- 5 transmission lines would be hard to justify for a national standard. 300 kv above and higher.
- Multiple entities have asked for the technical basis for this. Need to respond if we leave it at 3.
- "Or that remotely control a BES asset with a high impact rating" Asset= facility? Hardware?

VSLs

- VSLs measure R1 in terms of how many you miss. Assumes auditors know the right total. How will this be computed. This is defined by the entity. These are squishy number to begin with.
- Auditors won't use this. This is not looked at part of the audit itself. Use only when there is an alleged violation. After a potential violation an investigation is conducted to confirm a violation and the circumstances associated with a violation. Then someone comes to do analysis what the count should have been.
- Every requirement must have a VSL or FERC won't accept.
- We can make this a number vs. a %. 1, 2 or 3. Have not been identified more than 3 high.
- Previous VSLs had numbers. Some entities have suggested 5 could be a small number.
- Don't see the difference between 1 and %. Issue is entity is identifying the cyber system. Investigator and entity work together to define- a number or % calculated.
- Are we spending too much time on VSLs? Difficult to correlate the auditing fine and the VSLs. What value is added by debating VSLs *ad naseum*.
- What about using "misidentified"
- Get rid of % but develop better definition of the BES cyber system

Miscellaneous

- Is the whole functions area a mush?

- BES cyber system identification is up to the entity. Entities will appropriately draw the line in different ways.
- This is where we need NERC compliance to weigh in to provide advice to the SDT.
- Concrete recommendation: Eliminate line 1 on chart since it is untenable since you can't calculate a %.
- This is not an audit tool to determine if you have met the requirement.
- Requirement is to identify all BES cyber systems.
- First step is to find if you find a BES cyber system that wasn't identified. The investigator will develop the list.
- Add "Additional"?
- From #2, on it presupposes you have a list.

B. NERC Suggested Edits for CIP 002-4 *(Including Maureen Long and Dave Taylor)*

The Chair noted that since the Phoenix meeting, much work has been done by the 002 Sub-team responding to the input . The Team sent to NERC staff a preliminary draft for their input. However subsequent to that the Sub-teams produced further refinements to their drafts. The Team agreed to review the NERC comments in relation to the current draft 002. Howard Gugel led the SDT discussion of the NERC staff comments on an earlier draft of the SDT.

SDT Comments and Polls

Definitions section.

- Functions sentence should remain.
- List doesn't have a proper introduction in Dave's edits.
- Computer systems themselves are control centers, not the dispatch arena etc.? Not supporting
- In the field- this is a control center.
- Is there a something out there- is a computer or a programmable controller.
- This is the first time the SDT is using "computer systems"- will be confusion on this.
- Remote data collection equipment as well.
- A control system vs. control center? Leery to tying back to computers.
- Does fix some physical security if only around computer systems.
- Tied back to EOP 8. Do you need to define control center?
- Go back to original wording. Not trying to define BES cyber system.
- "associated"
- Propose striking second sentence.
- EOP 8- strong linkages with other standards raise double jeopardy issues.
- **Retaining the SDT language:**

Y	N
15	0

- **Add "Functions that support"**

Y	N
15	0

- "typically" in the second sentence)-
- For a definition, we should remove the second sentence.
- "At a minimum"? No.
- Are we removing reference to real time operations?

- Retain the 2nd sentence and remove "typically"?
- Delete: "listed below" in first sentence.
- All agreed. 002 Sub-team will follow up with these changes.
- Purpose addition. OK
- "including the date the identification was performed"? OK no objections all agreed.

R-1

- The 1st thing NERC suggested was to make 1 and 2 a single requirement that has 2 parts.
- If you don't put criteria on correctly but come up with violation. If you have list and criteria. Violation for either part? Or if stick with separately changes for R1 and R2. This might eliminate struggles with VSL statement earlier.
- R1- from "all " to "each"? "One or more" If we use R1. Why not make R3 subset of R1?
- NERC had advised against doing sub-requirements?
- Sub points not sub requirements. All one requirement. This is very confusing.
- Leaning towards keeping current structure.
- This format is being used in other standards. Filed with FERC. May be obligated to use. Either way may be acceptable.
- Benefit to sub numbering format. Keeps together things by. Sub numbers help clarify the numbers intent.
- In favor: of **Sub numbers option**

Y	N
7	9

- NERC's suggestions on R1. Requirement is to "identify" and "all" vs. "each". Identify and document each.
- **Should we accept the NERC R-1 recommendations?**

Y	N
1	16

- **Delete "Document"**

Y	N
2	15

- **"Each"**

Y	N
5	12

- Make sure you identify all cyber systems. Indentify suggests uniqueness.
- "Each" identify something- each in a set. Discreetly" problems with how you document. E.g. on multiple lists vs. 1 list.
- What do we mean by BES cyber system- box or applications? What does discreet"
- **Delete "Discreetly**

Y	N
16	0

- Use vs. own (regardless of whether you own it). E.g. I.d. 3rd party tagging application. Have to do something about. "Owns not uses"

- Note that asset owners and operators make for a big difference. Possibly use: "Owns, operates or owns/operates"
- Owner knows what the equipment is but the Operator may not.
- BES cyber systems that execute or enable?
- **"Owns" vs. "uses"**

Y	N
13	4

- Its got to be ownership or else there will be big headaches. Asset means ownership.
- What about jointly owned? Agreements/contracts would address those kinds of issues.
- SDT should lock it one way or another. There will be fewer exceptions with owned than "operates."
- To enable functions. Applicability is solved earlier. This is not the best place to deal with this. Applicability to the standard. The entity will resolve, not us.
- Leaving executes and enables?
- Taking out is not appropriate- Whatever we decide. It will bring comments. At least it is in the open in the informal comment process.
- This is not a new issue. There is joint ownership now under current standards. We operate generation for other. It all comes down to money.
- **"Own" (2nd poll)**

Y	N
11	6

- Figure out what we need to do with joint ownership. Technical owners vs. lease holders.
- Discreetly identify- make sure you can't have things in two cyber systems.
- There is no way to document if you haven't identified. Is this idea redundant?
- We will need to do better on documenting guidance- for industry.
- True requirement is identification. Document is the measure.
- "Appropriate?" This doesn't read well without this word.
- But "appropriate"- doesn't identify anything.
- Can we move benefits to reliability to a guidance document? No, benefits to reliability is needed for each requirement under NERC's current approach.
- **Strike "appropriate"**

Y	N
14	3

- R1. Is the last sentence on the objective superfluous language?
- Breaking out the objective of requirement offers great value in knowing what the objective was in terms to later determining intent.
- NERC's requirement is to set forth the "benefit to reliability." You need the who what and why set out in the requirement.
- Would it be possible to pull out separately? It is confusing to read. Are we bound by format?
- Could change wording, "for the application of security requirements and controls to BES cyber systems."
- SDT- consensus- ok.

R2

- John Lim indicated he believed the sub-team would not have problems with changes suggested by NERC.
- The SDT accepted the changes.
- Should we require "categorize and annually re-categorize."
- Delete re-categorize?
- "Annual" is better used in the attachment.
- **Delete "Re categorize" SDT Consensus= Yes.**
- "and document such categorization for" OK
- Missing a date here? Add here "including the date the identification was performed"?
- Will we have to put into every requirement?
- Look in measures- lists have to be dated. Have to tie this back to the requirement.
- Remove this language from the measure and the requirement. Y 16 N 0

R3

- Do R1 and R2 once. R3 from now on keep it up to date.10 years later you missed a system on the list. Do you violate R3, R1 or both?
- If you never made the change, then you missed it the first time.
- That is why the sub-team added "that it owns or operates "
- What if it is change because of a storm, not planned. "Emergency changes"?
- Concerned about consistency as we go through. End each with the benefit piece. Look at the different wording on R1, R2 and R3. Make consistent. If benefit the same, use same language. R1- to categorize
- Just voted down "owns or operates." Should we delete here? Want to monitor for changes.
- Planned vs. unplanned change. Have to keep the list fairly static. Changes in a planned way so you know to change the cyber system.
- Planned/unplanned—"planned"- triggering issues. May need to look at this some more.
- Is an annual refresh missing where you look at categorization to make sure something didn't happen that you missed?
- "Reviewing the categorization of the BES cyber systems"
- Remember these are minimum requirements. Do we want to state annually. Or leave it up to entity (best practice). If you have a planned change, you have to revisit it. People can revisit anytime they want.
- Can you have a change not specifically planned? To take a line out they have to do some studies to figure this out. This doesn't happen spontaneously.
- **Delete "or operates" yes. All**
- Transmission owners vs. operators- is a problem. R1 has it as "owns."
- Every one else who is a transmission operator. R1 and R2 have to identify assets (probably a control center).
- Categorization- if control center controls a high impact high asset, high impact control center.
- If we already have covered applicability, is it appropriate to put into requirements?
- **Delete "planned = no, All**

- **Add" "<u>the identification and categorization</u>"** Yes All
- **Add " annual review"? "Every 12 months or as …"** Y N
  1 16
- Comes up in R1 and R2- got rid because no reliability benefit.
- The requirement to notify changes to others is not here any longer?
- That is because the BES cyber system is categorized.
- Sub-team Ok with Dave Taylor's suggested edits.
- <u>"to the portion of the BES" ? OK</u> Planned changes for my stuff only.
- "Periodic reassessment?- CIP 002 sub-team dealt with.
- Other changes: calendar OK
- Difference between requirement and controls. Control objective statement 800-53. Writing requirements. Are we authorized to write controls? Source documents are controls based,
- **Use the word <u>requirements</u> throughout documents. All Agreed.**

Measures

- Delete discreetly? Yes, All agree.

Compliance

- Note that data retention language and the audit periods (3 or 6 year cycle). Gap of compliance only keep data for the year not the last audit. Need to keep data since the last time audited.

Attachment 1

- **Scoping statement important- place it first? Yes** Y N
  13 4
- Make this the first sentence?
- Since "real time" was added NERC staff struck the purpose paragraph.
- "Operations planning horizon" ? Do we want to include this in addition to "real time"?
- Planning could affect real time as well.
- This doesn't appear in any R, or attachment 2. List of functions only.
- Reconsider operations planning horizon in all requirements?
- When define the functions could take place in real time or in the operations planning horizon.
- **Reorder the 2 paragraphs? No** Y N
  3 16
- **Delete ~~"these functions take place in real time or operations.~~ Create a single paragraph**. **Yes** Y N
  14 3
- If you delete the above you will have to deal with word "immediately"
- Day ahead? Marketing term.
- Take out planning horizon?
- If you pick wrong units, in real time you will figure out.

- What we are after here are control systems. Protect- 1 and 0s turns into action out there.
- **Delete ~~Immediately ?~~** Y 11 N 6
- Initially defined "immediate" within 15 minutes"
- Real time? 1 hour or less in the NERC glossary. Upper case or affects the operations within 15 minutes.
- Need that kind time frame. We do need to maintain it. If you aren't specific, may put security controls where you don't need them.
- JVB: time frame- affecting real time. Leave immediately there and have real time (lower case).
- Further qualification? Is it and, and/or?
- Intent is the be "and"
- **Delete "further qualifications?" Yes** All
- Is "Immediate" related to ability to act?
- Concerned there could be other cyber systems that don't have immediate affect. The ones of greatest importance, at a minimum, should be protected- this should to be clear.
- **"Can have an immediate effect"** **Yes** Y 14 N 3
- Need a definition of immediate? "Faster than a human reaction"
- e.g. Immediate access revocation- 24 hours.
- Near term.
- What about adding: "only those that have the capability to monitor or control real time operation of the BES"
  Concerned about "monitor." State estimators replacing what you are monitoring.
- "respond" vs. control.
- Is it clear that it control?
- **Support for single reworked paragraph. Yes** Y 17 N 0
- "Dynamic response"- editorial accept. OK
- "Cause a condition" vs. "cause a reaction"? Any difference?
- "Balancing load and generation." Ok
- Controlling Frequency
- "which ensure real time"?
- Cant control without real time. Don't need the clause.
- "Controlling Voltage" editorial accept. OK
- "Managing constraints" editorial accept. OK
- "Control and operation" editorial accept. OK
- Restoration of BES- editorial accept. OK
- "Necessary" should remain.
- "Situational Awareness"
- It is partly a operations planning action?
- Contingency analysis, close to real time (not a day ahead).

- Delete “anticipate and plan”?
- If you take this out and you take out RTOs.
- Solve by eliminating “~~and anticipate effects of planned and unplanned changes to conditions.”~~?
- Take “current” out of it? Immediately affects situational awareness?
- Only reason to use this clause is to scope this down. Addressing concerns that “this applies to everything.”
- “Assess the condition of the Bes necessary for real time operation.”
- Control and operation and situational awareness.
- Difference between monitoring and assessing.
- control and operations- pure SKADA status of components. Situational awareness.
- Assess the current and anticipated operating state (or condition) of the BES?
- Is there different information used to assess the current vs. evaluate what the future?
- It can be data not from a real time environment.
- Day ahead studies, state estimation. Don’t want to get to other studies being done.
- “near term”? data collecting is real time.
- Current, expected and anticipated
- **Situational awareness: activities actions and conditions to asset the current expected and anticipated state of the BES.** ***As revised*** Y N 15 0
- Inter Entity Coordination and Communication
- Active coordination. Communication is the action.
- Coordination of real time operation.
- Add, **“real time coordination”** Yes. All agree.
- Tie to attachment 2? General comment.

Attachment 2

- (“As determined by….”) Maureen Long/NERC suggested a determination.
- “Responsible entities”= functional model entities. We are using this. She has injected this back in. e.g. 1.1 generation operator doesn’t have a role in this.
- “Operations planning”- SDT decided to take out yesterday.
- 1.1- Generation facilities- (as determined by the Generation owner or the generation operator”. Might be at times the generation operator
- This parentheses might be not needed.
- Doesn’t clearly identify shared facility. “if using a shared BES cyber system”
- If he has all BES cyber systems.
- Non-shared system will not be connected with each other.
- “Shared or connected Cyber systems”
- That would be everything in the system.
- “Each BES cyber system that either singly or in combination. **Yes** Y N 13 0
- May not be as clear.

- Remove the rest of sentence (" ~~or more in Texas and Quebec interconnections~~")
- BES cyber system affecting a plant bigger than 2000 MW- everything in it is high impact.
- Each BES cyber system?
- "would" this is a conditional word. That ~~would~~ immediately affects
- That has the capability to immediately? "Has the potential to"? "Can have an immediate effect" (from yester day)
- **Each BES Cyber system that can have an immediate effect on real time operations"**
  All agree.

- This came from a NERC document. Disturbance report Categorization criteria. Done in 2009.
- ERCOT has higher contingency reserve- less than ½ of reserve. Lose 2 units bigger than 1000 MW.
- Engineering analysis language was in December 09 posting.
- Arguing the 1000 MW number
- Any way to ask Planning Committee regarding this issue.
- SM: "good enough to post" to get industry comments back. Leave something in. If you assume 2000 is appropriate for east- % of size of interconnection.
- Impact of loss of MW is the focus.
- **Remove the rest of sentence ~~("or more in Texas and Quebec interconnections")~~**

Y	N
8	8

- **Remove?**

Y	N
13	3

- **Strike 1.1 and look at 1.3 and go with contingency reserve. Defer, for now. Get feedback from the planning committee.**
- **All OK**
- We need a criteria. This is key. Used the disturbance report as basis. What our basis for this concept in 1.1?
- Few generators with 2000 MW – few are high impact.
- E.g. 3 or more transmission lines
- Move to medium vs. dropping?
- Support this. Contingency reserve. We've discussed before. Agreed to leave them in.

1.2
Sub-team ok with NERC edits/additions. SDT ok.

> Facilities, singularly or in combination (if using a shared BES Cyber System), with aggregate higher of the most current and prior to the most current rated net Reactive Power capability of 1,000 MVAR or more in Eastern and Western Interconnections and 500 MVAR or more in Texas and Quebec Interconnections. (As determined by the Generator Owner or Generation Operator, Transmission Owner or Transmission Operator)

1.3 Contingency

- This is an annual reassessment issue
- List of issues for 002-
- Including operator. Why not "as determined by the asset owner." Not clear here.
- Refers to owner of BES cyber system. Put clause- after real power capability?
- Referencing Mod 24 and 26 testing and verification standards. The concern with linking together is possible double jeopardy. Justification in mod standards for doing both. Operator doing verification and Owner doing the setting.
- This may be an across the board issue.

Generation Facilities, singularly or in combination, (if using a shared BES Cyber System), whose aggregate rated net Real Power capability, as defined in 1.1 above, exceeds the largest value, for the 12 months preceding the categorization, of the Contingency Reserve or total of reserve sharing obligations for the Reserve Sharing Group. (As determined by the Generator Owner or Generation Operator)

1.4

- John Lim questioned if the proposed edit is correct.
- "designate" "as designated by". Balancing authority not always the one making the reliability decision.
- Could be a number of entities.
- Unless this is universal, should be these be in at all.
- Propose striking parenthetical.
- Balancing authority- ERCOT e.g. balancing authority. But there are several entities in other places.
- "all reliability coordinators" ?
- "planning coordinator."?
- Who has a generation facility. They know what contracts/terms for their facility. Shouldn't be who is determining. Person with the asset knows.
- Some may be good or not. Possibly delete all.
- You can't have reliability without a review contract. Compliance auditors know if they have in terms of contracts
- Strike throughout attachment.
- Transmission facilities are named. Scoping built in with those words vs. entity type.
- **Strike all parenthetical**.

Y	N
14	0

- 2.7 "or that remotely control a BES asset with a Medium rating"
- 2.5 "including FACTS devises? All high impact or insert language there. (including flexible .)

C. CIP 002 SDT Discussion of Open Issues and Follow Up

- Dave Taylor's VSLs comment (15% high number? Came out of guideline for VSLs.
- Purpose reference to 003-009 will be adjusted after security controls
- Sub-team will go through the measures to ensure they are consistent with the requirements as revised.
- 1.1 and 1.6 in Attachment I.
- "Immediate"
- Annual or periodic
- 1.5. 2.4 Medium- 3 transmission lines right criteria? Where is the right number and what is the basis for that?
- 1.7 transmission facilities. FACTs devices added. Flexible AC Transmission Systems.
- Include "protection system " associated with transmission facilities? In IROLs? What is the reason it is included?
- Added to criteria for threshold for transmission-
- Looking now for consistency.
- In medium added a clause regarding protection systems 300 KV.
- Protection systems added to l.7 (including their associated Protection Systems) Sub-team will resolve how to reference this.
- Control center definition resolved? Yes.
- Is there a cyber component of systems that are not special systems? Yes.
- Retirement of term cyber asset? SDT will need to decide whether to retire.

D. Final CIP 002 (010) discussion

On Friday, John Lim reviewed CIP 002 Sub-team's redline version to address some of the issues raised earlier in the meeting and presented revisions on CIP 002, which were documented in the latest version of CIP 002.

Definition of BES Cyber System + definition of "immediate".
Rather than another definition, the Sub-team proposed to focus on the BES Cyber System definition and added "within 15 minutes" within the BES Cyber System. If the effect on reliability is within 15 minutes then the item is a BES Cyber System. This gives a finite time.
SDT Comments

- Does this include protective relays? Yes.

High impact rating
SDT Comments

- Is this – reserve sharing usually goes up – is it intent to move more in or more out?
- Parenthetical – I understand it but not sure anyone outside this team will understand it
- Meant to qualify or explain as a shared BES cyber system

- This doesn't make the "shared" clear – may need an explanatory box as opposed to a parenthetical
- Delete front end of the parenthetical
- Meant to clarify what it is meant by combined operation
- Using singular or in combination
- Team will work on exact language – concern noted

Transmission facilities

- This language helps but still concerned about parallel lines
- Changed to 4 to address terminal stations
- The parallel lines are a concern in our area
- Not sure we can address in the standard itself
- Other changes are on the medium impact – will need to address some of the comments and changes in the high impact discussion
- 1.14 - Consider moving transmission operator functions to the front of the statement for clarity – agreed
-
- Jackie Collett's email offers a rephrased version of earlier discussion
- May need to take out the first "or" from restatement
- Too long a sentence and confusing, so she tried to break it into two sentences and add punctuation to help clarify.
- Programmable electronic device – don't you want to say processor somewhere? No, working on programmable devices
- Worried about phrasing – if send info to cell phone does that phone become a BES asset – do we need the phrase "on data display"? It is the use of the data displayed that is the problem, not the display of the data.
- Semantics that may cause more problem to correct – need to give it more thought to see if can address without creating more problems
- Shouldn't we pull in language from Attachment #1 to establish what the BES system is?
- Cannot refer to an outside document within a requirement.
- Trying to write the scope into the requirement? Careful, need to keep it general
- May be getting too specific to say data used by an identified operator.
- Would removing "data" address the question? No we are also protecting the data
- What are we adding with the additional statement about BES condition or disturbance? Pull out of here and put into
  Attachment #1 – we are trying to say the function in two different ways and it is confusing.
- But, again we cannot refer to a separate document.
- Shouldn't try to put any of the functions in – gets too messy.
- "relied on to make real time operations decisions"
- Propose taking suggestions to the subgroup for refinement.

- Consider two short definitions – one for BES cyber system and another for cyber system
- Rest of 002 Sub-team will review on Wednesday.
- In definition of situational awareness – when is the anticipated state? What period of time? See qualifier at the top of the page

III. CIP-003-009 REQUIREMENTS (CIP 011)

The SDT first reviewed the Security Governance draft approach and the progress made for each to the Sub-Teams since Phoenix. The Sub-Teams then met on Wednesday to continue drafting work and presented the draft document on Wednesday and Thursday.

A. Security Governance Sub-Team report

- Jon Stanford presented document noting his sub-team had received statements from only two sub-teams- looked to other sub-teams to get their requirements.
- What is the mechanism to get into 003.
- R1: 3 sub bullets. Scope of applicability to organizational and third party personnel
- Security roles and responsibilities
- Identification of a single senior management official with overall responsibility for leading and managing implementation of requirements within these standards.
  - Provision for emergency situations? Address in recovery and response? Policy objectives
  - Annual review and approval of cyber security policy assigned pursuant to R2. Not in agreement.
- Manager responsible for implementing. "review and approve" – suggesting an org structure.
- Separation of duties issue.
- Delete 1.5 out.
- Clause " with authority" is not in current draft.
- 1.3 "with overall authority and responsibility."
- Topical areas removed. Not addressed in policy document? Requirements by topics- replacement for part of your security document.
- From 2 on- cover policy statements by topics. You to have a plan here, topic sections will describe what's in the plan. Took topics out- carry over from Federal thinking. They will be requirement statements.
- 1.3 annual review? IN the base statement in R.1. Require the REs to annually review.
- FERC wants the same person to know about.
- 1.3 overall authority and responsibility.
- Consistency. In CIP 002- eliminated annual review. Initial and upon changes vs.
- Annual review in policy statements and cover it globally.
- Program review if global

- JS: some requirements for annual review of a plan.
- SM: Double jeopardy- how write language of policy in 3 vs. procedures and plans in other standards. Don't link too tightly together.
- Annual review- different from CIP 002 annual review issue. What would be the triggering event? At policy level. Annual review catches what has happened in year.
- Feds- bi-annual review of high level policy document. At least every 2 years.
- Annual review is practiced in the industry. Good to put in as a requirement. Don't need to say who does. Senior manager should approve?
- Tie to responsible entity
- Some have single policy, some have more than one policy. Separate policy for NERC CIP.
- Presupposes they approve.
- Interpretation questions. Single senior manager. Per responsible entity. A company could have different officials. Each functional model entity.
- Double jeopardy issue we can't solve
- By functional model- have many registered entity. Let the organization decide. Can be the same or different.
- CIP Cyber security policy focus here. Consistent with version 3. Not broader security policy.
- Senior manger was to insure accountability. $1 million a day. Why special requirement. FERC directive.

R2

- 4 sub numbers.
- Shall develop a system security plan for each BES Cyber System that: 4 bullets.
- What is the need for this? Comes from a federal space. We may not want a system security plan? (describes operating environment for what you are protecting)
- List of BES cyber system out of 002. Where is the best place to document. Some requirements provide for plans.
- All documentation required. If it is spread around, then take this out.
- Security plan not only in federal model. Becoming a standard way to define system security.
- Maybe as guidance- accumulate documentation and place where makes sense.
- Make auditing easier if they have 1 place to go to for each system. Easier to see how came about. If you provide this.
- Notice requirement for a document for each BES cyber system regardless of level. As written for each and every one. Auditor needs only finds a missing document to be in violation.
- Isn't a new challenge for large multi-nationals. "Real time" operations in CIP 002- number of different REs involved. Compartmentalization. Entergy- single VP- fossil nuclear, distribution, etc. fiduciary presidents of 5 operating companies in 4 states. If divide up may not have security.
- Program plan- describes things you have to address. IN areas such as access control systems
- If came back to command and control fabric- systems that do that. Organization "shall". Have a program plan for how to attack each of the technical area.

- Security plan for each BES cyber system.
- CIP 006 physical security plan that needs to get added.
- Keep this a much higher level.
- Why look at BES system first and then at BES cyber system.
- This could create nightmare scenario.
- Security plan that addresses the following for h/m/l. Not at each cyber system level.
- Too onerous. Have security requirements for low impact systems. Security plan doesn't add much to what you are already doing. Have to document environment to demonstrate compliance. Think of
- For high impact assets need this level of documentation because of their important. Specific plan. At low level, generic plan how we address these as a whole. Not as onerous.
- Program plan approach?
- Other requirements may lend themselves to this.
- Coalesce all the plan requirements into a program plan by topic. High assets- security plan requirements.
- Program plan a good one.
- Incidence response and restoration plan. Just mentioned. Cover exclusion for emergencies.
- Details of what is in the plans in others requirements.
- "The security for each BES cyber system will be addressed in a security plan.
- Responsible entities came from markets. Shakes down to 3 organizations. Operating unit.
- Model for policy statements- in R3.
- Each responsible entity shall:…..
- Program plan-- take each of the topical areas "BES cyber system connections" DHS Control system connections.
- Authorize and document external connections. Only those authorized are in place.
- Revise R2 to include topics.
- R4 down- talks about plans- info protection plans.
- Codify details of procedures.
- Rework R2 and put a program plan approach.

R3

- How is R3 a policy? Embedded in controls document. Pull out of here?
- Won't need this if we take program plan approach.
- **R3 is redundant**. All Agree. JS will remove.
- 3 Rs.- in 003 (manager, program plan)
- E.g. configuration management plan- vulnerability assessment etc. Will these be set out as topics?
- Keep simple, not require multiple plans, but set out the topical areas.
- Probably won't need topical areas going forward.
- Program plan approach simplifies. Collapse these down.
- "Policy"- what do we mean?

- "shall language"- requirements framework- everything is a shall. If you are getting into procedures, attributes. If you are talking about topics.
- E.g. Personnel screening process. Shall have this. Procedure on how implement.
- Have to be careful- shall includes- have to have a policy. These are the areas you have to address in the policy statement about the CIP standards.
- Recovery plans and incidence response plans- not policy? Require you have one and have to do it. Develop and implement the plan.
- The plan must contain the following- e.g. recovery plans must contain….
- E.g. CIP 008 and CIP 003 statement- possible double jeopardy?
- How to deal with CIP 003, if you don't have that requirement as a low? Low impacts that don't require a response plan.
- 1 approach – policy statements you will do access control, you will.
- 2nd approach- you have to have a plan for all these things.
- Current CIP require plans where you may not need plans. Create compliance activities that have been necessary for enhancing security.
- All in a single table- do everything in a table. Policy should address. E.g. 4.3 include applicable controls specific in Table 1 Information Protection Controls.
- CIP standards are topically light and DHS are topically heavy.
- Agreed on program plan approach. Don't know where policy will go. Then come back with a proposal.
- Easy to write a double jeopardy requirement. Just to create policy statements. Policy statement you have to have recovery plan. CIP 008 and 009- plan contents. Measure for the policy- policy statement. If measure in CIP 003- you have plans to support the policy. Draw a line between requirements for policies and writing plans.
- Sending over the plan? Annual review and updates in CIP 003. CIP 006 here is what plan contain.
- This is a global question. Handle annual review in 003 or in the subsections?
- Requirement- policy statement that addresses recovery plans. Go to CIP 8 & 9 about content of plans.
- In requirement- state what the policy must address. Guidance document to be developed what the thought was behind the requirement.

R4

- R4 a problem? Looks ok.
- R4- e.g. where you are putting in requirements for the contents of plan. Here just say you have to have a plan.
- If this creates a double jeopardy problem would have to roll up into R1.
- Address the topic of information protection.
- Read it as a family of one. Why not make it one.
- Tie up topical areas in R1. Policy statement to be made in topical areas will be made in the sections.
- Does this raise double jeopardy issues?

- Puts all high level requirements in one place- shows accountability.
- Asking whether we need policy statements in CIP? Every requirement in standards is a policy?
- In practice, that is how they are written today. Current 003- policies should address all requirements.
- Doing it by topic. Not as granular as current 003.
- Placed some of these info mgt requirements here in the last week- they tie the policies to the program elements. Put things together that belong together.
- Why not put under a single standard?
- Put all tables in a single standards
- Take outliers and make them standards themselves.
- Existing format- CIP 003 policy for this, implemented in CIP 005 .
- If we change into one standard, we will hurt ourselves with the outside world.
- Move to their own standard. CIP 007 single requirement about access control.
- Standard- talks about access control (physical or otherwise)
- Does NERC have a definition. CIP 006 physical security plan. CIP 004 cyber security control training program. Do we need to get one?
- Use the same word across all standards.
- What do want to call this? "Program" is what you are doing.
- Collect all the topics together. Figure out how to put together as a team. Plans, Programs,
- 002 about scope. 2nd is about governance- management requirements. Got to have a policy and a program to address different subject areas. Outliers- are common to others, e.g. access controls. Policy can be simple what is important are the plans, woven together under management oversight.
- 003 umbrella standard- 4-9 addressing in more detail. Jumping off point for more detailed to follow.
- This standard is skeletal- areas management.
- Compartmentalized- to some degree will be necessary.
- Plans and programs- different disciplines use the same words- physical guys call things plan. What we mean is program and not a plan.
- If it doesn't lend itself to a plan.

B. Quick Update on Sub-Team Progress since Phoenix Meeting

The CIP 003-009 Sub-teams provided progress reports on work since the Phoenix meeting and then met in small groups until mid afternoon to draft or refine their requirements.

1. Change management.

- Areas- CIP 003 didn't fit into oox standard.

- Coordination- low/medium/high impact and connectivity- environmental differences? Didn't have many.

2. Access control and Auditing

- Sharon Edwards noted the excellent contributions of Jeff Hoffman and Frank Kim
- Got input from NERC
- Open issues- password measurements.
- Review what NERC offered.

3. Recovery and response.

- Scott noted good progress made and acknowledged Tom Stevenson's help and has reviewed Maureen's suggestions.

4. Operations

- Jay Cribb report that the Requirements are in good shape.
- Work needed on objectives and measures
- Coordination- ESP access points. Electronic Access Points- defined term – happy with

5. Personnel and Physical Security

- Doug Johnson reported that they have reviewed Maureen and/Dave's comments
- CIP 004. Get some policy statements over to Jon Stanford- addressing physical security and training and physical risk
- Do we still have an electronic security perimeter?
- What we have been doing- we have a word doc with a list of requirements. Get that into a real document.

C. CIP 003-009 Sub-Team Requirement Review

1. Governance

Jon Stanford presented the changes made to CIP 003 offering the following points:

- 003 can become 010
- Edited R1- adding the 9 subject areas (1.4- 1.12)
- R2- Each responsible entity shall implement the requirements specified in Table 1 (Subject Area XXX here)
- R3: Each responsible entity will implement the requirements specified in Table 2 (subject area xxx) in order to (benefit to the BES here)
- Can link VSLs to requirements

SDT Discussion

- NERC staff recommended retiring existing CIP standards and start afresh with CIP 10. Some cross e.g. vulnerability assessment is in 3 areas currently.

- Allows to quickly look through and make sure not requiring same thing in 4 requirements.
- We would need to explain- here's the map from the old and the new ones.
- Another benefit- requirement language will be simplified. As standards evolve- you'll modify the table not the policy making it more adaptable for future.
- Don't have to have a requirement that says "develop a plan"- avoiding circular logic.
- There is 1 requirement for each subject area? Will have own VRF? Everything in that Table will have the same VRF. Table will in essence- be the sub requirements.
- If we want to differentiate VRFs, we can develop multiple requirements.
- Implementation plan that will need to go along with this. If 1 standard. New implementation for a full standard.
- This will help out with the implementation plan.
- Version 4 and dates
- CIP 8 and 9. How would that be handled?
- CIP 8 with 4 Requirements and 4 tables would become 1 requirement and 1 table. Or use a group heading..
- We will need a new number strategy for interpretations.
- Need the SDT to determine what are the topics. Starting with 9 proposed by the Governance sub-team.
- Rolling each into a requirement. Reporting potential violation. Physical security violations (minor and major). Not sure this is the right way to go.
- There is precedent for lots of standards.
- Helps with granularity. We need to think about all implications.
- List of stuff that needs to be done will be the same. The granularity of the standards will be different.
- Need different frames of references- think about this overnight.
- Its important that the SDT makes sure we have the buckets right. Make sure they are chunked the right way. How it is organized will make a lot of differences.
- SDT should flesh out proposal among the Team. We need to agree on chunking. Get together and decide uniformly and collectively.
- This is a hard subject to get one's head around. Anything changes in format will be initially received as not necessarily simpler. Awareness and staff capacity is an issue in the industry. Practically consider starting what we have.
- Should there be a motion to stay with current CIP framework?
- WECC auditors have indicated that this would be easier with one caveat that tables would need to be numbered. Need a way to track that to the table.
- This does not represent a radical change. In fact, the H/M/L categorization is the radical change. Tables right now don't work. Need to find a way to present appropriately. This is about presentation of requirements.
- About 140 requirements in a single standard. Will violations of any requirement be a violation of standard? This raises repeat violations. Measures more complex and VSLs VRFs.

- Do we have the time to do it? Most of the other teams have requirements written. Significant re-writing will need to be done. Content of both the tables and requirements.
- This will be seen as a radical change in the industry.
- Could improve reporting. Violation of categories. Better reporting overall. E.g. personnel risk assessment. Create a better taxonomy.
- This is the appropriate time to propose the change and get it in front of the industry.
- Changes to software. It will get updated.
- Not lots of additional work. You take requirements. Put together in 1 document. Not a step back in reworking a lot of things. Most requirements are already in a table format.
- This could go faster for us and present a better governance model. Not making changes for no reason.
- What is there to debate if we stick with the current?
- This model is a vast improvement to what we have now. Might be well received by the industry. This team shouldn't concern itself about the vendors. Rather debate the merits of the ideas.
- This approach could help us in terms of consistency checking. Consistency is important. Advantages. Lots of organizational and process changes in the industry. Vendor software is the least of it. If not restating things in multiple places.
- Initially I like it. We have forever been defending one family of standards and we have viewed as 1 standard. We keep as one standard anyway.
- Messy now. Access control and monitoring asset. 5 line requirement. Makes a mess today to figure out what kind of asset is that.
- Many trade organizations are together. NERC CIP, Smart Grid standards coming out. Tracking on 800-53 model. Several doing efforts internally to map all requirements to such a model.
- Granularity for compliance- removing.
- Explained the proposed formats.- 9 topical areas. Policy
- One of the issues- compliance implications of doing that. Now between 8 and 150 requirements. Fewer # and granularity. Single VRF factor. Single V Severity levels . What would they do in terms of an investigation. How report to regions. Penalty calculation.
- Now with 41 requirements moving down to smaller number or having 150 requirements in single standard.
- Putting all standards into 1 document and consist of requirements and table.
- Consider all existing standards 3 -9 into one standard. Requirements have table associated with it.
- As auditors- take requirements and put into table format. Still looking at R and compliance with R. Having worked with military docs. Once you have anything that large and point back in terms of compliance. First time you updated. Move anything else up. From version to version.
- Keeping up to date or compliance tool- hassle in terms of bookkeeping and paperwork accurate.

- R language would be fairly vanilla- table could change. Have policy and procedures with the details.
- 2 action items. Categories need to be finalized and agreed to. Coalesce to action quicker.
- Tom Hoffsetter offered comments

Wednesday evening the Chair asked Howard Gugel to prepare a sample "proof of concept" for the access control requirements to inform a decision regarding format.

D. Review of the Sub-Team Products

Thursday afternoon the SDT reviewed each of the sub-team's draft requirements as revised and refined in the sub-team meetings on Wednesday, offering guidance on various issues raised by the draft requirements.

III. CIP FORMAT REVIEW

A. Tables in the Standard(s)

Howard Gugel, NERC, reviewed the changes regarding format, tables- (R3 referring to table 1). Editing tables. Propose for title to Table R __ helping to tie back.

SDT Comments

- Multiple Rs referring to the same table?
- Keep each table specific with each requirement.
- Bring back question of multiple references to the same table.
- CIP 6- one table and the column as the Rs. Different from the others.
- Need to be consistent for the format for all requirements. Use same format for other tables.
- Consider the guidance documents.
- Rows in table play role of bullet items under each requirement. Separate table links back to each requirement. Resolves issue of multiple rows references back to multiple requirements.
- Grouping the Tables at the end of the standard. Disjointed in a standard. Lot more readable and manageable. Sub requirements, as table entries.
- Similar to attachments in CIP 002. Idea of tables at end, keep requirements concise. Will pose to Maureen to get her opinion. Consistency better at the end.
- Look at Rs and make sure wording is consistent with other requirements.
- Looking at each R how you would measure it. Proof of that- light on this.
- Look at objective statements- read and make sense it is the purpose of the standards.

B. Objective Statements

SDT Comments

- Putting the objective within the requirement? Fraught with danger down the road.
- Enhancing reliability purpose clear.
- Reason it is there, who it applies to why needs to be done.
- Putting in requirement language- gets in the way. Defer that language until requirement language drafted.
- Get requirements first then measures.
- Defer the objectives as part of the requirement. Corollary document.
- If doesn't have a basis in reliability, shouldn't be a requirement.
- Format- R words. Designate.
- The objectives makes it harder to read.
- However it is important to have objective in there.
- Need to be specific about the benefits.
- For now, just bracket the objective.
- Part of the deliverable- measures, VSLs and requirements formats at the end of the session.
- Benefits for reliability? NERC could throw their proposal on each of them.
- Important to deal with measures- know when the requirement been met with. Tangible proof of requirement.

C. CIP Proof of Concept for Format- Access Control

1. Access Control and Auditing- Review for Format

Sharon Edwards presented the work to date on access control including 004 R4, 005 R2, 008 R5 and dispersed throughout the standard.

R1. Account Specifications (007 R 5) **Table**

- Beginning of table- policy should include the following: 20 points. Technical high level controls- H. M. at low- need to understand what they have. #15 "immediate revocation" of access. FERC expectations and SDT's belief of a reasonable starting point. The Sub-team had hard time with this.

Electronic Access Controls

- Sharon noted that this may be redundant.
- Box- "remote access"- Could develop a definition to the standard at hand.

Table R2- Electronic Access Controls

SDT Comments

- Need to decide which formatting for H/M/L.
- Outlier- information protection- document management.
- Measures as previously written- "make available documentation….."
- Haven't tackled VSLs and clean up work. Need sub-team time today.

- Split tables up into more tables? Is violation of one piece, violation of the whole requirement?
- Chunked up more? Good question for further discussion of the sub-team
- Tables provide an improvement and clarity- Keep concept of table. Share concern about multiple violation. Groupings of similar rows and make a separate requirement.
- E.g. Password- under own requirement. Reduces impact re multiple violations.
- Lot of value of tables but reduce the impact in terms of compliance.
- Break into more logical groups and individual requirements.
- Table not to consolidate all requirements. Table facilitates the breakdown of requirement points.
- Table looks good. Clarification. Separate document for audit and monitoring?
- Looked and most of audits related to things NERC would be doing. Didn't develop another table for auditing requirements.
- Row 13- Ports and Services- overlap with Change Management and Operations Security? Probably needs coordination.
- Doesn't specify the content of use restrictions? Is this an issue.
- Wireless approach- didn't want a comprehensive set of wireless standards. Other standards already done a good job. Trying to be less proscriptive. Down the road with encryption. We are not resourced to do.
- What does a blank in the table mean? Clarify if not required or something else.
- Communications aspect of this? Things that are not connected vs. routably connected. Did you intend to stay away from this?
- We did talk about this in the Sub-Team. Spent a lot of time discussing FERC directive to remove access. FERC didn't suggest anything to treat differently. Didn't go down road- may be others. Made decision.
- If talking about remote access, not remote access for user sessions outside of the USPN.
- Format: Required vs. analogue values in the rows. Larger number of individual similar requirements as long as each is a discreet, well worded.
- Breaking out. Barrier. Not having VSL correlated with requirements. Break up or chunk the topic areas – access control.
- When doing measures, have a table form? Matching those in requirement?
- Sub-Team used the generic measures.
- Let's make sure that the SDT knows the topics. E.g. "Security management controls"?
- Repeated wording. E.g. 11 "is required"
- We need a section where you address FERC directives. They had one directive (immediate) Make sure that we cover that for each of the sub-team. We don't need this posting.
- Authentication of un-manned devices. We will see more and more. Will this be covered someplace else? Should this be "human" access control. Do we need to say that?

D. CIP Format Review

1. Overview of Format Questions

On Thursday morning, Howard Gugel presented to the SDT a proof of concept for the access control requirements. He asked the SDT to look at format not merits of requirements in order to get a picture of how the requirements would be presented. He noted the table would be embedded in text and at the end of each requirement. NERC standards review staff agreed with this format approach. This would be the same regardless of which approach is chosen.

- **Option 1.** Keep 003-009 and work from there.
- **Option 2**: retire existing CIP standards and organized by the topics in sequence from 010 on. Access Control e.g. CIP 017.
- **Option 3:** One standards document with 2 sections 010 (002) and 011 (003-009). All controls together. R1 security policies addressing all topics
  - R2 implement per table
  - R3- table for access control
  - R4 implement 2nd table (account specifications).

Initial SDT Member Comments on Format

- Will 002 be on its own? Yes speaking of 003-009 together.
- Where are we capturing connectivity? 005.
- Connectivity is more important than big iron.
- 1st 5 LMH.
- Left column- allows item tracking
- Title Access Controls.
- It will not hard to make change if industry doesn't like this format,
- Language of the table can address connectivity.
- Industry confusion currently in terms of audits at the requirement level. Radical format change may not be well advised.
- Missing opportunity- keep simpler to scope out key things, like was discussed in Austin.
- Tables concept came out of the Phoenix meeting.
- Will FERC have a problem with the tables? There may be no process for reporting on that currently. Process will need to be addressed in this document.
- Common PCI and HIPPA common auditing format for standards.
- Read tables- allows flexibility of the columns. Reporting issue not an issue. Row number tracking will help.
- Table structure agreed to a couple meetings back. We are using them. Whether we keep groupings separate or have a single standard for this is the question. Culture of compliance- repeated violation of standards might be held against the industry with the single format.
- Will it be possible to write a VSL for this table format?

- Separate tables for requirements? E.g. account info and another with remote access issue. Past VSL at requirement level and where with sub requirements. This could end up with a lot of "ors"
- Break out the VSLs with the sub requirements in the table?
- Everything happens at the requirements.
- "Foolish consistency is the hobgoblin of small minds."
- When file with FERC it becomes law.
- Same issue with the VSLs- regardless of options.
- Can split the tables into more areas- can get as granular as the SDT wants.
- Put Rs on left column. Lose the R4 and number Rs. Use if /then construction.
- Now would be the time to propose this. Timing for this.
- Clarification on status quo. Decide on the buckets? We don't do buckets. Stay with 003-009.
- Do some reorganization what is in each standard and possible move- but keep in. Fix for Order 706.
- 003-009 numbering. Moving some Rs around. Tweaking re 706.
- The Team needs to make sure this works. Sees value in topical groupings but has concern with industry confusion. When CIP version 2 was put out the numbering changed and industry members asked why.
- Have a comment form question to get feedback. Makes sense from various standpoints. Ask how much confusion this cause confusion. In the comment form.
- Is there precedent in other reliability standards- if you are generator operator, if you have X, then.
- Limited. Lots based on functional model. Rs directed to different functional entities.
- What ever we do there are going to be changes in the industry. Better we do on our guidance, the better the industry will know what's going on. Need a strong foot forward on guidance.
- Option one- access control. Are they outliers. Easy to place those in a standard.
- Public Comment: Owner operator. Option 3 will be confusing. Is it the whole standard you must follow? CIP have 3-9. Too many changes together for industry to handle. Do option 1.
- Not proposing 4 options. Need to understand difference between 1 and 2 & 3. 2 and 3 carry new organizations. Current standards are supposed to be considered together. They are 1 standard. Change 1 must change all. They are buried and possibly scattered around in the current. New organization with different topical naming.
- Lot of thinking into organization of current standards. Big change is a new organization scheme
- Use tables with all of these options.
- Version 1, 2, 3 confusion- application. Version 4. Renumber standards. Option 2 less confusing.
- Radical change in the standard is required. Some equivalency 3-9 but the approach we are taking and the different formats. Would cause more confusion to use the same numbers. Start for new set 10- onward. Not to be confused with 3-9. Option 2 doesn't follow. It is a

different set of controls organized differently. Likes smaller groupings regarding compliance.

- Tom Hoffstetter noted that he doesn't speak for NERC but that organization in tables is good and he likes the break-out in terms of topics. Required columns will make it a lot clearer for both entity and auditor.
- If we go to option 3- collapse into 1 standards. 140 controls in one standard. Violation more than1 get a penalty.
- Whole different paradigm require a new approach as to how penalties assess. Approach different in many ways. Wouldn't try to make current structure fit. Have to depart from traditional approach to penalties. Have to describe them differently and assess in a different format. Across the board.
- Nothing to argue with what TH said. These standards will be balloted and posted and implemented under the current process.
- Option 3 recognizes how tightly knit these are together.
- This may not matter in the end. Push in his company.
- Can NERC help with this issue that RK brought up? What is the audit standpoint. Can they do this. Might help to present options 2 and 3 at the Technical Workshop. Show how NERC and auditors of regional areas would handle. How models would be handled in audit and penalties.
- Option 3- organization within? Still the same? Structured as per 1 or 2?
- Constrained by current compliance structure. Could we propose a new approach? Put out standards with a proposed structure?
- Confined now to VSR VSL structure.

2. Initial Preference Ranking of Options and Voting for the Preferred Format Option

The Team following the discussion of the pros/cons of the options, voted first on each of the three options indicating its acceptability. Following that each Team member voted to support the option they found most acceptable or preferable based on the discussion and their perspective.

Format Option 1: keep existing CIP 003 to 009 in its current form maintaining its existing logical construct (may involve minor movement of existing requirements between standards)

Yes	*No*	*Indifferent/could go either way*
8	**7**	**3**

Format Option 2: Retire 003 to 009, create new CIP 010-16 grouping according to small group assignments.

Yes	*No*	*Indifferent/could go either way*
12	**2**	**6**

Format Option 3: Collapse CIP 003-009 into a single standard that contains all requirements created/edits by small groups and grouped according to small group assignments.

Yes	*No*	*Indifferent/could go either way*
12	**7**	**2**

The team then voted for one of the two highest ranked options under consideration:

- Option 2: Retire 003 to 009, create new CIP 010-16 grouping according to small group assignments. ***Yes*=6**
- Option 3 Collapse CIP 003-009 into a single standard that contains all requirements created/edits by small groups and grouped according to small group assignments. ***Yes*=10**
- *Abstained from voting for Option #2 or #3:* 4

Comments on the Options Ranking and Next Steps for the Sub-Teams

- Need to take into account the industry's reactions.
- Don't see any real difference between option 2 and 3.
- Not a single requirement vs. standard.
- It is different in terms of what is presented. Violation of any requirements may present problems.
- This is just an organization issue.
- What are the expectations for Sub-teams in terms of drafting VSLs?
- Allowed to have content- for each row of your table a VSL statement in that format.
- Finish up writing requirements. We can pull back together into multiple standards or into one standards following a decision.
- Would be helpful to go through one of the sub-team's reports before breaking. Substance requirements, measures and VSLs.
- Missing several definitions. Should we use boxes? Indicate it is guidance. If not, it will be exported to glossary, or in requirement.
- Note if put in guidance then not part of standard. If it goes out without guidance document. Comments won't be complete.
- As a reality check, take access control and go through it and reframe expectations. Going to need work after going out for informal comment. Interim work product posting. Work as hard. Focus on requirements.
- Some sub-teams are using different definitions for external connectivity. Factor into what is put in the rows on table. Each needs to do the walk through.
- Five remaining areas that need SDT guidance for sub-teams.
  - Square box definitions- specific to standards (vegetation management standard precedent
  - Control centers definition
  - Different types of communications
  - How should the sub-team address drafting measures or consider putting out document for industry review without measures

  - Address VSLs or consider putting out document for industry review without measures
- SDT should clarify outliers- definitions. Whose will be used? When will see all the definitions in the various document?
- Governance section, based on SDT input pulling policy statements up.
- Suggest that a SAR for a drafting team be considered. Address FERC 706 items that may be outside the scope of drafting team, e.g. NIST risk management framework.
- 9 Categories of proposals to organize. Put the level of controls in right hand columns or separate rows.
- Option 1. Allows different time frames. Separate line items for medium. Time frames in columns. Bulleted lists time frames.

3. Reviewing and Ranking Option 2 (2nd Round)

At the end of the day the Team took up the format issue again. The Vice Chair made a proposal that the Team use Option 2 (which would renumber the requirements using the topics to organize them. The Team discussed this option:

- Consider renumbering 002 as 010 – confusing to have 002 then renumber at 010
- Posted previously as 002, proposed keeping then renumbering new.
- Yes, different titles for the same thing that exist with a few split out.
- Some match what we have now, some are new – where we can group into the existing CIP we could do so and renumber only the new ones.
- Is media protection now media disposal? Where would you move information protection?
- How many teams work on multiple standards at the same time? Yes, others teams do address more than one but not ten of them
- The titles may seem the same but many of the sub-parts have been moved around except for 002 which is still focused on the same topic area – we would need to educate the industry on what is in each standard.
- Rename the last item 021 as Boundary protection rather than data communications?
- Will we map old standards into the new ones? If so, why not retain some of the old numbers
- Did not gain consensus on this earlier – this seems ad hoc.
- We probably need to agree on something today in order to to put this into a format.
- Propose altering proposal to start with 010 for old 002 – new numbers for all of them – less confusing
- Access control needs to be separated into physical and electronic.
- Under personnel and training – would that include training for all the other standards?
- Idea is to combine training and awareness and risk assessment.
- Change name of the last one and make electronic access protection or role into new 013 under system security?
- Heartache at pulling physical access control out as separate item.
- May still need further renaming or organization as we move forward.

- We have to write the standards so we are not assuming IT security and physical security will be handled by the same people
- Physical security and access control – IT controls access to server but not the badging for physical security –
- Need to go with this not as a concept but as framework – it is a format

The facilitators polled the team on their support for the option #2 (multiple standards) and 7 of 16 members were in support of utilizing this as the format.

An additional member joined and the Team then tested support for Option 3 (putting all into single standard) and 9 of 17 supported using this format. Neither format approach received sufficient support to make an SDT decision.

4. Numbering the Requirements

The Team them reviewed and tested support for each of the following propositions:

- **Change from existing CIP numbering system?** Yes- 13 favor changing (of 17 = 76%)

SDT Comments

- Adopting the headings would be the same under multiple numbers or as one
- If we keep CIP 002 as 002 for continuity then the rest are renumbered or just one,
- would be more confusing
- change to Option 2 if we revote but concerned this is under duress
- Think we need just one standard

5. Adopting Category Headings for Requirements

- **Adopt the proposed headings for the requirements as the categories whether as one or multiple standards** – Yes-13 (of 17 = 76%)

After further Team discussion it was determined that there was no longer a quorum and the Chair suggested postponing further discussion until Friday morning.

6. Final Review of Format Options

On Friday morning the SDT took up the final review of format options for the informal posting document(s) in order to make a decision.

The facilitator suggested the SDT use an acceptability ranking of the two possible format options that had been discussed and debated yesterday followed by clarification of concerns to see if they could be met and a requisite number of members could agree on the format to use for the informal posting.

He reviewed the scale to be used as: 4= fine as is, 3= support but have questions, 2= need to address concerns before I can support, or 1= cannot support. The SDT then ranked each option and those providing a 2 or 1 offered what their concern was.

Option #2 – Requirements in Multiple Standards

- Use the Topical areas discussed on Thursday and utilize multiple standards (example CIP 010 -020). CIP 002 also gets re-numbered.

4-3 3=7 2-6 1-0 (Avg. 2.81)

Option #2 Concerns

- All the standards have a single purpose and are meant to be viewed as one. Should be one for clarity.
- Efficiency of one (better implementation) - Don't like fragmentation between multiple standards.
- Much cleaner to have just one standard
- Current standards say to consider as one but in fact they are not treated that way thus making compliance difficult.
- There is a greater chance for double jeopardy. Easier to manage with Option 3 in a single standard format. Fragmentation leads to fragmented implementation rather than unified management.
- We do talk about the CIP standards as one but in practice they are treated differently.
- I like the grouping or headings but multiple standards looks like we are asking them to do more - also additional documentation
- If we post additional standards, the reaction of industry will be that we are asking them to do more. Having only one standard will reduce required documentation. Eventually multiple standards would be on different version levels, thus adding to confusion.

Option #3 – Requirements all in One Standard

Use the Topical areas discussed on Thursday, but one new standard is posted containing sections for.

4=6 3=5 2=3 1=2 (Avg. 2.93)

Option #3 Concerns

- Compliance implications - violating one standard even if different requirements- significant increased risk for multiple violations of one standard.
- Need to hear technical argument to support 3
- Compliance issue- non-compliance on low items makes you vulnerable to citations for repeat finding of non-compliance
- Compliance my main concern- tie our hands about splitting later- once merged cannot deal with future revisions separately
- Just trying to format for posting

- Concerned about complexity- more than value of unified
- Voted a 1 because of the number of requirements and sub-requirements. There are about 120 major requirements plus sub requirements. The 140 plus requirements may means that any violation of any of these requirements you are in violation of one standard. Compliance reporting and compliance sanction issue on the issue of multiple violation of the standard.
- When RSAW's are prepared, the SME should only view information pertinent to his area of expertise.
- Agree with concern about repeat violations of the same standard.
- Can the compliance situation could be fixed if the structure of the way NERC viewed the standards for sanctions, etc. were changed? However, that will not change.
- Is it likely that NERC would change the way they viewed compliance to support Option 3?
- Concern with the sheer complexity of the one standard. Also see disadvantages of the lack of a unified approach, but there have also been advantages in the divide and conquer approach.

SDT Options Discussion following the Ranking

- Fragmentation of the standards will contribute to lack of a unified management and implementation.
- Sometimes the only change in a standard is the change in the standard number. This makes no sense. If you look at the categories we approved yesterday, there will be tighter integration between the CIP standards. If we have separate standards, we need to make sure each can stand alone.
- Prefers the unified standard and believes that we can help the complexity by making them one. The big concern is the regulatory impact mentioned by others.
- The Current standards do not lend themselves to good organized implementation. The new adopted topic areas are the most important thing to consider. Can both options be presented to the industry for feedback?
- The facilitator asked NERC staff is we need one or the other for the posting?
- Scott Mix noted that raw work papers will not be sufficient for the posting. Presentation in two formats will likely confuse the industry. Perhaps the posting could be presented in one format, but we explain the other format and ask the industry to comment on whether they like the change or not.
- Scott Mix showed the Team the NERC generated report does show total violations by standard.
- Howard Gugel submitted the enforcement question to Joel DeJesus at NERC concerning compliance concerns. Is there a compounding effect? A: If there are multiple impacts of multiple violations of the same standard, there may be some compounding effect. If R3, R12, and R22 were violated, they would be separate violations with no compounding effect.

- The concern is the "culture of compliance" at NERC and FERC. If the same standard is violated, it will have the consequence of doubting the culture of compliance.
- If we get one single standard that has magnitudes of violations, it will send the wrong message and numbers of violations will be noticed.
- In terms in the ability to observe, Scott Mix suggested he did not see the difference.
- All the reports to the member committees are by standard number and he believes there will be a spike if all CIP is one standard.
- Legislators are aware of the collections of standards that the industry must deal with. For example FISMA is a collection they are familiar with.
- We need a decision. We spent too much time discussing this. We have agreed on the categories. Let's get something out there. We are wasting too much time.
- We could debate this all day, but we need to move forward.
- If we step away from CIP and started talking about vegetation management, he believes breaking the standard into multiple would not make sense.
- Lawmakers and congress will understand and support that while there are multiple topics, there is still one framework for improving cyber security implementation.
- Do we need a transition before moving dramatically to either new set?
- These categories make it hard to divide responsibility.
- Think new categories provide better organization and will improve implementation.
- Can we put out both as two separate documents?
- That may be too confusing to address option with questions in comment form
- Need to be accountable.
- We need to put a question to the NERC enforcement side. Can we go with this and limit compounding violations?
- Concerned about potential impact on Congress if there is a spike in non-compliance because multiple violations of one standard.
- Congress is most concerned about fragmentation and used to looking at one standard for an industry.
- The facilitator asked if any concerns addressed that would move their vote from a 3 or 4?
- Some members expressed concerns about suspending rules- changing the game. Needs to be a yes/no choice
- Concerned adding in "either" result in super majority for both options - then what?
- Is there an alternative embedded in the decision rules for this post for informal comment? Can the SDT use a majority (50%+) for purpose of posting using single standard or multiple standards and documenting the SDT differences in comment form for either choice.

The 17 SDT members present then voted for their preference for posting for informal comment between the two options with the following result:

Option #2 (multiple standards) **Yes = 6 (35%)**

Option #3 (single standard) **Yes = 11 (65%)**

The SDT agreed that while this decision to post for informal comment has a majority support (65%) but not the super majority (75%) of the members called for in the decision rules, the Team is asking for industry comment and input on the formats through comment form before finalizing a format to present in the formal comment draft in July, 2010. The Team discussed that this approach is consistent with the spirit of the following consensus rule provision: "In instances where the Team finds that even 75% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team."

IV. NEXT STEPS AND ASSIGNMENTS

On Friday the Chair reviewed the schedule, assignments and next steps for the SDT to produce a final version for posting on May 3, 2010. Joe Bucciero will lead with assistance from Howard Gugel the drafting of comment form with information provided by each of the team leads and will also add a question from discussion of the format to document discussion

The SDT will need to begin creating an implementation plan for posting in July for formal comment with a small group of SDT members in order to provide some frame for discussion at the May meeting and to answer any questions at the May workshop in Dallas. Scott Mix will be looking for individuals to work with – this will occur after May 3.

We need something in cover letter for May 3 posting that speaks to the SDT's philosophy on implementing the plan – industry needs to understand what we are doing. Need a couple paragraphs explaining our approach or intent Jackie Collett, John Lim and Doug Johnson agreed to work with Scott Mix on developing a draft implementation plan.

The Chair reviewed the schedule from April 19, Monday to posting on May 3, Monday. It was agreed the sub-teams need to complete their drafting and get these to Howard to put into "standard" for review by NERC staff. The plan will be to assimilate the NERC comments with team leads, then late in last week of April have a ready-talk and email vote for approval to post on May 3. Have conference call on April 26 for team leads and 29th for ready-talk review with full team Each Sub-team lead will seek to get work done and to Howard Gugel by Monday morning then review with Howard and team leads on Tuesday afternoon. The following schedule was reviewed and approved by the SDT:

- 19th by 5:00 – requirements, measures, vsl's and glossary drafts to Howard
- 20th Sub-team leads with Howard at 3:00 – 6:00 EST

- 21st Howard will get team drafts to NERC staff for review
- 27th full day (10-5) meeting with NERC staff with Sub-team leads and anyone else who wants to join (NERC comments back by 26th if possible to full team – concern is legal and compliance) – updated version send out on 28th to full team for review
- 29th full team meeting (1 to 4) for review and vote to post

The Chair and Vice Chair and the SDT thanked Jay Cribb for his excellent hosting and great facilities.
The meeting adjourned at 12:00 p.m.

Appendix # 1— Meeting Agenda
Project 2008-06 Cyber Security Order 706 SDT
Draft 20th Meeting Agenda
April 13, 2010, Tuesday- 1 PM to 5:30 PM EST
April 14, 2010 Wednesday- 8 AM to 6:15 PM EST
April 15, 2010 Thursday- 8 AM to 5 PM EST
April 16, 2010 Friday- 8 AM to 12 PM EST
Georgia Power
241 Ralph McGill Blvd
Atlanta, GA 30308
NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes

- Review the revised CSO 706 SDT 2010 Work plan and Schedule
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan and the May 2010 Technical Workshop
- Review, refine and adopt the Draft Final CIP-002-4 for industry informal comment
- Review, refine and adopt the Sub-Team Security Control Requirements draft for industry informal comment
- Develop related CIP 002 and Security Controls Requirements Guidance Documents
- Agree on next steps and assignments

Draft Agenda

Tuesday **April 13, 2009**
1:00 p.m. Welcome and Opening Remarks- *John Lim, Chair & Phil Huff, Vice Chair*

	Roll Call; NERC Antitrust Compliance Guidelines Facilitator review and SDT acceptance of March 9-12, 2010 Phoenix SDT meeting summary
1:10	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
1:15	Review and Discussion of CSO 706 SDT Workplan and Schedule - March-December, 2010- *Stu Langton*
1:45	Updates on other related cyber security initiatives- *NERC Staff and SDT Members*
1:55	Update on CIP Communication Plan and May 2010 Technical Workshop - *Carl Dombek*
2:15	Overview of Single Text- CIP-002-4 & Security Controls Requirements
2:45	*Break*
3:00	Review of Revised CIP-002-4 Draft Final and SDT Industry Response Document- *CIP-002-4 Drafting Team, John Lim et al.*
3:30	Full Team Consensus Testing on Refinements of draft final CIP 002-4
5:25	Review of Proposal for Wednesday Agenda
5:30	*Recess* ▪ *Possible Security Controls Requirements Sub Team Meetings- Evening* ▪ *If needed, CIP-002 Drafting Team to meet to finalize draft and present for adoption Wednesday morning.*

Wednesday	**April 14, 2010**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucierro*
8:10	Final Review of CIP-002-4 as revised
9:00	Security Governance Requirements- Overview and Consensus Testing
10:30	Break
10:45	Personnel and Physical Security Requirements and Guidance- Overview and Consensus Testing
12:15	Working Lunch
1:00	Operations Security Requirements and Guidance - Overview and Consensus Testing
2:30	Break
2:45	Recovery and Response Requirements- Overview and Consensus Testing
3:45	Access Control and Auditing- Requirements- Overview and Consensus Testing
5:00	Change Management, System Lifecycle and Information Management- Requirements- Overview and Consensus Testing
6:15	*Recess* ▪ *Possible Security Controls Requirements Sub Team Meetings- Evening*

Thursday	**April 15, 2010**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucierro*
8:10	Security Controls Sub-Teams Refinement Sessions
10:00	Break
10:15	Security Controls Sub-Teams Refinement Sessions
12:00	*Working Lunch*

1:00	Full Team Review and Consensus Testing on Final Draft
3:00	Break
3:15	Full Team Consensus Testing on Refinements-*Continued*
4:15	Motion to Adopt in Concept Draft CIP 002 and Security Controls Requirements for Informal Comment Posting Review Any Drafting Assignments and Friday Agenda
5:00	*Recess* ▪ *As needed ad-hoc drafting groups- Evening*

Friday	**April 16, 2010**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucierro*
8:10	Sub-Team Development of Guidance Documents
10:15	*Break*
10:30	SDT Review and Suggested Refinement of CIP Guidance Documents
11:15	Review of May 2010 Technical Workshop Planning and Preparation
11:45	Review of Dallas Agenda and Agree on Next Steps and Meeting Evaluation
12:00	*Adjourn & Lunch*

Appendix # 2 Attendees List
March 9-12, 2010, Phoenix, Arizona

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation
2. Jim Brenton	ERCOT (T/W/Th)
3. Jay S. Cribb	Southern Company Services
4. Sharon Edwards	Duke Energy
5. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
6. Gerald S. Freese	America Electric Pwr. (T/W/Th)
7. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
8. Doug Johnson	Exelon Corporation – Commonwealth Edison
9. Frank Kim	Hydro One Networks Inc. (T/W/Th)
10. Rich Kinas	Orlando Utilities Commission (Th/F)
12. John Lim, Chair	Consolidated Edison Co. NY
13. David Norton	Entergy (T/W/Th)
14. David S. Revill	Georgia Transmission Corporation
15. Scott Rosenberger	Luminant Energy (T/W/Th)
16. Jonathan Stanford	Bonneville Power Administration
17.Tom Stevenson	Constellation
18.Keith Stouffer	National Institute of Standards & Technology (T/W/Th)
19. John Van Boxtel	WECC
20. John D. Varnell	Technology Director, Tenaska Power Services Co.
21. William Winters	Arizona Public Service, Inc.
Scott Mix	NERC
Howard Gugel	NERC
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Hal Beardal	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center
Tom Hoffstetter	NERC (Thurs a.m. by phone)

SDT Members Attending via ReadyTalk and Phone

22. Jackie Collett	Manitoba Hydro
23. Patricio Leon	Southern California Edison (T/W/Th)
24. Kevin Sherlin	Sacramento Municipal Utility District (Th)

SDT Members Not Participating

Joe Doetzl	Kansas City Pwr. & Light Co

Others Attending in Person

Jim Fletcher	AEP
Brian Newell	AEP
Bryn Wilson	OGE
Clyde Poole	TDITX
Rod Hardiman	Southern Company
Elizabeth Moses	Georgia Transmission
Jason Marshall	Midwest ISO

Others Attending via WebEx and Phone

Andres	Lopez	andres.lopez@usace.army.com
Justin	Kelly	FERC
John	Fridye	jfridye@rrienergy.com
Steve	Newman	srnewman@midamerican.com
Maggy	Powell	margaret.powell@constellation.com
Bill	Keagle	william.a.keagle.jr@constellation.com
Steve	Newman	srnewman@midamerican.com
Jerome	Farquharson	jfarquharson@burnsmcd.com

Appendix # 3 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that
violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect
NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Sub-groups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost
- information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.

- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Sub-groups) may have a negative impact on particular entities and thus in that sense adversely
impact competition. Decisions and actions by NERC (including its committees and Sub-groups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Sub-group, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on

- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

APPENDIX # 4
CSO 706 SDT MEETING SCHEDULE
APRIL –DECEMBER 2010

Schedule Convergence: Full CIP V4 Package		
Date	**Week of**	**CIP Task**
SDT Meeting-Atlanta, (4/13-16)	4/12/2010	**Present Controls draft for full team review and comment. Sub team drafting. Finalize draft for Informal Comment, Full Package**
	4/19/2010	**NERC Prepares Full Package for Industry Comment**
	4/26/2010	**SDT Reviews and Approved Full Package for 30-day Industry Comment Period**
5/3/2010	5/3/2010	***Informal Comment Posting for full package starts Completes on 6/2/2010***
SDT Meeting-Dallas, (5/11-14)	5/10/2010	**Prepare for Industry Workshop**
5/19 & 5/20/2010	5/17/2010	**1.5-day Industry Technical Workshop (Dallas, TX)**
	5/24/2010	**SDT Considers Comments from Workshop**
6/4/2010	*5/31/2010*	***2nd Informal comment period ends***
6/2/2010		***Comment Period Ends***
6/3-6/4/2010		***SDT Summarizes Comments Received***
SDT Meeting, Sacramento (6/8-11)	6/7/2010	**SDT Meeting: Comment review, response process, re-drafting, as needed**
	6/14/2010	Sub team meetings
	6/21/2010	Sub team meetings
6/29/2010	6/28/2010	Sub team meetings. SDT interim online meeting.
	7/5/2010	Subteams Package modifications into Standard documents
SDT Meeting, Pittsburgh, (7/13-16)	7/12/2010	**Finalize & Approve Documents for posting for 45 day formal comment period**

Schedule Convergence: Full CIP V4 Package		
Date	**Week of**	**CIP Task**
	7/19/2010	***NERC Prepares Materials/SDT Approves Revisions/NERC Seeks SC Approval for Ballot***
7/26/2010	7/26/2010	***45 Day formal comment period starts (completes 9/8/10) /Ballot Pool formation (completes 8/25/10)***
	8/2/2010	**Industry Comments on Standards**
SDT Meeting, TBD, (8/10-13)	8/9/2010	**SDT Meeting: Prepare for Industry Webinar**
8/18/10	*8/16/2010*	***Hold Industry Webinar***
8/25/2010	8/23/2010	***30 Ballot Preview/Initial Comment Preview ends/Ballot Pool formed***
8/30/2010	*8/30/2010*	***Initial Ballot Starts***
SDT Meeting Winnipeg, (9/7-10)	9/6/2010	**Respond to comments received. Drafting revisions. Review Ballot Results and Additional Comments**
	9/8/2010	**Initial Ballot Ends**
	9/13/2010	Sub team meetings
9/24/10	9/20/2010	Sub team meetings; Full SDT on-line meeting to adopt revised draft of documents
	9/27/2010	NERC Staff Review of Documents and SDT Approval for Re-ballot
10/4 to 10/13/10	10/4/2010	Re-Ballot Period Begins
SDT Meeting TBD, (10/12-15)	10/11/2010	**Prepare responses to 2nd ballot comments**
10/19/2010	*10/18/2010*	***Sub-teams meet to adjust requirements***
10/29/2010	10/25/2010	***Prepare & Finalize revisions to standards and responses to comments on standards***
	11/1/2010	NERC Staff Review of Documents and SDT Approval for Re-ballot
11/8 to 11/17/2010	11/8/2010	3rd Ballot Period Begins

Schedule Convergence: Full CIP V4 Package		
Date	**Week of**	**CIP Task**
SDT Meeting TBD, (11/16-19)	11/15/2010	**Prepare responses to 3rd Ballot comments**
	11/22/2010	*NERC & SDT finalize responses to ballot package*
	11/29/2010	*Seek SC & BOT Approval for Filing*
	12/6/2010	*Seek SC & BOT Approval for Filing*
SDT Meeting TBD, (12/13-17)	12/13/2010	**SDT Meeting to review Filing and Celebrate Project Completion**
	12/24/2010	*Submit for Regulatory Approval*

Appendix #5

CSO 706 SDT DRAFTING SUB-TEAMS

Sub-Team	NERC Standards and DHS Control Families	Team Members
Security Governance	CIP-003 – R1, R2, R3; CIP-005 R4, CIP-007 R8 DHS 2.1 Security Policy, DHS 2.2 Organizational Security, DHS 2.7 Strategic Planning, DHS 2.17 Monitoring and Reviewing Control System Security Policy, DHS 2.18 Risk Management and Assessment, DHS 2.19 Security Program Management	Jon Stanford (Lead), Jerry Freese, Dave Norton
CIP 002-4	Draft revisions to CIP-002-4, and Summary of Responses to Industry comments	John Lim, Dave Revill, Rich Kinas, Jim Brenton, Jackie Collett, Bill Winters, Dave Norton *Rod Hardiman (Observer)*
Personnel and Physical Security	CIP-004 – R1, R2, R3, CIP-006 R1 through R6 DHS 2.3 Personnel Security, DHS 2.11 Security Awareness and Training DHS 2.4 Physical and Environmental Security,	Doug Johnson (Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin
Operations Security	CIP-005 R1, R3 CIP-007 R2, R3, R4, R6 DHS 2.8 System and Communication Protection DHS 2.14 System and Information Integrity	Jay Cribb (Lead), Jim Brenton, Jackie Collette, John Varnell
Recovery and Response	CIP-008 R1 & R2 CIP-009 R1 through R5 Incidence Response and Contingency Planning	Scott Rosenberger (Lead), Joe Doetzl, *Observer Participants: Jason Marshall*

Security Controls Sub-Team Principles and Drafting Guidance

CSO 706 SDT SECURITY CONTROLS SUB-TEAM DRAFTING PRINCIPLES

(ADOPTED BY CSO 706 SDT, JANUARY, 2010)

1. Applicability [NERC ROP] Each reliability standard shall clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted.	**9.Practicality** [NERC ROP] – Each reliability standard shall establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.
2.Reliabiliy Objective [NERC ROP] Each reliability standard shall have a clear statement of purpose that shall describe how the standard contributes to the reliability of the bulk power system.	**10. Consistent Terminology** [NERC ROP] To the extent possible, reliability standards shall use a set of standard terms and definitions that are approved through the NERC reliability standards development process.
3.Performance Requirement or Outcome (NERC ROP) Each reliability standard shall state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest.	**11. Commensurate Controls for BES Impact Categories.** Security controls shall be commensurate with the identified level of BES impact categories.
4. Measurability (ROP) Each performance requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement.	**12. Change Documentation.** Changes from prior versions of CIP Standards have clear rationale. These include the following types of changes: a. Above and beyond the current standards; b. Removal of requirements; and c. Major formatting changes.
5.Technical Basis in Engineering and Operations [NERC ROP] Each reliability standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.	**13. Reduce Administrative Overhead**. Administrative documentation shall be kept to the minimum that is necessary
6. Completeness (NERC ROP) Reliability standards shall be complete and self-contained. The standards shall not depend on external information to determine the required level of performance.	**14. Priority.** Implementation plans for the Standards are prioritized according to level of BES impact.
7. Consequences for Non-Compliance [NERC ROP] In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, the consequences of violating a standard are clearly presented to the entities responsible for complying with the standards.	**15. Eliminate or Minimize TFEs.** Security controls shall eliminate or at least minimize the need for TFEs. Allow for compensating controls to mitigate the need for a TFE.
8. Clear Language [NERC ROP] – Each reliability standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.	

SECURITY CONTROLS SUB-TEAM
PROCESS AND DRAFTING GUIDANCE AND DELIVERABLES

Guidance from the January, 2010 Tucker Meeting and the February 2010 Austin Meeting

For the purpose of maintaining consistency across the teams and capturing interim decisions and change documentation, each team should utilize the following development process:

1. **DHS Catalogue of Controls:** Begin by identifying applicable controls that are enumerated in the *DHS Catalog of Control System Security Recommendations* for High Impact Cyber Systems.
2. **Cross Reference CIP Version 3 Requirements/sub-Requirements:** For each security control identified in step 1, cross reference the CIP version 3 Requirement/sub-Requirement or validate previous mapping work.
3. **Specific not Prescriptive:** As a general rule, be specific but not prescriptive in writing the requirements.
4. **"What" not "How":** In general, seek to draft a "what" requirements, not "how" requirements.
5. **Develop the requirement language** for each security control identified in step 1.
   a. When mapping to existing CIP requirements, use language from CIP, making improvements where needed.
   b. When no associated requirement from CIP exists, develop the new requirement using language from the *DHS Catalog*.
6. **Document significant changes to CIP Standards:** Document significant changes made to previous versions of the CIP Standards. Conceptual or broad changes can be captured by a single statement.
7. **Incorporate existing CIP requirements not mapped to the *DHS Catalog*.** If a requirement is no longer necessary because the intent was captured elsewhere, then include this in the change documentation.
8. **Address specific directives from FERC Order 706** that may be applicable to the requirement.
9. **Analysis and Determination of Requirements for Medium and Low Impact:** In the analysis and determination of applicability of requirements to Medium and Low Impact Cyber Systems, consider the cost in relation to the security benefits (i.e., a minimal cost requirement that significantly mitigates risk would apply to *ALL* Cyber Systems. Similarly, a significant cost requirement that minimally reduces risk or provides little additional security may apply only to *HIGH* impact Cyber Systems).
10. **Specify Applicability to Environments:** Specify applicability of a requirement to Generation, Transmission, and/or Control Center environments.
11. **Apply Requirements to BES Cyber System:** Requirements should apply to either:
    (a) The BES Cyber System as a whole, or
    (b) Components of the BES Cyber System. However, when a requirement only applies to specific types of components, Sub-Teams should describe those types of components to determine where component classes exist.

(c) Requirements specific to boundary protection or ESP can be written to the interface of the BES Cyber System.

12: **Level of Requirements:** Sub-Teams should generally write the requirements at a high enough level to avoid applicability of specific technology. Where there are applicable CIP requirements, start with the CIP words and tweak if needed to include some DHS language/concept. However, the "level" of the requirements text should be raised, if needed.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 SDT — Project 2008-06

May 11, 2010 | 1:00 PM to 5:00 PM CDT
May 12, 2010 | 8:00 AM to 5:00 PM CDT
May 13, 2010 | 8:00 AM to 12 PM CDT
Dallas TX

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- Review the CSO 706 SDT 2010 Work plan and Schedule;
- Review and adopt the CSO 706 SDT 2010 Consensus Procedures as refined;
- Receive updates on other related cyber security initiatives;
- Receive a NERC overview of the Technical Workshop;
- Review and Refine "Parking Lot" Issues from the April, 2010 CIP Documents for Informal Posting;
- Sub-Teams will: detail how FERC directives have been addressed; develop a "change documentation" draft; develop Technical Workshop Presentations; and identify possible guidance areas and bullet lists of guidance content;
- To review a proposal for drafting a CIP Guidance Document for posting in July, 2010;
- To review how the SDT will develop the CIP Measures, VSLs and VRFs for posting in July, 2010;
- To review the May 27, 2010 meeting with NERC/SDT and FERC; and
- Agree on next steps and assignments

Draft Agenda

Tuesday **May 11, 2009**

1:00 p.m.	Welcome and Opening Remarks— *John Lim, Chair & Phil Huff, Vice Chair* Roll Call; NERC Antitrust Compliance Guidelines— *Joe Bucciero* Facilitator review and SDT acceptance of April 13-16, 2010 Atlanta SDT meeting summary
1:10	Review of Meeting Objectives, Agenda and Meeting Guidelines— *Bob Jones*
1:15	Review of April, 2010 Development of the Informal Documents for Posting- What Worked, What Could be Improved

1:30	Discussion of CSO 706 SDT Workplan, Schedule and Sub-team Expectations: May-December, 2010— *Stu Langton*
1:45	Review of Draft SDT Consensus Procedures
2:00	Updates on other related cyber security initiatives— *NERC Staff and SDT Members*
2:10	Technical Workshop Overview- Planning and Preparation- *Gerry Adamski?*
2:30	Review and Refine of "Parking Lot" Issues Draft from the April, 2010 Informal Posting Documents
3:00	*Break*
3:15	Review and Refine of "Parking Lot" Issues Draft from the April, 2010 Informal Posting Documents
4:45	Review of Expectations for Sub-Team Meetings on Wednesday
5:00	*Recess* ▪ *Possible Sub Team Meetings- Evening*

Wednesday **May 12, 2010**

8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucciero*
8:10	Security Controls Sub-Team Meetings Orientation and Expectations: • Detail how FERC directives have been addressed; • Develop a "change documentation" draft; • Develop Technical Workshop Presentations; • Identify possible guidance areas and bullet lists of guidance content; and • Begin to identify possible measures, VSLs and VRFs for Formal Comment posting in July.
8:30	Security Controls Sub-Team Meetings
10:30	Break
10:45	Security Controls Sub-Team Meetings
12:30	*Working Lunch*
1:15	Sub-Team Report CIP- 010- FERC directives, Change Documentation and Technical Workshop Presentations, Guidance Bullets
2:00	Sub-Team Reports CIP- 011 FERC directives, Change Documentation and Technical Workshop Presentations, Guidance Bullets
3:00	Break
3:15	Sub-Team Reports CIP- 011 FERC directives, Change Documentation and Technical Workshop Presentations, Guidance Bullets-*continued*
4:55	Review of Proposal for Thursday Agenda
5:00	*Recess* ▪ *Possible Sub Team Meetings- Evening*

Thursday **May 13, 2010**

8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucciero*

8:10	Sub-Team Reports CIP- 011 FERC directives, Change Documentation and Technical Workshop Presentations, Guidance Bullets-*continued*
10:00	*Break*
10:15	Review Proposal for a Guidance Document Drafting Team
10:30	Review How Measures, VSLs and VRFs will be Produced.
10:45	Review and Adopt SDT Consensus Procedures
11:00	Review May 27, 2010 NERC/SDT Meeting with FERC
11:15	Review of May 2010 Technical Workshop Planning and Preparation including Tuesday evening SDT Technical Workshop "Walk Through."
11:45	Review of Sacramento Agenda and Agree on Next Steps and Meeting Evaluation
12:00	*Adjourn & Lunch*

Cyber Security Order 706 Standard Drafting Team (Project 2008-06)

1. Chairman	**John Lim**, CISSP Department Manager, IT Infrastructure Planning	Consolidated Edison Co. of New York New York, New York
2. Vice-Chairman	**Philip Huff** Manager, IT Security and Compliance	Arkansas Electric Cooperative Corporation Little Rock, Arkansas
Members		
3.	**Robert Antonishen** Protection and Control Manager, Hydro Engineering Division	Ontario Power Generation Inc. Niagara-on the-Lake, Ontario
4.	**Jim Brenton**, CISSP-ISSAP Director, CIP Standards Development	Electric Reliability Council of Texas, Inc. Taylor, Texas
5.	**Jackie Collett** Cyber Security Operations Engineer	Manitoba Hydro Winnipeg, Manitoba
6.	**Jay S. Cribb** Information Security Analyst, Principal	Southern Company Services, Inc. Atlanta, Georgia
7.	**Joe Doetzl** Manager, Information Security	Kansas City Power & Light Co. Kansas City, Missouri
8.	**Sharon Edwards** Project Manager	Duke Energy Cincinnati, Ohio
9.	**Gerald S. Freese** Director, Enterprise Information Security	American Electric Power Columbus, Ohio
10.	**Jeffrey Hoffman** Chief Architect IT Policy & Security Division	U.S. Bureau of Reclamation Denver Federal Center Denver, Colorado
11.	**Doug Johnson** Operations Support Group Transmission Operations & Planning	Exelon - Commonwealth Edison Lombard, Illinois
12.	**Patricio Leon-Alvarado** Engineer, E&TS Compliance and Quality	Southern California Edison Pomona, California
13.	**Frank Kim** Director, Power System Information Tech.	Hydro One Networks, Inc. Barrie, Ontario
14.	**Richard Kinas** Manager of Standards Compliance	Orlando Utilities Commission Orlando, Florida
15.	**David L. Norton** Policy Consultant - CIP	Entergy Corporation New Orleans, Louisiana
16.	**David S Revill** Group Lead, Electronic Maintenance	Georgia Transmission Corporation Tucker, Georgia
17.	**Scott Rosenberger** Director, Security and Compliance	Luminant Dallas, Texas
18.	**Kevin Sherlin** Manager, Business Technology Operations	Sacramento Municipal Utility District Sacramento, California
19.	**Jon Stanford** Chief Information Security Officer	Bonneville Power Administration Portland, Oregon
20.	**Thomas Stevenson** Gen Supv. Engineering Projects Generation Services Dept	Constellation Energy Baltimore, MD
21.	**Keith Stouffer** Program Manager, Industrial Control System Security	National Institute of Standards & Technology Gaithersburg, Maryland
22.	**John Van Boxtel** CIP Compliance Engineer	Western Electricity Coordinating Council Vancouver, WA 98662
23.	**John D. Varnell** Director, Asset Operations Analysis	Tenaska Power Services Co. Arlington, Texas

24.	**William Winters** IS Senior Systems Consultant	Arizona Public Service Co. Phoenix, Arizona
Consultant to NERC	**Joseph Bucciero** President and Executive Consultant	Bucciero Consulting, LLC 3011 Samantha Way Gilbertsville, Pennsylvania 19525
Facilitator Consultant	**Hal Beardall**	FCRC Consensus Center Florida State University
Facilitator Consultant	**Robert M. Jones**	FCRC Consensus Center Florida State University
Facilitator Consultant	**Stuart Langton, PhD**	FCRC Consensus Center Florida State University
NERC Staff	**Gerard Adamski** Vice President and Director of Standards	North American Electric Reliability Corporation Princeton, New Jersey
NERC Staff	**Michael Assante** Vice President & CSO	North American Electric Reliability Corporation Princeton, New Jersey
NERC Staff	**Howard L. Gugel** Standards Development Coordinator	North American Electric Reliability Corporation Princeton, New Jersey
NERC Staff	**Roger Lampila** Regional Compliance Auditor	North American Electric Reliability Corporation Princeton, New Jersey
NERC Staff	**Scott R Mix** Manager Infrastructure Security	North American Electric Reliability Corporation Princeton, New Jersey
NERC Staff	**David Taylor** Manager of Standards Development	North American Electric Reliability Corporation Princeton, New Jersey
NERC Staff	**Todd Thompson** Compliance Investigator	North American Electric Reliability Corporation Princeton, New Jersey

CSO 706 SDT SCHEDULE: FULL CIP V4 PACKAGE		
Week Of	*Key Dates*	*CIP Task*
4/12/2010	**SDT Meeting Atlanta, GA (SouthernCo) (4/13-16)**	**Present Controls draft for full SDT review and comment. Sub team drafting. Finalize draft for Informal Comment, Full Package**
4/19/2010	4/19-4/23/2010 4/23/2010	**SDT Sub-Teams and Leads Meet to Finalize Documents** **NERC Receives and Prepares Full Package for Industry Comment**
4/26/2010	**4/26/2010** **4/27/2010** **4/28/2010** **4/29/2010**	**SDT Sub-Teams Develop Package** **SDT Reviews with NERC Staff Proposals** **SDT Scoping Meeting on Documents** **SDT Reviews and Approves Full Package for 30-day Industry Comment Period**
5/3/2010	**5/4/2010**	**Informal Comment Posting for full package starts** **Completes on 6/3/2010**
5/10/2010	**SDT Meeting Dallas, TX (Luminant) (5/11-13)**	**Review Parking Lot Issues, Prepare for Industry Workshop and Begin Development of Guidance Documents**
5/17/2010	5/19 & 5/20/2010	**1.5-day Industry Technical Workshop (Dallas, TX)**
5/24/2010	5/24 to 5/28/2010 5/27/2010	**SDT Considers Comments from Workshop** **Meeting with FERC to Review Standards and Posting**
5/31/2010	6/3/2010 6/4/2010	**Informal comment period ends** **SDT Reviews Comments Received** Sub team meetings to Review Comments Received
6/7/2010	6/7/2010 **SDT Meeting, Sacramento, CA (SMUD) (6/8-11)**	Sub team meetings to Review Comments Received **SDT Meeting: Industry Comment review, response process, re-drafting, as needed**
6/14/2010		Sub team meetings
6/21/2010		Sub team meetings
6/28/2010	6/29/2010	Sub team meetings. SDT interim online meeting.
7/5/2010		Sub teams Package modifications into Standard documents

CSO 706 SDT SCHEDULE: FULL CIP V4 PACKAGE		
Week Of	*Key Dates*	*CIP Task*
7/12/2010	**SDT Meeting, Pittsburgh, PA (CERT) (7/13-16)**	**Finalize & Approve Documents for posting for 45 day formal comment period**
7/19/2010		**NERC Prepares Materials/SDT Approves Revisions/NERC Seeks SC Approval for Ballot**
7/26/2010	7/26/2010	**45 Day formal comment period begins (closes on 9/8/2010)**
8/2/2010		**Formal comment period for CIP standards**
8/9/2010	**SDT Meeting, Chicago, IL (ComEd) (8/10-13)**	**SDT Meeting: Prepare for Industry Webinar**
8/16/2010	8/16/2010 8/18/2010	**Ballot Pool Formation Begins (completes 8/30/2010)** **Hold Industry Webinar (tentative)**
8/23/2010	8/25/2010	**Comment Preview Period Ends** **Ballot Pool formed**
8/30/2010	8/30/2010	**Initial Ballot Begins**
9/6/2010	**SDT Meeting Winnipeg, Canada (Manitoba Hydro) (9/7-10)**	**Respond to comments received. Drafting revisions. Review Ballot Results and Additional Comments**
9/8/2010		**Initial Ballot Ends**
9/13/2010		Sub team meetings
9/20/2010	9/24/2010	Sub team meetings; Full SDT on-line meeting to adopt revised draft of documents
9/27/2010		NERC Staff Review of Documents and SDT Approval for Re-ballot
10/4/2010	10/4 to 10/13/2010	Re-Ballot Period
10/11/2010	**SDT Meeting, Toronto, Canada (OPG) (10/12-15)**	**Prepare responses to 2nd ballot comments**
10/18/2010		**Sub-teams meet to adjust requirements**

CSO 706 SDT SCHEDULE: FULL CIP V4 PACKAGE		
Week Of	*Key Dates*	*CIP Task*
10/25/2010	10/29/2010	**Prepare and Finalize revisions to standards and responses to comments on standards**
11/1/2010		NERC Staff Review of Documents and SDT Approval for Re-ballot
11/8/2010	11/8 to 11/17/2010	3rd Ballot Period (if needed)
11/15/2010	**SDT Meeting, Baltimore, MD (Constellation Energy) (11/16-19)**	**Prepare responses to 3rd Ballot comments**
11/22/2010		*NERC and SDT finalize responses to ballot package*
11/29/2010		*Seek SC and BOT Approval for Filing*
12/6/2010		*Seek SC and BOT Approval for Filing*
12/13/2010	**SDT Meeting Tampa, FL (FRCC) (12/13-17)**	**SDT Meeting to review Filing Project Completion**
12/24/2010		***Submit for Regulatory Approval***

CYBER SECURITY FOR ORDER 706 STANDARD DRAFTING TEAM
Proposed Refinements to CSO 706 SDT Consensus Guidelines *(May, 2010)*

(To be Reviewed at the May 11-13, 2010 CSO 706 SDT Meeting in Dallas, TX)

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

Consensus Defined. Consensus is a participatory process whereby, on matters of substance, the Team strives for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for posting CIP standards documents for industry comment or balloting, and the Team finds that 100% acceptance or support of the members present is not achievable, decisions to adopt standards documents for balloting will require at least 75% favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing a Team consensus on substantive issues, which the industry will need to approve, by a 2/3's vote.

Postings for Industry Comment. For decisions on CIP standards documents to be posted for industry comment where the Team finds that 75% acceptance or support is not achievable but an option or options under consideration had greater than 50% support from the Team, the Team's accompanying Comment form will seek industry input to help the Team resolve any differences and select an option going forward.

Quorum Defined. The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 2/3 of the appointed members being present in person or by telephone.

Electronic Mail Voting. In instances when a quorum is not present (in the room and/or on the phone), the Chair may call for an option or proposal to be circulated by electronic mail for a vote by all SDT members. The notice of an electronic mail vote with a deadline will be conveyed by electronic mail to all SDT members. Results of an electronic mail vote will be sent to all SDT members and those on the "plus" list and reviewed at the next face-to-face SDT meeting.

Consensus Building Techniques and Robert's Rules of Order. The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Only Team members may participate in consensus ranking or votes on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Chair, Vice Chair or Facilitator.

The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure)*, as modified by the Team's adopted procedural guidelines, to make and approve motions. However, the 75% super-majority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision-making on substantive motions and amendments to motions. The Team will develop substantive written materials and options using their adopted

facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once the Chair determines that a facilitated discussion is completed.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

SDT Consensus Guidelines
Adopted Unanimously, November 13, 2008

Cyber Security for Order 706 Standard Drafting Team

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

General consensus is a participatory process whereby, on matters of substance, the members strive for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for the final package of recommended revisions, and the Team finds that 100% acceptance or support of the members present is not achievable, final consensus recommendations will require at least 75% favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing consensus throughout the process on substantive issues with the participation of all members. In instances where the Team finds that even 75% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team.

The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Team members, NERC staff and facilitators will be the only participants seated at the table. Only Team members may participate in consensus ranking or vote on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Facilitator and all written comments submitted on the comment forms will be included in the Team and facilitators' summary reports.

The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 51% of the appointed members being present (simple majority). The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure),* as modified by the Team's adopted procedural guidelines, to make and approve motions; however, the 75% supermajority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision making on substantive motions and amendments to motions. In addition, the Team will utilize their adopted meeting guidelines for conduct during meetings. The Team will make substantive recommendations using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once a facilitated discussion is completed.

The presiding chair and/or Facilitator of the SDT, in general, should use parliamentary procedures set forth in Robert's Rules of Order, as modified by the Team's adopted procedural guidelines.

To enhance the possibility of constructive discussions as members educate themselves on the issues and engage in consensus-building, members agree to refrain from public statements that may prejudge the outcome of the Team's consensus process. In discussing the Team process with the media, members

agree to be careful to present only their own views and not the views or statements of other participants and/or may direct such inquiries to the Team Chair and Vice Chair. In addition, in order to provide balance to the Team process, members agree to represent and consult with their stakeholder interest group.

CSO706 SDT April 13-16, 2010 Meeting Summary Contents

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CSO706 SDT APRIL 13-16, 2010 MEETING
EXECUTIVE SUMMARY

On Tuesday afternoon, the Chair, John Lim welcomed the members to the SDT's 21st meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. The host Jay Cribb, a SDT member, welcomed everyone to the facilities and covered logistics. Bob Jones, facilitator, reviewed the proposed meeting agenda. On Friday morning the SDT approved without objection the meeting summary for the March 9-12, 2010 SDT session in Phoenix, Arizona. Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines.

Stu Langton presented a proposed CSO 706 SDT schedule which was circulated within a day of the meeting and made adjustments in the process to allow for NERC reviews and formatting of materials.

John Lim provided an overview of the revisions of CIP-002 Draft Final and SDT Industry Response Document since the Phoenix meeting. The SDT discussed the following topics:

- "Immediately affect real time operations."
- Interconnections.
- Attachment 2, Item 1.6- 3 or more transmission lines.
- VSLs
- Miscellaneous topics including functions, compliance issues,

The Chair noted that since the Phoenix meeting, much work has been done by the CIP 002 Sub-team responding to the input and suggestions received. The Team sent to NERC staff a preliminary draft for their input. However subsequent to submitting the drafts to NERC, the Sub-teams produced further refinements to their drafts. The Team agreed to review the NERC comments and consider them in relation to the current draft of CIP-010. Howard Gugel led the SDT discussion of the NERC staff comments on the earlier draft of CIP-002 as well as various proposed edits, such as using the term "requirements" throughout the documents, utilizing owner/operator vs. user, defining "immediate" and "situational awareness." The SDT reviewed all of CIP 002 requirements and Attachments #1 and #2 and took a number of polls on whether to accept the proposed NERC edits.

On Friday, John Lim reviewed CIP 002 Sub-team's redline version to address some of the issues raised earlier in the meeting and reviewed the proposed language on: Definition of BES Cyber System and the definition of "immediate"; High impact rating; and Transmission facilities.

On Wednesday, the SDT reviewed the work of the CIP 003-009 Sub-teams since the Phoenix meeting (including Change Management; Access Control and Auditing; Recovery and Response; Operations; and Personnel and Physical Security). The SDT

focused first on reviewing and refining the Security Governance requirements including the proposed 9 category areas.

Wednesday evening the Chair asked Howard Gugel to prepare a sample "proof of concept" for the access control requirements to inform a decision regarding format of the standards.

Thursday afternoon the SDT reviewed each of the sub-team's draft requirements as revised and refined in the sub-team meetings on Wednesday, offering guidance on various issues raised by the draft requirements.

The SDT reviewed and confirmed previous decisions to use tables in the new CIP standards and to formulate objective statements for each requirement. Sharon Edwards presented the work to date on access control including CIP-004 R4, CIP-005 R2, CIP-008 R5 and dispersed throughout the standard as a way to highlighting the presentation of different formats. Following this the SDT reviewed three format options:

- **Option 1.** Keep CIP-003 to-009 and work from there.
- **Option 2**: retire existing CIP standards and organize the new standards by the topics in sequence from CIP-010 on. (e,g,.,Access Control could be CIP-017).
- **Option 3:** One big standard document with 2 sections CIP-010 (formerly CIP-002) and CIP-011 (formerly CIP-003 to -009). All controls requirements would be together in one CIP standard, with CIP-011:
  - R1 (security policies) addressing all topics.
  - R2 implement per table
  - R3- table for access control
  - R4 implement 2nd table (account specifications)
  - etc.

The Team following the discussion of the pros/cons of the options, voted first on each of the three options indicating its acceptability. Following that each Team member voted to support the option they found most acceptable or preferable based on the discussion and their perspective.

Format Option 1: keep existing CIP 003 to 009 in its current form maintaining its existing logical construct (may involve minor movement of existing requirements between standards)

Yes	*No*	*Indifferent/could go either way*
8	**7**	**3**

Format Option 2: Retire 003 to 009, create new CIP 011-17 grouping according to small group assignments.

Yes	*No*	*Indifferent/could go either way*
12	**2**	**6**

Format Option 3: Collapse CIP 003-009 into a single standard that contains all requirements created/edits by the sub-teams and grouped according to sub-team assignments.

Yes	*No*	*Indifferent/could go either way*
12	**7**	**2**

The team then voted for one of the two highest ranked options under consideration:

- Option 2: Retire 003 to 009, create new CIP 011-17 grouping according to small group assignments.
  ***Yes*=6**
- Option 3 Collapse CIP 003-009 into a single standard that contains all requirements created/edits by sub-teams and grouped according to sub-team assignments.
  ***Yes*=10**
- *Abstained from voting for Option #2 or #3:* 4

At the end of Thursday, the Team took up the format issue again. The Vice Chair made a proposal that the Team use Option 2 (which would renumber the requirements using the topics to organize them).

The facilitators polled the team on their support for the **Option #2 (multiple standards) and 7 of 16 members** were in support of utilizing this as the format. An additional member joined and the Team then tested support for **Option 3 (putting all into single standard) and 9 of 17 supported using this format.** Neither format approach received sufficient support to make an SDT decision.

The Team then reviewed and tested support for each of the following propositions:

1. Change from existing CIP numbering system? Yes- 13 favor changing (of 17 = 76%)
2. Adopt the proposed headings for the requirements as the categories whether as one or multiple standards? Yes-13 (of 17 = 76%)

On Friday morning the SDT took up the final review of format options for the informal posting document(s) in order to make a decision.

The facilitator suggested the SDT use an acceptability ranking of the two possible format options that had been discussed and debated yesterday followed by clarification of concerns to see if they could be met and a requisite number of members could agree on the format to use for the informal posting.

- **Option #2 – Requirements in Multiple Standards.** Use the Topical areas discussed on Thursday and utilize multiple standards (example CIP 010 -020). CIP 002 also gets re-numbered.
  4**=3,** 3**=7,** 2**=6,** 1-**0** *(Avg. 2.81)*

- **Option #3 – Requirements all in One Standard.** Use the Topical areas discussed on Thursday, but one new standard is posted containing sections for all topics. 4=**6,** 3=**5,** 2=**3,** 1=**2** *(Avg. 2.93)*

The 17 SDT members present then voted for their preference for posting for informal comment between the two options with the following result:

- **Option #2** *(multiple standards)* **Yes= 6 (35%)**
- **Option #3** *(single standard)* **Yes= 11 (65%)**

The SDT agreed that while this decision to post for informal comment has a majority support (65%) but not the super majority (75%) of the members called for in the decision rules, the Team is asking for industry comment and input on the formats through the comment form before finalizing a format to present in the formal comment draft in July, 2010. The Team discussed that this approach is consistent with the spirit of the following consensus rule provision: "In instances where the Team finds that even 75% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team."

On Friday the Chair reviewed the schedule, assignments and next steps for the SDT to produce a final version for posting on May 3, 2010. Joe Bucciero will lead, with assistance from Howard Gugel, preparation of the draft of comment form with information provided by each of the Sub-team leads. A question will also be added based on the discussion on the format of the CIP Standards. The SDT will need to begin creating an implementation plan for posting in July for formal comment. A small group of SDT members needs to be formed to provide some framework for discussion at the May meeting (in Dallas) and to answer any questions at the May SDT Workshop in Dallas. Scott Mix will be looking for individuals to work with him to prepare the Implementation Plan, and this will occur after May 3. The SDT agreed that the cover letter for the informal May 3 posting of the draft CIP Standards should speak to the SDT's philosophy on implementing the plan. Jackie Collett, John Lim and Doug Johnson agreed to work with Scott Mix on developing a draft implementation plan.

The Chair reviewed and the SDT agreed on the schedule of activities from Monday, April 19, to posting of the draft CIP Standards on Monday, May 3. The Chair and Vice Chair and the SDT thanked Jay Cribb for his excellent hosting and Southern Company for the great facilities.

The meeting adjourned at 12:00 p.m.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CYBER SECURITY ORDER 706 SDT- PROJECT 2008-06
21ST MEETING SUMMARY

April 13-16, 2010
Atlanta, Georgia

I. AGENDA REVIEW AND WORKPLAN

A. Agenda Review

On Tuesday afternoon, the Chair, John Lim welcomed the members to the SDT's 21st meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See Appendix #2*). The host Jay Cribb, a SDT member, welcomed everyone to the facilities and covered logistics. The Chair reviewed the following meeting objectives:

- Review the revised CSO 706 SDT 2010 Work plan and Schedule
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan and the May 2010 Technical Workshop
- Review, refine and adopt the Draft Final CIP-002-4 for industry informal comment
- Review, refine and adopt the Sub-Team Security Control Requirements draft for industry informal comment
- Develop related CIP 002 and Security Controls Requirements Guidance Documents
- Agree on next steps and assignments

Bob Jones, facilitator, reviewed the proposed meeting agenda *(See appendix #1*). On Friday morning the SDT approved without objection the meeting summary for the March 9-12, 2010 SDT session in Phoenix, Arizona.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

B. Workplan Schedule Review

Stu Langton presented a proposed CSO 706 SDT schedule which was circulated within a day of the meeting and made adjustments in the process to allow for NERC reviews and formatting of materials. Joe Bucciero suggested the SDT might want to review this overnight and take up first thing on Wednesday morning.

II. CIP 002 REQUIREMENTS

A. Overview of CIP-002 Requirements

John Lim provided an overview of the revisions of CIP-010 Draft Final and SDT Industry Response Document since the Phoenix meeting, noting the following:

- R1 changes: "Uniquely" changed to the adverb "discretely,"
- Member comments and suggestions included: take the adjective out. Consider "discretely" "distinctly" May not need this word. The call is document all; this may be "lawyer bait."
- R2- "appropriately: added.
- Attachment 2. Used terms defined in the glossary. Didn't change thresholds. 1.2- struck generation. Threshold too high. 1.6- before had separate criteria for protective systems. And protected at 350 or higher without any qualifications. Covered all substations at 350 KV. Not intended. Merged with 1.11 with 1.6.
- Medium: thresholds lower than before. Protection systems with 3 or more lines. Rest fall into the medium.
- Member comments: 2.5- no fax systems- everyone is high? This is an oversight.
- Low Impact: added to be consistent with high and medium.

SDT Comments on Overview

"Immediately affect real time operations."

- Short range planning impact issue? Other situational awareness but not in the "immediately affect real time operations" language? Does it include next day planning?
- John Lim noted that they didn't have a consensus in the group on this.
- "Immediately"- what does this mean? Week, day, now? Are they needed.
- Maybe we should distinguish from planning and real time operation.
- Since you refer to operations planning in part 1. In part 2 need to apply to operations planning.
- Look at beginning of Attachment #1 language.
- Attachment 2- 1.1- "facilities – why combine generation facilities?
- BES cyber system is subject which covers shared cyber system.

Interconnections.

- Texas- lower requirement for ERCOT? Why a separate requirement for ERCOT? Different size in terms of megawatt capability and mode.
- Why have spinning reserve requirements higher in ERCOT?
- This focuses on the Texas and Quebec interconnections.

- Did SDT December posting allowed for regional variation? Not by regional variations but by interconnection variations. Numbers come from category 3 events.
- Definition of control center? Lower threshold will bring in more things. E.g. 1.7 medium- primary and backup control centers? Are these defined? How are they distinguished from control centers? Shouldn't assume everyone understands these terms.
- Work is being done on a NERC back up facilities standard. Went through initial ballot but didn't get support on that proposal.

1.6- 3 or more transmission lines.

- 1.6- what was technical basis behind 3 lines?
- 1.6- 3 or more transmission lines? Individual connectors? What about DC circuit with 2 lines on the tower? One transmission line or referred to as conductors or phases.
- In the context of transmission planning studies, 2 or more would be ridiculous. 3 or more is a good place to draw a line.
- We have redundant subsystems. 3 line threshold may be too low some companies.
- 5 transmission lines would be hard to justify for a national standard. 300 kv above and higher.
- Multiple entities have asked for the technical basis for this. Need to respond if we leave it at 3.
- "Or that remotely control a BES asset with a high impact rating" Asset= facility? Hardware?

VSLs

- VSLs measure R1 in terms of how many you miss. Assumes auditors know the right total. How will this be computed. This is defined by the entity. These are squishy number to begin with.
- Auditors won't use this. This is not looked at part of the audit itself. Use only when there is an alleged violation. After a potential violation an investigation is conducted to confirm a violation and the circumstances associated with a violation. Then someone comes to do analysis what the count should have been.
- Every requirement must have a VSL or FERC won't accept.
- We can make this a number vs. a %. 1, 2 or 3. Have not been identified more than 3 high.
- Previous VSLs had numbers. Some entities have suggested 5 could be a small number.
- Don't see the difference between 1 and %. Issue is entity is identifying the cyber system. Investigator and entity work together to define- a number or % calculated.
- Are we spending too much time on VSLs? Difficult to correlate the auditing fine and the VSLs. What value is added by debating VSLs *ad naseum*.
- What about using "misidentified"
- Get rid of % but develop better definition of the BES cyber system

Miscellaneous

- Is the whole functions area a mush?

- BES cyber system identification is up to the entity. Entities will appropriately draw the line in different ways.
- This is where we need NERC compliance to weigh in to provide advice to the SDT.
- Concrete recommendation: Eliminate line 1 on chart since it is untenable since you can't calculate a %.
- This is not an audit tool to determine if you have met the requirement.
- Requirement is to identify all BES cyber systems.
- First step is to find if you find a BES cyber system that wasn't identified. The investigator will develop the list.
- Add "Additional"?
- From #2, on it presupposes you have a list.

B. NERC Suggested Edits for CIP 002-4 *(Including Maureen Long and Dave Taylor)*

The Chair noted that since the Phoenix meeting, much work has been done by the 002 Sub-team responding to the input . The Team sent to NERC staff a preliminary draft for their input. However subsequent to that the Sub-teams produced further refinements to their drafts. The Team agreed to review the NERC comments in relation to the current draft 002. Howard Gugel led the SDT discussion of the NERC staff comments on an earlier draft of the SDT.

SDT Comments and Polls

Definitions section.

- Functions sentence should remain.
- List doesn't have a proper introduction in Dave's edits.
- Computer systems themselves are control centers, not the dispatch arena etc.? Not supporting
- In the field- this is a control center.
- Is there a something out there- is a computer or a programmable controller.
- This is the first time the SDT is using "computer systems"- will be confusion on this.
- Remote data collection equipment as well.
- A control system vs. control center? Leery to tying back to computers.
- Does fix some physical security if only around computer systems.
- Tied back to EOP 8. Do you need to define control center?
- Go back to original wording. Not trying to define BES cyber system.
- "associated"
- Propose striking second sentence.
- EOP 8- strong linkages with other standards raise double jeopardy issues.
- **Retaining the SDT language:**

Y	N
15	0

- **Add "Functions that support"**

Y	N
15	0

- "typically" in the second sentence)-
- For a definition, we should remove the second sentence.
- "At a minimum"? No.
- Are we removing reference to real time operations?

- Retain the 2nd sentence and remove "typically"?
- Delete: "listed below" in first sentence.
- All agreed. 002 Sub-team will follow up with these changes.
- Purpose addition. OK
- "including the date the identification was performed"? OK no objections all agreed.

R-1

- The 1st thing NERC suggested was to make 1 and 2 a single requirement that has 2 parts.
- If you don't put criteria on correctly but come up with violation. If you have list and criteria. Violation for either part? Or if stick with separately changes for R1 and R2. This might eliminate struggles with VSL statement earlier.
- R1- from "all " to "each"? "One or more" If we use R1. Why not make R3 subset of R1?
- NERC had advised against doing sub-requirements?
- Sub points not sub requirements. All one requirement. This is very confusing.
- Leaning towards keeping current structure.
- This format is being used in other standards. Filed with FERC. May be obligated to use. Either way may be acceptable.
- Benefit to sub numbering format. Keeps together things by. Sub numbers help clarify the numbers intent.
- In favor: of **Sub numbers option**

Y	N
7	9

- NERC's suggestions on R1. Requirement is to "identify" and "all" vs. "each". Identify and document each.
- **Should we accept the NERC R-1 recommendations?**

Y	N
1	16

- **Delete "Document"**

Y	N
2	15

- **"Each"**

Y	N
5	12

- Make sure you identify all cyber systems. Indentify suggests uniqueness.
- "Each" identify something- each in a set. Discreetly" problems with how you document. E.g. on multiple lists vs. 1 list.
- What do we mean by BES cyber system- box or applications? What does discreet"
- **Delete "Discreetly**

Y	N
16	0

- Use vs. own (regardless of whether you own it). E.g. I.d. 3rd party tagging application. Have to do something about. "Owns not uses"

- Note that asset owners and operators make for a big difference. Possibly use: "Owns, operates or owns/operates"
- Owner knows what the equipment is but the Operator may not.
- BES cyber systems that execute or enable?
- **"Owns" vs. "uses"**

Y	N
13	4

- Its got to be ownership or else there will be big headaches. Asset means ownership.
- What about jointly owned? Agreements/contracts would address those kinds of issues.
- SDT should lock it one way or another. There will be fewer exceptions with owned than "operates."
- To enable functions. Applicability is solved earlier. This is not the best place to deal with this. Applicability to the standard. The entity will resolve, not us.
- Leaving executes and enables?
- Taking out is not appropriate- Whatever we decide. It will bring comments. At least it is in the open in the informal comment process.
- This is not a new issue. There is joint ownership now under current standards. We operate generation for other. It all comes down to money.
- **"Own" (2nd poll)**

Y	N
11	6

- Figure out what we need to do with joint ownership. Technical owners vs. lease holders.
- Discreetly identify- make sure you can't have things in two cyber systems.
- There is no way to document if you haven't identified. Is this idea redundant?
- We will need to do better on documenting guidance- for industry.
- True requirement is identification. Document is the measure.
- "Appropriate?" This doesn't read well without this word.
- But "appropriate"- doesn't identify anything.
- Can we move benefits to reliability to a guidance document? No, benefits to reliability is needed for each requirement under NERC's current approach.
- **Strike "appropriate"**

Y	N
14	3

- R1. Is the last sentence on the objective superfluous language?
- Breaking out the objective of requirement offers great value in knowing what the objective was in terms to later determining intent.
- NERC's requirement is to set forth the "benefit to reliability." You need the who what and why set out in the requirement.
- Would it be possible to pull out separately? It is confusing to read. Are we bound by format?
- Could change wording, "for the application of security requirements and controls to BES cyber systems."
- SDT- consensus- ok.

R2

- John Lim indicated he believed the sub-team would not have problems with changes suggested by NERC.
- The SDT accepted the changes.
- Should we require "categorize and annually re-categorize."
- Delete re-categorize?
- "Annual" is better used in the attachment.
- **Delete "Re categorize" SDT Consensus= Yes.**
- "and document such categorization for" OK
- Missing a date here? Add here "including the date the identification was performed"?
- Will we have to put into every requirement?
- Look in measures- lists have to be dated. Have to tie this back to the requirement.
- Remove this language from the measure and the requirement. Y 16 N 0

R3

- Do R1 and R2 once. R3 from now on keep it up to date.10 years later you missed a system on the list. Do you violate R3, R1 or both?
- If you never made the change, then you missed it the first time.
- That is why the sub-team added "that it owns or operates "
- What if it is change because of a storm, not planned. "Emergency changes"?
- Concerned about consistency as we go through. End each with the benefit piece. Look at the different wording on R1, R2 and R3. Make consistent. If benefit the same, use same language. R1- to categorize
- Just voted down "owns or operates." Should we delete here? Want to monitor for changes.
- Planned vs. unplanned change. Have to keep the list fairly static. Changes in a planned way so you know to change the cyber system.
- Planned/unplanned—"planned"- triggering issues. May need to look at this some more.
- Is an annual refresh missing where you look at categorization to make sure something didn't happen that you missed?
- "Reviewing the categorization of the BES cyber systems"
- Remember these are minimum requirements. Do we want to state annually. Or leave it up to entity (best practice). If you have a planned change, you have to revisit it. People can revisit anytime they want.
- Can you have a change not specifically planned? To take a line out they have to do some studies to figure this out. This doesn't happen spontaneously.
- **Delete "or operates" yes. All**
- Transmission owners vs. operators- is a problem. R1 has it as "owns."
- Every one else who is a transmission operator. R1 and R2 have to identify assets (probably a control center).
- Categorization- if control center controls a high impact high asset, high impact control center.
- If we already have covered applicability, is it appropriate to put into requirements?
- **Delete "planned = no, All**

- **Add" "<u>the identification and categorization</u>"** Yes All
- **Add " annual review"? "Every 12 months or as …"** Y N
  1 16
- Comes up in R1 and R2- got rid because no reliability benefit.
- The requirement to notify changes to others is not here any longer?
- That is because the BES cyber system is categorized.
- Sub-team Ok with Dave Taylor's suggested edits.
- <u>"to the portion of the BES" ? OK</u> Planned changes for my stuff only.
- "Periodic reassessment?- CIP 002 sub-team dealt with.
- Other changes: calendar OK
- Difference between requirement and controls. Control objective statement 800-53. Writing requirements. Are we authorized to write controls? Source documents are controls based,
- **Use the word <u>requirements</u> throughout documents. All Agreed.**

Measures

- Delete discreetly? Yes, All agree.

Compliance

- Note that data retention language and the audit periods (3 or 6 year cycle). Gap of compliance only keep data for the year not the last audit. Need to keep data since the last time audited.

Attachment 1

- **Scoping statement important- place it first? Yes** Y N
  13 4
- Make this the first sentence?
- Since "real time" was added NERC staff struck the purpose paragraph.
- "Operations planning horizon" ? Do we want to include this in addition to "real time"?
- Planning could affect real time as well.
- This doesn't appear in any R, or attachment 2. List of functions only.
- Reconsider operations planning horizon in all requirements?
- When define the functions could take place in real time or in the operations planning horizon.
- **Reorder the 2 paragraphs? No** Y N
  3 16
- **Delete ~~"these functions take place in real time or operations.~~ Create a single paragraph**. **Yes** Y N
  14 3
- If you delete the above you will have to deal with word "immediately"
- Day ahead? Marketing term.
- Take out planning horizon?
- If you pick wrong units, in real time you will figure out.

- What we are after here are control systems. Protect- 1 and 0s turns into action out there.
- **Delete ~~Immediately ?~~** Y 11 N 6
- Initially defined "immediate" within 15 minutes"
- Real time? 1 hour or less in the NERC glossary. Upper case or affects the operations within 15 minutes.
- Need that kind time frame. We do need to maintain it. If you aren't specific, may put security controls where you don't need them.
- JVB: time frame- affecting real time. Leave immediately there and have real time (lower case).
- Further qualification? Is it and, and/or?
- Intent is the be "and"
- **Delete "further qualifications?" Yes** All
- Is "Immediate" related to ability to act?
- Concerned there could be other cyber systems that don't have immediate affect. The ones of greatest importance, at a minimum, should be protected- this should to be clear.
- **"Can have an immediate effect"** **Yes** Y 14 N 3
- Need a definition of immediate? "Faster than a human reaction"
- e.g. Immediate access revocation- 24 hours.
- Near term.
- What about adding: "only those that have the capability to monitor or control real time operation of the BES"
  Concerned about "monitor." State estimators replacing what you are monitoring.
- "respond" vs. control.
- Is it clear that it control?
- **Support for single reworked paragraph. Yes** Y 17 N 0
- "Dynamic response"- editorial accept. OK
- "Cause a condition" vs. "cause a reaction"? Any difference?
- "Balancing load and generation." Ok
- Controlling Frequency
- "which ensure real time"?
- Cant control without real time. Don't need the clause.
- "Controlling Voltage" editorial accept. OK
- "Managing constraints" editorial accept. OK
- "Control and operation" editorial accept. OK
- Restoration of BES- editorial accept. OK
- "Necessary" should remain.
- "Situational Awareness"
- It is partly a operations planning action?
- Contingency analysis, close to real time (not a day ahead).

- Delete “anticipate and plan”?
- If you take this out and you take out RTOs.
- Solve by eliminating “~~and anticipate effects of planned and unplanned changes to conditions.”~~?
- Take “current” out of it? Immediately affects situational awareness?
- Only reason to use this clause is to scope this down. Addressing concerns that “this applies to everything.”
- “Assess the condition of the Bes necessary for real time operation.”
- Control and operation and situational awareness.
- Difference between monitoring and assessing.
- control and operations- pure SKADA status of components. Situational awareness.
- Assess the current and anticipated operating state (or condition) of the BES?
- Is there different information used to assess the current vs. evaluate what the future?
- It can be data not from a real time environment.
- Day ahead studies, state estimation. Don’t want to get to other studies being done.
- “near term”? data collecting is real time.
- Current, expected and anticipated
- **Situational awareness: activities actions and conditions to asset the current expected and anticipated state of the BES.** ***As revised*** Y N 15 0
- Inter Entity Coordination and Communication
- Active coordination. Communication is the action.
- Coordination of real time operation.
- Add, **“real time coordination”** Yes. All agree.
- Tie to attachment 2? General comment.

Attachment 2

- (“As determined by….”) Maureen Long/NERC suggested a determination.
- “Responsible entities”= functional model entities. We are using this. She has injected this back in. e.g. 1.1 generation operator doesn’t have a role in this.
- “Operations planning”- SDT decided to take out yesterday.
- 1.1- Generation facilities- (as determined by the Generation owner or the generation operator”. Might be at times the generation operator
- This parentheses might be not needed.
- Doesn’t clearly identify shared facility. “if using a shared BES cyber system”
- If he has all BES cyber systems.
- Non-shared system will not be connected with each other.
- “Shared or connected Cyber systems”
- That would be everything in the system.
- “Each BES cyber system that either singly or in combination. **Yes** Y N 13 0
- May not be as clear.

- Remove the rest of sentence (" ~~or more in Texas and Quebec interconnections~~")
- BES cyber system affecting a plant bigger than 2000 MW- everything in it is high impact.
- Each BES cyber system?
- "would" this is a conditional word. That ~~would~~ immediately affects
- That has the capability to immediately? "Has the potential to"? "Can have an immediate effect" (from yester day)
- **Each BES Cyber system that can have an immediate effect on real time operations"**
  All agree.

- This came from a NERC document. Disturbance report Categorization criteria. Done in 2009.
- ERCOT has higher contingency reserve- less than ½ of reserve. Lose 2 units bigger than 1000 MW.
- Engineering analysis language was in December 09 posting.
- Arguing the 1000 MW number
- Any way to ask Planning Committee regarding this issue.
- SM: "good enough to post" to get industry comments back. Leave something in. If you assume 2000 is appropriate for east- % of size of interconnection.
- Impact of loss of MW is the focus.
- **Remove the rest of sentence ~~("or more in Texas and Quebec interconnections")~~**

Y	N
8	8

- **Remove?**

Y	N
13	3

- **Strike 1.1 and look at 1.3 and go with contingency reserve. Defer, for now. Get feedback from the planning committee.**
- **All OK**
- We need a criteria. This is key. Used the disturbance report as basis. What our basis for this concept in 1.1?
- Few generators with 2000 MW – few are high impact.
- E.g. 3 or more transmission lines
- Move to medium vs. dropping?
- Support this. Contingency reserve. We've discussed before. Agreed to leave them in.

1.2
Sub-team ok with NERC edits/additions. SDT ok.

> Facilities, singularly or in combination (if using a shared BES Cyber System), with aggregate higher of the most current and prior to the most current rated net Reactive Power capability of 1,000 MVAR or more in Eastern and Western Interconnections and 500 MVAR or more in Texas and Quebec Interconnections. (As determined by the Generator Owner or Generation Operator, Transmission Owner or Transmission Operator)

1.3 Contingency

- This is an annual reassessment issue
- List of issues for 002-
- Including operator. Why not "as determined by the asset owner." Not clear here.
- Refers to owner of BES cyber system. Put clause- after real power capability?
- Referencing Mod 24 and 26 testing and verification standards. The concern with linking together is possible double jeopardy. Justification in mod standards for doing both. Operator doing verification and Owner doing the setting.
- This may be an across the board issue.

Generation Facilities, singularly or in combination, (if using a shared BES Cyber System), whose aggregate rated net Real Power capability, as defined in 1.1 above, exceeds the largest value, for the 12 months preceding the categorization, of the Contingency Reserve or total of reserve sharing obligations for the Reserve Sharing Group. (As determined by the Generator Owner or Generation Operator)

1.4

- John Lim questioned if the proposed edit is correct.
- "designate" "as designated by". Balancing authority not always the one making the reliability decision.
- Could be a number of entities.
- Unless this is universal, should be these be in at all.
- Propose striking parenthetical.
- Balancing authority- ERCOT e.g. balancing authority. But there are several entities in other places.
- "all reliability coordinators" ?
- "planning coordinator."?
- Who has a generation facility. They know what contracts/terms for their facility. Shouldn't be who is determining. Person with the asset knows.
- Some may be good or not. Possibly delete all.
- You can't have reliability without a review contract. Compliance auditors know if they have in terms of contracts
- Strike throughout attachment.
- Transmission facilities are named. Scoping built in with those words vs. entity type.
- **Strike all parenthetical**.

Y	N
14	0

- 2.7 "or that remotely control a BES asset with a Medium rating"
- 2.5 "including FACTS devises? All high impact or insert language there. (including flexible .)

C. CIP 002 SDT Discussion of Open Issues and Follow Up

- Dave Taylor's VSLs comment (15% high number? Came out of guideline for VSLs.
- Purpose reference to 003-009 will be adjusted after security controls
- Sub-team will go through the measures to ensure they are consistent with the requirements as revised.
- 1.1 and 1.6 in Attachment I.
- "Immediate"
- Annual or periodic
- 1.5. 2.4 Medium- 3 transmission lines right criteria? Where is the right number and what is the basis for that?
- 1.7 transmission facilities. FACTs devices added. Flexible AC Transmission Systems.
- Include "protection system " associated with transmission facilities? In IROLs? What is the reason it is included?
- Added to criteria for threshold for transmission-
- Looking now for consistency.
- In medium added a clause regarding protection systems 300 KV.
- Protection systems added to l.7 (including their associated Protection Systems) Sub-team will resolve how to reference this.
- Control center definition resolved? Yes.
- Is there a cyber component of systems that are not special systems? Yes.
- Retirement of term cyber asset? SDT will need to decide whether to retire.

D. Final CIP 002 (010) discussion

On Friday, John Lim reviewed CIP 002 Sub-team's redline version to address some of the issues raised earlier in the meeting and presented revisions on CIP 002, which were documented in the latest version of CIP 002.

Definition of BES Cyber System + definition of "immediate".
Rather than another definition, the Sub-team proposed to focus on the BES Cyber System definition and added "within 15 minutes" within the BES Cyber System. If the effect on reliability is within 15 minutes then the item is a BES Cyber System. This gives a finite time.
SDT Comments

- Does this include protective relays? Yes.

High impact rating
SDT Comments

- Is this – reserve sharing usually goes up – is it intent to move more in or more out?
- Parenthetical – I understand it but not sure anyone outside this team will understand it
- Meant to qualify or explain as a shared BES cyber system

- This doesn't make the "shared" clear – may need an explanatory box as opposed to a parenthetical
- Delete front end of the parenthetical
- Meant to clarify what it is meant by combined operation
- Using singular or in combination
- Team will work on exact language – concern noted

Transmission facilities

- This language helps but still concerned about parallel lines
- Changed to 4 to address terminal stations
- The parallel lines are a concern in our area
- Not sure we can address in the standard itself
- Other changes are on the medium impact – will need to address some of the comments and changes in the high impact discussion
- 1.14 - Consider moving transmission operator functions to the front of the statement for clarity – agreed
-
- Jackie Collett's email offers a rephrased version of earlier discussion
- May need to take out the first "or" from restatement
- Too long a sentence and confusing, so she tried to break it into two sentences and add punctuation to help clarify.
- Programmable electronic device – don't you want to say processor somewhere? No, working on programmable devices
- Worried about phrasing – if send info to cell phone does that phone become a BES asset – do we need the phrase "on data display"? It is the use of the data displayed that is the problem, not the display of the data.
- Semantics that may cause more problem to correct – need to give it more thought to see if can address without creating more problems
- Shouldn't we pull in language from Attachment #1 to establish what the BES system is?
- Cannot refer to an outside document within a requirement.
- Trying to write the scope into the requirement? Careful, need to keep it general
- May be getting too specific to say data used by an identified operator.
- Would removing "data" address the question? No we are also protecting the data
- What are we adding with the additional statement about BES condition or disturbance? Pull out of here and put into
  Attachment #1 – we are trying to say the function in two different ways and it is confusing.
- But, again we cannot refer to a separate document.
- Shouldn't try to put any of the functions in – gets too messy.
- "relied on to make real time operations decisions"
- Propose taking suggestions to the subgroup for refinement.

- Consider two short definitions – one for BES cyber system and another for cyber system
- Rest of 002 Sub-team will review on Wednesday.
- In definition of situational awareness – when is the anticipated state? What period of time? See qualifier at the top of the page

III. CIP-003-009 REQUIREMENTS (CIP 011)

The SDT first reviewed the Security Governance draft approach and the progress made for each to the Sub-Teams since Phoenix. The Sub-Teams then met on Wednesday to continue drafting work and presented the draft document on Wednesday and Thursday.

