	NERC
Scott Mix	NERC
Howard Gugel	NERC
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Hal Beardal	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center

SDT Members Attending via ReadyTalk and Phone

21. Jim Brenton	ERCOT
22. John D. Varnell	Technology Director, Tenaska Power Services Co.

SDT Members Not Participating

Joe Doetzl	Manager, Information Security, Kansas City Pwr. & Light Co

Others Attending in Person

John Van Boxtel	WECC
Brian Newell	AEP
Clyde Poole	TDITX
Sam Merrell	CERT

Others Attending via WebEx and Phone

Andres	Lopez	andres.lopez@usace.army.com
Rod	Hardiman	rchardim@southernco.com
John	Fridye	jfridye@rrienergy.com
Keith	Walters	step@eei.org
James	Bassett	james.bassett@invensys.com
Steve	Newman	srnewman@midamerican.com
John	Van Boxtel	jvanboxtel@wecc.biz
Maggy	Powell	margaret.powell@constellation.com
Bill	Keagle	william.a.keagle.jr@constellation.com
Steve	Newman	srnewman@midamerican.com
Bryn	Wilson	wilsonwb@oge.com
Ray	Andrews	randrews@involta.com
Sam	Merrell	smerrell@cert.org
andres	lopez	andres.lopez@usace.army.mil
William	Keagle	william.a.keagle.jr@constellation.com
Bill	Glynn	bill.glynn@westarenergy.com
John	Allen	john.allen@cityutilities.net
Annette	Johnston	ajjohnston@midamerican.com

Appendix # 3 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that
violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect
NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost
- information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Subroups) may have a negative impact on particular entities and thus in that sense adversely
impact competition. Decisions and actions by NERC (including its committees and Subroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on
- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.

- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

APPENDIX # 4
CSO 706 SDT MEETING SCHEDULE
JANUARY –DECEMBER 2010

Schedule Convergence: Full CIP V4 Package		
Date	**Week of**	**CIP Task**
SDT Meeting-Atlanta, (4/13-16)	4/12/2010	**Present Controls draft for full team review and comment. Sub team drafting. Finalize draft for Informal Comment, Full Package**
	4/19/2010	**NERC Prepares Full Package for Industry Comment**
	4/26/2010	**SDT Reviews and Approved Full Package for 30-day Industry Comment Period**
5/3/2010	5/3/2010	***Informal Comment Posting for full package starts Completes on 6/2/2010***
SDT Meeting-Dallas, (5/11-14)	5/10/2010	**Prepare for Industry Workshop**
5/19 & 5/20/2010	5/17/2010	**1.5-day Industry Technical Workshop (Dallas, TX)**
	5/24/2010	**SDT Considers Comments from Workshop**
6/4/2010	*5/31/2010*	***2nd Informal comment period ends***
6/2/2010		***Comment Period Ends***
6/3-6/4/2010		***SDT Summarizes Comments Received***
SDT Meeting, Sacramento (6/8-11)	6/7/2010	**SDT Meeting: Comment review, response process, re-drafting, as needed**
	6/14/2010	Sub team meetings
	6/21/2010	Sub team meetings
6/29/2010	6/28/2010	Sub team meetings. SDT interim online meeting.
	7/5/2010	Subteams Package modifications into Standard documents
SDT Meeting, Pittsburgh, (7/13-16)	7/12/2010	**Finalize & Approve Documents for posting for 45 day formal comment period**