A. Security Governance Sub-Team report

- Jon Stanford presented document noting his sub-team had received statements from only two sub-teams- looked to other sub-teams to get their requirements.
- What is the mechanism to get into 003.
- R1: 3 sub bullets. Scope of applicability to organizational and third party personnel
- Security roles and responsibilities
- Identification of a single senior management official with overall responsibility for leading and managing implementation of requirements within these standards.
  - Provision for emergency situations? Address in recovery and response? Policy objectives
  - Annual review and approval of cyber security policy assigned pursuant to R2. Not in agreement.
- Manager responsible for implementing. "review and approve" – suggesting an org structure.
- Separation of duties issue.
- Delete 1.5 out.
- Clause " with authority" is not in current draft.
- 1.3 "with overall authority and responsibility."
- Topical areas removed. Not addressed in policy document? Requirements by topics- replacement for part of your security document.
- From 2 on- cover policy statements by topics. You to have a plan here, topic sections will describe what's in the plan. Took topics out- carry over from Federal thinking. They will be requirement statements.
- 1.3 annual review? IN the base statement in R.1. Require the REs to annually review.
- FERC wants the same person to know about.
- 1.3 overall authority and responsibility.
- Consistency. In CIP 002- eliminated annual review. Initial and upon changes vs.
- Annual review in policy statements and cover it globally.
- Program review if global

- JS: some requirements for annual review of a plan.
- SM: Double jeopardy- how write language of policy in 3 vs. procedures and plans in other standards. Don't link too tightly together.
- Annual review- different from CIP 002 annual review issue. What would be the triggering event? At policy level. Annual review catches what has happened in year.
- Feds- bi-annual review of high level policy document. At least every 2 years.
- Annual review is practiced in the industry. Good to put in as a requirement. Don't need to say who does. Senior manager should approve?
- Tie to responsible entity
- Some have single policy, some have more than one policy. Separate policy for NERC CIP.
- Presupposes they approve.
- Interpretation questions. Single senior manager. Per responsible entity. A company could have different officials. Each functional model entity.
- Double jeopardy issue we can't solve
- By functional model- have many registered entity. Let the organization decide. Can be the same or different.
- CIP Cyber security policy focus here. Consistent with version 3. Not broader security policy.
- Senior manger was to insure accountability. $1 million a day. Why special requirement. FERC directive.

R2

- 4 sub numbers.
- Shall develop a system security plan for each BES Cyber System that: 4 bullets.
- What is the need for this? Comes from a federal space. We may not want a system security plan? (describes operating environment for what you are protecting)
- List of BES cyber system out of 002. Where is the best place to document. Some requirements provide for plans.
- All documentation required. If it is spread around, then take this out.
- Security plan not only in federal model. Becoming a standard way to define system security.
- Maybe as guidance- accumulate documentation and place where makes sense.
- Make auditing easier if they have 1 place to go to for each system. Easier to see how came about. If you provide this.
- Notice requirement for a document for each BES cyber system regardless of level. As written for each and every one. Auditor needs only finds a missing document to be in violation.
- Isn't a new challenge for large multi-nationals. "Real time" operations in CIP 002- number of different REs involved. Compartmentalization. Entergy- single VP- fossil nuclear, distribution, etc. fiduciary presidents of 5 operating companies in 4 states. If divide up may not have security.
- Program plan- describes things you have to address. IN areas such as access control systems
- If came back to command and control fabric- systems that do that. Organization "shall". Have a program plan for how to attack each of the technical area.

- Security plan for each BES cyber system.
- CIP 006 physical security plan that needs to get added.
- Keep this a much higher level.
- Why look at BES system first and then at BES cyber system.
- This could create nightmare scenario.
- Security plan that addresses the following for h/m/l. Not at each cyber system level.
- Too onerous. Have security requirements for low impact systems. Security plan doesn't add much to what you are already doing. Have to document environment to demonstrate compliance. Think of
- For high impact assets need this level of documentation because of their important. Specific plan. At low level, generic plan how we address these as a whole. Not as onerous.
- Program plan approach?
- Other requirements may lend themselves to this.
- Coalesce all the plan requirements into a program plan by topic. High assets- security plan requirements.
- Program plan a good one.
- Incidence response and restoration plan. Just mentioned. Cover exclusion for emergencies.
- Details of what is in the plans in others requirements.
- "The security for each BES cyber system will be addressed in a security plan.
- Responsible entities came from markets. Shakes down to 3 organizations. Operating unit.
- Model for policy statements- in R3.
- Each responsible entity shall:…..
- Program plan-- take each of the topical areas "BES cyber system connections" DHS Control system connections.
- Authorize and document external connections. Only those authorized are in place.
- Revise R2 to include topics.
- R4 down- talks about plans- info protection plans.
- Codify details of procedures.
- Rework R2 and put a program plan approach.

R3

- How is R3 a policy? Embedded in controls document. Pull out of here?
- Won't need this if we take program plan approach.
- **R3 is redundant**. All Agree. JS will remove.
- 3 Rs.- in 003 (manager, program plan)
- E.g. configuration management plan- vulnerability assessment etc. Will these be set out as topics?
- Keep simple, not require multiple plans, but set out the topical areas.
- Probably won't need topical areas going forward.
- Program plan approach simplifies. Collapse these down.
- "Policy"- what do we mean?

- "shall language"- requirements framework- everything is a shall. If you are getting into procedures, attributes. If you are talking about topics.
- E.g. Personnel screening process. Shall have this. Procedure on how implement.
- Have to be careful- shall includes- have to have a policy. These are the areas you have to address in the policy statement about the CIP standards.
- Recovery plans and incidence response plans- not policy? Require you have one and have to do it. Develop and implement the plan.
- The plan must contain the following- e.g. recovery plans must contain….
- E.g. CIP 008 and CIP 003 statement- possible double jeopardy?
- How to deal with CIP 003, if you don't have that requirement as a low? Low impacts that don't require a response plan.
- 1 approach – policy statements you will do access control, you will.
- 2nd approach- you have to have a plan for all these things.
- Current CIP require plans where you may not need plans. Create compliance activities that have been necessary for enhancing security.
- All in a single table- do everything in a table. Policy should address. E.g. 4.3 include applicable controls specific in Table 1 Information Protection Controls.
- CIP standards are topically light and DHS are topically heavy.
- Agreed on program plan approach. Don't know where policy will go. Then come back with a proposal.
- Easy to write a double jeopardy requirement. Just to create policy statements. Policy statement you have to have recovery plan. CIP 008 and 009- plan contents. Measure for the policy- policy statement. If measure in CIP 003- you have plans to support the policy. Draw a line between requirements for policies and writing plans.
- Sending over the plan? Annual review and updates in CIP 003. CIP 006 here is what plan contain.
- This is a global question. Handle annual review in 003 or in the subsections?
- Requirement- policy statement that addresses recovery plans. Go to CIP 8 & 9 about content of plans.
- In requirement- state what the policy must address. Guidance document to be developed what the thought was behind the requirement.

R4

- R4 a problem? Looks ok.
- R4- e.g. where you are putting in requirements for the contents of plan. Here just say you have to have a plan.
- If this creates a double jeopardy problem would have to roll up into R1.
- Address the topic of information protection.
- Read it as a family of one. Why not make it one.
- Tie up topical areas in R1. Policy statement to be made in topical areas will be made in the sections.
- Does this raise double jeopardy issues?

- Puts all high level requirements in one place- shows accountability.
- Asking whether we need policy statements in CIP? Every requirement in standards is a policy?
- In practice, that is how they are written today. Current 003- policies should address all requirements.
- Doing it by topic. Not as granular as current 003.
- Placed some of these info mgt requirements here in the last week- they tie the policies to the program elements. Put things together that belong together.
- Why not put under a single standard?
- Put all tables in a single standards
- Take outliers and make them standards themselves.
- Existing format- CIP 003 policy for this, implemented in CIP 005 .
- If we change into one standard, we will hurt ourselves with the outside world.
- Move to their own standard. CIP 007 single requirement about access control.
- Standard- talks about access control (physical or otherwise)
- Does NERC have a definition. CIP 006 physical security plan. CIP 004 cyber security control training program. Do we need to get one?
- Use the same word across all standards.
- What do want to call this? "Program" is what you are doing.
- Collect all the topics together. Figure out how to put together as a team. Plans, Programs,
- 002 about scope. 2nd is about governance- management requirements. Got to have a policy and a program to address different subject areas. Outliers- are common to others, e.g. access controls. Policy can be simple what is important are the plans, woven together under management oversight.
- 003 umbrella standard- 4-9 addressing in more detail. Jumping off point for more detailed to follow.
- This standard is skeletal- areas management.
- Compartmentalized- to some degree will be necessary.
- Plans and programs- different disciplines use the same words- physical guys call things plan. What we mean is program and not a plan.
- If it doesn't lend itself to a plan.

B. Quick Update on Sub-Team Progress since Phoenix Meeting

The CIP 003-009 Sub-teams provided progress reports on work since the Phoenix meeting and then met in small groups until mid afternoon to draft or refine their requirements.

1. Change management.

- Areas- CIP 003 didn't fit into oox standard.

- Coordination- low/medium/high impact and connectivity- environmental differences? Didn't have many.

2. Access control and Auditing

- Sharon Edwards noted the excellent contributions of Jeff Hoffman and Frank Kim
- Got input from NERC
- Open issues- password measurements.
- Review what NERC offered.

3. Recovery and response.

- Scott noted good progress made and acknowledged Tom Stevenson's help and has reviewed Maureen's suggestions.

4. Operations

- Jay Cribb report that the Requirements are in good shape.
- Work needed on objectives and measures
- Coordination- ESP access points. Electronic Access Points- defined term – happy with

5. Personnel and Physical Security

- Doug Johnson reported that they have reviewed Maureen and/Dave's comments
- CIP 004. Get some policy statements over to Jon Stanford- addressing physical security and training and physical risk
- Do we still have an electronic security perimeter?
- What we have been doing- we have a word doc with a list of requirements. Get that into a real document.

C. CIP 003-009 Sub-Team Requirement Review

1. Governance

Jon Stanford presented the changes made to CIP 003 offering the following points:

- 003 can become 010
- Edited R1- adding the 9 subject areas (1.4- 1.12)
- R2- Each responsible entity shall implement the requirements specified in Table 1 (Subject Area XXX here)
- R3: Each responsible entity will implement the requirements specified in Table 2 (subject area xxx) in order to (benefit to the BES here)
- Can link VSLs to requirements

SDT Discussion

- NERC staff recommended retiring existing CIP standards and start afresh with CIP 10. Some cross e.g. vulnerability assessment is in 3 areas currently.

- Allows to quickly look through and make sure not requiring same thing in 4 requirements.
- We would need to explain- here's the map from the old and the new ones.
- Another benefit- requirement language will be simplified. As standards evolve- you'll modify the table not the policy making it more adaptable for future.
- Don't have to have a requirement that says "develop a plan"- avoiding circular logic.
- There is 1 requirement for each subject area? Will have own VRF? Everything in that Table will have the same VRF. Table will in essence- be the sub requirements.
- If we want to differentiate VRFs, we can develop multiple requirements.
- Implementation plan that will need to go along with this. If 1 standard. New implementation for a full standard.
- This will help out with the implementation plan.
- Version 4 and dates
- CIP 8 and 9. How would that be handled?
- CIP 8 with 4 Requirements and 4 tables would become 1 requirement and 1 table. Or use a group heading..
- We will need a new number strategy for interpretations.
- Need the SDT to determine what are the topics. Starting with 9 proposed by the Governance sub-team.
- Rolling each into a requirement. Reporting potential violation. Physical security violations (minor and major). Not sure this is the right way to go.
- There is precedent for lots of standards.
- Helps with granularity. We need to think about all implications.
- List of stuff that needs to be done will be the same. The granularity of the standards will be different.
- Need different frames of references- think about this overnight.
- Its important that the SDT makes sure we have the buckets right. Make sure they are chunked the right way. How it is organized will make a lot of differences.
- SDT should flesh out proposal among the Team. We need to agree on chunking. Get together and decide uniformly and collectively.
- This is a hard subject to get one's head around. Anything changes in format will be initially received as not necessarily simpler. Awareness and staff capacity is an issue in the industry. Practically consider starting what we have.
- Should there be a motion to stay with current CIP framework?
- WECC auditors have indicated that this would be easier with one caveat that tables would need to be numbered. Need a way to track that to the table.
- This does not represent a radical change. In fact, the H/M/L categorization is the radical change. Tables right now don't work. Need to find a way to present appropriately. This is about presentation of requirements.
- About 140 requirements in a single standard. Will violations of any requirement be a violation of standard? This raises repeat violations. Measures more complex and VSLs VRFs.

- Do we have the time to do it? Most of the other teams have requirements written. Significant re-writing will need to be done. Content of both the tables and requirements.
- This will be seen as a radical change in the industry.
- Could improve reporting. Violation of categories. Better reporting overall. E.g. personnel risk assessment. Create a better taxonomy.
- This is the appropriate time to propose the change and get it in front of the industry.
- Changes to software. It will get updated.
- Not lots of additional work. You take requirements. Put together in 1 document. Not a step back in reworking a lot of things. Most requirements are already in a table format.
- This could go faster for us and present a better governance model. Not making changes for no reason.
- What is there to debate if we stick with the current?
- This model is a vast improvement to what we have now. Might be well received by the industry. This team shouldn't concern itself about the vendors. Rather debate the merits of the ideas.
- This approach could help us in terms of consistency checking. Consistency is important. Advantages. Lots of organizational and process changes in the industry. Vendor software is the least of it. If not restating things in multiple places.
- Initially I like it. We have forever been defending one family of standards and we have viewed as 1 standard. We keep as one standard anyway.
- Messy now. Access control and monitoring asset. 5 line requirement. Makes a mess today to figure out what kind of asset is that.
- Many trade organizations are together. NERC CIP, Smart Grid standards coming out. Tracking on 800-53 model. Several doing efforts internally to map all requirements to such a model.
- Granularity for compliance- removing.
- Explained the proposed formats.- 9 topical areas. Policy
- One of the issues- compliance implications of doing that. Now between 8 and 150 requirements. Fewer # and granularity. Single VRF factor. Single V Severity levels . What would they do in terms of an investigation. How report to regions. Penalty calculation.
- Now with 41 requirements moving down to smaller number or having 150 requirements in single standard.
- Putting all standards into 1 document and consist of requirements and table.
- Consider all existing standards 3 -9 into one standard. Requirements have table associated with it.
- As auditors- take requirements and put into table format. Still looking at R and compliance with R. Having worked with military docs. Once you have anything that large and point back in terms of compliance. First time you updated. Move anything else up. From version to version.
- Keeping up to date or compliance tool- hassle in terms of bookkeeping and paperwork accurate.

- R language would be fairly vanilla- table could change. Have policy and procedures with the details.
- 2 action items. Categories need to be finalized and agreed to. Coalesce to action quicker.
- Tom Hoffsetter offered comments

Wednesday evening the Chair asked Howard Gugel to prepare a sample "proof of concept" for the access control requirements to inform a decision regarding format.

D. Review of the Sub-Team Products

Thursday afternoon the SDT reviewed each of the sub-team's draft requirements as revised and refined in the sub-team meetings on Wednesday, offering guidance on various issues raised by the draft requirements.

III. CIP FORMAT REVIEW

A. Tables in the Standard(s)

Howard Gugel, NERC, reviewed the changes regarding format, tables- (R3 referring to table 1). Editing tables. Propose for title to Table R __ helping to tie back.

SDT Comments

- Multiple Rs referring to the same table?
- Keep each table specific with each requirement.
- Bring back question of multiple references to the same table.
- CIP 6- one table and the column as the Rs. Different from the others.
- Need to be consistent for the format for all requirements. Use same format for other tables.
- Consider the guidance documents.
- Rows in table play role of bullet items under each requirement. Separate table links back to each requirement. Resolves issue of multiple rows references back to multiple requirements.
- Grouping the Tables at the end of the standard. Disjointed in a standard. Lot more readable and manageable. Sub requirements, as table entries.
- Similar to attachments in CIP 002. Idea of tables at end, keep requirements concise. Will pose to Maureen to get her opinion. Consistency better at the end.
- Look at Rs and make sure wording is consistent with other requirements.
- Looking at each R how you would measure it. Proof of that- light on this.
- Look at objective statements- read and make sense it is the purpose of the standards.

B. Objective Statements

SDT Comments

- Putting the objective within the requirement? Fraught with danger down the road.
- Enhancing reliability purpose clear.
- Reason it is there, who it applies to why needs to be done.
- Putting in requirement language- gets in the way. Defer that language until requirement language drafted.
- Get requirements first then measures.
- Defer the objectives as part of the requirement. Corollary document.
- If doesn't have a basis in reliability, shouldn't be a requirement.
- Format- R words. Designate.
- The objectives makes it harder to read.
- However it is important to have objective in there.
- Need to be specific about the benefits.
- For now, just bracket the objective.
- Part of the deliverable- measures, VSLs and requirements formats at the end of the session.
- Benefits for reliability? NERC could throw their proposal on each of them.
- Important to deal with measures- know when the requirement been met with. Tangible proof of requirement.

C. CIP Proof of Concept for Format- Access Control

1. Access Control and Auditing- Review for Format

Sharon Edwards presented the work to date on access control including 004 R4, 005 R2, 008 R5 and dispersed throughout the standard.

R1. Account Specifications (007 R 5) **Table**

- Beginning of table- policy should include the following: 20 points. Technical high level controls- H. M. at low- need to understand what they have. #15 "immediate revocation" of access. FERC expectations and SDT's belief of a reasonable starting point. The Sub-team had hard time with this.

Electronic Access Controls

- Sharon noted that this may be redundant.
- Box- "remote access"- Could develop a definition to the standard at hand.

Table R2- Electronic Access Controls

SDT Comments

- Need to decide which formatting for H/M/L.
- Outlier- information protection- document management.
- Measures as previously written- "make available documentation….."
- Haven't tackled VSLs and clean up work. Need sub-team time today.

- Split tables up into more tables? Is violation of one piece, violation of the whole requirement?
- Chunked up more? Good question for further discussion of the sub-team
- Tables provide an improvement and clarity- Keep concept of table. Share concern about multiple violation. Groupings of similar rows and make a separate requirement.
- E.g. Password- under own requirement. Reduces impact re multiple violations.
- Lot of value of tables but reduce the impact in terms of compliance.
- Break into more logical groups and individual requirements.
- Table not to consolidate all requirements. Table facilitates the breakdown of requirement points.
- Table looks good. Clarification. Separate document for audit and monitoring?
- Looked and most of audits related to things NERC would be doing. Didn't develop another table for auditing requirements.
- Row 13- Ports and Services- overlap with Change Management and Operations Security? Probably needs coordination.
- Doesn't specify the content of use restrictions? Is this an issue.
- Wireless approach- didn't want a comprehensive set of wireless standards. Other standards already done a good job. Trying to be less proscriptive. Down the road with encryption. We are not resourced to do.
- What does a blank in the table mean? Clarify if not required or something else.
- Communications aspect of this? Things that are not connected vs. routably connected. Did you intend to stay away from this?
- We did talk about this in the Sub-Team. Spent a lot of time discussing FERC directive to remove access. FERC didn't suggest anything to treat differently. Didn't go down road- may be others. Made decision.
- If talking about remote access, not remote access for user sessions outside of the USPN.
- Format: Required vs. analogue values in the rows. Larger number of individual similar requirements as long as each is a discreet, well worded.
- Breaking out. Barrier. Not having VSL correlated with requirements. Break up or chunk the topic areas – access control.
- When doing measures, have a table form? Matching those in requirement?
- Sub-Team used the generic measures.
- Let's make sure that the SDT knows the topics. E.g. "Security management controls"?
- Repeated wording. E.g. 11 "is required"
- We need a section where you address FERC directives. They had one directive (immediate) Make sure that we cover that for each of the sub-team. We don't need this posting.
- Authentication of un-manned devices. We will see more and more. Will this be covered someplace else? Should this be "human" access control. Do we need to say that?

D. CIP Format Review

1. Overview of Format Questions

On Thursday morning, Howard Gugel presented to the SDT a proof of concept for the access control requirements. He asked the SDT to look at format not merits of requirements in order to get a picture of how the requirements would be presented. He noted the table would be embedded in text and at the end of each requirement. NERC standards review staff agreed with this format approach. This would be the same regardless of which approach is chosen.

- **Option 1.** Keep 003-009 and work from there.
- **Option 2**: retire existing CIP standards and organized by the topics in sequence from 010 on. Access Control e.g. CIP 017.
- **Option 3:** One standards document with 2 sections 010 (002) and 011 (003-009). All controls together. R1 security policies addressing all topics
  - R2 implement per table
  - R3- table for access control
  - R4 implement 2nd table (account specifications).

Initial SDT Member Comments on Format

- Will 002 be on its own? Yes speaking of 003-009 together.
- Where are we capturing connectivity? 005.
- Connectivity is more important than big iron.
- 1st 5 LMH.
- Left column- allows item tracking
- Title Access Controls.
- It will not hard to make change if industry doesn't like this format,
- Language of the table can address connectivity.
- Industry confusion currently in terms of audits at the requirement level. Radical format change may not be well advised.
- Missing opportunity- keep simpler to scope out key things, like was discussed in Austin.
- Tables concept came out of the Phoenix meeting.
- Will FERC have a problem with the tables? There may be no process for reporting on that currently. Process will need to be addressed in this document.
- Common PCI and HIPPA common auditing format for standards.
- Read tables- allows flexibility of the columns. Reporting issue not an issue. Row number tracking will help.
- Table structure agreed to a couple meetings back. We are using them. Whether we keep groupings separate or have a single standard for this is the question. Culture of compliance- repeated violation of standards might be held against the industry with the single format.
- Will it be possible to write a VSL for this table format?

- Separate tables for requirements? E.g. account info and another with remote access issue. Past VSL at requirement level and where with sub requirements. This could end up with a lot of "ors"
- Break out the VSLs with the sub requirements in the table?
- Everything happens at the requirements.
- "Foolish consistency is the hobgoblin of small minds."
- When file with FERC it becomes law.
- Same issue with the VSLs- regardless of options.
- Can split the tables into more areas- can get as granular as the SDT wants.
- Put Rs on left column. Lose the R4 and number Rs. Use if /then construction.
- Now would be the time to propose this. Timing for this.
- Clarification on status quo. Decide on the buckets? We don't do buckets. Stay with 003-009.
- Do some reorganization what is in each standard and possible move- but keep in. Fix for Order 706.
- 003-009 numbering. Moving some Rs around. Tweaking re 706.
- The Team needs to make sure this works. Sees value in topical groupings but has concern with industry confusion. When CIP version 2 was put out the numbering changed and industry members asked why.
- Have a comment form question to get feedback. Makes sense from various standpoints. Ask how much confusion this cause confusion. In the comment form.
- Is there precedent in other reliability standards- if you are generator operator, if you have X, then.
- Limited. Lots based on functional model. Rs directed to different functional entities.
- What ever we do there are going to be changes in the industry. Better we do on our guidance, the better the industry will know what's going on. Need a strong foot forward on guidance.
- Option one- access control. Are they outliers. Easy to place those in a standard.
- Public Comment: Owner operator. Option 3 will be confusing. Is it the whole standard you must follow? CIP have 3-9. Too many changes together for industry to handle. Do option 1.
- Not proposing 4 options. Need to understand difference between 1 and 2 & 3. 2 and 3 carry new organizations. Current standards are supposed to be considered together. They are 1 standard. Change 1 must change all. They are buried and possibly scattered around in the current. New organization with different topical naming.
- Lot of thinking into organization of current standards. Big change is a new organization scheme
- Use tables with all of these options.
- Version 1, 2, 3 confusion- application. Version 4. Renumber standards. Option 2 less confusing.
- Radical change in the standard is required. Some equivalency 3-9 but the approach we are taking and the different formats. Would cause more confusion to use the same numbers. Start for new set 10- onward. Not to be confused with 3-9. Option 2 doesn't follow. It is a

different set of controls organized differently. Likes smaller groupings regarding compliance.

- Tom Hoffstetter noted that he doesn't speak for NERC but that organization in tables is good and he likes the break-out in terms of topics. Required columns will make it a lot clearer for both entity and auditor.
- If we go to option 3- collapse into 1 standards. 140 controls in one standard. Violation more than1 get a penalty.
- Whole different paradigm require a new approach as to how penalties assess. Approach different in many ways. Wouldn't try to make current structure fit. Have to depart from traditional approach to penalties. Have to describe them differently and assess in a different format. Across the board.
- Nothing to argue with what TH said. These standards will be balloted and posted and implemented under the current process.
- Option 3 recognizes how tightly knit these are together.
- This may not matter in the end. Push in his company.
- Can NERC help with this issue that RK brought up? What is the audit standpoint. Can they do this. Might help to present options 2 and 3 at the Technical Workshop. Show how NERC and auditors of regional areas would handle. How models would be handled in audit and penalties.
- Option 3- organization within? Still the same? Structured as per 1 or 2?
- Constrained by current compliance structure. Could we propose a new approach? Put out standards with a proposed structure?
- Confined now to VSR VSL structure.

2. Initial Preference Ranking of Options and Voting for the Preferred Format Option

The Team following the discussion of the pros/cons of the options, voted first on each of the three options indicating its acceptability. Following that each Team member voted to support the option they found most acceptable or preferable based on the discussion and their perspective.

Format Option 1: keep existing CIP 003 to 009 in its current form maintaining its existing logical construct (may involve minor movement of existing requirements between standards)

Yes	*No*	*Indifferent/could go either way*
8	**7**	**3**

Format Option 2: Retire 003 to 009, create new CIP 010-16 grouping according to small group assignments.

Yes	*No*	*Indifferent/could go either way*
12	**2**	**6**

Format Option 3: Collapse CIP 003-009 into a single standard that contains all requirements created/edits by small groups and grouped according to small group assignments.

Yes	*No*	*Indifferent/could go either way*
12	**7**	**2**

The team then voted for one of the two highest ranked options under consideration:

- Option 2: Retire 003 to 009, create new CIP 010-16 grouping according to small group assignments. ***Yes*=6**
- Option 3 Collapse CIP 003-009 into a single standard that contains all requirements created/edits by small groups and grouped according to small group assignments. ***Yes*=10**
- *Abstained from voting for Option #2 or #3:* 4

Comments on the Options Ranking and Next Steps for the Sub-Teams

- Need to take into account the industry's reactions.
- Don't see any real difference between option 2 and 3.
- Not a single requirement vs. standard.
- It is different in terms of what is presented. Violation of any requirements may present problems.
- This is just an organization issue.
- What are the expectations for Sub-teams in terms of drafting VSLs?
- Allowed to have content- for each row of your table a VSL statement in that format.
- Finish up writing requirements. We can pull back together into multiple standards or into one standards following a decision.
- Would be helpful to go through one of the sub-team's reports before breaking. Substance requirements, measures and VSLs.
- Missing several definitions. Should we use boxes? Indicate it is guidance. If not, it will be exported to glossary, or in requirement.
- Note if put in guidance then not part of standard. If it goes out without guidance document. Comments won't be complete.
- As a reality check, take access control and go through it and reframe expectations. Going to need work after going out for informal comment. Interim work product posting. Work as hard. Focus on requirements.
- Some sub-teams are using different definitions for external connectivity. Factor into what is put in the rows on table. Each needs to do the walk through.
- Five remaining areas that need SDT guidance for sub-teams.
  - Square box definitions- specific to standards (vegetation management standard precedent
  - Control centers definition
  - Different types of communications
  - How should the sub-team address drafting measures or consider putting out document for industry review without measures

  - Address VSLs or consider putting out document for industry review without measures
- SDT should clarify outliers- definitions. Whose will be used? When will see all the definitions in the various document?
- Governance section, based on SDT input pulling policy statements up.
- Suggest that a SAR for a drafting team be considered. Address FERC 706 items that may be outside the scope of drafting team, e.g. NIST risk management framework.
- 9 Categories of proposals to organize. Put the level of controls in right hand columns or separate rows.
- Option 1. Allows different time frames. Separate line items for medium. Time frames in columns. Bulleted lists time frames.

3. Reviewing and Ranking Option 2 (2nd Round)

At the end of the day the Team took up the format issue again. The Vice Chair made a proposal that the Team use Option 2 (which would renumber the requirements using the topics to organize them. The Team discussed this option:

- Consider renumbering 002 as 010 – confusing to have 002 then renumber at 010
- Posted previously as 002, proposed keeping then renumbering new.
- Yes, different titles for the same thing that exist with a few split out.
- Some match what we have now, some are new – where we can group into the existing CIP we could do so and renumber only the new ones.
- Is media protection now media disposal? Where would you move information protection?
- How many teams work on multiple standards at the same time? Yes, others teams do address more than one but not ten of them
- The titles may seem the same but many of the sub-parts have been moved around except for 002 which is still focused on the same topic area – we would need to educate the industry on what is in each standard.
- Rename the last item 021 as Boundary protection rather than data communications?
- Will we map old standards into the new ones? If so, why not retain some of the old numbers
- Did not gain consensus on this earlier – this seems ad hoc.
- We probably need to agree on something today in order to to put this into a format.
- Propose altering proposal to start with 010 for old 002 – new numbers for all of them – less confusing
- Access control needs to be separated into physical and electronic.
- Under personnel and training – would that include training for all the other standards?
- Idea is to combine training and awareness and risk assessment.
- Change name of the last one and make electronic access protection or role into new 013 under system security?
- Heartache at pulling physical access control out as separate item.
- May still need further renaming or organization as we move forward.

- We have to write the standards so we are not assuming IT security and physical security will be handled by the same people
- Physical security and access control – IT controls access to server but not the badging for physical security –
- Need to go with this not as a concept but as framework – it is a format

The facilitators polled the team on their support for the option #2 (multiple standards) and 7 of 16 members were in support of utilizing this as the format.

An additional member joined and the Team then tested support for Option 3 (putting all into single standard) and 9 of 17 supported using this format. Neither format approach received sufficient support to make an SDT decision.

4. Numbering the Requirements

The Team them reviewed and tested support for each of the following propositions:

- **Change from existing CIP numbering system?** Yes- 13 favor changing (of 17 = 76%)

SDT Comments

- Adopting the headings would be the same under multiple numbers or as one
- If we keep CIP 002 as 002 for continuity then the rest are renumbered or just one,
- would be more confusing
- change to Option 2 if we revote but concerned this is under duress
- Think we need just one standard

5. Adopting Category Headings for Requirements

- **Adopt the proposed headings for the requirements as the categories whether as one or multiple standards** – Yes-13 (of 17 = 76%)

After further Team discussion it was determined that there was no longer a quorum and the Chair suggested postponing further discussion until Friday morning.

6. Final Review of Format Options

On Friday morning the SDT took up the final review of format options for the informal posting document(s) in order to make a decision.

The facilitator suggested the SDT use an acceptability ranking of the two possible format options that had been discussed and debated yesterday followed by clarification of concerns to see if they could be met and a requisite number of members could agree on the format to use for the informal posting.

He reviewed the scale to be used as: 4= fine as is, 3= support but have questions, 2= need to address concerns before I can support, or 1= cannot support. The SDT then ranked each option and those providing a 2 or 1 offered what their concern was.

Option #2 – Requirements in Multiple Standards

- Use the Topical areas discussed on Thursday and utilize multiple standards (example CIP 010 -020). CIP 002 also gets re-numbered.

4-3 3=7 2-6 1-0 (Avg. 2.81)

Option #2 Concerns

- All the standards have a single purpose and are meant to be viewed as one. Should be one for clarity.
- Efficiency of one (better implementation) - Don't like fragmentation between multiple standards.
- Much cleaner to have just one standard
- Current standards say to consider as one but in fact they are not treated that way thus making compliance difficult.
- There is a greater chance for double jeopardy. Easier to manage with Option 3 in a single standard format. Fragmentation leads to fragmented implementation rather than unified management.
- We do talk about the CIP standards as one but in practice they are treated differently.
- I like the grouping or headings but multiple standards looks like we are asking them to do more - also additional documentation
- If we post additional standards, the reaction of industry will be that we are asking them to do more. Having only one standard will reduce required documentation. Eventually multiple standards would be on different version levels, thus adding to confusion.

Option #3 – Requirements all in One Standard

Use the Topical areas discussed on Thursday, but one new standard is posted containing sections for.

4=6 3=5 2=3 1=2 (Avg. 2.93)

Option #3 Concerns

- Compliance implications - violating one standard even if different requirements- significant increased risk for multiple violations of one standard.
- Need to hear technical argument to support 3
- Compliance issue- non-compliance on low items makes you vulnerable to citations for repeat finding of non-compliance
- Compliance my main concern- tie our hands about splitting later- once merged cannot deal with future revisions separately
- Just trying to format for posting

- Concerned about complexity- more than value of unified
- Voted a 1 because of the number of requirements and sub-requirements. There are about 120 major requirements plus sub requirements. The 140 plus requirements may means that any violation of any of these requirements you are in violation of one standard. Compliance reporting and compliance sanction issue on the issue of multiple violation of the standard.
- When RSAW's are prepared, the SME should only view information pertinent to his area of expertise.
- Agree with concern about repeat violations of the same standard.
- Can the compliance situation could be fixed if the structure of the way NERC viewed the standards for sanctions, etc. were changed? However, that will not change.
- Is it likely that NERC would change the way they viewed compliance to support Option 3?
- Concern with the sheer complexity of the one standard. Also see disadvantages of the lack of a unified approach, but there have also been advantages in the divide and conquer approach.

SDT Options Discussion following the Ranking

- Fragmentation of the standards will contribute to lack of a unified management and implementation.
- Sometimes the only change in a standard is the change in the standard number. This makes no sense. If you look at the categories we approved yesterday, there will be tighter integration between the CIP standards. If we have separate standards, we need to make sure each can stand alone.
- Prefers the unified standard and believes that we can help the complexity by making them one. The big concern is the regulatory impact mentioned by others.
- The Current standards do not lend themselves to good organized implementation. The new adopted topic areas are the most important thing to consider. Can both options be presented to the industry for feedback?
- The facilitator asked NERC staff is we need one or the other for the posting?
- Scott Mix noted that raw work papers will not be sufficient for the posting. Presentation in two formats will likely confuse the industry. Perhaps the posting could be presented in one format, but we explain the other format and ask the industry to comment on whether they like the change or not.
- Scott Mix showed the Team the NERC generated report does show total violations by standard.
- Howard Gugel submitted the enforcement question to Joel DeJesus at NERC concerning compliance concerns. Is there a compounding effect? A: If there are multiple impacts of multiple violations of the same standard, there may be some compounding effect. If R3, R12, and R22 were violated, they would be separate violations with no compounding effect.

- The concern is the "culture of compliance" at NERC and FERC. If the same standard is violated, it will have the consequence of doubting the culture of compliance.
- If we get one single standard that has magnitudes of violations, it will send the wrong message and numbers of violations will be noticed.
- In terms in the ability to observe, Scott Mix suggested he did not see the difference.
- All the reports to the member committees are by standard number and he believes there will be a spike if all CIP is one standard.
- Legislators are aware of the collections of standards that the industry must deal with. For example FISMA is a collection they are familiar with.
- We need a decision. We spent too much time discussing this. We have agreed on the categories. Let's get something out there. We are wasting too much time.
- We could debate this all day, but we need to move forward.
- If we step away from CIP and started talking about vegetation management, he believes breaking the standard into multiple would not make sense.
- Lawmakers and congress will understand and support that while there are multiple topics, there is still one framework for improving cyber security implementation.
- Do we need a transition before moving dramatically to either new set?
- These categories make it hard to divide responsibility.
- Think new categories provide better organization and will improve implementation.
- Can we put out both as two separate documents?
- That may be too confusing to address option with questions in comment form
- Need to be accountable.
- We need to put a question to the NERC enforcement side. Can we go with this and limit compounding violations?
- Concerned about potential impact on Congress if there is a spike in non-compliance because multiple violations of one standard.
- Congress is most concerned about fragmentation and used to looking at one standard for an industry.
- The facilitator asked if any concerns addressed that would move their vote from a 3 or 4?
- Some members expressed concerns about suspending rules- changing the game. Needs to be a yes/no choice
- Concerned adding in "either" result in super majority for both options - then what?
- Is there an alternative embedded in the decision rules for this post for informal comment? Can the SDT use a majority (50%+) for purpose of posting using single standard or multiple standards and documenting the SDT differences in comment form for either choice.

The 17 SDT members present then voted for their preference for posting for informal comment between the two options with the following result:

Option #2 (multiple standards) **Yes = 6 (35%)**

Option #3 (single standard) **Yes = 11 (65%)**

The SDT agreed that while this decision to post for informal comment has a majority support (65%) but not the super majority (75%) of the members called for in the decision rules, the Team is asking for industry comment and input on the formats through comment form before finalizing a format to present in the formal comment draft in July, 2010. The Team discussed that this approach is consistent with the spirit of the following consensus rule provision: "In instances where the Team finds that even 75% acceptance or support is not achievable, the Team's report will include documentation of any differences as well as the options that were considered for which there was greater than 50% support from the Team."

IV. NEXT STEPS AND ASSIGNMENTS

On Friday the Chair reviewed the schedule, assignments and next steps for the SDT to produce a final version for posting on May 3, 2010. Joe Bucciero will lead with assistance from Howard Gugel the drafting of comment form with information provided by each of the team leads and will also add a question from discussion of the format to document discussion

The SDT will need to begin creating an implementation plan for posting in July for formal comment with a small group of SDT members in order to provide some frame for discussion at the May meeting and to answer any questions at the May workshop in Dallas. Scott Mix will be looking for individuals to work with – this will occur after May 3.

We need something in cover letter for May 3 posting that speaks to the SDT's philosophy on implementing the plan – industry needs to understand what we are doing. Need a couple paragraphs explaining our approach or intent Jackie Collett, John Lim and Doug Johnson agreed to work with Scott Mix on developing a draft implementation plan.

The Chair reviewed the schedule from April 19, Monday to posting on May 3, Monday. It was agreed the sub-teams need to complete their drafting and get these to Howard to put into "standard" for review by NERC staff. The plan will be to assimilate the NERC comments with team leads, then late in last week of April have a ready-talk and email vote for approval to post on May 3. Have conference call on April 26 for team leads and 29th for ready-talk review with full team Each Sub-team lead will seek to get work done and to Howard Gugel by Monday morning then review with Howard and team leads on Tuesday afternoon. The following schedule was reviewed and approved by the SDT:

- 19th by 5:00 – requirements, measures, vsl's and glossary drafts to Howard
- 20th Sub-team leads with Howard at 3:00 – 6:00 EST

- 21st Howard will get team drafts to NERC staff for review
- 27th full day (10-5) meeting with NERC staff with Sub-team leads and anyone else who wants to join (NERC comments back by 26th if possible to full team – concern is legal and compliance) – updated version send out on 28th to full team for review
- 29th full team meeting (1 to 4) for review and vote to post

The Chair and Vice Chair and the SDT thanked Jay Cribb for his excellent hosting and great facilities.
The meeting adjourned at 12:00 p.m.

Appendix # 1— Meeting Agenda
Project 2008-06 Cyber Security Order 706 SDT
Draft 20th Meeting Agenda
April 13, 2010, Tuesday- 1 PM to 5:30 PM EST
April 14, 2010 Wednesday- 8 AM to 6:15 PM EST
April 15, 2010 Thursday- 8 AM to 5 PM EST
April 16, 2010 Friday- 8 AM to 12 PM EST
Georgia Power
241 Ralph McGill Blvd
Atlanta, GA 30308
NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes

- Review the revised CSO 706 SDT 2010 Work plan and Schedule
- Receive updates on other related cyber security initiatives
- Receive a NERC update on implementing the CIP Communication Plan and the May 2010 Technical Workshop
- Review, refine and adopt the Draft Final CIP-002-4 for industry informal comment
- Review, refine and adopt the Sub-Team Security Control Requirements draft for industry informal comment
- Develop related CIP 002 and Security Controls Requirements Guidance Documents
- Agree on next steps and assignments

Draft Agenda

Tuesday **April 13, 2009**
1:00 p.m. Welcome and Opening Remarks- *John Lim, Chair & Phil Huff, Vice Chair*

	Roll Call; NERC Antitrust Compliance Guidelines Facilitator review and SDT acceptance of March 9-12, 2010 Phoenix SDT meeting summary
1:10	Review of Meeting Objectives, Agenda and Meeting Guidelines- *Bob Jones*
1:15	Review and Discussion of CSO 706 SDT Workplan and Schedule - March-December, 2010- *Stu Langton*
1:45	Updates on other related cyber security initiatives- *NERC Staff and SDT Members*
1:55	Update on CIP Communication Plan and May 2010 Technical Workshop - *Carl Dombek*
2:15	Overview of Single Text- CIP-002-4 & Security Controls Requirements
2:45	*Break*
3:00	Review of Revised CIP-002-4 Draft Final and SDT Industry Response Document- *CIP-002-4 Drafting Team, John Lim et al.*
3:30	Full Team Consensus Testing on Refinements of draft final CIP 002-4
5:25	Review of Proposal for Wednesday Agenda
5:30	*Recess* ▪ *Possible Security Controls Requirements Sub Team Meetings- Evening* ▪ *If needed, CIP-002 Drafting Team to meet to finalize draft and present for adoption Wednesday morning.*

Wednesday	**April 14, 2010**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucierro*
8:10	Final Review of CIP-002-4 as revised
9:00	Security Governance Requirements- Overview and Consensus Testing
10:30	Break
10:45	Personnel and Physical Security Requirements and Guidance- Overview and Consensus Testing
12:15	Working Lunch
1:00	Operations Security Requirements and Guidance - Overview and Consensus Testing
2:30	Break
2:45	Recovery and Response Requirements- Overview and Consensus Testing
3:45	Access Control and Auditing- Requirements- Overview and Consensus Testing
5:00	Change Management, System Lifecycle and Information Management- Requirements- Overview and Consensus Testing
6:15	*Recess* ▪ *Possible Security Controls Requirements Sub Team Meetings- Evening*

Thursday	**April 15, 2010**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucierro*
8:10	Security Controls Sub-Teams Refinement Sessions
10:00	Break
10:15	Security Controls Sub-Teams Refinement Sessions
12:00	*Working Lunch*

1:00	Full Team Review and Consensus Testing on Final Draft
3:00	Break
3:15	Full Team Consensus Testing on Refinements-*Continued*
4:15	Motion to Adopt in Concept Draft CIP 002 and Security Controls Requirements for Informal Comment Posting Review Any Drafting Assignments and Friday Agenda
5:00	*Recess* ▪ *As needed ad-hoc drafting groups- Evening*

Friday	**April 16, 2010**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucierro*
8:10	Sub-Team Development of Guidance Documents
10:15	*Break*
10:30	SDT Review and Suggested Refinement of CIP Guidance Documents
11:15	Review of May 2010 Technical Workshop Planning and Preparation
11:45	Review of Dallas Agenda and Agree on Next Steps and Meeting Evaluation
12:00	*Adjourn & Lunch*

Appendix # 2 Attendees List
March 9-12, 2010, Phoenix, Arizona

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation
2. Jim Brenton	ERCOT (T/W/Th)
3. Jay S. Cribb	Southern Company Services
4. Sharon Edwards	Duke Energy
5. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
6. Gerald S. Freese	America Electric Pwr. (T/W/Th)
7. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
8. Doug Johnson	Exelon Corporation – Commonwealth Edison
9. Frank Kim	Hydro One Networks Inc. (T/W/Th)
10. Rich Kinas	Orlando Utilities Commission (Th/F)
12. John Lim, Chair	Consolidated Edison Co. NY
13. David Norton	Entergy (T/W/Th)
14. David S. Revill	Georgia Transmission Corporation
15. Scott Rosenberger	Luminant Energy (T/W/Th)
16. Jonathan Stanford	Bonneville Power Administration
17.Tom Stevenson	Constellation
18.Keith Stouffer	National Institute of Standards & Technology (T/W/Th)
19. John Van Boxtel	WECC
20. John D. Varnell	Technology Director, Tenaska Power Services Co.
21. William Winters	Arizona Public Service, Inc.
Scott Mix	NERC
Howard Gugel	NERC
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Hal Beardal	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center
Tom Hoffstetter	NERC (Thurs a.m. by phone)

SDT Members Attending via ReadyTalk and Phone

22. Jackie Collett	Manitoba Hydro
23. Patricio Leon	Southern California Edison (T/W/Th)
24. Kevin Sherlin	Sacramento Municipal Utility District (Th)

SDT Members Not Participating

Joe Doetzl	Kansas City Pwr. & Light Co

Others Attending in Person

Jim Fletcher	AEP
Brian Newell	AEP
Bryn Wilson	OGE
Clyde Poole	TDITX
Rod Hardiman	Southern Company
Elizabeth Moses	Georgia Transmission
Jason Marshall	Midwest ISO

Others Attending via WebEx and Phone

Andres	Lopez	andres.lopez@usace.army.com
Justin	Kelly	FERC
John	Fridye	jfridye@rrienergy.com
Steve	Newman	srnewman@midamerican.com
Maggy	Powell	margaret.powell@constellation.com
Bill	Keagle	william.a.keagle.jr@constellation.com
Steve	Newman	srnewman@midamerican.com
Jerome	Farquharson	jfarquharson@burnsmcd.com

Appendix # 3 — NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that
violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect
NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Sub-groups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost
- information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.

- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Sub-groups) may have a negative impact on particular entities and thus in that sense adversely
impact competition. Decisions and actions by NERC (including its committees and Sub-groups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Sub-group, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on

- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

APPENDIX # 4
CSO 706 SDT MEETING SCHEDULE
APRIL –DECEMBER 2010

Schedule Convergence: Full CIP V4 Package		
Date	**Week of**	**CIP Task**
SDT Meeting-Atlanta, (4/13-16)	4/12/2010	**Present Controls draft for full team review and comment. Sub team drafting. Finalize draft for Informal Comment, Full Package**
	4/19/2010	**NERC Prepares Full Package for Industry Comment**
	4/26/2010	**SDT Reviews and Approved Full Package for 30-day Industry Comment Period**
5/3/2010	5/3/2010	***Informal Comment Posting for full package starts Completes on 6/2/2010***
SDT Meeting-Dallas, (5/11-14)	5/10/2010	**Prepare for Industry Workshop**
5/19 & 5/20/2010	5/17/2010	**1.5-day Industry Technical Workshop (Dallas, TX)**
	5/24/2010	**SDT Considers Comments from Workshop**
6/4/2010	*5/31/2010*	***2nd Informal comment period ends***
6/2/2010		***Comment Period Ends***
6/3-6/4/2010		***SDT Summarizes Comments Received***
SDT Meeting, Sacramento (6/8-11)	6/7/2010	**SDT Meeting: Comment review, response process, re-drafting, as needed**
	6/14/2010	Sub team meetings
	6/21/2010	Sub team meetings
6/29/2010	6/28/2010	Sub team meetings. SDT interim online meeting.
	7/5/2010	Subteams Package modifications into Standard documents
SDT Meeting, Pittsburgh, (7/13-16)	7/12/2010	**Finalize & Approve Documents for posting for 45 day formal comment period**

Schedule Convergence: Full CIP V4 Package		
Date	**Week of**	**CIP Task**
	7/19/2010	***NERC Prepares Materials/SDT Approves Revisions/NERC Seeks SC Approval for Ballot***
7/26/2010	7/26/2010	***45 Day formal comment period starts (completes 9/8/10) /Ballot Pool formation (completes 8/25/10)***
	8/2/2010	**Industry Comments on Standards**
SDT Meeting, TBD, (8/10-13)	8/9/2010	**SDT Meeting: Prepare for Industry Webinar**
8/18/10	*8/16/2010*	***Hold Industry Webinar***
8/25/2010	8/23/2010	***30 Ballot Preview/Initial Comment Preview ends/Ballot Pool formed***
8/30/2010	*8/30/2010*	***Initial Ballot Starts***
SDT Meeting Winnipeg, (9/7-10)	9/6/2010	**Respond to comments received. Drafting revisions. Review Ballot Results and Additional Comments**
	9/8/2010	**Initial Ballot Ends**
	9/13/2010	Sub team meetings
9/24/10	9/20/2010	Sub team meetings; Full SDT on-line meeting to adopt revised draft of documents
	9/27/2010	NERC Staff Review of Documents and SDT Approval for Re-ballot
10/4 to 10/13/10	10/4/2010	Re-Ballot Period Begins
SDT Meeting TBD, (10/12-15)	10/11/2010	**Prepare responses to 2nd ballot comments**
10/19/2010	*10/18/2010*	***Sub-teams meet to adjust requirements***
10/29/2010	10/25/2010	***Prepare & Finalize revisions to standards and responses to comments on standards***
	11/1/2010	NERC Staff Review of Documents and SDT Approval for Re-ballot
11/8 to 11/17/2010	11/8/2010	3rd Ballot Period Begins

Schedule Convergence: Full CIP V4 Package		
Date	**Week of**	**CIP Task**
SDT Meeting TBD, (11/16-19)	11/15/2010	**Prepare responses to 3rd Ballot comments**
	11/22/2010	*NERC & SDT finalize responses to ballot package*
	11/29/2010	*Seek SC & BOT Approval for Filing*
	12/6/2010	*Seek SC & BOT Approval for Filing*
SDT Meeting TBD, (12/13-17)	12/13/2010	**SDT Meeting to review Filing and Celebrate Project Completion**
	12/24/2010	*Submit for Regulatory Approval*

Appendix #5

CSO 706 SDT DRAFTING SUB-TEAMS

Security Controls Sub-Team Principles and Drafting Guidance

CSO 706 SDT SECURITY CONTROLS SUB-TEAM DRAFTING PRINCIPLES

(ADOPTED BY CSO 706 SDT, JANUARY, 2010)

1. Applicability [NERC ROP] Each reliability standard shall clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted.	**9.Practicality** [NERC ROP] – Each reliability standard shall establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.
2.Reliabiliy Objective [NERC ROP] Each reliability standard shall have a clear statement of purpose that shall describe how the standard contributes to the reliability of the bulk power system.	**10. Consistent Terminology** [NERC ROP] To the extent possible, reliability standards shall use a set of standard terms and definitions that are approved through the NERC reliability standards development process.
3.Performance Requirement or Outcome (NERC ROP) Each reliability standard shall state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest.	**11. Commensurate Controls for BES Impact Categories.** Security controls shall be commensurate with the identified level of BES impact categories.
4. Measurability (ROP) Each performance requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement.	**12. Change Documentation.** Changes from prior versions of CIP Standards have clear rationale. These include the following types of changes: a. Above and beyond the current standards; b. Removal of requirements; and c. Major formatting changes.
5.Technical Basis in Engineering and Operations [NERC ROP] Each reliability standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.	**13. Reduce Administrative Overhead**. Administrative documentation shall be kept to the minimum that is necessary
6. Completeness (NERC ROP) Reliability standards shall be complete and self-contained. The standards shall not depend on external information to determine the required level of performance.	**14. Priority.** Implementation plans for the Standards are prioritized according to level of BES impact.
7. Consequences for Non-Compliance [NERC ROP] In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, the consequences of violating a standard are clearly presented to the entities responsible for complying with the standards.	**15. Eliminate or Minimize TFEs.** Security controls shall eliminate or at least minimize the need for TFEs. Allow for compensating controls to mitigate the need for a TFE.
8. Clear Language [NERC ROP] – Each reliability standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.	

SECURITY CONTROLS SUB-TEAM
PROCESS AND DRAFTING GUIDANCE AND DELIVERABLES

Guidance from the January, 2010 Tucker Meeting and the February 2010 Austin Meeting

For the purpose of maintaining consistency across the teams and capturing interim decisions and change documentation, each team should utilize the following development process:

1. **DHS Catalogue of Controls:** Begin by identifying applicable controls that are enumerated in the *DHS Catalog of Control System Security Recommendations* for High Impact Cyber Systems.
2. **Cross Reference CIP Version 3 Requirements/sub-Requirements:** For each security control identified in step 1, cross reference the CIP version 3 Requirement/sub-Requirement or validate previous mapping work.
3. **Specific not Prescriptive:** As a general rule, be specific but not prescriptive in writing the requirements.
4. **"What" not "How":** In general, seek to draft a "what" requirements, not "how" requirements.
5. **Develop the requirement language** for each security control identified in step 1.
   a. When mapping to existing CIP requirements, use language from CIP, making improvements where needed.
   b. When no associated requirement from CIP exists, develop the new requirement using language from the *DHS Catalog*.
6. **Document significant changes to CIP Standards:** Document significant changes made to previous versions of the CIP Standards. Conceptual or broad changes can be captured by a single statement.
7. **Incorporate existing CIP requirements not mapped to the *DHS Catalog*.** If a requirement is no longer necessary because the intent was captured elsewhere, then include this in the change documentation.
8. **Address specific directives from FERC Order 706** that may be applicable to the requirement.
9. **Analysis and Determination of Requirements for Medium and Low Impact:** In the analysis and determination of applicability of requirements to Medium and Low Impact Cyber Systems, consider the cost in relation to the security benefits (i.e., a minimal cost requirement that significantly mitigates risk would apply to *ALL* Cyber Systems. Similarly, a significant cost requirement that minimally reduces risk or provides little additional security may apply only to *HIGH* impact Cyber Systems).
10. **Specify Applicability to Environments:** Specify applicability of a requirement to Generation, Transmission, and/or Control Center environments.
11. **Apply Requirements to BES Cyber System:** Requirements should apply to either:
    (a) The BES Cyber System as a whole, or
    (b) Components of the BES Cyber System. However, when a requirement only applies to specific types of components, Sub-Teams should describe those types of components to determine where component classes exist.

(c) Requirements specific to boundary protection or ESP can be written to the interface of the BES Cyber System.

12: **Level of Requirements:** Sub-Teams should generally write the requirements at a high enough level to avoid applicability of specific technology. Where there are applicable CIP requirements, start with the CIP words and tweak if needed to include some DHS language/concept. However, the "level" of the requirements text should be raised, if needed.

Agenda
Cyber Security Order 706 SDT — Project 2008-06

May 27, 2010 | 9:00 am – 3:00 pm Eastern Time
FERC Offices

1. **Administrative Items**
   a. Introductions — All
   b. Agenda and Objectives — John Lim (SDT Chair)

2. **Project 2008-06 Cyber Security Order 706**
   a. Overview of draft CIP-010-1, Cyber Security — BES Cyber System Categorization – John Lim (SDT Chair)
   b. Overview of draft CIP-011-1 Cyber Security — BES Cyber System Protection – Philip Huff (SDT Vice-Chair)
   c. Workshop Review and Topics of Discussion
   d. Implementation Plan Discussion
   e. Summary of standard drafting team's resolutions of FERC directives included in Cyber Security Order 706
   f. Discussion - All

3. **FERC Staff Questions of the Standard Drafting Team**

4. **Standard Drafting Team Questions of FERC Staff — SDT**

5. **Next Steps — John Lim & Philip Huff**

6. **Adjourn**

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

Standard Drafting Team Preliminary Questions of FERC Staff — SDT

a. Does FERC see any "gaps" in the draft CIP Standards as published? Please describe. If so, please provide some direction on how they should be closed.

b. Does FERC see any "show stoppers" in the current set of draft CIP Standards that would cause the standards to not be approved?

c. Please provide feedback on the new proposed structure of the CIP Standards (CIP-010 & CIP-011 vs. CIP-002 through CIP-009). State any likes and dislikes.

d. Please provide feedback on the proposed table structure for the draft requirements in CIP-011. Suggest any improvements that should be made.

e. Please provide input concerning the proposed "bright lines" defined in the new draft CIP Standards, as presented in Attachment 2 to CIP-010.

f. Please provide input on the proposed schedule for completion of the current draft version of the CIP Standards (CIP-010 & CIP-011).

g. In its proposed schedule, the drafting team has deferred addressing a small subset of the Order 706 directives that are very complex and would require extensive industry deliberation in addressing them. Please provide any comment or feedback on this approach. .

h. Please provide input on the proposed Implementation Plan concepts for the CIP-010 & CIP-011 standards.

i. Please describe FERC's plans to support the individual drafting sub-teams and the full SDT going forward.

j. Specific discussion topics include:

   1) Immediate revocation requirements included in FERC Order 706
   2) Appropriate application of TFEs for the new draft standards

k. Please discuss the list of items/issues (if any) that are still open that must be resolved prior to approval of the new draft CIP Standards.

l. Please provide a sense of acceptability of the new draft CIP Standards to FERC staff. What improvements or changes in direction are needed to achieve acceptability?

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Minutes
Cyber Security Order 706 SDT — Project 2008-06

May 27, 2010
FERC Office
Washington, DC

Atmosphere was cordial and professional, and the meeting was constructive.

FERC staff agreed that the approach taken in the draft CIP-010 and CIP-011 standards could work, but acknowledged that a lot of work is still needed in clearly defining the requirements, tables, and Attachment II of CIP-010.

FERC staff expressed concern that the Low impact level requirements are insufficient and need to be bolstered. The Low baseline is too low.

The proposed 36-month review of the categorization needs to be shortened, at least for the first review cycle (possibly to 12 months)

Beware of hidden requirements in the purpose statements of the requirements, and review with the intent to minimize the adjectives used in the text (e.g., sufficient, proper, adequate, etc.) and clarify what is required with respect to auditability and enforceability.

The bright line thresholds stated in Attachment II need to be justified or at least explained.

The SDT must ensure that all of the requirements are auditable.

Concern was expressed on the deferring of some FERC directives until next year.

FERC staff recognizes that the schedule of the project is ambitious, and appreciates the monumental effort being performed by the SDT in creating these standards.

Introductions and Anti-Trust Guidelines

Regis Binder, FERC, welcomed the NERC SDT members, industry stakeholders, and other participants to the meeting and covered meeting logistics. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call, and reviewed the need to comply with NERC's Antitrust Guidelines.

John Lim, SDT Chair, thanked FERC for hosting the meeting and providing the meeting room and facilities. He also reviewed the proposed meeting agenda.

FERC staff stated that they are not speaking for the Commission, and they recognize the importance of the cyber security issues to the industry and the country. FERC staff recognized the magnitude of the herculean effort and the excellent hard work being done by the SDT, in addition to everyone's day jobs, and stated this effort was fully appreciated.

The proposed agenda for the meeting is included as an attachment to this meeting summary. FERC staff was encouraged to ask questions throughout the presentation/discussion offered by the SDT regarding the new draft CIP standards.

Review of CIP-010-1

John Lim reviewed the strategy, approach, and history of CIP-010-1. The primary objectives of this standard are to: (1) help scope the electric system assets that are within the purview of the CIP-010 and CIP-011 standards; and (2) establish a list of reliability functions and "bright-lines" for categorization of the BES cyber systems.

a. Discussion of Scope

The process and criteria currently being used today for identifying critical assets in the electric system are thought to be inadequate. For example, less than 5% of the existing generation facilities around the country are considered to be critical assets, so the SDT has identified a new approach in the new CIP-010-1 standard.
The scoping process in the existing CIP-002 standard calls for identification of critical bulk electric system assets, then the associated critical cyber assets. In CIP-010, there are no 'out of scope' bulk electric system assets; instead a categorized list of those assets and their related cyber systems is required. That is one of the major differences between CIP-002 and CIP-010.

Attachment I of the draft CIP-010 standard is meant to provide the definition of scope and applicability. CIP-010 requires the categorization of cyber systems by defining a list of the real-time reliability functions that could have an impact on the reliable operation of the bulk electric system, and if a cyber system is doing any of those functions, then it is within scope.

Categorization of the electric system assets and the cyber systems based on multiple levels (High/Medium/Low) of their potential impact on the reliable operation of the bulk electric system is key aspect of the new draft CIP-010 & CIP-011 standards. Attachment II of the draft CIP-010 standard is meant to provide the criteria or "bright lines" to identify the potential impact (High/Medium/Low) on the reliable operation of the bulk electric system if the electric system asset or its cyber systems are destroyed, degraded, misused, or otherwise rendered unavailable. The concept is to take a more holistic view and move away from consideration of individual critical cyber asset issues, and place more focus on 'system' impacts.

One of the significant concepts behind collapsing the CIP-003 to CIP-009 standards into a single standard was to clarify the requirements for audit purposes and reduce the incumbent paper work thereby providing focus on the security of the key cyber systems. The SDT is concerned about the auditability of the requirements, and wants to ensure that the CIP-010 and CIP-011 requirements are auditable.

b. Discussion of CIP-010-1 Attachment I

The CIP-010 requirements apply to cyber systems that are relevant to real-time operations (not long term planning or systems that do engineering or marketing). The current benchmark parameter is "impactful within 15 minutes", where the 15 minutes relates to when the incident occurs. Discussion and feedback from the industry to determine if the 15 minute parameter is appropriate has been solicited through the recent informal posting and comment form for the draft CIP-010 and CIP-011 standards. FERC staff suggested that the drafting team consider adding security systems, both electronic and physical, to the list of Functions Essential to Reliable Operation, although the 15-minute rule probably shouldn't apply.

c. Discussion of Bright Lines

Question: In CIP-010 R1, the phrase "execute or enable" is used; what is meant by enable?

In some cases, a cyber system directly performs a function (as identified in Attachment I), but in other cases (e.g., data collection/aggregation or display) it is providing information to an operator or other systems to enable functions.

FERC staff observations: Once these draft CIP standards are filed, they will create a different benchmark or situation from the existing CIP standards for the industry to consider. Are we improving or not? What is the key yard stick? There seems to be a general belief that the number of assets identified to be critical to reliable operation of the BES under CIP-002 is inadequate (i.e., not enough assets being identified, less than 5% of generation). When these new draft CIP standards are filed, how can it be demonstrated that the key assets are identified? The size of unit is not the necessarily the key. What is the impact of the Contingency Reserve clause? Why is it appropriate; isn't

it similar to an N-1 analysis which the Commission rejected for applying CIP-002? Is the "medium" level of impact adequate for the number of units that can potentially fall into that category?

The intent is for the new CIP-010 standard to be comprehensive, in that all bulk electric system and cyber system assets will be covered to some level of impact. The "bright lines" are being provided to help clarify the assignment of the appropriate level of impact to each of the BES Cyber System assets. The SDT recognizes that measuring impact against what is considered 'critical' today is not good enough since today's results are not acceptable.

The SDT is looking for guidance from all industry participants with a stake in the game as to what is acceptable for the bright lines, and hoping to receive some guidance through the informal comments from the industry.

Allen Mosher: The draft CIP-010 standard is an improvement over what we have today, and we need to implement it soon. It's difficult to compare it to what we have today, because we have a different paradigm. We want to maximize our effort to identify the most critical assets and focus on the control systems. We should worry most about common use failures and wide spread loss of the bulk electric system.

Gerry Adamski: What are the criteria for identifying if an approach is adequate? What is adequate, and how do we identify it to help tweak the product? A thoughtful dialogue may be needed to better define the "bright lines" in Attachment II.
While the number of megawatts or the size of a unit can be one of the criteria used, the impact on day-to-day operations is also very important. The SDT should have a solid basis for the numbers used in Attachment II to define the "bright lines" that are used in the draft CIP-010 standard.

For example, generators, units, plants, etc. that are used intermittently, are they single or multiple control systems? The number of generation MWs connected to assets or to the control systems? If three units combined are over 2000 is it a High impact system? Are three separate control systems that are networked together a single cyber system? How does contingency analysis factor into the impact level criteria evaluation, if at all?
It might be helpful if the SDT can quantify the number of MWs of generation that would be classified as High impact using the new draft CIP-010 standard vs. today under the CIP-002 standard.A re-ordering the "bright lines" criteria identified in Attachment II should be considered, putting the control center criteria first.

FERC staff expressed concern that the requirements applicable to the Low impact criteria are not sufficient, and that the Low/Medium impact bright line is set too high.
Throughout CIP-010 there are references to quantities of MW; how were those quantities selected? Adding insight into how the values were determined (e.g., was a study done; is it from operating experience) would be very helpful. NERC indicated that many of the bright-line values came from a variety of resources available to NERC, plus active

participation and input from OC & PC members in the development of the standards. FERC does not have a magic study to use in its review and assessment of the bright lines.

d. Discussion of Guidance and Auditing

The SDT members agree that guidance is necessary for each of the requirements. There hasn't been enough time spent to-date to fully develop or flesh out guidance on each requirement. There is reason to believe not everyone knows or can identify all the key assets that auditors are concerned about, since the auditors learn something new every time they perform an audit.

Two NERC auditors have been engaged with the process of defining these new draft CIP 010 & CIP-011 standards as well as participation from the regional entities. There were many auditors involved in last week's SDT technical workshop held in Dallas, TX. The easiest standard to audit is a checklist, but that is the worst way to audit. Transparency is needed on how an entity is audited. The entity needs to know how the audit will be approached. In the filing, a summary description of what discretion is left to the entity may be helpful.

NERC will have its audit department staff review the draft CIP standards and provide comments from an auditor's perspective. Are the "bright lines" bright enough, including the concept of shared cyber systems?

e. Discussion of Compliance Review Schedule

The draft CIP-010 R3 requires at least a 36 month review cycle, since the bulk electric system doesn't change that much that often. Currently a three year process is used by the entities as a review trigger for going back to look at the standards and consider if any changes have occurred that would impact the High/Medium/Low categorizations. What are the triggering events for this review? Possibly the SDT should consider that a one to two year review cycle is needed at first, and then followed by the traditional three year cycle.

How assets are allowed to move from one category to another over time may be critical. Where should these requirements be addressed; in the audit process? Also, do we need to address assets that may be critical to a neighboring entity but may not be critical to my entity even though my entity controls the assets?

1. Review of CIP 011-1

Phil Huff provided an overview of CIP-011 and led the discussion. The overall approach by the SDT was to combine CIP-003 through CIP-009 into one standard, taking into account the FERC directives, the SDT's review of the DHS catalogue of cyber security requirements, and incorporation of those requirements that would be beneficial to the reliability of the BES.

a. Discussion of One vs. Multiple Standards

CIP-011 is presented as one standard with many parts. As such, putting all of the requirements together in one standard would tend to minimize the need to make conformance and cross-reference revisions solely because an associated CIP standard was modified.

Retaining the multiple standards approach carries with it some difficulties with synchronization of the requirements and versioning of the multiple standards. Retaining the multiple standards approach would possibly make it easier for entities to split up the CIP requirements for implementation and monitoring in a way to match the unique organization of the entities.

The SDT is divided on the issue of format for CIP-011 – formatting it in one standard communicates the standards should be seen as one. A multiple standards format makes it easier to change individual standards separately. The single standard approach would simplify the ability to incrementally change the full standard. However, implementation questions have been raised related to the substantial change it represents from the Version 3 numbering of standards and requirements.

The multiple standards approach carries the compliance issue of potentially multiple violations across multiple standards for the same identified problem. On the other hand, when violations are reported by standard, the single standard approach may result in this standard standing out in the violations report by combining so many requirements into one standard.

The SDT asked a question regarding format of the CIP-011 standard to gain some industry feedback, since the SDT itself could not reach a super majority decision on the best format approach.

b. Discussion of the Requirement Tables

A new feature in CIP-011 is how the requirements are presented, which is based on applicability/impact on the reliable operation of the BES. There are several subject areas identified in CIP-011, including: security governance and policy; personnel training, awareness, and risk assessment; physical security; electronic access control; etc. Each requirement has several characteristics identified, and each requirement is assigned to one

of the subject areas. A requirement is represented in the CIP-011 draft standard through a table that groups together all of the requirement's characteristics.

A few questions were raised by FERC staff regarding the requirements tables in CIP-011. For example, what is the intent of the 'blank' entries in a table? Are entities required to do anything? Can an entity be found in violation of a requirement if the corresponding table entry is blank? Should entities look at the rows in a table to determine compliance with the requirement?

c. Discussion of Specific Requirements and Wording

CIP-011 R1.3: What is the intent? The requirement to clearly identify a senior manager is not really stated in the requirement. The requirement is for the entities to designate a single official. How do you determine that, and when do you have to designate this individual? Nothing specifically says an entity shall designate this individual.
The training requirements seem to be scattered around the CIP-011 draft standard. Possibly a consolidation of the training requirements would be helpful. Also the choice and use of words such as 'training' vs. 'education', vs. 'credentials' needs to be reviewed for consistency of meaning. What is 'sufficient' training? Need to include a sense of frequency and magnitude around the training requirements.

Overall, the SDT needs to review the draft CIP standards with respect to the use of adjectives (e.g., sufficient, proper, adequate, etc.) and clarify what is required with respect to auditability and enforceability. For example, R5 vs. R16/R18 states "ensuring" vs. "guaranteeing". Which one is correct?

The SDT acknowledged that this draft of CIP-011 was prepared by multiple subteams within the SDT, and the multiple teams did not always use consistent language in developing the requirements. The SDT has been focused on developing compliance elements, but is now focused on writing the requirements clearly while also minimizing the need for TFEs.

d. Form and Format Issues

The Enforcement office at NERC is looking at the draft CIP standards with respect to the needs for enforceability and compliance, as well as the table structure of requirements. CIP 011 covers the requirements previously included in CIP-003 thru 009; have these requirements been incorporated or do the requirements from CIP-003 thru CIP-009 need to be maintained?

Some of the more document-focused requirements are no longer in the new draft standards. Does that meet the equally protective criteria? The intent is to improve the standards by removing the administrative requirements that do not improve reliability in any way.

The need for more than paper evidence of compliance may lead to actual need to demonstrate compliance. For example, current requirements call for paper demonstration rather than allow for actual demonstration of the protection system; the latter improves security. Creation of paper lists of authorized personnel is a Chinese fire drill that does not improve system security.

A mapping will be done to identify gaps in the standards that we will address in the version coming out in July for industry comment and ballot. The idea is to explain clearly why the gaps are there, and that these gaps do not affect the reliability of the BES. One of the biggest issues is the perception of a culture of compliance. Now you have multiple violations of the same standard, and from the way it would be reported today, it would stick out. NERC/FERC need to make sure this does not present a skewed view of the CIP standards.

Concern was raised about the status of the components that make-up the tables. The 'R' (for requirement) is not used for the components in the table. How does that relate to the roll-up methodology; what is and is not a requirement? What is the status of the actual wording in the parent requirement (ahead of the table), and how does it relate to the components in the table?

In Tables R4 to R9, there seems to be a general formula for the requirement, which is each responsible entity shall apply the criteria with a goal of preventing unauthorized access to BES cyber systems. However, a responsible entity that has a Low impact BES cyber system does not have an entry in the table that indicates that the entity has to address any of the subcomponents. Is that entity still subject to the requirements of R5? Similarly, if a Medium impact cyber system has in fact restricted physical access according to 5.1, but there is in fact an unauthorized access – would that be a violation of R5? The intent of the entries in the tables and the requirements needs to be clarified. How will the goal of preventing unauthorized access be accomplished on assets with Low impact, when there is no requirement defined?

e. Discussion of Applicable Time Barometer

The discussion centered around why a 15 minute time period was selected as the barometer for the impact time stated in the draft CIP-010 standard. Isn't it dependent on current system conditions? Whatever time period is chosen will it be readily evident to the entities?

How quickly can it be determined that there is an impact on the bulk electric system? When does the impact happen? Is it objective enough for an entity to determine for purposes of verifying for audits?

Is a qualifier needed for peak electric system conditions or most stressful conditions? Time of year and load conditions may impact the determination of the time used.

The draft CIP standard is written around how the set of functions impact the reliable operation of the bulk electric system; some functions have more immediate impacts and others take longer to impact the BES.

Misuse of a system may have a longer lead time, far longer than fifteen minutes, but an equally devastating impact. The SDT might need to revisit the definition or application of the fifteen minute time period.

2. Implementation Plan

Scott Mix provided a high level overview of the implementation plan concepts and issues being considered by the SDT. A subgroup has been formed to prepare the text for the Implementation Plan. They will likely start meeting during the SDT Meeting in June 2010 in Sacramento.

Scott Mix presented the slides he recently gave at the SDT Workshop in Dallas, TX. He noted that the plan is to retire CIP 002 and CIP 003-009 within a transition period as CIP-010 and CIP-011 become effective.

a. Discussion of Implementation Plan Issues

The SDT is working on relevant timetables for implementation of the draft CIP-010 and CIP-011 standards, including how to prioritize the effort in terms of importance and in terms of timing.

The SDT needs to try to identify in a general sense which assets will eventually fall into each of the High/Medium/Low impact categories and how many assets will be in each category. A significant benchmark between the CIP-002 and the CIP-010 & CIP-011 standards will be the number of assets involved, and has that number increased in size and scope.

How should the industry be incentivize to implement the new CIP-010 & CIP-011 standards, but not the Medium or Low impact controls at the expense of first focusing on the High impact assets. Possibly a 'rolling' implementation of the standards is in order. What is the impact categorization of a BES cyber system if it moves up or down an impact level? How should it be considered in the implementation plan?
The Implementation Plan subteam will also work with the nuclear folks to discuss policies and impacts vs. an implementation schedule. Two stakeholders from the nuclear industry will be part of the implementation plan subteam.

Some level of reporting to FERC on implementation plan development (including content and schedule) is encouraged. The reporting should be designed to provide review of justifications, milestones, and accountability while offering a degree of oversight.
One possible scenario for implementation plan development would be for the entities to quickly develop their lists of categorized assets, immediately followed by the

establishment of their respective implementation plan. The responsible entities should then report their implementation plans to the respective regional entity for approval. Guidance documents will be prepared by the SDT to provide a level of consistency and assistance in the development of the implementation plans. Potential conflicts between compliance deadlines and audit schedules must also be considered.

Allow entities to be compliant early especially through implementation of system upgrades that will need to be compliant later. We'll need to recognize that some entities may need additional time to do the job right while maintaining appropriate levels of oversight. For example, larger organizations may have a larger portion of assets affected by the new standards.

During the discussion, Allen Mosher suggested that a possibility to consider would be to base the implementation plan on the current mitigation plan process. The discussion of this idea continued with many including FERC staff seeing possible merit to this approach.

b. Discussion of Transition and Migration

A transition plan from the existing CIP-002 to CIP-009 requirements to the new draft CIP-010 and CIP-011 requirements is needed. Some CIP-011 requirements are a direct replacement for those in CIP-003-009 and a migration plan should be developed for those, while other requirements are new and an implementation plan is needed. Plans to guide the entity may be helpful to both the entity and the auditors. A roadmap for the transition/migration activities would help in the development of a schedule to accomplish these tasks.

The draft CIP-011 standard does not appear to provide a significant base level of protection for the low and medium impact controls. FERC staff expressed concern that the controls requirements for the "low" impact systems do not provide an adequate level of protection. The blank entries in the tables in CIP-011 might imply that there are no control requirements.

c. Discussion of Physical Controls

Physical items or locations may have protection but may not be auditable as a NERC standard, which focuses on cyber assets. For example, substations have physical protection, but how can an auditor be convinced that the physical fence or padlock was there thirty days ago.

The focus of the SDT is on cyber security. The team considered a separate SAR for physical security. The issue is not when the fence went up, but was it secured and was the lock actually locked – actually visiting remote sites to prove this might be too much.

Too much energy goes into such audits without corresponding benefit of protecting the system. An auditor might randomly select a few remote sites – because selection is random, but an entity would need to protect them all.

d. Discussion of Immediate Revocation

It's questionable if the industry can meet targets for "immediate revocation of access". Do timeframes of 72 hours work? May need a primary and secondary revocation applied to remote and/or physical access – this will also depend on the "cause" for revocation.

What does "immediate" really mean in these cases? For example, an entity may need to revoke access of an individual before letting the person go for cause. "Immediate" is not auditable, even if we set a time period. "As soon as possible" would be a better phrase or a set time period would be sufficient. If it is a planned termination, then it can be immediate because it precedes the termination. If it is part of an emergency, revocation may need a reasonable time period.

e. Discussion of Security Systems Protection

FERC staff suggested adding a fourth column to the tables in CIP-011 that would list the physical/cyber security system protection required for each asset. The intent is to apply the appropriate level of security. It was also suggested that a function be added to the table in Attachment I of CIP-010 for security/protection systems.
Security systems impact the BES. Passwords – maximize use without being prescriptive – suggested language – cut down on TFE's

f. Beyond CIP-010 and CIP-011

FERC Order 706 included some directives (e.g., defense in depth) that have not been addressed so far. The SDT felt there was too little time to accomplish these requirements and that tackling them might have derailed the process to this point.
Concern is that some of the items may have been part of the paradigm shift FERC was asking for in Order 706. How can some of these items in the order be defined, or implemented, or audited, etc.?

Implementation of an active vulnerability assessment (testing) can be contrary to reliability and security. Special care and guidelines are needed for this requirement.
The December 2010 date for filing of the new draft CIP standards for approval by FERC is not one of the Commission directives. It can become an informational filing, since it is not making law, and may be changed with FERC approval. Need to implement improvements sooner, but may not be able to resolve issues now.

The SDT is planning to file the new draft CIP-010 and CIP-011 standards by December 2010, and will start in January 2011 to look at the other remaining issues – may be a continuously moving target.

The recent SDT Technical Workshop was aimed in part at telegraphing this schedule to the industry and thereby telling them the new standards are not a completed deal. Scott Mix stated that 'Defense in depth' is implementation of guidance or guidelines for layered security, which is guidance for designing but not necessarily an auditable requirement. Concern was expressed that 'Defense in depth' was a difficult concept to define as enforceable requirements.

The SDT would benefit from a shared dialogue with FERC Staff on defense in depth and other issues about what we are trying to achieve, the overall objective, and what is needed for the industry to reach it. This dialogue would go beyond just the standards, but could also cover how you approach audits and compliance. NERC and the SDT still have to legally deal with the directives in FERC Order 706. The SDT may ask for clarification of specific parking lot issues, or maybe a separate filing on those issues should be developed.

3. Closing

The dialogue and sharing of information during this meeting was constructive and has been very useful. The FERC staff reminded us that they do not speak for the Commission. They may not agree with the statements or agreements reached. However, with continued dialogue and progress on the issues we may at least achieve a mutual understanding of the problems and concerns being addressed.

Gerry Adamski asked FERC staff about their general sense of acceptability of the body of work to date? Also, what needs more work? The approach is responsive, but as discussed earlier, there are many questions remaining, including how the impact levels will be applied. There is still a lot of work to be done to achieve the filing by the end of 2010. It is a very aggressive schedule, but there is recognition of the quality and amount of effort involved.

Meeting adjourned.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Draft Agenda

Cyber Security Order 706 SDT — Project 2008-06

June 8, 2010 | 8 a.m.–5 p.m. PDT
June 9, 2010 | 8 a.m.–5 p.m. PDT
June 10, 2010 | 8 a.m.–5 p.m. PDT
June 11, 2010 | 8 a.m.–noon PDT
Sacramento, California

NOTE:

1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Team Meetings May Not Have Access to Telephones and Ready Talk

Tuesday, June 8, 2010 8 a.m.–5 p.m. PDT

1. Introduction, Welcome and Opening Remarks
2. Discussion of Work Plan and Schedule: June-December 2010 — *Stu Langton*
3. Review and Seek Agreement on Drafting Team Proposal for refining the SDT Consensus Procedures
4. Updates on other related Cyber Security Initiatives — *NERC Staff and SDT Members*
5. Review Results of the May 27, 2010 Meeting with FERC and Guidance for Sub-teams
6. Technical Workshop Overview and Results
7. Overview of Industry Response to Request for Informal Comments — Scott Mix
8. Review of Industry Input on CIP Format and Consensus Testing on CIP Format going Forward
9. Sub-Teams Meet to Review and Discuss Industry Comments, Suggestions, and Changes to the Draft CIP Standards

Wednesday, June 9, 2010 8 a.m.–5 p.m. PDT

1. Sub-Team Initial Reports — Key Issues
2. Sub-Team Meetings
3. Sub-Team Reports

Thursday, June 10, 2010 8 a.m.–5 p.m. PDT

1. Sub-Team Reports and SDT Review of Industry Comments and Possible Changes

Friday, June 11, 2010 8 a.m.–noon PDT

1. Review Next Steps and Sub-Team Schedule

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

2. Review the SDT Pittsburgh Meeting Agenda and Perform the Meeting Evaluation
3. Sub-Team Meetings
4. Implementation Plan Drafting Team Report
5. Guidance Document Drafting Team Report

1. Chairman	**John Lim**, CISSP Department Manager, IT Infrastructure Planning	Consolidated Edison Co. of New York New York, New York
2. Vice-Chairman	**Philip Huff** Manager, IT Security and Compliance	Arkansas Electric Cooperative Corporation Little Rock, Arkansas
Members		
3.	**Robert Antonishen** Protection and Control Manager, Hydro Engineering Division	Ontario Power Generation Inc. Niagara-on the-Lake, Ontario
4.	**Jim Brenton**, CISSP-ISSAP Director, CIP Standards Development	Electric Reliability Council of Texas, Inc. Taylor, Texas
5.	**Jackie Collett** Cyber Security Operations Engineer	Manitoba Hydro Winnipeg, Manitoba
6.	**Jay S. Cribb** Information Security Analyst, Principal	Southern Company Services, Inc. Atlanta, Georgia
7.	**Joe Doetzl** Manager, Information Security	Kansas City Power & Light Co. Kansas City, Missouri
8.	**Sharon Edwards** Project Manager	Duke Energy Cincinnati, Ohio
9.	**Gerald S. Freese** Director, Enterprise Information Security	American Electric Power Columbus, Ohio
10.	**Jeffrey Hoffman** Chief Architect IT Policy & Security Division	U.S. Bureau of Reclamation Denver Federal Center Denver, Colorado
11.	**Doug Johnson** Operations Support Group Transmission Operations & Planning	Exelon - Commonwealth Edison Lombard, Illinois
12.	**Patricio Leon-Alvarado** Engineer, E&TS Compliance and Quality	Southern California Edison Pomona, California
13.	**Frank Kim** Director, Power System Information Tech.	Hydro One Networks, Inc. Barrie, Ontario
14.	**Richard Kinas** Manager of Standards Compliance	Orlando Utilities Commission Orlando, Florida
15.	**David L. Norton** Policy Consultant - CIP	Entergy Corporation New Orleans, Louisiana
16.	**David S Revill** Group Lead, Electronic Maintenance	Georgia Transmission Corporation Tucker, Georgia
17.	**Scott Rosenberger** Director, Security and Compliance	Luminant Dallas, Texas

18.	**Kevin Sherlin** Manager, Business Technology Operations	Sacramento Municipal Utility District Sacramento, California
19.	**Jon Stanford** Chief Information Security Officer	Bonneville Power Administration Portland, Oregon
20.	**Thomas Stevenson** Gen Supv. Engineering Projects Generation Services Dept	Constellation Energy Baltimore, MD
21.	**Keith Stouffer** Program Manager, Industrial Control System Security	National Institute of Standards & Technology Gaithersburg, Maryland
22.	**John Van Boxtel** CIP Compliance Engineer	Western Electricity Coordinating Council Vancouver, WA 98662
23.	**John D. Varnell** Director, Asset Operations Analysis	Tenaska Power Services Co. Arlington, Texas
24.	**William Winters** IS Senior Systems Consultant	Arizona Public Service Co. Phoenix, Arizona
Consultant to NERC	**Joseph Bucciero** President and Executive Consultant	Bucciero Consulting, LLC 3011 Samantha Way Gilbertsville, Pennsylvania 19525

12/24/2010		***Submit for Regulatory Approval***

Proposed Refinements to CSO 706 SDT Consensus Guidelines
(June 2010)

(Draft Procedure including Electronic Mail procedure drafted by Bill Winters and John Van Boxtel)

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

Consensus Defined. Consensus is a participatory process whereby, on matters of substance, the Team strives for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for posting CIP standards documents for industry comment or balloting, and the Team finds that 100% acceptance or support of the members present is not achievable, decisions to adopt standards documents for balloting will require at least 75% favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing a Team consensus on substantive issues, which the industry will need to approve, by a 2/3's vote.

Postings for Industry Comment. For decisions on CIP standards documents to be posted for industry comment where the Team finds that 75% acceptance or support is not achievable but an option or options under consideration had greater than 50% support from the Team, the Team's accompanying Comment form will seek industry input to help the Team resolve any differences and select an option going forward.

Quorum Defined. The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 2/3 of the appointed members being present in person or by telephone.

Electronic Mail Voting. Electronic voting will only be used when a decision needs to be made between regular meetings under the following conditions:

- It is not possible to coordinate and schedule a conference call for the purpose of voting, or;
- Scheduling a conference call solely for the purpose of voting would be an unnecessary use of time and resources, and the item is considered a small procedural issue that is likely to pass without debate.

Electronic voting will not be used to decide on issues that would require a super majority vote or have been previously voted on during a regular meeting or for any issues that those with opposing views would feel compelled to want to justify and explain their position to other team members prior to a vote. The Electronic Voting procedure shall include the following four steps:

1. The SDT Chair or Vice-Chair in his absence will announce the vote on the SDT mailing list and include the following written information: a summary of the issue being voted on and the vote options; the reason the electronic voting is being

conducted; the deadline for voting (which must be at least 4 hours after the time of the announcement).

2. Electronic votes will be tallied at the time of the deadline and no further votes will be counted. If quorum is not reached by the deadline then the vote on the proposal will not pass and the deadline will not be extended.
3. Electronic voting results will be summarized and announced after the voting deadline back to the SDT+ mailing list.
4. Electronic voting results will be recapped at the beginning of the next regular meeting of the SDT.

Consensus Building Techniques and Robert's Rules of Order. The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Only Team members may participate in consensus ranking or votes on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Chair, Vice Chair or Facilitator. The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure),* as modified by the Team's adopted procedural guidelines, to make and approve motions. However, the 75% super-majority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision-making on substantive motions and amendments to motions. The Team will develop substantive written materials and options using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once the Chair determines that a facilitated discussion is completed.

CSO706 SDT June 8-11, 2010 Meeting Summary Contents

CSO706 SDT JUNE 8-11, 2010 MEETING
SACRAMENTO, CA

EXECUTIVE SUMMARY

On Tuesday morning, the Chair, John Lim welcomed the members to the SDT's 23rd meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See Appendix #2*). The host Kevin Sherlin, a SDT member, welcomed everyone to the Sacramento, California SMUD meeting facilities and covered logistics. Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* The Chair reviewed the proposed meeting objectives. Bob Jones, facilitator, reviewed the proposed timed meeting agenda *(See appendix #1*). On Thursday morning the SDT approved without objection the meeting summary for the May 11-13, 2010 SDT session in Dallas, Texas.

Keith Stouffer, an SDT member, noted the release in the next couple of weeks of a new draft from NIST committee. Scott Rosenberger noted that Cyberstorm-3 will be taking place in the Fall of 2010 and they are looking again for volunteers.

Mr. Van Boxtel reviewed the proposed addition of an electronic voting section to the Team's Consensus Procedures with the Team. He noted it was narrowly designed to address those instances where the SDT could not secure a quorum for a face-to-face or conference call. The Team agreed to deleting the section "Posting of Industry Comment" as it would only apply to informal industry comment postings and agreed to extend the time for decision in the email vote procedure from 4 to 12 hours. The motion passed with 17 yeas and 1 nay. Dave Revill noted his concern was that the procedure was too narrow in that it did not allow electronic vote for posting documents for comments or ballot.

The SDT reviewed and discussed the schedule and work plan at several points during the Sacramento meeting. On Tuesday there was a discussion generally on the current plan that the Team adopted in May, 2010 to complete work and post for formal comment CIP 010 and 011 at the conclusion of the Pittsburgh meeting in July, 2010.

Phil Huff presented a draft schedule for the next four weeks to complete its work in Pittsburgh and file the CIP 010 and CIP 011 for formal comment and balloting. He noted the necessary deliverables including: CIP 010 and 011 standards/requirements; VSL's, measures, guidance document; FERC directives summary; CIP version 3 mapping; informal comment summary; and comment form for the formal comment posting.

Bob Jones summarized the context for the schedule which the Team had discussed noting the possibility of two rounds instead of three and using the additional time to improve product. Stu Langton reviewed the dynamic current political context and the need felt to demonstrate that the industry can produce a good product in a reasonable amount of time. However, as the Team has

discussed, once it sends the standard out for the first ballot they will lose flexibility in making changes.

It was noted that the Standards Committee was meeting concurrent with the SDT's Tuesday morning discussion. Following lunch on Tuesday, Howard Gugel reported to the Team on the Standards Committee call. He noted that NERC President Gerry Cauley and Standards Committee Chair Alan Mosher felt strongly a need to present some cyber security standards changes to FERC and Congress by the end of the year. CEOs in the industry have expressed concern that CIP 010 and 011 may not pass by end of the year and that there may be a need for a "Plan B" which might take CIP-010 with high and medium bright lines and then add CIP-003-009 as is. Jason Marshall noted that President Cauley is focused on responding to Congress.

Phil Huff reported on the Sub-team leads lunch discussion regarding schedule adjustments – think complete revisions based on comments by July, push formal posting until after August – it is not feasible to post prior to August 20th – also assumes support from NERC staff for drafting and adjusting the membership on some sub teams. The SDT Leadership will talk to standards committee and NERC management to seek pushing the initial posting back 31 days from the current plan which would mean the Chicago meeting in August. The end of year deadline depends on the level of industry acceptance in formal posting and ballots.

After discussion about the time frame and content the facilitators suggested a straw poll on different extensions of time assuming the same SDT monthly meeting schedule and interim conference calls and assuming that all FERC directives will be addressed including the "Post Version 4" directives. Members expressed their preferences among one of three options. Each option included the 38 days to the Pittsburgh meeting plus:

- **Option A.:** adding 30 more days, that is to the SDT Chicago meeting-August 10-13, (Sub-team leads proposal) and then to initial ballot – **2 members**.
- **Option B:** adding 60 more days, that is to the SDT Winnipeg, September 7-10 meeting, and then to initial ballot – **8 members.**
- **Option C**- adding 90 more days, that is to the SDT Toronto October 12-15 meeting, and then to initial ballot – **12 members.**

Following this, John Van Boxtel proposed a motion that was discussed and revised as follows:

> Based on the results of industry feedback from the informal comment period, and the need to send a quality product out to the industry to gain acceptance of the new standard, the SDT should compose a letter to the Standards Committee and key NERC staff identifying these issues and ask for an extension for the posting of the CIP draft standards in October 2010 to be added to the schedule to develop the CIP-010 and CIP-011

The Vote on the motion to adopt was: **11 yea – 5 nay (69%).**

Bob Jones suggested that the SDT is unanimous that it needs more time to do a quality job based on the industry comments, Order 706 directives and FERC comments. The Chair thanked the Team and suggested the Chair and Vice Chair would take this as guidance in their discussion on Friday morning with the Chair of the Standards Committee.

On early Friday morning, John Lim and Phil Huff reported to the SDT on a conference with the chair of the Standards Committee, Allen Mosher. They discussed with him the time and schedule for the CSO706 Project, and the Standards Committee was agreeable to a 90 day extension to complete the CIP-011 work if there could be a CIP-010 product going out to industry in July. Mr. Mosher requested the SDT to create a schedule for moving forward with both CIP-010 and CIP-011, and he suggested that in the interim until implementation of CIP-010 and CIP-011 that the SDT use an amended CIP-002 to address the issue of critical assets. Phil noted that he and John raised the remaining Order 706 directives issue, and Mr. Mosher understood the difficulty of getting both out by end of year but expressed the need for something by end of year if not the full package.

Phil Huff reviewed with each of the Sub-teams where each team was in summarizing the comments. Three teams are still working on summaries while others have identified key issues. None have moved on to consider how to address the comments and changes to the requirements. He noted that there was a possibility, if needed, to split up Jay Cribb's team into two sub-teams (005 and 007) and he would consult with Jay and other team members before a decision was made.

Following the morning call with the Standards Committee leadership, the SDT Chair and Vice Chair decided to schedule a SDT conference call meeting to discuss a proposed new schedule.

Bob Jones reviewed the documents compiled for the SDT's review of industry comments. He summarized an overall set of results showing the percentage of support or opposition for key components and questions. Scott Mix had sent out over the weekend a "consideration of comments" document that included over 900 pages.

The Chair noted that the Team received a significant amount of input from the industry and FERC since the posting, and the SDT will need to review and consider what kinds of revisions may be needed for the CIP-010 and CIP-011 requirements based on these comments and the SDT's continuing development of these requirements. He noted that the next phase will include a pre-ballot review followed by formal ballot, and underscored the point that there is a lot of work ahead of the SDT. The comment period closed on June 3, which did not give the SDT much time to review the comments prior to the Sacramento meeting. The SDT will need to rely on and trust that Sub-Teams will work to address the comments and share with the full SDT their summary of those comments.

The Team has maintained an ongoing "parking lot", a table list of issues raised in the course of the development and discussion of CIP-010 and CIP-011, and as part of the SDT's review of the industry comments. These were presented and discussed by the Team and a table that defines

these issues and identifies how they were or will be resolved or handled going forward is included as an appendix to this summary.

Joe Bucciero provided the SDT with a meeting summary that offered an overview of the FERC/SDT meeting held on May 27th at FERC's offices in Washington, DC (*See Appendix #X)*. John Lim noted that the atmosphere for the meeting was cordial and professional, and the meeting brought forth constructive input and ideas. In general, FERC staff agreed with the approach taken in the draft CIP-010 and CIP-011 standards, but acknowledged that a lot of work is still needed in clearly defining the requirements. Joe noted that FERC staff expressed the following issues and concerns:

- The Low impact level requirements are insufficient and need to be bolstered, i.e. the Low baseline is too low.
- The proposed 36-month review cycle for the impact categorization needs to be shortened, at least for the first review cycle (possibly to 12 months).
- Beware of hidden requirements in the purpose statements of the requirements, and review with the intent to minimize the adjectives used in the text (e.g., sufficient, proper, adequate, etc.) and clarify what is required with respect to auditability and enforceability.
- The bright line thresholds stated in Attachment II need to be justified or at least explained.
- The SDT must ensure that all of the requirements are auditable.
- Concern was expressed on the deferring of some FERC directives until next year.

FERC staff recognizes that the schedule of the project is ambitious, and appreciates the significant effort being performed by the SDT in creating these standards. Jan Bargen, FERC, noted that they recognize the considerable amount of work of the SDT so far, but believes there is still more to be done including both the justification and baseline issues – e.g., how do you address the minimum requirements, are we moving forward if more of the electric system is not covered, need to explain why this is better. There are too many items not currently included. What else is being brought in to the new standards? Is the baseline for protection of BES equipment set at the right level. The SDT also discussed the issue of "immediate revocation", the baseline for Low Impacts, Physical Security, bright lines, and avoiding the prescriptive (how) in drafting standards.

The SDT also held an industry technical workshop in Dallas, TX on May 19-20, 2010 as a form of outreach to the industry concerning the new cyber security requirements. The Chair noted that this was the first time NERC has used such a workshop in the context of a standards development process and any lessons learned would be helpful for NERC to consider. He suggested that there was excellent industry turnout for the workshop, and some excellent questions were raised and suggestions offered that the SDT should consider going forward. The Team discussed ways to make future workshops more interactive.

The Chair proposed that the Sub-teams meet to review and summarize industry comments and report back to the full SDT.

Bob Jones presented an overview of Industry responses for Question 9 regarding the format for CIP 011.

CIP 011 COMBINED REQUIREMENTS FORMAT

	Totals	*%*
Keep CIP 011-1 as one document-	(48)	40.3 %
Break CIP 011-1 into multiple standards	(38)	31.9 %
No preference-	(23)	19.3 %
Not checked -	(10)	8.4 %
Total:	(119)	100

Keep CIP 011-1 as one Document- Comment Topics

1. Better Organization and Organizational Review *(8 comments)*
2. Auditing and Multiple Violations of Single Standard *(6 comments)*
3. Format *(2 comments)*
4. Table Format *(1 comment)*
5. Revisions *(1comment)*
6. Alignment with Other Standards *(1comment)*

Break up CIP 011-1 into Multiple Standards- Comment Topics

1. Retain CIP-003-009 Format *(10 comments)*
2. Audit/Enforcement/Compliance and Negative Perceptions *(9 comments)*
3. Suggested Standard Format Combinations *(8 comments)*
4. Level of Effort and Cost of Changing Format *(6 comments)*
5. Use Functional Areas *(3 comments)*
6. Consistency with Other Industry Cyber Protection Standards *(2 comments)*
7. Makes Easier Ownership Assignment and Referencing *(1 comment)*
8. Monitoring Changes *(1 comment)*
9. Aids the Revision Process *(1 comment)*
10. Focus on Security *(1 comment)*
11. Approve as a Complete Set *(1 comment)*
12. CIP Standards Should Stand Alone *(1 comment)*

No Preference or Not Checked- Comment Topics

1. Implementation, Updates and Revisions *(4 comments)*
2. Focus on Defining Auditable Requirements *(3 comments)*
3. Reporting at a Requirement Level *(2comments)*
4. Simpler Management *(2 comments)*
5. Table Format *(1comment)*

Stu Langton reviewed with the SDT four key comments *(see below)* noting EEI and APPA represent approximately 60% of the industry. What are their arguments? Ameren suggests it will be easier to find requirements in one standard and use. EEI argued for the legacy of CIP-003-009 or at least a way similar to it as being easier for the industry to recognize and preserve sunk costs. APPA suggested sub-headings in CIP-011 are illustrative of the need to separate into multiple standards and that multiple standards would be simpler to work with and revise in the future. IRC suggested functional areas with each standard being a stand-alone. The discussion of these comments covered issues related to Compliance Enforcement and Reporting.

The facilitators initially suggested first taking a straw poll on which of the two formats members favored then ask members for propose a motion on the format. The straw poll resulted in 10 members favoring multiple standards (CIP-011 to CIP-021) based on the eleven sections of the CIP-011 standard, and 9 members favoring the one standard format of CIP-011. Following this there was a motion (Doug Johnson, second by John Lim) to adopt multiple standards (CIP-011 to CIP-021) resulting in 11 yeas (61%) and 7 nays (39%). The facilitators suggested revisiting this question at a later point noting the sentiment on the Team has appeared to shift in favor of multiple standards for CIP-011, but it fell short of the 75% needed to make a SDT decision on this question.

John Van Boxtel provided an initial presentation on a possible improvement in the format utilized for definition of the CIP-011 standard. He provided an overview of the standard format used by PCI (DSS standard format).

The facilitators reviewed the process for reviewing the group reports which presented summaries of the industry comments for each of the 54 questions in the Comment Form. He noted that he wants each sub-team to help ensure that we have identified the right issues and determine who needs to address them.

Phil Huff reviewed with the Team the responses to Question #54. There included comments on clarity or wording; on definitions especially hourly: moving definitions to NERC glossary, appreciate local definitions, separate attachment for all local definitions; timing issues; implementation plan –about “gap” in compliance programs, sufficient time for categorization, CIP-010 may require more time; categorization issues; consistency issues.

Phil Huff provided the overview for Question #53 including 66 comments, with 57 specific comments addressing: TFEs (passwords, malicious code, appropriate use, system hardening, security event monitoring, wireless and remote address, communication and date integrity) device characteristics, write clear requirements, and TFE process improvements.

John Lim provided the overview of industry comments for CIP-010 focusing on three questions: #1 – definitions, #6 – the Attachment 1 functions, and #7 – Attachment 2 categorization of BES cyber assets. Jim Fletcher presented a summary of the industry responses for question #6 with 58% of industry agreeing but suggesting the attachments need more definition, examples, and guidance especially in Attachment 1.

Rod Hardiman presented a summary of the industry responses to Question #7 including that 75% of the respondents disagree.

Dave Revill introduced his Sub-team's work noting it covered Questions 11 on Security Governance and Policy, and Questions #40-48. Question #47 on BES Cyber System maintenance included concerns about the interaction between the list of personnel in Table 26.1 and the lists granting authorized electronic and physical access; about the interaction with other user/account management requirements; regarding the allowance for emergency maintenance situations; requirements on maintenance devices should include system hardening; all maintenance devices should be documented in a list; and Ensure that systems used for maintenance do not act as an unauthorized access point. He noted they also received comments on the definition of "maintenance" – some said to consider that any temporary connection also have appropriate controls.

Sharon Edwards presented the following summary of industry comments on Question 17, Electronic Access control which included: Need a strategy for designing baselines by impact levels – we missed the mark; revocation of access – do not like the time parameters for revocation, transferred personnel should not be treated as risk, and clarify when the clock starts for no longer needing the access plus a distinction should be made in the standard between "primary" access and "secondary" access; clarity and definitions on acceptable use, account types, system access, remote access, external connectivity, wireless, etc.; separate remote and wireless access; consistency; and quarterly review is excessive.

Scott Rosenberg presented the overview of industry comments on response and recovery including: Guidance on cyber security incident classification highlighted; Definitions; Incident response for low impact or non routable connections should be removed; Consistency between requirements related to impact level; Single versus multiple incident response plans and testing issues; Combine incident response testing and review/update; Review results of incident response tests in other than 60 days; Recovery testing; Data retention identification requirements of personnel responsible; Coordination of physical aspects of cyber security incidents; Incident response and recovery plan reviews and question around changes required; Suggestions for re-wording; and Coordination of backup plans.

Jay Cribb noted and summarized the industry responses to System Security Questions #35-39 which covered more than 100 pages and addressed: malware prevention; patch management; system hardening; data and communications integrity; boundary protection and system boundary; and protective systems.

Doug Johnson presented the summary of industry comments on personnel and physical security including Question #12, R2, R3 R4, R5 and R6.

On Thursday the Team took up how to address FERC Order 706 issues that have been termed "post Version 4 issues" that include:

- Access Control Redundancy/~~Defense in Depth~~ (two or more diverse security measures in constructing electronic and physical security perimeter)
- Active vulnerability assessments every three years
- Forensic data collection

The Team agreed that it will take time to address these issues, but they should be included in the provisions of CIP-010 and CIP-011 if the SDT has some more time to complete the task. The SDT agreed they need to reach out to experts for assistance (e.g., Carnegie Mellon on Forensics) and increase the two-way communication concerning what FERC is asking for, i.e., the intent of the request. Jan Bargen, FERC, noted her understanding is that you do not have cyber security if you do not have security in-depth – too severe an interpretation that it has to be all or nothing and cannot been done in pieces – you can explain progress and point to it in the requirements and note what else needs to be worked on – recognize you are working on a new paradigm and have a window of opportunity.

Scott Mix presented the implementation plan concepts and approach. The Team asked him to develop and present options for proceeding.

On Thursday, Scott Mix offered the following Implementation Plan options for the SDT's consideration and consensus testing was performed on the options by the SDT:

1. Multiple fixed dates (based on connectivity and dependent on impact level)
   4 -6; 3 -8; 2 -5; 1-0 = **58 (3.2 of 4)**

2. Entity-specific implementation plan
   a. need to develop boundaries and approval guidance
   b. resource issues at regions for approving plans
   c. multiple versions in play at the same time for audits
   d. will require "true-up" of CIP 011 requirements for connectivity, etc.
   e. consistent with current NGP plans
   4 -3; 3 -11; 2 -4; 1 -1 = **54 (2.8 of 4)**

3. Single fixed date (independent of impact level)
   4 -4; 3 -9; 2 -3; 1 -2 = **51 (2.8 of 4)**

4. Fixed date for each requirement, for each impact level
   a. some requirements would be the same for all levels
   b. may have issues with "early compliance"
   c. will require a separate plan for NGP
   4 -0; 3 -1; 2 -14; 1 -4 = **35 (1.8 of 4)**

The Team discussed the low impact baseline and how to provide more detail in the standard including featuring the baseline in each table for each requirement.

Following the Sacramento meeting it was agreed there would be a need for weekly sub-team meetings and possible sub-team leads meetings. Later in June the schedule would be adjusted to reflect this and include some SDT meetings to develop drafts for NERC staff to review in advance of the July meeting in Pittsburgh. The Chair suggested convening the SDT to review a new draft schedule the following week once more information was available from NERC and the Standards Committee.

The Chair thanked SMUD and especially Kevin Sherlin for his excellent support for the SDT in hosting this meeting.

The meeting adjourned at 11:00 p.m. on Friday, June 11, 2010

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

23RD MEETING SUMMARY

Cyber Security Order 706 SDT — Project 2008-06
June 8-11, 2010
Sacramento, CA

I. AGENDA REVIEW, SDT WORKPLAN AND CONSENSUS PROCEDURES

A. Meeting Objectives and Agenda Review

On Tuesday morning, the Chair, John Lim welcomed the members to the SDT's 23rd meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See Appendix #2*). The host Kevin Sherlin, a SDT member, welcomed everyone to the Sacramento, California SMUD meeting facilities and covered logistics.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The Chair reviewed the following proposed meeting objectives:

- To review the CSO 706 SDT 2010 Work plan and Schedule;
- To review and adopt CSO 706 SDT 2010 Consensus Procedures draft;
- To receive updates on other related cyber security initiatives;
- To review the results of the FERC/NERC May 27 Meeting;
- To review the results of the May 19-20 Dallas Technical Workshop;
- To review the documents to be produced for the July, 2010 CIP posting;
- To receive an overview of the industry informal comments on CIP 010 and 011;
- To review industry input on the CIP format and to test SDT consensus on CIP format going forward;
- Sub-teams review industry input from the Technical Workshop and informal comments and propose any potential changes in the draft standards;
- SDT reviews Sub-Team reports on industry input from workshop and informal comments and any proposed changes in the draft standards;
- To review progress on the Implementation Plan Drafting Group and the Guidance Document Drafting Group; and
- To agree on next steps and assignments

Bob Jones, facilitator, reviewed the proposed timed meeting agenda *(See appendix #1*). On Thursday morning the SDT approved without objection the meeting summary for the May 11-13, 2010 SDT session in Dallas, Texas.

B. Related Cyber Initiatives

Keith Stouffer, an SDT member, noted the release in the next couple of weeks of a new draft from NIST committee. Scott Rosenberger noted that Cyberstorm-3 will be taking place in the Fall of 2010 and they are looking again for volunteers. John Van Boxtel noted that there is a concern that the result is already pre-determined. Gerry Freese suggested that even if it is pre-determined it is a good experience for people to better understand circumstances.

C. Review and Adoption of Revised SDT Consensus Procedures

At the Dallas SDT meeting, the Team reviewed some proposals for updating the consensus procedures originally adopted by the Team in November, 2008. At the conclusion of the discussion, the Chair asked John Van Boxtel and Bill Winters to serve as a drafting team and address the email voting procedure.

Mr. Van Boxtel reviewed the proposed addition of an electronic voting section with the Team *(See Appendix #5)*. He noted it was narrowly designed to address those instances where the SDT could not secure a quorum for a face-to-face or conference call and "will not be used to decide on issues that would require a super majority vote or have been previously voted on during a regular meeting or for any issues that those with opposing views would feel compelled to want to justify and explain their position to other team members prior to a vote."

The Team agreed to deleting the section "Posting of Industry Comment" as it would only apply to informal industry comment postings and agreed to extend the time for decision in the email vote procedure from 4 to 12 hours.

Jon Van Boxtel made a motion which Dave Norton seconded to adopt the proposed revisions. The motion passed with 17 yeas and 1 nay. Dave Revill noted his concern was that the procedure was too narrow in that it did not allow electronic vote for posting documents for comments or ballot.

II. REVIEWING THE CSO 706 SDT PROCESS AND SCHEDULE

A. Initial SDT Workplan Review

The SDT reviewed and discussed the schedule and work plan at several points during the Sacramento meeting. On Tuesday there was a discussion generally on the current plan that the Team adopted in May, 2010 to complete work and post for formal comment CIP 010 and 011 at the conclusion of the Pittsburgh meeting in July, 2010 (*See Appendix #4).*

Members and Participants Discussion Comments

- Are we talking about from now until early July to have weekly meetings? FERC recognized our schedule is ambitious. Before the SDT last posting in April the time crunch pushed members to vote yes even thought they still had questions and concerns to address and resolve.
- Jan Bargen, FERC, noted that the work plan schedule is aggressive and that FERC staff is interested in a quality product that represents the next cyber security paradigm for the industry and addresses the directives. Perhaps at the end of this meeting, the SDT needs to assess if they can get there or not – assess what it can do in the time – or express what could be done by when. Between now and the formal posting is the best time to improve the product.
- Mike Keene, FERC, noted that FERC staff would prefer a better product later than meeting a self imposed deadline – they would rather wait six months if necessary to get a quality result to review.
- NERC staff noted that NERC President Gerry Cauley has "put a stake in the ground" that the SDT, NERC and the industry will have a cyber security product approved by industry to present to FERC by the end of 2010 that would indicate the progress the industry is making in this area.
- NERC put in that schedule – if we could change President Cauley's mind, how could we get an extension of time without a new order?
- In the Short term between now and Pittsburgh there are 38 business days.

B. Proposed Revised Schedule

Phil Huff presented a draft schedule for the next four weeks to complete its work in Pittsburgh and file the CIP 010 and CIP 011 for formal comment and balloting. He noted the necessary deliverables including: CIP 010 and 011 standards/requirements; VSL's, measures, guidance document; FERC directives summary; CIP version 3 mapping; informal comment summary; and comment form for the formal comment posting.

Member Comments

- This is unrealistic – initial revisions of the requirements by the Sub-teams to NERC staff by end of next Tuesday? Then one week to compete?
- We haven't fully documented the industry informal comments to be addressed and only two days for meeting and finish, two days not already on our calendars – this is not ambitious, it is impossible.
- If Tuesday is unrealistic can the Sub-teams target of COB on Friday of the following week for revisions to requirements but send as they become available to Howard with June 18th deadline to complete all revisions?

Difficult to get this done if different sub teams are on different pages – how do we get the whole SDT onto the same page. We can get material out but are we trying to get this right?

- In addition, there are several cross and coordinating issues that have not been addressed and these may not possible to work out by next Friday.

Bob Jones summarized the context for the schedule which the Team had discussed noting the possibility of two rounds instead of three and using the additional time to improve product. Stu Langton reviewed the dynamic current political context and the felt need to demonstrate that the industry can produce a good product in a reasonable amount of time. However, as the Team has discussed, once it sends the standard out for the first ballot they will lose flexibility in making changes.

Member and Participant Discussion Comments

- If the SDT turns out a product industry cannot live with they will vote it down – the Team needs time to get it right than get it out sooner but wrong – lot of frustration that process will result in a changes that will not bring security and increase compliance problems.
- This has to be right. We can't allow ourselves to be beat into submission by politicos who do not understand the cyber security system – we are industry volunteers with real jobs.
- In light of the substantial level of informal comments, we can imagine the time needed in the formal comment phase and we have to respond to each comment.
- Can the July posting be another informal so we can address without responding to every single one?
- Want to propose the Team changes the deadline – sub-team leads can meet over lunch to determine how much additional time is needed?
- In the industry, if we know we cannot hit deadline with a good product, we change the deadline and add resources. Can the SDT get others (NERC staff) to review and compile the comments?
- Not sure clerks could have done the job – we have a window to get it right – the proposed schedule is too brittle and short and will not allow us to create a quality product. We should not live with a schedule dictated to us or have others determine what is the time needed. NERC executives do not fully understand the situation.
- Jan Bargen, FERC staff, noted that at the May 27th FERC meeting, FERC staff expressed concern that we need a quality product. The deadline at the end of the year is not being imposed by FERC.
- There is consensus in the room for a new deadline that provides for more time to get it right.
- We need to be careful and keep our focus is on reliability of the BES – not serving the industry with a less than quality product. It is not serving industry to remove an opportunity for comments – only two balloting periods is not realistic given the substantive change reflected in CIP 010 and 011.

- We need a motion to request a new deadline from NERC.

C. Standards Committee Input

It was noted that the Standards Committee was meeting concurrent with the SDT's Tuesday morning discussion. Howard Gugel was on that call and will bring back information. Might be wise to give him a chance to fill in context before moving forward. The Chair noted that if the SDT requests an extension, we will need to give an alternative schedule saying what we think it will take to get it done and by when. Phil Huff proposed meeting with the Sub-Team leads over lunch to discuss possible ideas for alternative schedule.

Following lunch, Howard Gugel reported to the Team on the Standards Committee call. He noted that NERC President Gerry Cauley and Standards Committee Chair Alan Mosher felt strongly a need to present some cyber security standards changes to for FERC and for Congress by the end of the year. CEOs in the industry have expressed concern that CIP 010 and 011 may not pass by end of the year and that there may be a need for a "Plan B" which might take 010 with high and medium bright lines and then add CIP 003-009 as is. Jason Marshall noted the President Cauley focused on responding to Congress.

Member Discussion Points

- This idea is to present "something" by end of year? Posted and balloted or just making progress?
- This is "something approved by industry to show Congress and FERC of progress being made.
- Does NERC have a plan B to finish this work or this team being asked to prepare a plan B? It is not clear.
- "Something" that meets deadline that also meets industry and Congressional concerns?
- Plan B may refer to perception on the Hill that industry has not responded to their concerns – such a plan may kick in after first ballot if the first ballot indicates an unreasonably low level of acceptance and low expectation of passage.
- There has not been much discussion of how 706 directives will be addressed by this "Plan B"-- 010 with CIP 003-009 package.
- The "Plan B" approach may be doable and can address 706 which points out what to address in the existing structure.
- We should consider a motion to draft a letter to NERC requesting an extension.

D. Sub-Team Leads Review of Schedule Needs and Review of Options

Phil Huff reported on the Sub-team leads lunch discussion re schedule adjustments – think complete revisions based on comments by July, push formal posting until after August – it is not feasible to post prior to August 20th – also assumes support from NERC staff for drafting and adjust membership on some sub teams – leadership talk to standards committee and NERC management to seek pushing posting back 31 days from the current plan which would mean in Chicago in August. The end of year deadline depends on the level of industry acceptance in formal posting and ballots.

After discussion about the time frame and content the facilitators suggested a straw poll on different extensions of time assuming the same SDT monthly meeting schedule and interim conference calls and assuming addressing all FERC directives including the "Post Version 4" directives. Members expressed their preferences among one of three options. Each option included the 38 days to the Pittsburgh meeting plus:

- **Option A.:** adding 30 more days to the SDT Chicago meeting-August 10-13 (Sub-team leads proposal) then to initial ballot – **2 members**.
- **Option B:** adding 60 more days to Winnepeg, September 7-10 SDT meeting, September and then to initial ballot – **8 members.**
- **Option C**- adding 90 more days to the SDT Toronto October 12-15 meeting- October and then to initial ballot – **12 members.**

SDT Discussion of Straw Poll

- Jay Cribb's issues may have an underlying problem of agreement that time alone may not address. May need to consider a change the members in the group to facilitate development of the requirements.
- Need a clearer rationale. E.g. discovery that industry is concerned abuot the post v4 issues discussed earlier which FERC has directed NERC to address.
- This is a request to extend time when the first formal posting takes place. We need time and full meeting to address comments and refine draft requirements.
- Also discussed shuffling to share the work load among the teams
- Feel 31 days is too short – need time to discuss and then develop guidance too – I can give another week in this month but not more – I think we need at least two more face to face meetings.
- June 2011 for end (a six month extension). If you go to the well, better be sure we get enough water.
- Assume that all of these options include a request for additional help from NERC. We can request it, but we may not get it

Following this, John Van Boxtel proposed the following motion, with Doug Johnson as a second.

> **1st Motion:** "Due to the amount of work remaining, and the need to send a quality product out to the industry to gain acceptance of the new standard, the SDT should compose a letter to the Standards Committee and key NERC staff asking for additional time to be added to the schedule to develop the CIP 010 and CIP 011 standards."

SDT Discussion Motion #1

- We need to state exactly what we are asking for – need team agreement on the time we are requesting and then add to the motion Concerned about only 31 days – not sure what we need but the schedule is tight and brittle – need to ask for more time, how much is still open but needs to be answered before sending the letter – industry comments suggest a lot of work.

- John noted he was amenable to a specific time frame being added to the motion.

Revised Motion #1: Based on the results of industry feedback from the informal comment period, the desire to address the FERC 706 directives (including the former post Version 4 issues), and the need to send a quality product out to the industry to gain acceptance of the new standard, the SDT should compose a letter to the Standards Committee and key NERC staff identifying these issues and ask for an extension for the posting of the CIP draft standards in October 2010 to be added to the schedule to develop the 010 and 011

Discussion of 1st Revised Motion #1

- Concerned about putting in "706" reference without saying "fully address" – okay with post v4 issues.
- Suggest putting such details in the letter to be drafted if motion passes.
- Not comfortable with the parenthetical related to post version 4 issues –this was covered by "fully address all"
- Question is the end date – asking for an end date to deliver to FERC?
- However, the end date is not in your control – discussion is how much time will it take the SDT to get to first formal posting.
- Asking Standards Commission for permission will get a "no". We should advise them we need more time and move forward with that schedule unless we hear otherwise from the Committee.
- Writing a letter starts a conversation – need communication between our leaders and NERC management – also need more resources to support volunteer effort – just agree to ask our leaders to seek extension from management to assure quality product.
- The Chair and Vice Chair have a conference call Friday morning with Standards Committee Chair. They need guidance on how much time we need – 90 days to complete the work in front of them based on comments and input from FERC – more staff is not the issue.
- Possible scenario – ask for more time for 010 and 011 and they go with plan B of 010 and CIP 003-009 for balloting process.
- Plan B would be voted down
- The scenario doesn't make sense – if we are struggling, the industry will not understand that plan B proposal.
- How much time will it take us to responsibly post for formal comment?
- Plan B will take it out of the hands of the drafting team/
- The more time we ask for, the more likely it is to be denied and taken away to assign plan B to be developed elsewhere.

John Van Boxtel (and Doug Johnson as a second) agreed to the following in light of the discussion as friendly amendments:

2nd Revised Motion #1: Based on the results of industry feedback from the informal comment period, and the need to send a quality product out to the industry to gain acceptance

of the new standard, the SDT should compose a letter to the Standards Committee and key NERC staff identifying these issues and ask for an extension for the posting of the CIP draft standards in October 2010 to be added to the schedule to develop the 010 and 011

Vote on the motion above to adopt the motion: 11 yea – 5 nay (69%)

Bob Jones suggested that the SDT is unanimous that it needs more time to do a quality job based on the industry comments, 706 directives and FERC comments. The Chair thanked the Team and suggested the Chair and Vice Chair would take this as guidance in their discussion on Friday morning with the Chair of the Standards Committee.

E. Discussion of Further Input from the Standards Committee Chair

On early Friday morning, John Lim and Phil Huff reported to the SDT on a conference with the chair of the Standards Committee, Alan Mosher. They discussed with him the time and schedule and the Standards Committee was agreeable to a 90 day extension to complete the CIP 011 work if there could be a 010 product going out to industry in July. Mr. Mosher requested the SDT create a schedule for moving forward with both 010 and 011 and suggested that in the interim between implementation of 010 and 011 that the SDT use an amended 002 to address the issue of critical assets. Phil noted they raised the remaining 706 directives and Mr. Mosher understood the difficulty getting both out by end of year but expressed the need for something by end of year if not the full package.

Member Comments on Standards Committee Call

- Confusing to throw out 010 without 011. We must be careful how we do it
- In terms of the implementation of the 010 and 011, we can't just put out 010 and attach CIP 003-009 – effectiveness of 010 comes from 011
- The modification of 002 will include what? Not sure but looking for something to use before effective date of implementation of CIP 010 and 011. Perhaps something to give bright line of critical assets – not sure how that works well given limited time – details still need to be worked out – entities may be concerned with using one set and then implementing another soon after this.
- Disappointed that NERC and the Standards Committee don't understand the situation. An interim change as a bridge may be another chase down a rabbit hole.
- This is essentially plan B
- The SDT needs to focus and not be distracted by political expediency – add ninety days and six more months
- We do not have to work on the 002 option – this is what they will be doing while we try to complete our work – this is the reality – while recognizing the technical difficulties – we do not work in a vacuum.
- We will be held accountable for technical shortfall pushed by politics – we need to keep 010 and 011 connected to avoid confusion.

- Keep in mind industry feedback – industry confused when 010 put out first time without support – putting medium up to high protections brings a ton of facilities and may cause further confusion if we are not careful
- We have not been assigned to amend 002 – we move forward on our own – that is a parallel path – meanwhile we get more time with ninety day extension – need to make use of that time – this team still engaged and owning its product.
- This was informal discussion with the Standards Committee Chair. He asked to come back with a formal schedule. We need to say can not meet end of year and offer an alternative that includes getting something out by end of year
- We are still operating under the original order which did not have a timeline – now the Standards Committee is imposing a timeline – this may be a fundamental change in the original charter – we will be held accountable for the final product – if they want us to meet a timeline then put it out to the public and we can react.
- We do not have to rush to get revised schedule out
- What do we do starting next Monday? What is the revised work plan? When is the next deadline for product?
- The Standards Committee has to drive this while we continue to work on CIP 010 and 011.
- We need to keep working at our pace to get job done – the short schedule proposed yesterday is not reasonable.
- That schedule is not workable nor feasible.
- We need to know if 010 is being decoupled from 011 – this is not a good idea but it does impact our work plan. Do we just guess? If decoupled and 010 has to go out in July then focus on 010 at a different pace.
- Industry said last time they wanted a whole package to react to – waste resources on splitting up – need one unit – we do the right thing – if they want something else then let them do it – we need to look back with pride on our product
- Start Monday with addressing industry comments and get to NERC by next Friday
- We need a sequencing calendar of the next few weeks leading to Pittsburgh and then to Chicago and communicate it to members soon to guide their work.
- We have comments that we need to process with requirements we have – get output to NERC for them to work with starting the end of next week for them to review – it is not the final product – hopefully by then we have more clarity on the schedule – yesterday 90 days seemed acceptable to the team.
- Plan B is not our problem, we still have charter to fill.
- Jan Bargen, FERC noted that FERC was concerned in January about splitting 002 from CIP 003-009 and industry was too. However things are different now. If 010 proceeded first, it could be filed later with CIP 011 and this also might give industry more time to consider impacts and coverage.
- Howard Gugel, NERC staff, recommended that the SDT should think of this as staggering the work vs. “decoupling.” Get CIP 010 out then CIP 011 later with overlap in the comment period – also staggers the work load of responding to formal comments

– before no one knew what 011 would look like, now the industry has an idea what to anticipate now - also allows more full group review.

- Final filing does not have to be staggered and would include implementation plan – already a stagger between 010 and 011 since you have to do 010 first to then implement 011.
- I think we can move to ninety day and understand that a separate tiger team may be ready to go on CIP 002 amendment. Our team cannot provide guidance to the NERC tiger team on our draft by next week. We are not even done compiling and reviewing comments
- What if tiger team at NERC scrubs for consistency then drafts initial VSLs, measures etc. – addresses issues we discussed yesterday as a base for Sub-teams to begin addressing the comments. This can also handle the grammar and structure and work from what you have already identified.
- Won't be hard to add lines to tables – send any concepts for us to put in draft and get you started.
- Phil Huff reviewed with each of the Sub-teams where each were in summarizing the comments. Three teams are still working on summaries while others have identified key issues. None have moved on to consider how to address the comments in changes to the requirements. He noted that there was a possibility, if needed, to split up Jay Cribb's team into two sub-teams (005 and 007) and he would consult with Jay and other team members before a decision was made.
- Following the morning call with the Standards Committee leadership, the SDT chair and vice chair would schedule a SDT meeting to discuss a proposed new schedule.

III. REVIEWING INDUSTRY AND FERC COMMENTS ON CIP 010 & 011

A. Overview of Industry Input

Bob Jones reviewed the documents compiled for the SDT's review of industry comments. He summarized an overall set of results showing the percentage of support or opposition for key components and questions. *(See, Appendix #10).* Scott Mix had sent out over the weekend a "consideration of comments" document that included over 900 pages.

The Chair noted that the Team received a significant amount of input from the industry and FERC since the posting and the SDT will need to review and consider what kinds of revisions may be needed for the CIP 010 and 011 requirements based on these comments and the SDT's continuing development of the CIP. He noted that the next phase will include a pre-ballot review followed by formal ballot and underscored the point that there is a a lot of work ahead of SDT. The comment period closed on June 3 which did not give the SDT much time to review prior to the Sacramento meeting. The SDT will need to rely on and trust that Sub-Teams will work to address the comments and share with the full SDT their summary of those comments.

Member Comments

- What do the percentages actually tell us?
- One vote could represent more than one individual or company
- Many may have disagreed but only wanted to tweak one or two words
- I stressed that respondents should provide constructive suggestions. Comments like "I don't like it" doesn't carry much weight without a suggestion for improvement.
- We can say we understand their concern, address it, include it, or explain why we keep it the same.
- We will publish a summary of comments and responses.
- Can we change the responses to substantially agree with and substantially disagree with to more accurately reflect responses?
- Yes, in future comment questions we can frame it that way.
- Can we use a 4-3-2-1 next time to gauge the level of concern – we may have gotten a ton of "3's" with minor concerns instead of "disagree"
- The percentages are based on the checked boxes – not a qualitative assessment of the responses.
- I most concerned where the percentages are close to even. These are where we need to understand the concern and address them as a group.
- Physical security section may be an indication of desire to move into a separate section

- We were told not to be prescriptive but many response comments asked for more prescription to clarify.
- System security put R15-19 together – may require more work to separate out the comments per requirement – may also account for low percentages for "agree"

B. "Parking Lot" Issues Raised by the SDT in the Development of the Draft 010 and 011

The Team has maintained an ongoing "parking lot" a table list of issues raised in the course of the development and discussion of CIP 010 and 011 and as the SDT is reviewing the industry comments. These were presented and discussed by the Team and a table setting these issues out and how they were or will be resolved or handled going forward is included as an appendix to this summary *(See, Appendix #7)*

C. Review of May 27 FERC/NERC Meeting

Joe Buchierro provided the SDT with an overview of the meeting summary distributed to the SDT members (*See, Appendix #6).* John Lim noted that the atmosphere for the meeting was cordial and professional, and the meeting brought forth constructive input and ideas. In general, FERC staff agreed with the approach taken in the draft CIP-010 and CIP-011 standards, but acknowledged that a lot of work is still needed in clearly defining the requirements. Joe noted that FERC staff expressed the following issues and concerns:

- The Low impact level requirements are insufficient and need to be bolstered, i.e. the Low baseline is too low.
- The proposed 36-month review of the categorization needs to be shortened, at least for the first review cycle (possibly to 12 months).
- Beware of hidden requirements in the purpose statements of the requirements, and review with the intent to minimize the adjectives used in the text (e.g., sufficient, proper, adequate, etc.) and clarify what is required with respect to auditability and enforceability.
- The bright line thresholds stated in Attachment II need to be justified or at least explained.
- The SDT must ensure that all of the requirements are auditable.
- Concern was expressed on the deferring of some FERC directives until next year.

FERC staff recognizes that the schedule of the project is ambitious, and appreciates the significant effort being performed by the SDT in creating these standards. Jan Bargen, FERC, noted that they recognize the considerable amount of work of the SDT so far, but believes there is still more to be done including both the justification and baseline issues – e.g. how do you talk about the minimum, are we moving forward if more of the electric system is not covered, need to explain why is this better. There are too many items not currently included. What else is being brought in to the new standards? Is the baseline for protection of BES equipment set at the right level.

Member Comments

- **Immediate revocation.** There was also discussion of the "immediate revocation" issues – how can that be defined to allow for prompt but effective responses and which items may not rise to immediate level?
- **Low Impacts.** Is low is too low? What does that mean and how do we set it? What is the rationale?
- There is a worry that something will fall through since the low has few requirements.
- Take input and address where appropriate – do not necessarily need more requirements – FERC staff is speaking as staff, not for the commission – treat as part of the informal comment period
- Regulators are not happy with the level of coverage now. Are they asking for every asset to be covered?
- Mike Keene, FERC noted that it is not the amount of equipment but does the low have enough protection for the low equipment – some level of protection for low equipment, not just blank
- Jan Bargen, FERC, asked if there are not requirements does that mean it does not need any protection? Then the baseline may look like there is no protection where you find blanks in the tables.
- All these discussions must be couched with "in relation to what?" What are we defending against? Everything against anything?
- FERC is trying to prompt us to look at the watt levels, etc., not just the H-M-L categories – looking for measurable standards.
- Concerned about having to create lists of low for audits – need to demonstrate you have a security program rather than a site-by-site list for purposes of audits.
- We are doing something for the low categories but this may not need to be a list subject to fines – we are doing something to protect or we wouldn't be in business.
- Mike Keene, FERC, noted that policies or procedures for low impact would be a good approach.
- **Physical Security.** Things are being done for the low but the SDT may want to think about moving physical security out into its own standard. There may be no way to marry our process with adequate protection of physical assets – we have discussed this as a team but we may need to revisit.
- Question of audits for physical security – there is a level of security for those but we do not want them brought into the meticulous audit process of today – this has been a big stumbling block for many members of this team.