Schedule Convergence: Full CIP V4 Package		
Date	**Week of**	**CIP Task**
	7/19/2010	***NERC Prepares Materials/SDT Approves Revisions/NERC Seeks SC Approval for Ballot***
7/26/2010	7/26/2010	***45 Day formal comment period starts (completes 9/8/10) /Ballot Pool formation (completes 8/25/10)***
	8/2/2010	**Industry Comments on Standards**
SDT Meeting, TBD, (8/10-13)	8/9/2010	**SDT Meeting: Prepare for Industry Webinar**
8/18/10	*8/16/2010*	***Hold Industry Webinar***
8/25/2010	8/23/2010	***30 Ballot Preview/Initial Comment Preview ends/Ballot Pool formed***
8/30/2010	*8/30/2010*	***Initial Ballot Starts***
SDT Meeting Winnipeg, (9/7-10)	9/6/2010	**Respond to comments received. Drafting revisions. Review Ballot Results and Additional Comments**
	9/8/2010	**Initial Ballot Ends**
	9/13/2010	Sub team meetings
9/24/10	9/20/2010	Sub team meetings; Full SDT on-line meeting to adopt revised draft of documents
	9/27/2010	NERC Staff Review of Documents and SDT Approval for Re-ballot
10/4 to 10/13/10	10/4/2010	Re-Ballot Period Begins
SDT Meeting TBD, (10/12-15)	10/11/2010	**Prepare responses to 2nd ballot comments**
10/19/2010	*10/18/2010*	***Sub-teams meet to adjust requirements***
10/29/2010	10/25/2010	***Prepare & Finalize revisions to standards and responses to comments on standards***
	11/1/2010	NERC Staff Review of Documents and SDT Approval for Re-ballot
11/8 to 11/17/2010	11/8/2010	3rd Ballot Period Begins

Schedule Convergence: Full CIP V4 Package		
Date	**Week of**	**CIP Task**
SDT Meeting TBD, (11/16-19)	11/15/2010	**Prepare responses to 3rd Ballot comments**
	11/22/2010	*NERC & SDT finalize responses to ballot package*
	11/29/2010	*Seek SC & BOT Approval for Filing*
	12/6/2010	*Seek SC & BOT Approval for Filing*
SDT Meeting TBD, (12/13-17)	12/13/2010	**SDT Meeting to review Filing and Celebrate Project Completion**
	12/24/2010	*Submit for Regulatory Approval*

Security Controls Sub-Team Principles and Drafting Guidance

CSO 706 SDT SECURITY CONTROLS SUB-TEAM DRAFTING PRINCIPLES

(ADOPTED BY CSO 706 SDT, JANUARY, 2010)

1. Applicability [NERC ROP] Each reliability standard shall clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted.	**9.Practicality** [NERC ROP] – Each reliability standard shall establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.
2.Reliabiliy Objective [NERC ROP] Each reliability standard shall have a clear statement of purpose that shall describe how the standard contributes to the reliability of the bulk power system.	**10. Consistent Terminology** [NERC ROP] To the extent possible, reliability standards shall use a set of standard terms and definitions that are approved through the NERC reliability standards development process.
3.Performance Requirement or Outcome (NERC ROP) Each reliability standard shall state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest.	**11. Commensurate Controls for BES Impact Categories.** Security controls shall be commensurate with the identified level of BES impact categories.
4. Measurability (ROP) Each performance requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement.	**12. Change Documentation.** Changes from prior versions of CIP Standards have clear rationale. These include the following types of changes: a. Above and beyond the current standards; b. Removal of requirements; and c. Major formatting changes.
5.Technical Basis in Engineering and Operations [NERC ROP] Each reliability standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.	**13. Reduce Administrative Overhead**. Administrative documentation shall be kept to the minimum that is necessary
6. Completeness (NERC ROP) Reliability standards shall be complete and self-contained. The standards shall not depend on external information to determine the required level of performance.	**14. Priority.** Implementation plans for the Standards are prioritized according to level of BES impact.
7. Consequences for Non-Compliance [NERC ROP] In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, the consequences of violating a standard are clearly presented to the entities responsible for complying with the standards.	**15. Eliminate or Minimize TFEs.** Security controls shall eliminate or at least minimize the need for TFEs. Allow for compensating controls to mitigate the need for a TFE.
8. Clear Language [NERC ROP] – Each reliability standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.	