Bright lines

- Need to be sure the numbers we use and how we arrived at those numbers are understood by a wider audience.
- Mike Keene, FERC, noted that FERC staff wondered about the "bright line issue" that distinguished medium and high – are they in the correct spot? Not as concerned with the low.
- **Avoid the prescriptive (how).** Clarify the standard but do not be prescriptive – identify the program and what it covers – identify what needs to be covered but not necessarily "how" to cover them – must have a documented program that covers these assets.

D. Review of Dallas Workshop Process and Results

The Chair noted that this was the first time NERC has used such a workshop in the context of a standards development process and any lessons learned would be helpful for NERC to consider. He suggested there was a good industry turnout for the workshop and some excellent questions were raised and suggestions offered that the SDT should consider going forward. He expressed surprise that during the interactive open session on day that only a limited number of people stepped up. He asked what other members thought of the workshops and the following points were offered for improvements on the process:

- The highly structured questions on day one limited the interactivity.
- That is why on day two we offered an open mike session to offer the opportunity for that interaction.
- Ideally, it would have been better to have scheduled the workshop a few weeks before so that participants could process the workshop results and prepare their comments on the posting.
- Should consider allowing for break out sessions next time to encourage more interactive discussions.
- Need to think about how to clarify what are the objectives of such a workshop. Some participants may have perceived that "this was a done deal, this is how it is, and there was no need to make comments."

E. Review of the SDT's Full and Sub-Team Process for Considering Industry Comments

The Chair proposed that the Sub-teams meet to review and summarize industry comments and report back to the full SDT.

Member Comments on Proposal

- Concerned letting sub teams review comments without full group review
- Wonder if breaking into sub-teams is still doing us any good – better to look at as a full group – may be slower but addresses the overlaps with the diversity of the full group.
- Bob Jones noted the Chair's proposal is not to look at how to respond but intended to enhance the full team discussion – attempting to make the most of the limited time with the scope of the complex task. He offered as an example of the challenge of summarizing th industry comments by looking at question 9 on format since it is not part of any sub-team. *(See Section F, Format below)* and tried to provide and organize the comments by topic. This suggests that the SDT will have to go through each industry comment and 900+ pages as a full group. The full SDT will have a chance to review and provide guidance on possible revisions. This will be enhance by an initial effort to summarize and not have to repetitively review similar comments.
- Good approach –but remain bothered anytime agenda says break into groups. The schedule is wagging the dog here. We should just do the best job we can then take our lumps.

- Concerned we did not get a full chance to review in full team the sub team work before this last cycle of review.
- Splitting up work can be good and efficient, but we need to do our work prior to coming to these meetings in order to use our time together most effectively – feel like we come to class without doing our homework first
- Note that in the Version 1 SDT we also broke up to write standards but then spent hours on the phone reviewing every word of the first set of standards at the end.
- We need to spend our time here to do that and use conference calls to do homework and prepare for in person discussions
- Just as a note, we have not been able to get the "homework" done prior to the in person meeting – sub groups between meetings successful about 50% of the time – requires a level of commitment to get work done prior to coming together to create products we can use – in this case there was no time to work on prior to this meeting so we need to take some time now to do that so we can then review together – have to do the pre-processing today and tomorrow – group the comments together by topics and frequency, do not decide what to do with them yet – then use final day and a half to review as a group
- Support the ideal process of using in person time together but having to deal with the comments on short turn around as JL pointed out – we did not have enough time from close of comment period to allow for processing – in July we need to be sure we have a product ready to make the best use of in person time
- In July we may also have some initial vetting by NERC – also note there are other items that need to be added for the formal posting such as measures
- Use the sub team time now to organize comments for full group review?

F. Review of Industry Input on CIP Format (Question #9)

1. Overview of Industry Format Reponses

Bob Jones presented an overview of Industry responses for Question 9 (*See, Appendix 8)*: *Do you prefer the currently proposed format for CIP-011-1, which contains a complete single set of requirements? Do you prefer the alternate format, where the requirements are grouped in separate standards? Or do you have no preference?*

CIP 011 COMBINED REQUIREMENTS FORMAT

	Totals	***%***
Keep CIP 011-1 as one document-	(48)	40.3 %
Break CIP 011-1 into multiple standards	(38)	31.9 %
No preference-	(23)	19.3 %
Not checked -	(10)	8.4 %
Total:	**(119)**	**100**

Keep CIP 011-1 as one Document- Comment Topics

1. Better Organization and Organizational Review *(8 comments)*

2. Auditing and Multiple Violations of Single Standard. *(6 comments)*
3. Format *(2 comments)*
4. Table Format *(1 comment)*
5. Revisions *(1 comment)*
6. Alignment with Other Standards *(1 comment)*

Break up CIP 011-1 into Multiple Standards- Comment Topics
1. Retain CIP 003-009 Format *(10 comments)*
2. Audit/Enforcement/Compliance and Negative Perceptions *(9 comments)*
3. Suggested Standard Format Combinations *(8 comments)*
4. Level of Effort and Cost of Changing Format *(6 comments)*
5. Use Functional Areas *(3 comments)*
6. Consistency with Other Industry Cyber Protection Standards *(2 comments)*
7. Makes Easier Ownership Assignment and Referencing *(1 comment)*
8. Monitoring Changes *(1 comment)*
9. Aids the Revision Process *(1 comment)*
10. Focus on Security *(1 comment)*
11. Approve as a Complete Set *(1 comment)*
12. CIP Standards Should Stand Alone *(1 comment)*

No Preference or Not Checked- Comment Topics
1. Implementation, Updates and Revisions *(4 comments)*
2. Focus on Defining Auditable Requirements. *(3 comments)*
3. Reporting at a Requirement Level *(2comments)*
4. Simpler Management *(2 comments)*
5. Table Format *(1comment)*

Member Discussion of Format Comments
- The industry is even more split than the team with no strong preference for either format – suggest leaving it as proposed given the results
- Has anyone discussed with NERC anyone not liking on requirement and voting down the standard – can industry vote on the individual requirements rather than the whole standard?
- For ballot is it a vote on 11 as a whole?
- Standard 11 is an up or down – do not get to pick or choose – historically that is the way it has been done
- Historical observation – these are informal comments and not sure how much attention we got from the industry as a whole – have we had three different sets of the industry responding each time we go out – will we get a different response in a formal comment period
- So what – we have to move forward – we cannot assess whether that is true or not
- Yes, we need to move forward, but be aware of the possibility
- Have to look at the individual comments to determine if they are by a group or association versus an individual or individual company

Stu Langton reviewed with the SDT four key comments *(see below)* noting EEI and APPA represent approximately 60% of the industry. What are their arguments? Ameren suggests it will be easier to find requirements in one standard and use. EEI argued for the legacy of CIP 003-009 or at least a way similar to it as being easier for the industry to recognize and preserve sunk costs. APPA suggested sub-headings in 011 are illustrative of the need to separate into multiple standards and that multiple would be simpler to work with and revise in the future. IRC suggested functional areas with each standard being a stand-alone.

Specific Industry Trade Associations and Task Force Comments on Format

9.83	Ameren	Keep CIP-011-1 as one document	It is much easier to find all the requirements when all contained is a single document and the chance of discrepancies between documents is greatly reduced. However, the CMEP should be updated to monitor and report violations by standard and requirement not just standard. Otherwise, CIP-011 will always be in the list of Top 10 most violated standards and create a misleading impression that utilities cannot figure out how protect the reliability of the BES.
9.35	EEI	Break CIP-011-1 up into multiple standards	It would be easier for entities to recognize and understand the similar or different requirements in version 4 if they were broken up in a manner similar to legacy CIP-003-009. Many organizations have made significant investments in training, policies, procedures, and document management systems that are based on the legacy CIP standard Requirement numbering structure. Staying with the legacy structure, to the degree that it is possible, may reduce stranded investment that needs to be recreated simply as a function of the name and numbering of the requirements.
9.42	APPA Task Force	Break CIP-011-1 up into multiple standards	The APPA Task Force believes the addition of sub-headings to CIP-011 is illustrative of the need to separate this standard into multiple standards. We also feel with multiple standards the revision process would be simplified. If only one section needs to be revised, then NERC could just post that particular section for industry comment.
9.17	IRC Standards Review Committee	Break CIP-011-1 up into multiple standards	(i) We disagree with the current structure. We'd suggest the SDT to establish new standards by functional areas and ensure there is not a circular loop relating to other standards. Each standard should be standalone(ii) We understand the need for this standard to take care of cyber security concern when there does not currently exist an across-the-board cyber protection standards that apply generically to all sectors that utilize cyber components and cyber access for control and data exchange. However, over time, we urge NERC and the electric industry to assess if indeed it needs to have its own cyber

			protection standards at all. Cyber protection is not unique to the electric industry. Other sectors - airline industry, national security/ defense, financial sector, banking system, etc. all employ a high level of cyber security to protect fraud and invasions. Wouldn't the electric industry be better served if owners of BES Cyber Systems be required to adopt similar practices of these other sectors as opposed to developing it own very detailed set of requirements which, for the most part, seem to replicate the other sectors' requirements? It will be desirable to have a generic set of Cyber protection standards that is applicable to all sectors that use Cyber Systems - may they be for BES control or access to airline reservation, air traffic control, e-banking, security trading, etc. NERC and the electric industry should take the lead to initiate a continent-wide effort to consolidate all such standards and practices to avoid redundant efforts.

Format Discussion Comments

- What did we learn from this we did not know before? Any new gems we need to think about?
- We have to think about why people commented or not – those who commented favored splitting it up while those favoring one standard did not comment.
- Support for one over the other is not clear
- We should note that some votes may represent more than one entity, e.g. EEI, etc.
- The weight of the vote and comments are not the same – not sure the comments reflect the weight of the vote, many who support said "however, …"
- **Compliance Auditing, Enforcement and Reporting.** This hinges on the compliance reporting and whether it is done at the standard or requirement level.
- NERC will have to address it differently –
- The number of comments for each category (for against, no preference) is not relevant – if you agree, then less likely to add a comment
- This result gives us a sense the industry is not clear either. The Team needs to make the best choice for the industry then to judge. It there anything here that changes any of our minds? Issue comes down to compliance and auditing for multiple versus single standard
- NERC is still asking for clarification of the compliance/auditing issue. Did talk to compliance about the compounding issue – they said compounding is done by requirement, not by standard.
- Is compliance the same as enforcement?
- The person at NERC answering the compliance issue is with enforcement. Also talked to those in reporting about changing reporting to a requirement-by-requirement basis. There is support for this as it improves granularity of analysis.
- How does that improve organizations response?

- The perception in Congress is that cyber security is not being addressed. That perception and letting industry learn from others mistakes would be improved if reported by requirement.
- Favored single format in Atlanta – but now favor multiple standards – can we take a straw poll on where we are today. This is a structural issue we need to resolve.
- You asked the question and got industry comments – my sense the industry does not think this is worth the time we are putting into this question.
- Heard many say informally they may favor multiple standards but probably harking back to CIP 003-009. But note the SDT has already moved away from CIP 003-009.
- We asked industry what would best help them make everything secure – I did not put up a big fight before because I wanted industry to respond to the question.
- This is not a big deal to industry so let's split it and move on.
- The SDT reached a consensus decision on moving away from CIP 003-009 and then we asked industry for preference on one or multiple standards. Since last time the SDT had a clear preference for one CIP 011 and industry did have a strong preference in either direction, we should stick with the single standard
- Do not agree with that analysis. The comments, not the raw count, suggest we look again at CIP 003-009 -
- The Chair noted the SDT already voted a super majority (over 75%) to move to a new format.
- Everyone needs to review the comments in response to Question 9 before we vote on this issue.
- What does the option for multiple standards mean? We have eleven sections – would that mean eleven standards?
- Some comments suggest cramming the eleven back into the CIP 003-009 format. Need to precisely state what the two options are before we vote.
- But nothing will change between now and Friday – the split means the eleven sections we have now into eleven standards. We have already decided to move on from CIP 003-009 –
- Note that we have some new areas that may not fit into the old CIP 003-009. We are spending too much time on format.
- The SDT already voted to move forward. The debate now is how to do it – writing new content and standards now, that means industry will have to change.
- We moved away from CIP 003-009 because of version confusion – need a new set of standards – important not to fall back into the old regime.
- What was the SDT asked to do? We were not asked to rewrite everything. We were asked to take industry comments into account, not just throw it out because we had a previous vote
- If we reopen the vote then we need to look at the tables again.
- The vote to go forward with the posting was a result of months of work. I thought we all felt good about the product – the remaining concern was a minor one of format – going back to CIP 003-009 would create substantive and substantial problems.
- We asked for industry input because we did not have a super majority on the SDT to present a team proposal on the format.

- Scott Mix noted again that NERC Compliance suggested that violations are cited by requirement and not by standards.
- This is not a critical path element – lets spend the SDT's time fixing requirements – Do we need to vote on this now?
- By Friday this may become a critical path decision in order to redraft requirements for posting.
- The Chair noted the SDT's need to resolve the format issue once and for all – we left Atlanta with a super-majority but short of 75% to post CIP 011 as one standard and ask industry. The industry said we don't really care. My thinking is just leave it as one
- We may need to defer this in case we have to work on plan B stuff – not precluding making the decision later. We have the CIP 011 categories and can move forward.
- We need to look past the raw votes into the reasons one way or another offered in the comments and look at the level of concern and from what proportion of the industry – changing it is arbitrary and causes pain
- I do not conclude that someone who voted for but did not make a comment is not strong in their comment – to say we are not improving is unfair – we can move forward and maintain progress without deciding it now
- Even splitting it back into 011-021 doesn't address Dave's concern – if numbers change, it is the same concern
- While the difference in the comment votes was only 10 but some were by trade associations that may represent far more than one vote in the final analysis. Those associations seem to be on the side for multiple standards for CIP 011.

2. SDT Consideration of Single or Multiple Standard Format for CIP 011

The facilitators initially suggested first taking a straw poll on which of the two formats members favored then ask members for propose a motion on the format. The straw poll resulted in 10 members favoring multiple standards based on the eleven sections (011-021) and 9 members favoring the one standard format of CIP 011. Following this there was a motion (Doug Johnson, second by John Lim) to adopt multiple standards (011-021) resulting in 11 yeas (61%) and 7 nays (39%). The facilitators suggested revisiting this question at a later point noting the sentiment on the Team has appeared to shift in favor of multiple standards for CIP 011, but it fell short of the 75% needed to make a SDT decision on this question.

3. Standard Format Example- PCI DSS

John Van Boxtel provided an initial presentation on a possible improvement in the format displayed for the CIP. He provided an overview of PCI DSS standard format (*See Appendix 10 for the presentation slides).*

Member Comments

- Audits more programmatic rather than a specific requirement? Requires more experienced auditors.
- John is proposing we look at the format and adopt as appropriate – not asking to look at audits though PCI audits are more efficient and allows for them to look at other things – with PCI you do not get fined for everything and more focused on if you have met requirements to be recertified to process cards.
- Main differences is the measure is up in the table? (Yes) What else? (using the measurements for auditing) So it is format and content.
- Measurements would need to be substantially written different from those today sense they are the basis of the audit – like the way the guidance is built in but not the focus for audits.
- Fits with the NERC results based process puts the guidance up with the requirement and the measures in the table would be different – audit only to the requirements and not to the measures as directed by FERC.
- FERC would approve the requirement column and applicability column and not the measures column – but this puts everything in and allows us to consider what in the measures needs to be in the requirement column for purposes of audits.
- Wish we had seen this when drafting CIP 001 – given what we have in place not sure this works.
- Jan Bargen, FERC, indicated this would address much of the angst she has heard in the discussions and she like the way it integrates guidance for audits and how to meet the requirement. On the question of how it fits in current audit system, keep in mind you are creating a new paradigm and we may need to do something different on the audit side too. Integrating this into the requirement helps FERC review especially the blanks in the table – make your case for process changes.
- If FERC understood this made for one rule across regions, they may consider the change as a better approach
- It is similar to NIST approach.
- We may just need to change a few action words in the requirement to take into account the measures
- Also may address the baseline concern expressed in the FERC meeting on the 27th.
- We will work with Howard Gugel to see if it would work – think we could move forward with this format.
- Should help in drafting the requirements – clarifies and makes them more actionable and improving the auditability.
- Asking for more time – showing them this way of improving and solving the TFE and audit mess would help the argument for more time.
- Not sure but we may need to work on the question of TFE a little more to clarify how it would work.
- Should we incorporate this format going forward? Work on the requirements and let NERC staff focus on the format

- Howard Gugel– this fits in with the paradigm pursued by the vegetative standards group – there may be ways to make this work within our paradigm.

G. Sub-Team Meetings and Reports

The facilitators reviewed the process for reviewing the group reports. Stu Langton reviewed the progress to date with the SDT meeting all the deadlines and gotten industry approval to date with a very large group here, diverse, talented and bright – 38 day period to address issues – Talented basketball teams that play together the best succeed. For most part this Team has been able to achieve our 75% level for decisions. But now have less air time, need more focus and suggestions for improvement. We need to stay focused, those who like to talk may need to talk less and give more focused responses – think in terms of what we as a group need to do to get the job done.

1. **Open Question (Question 54)**

Phil Huff reviewed with the Team the responses to Question #54 noting we want the Team to help us be sure we have identified the right issues and determine who needs to address them. There were:

- 19 comments on clarity or wording: blank fields, several overall language improvements, and minimize use of adjectives.
- 12 comments on definitions especially hourly: move definitions to NERC glossary, appreciate local definitions, separate attachment for all local definitions.
- Timing issues – 11 comments.
- Implementation plan – 11 comments concerned about "gap" in compliance programs, sufficient time for categorization, CIP-010 may require more time.
- Categorization – 10 comments: remove low impact requirements, possible increase in risk as focus on med/low impact areas.
- Consistency – 10 comments: move requirements in the table, remove "authorship" of sub teams, requirements language referencing the table.
- Other comments on: audits and guidance, address remaining FERC directives now, access control and system boundary protection.
- Two major approaches suggested from Entergy and Progress Energy (latter regarding nuclear)

Member Questions and Comments

- Produce guidance documents – who, how and when?
- This will be done for posting by a team
- Many complained about lack of definitions where it was supplied in other area, giving all definitions in one place is a good one
- If move to multiple standards, then one glossary will be helpful

- Entergy – fully laid out approach offered for consideration – our requirements are binary, apply one or not – looking at NIST approach calls for a layered approach – also discussion of focusing resources on key risks in routable protocols.
- 853 approach may not apply to low category.
  It is not just the impact but the type of equipment that needs to be considered – we have not noted the differences between systems.
- Need to look at this for cyber vulnerability, not physical risks of natural disasters
- Did not look at scoping activities for consistency.

2. Question 53

Phil Huff provided the overview:

- 66 comments, with 57 specific comments: several referenced TFEs
- TFE comments: passwords, malicious code, appropriate use, system hardening, security event monitoring, wireless and remote address, communication and date integrity – we will need to farm several of these out to appropriate group
- Other comments: device characteristics, write clear requirements, TFE process improvements

Any comments the SDT needs to look at in particular?

- Are we going to go through each TFE requirement to make changes or considering supplying entities with flexibility? How are we going to put parameters around each requirement?
- Not all requirements are created equal. Not all requirements should be eligible for TFE though most should be – may need a black list of those not eligible for TFE
- FERC order allowed many flavors of TFEs such as legal requirements, or safety requirements, not just technical feasibility
- Directive acknowledged flexibility needed but that "business judgment" was over used – still can use or request exceptions under other categories
- Suggest not to put TFEs in specific requirements – develop a broad statement without specifying the applicable requirements
- 16 comments on passwords may suggest we need to take it up a notch and not be so granular

3. CIP 010

John Lim provided the overview of industry comments.

4. Questions 1-8, with subparts- Overall

The Sub-team in particular looked at three questions: #1 – definitions, #6 – the Attachment 1 functions, and #7 – Attachment 2 categorization of BES cyber assets.

Question 1a

1.a. BES Cyber System Component — One or more programmable electronic devices (including hardware, software and data) organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; which respond to a BES condition or Disturbance; or enable control and operation.

34 (31%)= Agree with proposed definition
76 (69%)= Disagree with proposed definition

Dave Nortion summarized the industry comments to Question 1a:

- 71 responses were "no" with comment. Someone complained about each word in the definition
- From that created a suggested alternative definition
- Many do not think data should be there
- A definition is not "one or more" component(s) – it is just one component
- Look at systems, then components of a system, then individual items
- 11 "yes" with comments
- Separate out by operating systems suggested
- Suggestion to offer examples

SDT Member Comments and Questions

- What would be your recommendation in approach to making changes?
- Interesting observations – not sure what the implications are – first impression, we may need to make it simpler or more general or generic.
- Difficult in a definition to identify what is included in BES cyber system – have we provided enough guidance?
- Comments run the gamut of interpretation – some industry comments suggested it be "skinnied" down to just routable protocols and dial ups or it will be a monster to implement – everyone had heart burn with some word in the definition

Question 1c – control center

1.c. Control Center — A set of one or more BES Cyber Systems capable of performing one or more of the following functions for multiple (i.e., two or more) BES generation Facilities or Transmission Facilities, at multiple (i.e., two or more) locations:

- Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems,
- Acquisition, aggregation, processing, inter-utility exchange, or display of BES reliability or operability data for the support of real-time operations,
- BES and system status monitoring and processing for reliability and asset management purposes (e.g., providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES),
- Alarm monitoring and processing specific to operation and restoration function, or
- Coordination of BES restoration activities.

42 (40%)= Agree with proposed definition
63 (60%)= Disagree with proposed definition

- 23 pages – 63 disagreed, 40 agreed and many with no preference still had a comment.
- Control center should have "two or more" of the functions listed ("not one or more" functions)
- "…this standard is not the correct place to redefine BES and any language that does will force a no vote …"
- Some wanted definition of control centers
- "Multiple locations" mean geographic locations or multiple generating units?
- EEI comment: suggested a new definition
- Another comment attempted to scale down the scope of the requirement
- Does "location" refer to physical or electrical(?) locations?
- Generation plants refer to power plant or generation facility?
- Control center a cyber asset or a physical location?
- Remove AGC systems from function 1?
- Suggestion that in bullet 3 "asset management" may not be appropriate and should not be included
- Suggestion to remove bullet 4 as redundant.
- Bullet 5 comments suggest removing it
- Some real nuggets in the 23 pages we need to mine to improve the definition overall

Member Comments

- On restoration as not a cyber function – much of the communication system for manually switching needs to be considered from transmission center point of view.
- High level coordination has to occur to make sure it is safe and secure.

Question 6:
CIP-010-1 Attachment I contains a listing and brief description of Functions Essential to Reliable Operation of the Bulk Electric System. Do you have any suggestions that would improve the proposed criteria? If so, please explain and provide specific suggestions for improvement.
62 (58%)= Agree
45 (42%)= Disagree

Jim Fletcher presented a summary of the industry responses:

- 58% agree
- The one issue dominated the comments – the attachments needs more definition, examples and guidance in attachment 1
- Next better definition of real-time and the 15 minute window
- One suggestion to use 30 minutes but that seems beyond "real-time"

Summary data (slashes indicate repeat comments)
____ – "condition" not correct in context
No – use 30 minutes to match EOP std
No – Attachment 1 clarity, needs guidance //////

No – Attachment 1 should be guidance, not part of the standard /
No – "communications" implies voice
No – avoid using undefined terms or redefining preexisting NERC terms
No – when does the 15 minute period commence //
Yes – situational awareness of current state of bes results in too broad a scope ////
Yes – "functions" of Attachment 1 confusing overlap and ambiguous //////
Yes - need cut out for nuclear facilities covered by NRC
Yes – "shutdown condition" definition
Yes – concern for 15 minute window and real time adverse impact //
Yes – mitigation of event within 15 minute window needs to be included
Yes – voltage control needs to reference bes voltage
Yes – inter-entity communication too broad could include signal paths covered by other standards /
Yes – boundary for without external assistance /
Yes – need specific examples for reliability functions ///////////
Yes – delete attachment /
Yes – real time definition needed /
Yes – monitoring and control too broad
Yes – substitute NERC adequate level of reliability document for attachment 2
Yes – need to refer to other document for system restoration functions rather than make a definition here
Yes – remove 15 minute window /
Yes – treat control and monitoring as separate functions ////
Yes – inter-entity communications could imply voice
Yes remove inter-entity communications unless BES cyber systems can be defined to include components from multiple entities
Yes – system restoration is not a function supporting reliable operation
Yes – remove attachment 1
Yes – include more definition of functions supporting reliability of the bes in standard
Yes – should explicitly exclude voice systems

SDT Member Comments

- In terms of reliability determination something is lost in scoping – need to look at subject from the reliability coordinators perspective

Question 7 Attachment II

Question 7: CIP-010-1 Attachment II contains criteria for categorization of BES Cyber Systems for High, Medium and Low impact categories. The criteria were originally developed in collaboration with representatives of the Operating and Planning Committees, some of whom continued to provide input during the drafting of Attachment II. Do you have any suggestions that would improve the proposed criteria? If so, please explain and provide specific suggestions for improvement.

72 (67%)= Agree with proposed definition
35 (33%)= Disagree with proposed definition

Rod Hardiman presented a summary of the industry responses including the following points:

- If look at question then more accurate to note as much as 75% actually disagree
- Blackstart is not high impact/only include units in regional plan/openly include primary blackstart units – 24 comments

- "must run" is inappropriate term – 12 comments, 5 more related
- Should have a "no impact" level below low – 10 comments, 5 more related
- Provide justification for thresholds/thresholds are arbitrary – 10 comments
- Categorization should be based on engineering studie/need waivers from thresholds -9 comments
- Define "primary cranking path" – 9 comments
- Questions about defining "transmission line", local area , transmission facility, etc.
- Sorted attachment 2 categories by the number of times commented on

SDT Member Comments

- Top three deal with generation and transmission support centers –
- Some called for combining the generation categories, as well as the transmission categories
- Comments on 1.14 and 1.13? RAs and TOPs running at less than high given their coordination and communication? If interconnected, should all, even small ones be considered "high" to establish high trust levels?
- There is a level of protection at the application level but hard to put into the standard here
- Important to have some sort of protection from injection attacks – have some level of data protection – appropriate that industry pushes forward to get vendors to produce product

Other issues in 010

- Requirement R3 for updating lists and categorization – have not had a chance to review comments, assume many significant comments and will need to review in the next call – Question 5
- Variable generation is important to wind and solar providers and how it fits

5. Governance, Change Management, System Lifecycle and Information Protection and Maintenance Sub-Team

Dave Revill introduced the Sub-teams work noting it covered Questions 11, and 40-48.

SECURITY GOVERNANCE AND POLICY Question 11 – R1

11. Requirement R1 of draft CIP-011-1 states, "Each Responsible Entity shall develop, implement, and annually review formal, documented cyber security policies that address the following for its BES Cyber Systems:" and then provides a list of topics that must be addressed. Do you agree with this proposal and list? If not, please explain why and provide specific suggestions for improvement.

58(56%)= Agree with proposed definition
46(44%)= Disagree with proposed definition

John Stanford presented an overview of industry comments:

- Seeking clarity in the list, policy phraseology, or definitions of terms (19)

–Examples include: Formal, annually, boundary protection, sanitization, security roles and responsibilities, authorized access, personnel, third-party, non-employees, addresses.
–Desire to have terms used in later requirements defined here

- Seeking clarity in the policy expectations, purpose or structure (11)
  –Desire to have all access related issues defined here
  –Numerous questions on what is meant by policy language
  –Several concerns about how to demonstrate compliance with a policy
- Concerns about the term "annually" (9)
  –Numerous suggestions on alternate wording for clarity
- Questions about Senior Manager (8)
  –Mostly delegation or approval concerns, possible conflict with R3, or claims of double jeopardy between R1 and other requirements
- Concerns about burden of proof, compliance, legal or ownership (4)
  –Several concerns about allowing for non-ownership or non-operation of BES Cyber Systems
  –A few raised contractual obligation concerns
- Concerns about policy being too prescriptive (5)
  –Seems to be confusion about general policy hierarchy
- Suggested edits without actual disagreement (4)
  –All over the map
- Generic references, non-substantive comments, or misplaced (3)
  –Examples include comments about change management or "ditto" and "me too" comments submitted by others on other requirements

SDT Discussion Comments

- Need to be clearer on the overall intent here
- Some may be looking at results based requirements – looking for the what rather than the how
- Many comments want to clarity about what you are asking – clearly getting mixed message of clarity on what is expected versus being too prescriptive
- Would a guidance document help here?
- The phraseology may be asking for a lexicon – how far do we want to go there?
- Maybe there are some things we can glean from the responses to clarify the language rather than saying we need to teach them what we mean
- Some interpretations may need to be left to legal but others are terms of art that we may need to clarify with purpose of our intent
- Some concern about why governance and policy structure is a regulated area
- This is a balance between binary requirements and a policy structure
- Reinforcing the value of policy in a good security program
- FERC looking for management responsibility and policy is a linchpin
- Complying with the controls may not be enough – need good policy to drive compliance
- If done right policy can set a good foundation
- "annually" was mentioned here and in other groups – needs to be addressed

6. BES CYBER SYSTEM MAINTENANCE (R26) Question 47, R26

47. Requirement R26 of draft CIP-011-1 concerns procedures for BES Cyber System maintenance. Do you agree with the list of criteria that are included in Requirements Table R26? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification.

41 (48%)= Agree with proposed definition
45 (52%)= Disagree with proposed definition

Dave Revill presented the following overview of industry comments:

- Concerns about the interaction between the list of personnel in 26.1 and the lists granting authorized electronic and physical access (13)
- Concerns about the interaction with other user/account management requirements (12)
- Comments regarding the allowance for emergency maintenance situations (2)
- Requirements on maintenance devices should include system hardening (2)
- All maintenance devices should be documented in a list (2)
- Ensure that systems used for maintenance do not act as an unauthorized access point (1)

He noted they also got comments on the definition of "maintenance" – some said to consider the temporary connection also have appropriate controls.

SDT Comments

- Overlap on responsibilities that we may need to address
- Some entities may not have specific devices set aside for maintenance – but may be burdensome the random use of a laptop to perform maintenance
- What is "maintenance"? What are the devices are you connecting for maintenance activities, such as field devices
- In guidance document may want to put in something about how you can provide evidence of compliance with this requirement

7. ELECTRONIC ACCESS CONTROL (R7 –R14)

Question 17. Requirement R7 of draft CIP-011-1 states "Each Responsible Entity shall document BES Cyber System accounts by incorporating the criteria specified in CIP-011-1 Table R7 – Account Management Specifications to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems." Do you agree with the list of electronic access control requirements that are included in Requirements table R7? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please Explain and provide any suggestions for modification.

56 (58%)= Agree with proposed definition
40 (42%)= Disagree with proposed definition

Sharon Edwards presented the following summary of industry comments:

- Misunderstand that they are to define acceptable use
- Local definition/description of account types
- Soft language
- Top themes:
- 1 - Need a strategy for designing baselines by impact levels – we missed the mark
- Strategy going forward include policy requirements, verification of implementation
- 2 – revocation of access – do not like the time parameters for revocation, transferred personnel should not be treated as risk, and clarify when the clock starts for no longer needing the access
- make distinction between "primary" access and "secondary" access; primary access includes the domain user account, remote access credentials, and physical access; etc.
- 3 – clarity and definitions on acceptable use, account types, system access, remote access, external connectivity, wireless, etc.
- 4 – separate remote and wireless access
- 5 - consistency
- 6 – quarterly review is excessive
- Discussion – if we take this approach it needs to be justified and segmented appropriately in h-m-l

SDT Questions or comments

- Don't make distinction between BA, TO, TOP, GO? Those are the comments? That is surprising in terms of the parameters for revocation.
- Comments may be coming from control centers who want to relax the requirement – this is in contrast to the request to make it "immediate."
- May need to segregate requirements and make distinction for those terminated for cause and others who are lower risk
- Are we addressing privileged accounts? This is a case were you need to run, not walk.
- Yes, but it is not under revocation
- Need to coordinate revocation ahead of termination of those with key access
- Highly recommend not using "primary" or "secondary" access – you either have access or don't – need a three level recognition of revocation including those with privileged accounts
- "quarterly review" – assumption the this included quarterly reauthorization – that would be a burden – need to clarify quarterly reauthorization is not part of the requirement
- need to coordinate the timing required in other requirements
- need to look for overlaps and need for coordination between the teams
- quarterly review is part of the monitoring, not reauthorization – need to clarify proposal
- quarterly review is meant to catch and fix those we missed – should not have to self report those.

8. Response and Recovery

CYBER SECURITY INCIDENT RESPONSE (R27 –R29)

49. Requirements R27 to R29 of draft CIP-011-1 concern procedures for Cyber Security Incident response. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R27 to R29? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

54 (61%)= Agree with proposed definition
34 (39%)= Disagree with proposed definition

50. Tables R27 to R29 provide direction concerning what impact level of BES Cyber Systems to which Requirements R27 to R29 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

52 (60%)= Agree with proposed definition
34 (40%)= Disagree with proposed definition

BES CYBER SYSTEM RECOVERY (R30 –R32)

51. Requirements R30 to R32 of draft CIP-011-1 concern procedures for BES Cyber System Recovery. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R30 to R32? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

39 (46%)= Agree with proposed definition
46 (54%)= Disagree with proposed definition

52. Tables R30 to R32 provide direction concerning what impact level of BES Cyber Systems to which Requirements R30 to R32 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

52 (65%)= Agree with proposed definition
28 (35%)= Disagree with proposed definition

Scott Rosenberg presented the overview of industry comments:

- Guidance on cyber security incident classification highlighted.
- Definitions
- Coordination with 001
- Incident response for low impact or non routable connections should be removed?
- Consistency between requirements related to impact level?
- Single versus multiple incident response plans and testing issues.
- Combine incident response testing and review/update.
- Review results of incident response tests in other than 60 days
- Recovery testing
- Recover plan testing clarifications
- Data retention identification requirements of personnel responsible
- Coordination of physical aspects of cyber security incidents
- Incident response and recovery plan reviews and question around changes required
- Suggestions for re-wording

- Coordination of backup plans

SDT Questions or comments

- FERC said we may not have enough requirements? More important to set a base line, focus on quality not quantity with security need in mind – not the number of requirements but the right ones
- Timing questions – can NERC develop a Gant chart of the timing requirements?
- Summarized in one place would be helpful to entities
- Good appendix to a guidance document
- Helpful to team for coordinating and consistency across the requirements
- A table of all the timings? Yes
- "annual" is across several requirements – may need a joint effort to define a common understanding
- Proposing the team draft glossary definition of "annual"?
- Careful – this may become an audit issue – may need to be given to the Standards Committee.
- Define for local purposes – how does the team want to use the word? Do we mean 365 days? Once a calendar year?
- When we use time related items, need to identify what we are trying to achieve – think about a flexible window for compliance and auditing.
- Any time based requirements? Quarterly?
- Good to have a base line approach to incident response.
- Need to present context without putting into requirements
- Taking requirements and putting into a table? Are there requirements for how to do that from NERC?
- Industry has said it makes sense and offered suggestions for refinement – may need to identify multiple requirements in the same table or split them out
- Can we put up an example of a table for comparison? Send out by email then take a look at together tomorrow.
- Backup control center – some asked why do I need to do anything else?
- Might put in words to say fully function backup center is sufficient for recovery
- Still need a recovery plan.
- This is a cyber incident possibility – a hot backup may be corrupted or could lose both – cold backup is less likely to be corrupted in the same incident.
- Business continuity to keep operating and then there is restoration of the original assets
- This is recovery of the cyber system – not a backup system
- Need to recovery ability to execute control – differs from recovery of the assets
- Three levels: recover capability, recover the assets, and recover.
- Purpose to protect the grid or the assets?

9. Systems Security (R15 –R19)

35. Requirements R15 to R19 of draft CIP-011-1 concern procedures for system security protection. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R15 to R19? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

25 (27%)= Agree with proposed definition
67 (73%)= Disagree with proposed definition

36. Tables R15 to R19 provide direction concerning what impact level of BES Cyber Systems to which Requirements R15 to R16 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

40 (45%)= Agree with proposed definition
49 (55%)= Disagree with proposed definition

BOUNDARY PROTECTION (R20 –R22)

37. Requirements R20 to R22 of draft CIP-011-1 concern procedures for boundary protection. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R20 to R22? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

28 (31%)= Agree with proposed definition
62 (69%)= Disagree with proposed definition

38. Do you agree with the proposed definition of electronic access point? Please explain and provide any suggestions for modification.

49 (56%)= Agree with proposed definition
38 (44%)= Disagree with proposed definition

39. Tables R20 to R22 provide direction concerning what impact level of BES Cyber Systems to which Requirements R20 to R22 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

38 (46%)= Agree with proposed definition
44 (54%)= Disagree with proposed definition

Jay Cribb noted that the industry responses to Questions 35-39 covered more than 100 pages.

R15 – Malware Prevention

15.Requirements R5 and R6 of draft CIP-011-1 concern procedures for physical security, which were previously contained in CIP-006. Do you agree with this proposal? If not, please explain why and provide specific suggestions for improvement.

37(40%)= Agree with proposed definition
56(60%)= Disagree with proposed definition

Jay Cribb summarized the industry responses as:

- Don't' require malware testing
- Very difficult to audit current language
- Need device class language or many TFEs

SDT Comments and Questions

- What is the problem with malware testing?
- Language looks like you are ask to put malware into your system to test the system
- Need to clarify we are trying to prevent propagation of malicious malware
- Testing has to take place outside the production system
- Testing the protection systems
- Test in a real world already – we know the products work – why test my antivirus when it is tested every day in the real world –
- need to clarify the language and intent
- do we need this here or is it already covered elsewhere?

R16 – Patch Management

- What starts the clock? Release vs. availability
- Fixed date of implementation

SDT Comments and Questions:

- Getting reliability tested on their systems first and certifying it is more important than the contract.
- #2 is a misnomer – the requirment asks for applying the patch and pick a date or date for mitigation – reasonable requirement –

R17 – system hardening

16. Tables R5 and R6 provide direction concerning what impact level of BES Cyber Systems to which Requirements R5 and R6 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

37(41%)= Agree with proposed definition
54(59%)= Disagree with proposed definition

Jay Cribb provided the following overiew of Question 17 industry responses:

- What is "externally accessible physical port"? (By far the most common comment)
- Physical port disabling on devices that are already secured

SDT Comments and Questions:

- Physical ports? Need to relook at this – reframe to cover accidental use
- Need to disable the local services too
- We test many best practices that do not actually add to security

R18 – security event logging and monitoring

18. Table R7 provides direction concerning what impact level of BES Cyber Systems to which Requirement R7 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

66 (69%)= Agree with proposed definition
30 (31%)= Disagree with proposed definition

Jay Cribb provided the following overiew of Question 18 industry responses:

- Is weekly manual log review really needed with continuous monitoring?
- What is a "cyber security event"?

SDT Comments and Questions:

- None.

R19 – data and communications integrity

19. At the present time, the Access Control requirements for Physical Access have not been combined with the Access Control requirements related to Electronic Access. Do you agree with this method? Or would you prefer to have the Physical Access control requirements combined with the Electronic Access control requirements? Please explain and provide any suggestions for modification.

74(80%)= Agree with proposed definition
19(20%)= Disagree with proposed definition

SDT Comments and Questions:

- Very unclear what is validation and what is satisfactory?
- True validation happens at the application layer – dependent on vendor, etc.
- Proving malicious intent of invalid data received is very problematic (impossible)

Boundary Protection

20. Requirement R8 of draft CIP-011-1 states "Each Responsible Entity shall apply the criteria specified in CIP-011-1 Table R8 – Account Management Implementation to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems." Do you agree with the list of criteria that are included in Requirements Table R8? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification. Do you agree with the impact levels for each criteria as represented in the table? Please explain and provide any suggestions for modification.

45 (48%)= Agree with proposed definition
48 (52%)= Disagree with proposed definition

Jay Cribb provided the following overview of the industry comments:

- Rename this and the tables back to ESP
- Remove or clarify the alerting timeframes (the 48/12 hrs)
- Weekly review of log entries
- Clarity – what is a "communication path", "authorized access"
- Clarify access points and their interaction with multiple BES cyber systems

SDT Comments and Questions:

- Looking at taking review of logs and alerting time frames and moving them up into the requirement – thus one requirement for system monitoring rather than in two places
- Pull physical into it too?
- Did we have a question that asked if prefer consolidated or separated?

- Comments favored keeping physical and electronic separate
- But is it the same distinction for monitoring?
- Makes sense
- But caution – physical and electronic monitoring may be done by two different sets of people – careful how it is worded

R21 – system boundary

21. Table R8 provides direction concerning what impact level of BES Cyber Systems to which Requirement R8 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

50 (55%)= Agree with proposed definition
41 (45%)= Disagree with proposed definition

Jay Cribb provided the following overview of the industry comments:

- Remove the requirement – overly prescriptive
- How does this requirement differ from R20

SDT Comments and Questions:

- Is it realistic to address and incorporate the changes suggested by this July?
- These are just the top issues from 100's
- Little more detail on system boundary – is it about the logical separation piece?
- R21 separates systems that could have a single point more than they are now – it is not just systems boundary
- Confusion about the differences between the two, some argued to combine
- Making it a requirement may be too much – putting in a best practice and making it auditable
- Point is to address shared systems and being sure they are protected to the same level – or not share – if combine the two we can achieve the same goal and reduce confusion
- Access points can be physical or electronic – need to clarify to improve understanding
- Access point is the interface and that is what you need to protect – not the same as the firewall
- Focus on the interface
- Making distinction between firewall challenge and access control(?)?
- Requirement addressed access control at the interface level

R22 – Protective systems

22. FERC has mandated immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset. Requirement R9 of draft CIP-011-1 states "Each Responsible Entity shall revoke system access to its BES Cyber Systems as specified in CIP-011-1 Table R9 – Access Revocation to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems." Do you agree with the list of criteria that are included in Requirements Table R9? Please explain and provide any suggestions for modification, including time proposals. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification.

27 (29%)= Agree with proposed definition
67 (71%)= Disagree with proposed definition

Jay Cribb provided the following overview of the industry comments:

- Remove and put the systems in scope of the relevant requirements
- Weaker than the current standard

Jay Cribb then noted some overall issues raised in the industry comments:

1) TFE allowances – where and how. All of our requirements will need them
2) Clarity around when the requirement applies to "systems" and "components"
3) External connectivity matters – do not require external connectivity in order to meet RQ's
4) "no impact" category needed

SDT Comments and Questions:

- approval rating for this section very low for this whole section
- many of the comments related to the existing requirements and concerns
- can we retool these requirements in 38 days?
- Doesn't need more people but need to retool timing by asking FERC to give NERC more time – need to retool the time – I think the FERC people understand, but do the NERC people – change the time
- NERC can ask for more time
- Take up and address the timing issue tomorrow as part of the schedule discussion

10. Personnel & Physical Security

Doug Johnson presented the summary of industry comments on personnel and physical security. The one on training we changed the least from the CIP garnered the most comments.

- Questions 12-14 for R2, 3 and 4
- Questions 15-16 for R5 and 6

PERSONNEL TRAINING, AWARENESS, AND RISK ASSESSMENT (R2 –R4)

12. Requirements R2 to R4 of draft CIP-011-1 concern personnel training, awareness, and risk assessment, which were previously contained in CIP-004. Do you agree with this proposal? If not, please explain why and provide specific suggestions for improvement.

23(23%)= Agree with proposed definition
77(77%)= Disagree with proposed definition

13. Do you agree with the proposed definitions for external connectivity, routable protocol, and non-routable protocol? Please explain and provide any suggestions for modification.

59(60%)= Agree with proposed definition
39(40%)= Disagree with proposed definition

14. Tables R3 and R4 provide direction concerning what impact level of BES Cyber Systems to which Requirements R3 and R4 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

43(47%)= Agree with proposed definition
48(53%)= Disagree with proposed definition

Doug Johnson presented an overview of industry comments on Question 12, R2

- What security awareness program is being referenced? (see R1)
- Replace the term "reinforcement" with "awareness material and replace "provide all" with "make available to all"

SDT Comments and Questions:

- May want to divide R1 much the way others divided into the other requirements
- What should the policy or program have in it? R1 says must have a policy
- R1 language could be adjusted to be consistent with the following – may break 1.4 into multiple parts – R1 lacks detail
- Does programmatic guidance need to be in R1 or broken out into sub parts? Approach affects other areas too
- Need to write it down and come back to for more discussion – how is the low approach depicted and approached?

R3

- 3.2 – add clarification or make it role specific
  - (the clarification is important to acknowledge that the intent is clearly not to have all personnel with electronic access to any BES cyber system to become network engineers)
- What is Annual?
- Would it be better to include the table for consistency?

STD Questions and Comments:

- "annual" appears in only one place – in R1
- here the concern is about any time frame – not the specific word
- need a consistent way to reference to be clear
- at least once every twelve months – is that not clear enough?

R4

- Why is photo ID now being required?
- Address how to better handle vendors and contactors

STD Questions and Comments:

- Not realistic to require CISCO to go through training process for remote access
- Concern about allowing third party access and support especially in an emergency to maintain reliability
- May need NERC to certify and support a third party vendor training
- Entity may need to define and document emergency situation – allow for exception in such circumstances

- Not something NERC creates – need to put into a requirement – unless willing to do that, then NERC is not going to do it – operator stuff was created by the industry – NERC will not certify appropriate persons with operator access
- Distinction is in the authorization for access control – person given temporary access working through someone with authorization – latter is required to document and have management approval
- Operator certification is provided by third parties
- NERC could not provide training for the procedures for all of the entities, especially given the diversity of entities and their procedure
- Focus here is on remote support access
- Escorted remote access? No equivalent on electronic side to the current escorted physical access – an issue for all the entities
- R3 and 4 have exception clauses for emergency to the training requirement – some better definition in the maintenance that documents the emergency clause rather than a requirement for training in emergency situation

R5

- Immediate revocation of access
- What is meant by the term monitor?

STD Questions and Comments:

- Is escorted electronic access an open issue for interpretation?
- That is not the interpretation requested
- "authorized access" is not used in the standard – the standard does not address the concept – only unauthorized physical access and granting electronic access are in the standard
- parking lot issue of combining physical and electronic access revocation – 80% of those offering comments agreed to separating the two?
- Need a single person revocation of both physical and electronic access – personnel revocation
- Are we moving forward with them as separate items? Yes
- Granting access and revocation need to be consistent

R6

- Physical Access Control Systems need to be defined
- Potential for a fourth column

STD Questions and Comments:

- Consider a fourth column where needed to where physical controls need to be applied – we do not need physical access controls lumped in with the electronic controls – do we need a fourth column?
- For end user it may be better to have a separate requirement rather than search through all of the related requirements
- Comments suggested embedding electronic controls – but keep physical controls separate

- There is a broader category here – requirements apply to BES and protective systems
- Keep physical access on their own
- Parking lot issue: protection requirements for electronic and physical access controls and systems (Phil Huff)
- May need to insert a "local" definition

Overall question for SDT

- Is it possible for an entity to have no BES Cyber Systems?

STD Questions and Comments:

- May want to address in 010
- Several hundred distribution providers who do not have BES assets but need target protection

IV. OTHER 706 ISSUES AND CIP DOCUMENT PREPARATION

A. FERC Order 706 Issues In Addition to CIP 010 and 011

On Thursday the Team took up how to address 706 issues that have been termed "post Version 4 issues" that include:

A. Access Control Redundancy/~~Defense in Depth~~ (two or more diverse security measures in constructing electronic and physical security perimeter)
B. Active vulnerability assessments every three years
C. Forensic data collection

SDT Members Discussion

- Issues raised during the workshop
- Comments also appeared in question 54 and in Doug Johnson's group
- These are non trivial and will take even more time and discussion than taken so far – trying to get 011 done first without delay.
- Willing to write single page description of each issue?
- Strong concern in industry about punting to another version – can we address in a limited manner at least as a place holder – concerned it is doomed with FERC without defense in depth for example – scope it down and phase in.
- That is not what the FERC directive said.
- Yes will take time, but is this justification for an extension from FERC.
- Rename defense in depth to access control redundancy of access perimeters
- Need to do vulnerability assessments on redundant not live systems – careful how we write – also need clarification from FERC (Mike Peters) on the issue
- Not talking about putting in two access points to perimeters
- Peters said defense in depth is fundamental and bolting on later will cause trouble for industry

- Need more two way communication as to what FERC is asking for, the intent of the request. This is too important to make assumptions and the goals are too important/
- Put in words from the actual order – paragraph 480
- Paragraph 502 also says flexibility – it also says it is not intended to create an inflexible requirement.
- Misconception written into the order – most systems already have three levels – can do three things at the same level rather than pick different levels.
- Ignore the Commission's request and tell them what they should have said
- Seeking clarification
- Paragraph 725 – need to pull out of 011? – Paragraph 710 requires data in blackout report and improved forensics.
- We need to research what the commission is asking for.
- Jan Bargen, FERC, noted her understanding is that you do not have cyber security if it is not in depth – too severe an interpretation that it has to be all or nothing and cannot been done in pieces – you can explain progress and point to in the requirements and note what else needs to be worked on – recognize you are working on a new paradigm and have a window of opportunity.
- Language in 706 says you have flexibility in how to approach concerns – by accepting phased approach to implementation in the past FERC is indicating you can apply to defense in depth and forensics.
- Putting so much protection at the boundary that you need some depth – if get through firewall you need another layer – not necessarily another duplicative firewall but cannot get through just one vulnerability.
- These don't have to be next to each other.
- We have to assume the bad guys are in your business system and you need to protect the high end assets.
- We will need to review current draft requirements to see what is already addressed, then assess what it would take to address in part or full the issues.
- Support that approach – also agree we are in a new paradigm – also need optics we are trying to deal with issues – and fourth, we need clear grounds for an extension.
- Fourth issue of operation test of the recovery plan addressed in CIP 011
- Need to review and develop possible ways to address in small team groups.
- Under forensics – half may already be dealt with under Jay's group and the rest in Scott's under recovery.
- Can we ask Carnegie-Mellon to help with this – meeting is in Pittsburgh next month
- We have now have 38 days left – Jay's sub-team is not done and it is the key – we need a backup plan – we just added to Jay's sub-team's responsibility – have to figure out how to address this soon or have a backup plan – maybe it is just a patch of the old CIP 005 and 007 and not a brand new system?
- Item B will also be addressed in Jay's group

- Item A, part 2 in my group – have not discussed yet – given volume of comments to deal with, not sure if we can get to it in the time frame we have
- We are in a countdown mode with an artificial deadline. In order to get it right, we may need to adjust the deadline

B. Implementation Plan Options

Scott Mix presented the implementation plan concepts and approach.

- Open issue about early compliance – example, implementation time frame that adds up 2 or 3 years before version 4 kicks in but buying new EMS now and want to be compliant with v4 in the new system - legal said "no" – hopefully they did understand the question, will try to discuss issue with legal further.
- Floated to FERC the concept of compliance with high in two years, medium in five years and low in ten years – focus on smaller number of assets first with the biggest bang for the buck or investment of time and resources.
- What about entity with only low assets? Do they get to wait eight years to do anything? How can we incentivize them to move quicker or start earlier?
- Implementation plan may look similar to a mitigation plan – come up with list of assets "quickly" (30-90 days?) – create an implementation plan for your entity – provide guidance and oversight with yes or no on the early compliance plan and audit to the accepted plan – regional entities are the ones who approve the plan
- May create confusion for audit teams and regions
- Cannot let industry appear to be delaying the inevitable
- Favorable reception by FERC staff for early compliance plans – at least one of the regions is considering a similar approach – proposal may still need time and attention
- Nuclear process is a similar approach
- Have a team to help draft approach

SDT Questions and Comments

- Flabbergasted – if going after highs in the first phase
- Jan Bergen, FERC, noted that it is worth exploring opportunities to implement sooner than 10 years.
- Mike Keene, FERC, suggested this function as long as requirements in 011 are done in appropriate manner – conception is an acceptable approach
- Focus on the real attack surface first – we don't have the proper focus on the appropriate attack surface – too focused on big iron and not the cyber system.
- The approach makes sense – especially for those putting in new systems now – concern from some that they do not want to have to comply with two different versions at the same time
- I am not a fan of approach – letting entities build their own plan misses the interdependence of the small and big entities – do not think one entity gets fined on a low

asset down the road from another entity that is not under compliance for anther four years – also end up with different timelines for compliance on physical protections
- Have to order the sequence of implementation – cannot do everything at once.
- Have to run a test on the low to be sure of impact before full implementation.
- Allows for quicker implementation of those easier or lower cost without waiting.
- Take care of controls in the tables to address connectivity since they were removed from 010 – where applicable
- Concerned about overhead and oversight and approval from regions – subject to subjectivity – every entity plan will have to be processed by the region
- What to demonstrate we are moving forward – if set a future date, any delay waiting for that date makes it look like industry is not forward – better to show some in industry are moving forward and not waiting.
- Disappointed that proposal offered to FERC without discussing with sub-group or full team – be careful not to introduce complexity – advantages to letting entities to move forward but danger of adding complexity – better to give industry reasonable firm times in which to comply – need to be less concerned about when low impact entities comply and focus on the high
- Scott Mix did not bring up the plan at FERC meeting– Alan Mosher did.
- Some of the "lows" have access to higher assets through IP.
- Need to file an implementation plan ready for time of posting.
- Need to start drafting soon – need direction on how to proceed.
- Is it based on a fixed date per requirement per impact or flexible date with submission of implementation plans for approval by regions?
- Come back with a formal proposal for members to express a preference.

On Thursday, Scott Mix offer the following Implementation Plan options for the SDT's consideration:

1. **Multiple fixed dates (based on connectivity and dependent on impact level)**
   4 -6 3 -8 2 -5 1 -0= **58 (3.2 of 4)**

2. **Entity-specific implementation plan**
   a. need to develop boundaries and approval guidance
   b. resource issues at regions for approving plans
   c. multiple versions in play at the same time for audits
   d. will require "true-up" of CIP 011 requirements for connectivity, etc.
   e. consistent with current NGP plans
   4 -3 3 -11 2 -4 1 -1= **54 (2.8 of 4)**

3. **Single fixed date (independent of impact level)**
   4 -4 3 -9 2 -3 1 -2=**51 (2.8 of 4)**

4. **Fixed date for each requirement, for each impact level**

a. some requirements would be the same for all levels
b. may have issues with "early compliance
c. will require a separate plan for NGP

4 -0 3 -1 2 -14 1 -4= **35 (1.8 of 4)**

SDT Questions and Comments:

- #4 – when do I need to be in compliance? I cannot give you a date, not to mention the inconsistency of being in compliance with one element before another
- Only alternative is reduce the number of dates and gloom them together – getting it done early may be detrimental – should improve reliability by allowing early compliance
- Cyber system and cyber system components are different – suppose to be looking at functions –
- This is a complex system with many components – I apply patches to individual components
- For nuclear plants – are they allowed to beyond the recommended date? Why is it an either or choice here? Is there a hybrid? Some fixed dates under #2
- Some might be fixed date but other programs may lend themselves to early implementation.
- Option 2 is more successful in nuclear arena – scope is more focused – with electric industry looking at vastly larger and more diverse set
- Favor a set date – option #3 – fixed and singular independent of impact level
- SE – difference between requirements makes for a nightmare for implementation under option #4. Option #2 may work well for entities with multiple business units
- multiple fixed dates based on connectivity and dependent on impact level as option 1
- Option 2 is based on entity registration

C. Low Impact Baseline

- Do we need to modify something in the governance section to identify low to better depict what is included in low?
- Put everything up in R1 but detail in the subsequent requirements – hard to follow – if R1 is the baseline, it only looks like an outline and needs more – Sub teams need to know how to proceed
- Sounds risky to go off and just assume it will be dealt with in R1.
- Sub teams would need to identify and shift words up to R1.
- Clarifies next steps for sub teams.
- Do we need to revisit decision to shove everything up to R1 and governance? Better to put baseline in the individual areas to tailor to the need.
- R1 doesn't have the detail needed – need the detail in the individual areas
- Jan Bargen, FERC, noted the format presentation by John Van Boxtel would offer you the opportunity to identify the detail you need in each section.
- Articulate the baseline in the table for each section?
- References in the technical controls are not tied back to R1.

- Controls do not appear to be well fleshed out at this time in current form putting everything up in R1.
- The requirements themselves are the policy – go through and identify those that need more clarity and lift them up to a table in R1.
- Should we address connectivity with low?
- Not addressing levels, applies to H-M-L – concern is to protect from upstream.
- If have a routable connection it should be higher – substations connected to control center or control system – it is the connectivity we are trying to protect, not the individual substation.
- John Van Boxtel's presentation allowed for recognizing that connectivity.
- Everything to date has focused on BES assets – paradigm shift to look at the connectivity – if routable connection to substation, it should not raise the level of every relay in the substation.
- It is the level of protection on the low item needs to be higher if it is connected – but only for certain requirements.
- Taking it down into the individual areas and put into our requirements, not sending it over to move into R1.
- Agree, but don't need policy in every requirement – do not need to write new policy requirements.

V. NEXT STEPS AND ASSIGNMENTS

Following the Sacramento meeting it was agreed there would be a need for weekly sub-team meetings and possible sub-team leads meetings. Later in June the schedule would be adjusted to reflect this and include some SDT meetings to develop drafts for NERC staff to review in advance of the July meeting in Pittsburgh.

The Chair suggested convening the SDT to review a new draft schedule the following week once more information was available from NERC and the Standards Committee.The Chair thanked Kevin Sherlin for his excellent support for the SDT in hosting this meeting.
The meeting adjourned at 11:00 p.m. on Friday, June 11, 2010

_____

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix # 1— Meeting Agenda

Project 2008-06 Cyber Security Order 706 SDT
Draft 23rd Meeting Agenda
June 8, 2010, Tuesday- 8:00 AM to 5:00 PM PDT
June 9, 2010 Wednesday- 8:00 AM to 5:00 PM PDT
June 10, 2010 Thursday- 8:00 AM to 5:00 PM PDT
June 11, 2010 Friday- 8:00 AM to 12:00 PM PDT
Sacramento, California

NOTE:
1. Agenda Times May be Adjusted as Needed during the Meeting
2. Drafting Team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- To review the CSO 706 SDT 2010 Work plan and Schedule;
- To review and adopt CSO 706 SDT 2010 Consensus Procedures draft;
- To receive updates on other related cyber security initiatives;
- To review the results of the FERC/NERC May 27 Meeting;
- To review the results of the May 19-20 Dallas Technical Workshop;
- To review the documents to be produced for the July, 2010 CIP posting;
- To receive an overview of the industry informal comments on CIP 010 and 011;
- To review industry input on the CIP format and to test SDT consensus on CIP format going forward;
- Sub-teams review industry input from the Technical Workshop and informal comments and propose any potential changes in the draft standards;
- SDT reviews Sub-Team reports on industry input from workshop and informal comments and any proposed changes in the draft standards;
- To review progress on the Implementation Plan Drafting Group and the Guidance Document Drafting Group; and
- To agree on next steps and assignments

Draft Agenda

Tuesday, June 8, 2010 8:00 a.m.-5:00 p.m.

- Introduction, welcome and opening remarks
- Discussion of CSO 706 SDT Work plan and schedule: June-December, 2010- *Stu Langton*
- Review and seek agreement on Drafting Team Proposal for refining the SDT Consensus Procedures
- Updates on other related cyber security initiatives- *NERC Staff and SDT Members*

- Review results of the May 27, 2010 NERC/SDT Meeting with FERC and guidance for sub-teams
- Review Technical Workshop overview and results
- Initial Overview of Industry Response to Request for Informal Comments
- Review of industry input on CIP format and consensus testing on CIP format going forward
- Sub-Teams meet to review and discuss industry comments *(Afternoon)*

Wednesday, June 9, 2010 8:00 a.m.-5:00 p.m.

- Sub-Team Meetings, Cont'd *(till mid-day)*
- Sub-Team Reports and SDT Discussion- Key Issues, Comments and Possible Changes to Requirements. *(Afternoon)*

Thursday, June 10, 2010, 8:00 a.m.-5:00 p.m.

- Sub-Team Reports and SDT Discussion- Key Issues, Comments and Possible Changes to Requirements

Friday, June 11, 2010, 8:00 a.m.-12:00 p.m.

- Review Next Steps and Sub-Team Schedule and Production of new Draft Requirements and related filing documents.
- Review the SDT Pittsburgh Meeting Agenda and Perform the Meeting Evaluation
- Review Implementation Plan Drafting Team progress and next steps
- Review Guidance Document Drafting Team progress and next steps

Appendix # 2 Attendees List
June 8-11, 2010, Sacramento CA

Attending in Person — SDT Members and Staff

1. Jim Brenton	ERCOT
2. Jay S. Cribb	Southern Company Services
3.Joe Doetzl	Kansas City Pwr. & Light Co (T/W/Th)
4. Sharon Edwards	Duke Energy (T/W/Th)
5.Gerald S. Freese	America Electric Pwr. (T/W/Th)
6. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
7. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation (W/T/Fr)
8. Doug Johnson	Exelon Corporation – Commonwealth Edison
9. Patricio Leon	Southern California Edison
10. John Lim, Chair	Consolidated Edison Co. NY
11. David Norton	Entergy (T/W/Th)
12. David S. Revill	Georgia Transmission Corporation
13. Scott Rosenberger	Luminant Energy (T/W/Th)
14. Kevin Sherlin	Sacramento Municipal Utility District (W)
15. Jonathan Stanford	Bonneville Power Administration
16.Tom Stevenson	Constellation (W/Th/F)
17.Keith Stouffer	National Institute of Standards & Technology (T/W/Th)
18. John Van Boxtel	WECC (T/W/Th)
19. John D. Varnell	Technology Director, Tenaska Power Services Co.
Scott Mix	NERC
Roger Lampila	NERC
Howard Gugel	NERC
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center

SDT Members Attending via ReadyTalk and Phone

Rob Antonishen	Ontario Power Generation (T/W)
Jackie Collett	Manitoba Hydro (W/Th/F)
Frank Kim	Hydro One Networks Inc. (Th/F)
Rich Kinas	Orlando Utilities Commission (T)

SDT Members Not Participating

William Winters	Arizona Public Service, Inc.