SECURITY CONTROLS SUB-TEAM
PROCESS AND DRAFTING GUIDANCE AND DELIVERABLES

Guidance from the January, 2010 Tucker Meeting and the February 2010 Austin Meeting

For the purpose of maintaining consistency across the teams and capturing interim decisions and change documentation, each team should utilize the following development process:

1. **DHS Catalogue of Controls:** Begin by identifying applicable controls that are enumerated in the *DHS Catalog of Control System Security Recommendations* for High Impact Cyber Systems.
2. **Cross Reference CIP Version 3 Requirements/sub-Requirements:** For each security control identified in step 1, cross reference the CIP version 3 Requirement/sub-Requirement or validate previous mapping work.
3. **Specific not Prescriptive:** As a general rule, be specific but not prescriptive in writing the requirements.
4. **"What" not "How":** In general, seek to draft a "what" requirements, not "how" requirements.
5. **Develop the requirement language** for each security control identified in step 1.
   a. When mapping to existing CIP requirements, use language from CIP, making improvements where needed.
   b. When no associated requirement from CIP exists, develop the new requirement using language from the *DHS Catalog.*
6. **Document significant changes to CIP Standards:** Document significant changes made to previous versions of the CIP Standards. Conceptual or broad changes can be captured by a single statement.
7. **Incorporate existing CIP requirements not mapped to the *DHS Catalog*.** If a requirement is no longer necessary because the intent was captured elsewhere, then include this in the change documentation.
8. **Address specific directives from FERC Order 706** that may be applicable to the requirement.
9. **Analysis and Determination of Requirements for Medium and Low Impact:** In the analysis and determination of applicability of requirements to Medium and Low Impact Cyber Systems, consider the cost in relation to the security benefits (i.e., a minimal cost requirement that significantly mitigates risk would apply to *ALL* Cyber Systems. Similarly, a significant cost requirement that minimally reduces risk or provides little additional security may apply only to *HIGH* impact Cyber Systems).
10. **Specify Applicability to Environments:** Specify applicability of a requirement to Generation, Transmission, and/or Control Center environments.
11. **Apply Requirements to BES Cyber System:** Requirements should apply to either:
    (a) The BES Cyber System as a whole, or
    (b) Components of the BES Cyber System. However, when a requirement only applies to specific types of components, Sub-Teams should describe those types of components to determine where component classes exist.

(c) Requirements specific to boundary protection or ESP can be written to the interface of the BES Cyber System.

12: **Level of Requirements:** Sub-Teams should generally write the requirements at a high enough level to avoid applicability of specific technology. Where there are applicable CIP requirements, start with the CIP words and tweak if needed to include some DHS language/concept. However, the "level" of the requirements text should be raised, if needed.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 SDT — Project 2008-06

April 13, 2010 |1 PM to 5:30 PM EDT
April 14, 2010 | 8 AM to 6:15 PM EDT
April 15, 2010 | 8 AM to 5 PM EDT
April 16, 2010 | 8 AM to 2 PM EDT

Georgia Power
241 Ralph McGill Blvd
Atlanta, GA 30308

NOTE: 1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Sub-Team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes

- Review the CSO 706 SDT 2010 Work plan and Schedule
- Review, refine and adopt the Draft Final CIP-002-4 for NERC Staff Review in advance of Industry Informal Comment posting on May 3.
- Review, refine and adopt the Sub-Team Security Controls Requirements draft for NERC Staff
- Review in advance of Industry Informal Comment posting on May 3.
- Develop Related Documents including Comment Form and Cover Letter for Informal Comment Posting.
- Agree on next steps and assignments

Draft Agenda

Tuesday April 13, 2009

1:00 p.m.	Welcome and Opening Remarks- *John Lim, Chair & Phil Huff, Vice Chair* Roll Call; NERC Antitrust Compliance Guidelines - *Joe Bucciero* Facilitator review and SDT acceptance of March 9-12, 2010 Phoenix SDT meeting summary
1:10	Review of Meeting Objectives, Agenda and Meeting Guidelines — *Bob Jones*
1:15	Review and Discussion of CSO 706 SDT Workplan and Schedule - April-December, 2010- *Stu Langton*
1:20	Overview of CIP-002-4 & Security Controls Requirements Refinements
1:30	Review of Revised CIP-002-4 Draft Final and SDT Industry Response Document- *CIP-002-4 Drafting Team - John Lim, et al.*

3:00	Break
3:15	Continue Review of Revised CIP-002-4
4:15	Full Team Consensus Testing on Refinements of CIP 002-4 Draft Final and SDT Industry Response Document
5:15	Review of Wednesday's Agenda
5:30	Recess

- *Possible Security Controls Requirements Sub Team Meetings- Evening*
- *If needed, CIP-002 Drafting Team to meet to finalize draft and present for adoption Wednesday morning.*

Wednesday April 14, 2010

8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucciero*
8:10	*(As Needed)* Review of Any Revisions and Adoption of CIP-002-4
9:00	Sub-Team Reports on Requirements Drafting and Any Overlaps
9:10	Security Governance Requirements
10:00	Break
10:15	Personnel and Physical Security Requirements and Guidance- Overview and Consensus Testing
11:00	Operations Security Requirements and Guidance - Overview and Consensus Testing
11:45	Recovery and Response Requirements- Overview and Consensus Testing
12:15	Working Lunch
12:45	Access Control and Auditing- Requirements- Overview and Consensus Testing
1:30	Change Management, System Lifecycle and Information Management- Requirements-Overview and Consensus Testing
2:15	*Security Controls Requirements Sub Team Meetings to Refine Documents for Thursday Review*
6:15	*Recess*

Thursday April 15, 2010

8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucciero*
8:10	Security Governance Requirements
9:15	Personnel and Physical Security Requirements and Guidance- Overview and Consensus Testing
10:15	Break
10:30	Operations Security Requirements and Guidance - Overview and Consensus Testing
11:30	Recovery and Response Requirements- Overview and Consensus Testing
12:15	Working Lunch
12:45	Access Control and Auditing- Requirements- Overview and Consensus Testing
1:45	Change Management, System Lifecycle and Information Management- Requirements- Overview and Consensus Testing

2:45	Review of Progress and Drafting Assignments
3:15	*Possible Sub-Team and Ad Hoc Drafting Groups* Cover Letter, Comment Form, Implementation Plan, VSLs/VFRs Drafting Meetings
4:55	Review Any Drafting Assignments and Friday Agenda
5:00	Recess

- *As needed sub-team and ad-hoc drafting groups- Evening*

Friday April 16, 2010

8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucciero*
8:10	Final Review of CIP Drafts for NERC Staff Review
10:15	*Break*
10:30	Final Review and Adoption of CIP Drafts for NERC Staff Review
12:15	Working Lunch
12:45	SDT Review of Document Preparation Schedule Proposed Sub-Team Lead meetings with NERC Staff April 21 & 26 SDT Teleconference Meeting week of April 29 to Review and Adopt Documents for Posting for Informal Industry Comment on May 3.
1:00	SDT Review of Plan to Draft CIP Guidance Documents on May Meeting
1:15	Review of Dallas SDT Agenda
1:25	May 2010 Technical Workshop Planning, Assignments, and Preparation, as needed
1:55	Agree on Next Steps and Meeting Evaluation
2:00	*Adjourn*