Others Attending in Person

Jan Bargen	FERC
Summer Esquerre	Next Era Energy (FPL)
Jim Fletcher	American Electric Power
Joel Garmon	Next Era Energy (FPL)
Michael Keane	FERC
Jerry Mercado	SMUD
Sam Merrell	CERT/Software Engineering Institute
Brian Newell	American Electric Power
Guy Zito	NPCC

Others Attending via Readytalk and Phone

June 8, 2010, Tuesday

Annette	Johnston	Mid American Energy
Justin	Kelly	FERC
Peter	Kuebeck	FERC
Drew	Kittey	FERC
Jerome	Farquharson	Burns McDonald
Daniel	Bogle	FERC
Ingrid	Rayo	Constellation
Rod	Hardiman	Southern Company
Bill	Glynn	Westarenergy
Steve	Newman	Mid American Energy

June 9, 2010, Wednesday

Rod	Hardiman	Southern Company
Ingrid	Rayo	Constellation Energy
Jerome	Farquharson	Burns McDonald
Peter	Kuebeck	FERC

June 10, 2010, Thursday

Drew	Kittey	FERC
Peter	kuebeck	FERC
Rod	Hardiman	Southern Company
Justin	Kelly	FERC
Jerome	Farquharson	Burns & McDonald
Ingrid	Rayo	Constellation Energy

June 11, 2010

Ingrid	Rayo	Constellation Energy
Rod	Hardiman	Southern Company
Annette	Johnston	Mid American Energy

Appendix #3 NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Subgroups) may have a negative impact on particular entities and thus in that sense

adversely impact competition. Decisions and actions by NERC (including its committees and Subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on
- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed

with NERC's General Counsel before being discussed.

APPENDIX # 4
CSO 706 SDT MEETING SCHEDULE
APRIL –DECEMBER 2010

CSO 706 SDT SCHEDULE: FULL CIP-010 & CIP-011 PACKAGE		
Week Of	***Key Dates***	***CIP Task***
4/12/2010	**SDT Meeting Atlanta, GA (Southern Co) (4/13-16)**	**Present Controls draft for full SDT review and comment. Sub team drafting. Finalize draft for Informal Comment, Full Package**
4/19/2010	4/19-4/23/2010 4/23/2010	**SDT Sub-Teams and Leads Meet to Finalize Documents NERC Receives and Prepares Full Package for Industry Comment**
4/26/2010	**4/26/2010 4/27/2010 4/28/2010 4/29/2010**	**SDT Sub-Teams Develop Package SDT Reviews with NERC Staff Proposals SDT Scoping Meeting on Documents SDT Reviews and Approves Full Package for 30-day Industry Comment Period**
5/3/2010	**5/4/2010**	**Informal Comment Posting for full package starts Completes on 6/3/2010**
5/10/2010	**SDT Meeting Dallas, TX (Luminant) (5/11-13)**	**Review Parking Lot Issues, Prepare for Industry Workshop and Begin Development of Guidance Documents**
5/17/2010	5/19 & 5/20/2010	**1.5-day Industry Technical Workshop (Dallas, TX)**
5/24/2010	5/24 to 5/28/2010 5/27/2010	**SDT Considers Comments from Workshop Meeting with FERC Staff to Review Draft Standards and Posting**
5/31/2010	6/3/2010 6/4/2010	**Informal comment period ends SDT Reviews Comments Received Sub team meetings to Review Comments Received**
6/7/2010	6/7/2010 **SDT Meeting, Sacramento, CA (SMUD) (6/8-11)**	**Sub team meetings to Review Comments Received Industry comment review, response process, re-drafting, as needed**
6/14/2010		Sub team meetings to prepare sections for review

CSO 706 SDT SCHEDULE: FULL CIP-010 & CIP-011 PACKAGE		
Week Of	***Key Dates***	***CIP Task***
6/21/2010	SDT Meeting and Subteams via ReadyTalk	SDT interim online meetings and Sub-team meetings to prepare sections for review
6/28/2010	SDT Meeting and Subteams via ReadyTalk	SDT interim online meetings and Sub-team meetings to prepare sections for review
7/5/2010	NERC Staff review	Sub teams complete all work assignments & NERC Review
7/12/2010	**SDT Meeting, Pittsburgh, PA (CERT) (7/13-16)**	**Finalize & Approve Documents for posting for 45 day formal comment period**
7/19/2010	7/19/2010 7/21/2010 7/21/2010	**-NERC seeks SC Approval for Ballot** **-Post CIP Standards for Formal Comment** **-45 Day formal comment period begins (closes on 9/3/2010)** **-Begin Ballot Pool Formation**
7/26/2010		**Formal comment period for CIP standards** **Prepare for industry webinar**
8/2/2010		**Formal comment period for CIP standards** **Prepare for industry webinar**
8/9/2010	**SDT Meeting, Chicago, IL (ComEd) (8/10-13)**	**Formal comment period for CIP standards** **Finalize presentation for industry webinar**
8/16/2010	8/17/2010 8/19/2010	**Hold Industry Webinar (tentative)** **Ballot Pool Formation Ends**
8/23/2010	8/25/2010	**Initial Ballot Begins**
8/30/2010	9/3/2010	**Initial Ballot Ends**
9/6/2010	**SDT Meeting Winnipeg, Canada (Manitoba Hydro) (9/7-10)**	**Review ballot results** **Respond to comments received** **Draft revisions to standards**
9/13/2010		Sub-team meetings
9/20/2010	9/20/2010	Sub-team meetings, NERC Staff Review

CSO 706 SDT SCHEDULE: FULL CIP-010 & CIP-011 PACKAGE		
Week Of	***Key Dates***	***CIP Task***
	9/24/2010	Full SDT on-line meeting to approve revised draft of documents for re-ballot
9/27/2010	9/27 to 10/6/2010	Re-Ballot Period
10/4/2010	10/6/2010	Re-Ballot ends; comments received by SDT
10/11/2010	**SDT Meeting, Toronto, Canada (OPG) (10/12-15)**	**Prepare responses to 2nd ballot comments**
10/18/2010		**Sub-teams meet to adjust requirements, as needed**
10/25/2010	10/25/2010 10/29/2010	**-Prepare and finalize revisions to standards** **-NERC Staff review** **-SDT Approval for re-ballot (if needed)**
11/1/2010	11/1 to 11/10/2010	3rd Ballot Period (if needed)
11/8/2010	11/10/2010	Ballot period ends
11/15/2010	**SDT Meeting, Baltimore, MD (Constellation Energy) (11/16-19)**	**Prepare responses to 3rd Ballot comments**
11/22/2010		*NERC and SDT finalize responses to ballot package*
11/29/2010		*Seek SC and BOT Approval for Filing*
12/6/2010		*Seek SC and BOT Approval for Filing*
12/13/2010	**SDT Meeting Tampa, FL (FRCC) (12/13-17)**	**SDT Meeting to review Filing** **Completion of Phase 2**
12/24/2010		***Submit for Regulatory Approval***

Appendix #5 SDT Consensus Procedures
CYBER SECURITY FOR ORDER 706 STANDARD DRAFTING TEAM
Proposed Refined Consensus Guidelines (June, 2010)

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

Consensus Defined. Consensus is a participatory process whereby, on matters of substance, the Team strives for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for posting CIP standards documents for industry comment or balloting, and the Team finds that 100% acceptance or support of the members present is not achievable, decisions to adopt standards documents for balloting will require at least 75% favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing a Team consensus on substantive issues which the industry will need to approve by a 2/3's vote.

~~***Postings for Industry Comment.*** *For decisions on CIP standards documents to be posted for industry comment where the Team finds that 75% acceptance or support is not achievable but an option or options under consideration had greater than 50% support from the Team, the Team's accompanying Comment form will seek industry input to help the Team resolve any differences and select an option going forward.*~~

Quorum Defined. The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 2/3 of the appointed members being present in person or by telephone.

Electronic Mail Voting. Electronic voting will only be used when a decision needs to be made between regular meetings under the following conditions:

- It is not possible to coordinate and schedule a conference call for the purpose of voting, or;
- Scheduling a conference call solely for the purpose of voting would be an unnecessary use of time and resources, and the item is considered a small procedural issue that is likely to pass without debate.

Electronic voting will not be used to decide on issues that would require a super majority vote or have been previously voted on during a regular meeting or for any issues that those with opposing views would feel compelled to want to justify and explain their position to other team members prior to a vote. The Electronic Voting procedure shall include the following four steps:

1. The SDT Chair or Vice-Chair in his absence will announce the vote on the SDT mailing list and include the following written information: a summary of the issue being voted on and the vote options; the reason the electronic voting is being conducted; the deadline for voting (which must be at least ~~*4*~~ 12 hours after the time of the announcement).

2. Electronic votes will be tallied at the time of the deadline and no further votes will be counted. If quorum is not reached by the deadline then the vote on the proposal will not pass and the deadline will not be extended.
3. Electronic voting results will be summarized and announced after the voting deadline back to the SDT+ mailing list.
4. Electronic voting results will be recapped at the beginning of the next regular meeting of the SDT.

Consensus Building Techniques and Robert's Rules of Order. The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Only Team members may participate in consensus ranking or votes on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Chair, Vice Chair or Facilitator. The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure),* as modified by the Team's adopted procedural guidelines, to make and approve motions. However, the 75% super-majority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision-making on substantive motions and amendments to motions. The Team will develop substantive written materials and options using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once the Chair determines that a facilitated discussion is completed.

Appendix #6- FERC Meeting Summary May 27, 2010

Cyber Security Order 706 SDT — Project 2008-06
SDT Meeting with FERC Staff and Industry Stakeholders
May 27, 2010 Meeting Summary
FERC's Offices
Washington, DC
Joe Bucciero

Meeting Executive Summary

Atmosphere was cordial and professional, and the meeting was constructive.

FERC staff agreed with the approach taken in the draft CIP-010 and CIP-011 standards, but acknowledged that a lot of work is still needed in clearly defining the requirements.

FERC staff expressed concern that the Low impact level requirements are insufficient and need to be bolstered. The Low baseline is too low.

The proposed 36-month review of the categorization needs to be shortened, at least for the first review cycle (possibly to 12 months)

Beware of hidden requirements in the purpose statements of the requirements, and review with the intent to minimize the adjectives used in the text (e.g., sufficient, proper, adequate, etc.) and clarify what is required with respect to auditability and enforceability.

The bright line thresholds stated in Attachment II need to be justified or at least explained.

The SDT must ensure that all of the requirements are auditable.

Concern was expressed on the deferring of some FERC directives until next year.

FERC staff recognizes that the schedule of the project is ambitious, and appreciates the monumental effort being performed by the SDT in creating these standards.

Cyber Security Order 706 SDT — Project 2008-06
SDT Meeting with FERC Staff and Industry Stakeholders
May 27, 2010 Meeting Summary
FERC's Offices
Washington, DC

Joe Bucciero

1. Introductions and Anti-Trust Guidelines

Regis Binder, FERC, welcomed the NERC SDT members, industry stakeholders, and other participants to the meeting and covered meeting logistics. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call, and reviewed the need to comply with NERC's Antitrust Guidelines.

John Lim, SDT Chair, thanked FERC for hosting the meeting and providing the meeting room and facilities. He also reviewed the proposed meeting agenda.
FERC staff stated that they are not speaking for the Commission, and they recognize the importance of the cyber security issues to the industry and the country. FERC staff recognized the magnitude of the herculean effort and the excellent hard work being done by the SDT, in addition to everyone's day jobs, and stated this effort was fully appreciated.
The proposed agenda for the meeting is included as an attachment to this meeting summary. FERC staff was encouraged to ask questions throughout the presentation/discussion offered by the SDT regarding the new draft CIP standards.

2. Review of CIP-010-1

John Lim reviewed the strategy, approach, and history of CIP-010-1. The primary objectives of this standard are to: (1) help scope the electric system assets that are within the purview of the CIP-010 and CIP-011 standards; and (2) establish a list of reliability functions and "bright-lines" for categorization of the BES cyber systems.

a. Discussion of Scope

The process and criteria currently being used today for identifying critical assets in the electric system are thought to be inadequate. For example, less than 5% of the existing generation facilities around the country are considered to be critical assets, so the SDT has identified a new approach in the new CIP-010-1 standard.
The scoping process in the existing CIP-002 standard calls for identification of critical bulk electric system assets, then the associated critical cyber assets. In CIP-010, there are no 'out of scope' bulk electric system assets; instead a categorized list of those assets and their related cyber systems is required. That is one of the major differences between CIP-002 and CIP-010.

Attachment I of the draft CIP-010 standard is meant to provide the definition of scope and applicability. CIP-010 requires the categorization of cyber systems by defining a list of the real-time reliability functions that could have an impact on the reliable operation of the bulk electric system, and if a cyber system is doing any of those functions, then it is within scope.
Categorization of the electric system assets and the cyber systems based on multiple levels (High/Medium/Low) of their potential impact on the reliable operation of the bulk electric system is key aspect of the new draft CIP-010 & CIP-011 standards.
Attachment II of the draft CIP-010 standard is meant to provide the criteria or "bright lines" to identify the potential impact (High/Medium/Low) on the reliable operation of the bulk electric system if the electric system asset or its cyber systems are destroyed, degraded, misused, or otherwise rendered unavailable. The concept is to take a more holistic view and move away from consideration of individual critical cyber asset issues, and place more focus on 'system' impacts.
One of the significant concepts behind collapsing the CIP-003 to CIP-009 standards into a single standard was to clarify the requirements for audit purposes and reduce the incumbent paper work thereby providing focus on the security of the key cyber systems. The SDT is concerned about the auditability of the requirements, and wants to ensure that the CIP-010 and CIP-011 requirements are auditable.

b. Discussion of Response Time

The CIP-010 requirements apply to cyber systems that are relevant to real-time operations (not long term planning or systems that do engineering or marketing). The current benchmark parameter is "impactful within 15 minutes", where the 15 minutes relates to when the incident occurs. Discussion and feedback from the industry to determine if the 15 minute parameter is appropriate has been solicited through the recent informal posting and comment form for the draft CIP-010 and CIP-011 standards.

c. Discussion of Bright Lines

Question: In CIP-010 R1, the phrase "execute or enable" is used; what is meant by enable?

> In some cases, a cyber system directly performs a function (as identified in Attachment I), but in other cases (e.g., data collection/aggregation or display) it is providing information to an operator or other systems to enable functions.

Staff observation: Once these draft CIP standards are filed, they will create a different benchmark or situation from the existing CIP standards for the industry to consider. Are we improving or not? What is the key yard stick? There seems to be a general belief that the number of assets identified to be critical to reliable operation of the BES under CIP-002 is inadequate (i.e., not enough assets being identified, less than 5% of generation). When these new draft CIP standards are filed, how can it be demonstrated

that the key assets are identified? The size of unit is not the necessarily the key. Is the "medium" level of impact adequate for the number of units that can potentially fall into that category?
The intent is for the new CIP-010 standard to be comprehensive, in that all bulk electric system and cyber system assets will be covered to some level of impact. The "bright lines" are being provided to help clarify the assignment of the appropriate level of impact to each of the BES Cyber System assets. The SDT recognizes that measuring impact against what is considered 'critical' today is not good enough since today's results are not acceptable.
The SDT is looking for guidance from all industry participants with a stake in the game as to what is acceptable for the bright lines, and hoping to receive some guidance through the informal comments from the industry.

Allen Mosher: The draft CIP-010 standard is an improvement over what we have today, and we need to implement it soon. It's difficult to compare it to what we have today, because we have a different paradigm. We want to maximize our effort to identify the most critical assets and focus on the control systems. We should worry most about common use failures and wide spread loss of the bulk electric system.

Gerry Adamski: What are the criteria for identifying if an approach is adequate? What is adequate, and how do we identify it to help tweak the product? A thoughtful dialogue may be needed to better define the "bright lines" in Attachment II.
While the number of megawatts or the size of a unit can be one of the criteria used, the impact on day-to-day operations is also very important. The SDT should have a solid basis for the numbers used in Attachment II to define the "bright lines" that are used in the draft CIP-010 standard.

For example, generators, units, plants, etc. that are used intermittently, are they single or multiple control systems? The number of generation MWs connected to assets or to the control systems? If three units combined are over 2000 is it a High impact system? Are three separate control systems that are networked together a single cyber system? How does contingency analysis factor into the impact level criteria evaluation, if at all?
It might be helpful if the SDT can quantify the number of MWs of generation that would be classified as High impact using the new draft CIP-010 standard vs. today under the CIP-002 standard.

A re-ordering the "bright lines" criteria identified in Attachment II should be considered, putting the control center criteria first.

FERC expressed concern that the requirements applicable to the Low impact criteria are not sufficient, and that the Low/Medium impact bright line is set too high.
Throughout CIP-010 there are references to quantities of MW; how were those quantities selected? Adding insight into how the values were determined (e.g., was a study done; is it from operating experience) would be very helpful. NERC indicated

that many of the bright-line values came from a variety of resources available to NERC, plus active participation and input from OC & PC members in the development of the standards. FERC does not have a magic study to use in its review and assessment of the bright lines.

d. Discussion of Guidance and Auditing

The SDT members agree that guidance is necessary for each of the requirements. There hasn't been enough time spent to-date to fully develop or flesh out guidance on each requirement.
There is reason to believe not everyone knows or can identify all the key assets that auditors are concerned about, since the auditors learn something new every time they perform an audit.
Two NERC auditors have been engaged with the process of defining these new draft CIP 010 & CIP-011 standards as well as participation from the regional entities. There were many auditors involved in last week's SDT technical workshop held in Dallas, TX.
The easiest standard to audit is a checklist, but that is the worst way to audit.
Transparency is needed on how an entity is audited. The entity needs to know how the audit will be approached. In the filing, a summary description of what discretion is left to the entity may be helpful.
NERC will have its audit department staff review the draft CIP standards and provide comments from an auditor's perspective. Are the "bright lines" bright enough?

e. Discussion of Compliance Review Schedule

The draft CIP-010 R3 requires at least a 36 month review cycle, since the bulk electric system doesn't change that much that often. Currently a three year process is used by the entities as a review trigger for going back to look at the standards and consider if any changes have occurred that would impact the High/Medium/Low categorizations. What are the triggering events for this review? Possibly the SDT should consider that a one to two year review cycle is needed at first, and then followed by the traditional three year cycle.
How assets are allowed to move from one category to another over time may be critical. Where should these requirements be addressed; in the audit process? Also, do we need to address assets that may be critical to a neighboring entity but may not be critical to my entity even though my entity controls the assets?

3. Review of CIP 011-1

Phil Huff provided an overview of CIP-011 and led the discussion. The overall approach by the SDT was to combine CIP-003 through CIP-009 into one standard, taking into account the FERC directives, the SDT's review of the DHS catalogue of cyber security requirements, and incorporation of those requirements that would be beneficial to the reliability of the BES.

a. Discussion of One vs. Multiple Standards

CIP-011 is viewed as one standard with many parts, and as such putting all of the requirements together in one standard would tend to minimize the possibilities for multiple violations of the same standard, and the number of violations in general. Retaining the multiple standards approach would tend to make synchronization of the requirements and versioning of the multiple standards more difficult, resulting in possible multiple reporting of violations for the same standard. Retaining the multiple standards approach would possibly make it easier for entities to split up the CIP requirements for implementation and monitoring in a way to match the unique organization of the entities.
The SDT is divided on the issue of format for CIP-011 – putting in one standard communicates the standards should be seen as one – multiple standards makes it easier to change individual standards, separately, but creates the compliance issue of potentially multiple violations across multiple standards for the same identified problem. The single standard approach would simplify the ability to incrementally change the full standard. On the other hand, given the way violations are reported now, one standard may result in this standard standing out like a sore thumb if it combines so many requirements.
The SDT wanted to ask the question regarding format of the CIP-011 standard to gain some industry feedback, since the SDT itself could not reach a super majority decision on the best format approach. The SDT wants industry feedback on the approach, including if it makes sense.

b. Discussion of the Requirement Tables

A new feature in CIP-011 is how the requirements are presented, which is based on applicability/impact on the reliable operation of the BES. There are several subject areas identified in CIP-011, including: security governance and policy; personnel training, awareness, and risk assessment; physical security; electronic access control; etc. Each requirement has several characteristics identified, and each requirement is assigned to one of the subject areas. A requirement is represented in the CIP-011 draft standard through a table that groups together all of the requirement's characteristics.
A few questions were raised by FERC staff regarding the requirements tables in CIP-011. For example, what is the intent of the 'blank' entries in a table? Are entities required to do anything? Can an entity be found in violation of a requirement if the corresponding table entry is blank? Should entities look at the rows in a table to determine compliance with the requirement?

c. Discussion of Specific Requirements and Wording

CIP-011 R1.3: What is the intent? The requirement to clearly identify a senior senior manager is not really stated in the requirement. The requirement is for the entities to

designate a single official. How do you determine that, and when do you have to designate this individual? Nothing specifically says an entity shall designate this individual.
The training requirements seem to be scattered around the CIP-011 draft standard. Possibly a consolidation of the training requirements would be helpful. Also the choice and use of words such as 'training' vs. 'education', vs. 'credentials' needs to be reviewed for consistency of meaning. What is 'sufficient' training? Need to include a sense of frequency and magnitude around the training requirements.
Overall, the SDT needs to review the draft CIP standards with respect to the use of adjectives (e.g., sufficient, proper, adequate, etc.) and clarify what is required with respect to auditability and enforceability. For example, R5 vs. R16/R18 states "ensuring" vs. "guaranteeing". Which one is correct?
The SDT acknowledged that this draft of CIP-011 was prepared by multiple subteams within the SDT, and the multiple teams did not always use consistent language in developing the requirements. The SDT has been focused on developing compliance elements, but is now focused on writing the requirements clearly while also minimizing the need for TFEs.

d. Form and Format Issues

The Enforcement office at NERC is looking at the draft CIP standards with respect to the needs for enforceability and compliance, as well as the table structure of requirements. CIP 011 covers the requirements previously included in CIP-003 thru 009; have these requirements been incorporated or do the requirements from CIP-003 thru CIP-009 need to be maintained?
Some of the more document-focused requirements are no longer in the new draft standards. Does that meet the equally protective criteria? The intent is to improve the standards by removing the administrative requirements that do not improve reliability in any way.
The need for more than paper evidence of compliance may lead to actual need to demonstrate compliance. For example, current requirements call for paper demonstration rather than allow for actual demonstration of the protection system; the latter improves security. Creation of paper lists of authorized personnel is a Chinese fire drill that does not improve system security.
A mapping will be done to identify gaps in the standards that we will address in the version coming out in July for industry comment and ballot. The idea is to explain clearly why the gaps are there, and that these gaps do not affect the reliability of the BES.
One of the biggest issues is the perception of a culture of compliance. Now you have multiple violations of the same standard, and from the way it would be reported today, it would stick out. NERC/FERC need to make sure this does not present a skewed view of the CIP standards.
Concern was raised about the status of the components that make-up the tables. The 'R' (for requirement) is not used for the components in the table. How does that relate

to the roll-up methodology; what is and is not a requirement? What is the status of the actual wording in the parent requirement (ahead of the table), and how does it relate to the components in the table?
In Tables R4 to R9, there seems to be a general formula for the requirement, which is each responsible entity shall apply the criteria with a goal of preventing unauthorized access to BES cyber systems. However, a responsible entity that has a Low impact BES cyber system does not have an entry in the table that indicates that the entity has to address any of the subcomponents. Is that entity still subject to the requirements of R5? Similarly, if a Medium impact cyber system has in fact restricted physical access according to 5.1, but there is in fact an unauthorized access – would that be a violation of R5? The intent of the entries in the tables and the requirements needs to be clarified. How will the goal of preventing unauthorized access be accomplished on assets with Low impact, when there is no requirement defined?

e. Discussion of Applicable Time Barometer

The discussion centered around why was a 15 minute time period was selected as the barometer for the impact time stated in the draft CIP-010 standard. Isn't it dependent on current system conditions? Whatever time period is chosen will it be readily evident to the entities?
How quickly can it be determined that there is an impact on the bulk electric system? When does the impact happen? Is it objective enough for an entity to determine for purposes of verifying for audits?
Is a qualifier needed for peak electric system conditions or most stressful conditions? Time of year and load conditions may impact the determination of the time used.
The draft CIP standard is written around how the set of functions impact the reliable operation of the bulk electric system; some functions have more immediate impacts and others take longer to impact the BES.
Misuse of a system may have a longer lead time, far longer than fifteen minutes, but an equally devastating impact.
The SDT might need to revisit the definition or application of the fifteen minute time period.

4. Implementation Plan

Scott Mix provided a high level overview of the implementation plan concepts and issues being considered by the SDT. A subgroup has been formed to prepare the text for the Implementation Plan. They will likely start meeting during the SDT Meeting in June 2010 in Sacramento.
Scott Mix presented the slides he recently gave at the SDT Workshop in Dallas, TX. He noted that the plan is to retire CIP 002 and CIP 003-009 within a transition period as CIP-010 and CIP-011 become effective.

a. Discussion of Implementation Plan Issues

The SDT is working on relevant timetables for implementation of the draft CIP-010 and CIP-011 standards, including how to prioritize the effort in terms of importance and in terms of timing.

The SDT needs to try to identify in a general sense which assets will eventually fall into each of the High/Medium/Low impact categories and how many assets will be in each category. A significant benchmark between the CIP-002 and the CIP-010 & CIP-011 standards will be the number of assets involved, and has that number increased in size and scope.

How should the industry be incentivize to implement the new CIP-010 & CIP-011 standards, but not the Medium or Low impact controls at the expense of first focusing on the High impact assets. Possibly a 'rolling' implementation of the standards is in order.
What is the impact categorization of a BES cyber system if it moves up or down an impact level? How should it be considered in the implementation plan?
The Implementation Plan subteam will also work with the nuclear folks to discuss policies and impacts vs. an implementation schedule. Two stakeholders from the nuclear industry will be part of the implementation plan subteam.

Some level of reporting to FERC on implementation plan development (including content and schedule) is encouraged. The reporting should be designed to provide review of justifications, milestones, and accountability while offering a degree of oversight.
One possible scenario for implementation plan development would be for the entities to quickly develop their lists of categorized assets, immediately followed by the establishment of their respective implementation plan. The responsible entities should then report their implementation plans to the respective regional entity for approval. Guidance documents will be prepared by the SDT to provide a level of consistency and assistance in the development of the implementation plans. Potential conflicts between compliance deadlines and audit schedules must also be considered.
Allow entities to be compliant early especially through implementation of system upgrades that will need to be compliant later. We'll need to recognize that some entities may need additional time to do the job right while maintaining appropriate levels of oversight. For example, larger organizations may have a larger portion of assets affected by the new standards.

b. Discussion of Transition and Migration

A transition plan from the existing CIP-002 to CIP-009 requirements to the new draft CIP-010 and CIP-011 requirements is needed. Some CIP-011 requirements are a direct replacement for those in CIP-003-009 and a migration plan should be developed for those, while other requirements are new and an implementation plan is needed. Plans to guide the entity may be helpful to both the entity and the auditors.

A roadmap for the transition/migration activities would help in the development of a schedule to accomplish these tasks.

The draft CIP-011 standard does not appear to provide a significant base level of protection for the low and medium impact controls. FERC expressed concern that the controls requirements for the "low" impact systems do not provide an adequate level of protection. The blank entries in the tables in CIP-011 might imply that there are no control requirements.

c. Discussion of Physical Controls

Physical items or locations may have protection but may not be auditable as a NERC standard, which focuses on cyber assets. For example, substations have physical protection, but how can an auditor be convinced that the physical fence or padlock was there thirty days ago.
The focus of the SDT is on cyber security. The team considered a separate SAR for physical security. The issue is not when the fence went up, but was it secured and was the lock actually locked – actually visiting remotes sites to prove this might be too much.
Too much energy goes into such audits without corresponding benefit of protecting the system. An auditor might randomly select a few remote sites – because selection is random, but an entity would need to protect them all.

d. Discussion of Immediate Revocation

It's questionable if the industry can meet targets for "immediate revocation of access". Do timeframes of 72 hours work?

May need a primary and secondary revocation applied to remote and/or physical access – this will also depend on the "cause" for revocation.

What does "immediate" really mean in these cases? For example, an entity may need to revoke access of an individual before letting the person go for cause.

"Immediate" is not auditable, even if we set a time period. "As soon as possible" would be a better phrase or a set time period would be sufficient. If it is a planned termination, then it can be immediate because it precedes the termination. If it is part of an emergency, revocation may need a reasonable time period.

e. Discussion of Security Systems Protection

FERC suggested adding a fourth column to the tables in CIP-011 that would list the physical/cyber security system protection required for each asset. The intent is to apply

the appropriate level of security. It was also suggested that a function be added to the table in Attachment I of CIP-010 for security/protection systems.
Security systems impact the BES

Passwords – maximize use without being prescriptive – suggested language – cut down on TFE's

f. Beyond CIP-010 and CIP-011

FERC Order 706 included some directives (e.g., defense in depth) that have not been addressed so far. There was too little time to accomplish these requirements and it might have derailed the process to this point.
Concern is that some of the items may have been part of the paradigm shift FERC was asking for in Order 706. How can some of these items in the order be defined, or implemented, or audited, etc.?
Implementation of an active vulnerability assessment (testing) can be contrary to reliability and security. Special care and guidelines are needed for this requirement.
The December 2010 date for filing of the new draft CIP standards for approval by FERC is not one of the Commission directives. It can become an informational filing, since it is not making law, and may be changed with FERC approval. Need to implement improvements sooner, but may not be able to resolve issues now.
The SDT is planning to file the new draft CIP-010 and CIP-011 standards by December 2010, and will start in January 2011 to look at the other remaining issues – may be a continuously moving target.
Think about how to telegraph the issue to the industry
The recent SDT Technical Workshop was aimed in part at telegraphing this schedule to the industry and thereby telling them the new standards are not a completed deal.
'Defense in depth' is implementation of guidance or guidelines for layered security, that is guidance for designing but not necessarily an auditable requirement.
The SDT would benefit from a shared dialogue with FERC Staff on this and other issues about what we are trying to achieve, the overall objective, and what is needed for the industry to reach it. This dialogue would go beyond just the standards, but could also cover how you approach audits and compliance.
NERC and the SDT still have to legally deal with the directives in FERC Order 706, and ask for clarification in the December 2010 filing. The SDT may ask for clarification of specific parking lot issues, or maybe a separate filing on those issues should be developed.

5. Closing

The dialogue and sharing of information during this meeting was constructive and has been very useful.

The FERC staff reminded us that they do not speak for the Commission. They may not agree with the statements or agreements reached. However, with continued dialogue and progress on the issues we may at least achieve a mutual understanding of the problems and concerns being addressed.

Gerry Adamski asked FERC staff about their general sense of acceptability of the body of work to date? Also, what needs more work?

> The approach is responsive, but as discussed earlier, there are many questions remaining, including how the impact levels will be applied. There is still a lot of work to be done to achieve the filing by the end of 2010. It is an ambitious schedule, but there is recognition of the quality and amount of effort involved.

Meeting adjourned.

Appendix #7 "Parking Lot Issues"

CIP VERSION 4 PARKING LOT (JUNE, 2010)

Issue (Reference)	Raised By	Date Raised	Sub-Team Assigned	Resolution (Date)
Review clarity of item 1.1, Attachment 2 – Generation Facilities and criteria for Contingency Reserve and Reserve Sharing	Rich Kinas	4/29	CIP-002	**AI:** Revise item 1.1 with input from the industry through the informal comments received.
Shouldn't there be delegations made by the Senior Manager for any exceptions (CIP-011 R2 & R3)	Jackie Collett	4/29	Governance	**Resolved** by the revised CIP-011 text that was posted.
User type access (R3) 3.2 Review the need for network device training (Operators, etc.)	Jim Brenton	4/29	Physical/Cyber & Access Control	Possibly regarding the level of access for outward facing and inward facing devices. What type of user training is required for each level? **Add role-based access (e.g., admin vs. application level access) – physical access & training requirements. Awareness training for everyone, and role-based training as required.**

4. Simpler Management *(2 comments)*
5. Table Format *(1comment)*

A. BREAK UP CIP 011 INTO MULTIPLE STANDARDS

1. Retain 003-009 Format (10)

- (18) simply the fourth iteration of Version 1. ii) SDT should lay FERC Order 706 side by side with CIP-003-3 through CIP-009-3 and make changes specifically attendant to 706 FERC directives - no more, no less. iii) Topical subjects addressed in CIP-003-3 through CIP-009-3 Standards respectively should remain the same, i.e., subject matter organization should not be moved under from under one Standard to another; iv) Concepts already well established and understood throughout the industry created under CIP V1, e.g., CA, CCA, ESP, PSP, etc., should be preserved intact
- (24) Keeping (as much as possible) the existing CIP Standards and Requirements in place, and augmenting each of the existing Standards with new and modified Requirements. This strategy will allow participating entities to transition to the new version 4 requirements in an easier fashion, while making better use of existing documentation and procedures.
- (26) For Responsible Entities, their Compliance Teams, their Employees, and their Contractors have all been indoctrinated with the terminology, standards and requirement numbering of CIP 002-009. One reason for continuing a similar number standard is to reduce the confusion for all those involved with compliance, and migration from CIP-002/009 to CIP-010/011.
- (33, 34, 35, 40, 48) It would be easier for entities to recognize and understand the similar or different requirements in version 4 if they were broken up in a manner similar to legacy CIP-003-009. Many organizations have made significant investments in training, policies, procedures, and document management systems that are based on the legacy CIP standard Requirement numbering structure. Staying with the legacy structure, to the degree that it is possible, may reduce stranded investment that needs to be recreated simply as a function of the name and numbering of the requirements
- (36) The revolutionary approach proposed will cause confusion, which may adversely affect the reliability of the BES. The version 4 standards should be built upon the existing standards to avoid the unnecessary confusion that will be introduced during the implementation of CIP-011. Rewrite CIP-011 and apply the requirements to existing CIP-003 thru CIP-009 standards.
- (43) The original setup seems indicated some logic on how cyber security should be addressed. Also, it has been there for several years. Most people probably have become used to the titles and subjects.

2. Audit/Enforcement/Compliance and Negative Perceptions (9)

- (10) Breaking CIP-011-1 into multiple standards lends itself very well to being audited.
- (18) From an enforcement perspective, using a single Standard document consisting of many Requirements is highly problematic. Per the current codified NERC Standards Development Process any Standard can be assigned only a single Violation Risk Factor (VRF).
- … it could well be that all Responsible Entities in the industry are found to be out of compliance with some aspect of a single large multi-Requirement Standard every year.
- (20) Because of the number of requirements involved, combining all into one document will make it more difficult for stakeholders to use, and make it more difficult to assess compliance.

- (23) …combining them all does not make it easier to comply. ..Has a decision yet been made how this would be audited as a single standard? Would we now have compliance violations reported on a requirement level instead of a standard level?
- (41, 40) The addition of sub-headings into CIP-011 is illustrative of the need to separate them. From a presentation perspective, e.g., most frequency violated standards, we would be faced with tough decision of either having one standard with a very large bar in a top 10 bar chart, or possibly having multiple CIP standards is the bar chart, until the Industry gets used to the new standards. Either way is politically difficult, so, the simpler approach is probably the preferable approach of multiple standards on different security topics.
- (45) The standard grouping in CIP11 will result in a negative perception as to the progress industry is making in improving cyber security of the BES.
- …Consider individual standards or a new approach to metrics reporting that focuses on the security domain versus the standard.

3. Suggested Standard Format Combinations (8)

- (23)Some standard combinations that do make sense are physical, electronic and information access (CIP-003 R4, CIP-005 R2-R3, and CIP-006 R2-R6). Also, combining incident response and recovery makes sense
- (26) …consider skipping CIP-010, and name it CIP-012. Then take the content related to CIP-003, and organize it into CIP-013. Effectively, putting the next evolution of the standards into the next "decade", whereby the second-digit is incremented.
- (28)break up the standard into three (3) standards, one (1) for low impact BES Cyber System, one (1) for medium impact BES Cyber System, and one (1) for high impact BES Cyber System.
- (30) In addition to breaking up the standards by grouping, they should be broken up by facility type and/or function.
- (31) Suggest adding a matrix of all the requirements by a major category showing all the requirements and impacts, not just the ones which differ. Having one standard would require the entire standard to be re-issued for any change.
- (31) Suggest multiple standards or using a numbering scheme such as CIP-011-1.1, CIP-011-1.2, CIP-011-1.3, etc to separate the requirements by major categories. If there is a change to a major category, the numbering would be CIP-011-1.2a, CIP-011-1.3c, etc.
- (32) It would be clearer if the requirements were organized based on their objectives: physical security, system security, boundary security, personnel management, access, etc
- (44) The section of standards that deal with controls should be divided into components that are grouped thematically. For instance, management of personnel may contain all requirements pertaining to training, background checks, etc., as one standard. Another standard should be used for governance functions such as policy making and management, audit documents, change management, etc. A third standard for Access Management can be used to list in detail end-to-end access controls for interactive access that is electronic, escorted and unescorted physical access and access to information. Boundary protections, physical and electronic, can be addressed as a family of security controls along with system security requirements as a fourth standard. A section that describes priority of controls within each requirement, in addition to a VRF/VSL document, should be provided so that RE's can implement controls at a granular level even within the High-Medium-Low framework. SCE supports the modification of the

CIP standards from a family of eight controls in the current version, and the reduction of the number of sub-levels within requirements.

4. Level of Effort and Cost of Changing Format (6)

- (19) many entities are now in the compliance phase of the current CIP Standards and have spent a great deal of effort in developing documentation and evidence gathering processes base on the CIP-002 through CIP-009 Standards. Concerned about the upheaval required to alter processes and procedures, currently tied to multiple Standards, to match a single Standard.
- (23) …combining them all creates an administrative mess by requiring everyone to change all their document references to conform to the new standards and requirements.
- (24) We've put a lot of time into the organization, layout, and design of our process and materials and it appears to be a daunting task to revamp all of this to comport with almost completely new Standards.
- … Transitioning to a comprehensive single document requires Entities to perform additional translation, communication, implementation and review across departments, organizational structures and systems owners, and increases the potential for communication and task errors, and the potential probability of introducing an operational or security concern.
- (27) Given the extensive work that has been done to establish monitoring and compliance tracking systems, the wholesale change in format will cause extensive rework to compliance programs (systems, procedures, governance models, etc...). One must ask how this re-work is intended to improve reliability.
- …Staying with the legacy structure, to the degree that it is possible, may reduce stranded investment that needs to be recreated simply as a function of the name and numbering of the requirements.

5. Use Functional Areas (3)

- (16,17)Establish new standards by functional areas- Ensure there is not a circular loop relating to other requirements/standards, each requirement/standard should be standalone
- (38) Most owners of BES equipment have multiple departments that manage different corporate functions. These departments include Information Resources, System Operations, Human Resources, Relay Protection, Engineering, etc. Organizing the CIP requirements into topic-specific standards (as was done for CIP-002 through CIP-009), will facilitate corporate management of compliance.

6. Consistency with Other Industry Cyber Protection Standards (2)

- (17)Cyber protection is not unique to the electric industry. generic set of Cyber protection standards that is applicable to all sectors that use Cyber Systems
- (118) *No preference.* We urge NERC and the electric industry to assess if indeed it needs to have its own cyber protection standards at all. Cyber protection is not unique to the electric industry. Other sectors - airline industry, national security/ defense, financial sector, banking system, etc. all employ a high level of cyber security to protect fraud and invasions.

7. Makes Easier Ownership Assignment and Referencing (1)

- (21) Multiple standards allows for easier ownership assignment and referencing (indexing) within policies and programs. The new format still provides multiple reference for the same item in multiple locations (e.g. Access), therefore this supports keeping multiple standards.

8. Monitoring Changes (1)

- (37) Monitoring changes to the requirements would be easier if they were separated into different standards.

9. Aids the Revision Process (1)

- (42) We also feel with multiple standards the revision process would be simplified. If only one section needs to be revised, then NERC could just post that particular section for industry comment.

10. Focus on Security (1)

- (46) Breaking up the requirements will allow emphasis to be placed on categories that may be more critical to security. Breaking up the requirements will also allow for much easier application.

11. Approve as a Complete Set (1)

- (39) Multiple standards that are logically separated is preferred. However, if separated the standards still should be approved as a complete set.

12. Stand Alone (1)

- (29) If NERC separates into multiple standards, need to make sure the CIP standards are stand alone.

KEEP AS A SINGLE 011

1. Better Organization and Organizational Review (8)

- (10)Keeping it as one single CIP-011-1 standard will ease discussions throughout organization when talking about CIP as there will only be one standard for all controls and it makes sense based on the previous versions repeated statement that the standards should be treated as one standard.
- (81) Having CIP-011-1 as one document makes it more streamlined and is easier to follow.
- (82) Having the requirements in a single standard significantly improves understanding and ease of reading.
- (83) It is much easier to find all the requirements when all contained is a single document and the chance of discrepancies between documents is greatly reduced.
- (86) One document makes it a lot cleaner for a smaller entity to deal with.
- (89) The previous CIP-003 through CIP-009 required cross-referencing between the standards and standard owners to get it right. CIP-011 is much easier to follow and understand.
- (90) The single document format clearly states the requirements unlike the current standards which link to one another but do not clearly link the requirements. Having

CIP-011-1 as one document rather than multiple standards is great. All of the requirements are in one place and easy to find.

- (95) With the requirements in a single document, it seems that it will be easier to arrange and consolidate requirements to alleviate the duplications and contradictions which have plagued the preceding CIP standards.

2. Auditing and Multiple Violations of Single Standard. (6)

- (81) The concern is how multiple violations of several different sub-requirements will be looked at by the compliance enforcement agencies. If an entity is found in violation of CIP-011-1 R4 for example and is later found in violation of CIP-011-1 R26 will this be considered a second violation? If so, FEUS would prefer CIP-011-1 to be grouped into separate standards.
- (83) However, the CMEP should be updated to monitor and report violations by standard and requirement not just standard. Otherwise, CIP-011 will always be in the list of Top 10 most violated standards and create a misleading impression that utilities cannot figure out how protect the reliability of the BES.
- (84) Keeping the controls in one document as proposed is preferable; provided that the intent is not that ALL requirements in CIP-011-1 have to be audited as a family of requirements.
- (93) We are concerned about the current compliance monitoring and enforcement structure where the magnitude of fines and sanctions are levied based on prior violations, and the violations are reported per standard. The proposed standard contains over one hundred requirements and sub-requirements, which increases an entity's exposure to multiple violations for a single standard, and increases the exposure of the industry to a large number of violations to a single standard.
- (94) However, by consolidating the current version 3 standards into one document, this new CIP-011 standard would become one of the NERC's standards with the largest number of requirements. This could potentially make it "the most violated" one as well consequently impact the amount of monetary sanctions. If the proposed format is adopted, special compliance consideration should be adopted when dealing with violations
- (111) *No preference* Having them in one document could prevent public documentation of specific areas of weakness for an organization as audit results are public information and published on the NERC website. It also eliminates the need for circular referencing that is in the current CIP-002 to CIP-009 (e.g., CIP-005 R1.5).

3. Format (2)

- (88) Keep CIP-011-1 as one document if: 1. Requirement number should be consistent with the Requirement table numbering. For example, currently requirement 3.1 Cyber Security Training does not relate to Table item 3.1 Electronic Access. The result is two items that would be referenced as CIP-011 3.1 on completely different topics.2. Every requirement should have a related table. Currently R1 & R2 do not have related tables for applicability. It is 'bad practice' to assume the interpretation that those requirements without a table apply to everything 3. The 'local definitions' should be gathered in a separate definitions section and numbered. Lacking a definitions section there is no convenient mechanism to refer to local definitions.4. While I understand the expressed opinion makes the standard easier to use, I don't agree with that opinion. The defined terms related to this standard should be listed in a separate section. My opinion is that

the current format of the local definitions is more confusing than clarifying.5. Based on the CIP Standards Workshop information, I would suggest the Requirement statement (R1, R2, R3, etc.) be a statement of the requirement objective, and the Table rows be implementing requirements for that objective. This approach should also resolve items 1 & 2 above.

- (92) Using a single standard for all requirements is preferred, however the format internal to the single standard appears to be inconsistent. For example, some requirements are in paragraph form while others are embedded in a requirements Table. All requirements should be contained within a requirements Table. Where possible, information preceding the table should be used only to state the context and establish the security objective or intent behind the requirements.

4. Table Format (1)

- (91) The tables holding the sub-requirements are a good feature that enhances readability. CIP-011 R3 and R4 have some requirements outside of the table and some in the table. Please move all sub-requirements to table format so each requirement would become a paragraph followed by a table with sub-requirements. This will help minimize confusion caused by having a requirement and a table entry with the same number.

5. Revisions (1)

- Future changes that do not impact the compliance documentation numbering should be considered

6. Alignment with Other Standards (1)

- (87) Alignment of CIP security controls with security controls based on NIST 800 series standards and implemented in NEI 08-09, Revision 6, for nuclear plant systems would prevent regulatory uncertainty and potential dual regulation of a single system.

C. NO PREFERENCE

1. Implementation, Updates and Revisions (4)

- (115) The SDT should consider the advantages of breaking the Standard into multiple standards, as far as implementation goes. Some requirements will require more time to implement than others. Having the standard broken apart may make distinguishing these timeframes easier.
- (112) The disadvantage is that more of the requirements will potentially be exposed to comments whenever the standard is being updated.
- (112) Additionally, multiple standards permit parallel modification efforts whereas a single standard may result in single-threaded modifications over a prolonged development and approval timeframe.
- (119)One document eliminates potential confusion about the use of the correct version. However, during the initial implementation phase, there may be multiple revisions for CIP-011 being issued each month/quarter.

2. Focus on Defining Auditable Requirements. (3)

- (109) Believe the SDT's time and effort are better spent on defining well-understood and auditable requirements that will enhance BES security & reliability than on trying to force-fit new/updated requirements into existing document structures.
- (112) Having all of the requirements in one document as opposed to many makes no difference to the compliance monitoring and enforcement process as long as Violation Severity Levels and Violation Risk Factors do not roll up higher than the main-level enumerated requirements.
- (113) Breaking CIP-011 into multiple documents facilitates certain compliance and accountability aspects

3. Reporting at a Requirement Level (2)

- (108) A personnel training issue can cause a violation of the whole standard that will be looked at as the same as a Cyber System boundary problem (Outsider Scanning). Until violations reporting and sanctions are reported at the requirement level only, then this could have a disproportionate impact on the entity relates to potential impact on the BES.
- (117) Violations are by requirement, so whether it is one standard or multiple standards makes no difference.

4. Simpler Management (2)

- (112)The advantage of keeping everything in one document is simpler version management and reducing the need for cross-standard references.
- (113) Keeping CIP-011 as one document reduces complexity and makes overall understanding easier.

5. Table Format (1)

- (116) The tabular format for the requirements section is an excellent vehicle to capture the individual requirements. This should be expanded to include all requirement items. The numbering in the tables should be made unique to match the associated requirements in the standards body. (i.e., R3.1 is related to security training while table entry 3.1 is related to electronic access.)Sections of the table which do not apply should be marked N/A.

Testing (measures)

PCI DSS Requirements	Testing Procedures	In Place	Not in Place	Target Date/ Comments
10.1 Establish a process for linking all access to system components (especially access done with administrative privileges such as root) to each individual user.	10.1 Verify through observation and interviewing the system administrator, that audit trails are enabled and active for system components.			
10.2 Implement automated audit trails for all system components to reconstruct the following events:	10.2 Through interviews, examination of audit logs, and examination of audit log settings, perform the following:			
10.2.1 All individual accesses to cardholder data	10.2.1 Verify all individual access to cardholder data is logged.			
10.2.2 All actions taken by any …	10.2.2 Verify actions taken by any individual with root or …			

Western Electricity Coordinating Council

Example Requirement

PCI Security Standards Council

Regularly Monitor and Test Networks

Requirement 10: Track and monitor all access to network resources and cardholder data.

Logging mechanisms and the ability to track user activities are critical in preventing, detecting, or minimizing the impact of a data compromise. The presence of logs in all environments allows thorough tracking, alerting, … d analysis when something does go wrong. Determining the cause of a compromise is very difficult without system activity logs.

More Examples of Guidance

PCI Security Standards Council

Requirement 6: Develop and maintain secure systems and applications

Unscrupulous individuals use security vulnerabilities to gain privileged access to systems. Many of these vulnerabilities are fixed by vendor-provided security patches, which must be installed by the entities that manage the systems. All critical systems must have the most recently released, appropriate software patches to protect against exploitation and compromise of cardholder data by malicious individuals and malicious software.

Note: Appropriate software patches are those patches that have been evaluated and tested sufficiently to determine that the patches do not conflict with existing security configurations. For in-house developed applications, numerous vulnerabilities can be avoided by using standard system development processes and secure coding techniques.

PCI Security Standards Council

Implement Strong Access Control Measures

Requirement 7: Restrict access to cardholder data by business need to know

To ensure critical data can only be accessed by authorized personnel, systems and processes must be in place to limit access based on need to know and according to job responsibilities.

"Need to know" is when access rights are granted to only the least amount of data and privileges needed to perform a job.

WECC Western Electricity Coordinating Council

Examples of Guidance

PCI Security Standards Council

Protect Cardholder Data

Requirement 3: Protect stored cardholder data

Protection methods such as encryption, truncation, masking, and hashing are critical components of cardholder data protection. If an intruder circumvents other network security controls and gains access to encrypted data, without the proper cryptographic keys, the data is unreadable and unusable to that person. Other effective methods of protecting stored data should be considered as potential risk mitigation opportunities. For example, methods for minimizing risk include not storing cardholder data unless absolutely necessary, truncating cardholder data if full PAN is not needed, and not sending PAN in unencrypted e-mails.

Please refer to the *PCI DSS Glossary of Terms, Abbreviations, and Acronyms* for definitions of "strong cryptography" and other PCI DSS terms.

- Good example of complicated technical requirement referencing external document

WECC Western Electricity Coordinating Council

Inspiration from similar requirements?

- **Segmentation**
  - **Requirement**

    1.3.7 Place the database in an internal network zone, segregated from the DMZ.
  - **Measure**

    1.3.7 Verify that the database is on an internal network zone, segregated from the DMZ.

WECC Western Electricity Coordinating Council

Inspiration from similar requirements?

- **ESP**
  - **Here is one piece out of Requirement 1 which is their Electronic Perimeter Req.**

1.2 Build a firewall configuration that restricts connections between untrusted networks and any system components in the cardholder data environment.	**1.2** Examine firewall and router configurations to verify that connections are restricted between untrusted networks and system components in the cardholder data environment, as follows:
Note: An "untrusted network" is any network that is external to the networks belonging to the entity under review, and/or which is out of the entity's ability to control or manage.	

Guidance right next to the specific requirement

WECC Western Electricity Coordinating Council

Appendix A – Additional Requirements based on risks

- PCI DSS standard sets a "base level" of security that all card processors must meet.
- They layer additional requirements on with appendixes.
- This might work well for us:

  Appendix 1 - Routable, Dialup, Remotely Accessible Components
  Appendix 2 - Control Centers / Data Centers (2-layer ESP? forensics?)
  Appendix 3 - Data and Communications Integrity
  Appendix 4 - Virtualization
  Appendix 5 - Wireless

WECC Western Electricity Coordinating Council

Policy Requirement

PCI Security Standards Council

Maintain an Information Security Policy

Requirement 12: Maintain a policy that addresses information security for employees and contractors.

A strong security policy sets the security tone for the whole company and informs employees what is expected of them. All employees should be aware of the sensitivity of data and their responsibilities for protecting it. For the purposes of this requirement, "employees" refers to full-time and part-time employees, temporary employees and personnel, and contractors and consultants who are "resident" on the company's site.

PCI DSS Requirements	Testing Procedures	In Place	Not in Place	Target Date/ Comments
12.1 Establish, publish, maintain, and disseminate a security policy that accomplishes the following:	12.1 Examine the information security policy and verify that the policy is published and disseminated to all relevant system users (including vendors, contractors, and business partners).			
12.1.1 Addresses all PCI DSS requirements.	12.1.1 Verify that the policy addresses all PCI DSS requirements.			
12.1.2 Includes an annual process that identifies threats, and vulnerabilities, and results in a formal risk assessment.	12.1.2 Verify that the information security policy includes an annual risk assessment process that identifies threats, vulnerabilities, and results in a formal risk assessment.			
12.1.3 Includes a review at least once a year and updates when the environment changes.	12.1.3 Verify that the information security policy is reviewed at least annually and updated as needed to reflect changes to business objectives or the risk environment.			
12.2 Develop daily operational security procedures that are consistent with requirements in this specification (for example, user account maintenance procedures, and log review procedures).	12.2.a Examine the daily operational security procedures. Verify that they are consistent with this specification, and include administrative and technical procedures for each of the requirements.			

WECC Western Electricity Coordinating Council

Appendix B – Compensating Controls

- Appendix B "Compensating Controls" is basically what we would call TFEs. It starts with this phrase:

  Compensating controls may be considered for most PCI DSS requirements when an entity cannot meet a requirement explicitly as stated, due to legitimate technical or documented business constraints, but has sufficiently mitigated the risk associated with the requirement through implementation of other, or compensating, controls.

  1) Compensating controls must satisfy the following criteria:

  …

- This approach of a process for handling situations of not meeting the requirements INCLUDED inside the standard addresses industry feedback that the TFE process wasn't as open as the standard development process; however, it might be too late.

Western Electricity Coordinating Council

Appendix A – Additional Requirements Example

PCI Security Standards Council

Appendix A: Additional PCI DSS Requirements for Shared Hosting Providers

Requirement A.1: Shared hosting providers must protect the cardholder data environment

As referenced in Requirement 12.8, all service providers with access to cardholder data (including shared hosting providers) must adhere to the PCI DSS. In addition, Requirement 2.4 states that shared hosting providers must protect each entity's hosted environment and data. Therefore, shared hosting providers must additionally comply with the requirements in this Appendix.

Requirements	Testing Procedures	In Place	Not in Place	Target Date/ Comments
A.1 Protect each entity's (that is merchant, service provider, or other entity) hosted environment and data, per A.1.1 through A.1.4: A hosting provider must fulfill these requirements as well as all other relevant sections of the PCI DSS. *Note: Even though a hosting provider may meet these requirements, the compliance of the entity that uses the hosting provider is not guaranteed. Each entity must comply with the PCI DSS and validate compliance as applicable.*	**A.1** Specifically for a PCI DSS assessment of a shared hosting provider, to verify that shared hosting providers protect entities' (merchants and service providers) hosted environment and data, select a sample of servers (Microsoft Windows and Unix/Linux) across a representative sample of hosted merchants and service providers, and perform A.1.1 through A.1.4 below.			
A.1.1 Ensure that each entity only runs processes that have access to that entity's cardholder data environment.	**A.1.1** If a shared hosting provider allows entities (for example, merchants or service providers) to run their own applications, verify these application processes run using the unique ID of the entity. For example: • No entity on the system can use a shared web server user ID. • All CGI scripts used by an entity must be created and run as the entity's unique user ID.			

Supplemental Documents

- The PCI SSC has released several supplemental pieces of information to clarify various requirements. These documents include the following
  - Information Supplement: Requirement 11.3 Penetration Testing[5]
  - Information Supplement: Requirement 6.6 Code Reviews and Application Firewalls Clarified[6]
  - Navigating the PCI DSS - Understanding the Intent of the Requirements[7]
  - Information Supplement: PCI DSS Wireless Guidelines[8]
- These are NOT referenced inside the standard and updated independently (might not be work for us because of NERC standard procedures ?)

What are we already using?

- Requirements grouped by Sections
- Broad simple requirement sentence is similar to current approach of generic requirement statement “in Table X…” above the table of specifics
- Table below broad requirement statement with specifics on how to achieve the requirement.

What might we want to consider?

- Moving measures into the table immediately next to requirement.
  - Simplifies knowing what is necessary to prove compliance
  - Simplifies auditing
  - Perhaps since the measures are now in the table beneath the broad requirement sentence they are "part of the requirement"
  - Easy to argue "auditing to the requirement"

WECC Western Electricity Coordinating Council

What might we want to consider?

- Several comments about breaking out the "objective" phrasing contained in the requirement. This is exactly like the PCI standard does in italics above the tables.
- Can link to supplemental guidance documents in the area above the requirement table.
- Using Appendixes to "layer" on additional requirements for specific situations

WECC Western Electricity Coordinating Council

What would this potentially look like:

Requirement 9 - Revoke access to BES Cyber Systems when access is no longer required

Each Responsible Entity shall have processes or procedures to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems. Personnel that no longer require access shall have the ability to access that equipment revoked at the time of termination (immediately). Accounts will be removed within reasonable time frames to prevent them from being accessed by unknown access methods, failure of primary access control methods, or misused by other personnel.

NERC CIP - Requirement 9			Applicability		
Requirement		Measurement	Low Impact BES Cyber System	Medium Impact BES Cyber System	High Impact BES Cyber System
9.1	Immediately revoke access for personnel terminated for cause.	Verify that a policy for immediate revocation of access exists and that procedure and process exists to prevent access to the BES Cyber System. Perform a random sample of the process to ensure that procedure is followed and prevents access.	Required	Required	Required
9.2	Remove or disable accounts on BES Cyber Systems within a Control Center within the following time periods.	Perform a sample validation of account removal from several systems inside the Control Center for personnel that had access revoked.	7 days	3 days	1 day (24 Hours)
9.3	Remove or disable accounts on BES Cyber Systems controlling Transmission within the following time periods.	Perform a sample validation of account removal from several systems inside the Control Center for personnel that had access revoked.	30 days	7 days	1 day (24 Hours)
9.4	Remove or disable accounts on BES Cyber Systems	Perform a sample validation of account removal from several	30 days	7 days	1 day

WECC Western Electricity Coordinating Council

Conclusion

- We have already adopted several of the formatting elements from PCI
- It would not take much to adopt our existing draft into this format
- Much easier to read, audit, and reach compliance by Responsible Entities
- Most likely fits existing NERC Rules of Procedures – minimal if any changes

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 SDT — Project 2008-06

July 13, 2010 | 8:00 AM to 5:00 PM EDT
July 14, 2010 | 8:00 AM to 5:00 PM EDT
July 15, 2010 | 8:00 AM to 5:00 PM EDT
July 16, 2010 | 8:00 AM to 12:00 PM EDT
CERT Software Engineering Institute, Carnegie Mellon University
Pittsburgh, PA

Proposed Meeting Objectives/Outcomes:

- To review the CSO706 SDT 2010 Work Plan and Schedule for CIP-002-4
- To explore and clarify the Work Plan and Schedule for completing CIP-010 & 011
- To review, clarify and refine the strawman CIP-002-4 standard proposal
- To convene sub-teams to review the sub-team responses to Industry comments and proposed changes to CIP-010 and 011
- To provide SDT guidance so sub-teams can make further refinements to CIP 002-4, 010 & 011
- To agree on next steps and assignments

Tuesday, July 13, 2010 8:00 a.m. - 5:00 p.m.

- Introduction, welcome, and opening remarks -*(Morning)*
- Overview of CSO706 SDT Work plan and schedule for CIP 002-4 and Explore and Clarify CIP 010 & 011-*(Morning)*
- Review and seek agreement on proposal for refining the SDT Consensus Procedures -*(Morning)*
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review and refine draft CIP 002-4 standard and related documents. *(Morning)*
- "Lunch and Learn"- Format Proposal*(Lunch)*
- Review and refine draft CIP 002-4 standard and related documents. *(Afternoon Plenary)*

Wednesday, July 14, 2010 8:00 a.m. - 5:00 p.m.

- Sub-teams present requirement changes and test SDT consensus on directions and changes *(Morning Plenary)*
- "Lunch and Learn"- NERC CIP SDT and the ASAP-SG Architecture Team
- Sub-teams present requirement changes and test SDT consensus on directions and changes *(Afternoon Plenary)*

Thursday, July 15, 2010, 8:00 a.m. - 5:00 p.m.

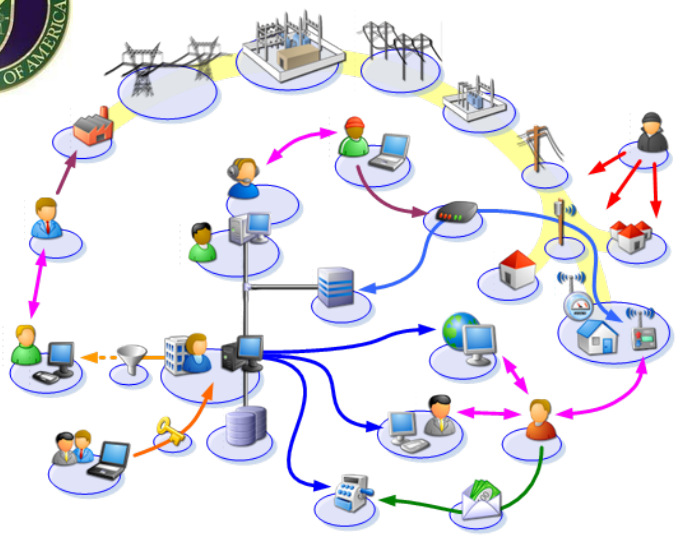
- Sub-teams present requirement changes and test SDT consensus on directions and changes *(Morning)*
- "Lunch and Learn"- Substation Networks (Varnell)
- CIP-010 and 011 Sub-Teams address changes in requirements in light of industry c*omments & i***n**puts from the SDT *(Afternoon)*
- Sub-teams present requirement changes and test SDT consensus on directions and changes *(Afternoon)*

Friday, July 16, 2010, 8:00 a.m. - 12:00 p.m.

- Review of CIP-002-4 Refinements (Morning)
- Review SDT Workplan Schedule to prepare new Draft CIP-010 and 011 Requirements documents. *(Morning)*

Review Next Steps and Sub-Team schedule and SDT Chicago Meeting Agenda (*Late Morning)*

ASAP-SG: Summary



- **Project Description:**
  - Utility-driven, public-private collaborative project to develop system-level security requirements for smart grid technology
- **Needs Addressed:**
  - **Utilities:** specification in RFP
  - **Vendors:** reference in build process
  - **Government:** assurance of infrastructure security
  - **Commissions:** protection of public interests
- **Approach:**
  - Architectural team → produce material
  - Usability Analysis team → assess effectiveness
  - NIST, SG Security → review
  - SG Security, UCAIug → approve
- **Deliverables:**
  - Strategy & Guiding Principles white paper
  - Security Profile Blueprint
  - 6 Security Profiles
  - Usability Analysis

Schedule: June 2009 – May 2011

Budget: $3M/year

($1.5M Utilities + $1.5M DOE)

Performers: Utilities, EnerNex, SEI, ORNL

Partners: DOE, EPRI

Release Path: UCAIug, NIST

Contacts:

Bobby Brown bobby@enernex.com

Darren Highfill darren@utilisec.org

ASAP-SG Security Profiles

- Prescriptive, actionable guidance
  - How to build-in and implement security
- Tailored to a set of specific smart grid functions, such as
  - Advanced Metering Infrastructure  COMPLETE
  - Automated Data Exchange  COMPLETE
  - Distribution Management  UNDERWAY
  - Home Area Networks  PROPOSED
  - Wide Area Situational Awareness (Synchrophasors)  PROPOSED
  - Substation Automation  PROPOSED

SG Security Working Group

- **Mission:** detailed requirements and best practices guidance for utilities procuring, implementing, and deploying smart grid technology
  - Technology-specific, but vendor-agnostic
  - Feed and accelerate SDO work (IEC, IEEE, etc.)
- **Status**
  - AMI Security Profile v2.0 ratified June, 2010
  - Third Party Data Access Security Profile under review
- **Participation**
  - 400+ Subscribers to various Listservs across 8 countries and 4 continents
  - Broad mix of utilities, vendors, government, and academia

CSO706 SDT July 13-16, 2010 Meeting Summary Contents

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CSO706 SDT JULY 13-16, 2010 MEETING
CERT Software Engineering Institute, Carnegie Mellon University
Pittsburgh, PA

EXECUTIVE SUMMARY

On Tuesday morning, the Chair, John Lim and Vice Chair Phil Huff welcomed the members and participants to the SDT's 24th meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. The host Sam Merrill, a participant in the SDT sub-team process, welcomed everyone to the facilities and covered logistics. Bob Jones, facilitator, reviewed the proposed meeting agenda. On Wednesday afternoon the SDT approved without objection the meeting summary for the June 8-11, 2010 SDT session in Sacramento, California. Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines each day of the meeting.