SCHEDULE CONVERGENCE: FULL CIP V4 PACKAGE		
Date	**Week of**	**CIP Task**
SDT Meeting- Atlanta, (4/13-16)	4/12/2010	**Present Controls draft for full team review and comment. Sub team drafting. Finalize draft for Informal Comment, Full Package**
	4/19/2010	**NERC Staff Prepares Full Package for Industry Comment**
4/21/2010	*4/19/2010*	*Proposed NERC Staff Meeting with SDT Sub-Team Leads- Mid-stream Review of Package Preparation*
4/26/2010	*4/26/2010*	*Proposed NERC Staff Meeting with SDT Sub-Team Leads- Final Review of Package Preparation*
4/29/2010	4/26/2010	**SDT Reviews and Approved Full Package for 30-day Industry Comment Period**
5/3/2010	5/3/2010	*Informal Comment Posting for full package starts Completes on 6/2/2010*
SDT Meeting- Dallas, (5/11-13)	5/10/2010	**Prepare for Industry Workshop- CIP Guidance Documents**
5/19 & 5/20/2010	5/17/2010	**1.5-day Industry Technical Workshop (Dallas, TX)**
	5/24/2010	**SDT Considers Comments from Workshop**
6/2/2010	*5/31/2010*	*2nd Informal comment period ends*
6/3-6/2010		*SDT Summarizes Comments Received*

SDT Meeting, Sacramento (6/8-11)	6/7/2010	**SDT Meeting: Comment review, response process, redrafting**
	6/14/2010	Sub team meetings
	6/21/2010	Sub team meetings
6/29/2010	6/28/2010	Sub team meetings. SDT interim online meeting.
	7/5/2010	Subteams Package modifications into Standard documents
SDT Meeting, Pittsburgh, (7/13-16)	7/12/2010	**Finalize & Approve Documents for posting for 45 day formal comment period**
	7/19/2010	*NERC Prepares Materials/SDT Approves Revisions/NERC Seeks SC Approval for Ballot*
7/26/2010	7/26/2010	*45 Day formal comment period starts (completes 9/8/10) /Ballot Pool formation (completes 8/25/10)*
	8/2/2010	**Industry Comments on Standards**
SDT Meeting, TBD, (8/10-13)	8/9/2010	**SDT Meeting: Prepare for Industry Webinar**
8/18/10	*8/16/2010*	*Hold Industry Webinar*
8/25/2010	8/23/2010	*30 Ballot Preview/Initial Comment Preview ends/Ballot Pool formed*
8/30/2010	*8/30/2010*	*Initial Ballot Starts*
SDT Meeting Winnipeg, (9/7-10)	9/6/2010	**Respond to comments received. Drafting revisions. Review Ballot Results and Additional Comments**
	9/8/2010	**Initial Ballot Ends**
	9/13/2010	Sub team meetings

9/24/10	9/20/2010	Sub team meetings; Full SDT on-line meeting to adopt revised draft of documents
	9/27/2010	NERC Staff Review of Documents and SDT Approval for Re-ballot
10/4 to 10/13/10	10/4/2010	Re-Ballot Period Begins
SDT Meeting TBD, (10/12-15)	10/11/2010	**Prepare responses to 2nd ballot comments**
10/19/2010	*10/18/2010*	*Sub-teams meet to adjust requirements*
10/29/2010	10/25/2010	*Prepare & Finalize revisions to standards and responses to comments on standards*
	11/1/2010	NERC Staff Review of Documents and SDT Approval for Re-ballot
11/8 to 11/17/2010	11/8/2010	3rd Ballot Period Begins
SDT Meeting TBD, (11/16-19)	11/15/2010	**Prepare responses to 3rd Ballot comments**
	11/22/2010	*NERC & SDT finalize responses to ballot package*
	11/29/2010	*Seek SC & BOT Approval for Filing*
	12/6/2010	*Seek SC & BOT Approval for Filing*
SDT Meeting TBD, (12/13-17)	12/13/2010	**SDT Meeting to review Filing and Celebrate Project Completion**

	12/24/2010	*Submit for Regulatory Approval*

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CSO706 SDT APRIL 13-16, 2010 MEETING
EXECUTIVE SUMMARY

On Tuesday afternoon, the Chair, John Lim welcomed the members to the SDT's 21st meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. The host Jay Cribb, a SDT member, welcomed everyone to the facilities and covered logistics. Bob Jones, facilitator, reviewed the proposed meeting agenda. On Friday morning the SDT approved without objection the meeting summary for the March 9-12, 2010 SDT session in Phoenix, Arizona. Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines.