The Chair noted that the Team had met by conference call/ready talk three times since the Sacramento meeting to review and adopt a revised schedule to produce, ballot and send on to FERC a narrowly framed CIP 002-4 by the end of 2010. He also pointed out that the draft agenda sent out the week before has been revised based on member feedback so that the Team will be meeting together in a plenary format until at least Thursday.

The Vice Chair, Phil Huff noted the inclusion of "lunch and learn" sessions that are intended to present helpful additional information and briefings as requested by the Team.

The Chair and Vice Chair introduced the challenge of functioning with 26 members and an 18-member quorum to conduct business. After discussing the pros and cons a straw poll was taken of those members in favor of changing quorum in which 4 were in favor and 16 opposed. Following the straw poll the motion was withdrawn. A second proposal was offered for changing 75% decision rule to 2/3's. After discussing the pros and cons a motion was made to change the 2/3 decision voting rule for the SDT to 2/3s from the current ¾ and 17 members voted in favor with 3 opposed (85%) which passed.

This SDT reviewed information on the CIP 005 SAR presented by Scott Mix of NERC staff. Joe Bucciero reported that the NISTIR report released for internal review by NIST.

The Vice Chair and Chair introduced the concept of lunch briefings on key issues or efforts that have been discussed or requested by Team members. They noted that a "forensics" lunch and learn presented by SERT originally planned for this meeting will be scheduled for the Chicago meeting. At this Pittsburgh meeting three sessions were organized and presented:

1. Standard Format Concepts- Proposed New Approach to Scoping Controls Presentation - John Von Boxtel on Tuesday

2. A joint meeting with Darren Highfill and the Advanced Security Acceleration Project for the Smart Grid (ASAP-SG) Team meeting at SERT on Wednesday.
3. Substation Networks Presentation- John Varnell

The Chair summarized the SDT agreement reached on the July 2 teleconference to finish CIP 002-4 and ballot it and submit to FERC by the end of the year mean that the Team needs to finish CIP 002-4 by August in Chicago so that NERC staff can review and then the Team will refine and adopt it at the September using initial results of industry survey. The Team will continue working but will have to adjust the CIP 010 and 011 schedule for the industry review and response to after the completion of the CIP 002-4. The SDT explored working simultaneously and separately on survey and CIP-002-4 vs. releasing both at same time. At the conclusion of the schedule and survey discussion on Tuesday, the Chair asked Howard Gugel to develop and present some schedule options for the SDT to consider on Thursday. On Thursday afternoon Howard Gugel reviewed and the SDT conducted two straw polls on the following two options:

Option 1 – Release 002-4 after survey results, provide two days for the SDT to analyze survey results before approving for NERC staff review and send to Standards Committee for approval – only one ballot with possible re-circulation ballot for 10 days. (***Acceptable: 12 Not Acceptable: 0 Abstain: 4)***

Option 2 – Approve 002-4 and all related documents by end of July to post by August 6, release 002-4 concurrently with survey and have a 45 informal comment period without ballot, refine based on comments and another 30 day period leading to the ballot. (***Acceptable: 8 Not Acceptable: 5 Abstain: 3)***

Howard Gugel, NERC staff, outlined the NERC effort draft and conduct an Industry Survey on information that the SDT could utilize in the CIP 002-4 drafting effort. He reviewed the schedule which required industry comments on the draft, BOT approval of the survey and NERC conducting the survey in August with the results due back on September 7, which would be during the SDT's meeting in Winnipeg. The SDT discussed the survey covering the following areas:

- Mandatory information request.
- Justification for Thresholds.
- Focus on Completing CIP 002-4 first.
- Industry Ability to Respond.
- NERC Survey vs. SDT Survey.

The facilitator summarized the conversation noting Team concerns over: the "mandatory" nature of the request, the appearance that the request coming from the team and not NERC; concerns and assurances about how will information be used by NERC; and balancing whether there is any way to accelerate the survey process to have results in time to review in September, yet enough time to respond accurately if "mandatory."

The Chair noted that NERC has already posted a survey document for comment and date for responses to the draft survey cannot be changed. Thirty days for industry response seems to be minimum time we can allow for response to the survey. At the conclusion of the discussed the following motion was adopted:

- The SDT requests that NERC modify the survey language and transmittal letter to state that NERC is requesting the survey and correct the reference that states that the CSO706 SDT drafting team requested the survey. ***(18, in favor, 1 opposed)***

Following the motion, Howard Gugel presented draft survey revisions to the SDT consistent with the motion to address the concerns. On Friday, Howard Gugel asked for SDT feedback on the survey for the following concept regarding "at-large" generation facilities: "Generation Units as CAs that are at-large facilities (i.e. plants whose combined output is greater than the contingency reserve). CCA to be narrowly defined as the shared systems (requires changes to R2)." ***Members favoring concept: 10; oppose 0; abstain 1***

The Team reviewed and discussed a draft CIP 002-4 objective statement drawn from materials provided at the July 2 conference call meeting and suggested taking a few minutes to be sure the SDT agrees on the objective or outcomes we are hoping to produce with the development of CIP 002-4.

John Lim then presented the CIP 002-4 strawman for the SDT's consideration and input. He walked the SDT through the sections of the draft. The CIP 010 sub-team worked on producing this initial draft. The sub-team started with CIP 002-3 and developed a redline of proposed changes. The SDT discussed the draft CIP 002-4purpose statement including whether functions will be referenced.

4.3 exemption from 002-4 and Facilities

Straw Poll In favor removing 4.2? 15 members favor of removal of 4.2, 3 opposed. (83% support)

Requirements

Straw Poll on R2 examples

- How many favor including a list of functions as attachment – *5 in favor*
- How many favor the original R2 with examples? *6 in favor.*
- How many favor the original R2 without examples? *12 in Favor.*

Motion: to remove examples and keep remaining language R2 in first paragraph 14 in favor, 4 opposed. (Passes 78%)

Motion: The SDT objective for CIP 002-4 is to leverage the work already completed by the SDT for CIP 010 in developing a revised CIP 002-4 version that is narrowly scoped to identify

the Critical Assets in the Bulk Electric System through the use of bright line criteria as currently under development in CIP 010. 15 in favor; 3 opposed. Passes (83%)

The SDT reviewed and discussed and polled the proposed revisions to Attachment #1. The following are the Straw Poll results:

- Support for dropping 1.1: 15 in favor; 3 opposed. (83%)
- Support for Revised 1.2 language (a-d). Support for – Support 0 Oppose 19
- Support proposed changes to 1.3 - 13 oppose 0 support ; abstain 7
- Support section 1.4 as changed: 14 support; 5 oppose (74%)
- Support 1.5 as revised – 18 in favor 0 opposed, 1 abstain (100%)
- Support 1.6 as revised – 19 in favor 0 opposed (100%)
- Support including 1.7: 18 in favor; 0 oppose; 1 abstain. (100%)
- Substitute in 345kV –5 in favor; 14 oppose. (26%)
- Support 1.9 original language with FACTS and IROLs: Support 12; Oppose 0; Abstain 6 (100%)
- Delete the second sentence in 1.9 –14 in favor: 0 oppose: abstain 3 (100%)
- Proposal to use “control center” – Support 17, Oppose 2. (89%)
- Proposed language without limits for 1.14-1.16: 10 in support; Opposed 10 (50%)
- Support for: “Any control center or systems that are or could be used by a NERC registered RC or its delegate to perform RC functions. Support 13; Oppose 1; Abstain 8 (93%)
- Support for: “Any control center or systems and backup control center or systems performing RC functions.” 17 in support; 0 Opposed Abstain: 1 (100%)
- Support for Approach: Appropriate to incorporate bright line criteria from attachment 1 into the risk based methodology. Support 8 Oppose 12 (40%)
- Support for Thresholds on 1.18- 9 in Favor; 8 Oppose ; 1 Abstain (53%)
- Support for Thresholds on 1.19 10 in Favor; 8 Oppose ; 1 Abstain (56%)
- Support for Thresholds on 1.20. -12 in Favor; 6 Oppose; 1 Abstain (67%)
- Support for taking out distribution provider in 1.15: Support 14; Oppose 1; Abstain 1 (93%)
- Support for Wording in 1.14 and 1.15 from 002-3 R1.25 – “System and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.” Support 14; oppose 0 (100%)

On Friday morning the Vice Chair asked each Sub-team lead to give a report on progress since the Sacramento meeting. He suggested that as a minimum, each sub-team should complete its summary of industry informal comments received as well as the Dallas workshop input so a response document can be developed and be prepared for posting. Each of the following Sub-teams presented updates:

1. Systems Security and Boundary Protection (Jay Cribb, Lead)
2. Recovery Management Scott Rosenberger (Lead)
3. Personnel and Physical Security Doug Johnson (Lead),
4. Change Management, System Lifecycle, Information Protection, Maintenance, and Governance. Dave Revill (Lead)\
5. Access Control Sharon Edwards (Lead)
6. Implementation Plan Sub-Team Scott Mix (Lead)

The Vice Chair thanked the sub-teams for the significant work done by sub-teams despite the political sideshow. He noted he had underestimated when the SDT could get back to CIP 010 and CIP 011which may not be until December. Many in industry will want to know what was said and done at the Dallas workshop as well as the industry's informal comments. We need to decide soon how we want to address and respond to those in the future, but for now we need some closure on summarizing the comments we have received. WE may need a conference call or a webinar to explain why we are moving 002-4 and putting the 010 and 011 on hold. He urged each sub team to hold at least another call in order to create a response summary to industry comment by the Chicago meeting.

The SDT then conducted an initial discussion of CIP 010 and 011 Schedule. The Vice Chair noted the Team will review and adopt a proposed schedule in Chicago to send to the Standards Committee.

Phil Huff noted the 002-4 team will continue working. He discussed developing a revised schedule with 3 full days of meeting after September. Finally, the Vice Chair, on behalf of the SDT, thanked Sam Merrill and the CERT for their excellent hosting and facilities. He noted Doug Johnson will be our host in Chicago in August and urged members to register for the session.

Meeting adjourned at 11:30 a.m.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

24TH MEETING SUMMARY
Cyber Security Order 706 SDT- Project 2008-06
July 13-16, 2010
CERT Software Engineering Institute, Carnegie Mellon University
Pittsburgh PA

I. AGENDA REVIEW, WORKPLAN, SCHEDULE AND REVIEW OF NERC SURVEY

A. Agenda Review

On Tuesday morning, the Chair, John Lim and Vice Chair Phil Huff welcomed the members to the SDT's 24th meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call *(See Appendix #2*). The host, Sam Merrill a participant in the SDT sub-team process, welcomed everyone to Pittsburgh and Carnegie Mellon University and the meeting facilities and he reviewed the history and role of SEI in cyber security and covered logistics.

Mr. Bucciero reviewed the need to comply with NERC's Antitrust Guidelines *(See Appendix #3).* He urged the team and other participants in the process to carefully review the guidelines as they would cover all participants and observers. He urged all to avoid behaviors or appearance that would be anti-competitive nature and also reminded the group of the sensitive nature of the information under discussion.

The Chair noted that the Team had met by conference call/ready talk three times since the Sacramento meeting to review and adopt a revised schedule to produce, ballot and send on to FERC a narrowly framed CIP 002-4 by the end of 2010. He also pointed out that the draft agenda sent out the week before has been revised based on member feedback so that the Team will be meeting together in a plenary format until at least Thursday. He then reviewed the following proposed meeting objectives:

- To review the CSO706 SDT 2010 Work Plan and Schedule for CIP-002-4
- To explore and clarify the Work Plan and Schedule for completing CIP-010 & 011
- To review, clarify and refine the strawman CIP-002-4 standard proposal
- To receive presentations on forensics, sub-station networks and advanced persistent threats
- To convene sub-teams to review the sub-team responses to Industry comments and proposed changes to CIP-010 and 011
- To provide SDT guidance so sub-teams can make further refinements to CIP 002-4, 010 & 011

- To agree on next steps and assignments

The Vice Chair, Phil Huff noted the inclusion of "lunch and learn" sessions that are intended to present helpful additional information and briefings as requested by the Team. Bob Jones, facilitator, reviewed the proposed timed meeting agenda *(See Appendix #1*). The Team agreed to proceed with the agenda and on Thursday morning the SDT approved without objection the meeting summary for the June 8-11, 2010 SDT session in Sacramento, California.

B. SDT Consensus Procedures

The SDT were sent, as part of the agenda packet, some changes being suggested by the Chair and Vice Chair. (See Appendix #). Phil noted the challenge of maintaining a quorum in meetings when the Team has grown to 26 members. The current rule requires at least 2/3s of the members (18) present to establish a quorum. The proposal is to ask standards committee to allow 50% +1 rule for the SDT which would mean we would need 14 members present to establish a quorum. Phil Huff moved to and John Lim seconded the motion to change the quorum rule.

Discussion Comments

- Have we ever not had quorum at in person meeting? (Yes) Problem is with decisions on conference calls that we cannot participate on. May not be aware of the meeting and decisions will be made without members knowledge.
- Two conference call meetings in June to discuss and adopt a revised schedule had to be rescheduled due to lack of quorum.
- The is a quorum, not decision rule
- Could have two votes on two days and have different results?
- Why has the SDT gotten larger? A: Two new members were appointed by the Standards Committee to help the SDT with nuclear issues.
- Did not know that. Not happy about increasing size of group – why do we schedule decisions for Friday mornings instead of Tuesdays – Is this a scheduling issue?
- Concerned that we need to look at both rules together. So if we drop to 50% +1 quorum and down to 2/3's to make a decision, then it would be possible to make a decision with 2/3 or 10 of 14 or can make decisions with only 38% of the members.
- May also need to address issue of members who do not regularly participate but require a larger quorum.
- Not all of the SDT's business, considering the amount of work we need to do, can be done in person and requires phone review and votes. Yes, we need to address the issue of regular participation too – may need rules about participation in person and

by phone. Ready talk counts as participation to in-person meetings – when members agreed to join the SDT there was an expectation you could meet the obligation to participate. It would help for member to notify leaders if you can not make calls. When we send a notice of a call, the assumption is everyone can participate.

- We do try to participate on calls and we do have a real jobs. I commit to make the whole meeting as schedules. There should be no excuse to leave early. Friday votes may be necessary to follow on discussion and review at in person meetings – have to make the effort to be here, that is the commitment .
- I think that is a good point – commitment is to be available, even if team meets more often and longer than most – this team does not determine the standard, the ballot body does – you need to get something to the ballot body.
- Suggest that if the expectation is for more SDT conference calls, then we should schedule ahead of time on regular basis in order to allow us to reserve time in our schedule – one week notice is not enough time to set aside time for calls.
- Is the 2/3's vote for approval 2/3's of those present where there is a quorum? Yes.
- Need to understand in order to make judgment on quorum. It would mean that less than half the team could make decisions.
- Most standards teams are smaller and do not even have votes.
- This is a new subject, thus the larger team and more difficulty in making decisions

A straw poll was taken of those members in favor of changing quorum: 4 in favor: 16 opposed. (20%)

Following the straw poll the motion was withdrawn.

The second proposal was for changing 75% decision rule to 2/3's. Phil Huff made the motion and John Lim seconded.

Member Discussion

- This change might assist the SDT in making decisions more quickly and moving team forward and it follows the 2/3 quorum.
- 2/3 is the standards process default – team used 75% when it was smaller and to achieve higher approval level. This has proven difficult with the quorum at 2/3 (i.e. 18 members) 75% may be even more difficult to achieve and move the team forward.
- We need to be able to move forward with certainty. This is a brand new area, and in order to effectively convince industry we need to be sure team is fully on board. On any vote we have had, we have 1/3 on each side with the middle third going one way or the other – we need a substantial margin to ensure even members disagreeing on

particular issues can support decision on the package once made. WE need to hold ourselves to a higher level

- Do we need a quorum at time of the vote? A: yes. SM – quorum must be present at time of vote according to NERC's legal counsel.
- Need to be able to bring some of the dissenting third on board into the decision if we then want to sell it to the industry. In the end we have to do a better job of selling issue to the industry and that starts with building consensus in the room.
- We also have to be willing to compromise and some individuals in this room have found it hard to compromise – taking hard positions and refuse to move – too many on the team

Motion: To change the 2/3 decision voting rule for the SDT to 2/3's from the current ¾ 's (75%).

17 in favor 3 opposed Passes (85%)

Comments after the Vote

- We need to promote member participation and schedule votes well in advance – need to bring the dissenting side along as much as possible – need to work together, collaborate on decisions
- It is easier to schedule early and cancel than to schedule late.
- We will try to schedule votes ahead of time as much as possible – members need to reply if they cannot make it so we can have an idea if we will have quorum – if you do not respond, assume you will be able to make it.
- Is a proxy vote or vote *in-abstentia* possible? A: not allowed under NERC's standards rules.
- May not have an hour for long discussion but can jump on for quick review and vote in 5 to 10 minutes – also need subject of the vote to determine importance of participation.
- We will clarify if a call involves a vote and what subject of the vote will be.
- Can we use an on-line voting tool that allows us to read it and cast vote over a period of time? The SDT approved an email voting provision but it is very limited in its use.
- We also need to allocate enough time for calls in which votes will be taken.
- Set regular schedule of time blocks for possible calls such as every two weeks.
- Voting in the interim between meetings has been used twice due to time and schedules – also, note the last month was sloppy due to requests from the Standards Committee – not a good precedent – hopefully used only in emergencies – blocking off time is a good idea, but use only if needed.
- The consensus process provides that the SDT strive first for unanimous agreement based on thorough discussion but that depends on willingness of some not to oppose after thorough vetting of issues and concerns – have to be willing to listen to others as well as argue your own point – broader effort to get quality product from the collective knowledge you bring to the table.

C. Related Cyber Initiatives

1. CIP 005 SAR.

- Scott Mix provided an update on urgent action process for reviewing CIP 5 - SAR is done and the standard is 80% complete – deals with support and maintenance from vendors and the devices used for remote access – wholly impractical to have critical assets located at vendors. Jim Brenton noted he was involved and it was a good team. They are clarifying terms including the use of laptops for system maintenance and vendor access – look at advisory and it sets out the valid reasons for the vendor access and need for control and oversight of the laptops.

Member Discussion

- How can I get involved?
- What is the relationship between the CAN information, Jim's team, and our effort? A: CAN and urgent action process relationship? None – for this team, need to be sure later work on 011 matches up with work done by the CAN and Jim's team.
- Do this replace this teams work? –The process is very unclear
- No, but need to be sure they match up
- Almost all support can access the system and test operations – the CAN missed the mark, puts the grid at risk by limiting our efforts to make process and access more efficient – reduces reliability rather than enhances
- Urgent action is a new version? When is it due out? May cause confusion
- All hits about the same time
- Seems like it will slide in well with the draft maintenance section in 011
- Six wall perimeter and how you handle it – careful if we are changing ESP's
- Reviewed the people working on the urgent action team

2. NISTIR Report

Joe Bucciero reported that the NISTIR report released for internal review by NIST – three volumes – to be released soon to outside review – will not go through a FERC process before release to industry and is not subject to formal FERC approval.

Member Comments

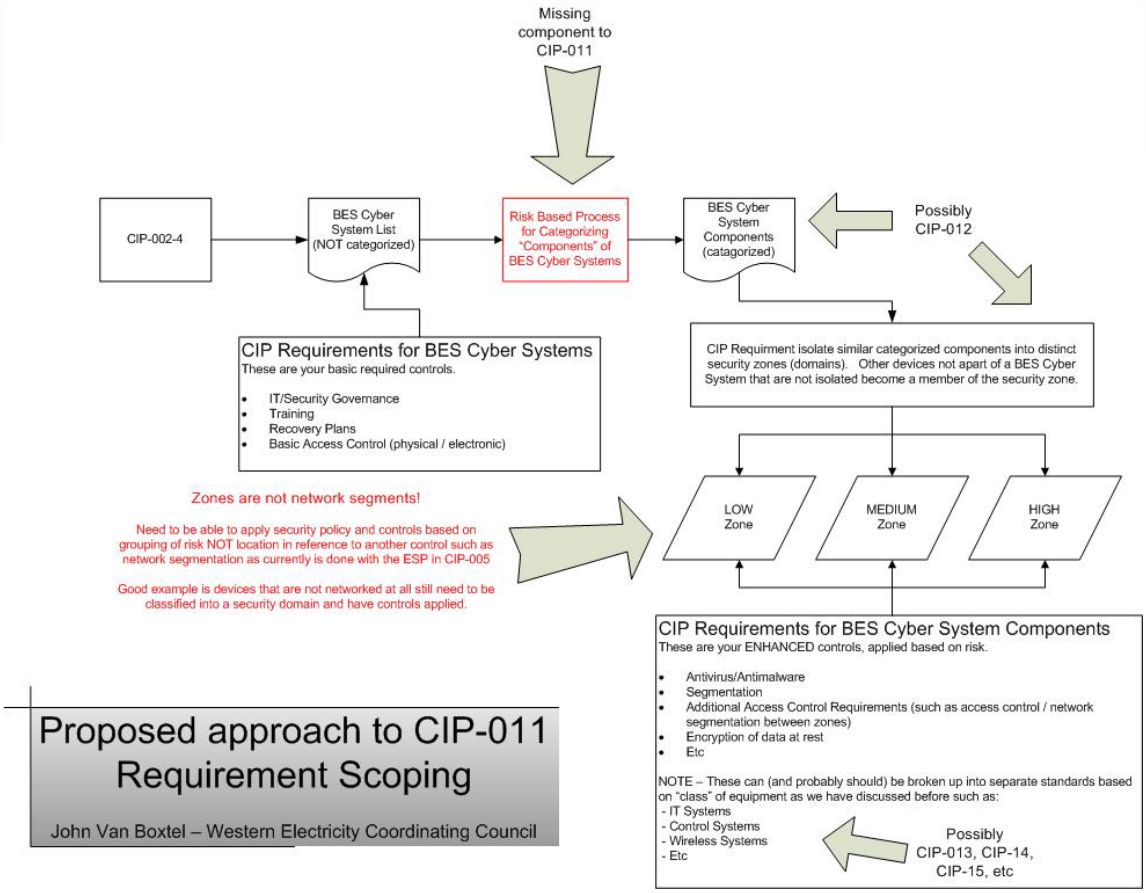
- FERC is providing input if not formal approval
- CCI guidelines completed and now official
- Cyber security group formed by NASBE too – still high level at this point
- Has anyone discussed Senator Collins Bill? It includes a requirement to report cyber incidents to new Homeland Security director position.

D. Lunch and Learn Sessions

The Vice Chair and Chair introduced the concept of lunch briefings on key issues or efforts that have been discussed or requested by Team members. They noted that a "forensics" lunch and learn presented by SERT originally planned for this meeting will be scheduled for the Chicago meeting. At this Pittsburgh meeting three sessions were organized and presented.

1. Standard Format Concepts- Proposed New Approach to Scoping Controls Presentation - John Von Boxtel

John Van Boxtel presented a proposed different format approach to scoping and tailoring controls to risk. This would be an approach that would leverage the work on CIP-010 while solving some of the problems with trying to apply controls only based on the impact level of BES Cyber Systems. The main proposed difference is to apply a base level of controls at a BES Cyber System Level and to apply additional controls to the BES Cyber System Components based on grouping into different security zones based on risk for the SDT to consider. During and following the presentation the SDT informally discussed some of the ideas presented.



Member Discussion

- Changing words to zone or segment is not effective – now we have high, medium and low – should have different boundaries – if not connected then just a physical boundary.
- You can have protection around h-m-l and have further system segregation for high assets
- If you have one high connected to low – the attack will come through the low to get to the high.
- We need to break things up based on risk, not as part of systems.
- Separating those that are at risk from those that are not is the "crux of the biscuit" (Frank Zappa – apostrophe album) Further segmentation is the concern. "Domain" means different things in different contexts.
- What about calling them "zones"?
- How do you segment zones
- Initial requirement in 011, then additional requirements in subsequent standards to further layer on additional controls for specific zones.

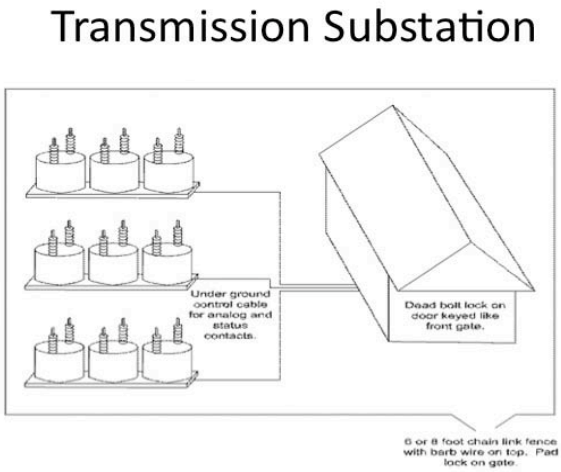
- How would you determine high-medium-low?
- Still have to establish the criteria.
- Is this biased toward the controller? Problematic if bringing in broader ring of corporate assets.
- This may be the "three by three" matrix creeping back – zone classifications come out of that matrix.
- This is similar but a little more broken out.
- The red box pulls the multiple matrix back in and we do not have time or understanding to pull that together.
- This is a separate standard from 010
- The multiple matrix was only in the concept paper and the industry gave strong feed back not to do that because it was too complicated.
- Might be more receptive if you give industry their own risk based methodology for figuring out the h-m-l –
- Problem with the "red" box is that it moved away from "acceptance of risk" to meet FERC concerns – if identify as critical then you have to be prescriptive.
- Also, how do multiple zones work within one interconnected system?
- It will depend on how they are connected to determine the vulnerability of a component – two separate sets of risk assessment.
- This might work with IT but not in the power industry.
- This is where the smart grid is headed.
- This will give too much leeway to a few to screw it up for the rest of the industry – need to universally apply standards to be fair. Could create a competitive disadvantage for fully identifying critical assets.
- This works if the team can come up with something reasonable for the red box.
- Previous teams wrestled with this issue. You can use categories, classes or zones, but Mike Peters at FERC consistently says that everything needs something – you have the production and the distribution – baseline is and ought to be different for a control center and a substation – give thought to differences in the physical location. We have been thinking about big, medium and little iron. The Team should think more about the connection to the system.
- Zones allow for baseline for everything and additional protection for a control center – have to address the issue or will be wasting time on 011.
- Taking something from routable to serial should not be considered gaming the system – instead it is a business decision.

- Is the SDT getting away from 706 – take what is in the order and fix 003-009. (*participant)*
- 4.2.1? FERC asked for clarification – should cabling be exempt if within the physical boundary (*participant)*
- Use base level of protection on all assets and a cyber risk assessment above and beyond the base.
- Also tired of hearing about gaming – it is business decisions – we do not have a well defined problem statement – clarifying what are we trying to accomplish will be key to project management.

2. **A joint meeting with the ASAP-SG Architecture Team meeting at SERT on Wednesday.**
   Darren Highfill and the Advanced Security Acceleration Project for the Smart Grid (ASAP-SG) Team met with at SERT with the SDT and discussed possible opportunities for coordination.

3. **Substation Networks Presentation- John Varnell**

John Varnell presented information on Sub-station Networks for the SDT to consider. During and following the presentation the SDT informally discussed some of the ideas presented.



II. CIP 002-4 REVIEW AND REFINEMENT

A. CIP 002-4 Schedule

1. Initial CIP 002-4 Schedule Issues Discussion

The Chair summarized the SDT agreement reached on the July 2 teleconference to finish CIP 002-4 and ballot it and submit to FERC by the end of the year mean that the Team needs to finish CIP 002-4 by August in Chicago so that NERC staff can review and then the Team will refine and adopt it at the September using initial results of industry survey. The Team will continue working but will have to adjust the CIP 010 and 011 schedule for the industry review and response to after the completion of the CIP 002-4.

Member Comments

- Results will be essential to setting metrics – however there is a scheduling disconnect that will not allow the Team to review, analyze and incorporate the learning from the survey results into CIP 002-4 that same week.
- The facilitator noted that the Team had tried to change SDT meeting to the following week but that would conflict with CIPSE meeting which a number of Team members and NERC staff directly participate in.
- Can we cut some red tape and streamline the survey process? Looked carefully at this but there is very little flexibility in the notice times etc.
- Critical path for the SDT is through the survey. We need to find a way to accelerate the survey to get the info back sooner – no one looking at it yet because the date is too far off in the queue of work. NERC President, Gerry Cauley, may be the only one who can light a fire and get it done
- We need a schedule we can all live with. Concerned about the confusion this might create in the industry. Looking at the overall 010 and 011 schedule, it looks like industry voting in February while 002-4 moving through approval with FERC?
- The schedule only provides for 2 CIP 002-4 ballots with the 2nd in December.
- The Motion adopted on July 2 by the SDT call does not include balloting beyond 002-4. The CIP 010 and 011revised schedule has not been discussed and approved by team yet.
- A draft of the survey was briefly reviewed by Howard Gugel with the SDT at the July 2 conference call meeting on schedule. There is an appendix of the draft in the July 2 meeting summary.
- The SDT agreement was to complete CIP 002-4 without impacting the CIP 010 and 011 effort. However that is not realistic. We need to continue to work on these simultaneously, however we should focus on completing 002-4 first.

- Is the comment period required under the NERC rules of procedure? Yes, and it is being expedited.
- **Working Simultaneously and Separately on Survey and CIP-002-4 vs. Releasing both at same time.**
- Why can't the survey be part of the info requested during the posting of CIP 002-4? Try to fold into the comment period?
- NERC is under pressure to get numbers to share for Congress.
- NERC is proposing not folding the two together but rather conducting simultaneously and separately with CIP 002-4 for comment at same time the mandatory survey request is out.
- What about finishing CIP 002-4 complete by end of the Chicago meeting and put out simultaneously with the survey?
- If we try to finish by end of the SDT August meeting and post at same time as the survey, we might buy some time for a third ballot but we would have to complete our work at this meeting so NERC staff could review between now and Chicago.
- Are we severely underestimating amount of work needed for 002-4? The Team should consider dividing up to work on 002-4 and the rest of the Team could continue to work on 010 and 011. Bringing this up now because it impacts any proposed schedule.
- The NERC survey is intended to help the Team to understand if we have the line for heavy/medium drawn in the right place –Question 1 and 2 are quick, 3 may take a little more time – if compress it, industry will express concerns about the validity of result.

2. Review and Testing Consensus on CIP 002-4 Schedule Options

At the conclusion of the schedule and survey discussion on Tuesday, the Chair asked Howard Gugel to develop some schedule options for the SDT to consider on Thursday.

a. Option 1- Conduct Survey in August, Post CIP 002-4 in September

On Thursday afternoon Howard Gugel reviewed with the SDT the Option 1 schedule which called for release of the NERC survey in August, the SDT analyzing survey results at their September meeting before approving for NERC staff review CIP 002-4 and send to Standards Committee for approval. It would provide for only one ballot with possible re-circulation ballot.

Member Comments

- Line 53 – what criteria will be posted in the survey?

- Date actual survey will go out – include the teams output – may be additional data points that NERC staff will include such as 1.1 – not painted as a request from the team, only from NERC – very quick turn around – may add an arbitrary line for "medium" to get additional level of data.
- May cut "high" in half for "medium" as a data point.
- Line 56 – challenging to get results and make decisions by that next Friday
- Two days is for team to analyze – survey closes in thirty days during the SDT Winnipeg meeting.
- Survey finalized by 7/26? Good chance "high" as we have it will not identify enough – think in Chicago about "what if" scenario responses to possible survey results – wait until September and results in hand may be difficult.
- This approach takes away from getting other work done.
- May need to organize discussion to test potential responses.
- May be better to let a sub group of 2-3 create straw man without putting too much full team time into speculative responses.
- Trying to back everything into same time period – May need to schedule a team call for the Sept. 15th? Same day as CIPC meeting.
- Will NERC put in request for information on nuclear even if not in the current version? A: Yes.
- Will gain assets, stay the same or will lose assets – industry fears impact of increased number and cost impact and decrease on political optics - any space for narrative responses we have to respond to? A: No, data only.
- Comment period is on now for survey structure – this schedule is very tight.
- How can we work on this, on 010 and 011 and our real jobs too?
- NERC staff will prepare draft responses to the first posting of 002-4 as starting points for the team to work on.
- Will we work on the other documents related to 002-4 in Chicago in August – comment form, VSLs, etc.?
- Might be of value for each of us to fill out survey as a subset of the survey and use as an example to think about responses at the Chicago August SDT meeting.
- What about the implementation plan for 002-4? A: 24 months as planned for 002-3.
- We should consider splitting into separate teams to make progress on 010-011 and the 002-4 in the time given
- Even if initially review, we still need full team review for approval and adoption.

- Should we consider going to the Standards Committee to split the team into two separate teams to work on the two tracks?
- Schedule needs to reflect the implementation plan and other related documents for 002-4 and factor in the time needed.
- We will need to focus full group time to review and discuss – small sub group could bring a product forward.
- It will be folly to think much progress will be made on 010-011 until end of the year and work on 002-4 completed – given a new directive.

Straw Poll
Option 1 – Release 002-4 after survey results, provide two days for the SDT to analyze survey results before approving for NERC staff review and send to Standards Committee for approval – only one ballot with possible re-circulation ballot for 10 days.

Acceptable: 12 ***Not Acceptable: 0*** ***Abstain: 4***

b. Option 2: Post CIP 002-4 along with Survey

Howard Gugel reviewed with the SDT the Option 2 schedule which would allow for two comment periods, issuing the first version of 002-4 along with the survey. The SDT will have to respond to two comment periods and need an approval by end of July for CIP 002-4 – not a ballot – but includes implementation plan.

Member Comments
- May get the same result from option 1 by putting content into the survey.
- The thought here is that people prepare comments along with survey and gives team two shots at explaining rationale – providing the pros and cons to both approaches.
- Which option offers most time to evaluate data – only two days in the first option and seven days in option two?
- Favor second option – still don't see us making progress on 010-011 until end of the year with either option.
- Hopefully the survey will inform our understanding and rationale.
- The survey will inform the second posting in this option
- The work products due with posting means the SDT will have only two weeks time to review and develop the implementation plan under this option
- With option 2, how much harder will it be to make changes based on survey input?

- May be easier with two comment periods in option 2. The first comment period does not include a ballot.
- Explanation of the criteria may not be enough – balance realities of what has to happen with what industry may say if there is a big increase in assets identified.
- In terms of the implementation plan, if you don't have to recreate critical asset plan then that will greatly reduces the amount of work
- The first option allows us to make changes and justify using the survey results.
- May be a lot of association pressure to pass whatever version we put out regardless of grousing.
- An implementation plan requiring changes would not be justified at this point. It should be a relatively simple plan – probably able to prepare in three days.
- CIP 003-009 changes are just conforming? Yes
- Yes, except for the other group on CIP 005 which may only confuse the industry more
- Survey going out independently might mean the data is less skewed.
- Delivery of CIP 002-4 by the end of July is the major problem with Option 2
- Possible exception for additional documents with the posting? A: probably not.
- Much of the comments last time related to the lack of related documentation – people want to know the rationales.

Straw Poll

Option 2 – Approve 002-4 and all related documents by end of July to post by August 6, release 002-4 concurrently with survey and have a 45 informal comment period without ballot, refine based on comments and another 30 day period leading to the ballot.

Acceptable: 8 **Not Acceptable: 5** **Abstain: 3**

B. NERC Industry Survey and CIP 002-4

Howard Gugel, NERC staff, outlined the NERC effort draft and conduct an Industry Survey on information that the SDT could utilize in the CIP 002-4 drafting effort. He reviewed the schedule which required industry comments on the draft, BOT approval of the survey and NERC conducting the survey in August with the results due back on September 7, which would be during the SDT's meeting in Winnipeg.

Member Comments on Survey

Mandatory information request.

- Is this a mandatory request? Yes, industry must respond. However there is a statement that the data will not be used to monitor compliance.
- NERC is using a "mandatory" request to insure timely responses that can be used by the SDT. There was a request at the Dallas workshop for a voluntary response which was met with total silence. However the mandatory 1600 process brings with it a slower bureaucratic process.
- People concerned are at one level above those who have to respond – yes, you probably need to go mandatory.
- It would be possible, but perhaps not advisable, to post CIP 002-4 during the survey, but we cannot delay the survey to look at final version and meet the December deadline. We would have a scheduling nightmare, the proposed schedule is the only way to physically meet the deadline.
- NERC realizes Congress and Senate up for reelection and under pressure to do something – Gerry Cauley needs hard numbers to fend off pressure. I misunderstood and told my folks it would not be mandatory and would be anonymous.
- Of mandatory then it may raise flags of concern in the industry that it will be used against us.
- Uneasy feeling that this is about FERC and Congress asking if this is enough critical assets – what are we going to do with the data, nothing – what if the the former says it is not enough assets?
- Comfortable with an informal survey but mandatory response will put team in position we do not want to be – this may mean the list will have to be the same as the final list we will be requiring – if it is not the same, what happens to the company – if numbers don't match, companies may find themselves in hot water? A: The survey instructions say the survey is to only inform the team and guide development of the standard. We are looking for a reasonable response, not an exhaustive one. The survey also states how the data will be used, and that is will not be used for any future compliance action or monitoring.
- This will still be seen by industry as a legal requirement.

Justification for Thresholds.

- 002-4 uses same bright line criteria, sort of, as 010 – told we need to provide clear basis for bright line – industry feels they are arbitrary – the questionnaire just moves the arbitrary line – we tweak the lines to get the number we or someone else wants? Difficult to establish the basis for the threshold, boat load of work
- The industry perceives little difference between team and NERC. Why put the times together? Industry is confused why going back to 002-4 from 010 – conflicting message, survey just adds to the confusion.

- Concerned that we have roughly same set of criteria on three different development tracks – 002-4, 010 and survey – survey may not be in sync with team's work on 002-4?
- The team must provide comment saying this is what we want to include in the survey
- NERC and team are not seen as the same in the industry – industry understands the difference – also, is NERC management going to push back if we change 002-4? That is why it is important to ask industry based on the changes to 002-4
- Still not really getting a bright line
- People appear more concerned about the political perception of "high" than actual number
- We will not have any more assets identified than before?
- Some confusion in industry but to try and resolve the confusion may cause more confusion through industry as a whole.
- Similar concerns are that we are not resolving the correct issue and just stopping to identify assets, not identifying the correct critical assets – the survey doesn't get at the latter.

Focus on Completing CIP 002-4 first.

- Need to focus on getting 002-4 done first
- Depending on when schedule is needed for the 010 and 011 – we need to push that off and focus on getting 002-4 done.
- How much time do we spend on 010 and 011 sub team reports versus focusing on 002-4?
- We have three days, we could get 002-4 done by Friday – just proposing a few days delay on 010 and 011?

SDT to Summarize CIP 010 & 011 Informal Comments and Workshop Input in August.

- We should not suspend 010 work. Indeed the work on 002-4 should inform 010
- We had an informal comment period and teams have addressed those comments for 010 and 011 – we should not stop, but provide comments – have to balance tasks
- Need to get 002-4 out – also need a schedule that reflects reality about getting 010 and 011 out.
- Since there was not unanimity among the SDT about going forward with 002-4. Consider the possibility of splitting our resources to make progress on both tracks –

also allows those who don't support 002-4 approach to distance themselves from that process.

Industry Ability to Respond.

- Will industry be able to provide this information in a such a short interval? The survey was designed to be relatively straightforward to complete with existing CIP data.
- The chair noted that the Team will have to wait and see results before we can evaluate – will do what we can in September and hold additional calls, if needed, to finish work.

NERC Survey vs. SDT Survey.

- This language needs to be clarified that request is from NERC, not from this Team.
- Howard Gugel agreed to take the SDT's suggestion into account in finalizing the survey.
- The team did not ask for the survey, do not present that way – request is from NERC – don't like the politics affecting technical questions, but that is the reality – there is no identified number of critical assets just a politic perception – not thrilled with approach but that is what we have to do to get the job done.
- Seems to be too much red tape here – team had nothing to do with this and should not be presented as requesting the information
- Appears NERC is asking for a lot of data in just two weeks? A: Only asking for comment on the survey in two weeks before getting BOT sign off, then there will be 30 days.
- Even thirty days requires legal and management review – question why we are requesting – remove our name and say NERC wants to know.

The facilitator summarized the conversation noting Team concerns over: the "mandatory" nature of the request, the appearance that the request coming from the team and not NERC; concerns and assurances about how will information be used by NERC; and balancing whether there is any way to accelerate the survey process to have results in time to review in September, yet enough time to respond accurately if "mandatory." The Chair noted that NERC has already posted a survey document for comment and date for responses to the draft survey cannot be changed. Thirty days for industry response seems to be minimum time we can allow for response to the survey. NERC should look to whether it might be possible to shave a week to post survey sooner than the August 6th date. Request NERC look at end of comment period and posting of the survey. Howard Gugel noted that NERC staff need time to analyze and comment on industry comments

and make possible changes to survey and produce a recommendation for review by the Board of Trustees as urgent action on August 5, in only nine days.

After additional facilitated discussion which highlighted that the SDT could use any resulting information to inform and modify their standards drafting going forward, Sharon Edwards made and Jim Brenton seconded the following motion:

- **The SDT requests that NERC modify the survey language and transmittal letter to state that NERC is requesting the survey and correct the reference that states that the CSO706 SDT drafting team requested the survey.**

Having confirmed a quorum, the Team adopted this statement *(18, in favor, 1 opposed)*

Following the motion, Howard Gugel presented draft survey revisions to the SDT to address the concerns. Howard noted that he had replaced "team" with "NERC" – also bolded the language that data not used as basis for determining compliance.

Member Comments

- What does "currently enforceable" mean? Could be used for 002-4? Add the phrase "and any future standards"? By saying one and not the other, it leaves open the question.
- NERC would be using the data cumulatively to determine compliance in the future
- Does the data assists and validate the standards, not compliance? Yes. This is not meant to apply to any individual
- NERC should modify to include that clarification.
- Not used for compliance of individual entity but cumulative for determining compliance standard.
- Worried it flags issues for auditors to look at going forward – "currently" cannot be used here – put in the specific language.
- Regions need to clarify the auditors cannot use the information for future audits
- Roger Lampila noted the information is only going to NERC not the regions. I would hope you would say no if the region came and asked for the info. That list for the survey should have no basis for the audit.
- Clarify that it won't be used for compliance and you will publish a cumulative compilation, not individual data.
- In addition, note that Section 1600 mandatory request provisions do not apply to compliance actions. This should be put that into the statement

On Friday, Howard Gugel asked for SDT feedback on the survey for a concept regarding "at-large" generation facilities. He noted the need to know what attachment will look like for CIP 002-4 since the survey will key off of that. The SDT discussed the need to draw lines for control centers and the characterization of high and medium- "darts", noting that we should try to find points that industry can easily fill out and that also helps the team draw some lines in CIP 002-4. He then asked the SDT to give him feedback on the following:

Concept: Generation Units as CAs that are at-large facilities (i.e. plants whose combined output is greater than the contingency reserve). CCA to be narrowly defined as the shared systems (requires changes to R2)

Discussion of Concept

- Targeting reliability factor
- Do assessment for CA then go back to CCA?
- Looking at aggregate impact
- Before it was the sum of the reserve
- Attempting to use the balloted language
- Generator would know if they exceed the minimum requirement of shared system
- Headed in the right direction – but point out "plant" is ill defined term much like difficulty we have had in defining control center.

Favor concept: support 10; oppose 0; abstain 1

C. Discussion of CIP 002-4 Overall Objectives

The Team reviewed and discussed the draft CIP 002-4 objective statement. Bob Jones reviewed the statement which was drawn from materials provided at the July 2 conference call meeting and suggested taking a few minutes to be sure the SDT agrees on the objective or outcomes we are hoping to produce with the development of CIP 002-4. The strikethrough and underlined reflect the discussion comments below but not effort was made to test for SDT support for the statement.

> ~~"Both NERC and the Standards Committee, with concurrence from major stakeholders and trade associations, believe there is a need for the SDT to develop a CIP 002-4 consistent with its approach to CIP 010 and 011 in order to demonstrate industry responsiveness with very high stakes in play. The SDT's revised work plan and schedule will provide additional time for the SDT to~~

~~produce a quality product for the next formal posting of a very substantial package of CIP-010 and CIP-011 with associated required documents.~~

The SDT ~~agrees to~~ will work to accomplish the following ~~objectives to~~ in developing a CIP-002-4 in 2010:

1. To provide an incremental step forward towards developing a CIP 010, CIP 011,etc. as new CIP standards for industry review and acceptance in 2011.
2. To leverage the work already completed by the SDT for CIP-010 in developing a revised CIP-002-4 version that is narrowly scoped to ~~more fully~~ identify the Critical Assets in the Bulk Electric System through the use of bright line criteria as currently under development in CIP-010 in place of the risk-based methodology in CIP-002-
3. ~~To ensure that we have covered all of the nuclear facilities and 500kV transmission facilities in the CIP-002-4 bright line definitions.~~
4. To meet the goal for a successful industry standards ballot and filing to FERC of the revised CIP-002-4 before the end of 2010."

Member Comments

- Objective 4? All we can do is put proposal out and respond to comments but we cannot be sure it will get to FERC by December
- Objective #1? Agree that we want to be responsive to industry but question what NERC supports and what the team is doing.
- Not sure the opening it is a true statement – portions of the industry not on board
- Seems disjointed as to the trade associations
- Representatives from trade associations on the July 2 call seemed to suggest they support this support. Allen Mosher addressed the team on this.
- The executive committee of the Standards Committee expressed support for this approach.
- Objective 3 – problem with including nuclear facilities and 500Kv facilities as bright line specifically in the criteria. Suggest deleting here and addressing in CIP 002-4 as appropriate. It might be better to address these in next CIP 010 and 011 and not a bright line assessment.
- It is confusing as to who is speaking at different points in this statement – first part seems to be a call to action from NERC and the 2nd sentence a response of team – may need to clarify into the first paragraph as the call and 2nd paragraph as response.
- Suggest deleting the opening paragraph.
- Concerned with the phrasing "more fully" Suggest removing the phrase – identify critical assets using the bright line criteria.

- What is the purpose of this exercise? How will this statement be used? We are off of our focus if we are dealing with critical cyber assets.
- SDT still needs to clarify what are we trying to protect and from whom with the CIP?
- The point is being sure we have a common basis for this effort moving forward.
- If we want the statement to guide us, we would need more team time refining it. We do not need this for the SDT to move forward on 002-4.
- The facilitator clarified that there is no need to refine and test the acceptability of the statement and it will be reflected in the meeting summary as a set of discussion point.

D. Review of CIP-002-4 Strawman

John Lim presented the CIP 002-4 strawman for the SDT's consideration and input. He walked the SDT through the sections of the draft. The CIP 010 sub-team worked on producing this initial draft. They started with CIP 002-3 and did a redline of changes.

1. Purpose and Appliability

- In the purpose statement, it says we are not changing CIP 003-009. Does that require a separate purpose statement for those and would that cause confusion?
- There is intended to be no changes to the CIP 003-009 requirements
- Are we changing the purpose statement for all of the standards
- Are the changes considered local to 002 or across the standards as we always did before?
- The Sub-team is just conforming changes to 003-009, not changes to the requirements.
- Only substantive changes will be in 002 – let others worry about conforming changes.
- We will have to change version numbering for 003-009 to show conforming changes.
- First word of third paragraph – "business"?
- That was already there in the earlier versions

Functions

- Are functions folded into this? If not, do we need to add something to the end of the sentence? How are we attacking the drafting? not a substance question.

- At the last sub-team's meeting they agreed to remove all reference to functions. Not all members were on and some expressed concerns regarding the treatment of functions
- There are also outstanding issues when we get to applicability if we remove nuclear. The current CIP 003-009- 3 says not applicable to nuclear and to include it would be an applicability change, not just a conforming change.
- Can follow a later schedule for the conforming changes?
- Because we include the nuclear industry we may need to put out for 45 day comment period – can be posted as a package
- We will have to have a detailed technical team meeting to review –SE – the purpose statement has changed – need consistency for applicability
- No one is proposing changing the purpose statements for 003-009 – each will stand on their own with version changes only because of applicability to nuclear – also included in R2 examples of control centers – other things we need to capture and add to the sentence.
- These are not examples – industry wants us to tell them what we need to do – allow industry to do risk based assessment but with clear guidelines, tell them what to put into the risk based assessment – industry would accept that as a slight adjustment and clarification.
- First concern is time – can we make December time if we have to revise whole set of 003-009?
- We are trying to keep within scope to get it to the industry and on to FERC by December. We are not trying to include all of the work in CIP 010 in CIP 002-4.
- We are really trying to tweak 002 and not bring all of the work on CIP 010 into the CIP 002-4
- We will have the purpose statement for 002-4 but new language in the purpose statements in CIP 003-009

Applicability- Distribution provider

- The draft suggests adding distribution provider.
- Need to be clear on the reason for adding distribution provider.
- How much heartburn from industry did we get on adding distribution provider? No much attention paid to it.

Bright lines for load shedding.

- Should we be drawing a bright line for the amount of load to be shed? (HG – yes) but make sure the number is clear, that it is the right number and the steps involved
- This only applies to the portion of assets under NERC scope and nothing else. There are other standards that address load shed
- Are we beginning to address issue not addressed before – should be a primary cranking path
- There is not one and is not in the scope of this group
- "initial cranking path" may be the key term – NERC functional model should determine this.

- An example of physical security as an alternative method of protection – here we were trying to address cabling between separate entities – the Progress Energy RFI was addressing a cable that ran outside the physical security but connected the same location
- Involved six wall perimeters –this is an example of a general protection with added layers of security as required
- This could take the scale of assets to be protected from hundreds to thousands
- If only addressing CIP 002-4 here then do not add

Applicability 4.3 exemption from 002-4 and Facilities

- Eliminate exemption statement of 4.3.1?
- Facilities can mean many different things.
- Does the need for exemption goes away under 4.2.1?
- Systems of facilities within?
- "facilities" refers to those with terminals – careful how we use "facilities" – the capitalized glossary term does not mean just a building.
- For example, nuclear considers everything inside the outer fence as part of the facility – this allows them to include those as "facilities."
- Does this clarify what is in NERC's jurisdiction? Does not seem to add anything. Jurisdiction is determined outside the standard.

Straw Poll

In favor removing 4.2?

15 members favor removal of 4.2, 3 opposed. Passes 83%

- Is FERC okay with that? A: not sure what you are doing with 4.3.1
- That stays out as an exception

2. Requirements section

R1

- Creating a new attachment 1? (Yes)
- There is a request for interpretation on this language already *(participant)* – cable between units in the same perimeter?
- Have separate ESP's
- If one ESP then you have to have physical six wall protection? A: yes

R2

- Should examples be in the requirement? John Lim proposes taking them out
- Support taking examples out and place in guidelines
- Agree to remove, as they do not add to the requirement
- Reviewed the alternative – takes current list of functions and include as attachment #2.
- Breaks R2 down into three parts - each piece is different set of assets to be identified
- Are we re-introducing function based assessment? Given short time frame for posting, not sure we can fully develop this.
- "situation awareness" was a big concern in the industry comments – we need to be able to clearly define it.
- We should include and be able to define – "situational awareness" as a component of every outage
- Trying to get industry to think more about computer connected systems – the industry rejected the Maureen edit of "functions", not what we originally wrote – network computing is what this is all about.
- Concerned about the time this will take in completing our task on CIP 002-4
- Don't add attachment #2 to CIP 002-4 – there is not enough time to develop both attachments and address the push back on both.

- We don't define situational awareness from whose point of view –
- Cyber assets with dial up? We may need to clarify intent and modernize if necessary to include any remote access.
- Without examples of functions, I question the effectiveness of R2

Straw Poll

- How many favor Rich's alternative to includes list of functions as attachment – 5 in favor
- How many favor the original R2 with examples? 6 in favor.
- How many favor the original R2 without examples? 12 in Favor.

- How is entity and auditors going to determine what is essential without examples or an attachment?
- That is what they do today
- R1 is the reason we are doing it
- Keep wording like it is today but in the new world for 010 and 011 we need examples
- May need guidance with examples or attachment 2
- Are we giving the industry an opportunity to shoot itself again – leave in a loop hole here then have an empty critical cyber asset list
- Need to make clear the essential cyber system functions, and we need a bright line
- Agree for more clarity on what CCA's are supposed to be but there is a risk that introducing it here is too big an initial step. We are dealing now with 002, then go back to 003-009 – trying to get industry acceptance.
- Ff it is not routable it is not in scope
- We have been asked to do a minimal scope then return to what we were doing with 010 and 011
- R1 is an eighteen page guideline from a different standards process –
- If a guideline exists, then we should use it
- Even if it is just guidance and auditors can not use it or enforce it
- **Motion (Lim/Brenton) to remove examples and keep remaining language R2 in first paragraph – 14 in favor, 4 opposed. Passes (78%)**

- Separate discussion of 2.1, 2.2 ad 2.3:

- R2.2 –need to expand
- That is a good idea but not for this round as it brings in a whole new set of assets.
- FERC had indicated that the SDT will need to justify why you are removing requirements.
- Without this change we will not head off the politics surrounding us
- It is the right thing to do, it is an update.
- It amounts to replacing all three with "if connected by routable protocols" – may turn into critical assets without any outside connectivity
- Industry may have to unplug assets
- Better than letting outside threats bang on it
- The industry needs to be defending at the host level and on interior systems too
- This is the problem with the 002-4 process – we are balancing what can get past industry and what Congress will accept.
- We still have not determined what we can afford to protect or we will have scope creep
- If advanced persistent threat is what we are after and we remove ability to communicate outside, then why cover routable within the same cabinet?
- Miss list of those authorized to access, also miss out on recovery plans, testing, etc. too – those are the things we need to determine the full threat – all these devices need to be included in a minimum protection scheme.
- Dave's proposal goes in the wrong discussion. Doing something fast is important now – we were on the right path and were told to stop and do something quick, then go back to the right path – cannot deviate and make everything right at this point – true we could make it better but have to get this job done first.
- Need a better update on risk assessment – need a clear cut set of risks to address
- Jim (phone) – agree we need to be more encompassing – note many sticks used to attack routable protocols through introducing viruses without being connected.
- Support moving forward quickly in order to get back to the right path
- For each requirement we need to ask what is the right thing to do, not just expand critical assets by the end of the year.
- We should always ask if this is the last time we get to discuss, what should we do because it may get yanked out of our hands – need to educate industry

- Important to do the right thing and need to secure the system – the next version will be more tailored to the equipment we are using – we need this now to allow industry to regulate itself
- If we use what the threats really are, would require massive education of congress, auditors, industry and others – now we are checking boxes for compliance.
- We can get something acceptable to industry short term in order to get time to do the right thing for the industry
- Cannot be yanked away from us without Standards Committee based on motion of author – the SDT should focus on solving the problem and less on Congress
- Need to play game and find medium to get us there – suggest addressing the dial-up language too.
- This will pass industry – EEI CEO's are whipped up and concerned they will lose authority to regulate themselves – this will not be rejected by industry
- If we put in those changes and it will be rejected
- If we make further tweaks here then need to make tweaks in 003-009 – cannot support change here.
- Would it be suicidal for the industry to ask you to stop and change direction then vote it down?
- The fundamental difference here is we are not just addressing critical assets but trying to improve standards as we go. We will continue to butt into this difference in approach
- Limited scope to change – now changing more – where is the line? Need to work on the bright lines.
- We all want a material impact on identifying critical assets – we need real security, not just paper security.
- Already made changes to R2 which is part of 010 – trying to make it better but not addressing everything you already changed.
- We never reached consensus on what our objective was. We did not change R1 but did start to change R2?
- Way too far to go to change everything and file by December – but changes here go to informing people where you are headed – need to include a list of cyber assets that need protection.
- Changes in R2 to remove functionality impacts in the definition of CCA's – may have removed some and weakened it.
- The issue of list not having enough on it – started with Mike Assante's letter – if we do not fix the CCA list then still have empty list?

- Note that "cyber" does not even appear in survey – it only asks about CAs
- Midwest organization ran the survey and had fewer CAs on the list
- Motion to focus discussion – suggest #2 on the purpose statement list captures what we need to do
- Scott Rosenberger's motion (John Lim second):

The SDT objective for CIP 002-4 is to leverage the work already completed by the SDT for CIP 010 in developing a revised CIP 002-4 version that is narrowly scoped to identify the Critical Assets in the Bulk Electric System through the use of bright line criteria as currently under development in CIP 010 ~~in place of the risk based methodology in CIP 002-3~~

Discussion of the Motion

- Clarifying question? Earlier changes discussed would be negated? Yes
- This represents a principle to help us move through and get CIP 002-4 done
- Friendly amendment to shorten and remove reference to CIP 010? No leave as is.
- The less we say the better – say what needs to be said and no more
- This acknowledges leveraging work done to date
- Should we make entities use bright line within their current process? There should be no need to replace current risk based assessment if we provide bright line
- This motion is trying to make sure we fix CA discussion. We can then consider a separate proposal to refine direction
- Suggest adding CCA? No.
- In Dallas one company said approach then cut their legs out from under them
- Scott is comfortable putting in period after CIP 010 and drop last clause:
- Need to make clear they are inclusive, not options
- Need to replace risk based with bright line?
- SR – that is not covered here – did not want to leave in risk based to keep assets from falling of the list.
- Does this rescind earlier discussion on R2, including deleting the examples?
- Does this include "engineering studies"? (No)
- Very concerned that some at entities who tried to do the right thing will now lose their jobs

- CIP 010 and 011 will bring those back in scope when we get done

Motion above: 15 in favor; 3 opposed. Passes (83%)

- R1, R2 and R3 will remain the same

3. Attachment #1

Below is an overview of the straw polls taken on various provisions of the draft Attachment #1 for CIP 002-4. Following are discussions points on the sections.

The SDT reviewed and discussed and polled the proposed revisions to Attachment #1.
The following are the Straw Poll results:

- Support for dropping 1.1: 15 in favor; 3 opposed. (83%)
- Support for Revised 1.2 language (a-d). Support for – Support 0 Oppose 19
- Support proposed changes to 1.3 - 13 oppose 0 support ; abstain 7
- Support section 1.4 as changed: 14 support; 5 oppose (74%)
- Support 1.5 as revised – 18 in favor 0 opposed, 1 abstain (100%)
- Support 1.6 as revised – 19 in favor 0 opposed (100%)
- Support including 1.7: 18 in favor; 0 oppose; 1 abstain. (100%)
- Substitute in 345kV –5 in favor; 14 oppose. (26%)
- Support 1.9 original language with FACTS and IROLs: Support 12; Oppose 0; Abstain 6 (100%)
- Delete the second sentence in 1.9 –14 in favor: 0 oppose: abstain 3 (100%)
- Proposal to use “control center” – Support 17, Oppose 2. (89%)
- Proposed language without limits for 1.14-1.16: 10 in support; Opposed 10 (50%)
- Support for: “Any control center or systems that are or could be used by a NERC registered RC or its delegate to perform RC functions. Support 13; Oppose 1; Abstain 8 (93%)
- Support for: “Any control center or systems and backup control center or systems performing RC functions.” 17 in support; 0 Opposed Abstain: 1 (100%)

- Support for Approach: Appropriate to incorporate bright line criteria from attachment 1 into the risk based methodology. Support 8 Oppose 12 (40%)
- Support for Thresholds on 1.18- 9 in Favor; 8 Oppose ; 1 Abstain (53%)
- Support for Thresholds on 1.19 10 in Favor; 8 Oppose ; 1 Abstain (56%)
- Support for Thresholds on 1.20. -12 in Favor; 6 Oppose; 1 Abstain (67%)
- Support for taking out distribution provider in 1.15: Support 14; Oppose 1; Abstain 1 (93%)
- Support for Wording in 1.14 and 1.15 from 002-3 R1.25 – "System and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more." Support 14; oppose 0 (100%)

"Nuclear generation facilities"

- It should not matter how we boil water – the fuel source has no impact on reliability – addressed that nuclear facilities have to comply by removing them as an exception – should not say all nuclear facilities, regardless of size, are included
- Nuclear units take twenty-four hours to come back on line – no need to call them out just because they are nuclear.
- Some fossil fuel plants can take up to eight hours to come back on – NRC controls safety aspect of nuclear fuel
- Agree with comments – There is no engineering basis to call out nuclear separately as to reliability – Might include them in 1.2 criteria in some manner.
- We should be forward looking to changes in nuclear and new technologies.
- No technical justification for including nuclear separately – it is all electricity regardless of how it is produced – this is politically driven.
- Some agreement with NRC to include nuclear as critical assets – do nuclear facilities already have standards for their facilities?
- Nuclear safety is covered by NRC – more risk to the plant by the system than to the system by nuclear plants.
- Thought we were handling by saying "a generating unit, including a nuclear generation, …" in 1.2
- This is not in to address any agreement with NRC, rather it is in for political optics – even including in 1.2 appears to give an out for including a nuclear plant as not critical
- We did not make any distinction for any other fuels through the whole standard – from reliability stand point it does not matter – putting into 1.2 says we are listening but not actually recognizing any difference in reliability – that is the purpose of the standards

- Agree with comments – does not matter what fuel is used – may explain optics by changes in the applicability section, but if in the attachment, better in 1.2.
- Prefer putting in the applicability section but may not be obvious enough
- Nuclear is beginning to require cyber security measures in their licensing process – they have a defense in depth methodology in place – may miss on the optic side if only four out of over 100 units are identified as CAs
- Lots of talk about optics – NERC communications director can communicate – let industry know the justification – no technical basis, only political optics – NERC needs to do a better job handling the optics
- 1.11 addresses interface with nuclear that is reliability based.
- The threshold of 2000 for high will not capture most nuclear units that operate in pairs to create 1800.
- Consider naming them in 1.1 subject to criteria listed below.
- Agree to remove 1.1? If so, do we need additional criteria for nuclear?
- Motion to drop 1.1, with removal of exception for nuclear
- If the SDT removes 1.1 we will get comments back on the record from NERC to put it back in
- **Support for dropping 1.1: 15 in favor; 3 opposed. (83%)**

1.2

- Confused – "a group of units" relies on common control system – language is confusing, the concept is right
- Is it the lowest of the three or the highest of the three? Should be the lowest
- There is a contingency reserve or a shared contingency reserve – same thing – matter of total reserve.
- If 2000 mw or lowest value – then drop c.
- A and B are the same thing – combine with an "or"
- 1.2 needs to be more succinct and plain language – also is 2000 MW enough?
- Not the most productive to wordsmith as a group – Jason Marshall offered the Chair agreed to let him take a shot at redrafting and bring back tomorrow for review
- Intent is to capture the cyber systems that are part of the aggregate
- Is 2000 mw the right value?
- There is a logic issue between a, b and c.

- Support creating a proposal – do not forget we may need criteria for covering nuclear
- Needs to be based on reliability
- You have to have contingency reserve in nuclear
- Mike – no single units of nuclear exceed 2000 mw – and no mediums identified here
- Still looking at common or aggregating control systems
- Talking about big iron, share concern about 2000mw
- Those units do not share common control systems – might need to discuss aggregate bus as was described
- What are we protecting against – do not care why I lose unit, just about getting the supply back on line
- Generators themselves may not have common control – but other GCS systems may be in common .
- Comment may be covered by 1.17 which addresses generation control, not generator control
- Generation control is not within the generator control room
- We should be careful we invest in the units that we need to.