Stu Langton presented a proposed CSO 706 SDT schedule which was circulated within a day of the meeting and made adjustments in the process to allow for NERC reviews and formatting of materials.

John Lim provided an overview of the revisions of CIP-002 Draft Final and SDT Industry Response Document since the Phoenix meeting. The SDT discussed the following topics:

- "Immediately affect real time operations."
- Interconnections.
- Attachment 2, Item 1.6- 3 or more transmission lines.
- VSLs
- Miscellaneous topics including functions, compliance issues,

The Chair noted that since the Phoenix meeting, much work has been done by the CIP 002 Sub-team responding to the input and suggestions received. The Team sent to NERC staff a preliminary draft for their input. However subsequent to submitting the drafts to NERC, the Sub-teams produced further refinements to their drafts. The Team agreed to review the NERC comments and consider them in relation to the current draft of CIP-010. Howard Gugel led the SDT discussion of the NERC staff comments on the earlier draft of CIP-002 as well as various proposed edits, such as using the term "requirements" throughout the documents, utilizing owner/operator vs. user, defining "immediate" and "situational awareness." The SDT reviewed all of CIP 002 requirements and Attachments #1 and #2 and took a number of polls on whether to accept the proposed NERC edits.

On Friday, John Lim reviewed CIP 002 Sub-team's redline version to address some of the issues raised earlier in the meeting and reviewed the proposed language on: Definition of BES Cyber System and the definition of "immediate"; High impact rating; and Transmission facilities.

On Wednesday, the SDT reviewed the work of the CIP 003-009 Sub-teams since the Phoenix meeting (including Change Management; Access Control and Auditing; Recovery and Response; Operations; and Personnel and Physical Security). The SDT

focused first on reviewing and refining the Security Governance requirements including the proposed 9 category areas.

Wednesday evening the Chair asked Howard Gugel to prepare a sample "proof of concept" for the access control requirements to inform a decision regarding format of the standards.

Thursday afternoon the SDT reviewed each of the sub-team's draft requirements as revised and refined in the sub-team meetings on Wednesday, offering guidance on various issues raised by the draft requirements.

The SDT reviewed and confirmed previous decisions to use tables in the new CIP standards and to formulate objective statements for each requirement. Sharon Edwards presented the work to date on access control including CIP-004 R4, CIP-005 R2, CIP-008 R5 and dispersed throughout the standard as a way to highlighting the presentation of different formats. Following this the SDT reviewed three format options:

- **Option 1.** Keep CIP-003 to-009 and work from there.
- **Option 2**: retire existing CIP standards and organize the new standards by the topics in sequence from CIP-010 on. (e,g,.,Access Control could be CIP-017).
- **Option 3:** One big standard document with 2 sections CIP-010 (formerly CIP-002) and CIP-011 (formerly CIP-003 to -009). All controls requirements would be together in one CIP standard, with CIP-011:
  - R1 (security policies) addressing all topics.
  - R2 implement per table
  - R3- table for access control
  - R4 implement 2nd table (account specifications)
  - etc.

The Team following the discussion of the pros/cons of the options, voted first on each of the three options indicating its acceptability. Following that each Team member voted to support the option they found most acceptable or preferable based on the discussion and their perspective.

Format Option 1: keep existing CIP 003 to 009 in its current form maintaining its existing logical construct (may involve minor movement of existing requirements between standards)

Yes	*No*	*Indifferent/could go either way*
8	**7**	**3**

Format Option 2: Retire 003 to 009, create new CIP 011-17 grouping according to small group assignments.

Yes	*No*	*Indifferent/could go either way*
12	**2**	**6**

Format Option 3: Collapse CIP 003-009 into a single standard that contains all requirements created/edits by the sub-teams and grouped according to sub-team assignments.

Yes	*No*	*Indifferent/could go either way*
12	**7**	**2**

The team then voted for one of the two highest ranked options under consideration:

- Option 2: Retire 003 to 009, create new CIP 011-17 grouping according to small group assignments.
  ***Yes*=6**
- Option 3 Collapse CIP 003-009 into a single standard that contains all requirements created/edits by sub-teams and grouped according to sub-team assignments.
  ***Yes*=10**
- *Abstained from voting for Option #2 or #3:* 4

At the end of Thursday, the Team took up the format issue again. The Vice Chair made a proposal that the Team use Option 2 (which would renumber the requirements using the topics to organize them).

The facilitators polled the team on their support for the **Option #2 (multiple standards) and 7 of 16 members** were in support of utilizing this as the format. An additional member joined and the Team then tested support for **Option 3 (putting all into single standard) and 9 of 17 supported using this format.** Neither format approach received sufficient support to make an SDT decision.

The Team then reviewed and tested support for each of the following propositions:

1. Change from existing CIP numbering system? Yes- 13 favor changing (of 17 = 76%)
2. Adopt the proposed headings for the requirements as the categories whether as one or multiple standards? Yes-13 (of 17 = 76%)

On Friday morning the SDT took up the final review of format options for the informal posting document(s) in order to make a decision.

The facilitator suggested the SDT use an acceptability ranking of the two possible format options that had been discussed and debated yesterday followed by clarification of concerns to see if they could be met and a requisite number of members could agree on the format to use for the informal posting.

- **Option #2 – Requirements in Multiple Standards.** Use the Topical areas discussed on Thursday and utilize multiple standards (example CIP 010 -020). CIP 002 also gets re-numbered.
  4**=3,** 3**=7,** 2**=6,** 1-**0** *(Avg. 2.81)*

- **Option #3 – Requirements all in One Standard.** Use the Topical areas discussed on Thursday, but one new standard is posted containing sections for all topics. 4=**6,** 3=**5,** 2=**3,** 1=**2** *(Avg. 2.93)*

The 17 SDT members present then voted for their preference for posting for informal comment between the two options with the following result:

- **Option #2** *(multiple standards)* **Yes= 6 (35%)**
- **Option #3** *(single standard)* **Yes= 11 (65%)**

The SDT agreed that while this decision to post for informal comment has a majority support (65%) but not the super majority (75%) of the members called for in the decision rules, the Team is asking for industry comment and input on the formats through the comment form before finalizing a format to present in the formal comment draft in July, 2010. The Team discussed that this approach is consistent with the spirit of the following consensus rule provision: "In instances where the Team finds that even 75% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team."

On Friday the Chair reviewed the schedule, assignments and next steps for the SDT to produce a final version for posting on May 3, 2010. Joe Bucciero will lead, with assistance from Howard Gugel, preparation of the draft of comment form with information provided by each of the Sub-team leads. A question will also be added based on the discussion on the format of the CIP Standards. The SDT will need to begin creating an implementation plan for posting in July for formal comment. A small group of SDT members needs to be formed to provide some framework for discussion at the May meeting (in Dallas) and to answer any questions at the May SDT Workshop in Dallas. Scott Mix will be looking for individuals to work with him to prepare the Implementation Plan, and this will occur after May 3. The SDT agreed that the cover letter for the informal May 3 posting of the draft CIP Standards should speak to the SDT's philosophy on implementing the plan. Jackie Collett, John Lim and Doug Johnson agreed to work with Scott Mix on developing a draft implementation plan.

The Chair reviewed and the SDT agreed on the schedule of activities from Monday, April 19, to posting of the draft CIP Standards on Monday, May 3. The Chair and Vice Chair and the SDT thanked Jay Cribb for his excellent hosting and Southern Company for the great facilities.

The meeting adjourned at 12:00 p.m.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CYBER SECURITY ORDER 706 SDT- PROJECT 2008-06
21ST MEETING SUMMARY

April 13-16, 2010
Atlanta, Georgia

I. AGENDA REVIEW AND WORKPLAN

A. Agenda Review

On Tuesday afternoon, the Chair, John Lim welcomed the members to the SDT's 21st meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See Appendix #2*). The host Jay Cribb, a SDT member, welcomed everyone to the facilities and covered logistics. The Chair reviewed the following meeting objectives:

- Review the revised CSO 706 SDT 2010 Work plan and Schedule
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan and the May 2010 Technical Workshop
- Review, refine and adopt the Draft Final CIP-002-4 for industry informal comment
- Review, refine and adopt the Sub-Team Security Control Requirements draft for industry informal comment
- Develop related CIP 002 and Security Controls Requirements Guidance Documents
- Agree on next steps and assignments

Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). On Friday morning the SDT approved without objection the meeting summary for the March 9-12, 2010 SDT session in Phoenix, Arizona.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

B. Workplan Schedule Review

Stu Langton presented a proposed CSO 706 SDT schedule which was circulated within a day of the meeting and made adjustments in the process to allow for NERC reviews and formatting of materials. Joe Bucciero suggested the SDT might want to review this overnight and take up first thing on Wednesday morning.

II. CIP 002 REQUIREMENTS

A. Overview of CIP-002 Requirements

John Lim provided an overview of the revisions of CIP-010 Draft Final and SDT Industry Response Document since the Phoenix meeting, noting the following:

- R1 changes: "Uniquely" changed to the adverb "discretely,"
- Member comments and suggestions included: take the adjective out. Consider "discretely" "distinctly" May not need this word. The call is document all; this may be "lawyer bait."
- R2- "appropriately: added.
- Attachment 2. Used terms defined in the glossary. Didn't change thresholds. 1.2- struck generation. Threshold too high. 1.6- before had separate criteria for protective systems. And protected at 350 or higher without any qualifications. Covered all substations at 350 KV. Not intended. Merged with 1.11 with 1.6.
- Medium: thresholds lower than before. Protection systems with 3 or more lines. Rest fall into the medium.
- Member comments: 2.5- no fax systems- everyone is high? This is an oversight.
- Low Impact: added to be consistent with high and medium.

SDT Comments on Overview

"Immediately affect real time operations."

- Short range planning impact issue? Other situational awareness but not in the "immediately affect real time operations" language? Does it include next day planning?
- John Lim noted that they didn't have a consensus in the group on this.
- "Immediately"- what does this mean? Week, day, now? Are they needed.
- Maybe we should distinguish from planning and real time operation.
- Since you refer to operations planning in part 1. In part 2 need to apply to operations planning.
- Look at beginning of Attachment #1 language.
- Attachment 2- 1.1- "facilities – why combine generation facilities?
- BES cyber system is subject which covers shared cyber system.

Interconnections.

- Texas- lower requirement for ERCOT? Why a separate requirement for ERCOT? Different size in terms of megawatt capability and mode.
- Why have spinning reserve requirements higher in ERCOT?
- This focuses on the Texas and Quebec interconnections.

- Did SDT December posting allowed for regional variation? Not by regional variations but by interconnection variations. Numbers come from category 3 events.
- Definition of control center? Lower threshold will bring in more things. E.g. 1.7 medium- primary and backup control centers? Are these defined? How are they distinguished from control centers? Shouldn't assume everyone understands these terms.
- Work is being done on a NERC back up facilities standard. Went through initial ballot but didn't get support on that proposal.

1.6- 3 or more transmission lines.

- 1.6- what was technical basis behind 3 lines?
- 1.6- 3 or more transmission lines? Individual connectors? What about DC circuit with 2 lines on the tower? One transmission line or referred to as conductors or phases.
- In the context of transmission planning studies, 2 or more would be ridiculous. 3 or more is a good place to draw a line.
- We have redundant subsystems. 3 line threshold may be too low some companies.