At the request of the Chair, Jason Marshall brought back some revised 1.2 language for the SDT's consideration which includes four options a-d

1.1. A generating unit, or a group of generating units that share or are reliant (dependent) upon a common cyber asset (e.g., control system) that has/have an aggregate highest rated net Real Power capability exceeding:

a. the Contingency Reserve of the associated Balancing Authority, or
b. the Contingency Reserve for the Reserve Sharing Group,
c. the associated Balancing Authority's obligation or share of the Reserve Sharing Group's Contingency Reserve or
d. 2000 MW.

Member and Participant Comments

- The 12 months was in there to cover seasonal ratings to keep units form going on and off the list.
- Makes sense at first blush but once on the list you will apply cyber security controls.
- It would allow gaming and the 12 months would limit potential gaming
- Can add it back; just trying to make it simpler

- 12 months limits fluctuation of value – need to set a definite value
- If move things in and out may only be in the interpretation phase and never get to implementation
- I think it adds confusion between 12-month sliding period within the three years
- The preceding 12 months sets the time period
- But compliance period is over three years – this is overly complicated, if any time in the three years then it must comply
- Look at R1 and R2 – words say on that day of annual review
- Sets an anchor – propose keeping the 12 month language to anchor the value
- All assets get roped in as critical assets even those not interconnected
- Suggest putting "that would have an impact on the reliable operation of the group o units within 15 minutes"
- How do we audit time compliance? How do we provide evidence to auditor?
- We can take an asset down and document that event
- Cannot provide evidence you can audit to it
- We are both a balancing authority and in a shared group – looking at "b" we could hit that – "c" is a different value for the same entity, how do I pick the appropriate one
- Says "or" – can choose the lower one
- Does that mean everything over my minimum obligation in "c" must be covered as a high?
- If balancing authority loses your share does that put the system in danger?
- I cannot defend that we have to cover everything over our minimum share if we also have the ability to cover the full reserve on our own
- Concerned about the addition of "c". How does c relate to a? Also concerned that our share under c is but a sliver of the pie. Compliance impacts that could come back and bite us
- Instances of "a" few and far between – "b" more likely – "c" may be lower as your portion of the shared group's reserve
- Still concerned about adding "c"
- Also concerned about "c" expanding obligation beyond obligation under "b'
- Concerned this addresses the reliability of individual entities rather than the bulk electric system – disproportion impact on PA's?
- Concerned about the actual grammar used – the "(e.g. control system)", and also the 15 minutes as equal to "real time"

- Jackie Collett noted she was willing to volunteer to rework the language
- This is confusing as to which direction it is going – for our organization it would bring in about 75% or more of our assets
- Propose b and c are exclusive of each other – either use full groups number or your portion – go with either b or c – your share under c is always lower – suggest dropping "c"
- We would have to go to "d" – for us "c" would be arbitrary

Support for including "c" – No Members

No changes to 1.3 and 1.4

1.5

- Added "primary" to 1.5 – though there is no definition for "primary"
- Last call we discussed the term "primary" and suggested using the term "designated" instead – neither word is officially defined – what wording should we use?
- Blackstart is not about reliability but recovery
- Instead of "primary" –since there are different stages of restoration, focus on initial stage of restoration as the critical moment
- Primary and designated are not the same thing
- Need to be sure designation plans are the right source – hundreds of units included in our area to cover multiple contingencies
- R1.3 – coordination between individual transmission operator restoration plans
- But R1.5 has the assets
- We have to be careful to avoid unintended consequences
- Question about contingency requirement and not meet a or b? Ever not meet contingency reserve in a or b and have to fall under d
- Concern about 12 months – consider prior calendar year rather then preceding 12 months? Variability in what this captures by entity – how do we know what it captures; does it capture the appropriate assets? This is too obscure for oversight as an entity by entity threshold.
- There are three or four ways to say the same thing – needs to be one number to meet whether as a single unit or in combination – propose one value for 12 months – conversation should be on the right number, not how you get there.

- Comfortable with removing “b”
- If we remove “b” we need “d”
- Concerned about removing “b” – confusing if we are left only with “a” – who is the associated balancing authority?
- Agree cyber system needs to be protected but do we mean that the small pieces that add up to the whole are each in themselves critical? The generators themselves are not critical.
- Nuclear – it is the control system we are trying to protect.
- May not be the right approach for the generating units.
- Trying not to lose control system by looking at individual units.
- This says the individual units are critical if they aggregate up to a critical level.
- Have to take the units as a group and look at the system critical for running that group – not the individual units.
- Does the wording here say that? May inadvertently be focusing on the individual units rather than the control system of the group.
- Bringing in every system for each unit which may not be critical.
- May need to look back at possible link to R2 as well.
- Remove the part discussing the combination of units, go down to 1.17 and add any system controlling the aggregate of units – possibly added as 1.18?
- This list is trying to identify which generators are critical to maintaining the reliability of the grid –
- Delete “a generating unit for” to be sure not looking at individual units and focusing on group. Also make the subject “common cyber asset” though that may not help with political optics of identifying more assets as critical.
- Phone? – adding language in “a’ drops the threshold to a low number bringing too many units into play?
- Goal is to protect the common asset – strike first sentence up to “upon.”
- Can you have a reserve less than the unit?
- Think about what we want for the outcome – do you want the group rather than individual units – focus needs to be on protecting cyber systems not the generation units.
- Talking about the bulk electric system reliability and the cyber systems that are connected to them.

1.3

Member and Participant Comments

- Why 1,000? What is the rationale?
- Best number we could agree on using our professional experience, expertise and judgment.
- 1,000 seems arbitrary – need to reword to tie to RC and not tie to a number – add "any reactive resource listed with in a mitigation plan approved by the reliability coordinator."
- The RC does not decide what equipment should be installed – also need to substitute NERC glossary term for the mitigation plan – need to be an operating procedure and process rather than mitigation plan.
- How hard or would it be possible to write up the reasoning behind the number? Bright lines are arbitrary with some rationale behind them – is this a work product for later?
- Documenting the rationale helps flesh out the petition to oversight authority.
- Trying to understand the impact of the proposed language – how much stuff would be coming in?
- Will it be clear which operating procedures will apply? Which ones belong to the RC's? Test new 1.3 language?
- Provides more of a rationale than the arbitrary number.
- Like to add "required" operating procedures.
- Are plans "approved" by the RC – change "approved" to "required."
- How does the owner find out what is in the RC operating procedure?
- RC has to communicate those procedures.
- Concerned about how logistics would work – bright line was easier to determine what this applies to.
- Add "Operating Procedure, Operating Plan and Operating Process"
- Will have many requesting plans that may not be related to this issue.

Straw Poll

- **Favor changes to 1.3 - 13 oppose 0 support ; abstain 7**

1.4

Member and Participant Comments

- Concerned about impact – not understanding or it is not worded correctly – looks like everything would be medium – also "Wide Area"
- "Must run" is a market concept and should be deleted
- As used here reliability is not a glossary term – reliability "must run" is distinguished from market concept – put back in in response to comments, need to clarify it is there for reliability purposes – need to keep track of the rationale
- Will Maureen let us get away with the quotes?
- Longer than the implementation schedule?
- May be there until a transmission or generation unit can be built
- Appropriate to say "pre-designated by the reliability coordinator as …"
- Still concerned about using "Wide Area"
- It is not always the planning coordinator – pre-designated covers both if not as clear as adding reliability coordinator
- Planning coordinator is responsible for coordinating with the asset manager – replace reliability coordinator with the planning coordinator
- What does pre-designate mean? Strike in favor of "identified by the Planning Coordinator."
- Can we eliminate "Wide Area reliability impacts"?
- Keep developing in passive voice – planning coordinator identifies as…

Straw Poll

- **In favor of section as changed: 14 support; 5 oppose (74% Passes)**

1.5

Member and Participant Comments

- Delete "primary"
- Could be unintended consequence of reducing the blackstart units covered
- Agree – another suggestion – no basis for primary, and language is redundant –
- Alternative – Blackstart Resource and the Facilities comprising Cranking Paths contained in the transmission Operator's restoration plan
- Can also use tie line to restore – not covered here
- Cranking paths include tie lines?
- Facilities as capitalized is defined – do we need a more specific level?

- The language here covers each of the issues discussed
- I read it differently because of the "and" means 1.5 does not apply at all – suggest two items
- Blackstart resources is well defined – let stand alone
- Any Blackstart Resources contained in the Transmission Operator's restoration plan.
- The Facilities comprising Cranking Paths contained in the Transmission Operator's restoration plan

Straw Poll

- **Support 1.5 as revised – 18 in favor 0 opposed, 1 abstain**
- **Support 1.6 as revised – 19 in favor 0 opposed**

1.7 – New

Member and Participant Comments

- Optics type criteria added
- No problem with the requirement but question the optics –
- Regional issue to define
- How do we handle the fact that NYC is not covered – bad optics
- Need to have a technical reason – if just adding for optics, we will get called on it
- Not every criteria has a technical reason or justification
- Many industry comments asked for technical reliability based reason for various criteria – need to be able to say why this was put here beyond perception
- Rationale: to protect the back bone of the system
- Do we have anything in writing to put this in here? If we pull it out, will we get a response or directive to put it in with a rationale?
- In CIP 010 we said had to have "four lines" – how do we do that later with 010 if we put this in here?
- With some research could create some rationale – critical to us in Florida – need something to support putting it in
- Team did not include this, but NERC staff did in response to informal directive – I do not have an issue with including it – clearly critical at this level
- This may be arbitrary but it does not hurt us and should be included, just with some justification beyond political optics

- Support including, goes with 1.8 – if you take 1.7 out then would need major rewrite of 1.8
- Including is a good idea – engineering analysis may not justify but collective experience of this group does
- No problem with 500kV, but need more than political optics to hang our hat on

Straw Poll

- **Support including 1.7: 18 in favor; 0 oppose; 1 abstain.**
- **Substitute in 345kV –5 in favor; 14 oppose.**

1.3 and 1.4

- 1.3 – "reliability coordinator" – RC does not require anything, not part of his job, just enacts guidelines passed to him – and, "mitigation plan" is a compliance term
- We know how to operate the system but may not have the language to properly explain it – "require" may not be the right word
- Majority of plans are for coordination – if trying to identify assets, then need to look at other documents, not to the RC
- Look to responsible entity's
- Look to the definition of "operating procedure"
- Put in "owned by a registered entity" and "submitted to a reliability coordinator"
- Doesn't add anything
- Some RC have copies just in case not because it is critical – "invoked by the RC"?
- Way it reads now it includes any reactive resource
- Only those submitted to RC to address and issue
- Will take back to his RC

1.8

Member and Participant Comments

- Syncer phaser requirement?
- Many – nothing to do with it
- Texas interconnection but run by ERCOT
- Needs to say "Texas Inter-connection"
- Same for Eastern Interconnection and Western Interconnection

1.9

Member and Participant Comments

- Strike FACTS
- But that is how you define an acronym in a document by spelling it out followed by parenthetical
- FACTS is well defined – question removing it – serve a real purpose where they are located
- Make it a line item for just FACTS
- Used to have a separate item for FACTS and IROLS
- Do we need to delineate into separate items
- Not sure if we need to delineate, but recognize to avoid unnecessary comments
- Reason for choosing IROLs instead of SOLs
- Is there a critical link between FACTS and IROLs? If not, then separate

1.9 original language with FACTS and IROLs: Support 12; Oppose 0; Abstain 6

Member and Participant Comments

- Why include Cascading – seems like the line is not bright here
- Because of the definition and inclusion of IROLs here
- Define FACTS
- We define only if it is different from commonly accepted definition or need for clarification in the industry
- Do not capitalize items unless they are part of the glossary
- Agree this looks sort of like a study – not many studies look at misuse of devices – support including FACTS devices but consider as a separate item
- By tying to IROLs it raise key devices without putting in more than needed if FACTS devices are separate out as a stand alone item
- We can simplify this and clarify coverage
- We could drop the whole second half of the sentence
- Need some delineation because not all of the FACTs devices are critical – they are local area things, not critical to BES reliability
- Add “outages” after Cascading
- Not needed

- Transmission Facilities, including Flexible AC Transmission Systems (FACTS), that , if destroyed, degraded, misused or otherwise rendered unavailable, would violate one or more Interconnection Reliability Operating limits (IROLs) – simply drops the second sentence
- But some areas do not have IROLs
- Recommend keeping the second sentence in
- Same concern – keep it in
- Need to change the second sentence if it remains
- Not available or not identified?
- Do both sentences say the same thing – does anything fall out if we drop the second sentence?

Straw Poll

Delete the second sentence –14 in favor: 0 oppose: abstain 3

- May be a compliance issue in areas without IROLs.
- Have to have studies to show they do not have cascading problem.
- For compliance, you need the second sentence.
- End of first sentence add comma and "would result in instability, uncontrolled separation or Cascading."
- Looking at different definitions and comparing the language.

1.10

- This is similar to 1.2 which we changed and are still revising
- Do we need to wait and see what we get there?
- Jackie Collett will edit 1.10 to include or conform to changes in 1.2
- Bus tie breaker? Do we need to include the breakers?
- But it is the transmission facility
- If interconnection occurs at the breakers, then include – it is for the utility to decide where the connection is.
- Suggest we capitalize Facilities and add "and Elements" which by definition includes breakers
- Do we need to add "Elements" to other areas we have "Facilities"?
- Facilities is a collection of Elements – add here but not above in 1.2
- Do we need "Transmission" at the start of the sentence

- Looking at transmission substations – just say “Facilities”
- A collector bus is a “Facility”
- Call out generation too – begin sentence with “Transmission Facilities and generation Facilities”
- Identified in the generation interconnection agreement

1.11

Member and Participant Comments

- Does it need to be called out? Can we reference another standard in the standard?
- Best not to reference another standard, put period after “Requirements” since NPIR is a defined term.
- Consider moving this up to the other nuclear item
- The other item was deleted and also we were trying to keep generation items together.

1.12

Member and Participant Comments

- Does local area create problems?
- Put language in due to the lack of a clear definition
- But what does it mean?
- Don’t think NERC definition will help
- We had a great deal of discussion before landing on the existing language as a compromise
- What about using RROs?
- Not everyone has an RRO
- Concept of local area is important to capture

1.13

Member and Participant Comments

- Does this change the meaning under CIP 2-3? Does it bring in the smart grid? What is the source of the 300 MW bright line?
- Bright line written for 010 – may need to rewrite here – as for smart grid, intent was to capture it going forward as it involves dropping a block of load to protect the reliability of the BES – we say automatic aggregate load shedding but not how or why

- 300 MW came from DOE 417 – also, what ever system can initiate the dump is critical, not the individual units that shed the load (unless it can unload 300 MW by itself)
- Grammatically say automatic load shedding in the aggregate?
- Will review language
- Would collection of small loads constitute high impact?
- Need to determine if system controls 300 MW
- Do we need to also cover a BES element that could draw 300 MW?
- Any BES element that can result in over 300 MW loss is covered
- Any control center that is capable of controlling more than 300 MW of load?
- Control system, yes – not just control center which also would be covered
- Operator versus automatic – the former is not covered, only the latter

1.14-1.17 were combined and have now been separated out

Member and Participant Comments

- The way this reads and auditor could read everything inside your fence is critical asset
- Need to change the word center to system
- For RC need to say situational awareness
- We have not adequately defined situational awareness
- As it stands you will greatly increase the devices covered –
- Term control center is vague – guidelines help but are not applicable here
- Primary system or backup system
- We are still in the old original paradigm – we are protecting the cyber asset – what is essential to the control center to ensure reliability of the BES? It is the control system – the issue is resolved in the next version of 011
- Have to include 1.14-1.17 to be sure central control centers are included
- Concerned we have added many assets we do not need to
- Leave as is, most will understand what is included in the control center
- Backup center in large building but sequestered – this is not a problem
- Assuming the next set, 010 and 011, will follow soon after this version but understand this version may be in place for awhile

- We are describing things by physicality rather than function here
- FERC needs to understand entities expense in time and resources to meet current standards, this new interim one and then subsequent 010 and 011
- Where does the control center begin? It is not the building or outer fence – need to identify where the BES assets that control the system are located
- Control center is a different issue for critical asset while control system is critical cyber system – each entity must determine where the control center is
- If you can define your control center – we had to use systems to define criticality because we could not define by physicality – not acceptable to determine how we have to define our control center
- The building is not the critical asset
- For CCA's in subcabinets – how controlling the cabinets
- Have a physical perimeter around cabinets
- Proposal to change center to system? I have not heard any concerns
- Many expressed concerns about changing
- We have many control systems – they do not perform the function of the control center – control systems do not capture the intent of this section
- Identifying critical assets not critical cyber assets
- Proposal to change from one undefined term to another undefined term
- Critical assets is a defined term – includes systems

Proposal to use "control center" – Support 17, Oppose 2. (89%)

Comments after Straw Poll

- Concerned about stripping out base for control centers – if remove BAs then no impact
- But need to account for misuse, malicious or not
- We need a bar, a bright line
- We stripped out those limits, bars, etc. – need some limit on identifying "critical"
- "Performing"? Are they registered? Or responsible entity?
- The language here brings in too many small entities and may exclude large entities controlling several small
- If you want a bar, you need to state what that bar should be
- Go back to high language we had before

- Remember 911 attack came through Bal Harbor to get to Boston
- If we keep this language then we keep in medium when we move back to 010.
- The control system is the key asset we are protecting – sophisticated level of attacks means we need to do more and have more robust protection even at small or remote sites – need to add "registered" in front of each entity identified in each of these – need to be sure people performing the high risk functions are asked to do more
- Jay – recognize were we are in the time line – we have to do a little optical maintenance at this stage
- In 011 we should force protection for all iccp's across the board
- Now telling those who used systems go back to big iron approach only to be told to go back to systems approach with 011
- Suggest striking 15-17 here and address using systems in 011
- Need to accelerate protections while meeting political expedience – get people moving in the right direction with the first step
- Control centers are covered in 1.2.1 – cannot take it out at this point
- FERC position – if new version removes requirements then it needs strong justification
- Current 010 identified high, medium – if make everything high, then cannot go back
- Size with control systems does not matter – only matters for big iron
- Propose adding back in language for 1.15 and 1.16 – to preserve option for high and medium in the next phase developing 010 and 011
- Not okay to use system to scope down but can for size of asset?
- If include language used in Dallas workshop, we need to include justification for the commission
- Talking about critical infrastructure – this is not a new thing
- Is there any tweaks from the workshop or comments we need for preserving the high and medium as we move to 010
- Still need to document justification
- When we did 010 we separated high and medium, in 011 we moved much of medium up to high
- When we get to 011 we will add more to high than are currently in 003-009
- Should we have a level? If so, maybe we need to determine the bar or line for each level

- What would we not do for medium level control center that we do not already do for a high control center
- FERC has said cost is not a justification for not doing it – propose we test language as offered here without going back to previous language

Straw Poll- Language as offered without limits for 1.14-1.16: 10 in support; Opposed 10

- Proposal to start fresh tomorrow?
- Concerned about having to cover as critical units that are not connected to outside units that collectively have less than 200 mw impact should be classified as critical and require high levels of protection
- Small cities with limited connection do not have a high impact on the BES
- Are they a BA or a generation control center?
- Can we ask John Lim if there were any additional edits to incorporate to limits from comments at the workshop or responses to industry comments
- Legal also concerned about the language in the survey – agree with the changes proposed by the team but make the change for the posting of the survey and the cover letter
- Does the team have to make a formal comment to make the changes happen
- Comment on the survey is open but not the data collection – board will approve the survey and will have the final version of 002-4 to base the survey language on – better to let staff make changes to survey language without the formal comment

Control Centers

- Should we look at Jackie's updates first
- Joe has the changes to present
- This is a criteria for figuring out what is needed for reliability of the BES not cyber security – then figure out what cyber security system is attached
- Then we should change the title to "Big Iron with computers attached to it"
- Reviewed suggested revisions – also change cyber system to critical asset – highlighted changes with blue – Word changed the numbers.
- Last time we posted it had the clarifiers on the thresholds, what comments did we get back?

- In 1.18 at the end is an “and” that needs to be an “or”

New 1.17

Member and Participant Comments

- What are we trying to solve, what does this do for us – we would fall out as a balancing authority – this would drop us out for a short time until we revise 011 – may not be as a big a deal not to have the qualifying criteria as we discussed yesterday.
- We have small systems that does not impact anything – not all control centers are the same – this becomes the high going forward and will remain so in the next version – many other small entities will have the same problem.
- Stay focused on what we are doing in 002-4 – not necessarily the case we will be stuck with the change – we may need to scope the controls at the component level instead – focus on this for now and not try to predict the future by looking into the crystal ball
- Are we implying there are other control centers not included? Even if a control center currently is or could be used to control the system it should be covered.
- Agree with RC – not putting any limits in 1.17.
- Current language in 003 causes problems – title of this is critical cyber assets – it is not about control centers.
- Backup control centers are not captured here.
- What about backup control centers – backup has baggage to it.
- Change to any control center that is or could perform RC functions – capability to perform.
- How big an issue is it for entities to identify primary and backup control centers
- Backup center is passive, it does not control anything, but watches – we declared control systems as critical assets used to run the iron.
- Multitude of control centers that do not run reliability of the system
- But should be if it performs any reliability coordinator function
- What does RC actually do – only 17 in the country – seems obvious that what they do is essential.
- We have no skin in the RC game – makes sense if registered as a RC or through delegation – Entergy used to be an RC but not now. Should they be covered?
- Any of the members could be an RC – should remove ‘with capability’ and change to ‘which.’

- Capability could be an avenue to attack whether you are actively using the capability currently or not.
- Concerned that we do need "capability" – narrow down from capability but need more than just active current ability.
- Most RC's have smaller staffs.
- But RCs are powerful in that they give directives to others – consider "host RC. functions" – trying to get at those who can give directives – or "designated" – also, can we get away from concept of it being a place or room by saying "equipment"?
- Concerned about removing "centers" – may be able to add "systems" but cannot remove "centers"
- What about systems that support the control centers such as fire suppression systems – are we trying to include them.
- "Any control center and its systems that are designated to perform the RC functions"
- Many have capability – trying to capture those who are doing it or have backup to do it – designated covers that with too broad "capability"
- "Designated" better but still not sure right word – not sure we "designate" a system, but do use them for that function
- Who and how RC functions are done varies between regions – designated may be vague in our area – prefer "capability" as capturing the essential functions.
- Functional model is not clear in the overlay of the system – say the "computers used"
- "That are used by a registered RC or its delegate to perform Reliability Coordinator functions.
- Control center or its system – you get the choice to choose which one, not required to do both
- "Or"? Systems needed to perform RC functions include the air conditioning system?
- Not a reliability function.
- Scoped out when looking at critical cyber assets.
- "used by…" is inclusive but could be simplified to say "used to perform."
- SM – need the additional language to capture everyone
- JM – instead of registered should it say NERC registered – who registers RCs? Say a "NERC registered entity"
- Suggest we use "used to perform"

Poll language: Any control center or systems that are or could be used by a NERC registered RC or its delegate to perform RC functions

Straw Poll

Support 13; Oppose 1; Abstain 8

Comments on the Poll

- Concerned about "could be used" – sounds too vague
- reliability coordination is not a glossary term, change to Reliability Coordinator functions
- "or could be used" is not needed.
- Every entity needs a plan.
- Do we need to add RC emergency plan.
- "Could be used" opens it up too much
- How about adding "including backup control…"
- Raises concerns
- Include "emergency plan" instead of "could be used"
- "identified in the emergency plan"
- "reliability coordinator plan"
- That is a different plan
- "that are identified in an emergency plan"
- Need to simplify to used by
- Need to captured what they plan to use – protect the stuff they need to use in an emergency
- "Or systems that are or could be used by a NERC registered RC or its delegate to perform RC functions, as identified in their operational or emergency plan"
- Why include "or could be used."
- Not required otherwise to include them.
- This is still about RC functions – drop the "operational or emergency plans" – adding words that will confuse
- Agree may limit confusion
- Test again without last phrase: or systems that are or could be used by a NERC registered RC or its delegate to perform RC functions?
- We figured out that once system comes on it must be compliant

- Requirement for RC to have emergency or backup is already covered elsewhere – "that are used by."
- Any control center or backup control center that performs a RC function – that is simpler and clearer.
- Have to add "or control systems"
- Control systems do not perform functions

Any control center or systems and backup control center or systems performing RC functions

17 in support 0 Opposed Abstain: 1

1.18 as rewritten with the language above

- If we use this criteria we are dropping out up to 25% of critical assets related to BAs and that makes for bad optics – many munis who are doing the right thing would not be covered
- NERC registry has 139 BAs including Homestead, New Smyrna Beach, Reedy Creek and several other little cities around the country – do we intend to include them as critical – supports having criteria, but are these the right ones
- Thresholds are okay, but we need to discuss the thresholds and not just the words that go in here
- Some drop off, but are some others added in? This keeps anyone form simply saying they are too small and do not need to respond
- Existing standards allow someone to put more on that they think is important than is required
- No one would do that – they would not accept the risk – also related to the BA function, think we should not have any qualifications
- This is why in the original effort we allowed to identify as important but at a lower level – should we have limiting factors, if so, then decide where the bar should be
- Whatever limits you set needs support of justification.
- Put in bright lines and we may take many out – we should wait and put bright lines in the next version
- Current system lists a lot more entities than BA, RC, and TO
- We are changing from a risk based system to setting bright lines
- But many more entities currently have to determine whether they are in – IA, Transmission Providers, others, fall off the list – need some justification for the change

- Difference here we are talking about functions not entities
- With limited scope we are trying to set maybe the bright line is not the way to go
- Justification is short hand for explaining why this is better, especially if the appearance is to drop assets off – simply a rational for the change
- Drop all of these and simply say any control center or backup or systems used to perform reliability functions
- We have never done a sufficiency analysis on any of these items – protecting bulk power rather than protecting the grid – need sufficiency analysis on any bright lines
- I would vote against the limiters in the proposed language – not in favor of removing mandatory control only because entity is small –
- FERC is looking to industry expertise to set rational levels and the reason for them
- Working under order to have more CCAs and CAs – wait for 010 and 011 to help reset levels
- Goals to have more CAs, though more CCAs may have been implied – need to see survey results to know if 002-4 gets there
- Who has cyber asset that if compromised would have the highest impact on the reliability of the BES – those are who we need to target and set criteria to include
- With limits we were trying to match the bright lines set above to identify CA – control two or more of the critical assets identified above
- This is not about size but attack vectors – doesn't matter how big they are
- CIP has always been backwards – working from figuring out what is in or out then setting criteria – here we are trying to work backward from 010 and 011 – need to determine the risk first
- Would it be possible to still include risk based and add bright lines to augment the list of those already covered under risk based
- This is set up as CA but trying to get to critical cyber assets – small control center that is not connected, then out, but if interconnected then does not matter how big you are – may want to put in additional language to cover
- Test simple concept: check on whether limitations should be included, if so, then discuss what the limitations should be
- Are we going to look at telling entities they conduct risk based assessment with the limitations as a minimum
- Modifying the current risk based assessment with these minimums – have to include these at a minimum

- The charge was to replace the risk based criteria with bright line – that is a deviation from the request that would need to be justified – request came from the call with Mosher and Adamsky.
- There is nothing in writing – we are working off the agreement we voted on in the July 2 call
- Perception of NERC executives direction was to replace with bright lines
- Long discussion on these sub requirements – ultimate goal of this group is a standard that adds critical assets to the list, if we don't, it will not be accepted – focus on adding more assets.
- My company was okay with keeping risk based and adding bright lines
- Given direction but were not told alternatives for achieving the outcome should not be considered – this meets the same goal in a way acceptable to the industry
- This method would increase the number of assets which is the goal.
- The associations asked for bright line criteria – we have brighter but still fuzzy lines – careful we do not end up decreasing the number of critical assets – our job is to accomplish the intent to increase the number
- The request may not have considered that some might use the new criteria to reduce the number of critical assets identified – the option here is a good compromise to accomplish the intent of the request
- Using bright line does not make sense – either have to use a methodology or a set of bright line criteria – one or the other, not both
- Data survey request structured to help us make this decision later – it will give us the data to determine which method ends up with which assets
- We were asked to create bright lines, let's finish it – the methodology will require months to prepare
- Not sure survey will clearly establish which assets are identified by bright line versus the methodology
- We can take a high cut at it, without identifying individual entities, by looking at the gross numbers
- Suggest taking R1 from 002-3 and adding "and at a minimum contains the bright line criteria contained in Attachment 1."
- Considers and includes other things – "and as a minimum…."
- Concerned about how this is applied in the real world
- The "bright line" is just additional criteria for you to apply in addition to their existing evaluation methodology – a methodology + process

- Most entities may rewrite their methodology to include the bright lines –
- The difference is that it gets additional message that criteria they were using in the methodology was not tight enough
- Concerned about mixing methods – telling them this is the answer we want you to get whatever methodology is that you use – you may go down if the bright line is in the wrong place – will we get enough granular data to know if number is going down
- "and as a minimum applies (or satisfies) the criteria."
- This does not work for me.
- You have criteria as minimum to include in risk based methodology.
- Keep R1 the same and add bright line augmentation in R2.
- Concerned we will confuse entities – asking them the keep existing methodology and add minimum criteria – if asking them to keep what they have then ask them to use the same criteria without adjusting the methodology
- In NIST had language to use risk based criteria and basic criteria – treat the latter as the only thing they can concretely identify
- We are working on 002-4 because the risk based methodology is not handle properly or has been insufficient at identifying critical assets – we are not fixing the problem but only putting on a patch
- Auditors only identify you have a methodology not its sufficiency – this would allow them to do so
- List bright line criteria in R2 and put the proposed language in as R3
- Presumption that methodology doesn't change from year to year – add "any previously identified assets" to keep entities from changing their methodology
- This is important tool but don't even know if we need to do this until we get the data – focus on getting the right data first
- Risk based methodology is not frozen as risk shifts.
- R1 stays the same
- R1.1 stays the same
- R1.2 Or, create a new sub-requirement in parallel here to speak to attachment as minimum that must be captured by entities risk based system.
- R1.3 The risk based assessment shall consider the following assets: (with list)

Approach statement – appropriate to incorporate bright line criteria from attachment 1 into the risk based methodology

- **Support 8 Oppose 12**

- Important to understand why people opposed
- Need to spend time more constructively
- We either have limitation language or not for all of them
- But we have not even looked at 1.20 yet
- Take them one at a time
- Check on whether limitations language should be included (if so, then discuss what the limitations should be)
- **On 1.18- Support 9; Oppose 8; Abstain 1**
- **On 1.19- Support 10; Oppose 8; Abstain 1**
- Willing to accept limitations if entities could continue to use risk based methodology
- Instead of methodology – another line item saying "any other assets essential to reliability…"
- We want a process that includes CA identified today, anything else you want to add and the minimums of the bright lines – we need ideas to accomplish the goal
- Request poll on twenty (1.20) too?
- Abstained – recognize need levels in identifying CA – trying to narrowly scope and fix in the next version – can we come up with good thresholds at this point in time – reluctantly willing to stick closer to what is in the existing standard
- That may be where we end up but need limits in the survey to give us information what falls above or below
- Political optics of rising and falling numbers
- The Vice-Chair proposed a team of John Van Boxtel, Doug Johnson, Scott Rosenberger, Jim Brenton and Jackie Collett to review and prepare an alternative proposal.

1.20

Member and Participant Comments

- Suggest changing language – Automatic Generation Control is a glossary term
- Changing that term in another committee
- AGC also include operator doing generation control?
- No, definition says equipment

- It is the system that is controlling from a distance
- AGC is becoming cloudy as entities shift how the handle this – some may control in their control room
- Everything else in this area is a functional model – "used to perform the Generator Operator function" to make consisted with the others
- Where does ACE control fall in this –
- It is covered under Balancing Authority in earlier section
- Threshold as written is very low

Straw Polls

Thresholds on 1.18- 9 in Favor; 8 Oppose ; 1 Abstain

Thresholds on 1.19 10 in Favor; 8 Oppose ; 1 Abstain

Thresholds on 1.20. -12 in Favor; 6 Oppose 6; 1 Abstain

Jackie Collett brought back some revisions for the SDT's consideration on Thursday afternoon.

Revision to 1.2

Member and Participant Comments

- 1.2a and b?
- talking about two different time periods
- Contingency reserve different? Should both be Balancing Authority?
- That's where we ended yesterday
- Difference between what it is rated to do and what we actually do – never try to get to capability level
- Think they are talking about net dependable capability – gross minus axillaries
- Make as a recommendation without input or explanation from John Lim who is not here
- It is net Real Power capability – addressed in MOD 24
- Is this the time to discuss 1.2a? Brings threshold down to units over 200 MW – individually a very small amount,
- Should say a reserve sharing group – at least an "and/or"
- Three levels to ensure capture key assets
- Still calculating your contingency reserve as a BA, then figuring out shares
- Requirement as a BA may be lower than the total of a shared group

- Is premise for a shared group valid in cyber system attack
- Contingency reserve for BA bigger than the total for the shared group? The opposite
- Say which ever is the larger of the two.
- If go to the largest, then the 2,000 number becomes the criteria.
- SR – but only if you don't have either the BA or shared contingency categories – instead of the "lowest" use the "larger" of the two or the 2,000 with "total" in front of load share
- Anna – 1.2a should read "the greater value of the Contingency Reserve requirement of the associated Balancing Authority or the Reserve Sharing Group…"
- Have to have one of them
- Went to "lowest" to get the lowest from the previous 12 months
- Can we delete "b" and "c" and just have "a"?
- Like deleting b and c then breaking a up
- We are not saying what the contingency reserve should be but that you can use it
- We are interested in the "high" level – otherwise we get lost in the weeds
- Never have a single unit that exceeds the total
- No single unit is essential to the system
- Offered replacement language for "a" – The CR requirement of the RSG of the BA that is not a member of a Reserve Sharing Group – picking the one number you have rather than the higher of two possible numbers
- Goal is to set a threshold – the threshold we are after is the larger number
- Entities under identifies units because they can move load around without any one unit carrying the load – the size of the unit does not matter
- This is not about how you carry your reserve
- Reality is that type of fuel does not matter and no single unit matters to reserve capacity – the issue of concern here came from separating the two – consider putting back into one
- Lean toward deleting 1.2.a
- Work on 1.3 – if not needed then delete 1.2a
- These were one point before – pull back to just one single number or bright line without need to determine which one you fall into
- Support return to a combined criteria

- Put unit or group of units back together
- What we have said is that no single generator (including nuclear) is considered critical
- No single generator is critical because of the contingency plans
- Point out that under this language no singe or nuclear plants identified as critical assets in the United States – since no nuclear units share control centers – be prepared to state and justify that fact
- No single unit is critical based on size – may be critical for other reasons such as as a black start unit
- Order says n-1 approach will give us nonsensical approach and that saying single units are not noncritical by size – isn't that what I just said
- Need to give NERC or FERC the language they need to explain why a nuclear unit is not "critical"
- That is where we were going with 010 and 011
- Assumption is that 002-4 is not to address the Order – that is the 010-011 effort which will put protection on all units
- The goal to get more big asset generation on the critical asset list? Pick a number to get a correspondingly higher number of units on the list?
- Consider using how much a unit produces over a year

Revisions to 1.9 and 1.10

Member and Participant Comments

- 1.9 – are we trying to say there is an area that does not have IROLs? I don't have them, so then I have to run studies on cascading
- Recall that is a null set that does not require a study
- Okay with taking that out – the whole second sentence in both 1.9 and 1.10
- No objections to the remaining language

1.11 - Same issue we discussed above

1.14 and 1.15 were one item before – split now to BES Elements and aggregate automatic load shedding

Member and Participant Comments:

- Distribution providers in smart grid? Smart meter network would argue not designed to dump load? Should it say "capable of performing" rather than "that perform"?
- May need to lose the word "automatic" – automatic load shed is different from capable of -need to decide to use one or the other, but not both.

- Reluctant to drop the automatic load shedding –
- If we stick with "or" then change common Cyber Asset.
- Tried to capture with common Cyber Assets
- 1.15 is more important
- Support keeping both 1.14 and 1.15 but prefer keeping them simpler – too many words, need straightforward sentence
- Lots of different ways to shed load – the drop due to automatic shedding is what we are getting at here.
- Does the wording in 1.15 automatic include unintended assets?
- Does it include 300 MW of air conditioners when we turn up the thermostat? A: Yes, under the current standard – the concept has not changed
- Distribution providers were not included – only the transmission providers were covered
- If dumping 300 MW – suggestion to remove distribution provider?
- Could you put in an exception in this requirement rather than remove from the whole standard?
- Example of creating interim solution after developing a better process – not fair to say do it this way for now and we will change the rules on you again soon.
- FERC only has authority over bulk power, not distribution.
- Actually for bulk system reliability –
- This is not related to CIP 003 – we need to keep eye on the ball
- We put distribution provider in then out and back again – concern is in the load shed?
- This is new stuff added in to interim step?
- This is a new introduction with big implications

Propose Take out distribution provider? Support 14; Oppose 1; Abstain 1 (93%)

- Much in the news about smart grid and dropping load shed – will be a question we will need to address in the future.
- Wording in 1.15 – propose putting in the wording from 002-3 R1.25 – "System and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more."
- Need to address in 1.14 too
- Could we drop both 1.15 and 1.14 in favor of this language.

Support this change in wording and drop 1.15 and 1.14:

- **Support 14; oppose 0 (in the room)**

Preamble under Critical Asset Criteria

Member and Participant Comments

- I like the additional language upfront but what if facility has no impact?
- Concerned about including invites argument that a particular facility has no impact
- Read current definition of CA – do industry a disservice if we use different wording here
- Take a look again at 1.9 and 1.10 language – left the language in here
- Gives someone capability to declare an asset – they may want to keep it on their list and then drop later with new version
- Goes along with risk based assessment

Jackie Collett brought back a report from the evening session. She noted the purpose was to provide a version of 002-4 to go out with or inform the survey – trying to get information in the survey to help inform the final version of 002-4. How do we preserve critical assets already identified and build on that set? Give entity a chance to identify a list that will stay on for a few years before having to change it again – allow them the option of putting on assets that may not be required as well as require a minimum – keep those on the list from the risk based methodology in addition to a minimum set.

She suggested that the SDT should keep in mind the big cost is getting something into compliance. Once that is done, then it is the cost in maintaining compliance due to compliance exposure. Preserve what is already identified by current risk based. Question for Howard – how much can we change the data request form? May want to add specific questions to help inform team to tweak draft for final version. (Yes, some flexibility to modify data request)

Member and Participant Discussion

- Can we figure out how many assets are added beyond the current base, but not what those assets are – that would go beyond a simple data request.
- Ask for three sets of numbers – number of current assets identified by current risk based methodology, number by category (current CIP 003-009), and estimated total identified using attachment 1 in place of risk based methodology

- This exercise is to deal with perception that not enough assets are identified under the current system – develop a threshold and modify R2 category to identify the common cyber assets for the groups of units rather than individual units – interim phase to move toward 010 – captures more generation assets – question about whether it would apply to transmission, etc.
- Look at current version of 002-4 – how do we capture those concepts?
- Modify and add words from 002-3?
- Any previously identified assets not captured by bright lines need to be sure do not drop off.
- Focus on cyber assets in generation – in transmission?
- Came up with criteria for generation – not sure applies to transmission
- Routable protocol in control center is included – do we need a similar substation or transmission criteria - deleted "in its assessment in 1.19."
- 1.20 Any critical assets that are identified in the last 24 months that are not identified in the bright line criteria – buts a time limit on when I can stop using risk based assessment
- Don't think it is a disaster if those assets fell off the list – will be captured later under medium.
- Take off list, list is too small and list requirement may come back even worse
- What happens if the 010 and 011 are not in place within 24 months?
- Those assets fall off – incentive to complete next version.
- Data request helps determine if we need that item or not.
- FERC put out metrics saying to respond to standards work within 18 months.
- There could be many scenarios in which 10 and 11 are not in place in 24 months, not just FERC approval.
- Wording of 1.20 – have to go back two years to see what was on your list or what is on list now stays on for next 24 months?
- The intent is the latter – do not want to lose ground.
- These words imply the former – need to clarify or modify.
- Add "in a risk-based methodology.
- Don't have to specifically ask what drops out – based on this language are we maintaining risk-based? If not, then say "any CAs identified in CIP 002-3 will remain on the list for the next 24 months…."

- Understand 24 months but puts pressure to ensure next version is in place in time to prevent anything drops off
- Bringing the results back? Rather run the risk based methodology
- Running RBM or anything else you want to add doesn't guarantee anything – if trying to keep CA's on the list, doesn't guarantee it.
- If get to re-run it each year then no guarantees – we voted we did not want a hybrid system of RBM and bright lines.
- How do we accomplish maintaining what we have and building on it? Shouldn't build on current list?
- Shouldn't lose ground, but not sure how do that
- Started with control centers – how do we address those, keep those in?
- Keep thresholds for data collection to see if they do anything for us
- Recommendation to put off decision until we get the data to analyze?
- Yes, keep thresholds in for data request
- Need data to inform the decision for the final version
- Only have one shot at data collections
- If leave thresholds in here then set false expectation in the industry that smaller units will not need to be covered – acquiesce in doing it, but concerned
- Do we still add criteria to drive data request directed at control centers – one that just says control center to have a baseline to compare to?
- Suggestion for 1.20 – have criteria with a lot of numbers – is that the right number? If number goes down then adjust the criteria – this goes away if we use survey for its purpose.
- Survey does not tell us how to adjust if we do not get the number expected.
- Maintain what you are doing along with the minimum as an interim step
- Also need to pay attention to survey ability to test additional thresholds – to see how the different levels play out and allow us to adjust high and medium
- Would not capture below 2000 MW – we have a hole in the control centers we could identify TS – seems we need more granularity in the survey – still also don't know what the number should be – why are they reluctant to give us a "good" number they are looking for?
- Regions are still developing and do not have the numbers they are trying to establish.
- Possible to get numbers back to review in August?

- Scott Rosenberger suggested using the team members as an initial sample.
- Leverage EEI members to get some numbers? Question number 2 will help but may have multiple assets that cover across categories.
- What we put in the survey will drive industry expectation especially given attachment #1 is our criteria – otherwise Howard will have to respond to comments about why did you choose that level.
- Draft survey already out there for comment.
- Always free to add anything we want to the list
- Aware anything we put out will look like a possible standard – everything is under development until approved – language says looking for data to inform development – cannot prevent them from reading implications into language – need to be sure to state this is not the final product.
- There is a value in its looking different.
- Should the Team file formal comment to allow staff to respond and change?
- Would require a call before Chicago with a quorum which has been difficult to obtain on a call.
- Not putting developing final criteria language off indefinitely, but need data to inform us.
- May be rare opportunity to hold an email vote on this issue of comments to the survey.
- Additional discussion on transmission language?
- Beyond the survey is that a concept we need to capture?
- Requires changes to R2
- Are we good with the concept? We struggled with specific words – capture in concept statement – the "fence theory"

III. CIP 011 SUB-TEAM PROGRESS REPORTS

On Friday morning the Vice Chair asked each Sub-team lead to give a report on progress since the Sacramento meeting. He suggested that as a minimum, each sub-team should complete its summary of industry informal comments received as well as the Dallas workshop input so a response document can be developed and be prepared for posting.

A. Sub-Team Progress Reports

1. Systems Security and Boundary Protection

Members: Jay Cribb (Lead), Jackie Collett, John Varnell, John Van Boxtel, Philip Huff *(Observer Participant: Brian Newell) (FERC: Justin Kelly)*

Jay Cribb reported on the Sub-team's efforts since Sacramento. They have split up and assigned requirements to member and are making progress – one or two troublesome ones we may recommend deleting, will distribute explanation – working with DJ's team to coordinate on perimeters – putting a straw man for both groups to review.

Member Comments:

- How much more time does your Sub-team need? A: As much as the schedule will allow us – also trying to use terminology from 003-009 to make industry comfortable.

2. **Recovery Management**

*Members:*Scott Rosenberger (Lead), Joe Doetzl, Tom Stevenson (*Observer Participant: Jason Marshall)(FERC: Dan Bogle)*

Scott Rosenberger reported that the Sub-team made some but not substantial progress over the past several weeks.

3. **Personnel and Physical Security**

Members: Doug Johnson (Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin *(FERC: Drew Kittey)*

Doug Johnson spent time looking at rationale and his sub-team still needs to know if we are splitting the rationale out into one box and guidance into a separate box – still need to look at the levels again and be sure incorporated external communication and connections in proper way – meeting and coordinating with Jay's group – also working to coordinate with Sharon's group on revocation

4. **Change Management, System Lifecycle, Information Protection, Maintenance, and Governance**.

Members: Dave Revill (Lead), Jon Stanford, Keith Stouffer, Bill Winters *(Observer Participant: Brian Newell)(FERC: Jan Bargen, Matthew Dale)*

David Revill offered a report from the "hodge-podge" sub-team. He noted they had made good progress based on feedback in Sacramento. They have tried to address areas of overlap with other teams. They have also crafted new requirement for vulnerability assessment and believe they are a few side meetings away from presenting to full group.

Have not documented responses to informal comments yet – we need whatever time we can get plus one day.

5. Access Control

Members: Sharon Edwards (Lead), Jeff Hoffman, Jerry Freese *(Observer Participants: Roger Fradenburgh, Sam Merrell) (FERC: Mike Keane)*

Sharon Edwards reported on the sub-team electronic access good meetings. R7 added text boxes – reviewed other changes by requirement: R9 combined with R13, divided revocation into 4 distinct categories, leave of absence, voluntary and involuntary revocation,
R10 – passwords, if used as authenticators – tried to avoid TFEs.

6. Implementation Plan Sub-Team

Members: Scott Mix (Lead), Doug Johnson, John Lim, Jim Brenton, Tom Stevenson, Joe Bucciero, Bradley Yeates, William Gross, *(Jeff Drowley)(FERC: Jan Bargen, Mike Keane)*

This Team will be assisting with the CIP 002-4 implementation plan.

The Vice Chair thanked the sub-teams for the significant work done by sub-teams despite the political sideshow. He noted he had underestimated when the SDT could get back to 010 and 011 which may not be until December. Many in industry will want to know what was said and done at the Dallas workshop as well as the industry's informal comments. We need to decide soon how we want to address and respond to those in the future, but for now we need some closure on summarizing the comments we have received. WE may need a conference call or a webinar to explain why we are moving 002-4 and putting the 010 and 011 on hold. He urged each sub team to hold at least another call in order to create a response summary to industry comment by the Chicago meeting.

Industry Response Format Comments

- Format for that? # and summary of responses?
- Similar to responses last December – highlight of responses.
- Responses by question or free form – do we need a common format?
- Our team cannot respond by question but a common format might be helpful – will template a format for sub teams to use.
- Can say this is what we heard but not formulate how we will address the comment yet.
- Sub teams were provided summaries of comments related to their group – promised the industry we would publish comments from Dallas workshop

- Each group needs to review the transcripts from Dallas
- Spreadsheet from Bryan might be helpful in this process

B. Initial Discussion of CIP 010 and 011 Schedule

In light of the CIP 002-4 effort and the Sub-Team reports the Vice Chair asked the SDT to discuss issues surrounding the development of a revised CIP 010 & 011 schedule. Below are discussion points made.

Member Discussion Points

- Schedule – no end date formally communicated yet.
- Allen Mosher – finish product enacted by Dec 2011.
- What date does team have to deliver product to get approval by Dec. 2011.
- Sooner we get product to industry for comment the better the end product and more opportunity for industry to internalize the implications and build acceptance.
- Only have the schedule that starts ballots in January and ends in July
- Roughly move ballot in summer to end by December
- Try to prepare by May to get more rounds of comments
- Survey is in Word format – encourage team to offer suggestions
- Trying to put in additional criteria to establish useful numbers – should we break the h-m-l and instead put into a series of questions to avoid perception of moving toward a specific standard – allows to test different levels regarding control centers
- Concerned send out draft attachment 1 industry will take that as final product – reformat attachment?
- Just ask twenty-two questions rather than a table? Avoid industry expectation of the standard
- Trying to figure out how we capture the data
- Two different sets of questions
- More efficient to fill out the table?
- It is the h-m-l that will make people associated numbers to the potential standard
- More than twenty questions if ask about medium too
- Reorient the table in question 2
- We will use the results to explain why we changed the criteria numbers
- We are not set up to ask for the right threshold number
- We will know the response to the number of assets under threshold of 2000 and 1000
- Ask for as many pieces as you can to help inform 002-4 development and for 010 and 011 development
- But the more difficult you make it for entities to respond – trying to keep response burden to a minimum but get the most useful information – trying to balance

- Take the same assets from question 1 and now separate out into categories – sum of #2 will equal #1 – question #3 gets to the additional assets from bright lines – do we need a question to capture those assets that drop off
- May have a critical asset that is not even captured in question #1
- Question #3 gets to the delta between what you do today versus what you might do with bright line criteria
- Too complicated to ask questions to get to the right number? Need data to help set the hard break of bright lines
- Generation units we put on because of transmission constraints – but those units will not be identified in this survey
- We did an analysis based on the version 3 that went out in May for comment – ask the question more directly about what assets would be added and ask if items drop out ask why rather than asking for a number and then subtracting to figure out the corresponding numbers – makes information more transparent and will gain greater acceptance in the document
- That becomes more than a data request and would require team responses – team has to take data and respond by making changes to then post document within a week – captures a fine level of detail the team may not have enough time to respond to and reflect in the document to post
- Suggestions will be part of comment responses to the survey
- Sum of question #2 must equal #1 is lost in the middle of the paragraph – should make that more explicit in the directions or bolded
- Have to tell them they have to put items from #1 in one and only one spot in #2
- Any critical assets that cannot be categorized in #2 – we have a category for low
- We ask for anything else – this gets at the assets identified as important but not captured by the risk based assessment
- Can team members take an early run at completing survey as a sample to look at in Chicago
- Won't have final version of the survey ready until July 28 to be posted as part of package to Board of Trustees
- Won't be much advanced notice. Straw survey-
- Get a not quite final form. Fill out and then bring to Chicago. (before beginning)

IV. NEXT STEPS

Phil Huff noted the 002-4 team will continue working. Implementation plan development for 002-4 *(use the CIP 10 and 11 implementation team).* Guidance/ Rationale. Members will try to get their companies to do the survey. The suggestions on framing the survey will be incorporated as discussed by NERC. CIP 10 and 11 sub-teams should capture work done and keep meeting to develop industry comment summary. Phil offered to send out a template for the sub-teams to use. All members should review the transcription of workshop and provide NERC any feedback by Chicago on any red flags or mistakes.

The Vice Chair noted the Detroit open Smart Grid meeting next week. Phil will send out request of other SDT members to see if any can attend and suggested that the SDT would like to continue collaboration but was unlikely for their next meeting.

The SDT will consider going to 3-day meeting schedule after September with longer days on Tuesday –Thursday. The Vice Chair asked members to make the commitment to stay through to Friday noon at the next SDT meeting in Chicago. He also said that in light of the quorum requirements he and the Chair will consider an attendance policy and consult with members who have had difficulty in participating over the past several months. The SDT reviewed the issue of a letter of appreciation to the CEO's of the member companies from the President of NERC for the hard work and commitment of the members to the CIP revisions. It was agreed that NERC staff would take any requests from members to the NERC president.

Finally, the Vice Chair, on behalf of the SDT, thanked Sam Merrill and the CERT for their excellent hosting and facilities. He noted Doug Johnson will be our host in Chicago in August and urged members to register for the session.

Meeting adjourned at 11:30 a.m.

Appendix #1

Project 2008-06 Cyber Security Order 706 SDT

Draft 24th Meeting Agenda

July 13, 2010, Tuesday- 8:00 AM to 5:00 PM EDT

July 14, 2010 Wednesday- 8:00 AM to 5:00 PM EDT

July 15, 2010 Thursday- 8:00 AM to 5:00 PM EDT

July 16, 2010 Friday- 8:00 AM to 12:00 PM EDT

CERT Software Engineering Institute, Carnegie Mellon University

Pittsburgh, PA

NOTE:

1. Agenda Times May be Adjusted as Needed during the Meeting

2. Drafting and Sub-team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- To review the CSO706 SDT 2010 Work Plan and Schedule for CIP-002-4
- To explore and clarify the Work Plan and Schedule for completing CIP-010 & 011
- To review, clarify and refine the strawman CIP-002-4 standard proposal
- To convene sub-teams to review the sub-team responses to Industry comments and proposed changes to CIP-010 and 011
- To provide SDT guidance so sub-teams can make further refinements to CIP 002-4, 010 & 011
- To agree on next steps and assignments

Tuesday, July 13, 2010 8:00 a.m. - 5:00 p.m.

- Introduction, welcome, and opening remarks -*(Morning)*
- Overview of CSO706 SDT Work plan and schedule for CIP 002-4 and Explore and Clarify CIP 010 & 011-*(Morning)*
- Review and seek agreement on proposal for refining the SDT Consensus Procedures -*(Morning)*
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review and refine draft CIP 002-4 standard and related documents. *(Morning)*
- "Lunch and Learn"- Format Proposal*(Lunch)*
- Review and refine draft CIP 002-4 standard and related documents. *(Afternoon Plenary)*

Wednesday, July 14, 2010 8:00 a.m. - 5:00 p.m.

- Sub-teams present requirement changes and test SDT consensus on directions and changes *(Morning Plenary)*
- "Lunch and Learn"- NERC CIP SDT and the ASAP-SG Architecture Team
- Sub-teams present requirement changes and test SDT consensus on directions and changes *(Afternoon Plenary)*

Thursday, July 15, 2010, 8:00 a.m. - 5:00 p.m.

- Sub-teams present requirement changes and test SDT consensus on directions and changes *(Morning)*
- "Lunch and Learn"- Substation Networks (Varnell)

- CIP-010 and 011 Sub-Teams address changes in requirements in light of industry c*omments & i***n**puts from the SDT *(Afternoon)*
- Sub-teams present requirement changes and test SDT consensus on directions and changes *(Afternoon)*

Friday, July 16, 2010, 8:00 a.m. - 12:00 p.m.

- Review of CIP-002-4 Refinements (Morning)
- Review SDT Workplan Schedule to prepare new Draft CIP-010 and 011 Requirements documents. *(Morning)*
- Review Next Steps and Sub-Team schedule and SDT Chicago Meeting Agenda (*Late Morning)*

Appendix # 1— Meeting Agenda

Project 2008-06 Cyber Security Order 706 SDT
Draft 25th Meeting Agenda
August 10, 2010, Tuesday- 8:00 AM to 5:00 PM CDT
August 11, 2010 Wednesday- 8:00 AM to 5:00 PM CDT
August 12, 2010 Thursday- 8:00 AM to 5:00 PM CDT
August 13, 2010 Friday- 8:00 AM to 12:00 PM CDT
Exelon Corporation
10 S. Dearborn Street, 48th Floor , Chicago, IL
NOTE: 1. Agenda Times May be Adjusted as Needed during the Meeting
NOTE: 2. Drafting Sub-team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- To review the adopted CSO706 SDT 2010 Work Plan and Schedule for CIP-002-4 in 2010
- To review and adopt a Work Plan and Schedule for completing CIP-010 & 011 in 2011
- To review and discuss the results and implications of SDT member companies' data survey results for the CIP 002-4 draft.
- To review, clarify, refine and adopt CIP-002-4 standard proposal for NERC staff review
- To review CIP-010 & 011 sub-teams draft responses to industry and Dallas workshop
- To agree on next steps and assignments

Tuesday, August 10, 2010 8:00 a.m. - 5:00 p.m.

- Introduction, welcome, and opening and guest remarks -*(Morning)*
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review of CSO706 SDT Work plan and schedule for CIP 002-4 *(Morning)*
- Review of CSO706 Draft SDT Work plan and schedule for CIP 010 & 011 *(Morning)*
- "Lunch and Learn"- Forensics U.S. CERT *(Lunch)*
- Overview of NERC Survey Development and Industry Comments *(Afternoon)*
- Review and refine draft CIP 002-4 standard and related documents *(Afternoon)*

Wednesday, August 11, 2010 8:00 a.m. -5:00 p.m.

- Review and discuss the SDT member survey responses and their implications for CIP 002-4 drafting *(Morning)*
- Review and refinement of CIP-002-4 documents including implementation plan for NERC staff review *(Afternoon)*

Thursday, August 12, 2010, 8:00 a.m. - 5:00 p.m.

- Adoption of CIP 002-4 documents for NERC staff review *(Morning)*
- Adoption of CIP 010 & 011 Draft Schedule *(Morning)*
- CIP-010 and 011 Sub-teams present draft summary responses to Industry Comments and Workshop input *(Morning and Afternoon)*
- Agree on schedule for incorporating draft responses to Industry Comments and Workshop input into a single response document. *(Afternoon)*

Friday, August 13, 2010, 8:00 a.m. - 12:00 p.m.

- Review directions and next steps to CIP-010 and 011 Sub-teams – *as needed (Morning)*
- Address 002-4 planning for September Webinar *(Morning)*
- Review SDT September 8-10, 2010 Winnipeg Meeting Agenda (*Late Morning)*

- To agree on next steps and assignments

Draft Agenda

Tuesday	**August 10, 2010 - 8:00 a.m. - 5:00 p.m.**
8:00 a.m.	Welcome and opening remarks- *John Lim, Chair & Phil Huff, Vice Chair* Roll Call; NERC Antitrust Compliance Guidelines- *Joe Bucciero* Facilitator review and SDT acceptance of July 13-16, 2010 Pittsburgh SDT meeting summary
8:15	Review of meeting objectives, agenda and meeting guidelines- *Bob Jones*
8:20	Standards Committee Chair and Senior NERC Management Comments to the SDT on their work
8:40	Review of CSO 706 SDT CIP 002-4 adopted work plan and schedule: *Stu Langton*
8:45	Review and Discussion of CSO 706 SDT CIP 010 & 011 draft work plan and schedule: *Stu Langton*
9:30	Updates on other related cyber security initiatives- *NERC Staff and SDT Members*
10:00	*Break*
10:15	Overview of SDT CIP 002-4 Strawman documents
10:45	Review and refine draft CIP 002-4 standard and related documents
12:00	"Lunch and Learn"- Forensics U.S. CERT *(Lunch)*
1:30	Overview of NERC Survey development and industry comments
2:00	Review and refine draft CIP 002-4 standard and related documents
3:15	*Break*
3:30	Review and refine draft CIP 002-4 standard and related documents
4:50	Review any drafting assignments and Wednesday agenda
5:00	*Recess*

- *Possible Ad Hoc Drafting or Sub Team Meetings- Evening*

Wednesday	**August 11, 2010 - 8:00 a.m. - 5:00 p.m.**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *John Lim, Phil Huff, Joe Bucciero*
8:15	Review and discuss the SDT member survey responses and their implications for CIP 002-4 drafting
10:00	*Break*
10:15	Review and discuss the SDT member survey responses and their implications for CIP 002-4 drafting
12:00	*Lunch*
1:00	Review and refinement of CIP-002-4 documents including implementation plan for NERC staff review
3:00	*Break*
3:15	Review and refinement and consensus testing of CIP-002-4 documents including implementation plan for NERC staff review
4:50	Review any drafting assignments and Thursday agenda
5:00	*Recess*

- *Possible Ad Hoc Drafting or Sub Team Meetings- Evening*

Thursday	**August 12, 2010 - 8:00 a.m. - 5:00 p.m.**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *Phil Huff, Joe Bucciero*
8:15	Adoption of CIP 002-4 documents for NERC staff review
9:00	Review and Adoption of CIP 010 & 011 Draft Schedule
10:00	*Break*
10:15	CIP-010 and 011 Sub-teams present draft summary responses to Industry Comments and Workshop input
12:00	*Lunch*
1:00	CIP-010 and 011 Sub-teams present draft summary responses to Industry Comments and Workshop input
3:00	*Break*
4:30	Agree on schedule for incorporating draft responses to Industry Comments and Workshop input into a single response document *(Afternoon)*
4:50	Review any drafting assignments and Friday agenda
5:00	*Recess*

- *Possible Ad Hoc Drafting or Sub Team Meetings- Evening*

Friday	**August 13, 2010 - 8:00 a.m. - 12:00 p.m.**
8:00	Welcome and Agenda Review, Roll Call and Antitrust Guidelines- *Phil Huff, Joe Bucciero*
8:15	Address CIP 002-4 schedule and tasks including planning for September Webinar
10:00	*Break*

10:15	Review directions and next steps to CIP-010 and 011 Sub-teams
11:00	Review CIP-010 and 011 Sub-Team Schedule
11:30	Review the Winnipeg Meeting Agenda and Next Steps and Assignments
12:00	*Adjourn & Lunch*

- **Appendix # 2 Attendees List**

July 13-16, 2010, Pittsburgh PA

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation (T/W)
2. Jim Brenton	ERCOT
3. Jay S. Cribb	Southern Company Services
4.Jackie Collett	Manitoba Hydro (W/Th/F)
5.Joe Doetzl	Kansas City Pwr. & Light Co (T/W/Th)
6. Sharon Edwards	Duke Energy (T/W/Th)
7.Gerald S. Freese	America Electric Pwr.
8. Jeff Hoffman	U.S. Bureau of Reclamation, Denver (T/W/Th)
9. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
10. Doug Johnson	Exelon Corporation – Commonwealth Edison
11.Rich Kinas	Orlando Utilities Commission (T/W/Th)
12. Patricio Leon	Southern California Edison
13. John Lim, Chair	Consolidated Edison Co. NY (T/W)
14. David Norton	Entergy (T/W)
15. David S. Revill	Georgia Transmission Corporation
16. Scott Rosenberger	Luminant Energy
17. Kevin Sherlin	Sacramento Municipal Utility District (T/W/Th)
18.Tom Stevenson	Constellation
19. John Van Boxtel	WECC (T/W/Th)
Scott Mix	NERC
Roger Lampila	NERC
Howard Gugel	NERC
Joe Bucciero	NERC/Bucciero Consulting, LLC
Robert Jones	FSU/FCRC Consensus Center
Stuart Langton	FSU/FCRC Consensus Center

SDT Members Attending via ReadyTalk and Phone

19. John D. Varnell	Technology Director, Tenaska Power Services Co.

SDT Members Not Participating

Frank Kim	Hydro One Networks Inc. (Th/F)
Keith Stouffer	National Institute of Standards & Technology (T/W/Th)
Jonathan Stanford	Bonneville Power Administration
William Winters	Arizona Public Service, Inc.

Others Attending in Person

Jan Bargen	FERC
Summer Esquerre	NextEraEnergy (FPL)
Jim Fletcher	American Electric Power
Michael Keane	FERC
Drew Kittey	FERC
Jason Marshall	Midwest ISO
Sam Merrell	CERT/Software Engineering Institute
Brian Newell	American Electric Power
Anna Wang	Burns & McDonnell

Brian Newell - AEP
-
Robert Preston Lloyd - SCE
Alex Salinas - SCE
Sam Merrell - SEI/CERT
Jim Stevens - SEI/CERT

Others Attending via Readytalk and Phone
July 13, 2010, Tuesday
July 14, 2010, Wednesday
July 15, 2010, Thursday
July 16, 2010, Friday

Appendix #3 NERC Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and Subroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and Subgroups) may have a negative impact on particular entities and thus in that sense

adversely impact competition. Decisions and actions by NERC (including its committees and Subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation and Bylaws are followed in conducting NERC business. Other NERC procedures that may be applicable to a particular NERC activity include the following:

- Reliability Standards Process Manual
- Organization and Procedures Manual for the NERC Standing Committees
- System Operator Certification Program

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or Subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on
- electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.
- Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and
- employment matters; and procedural matters such as planning and scheduling meetings.

Any other matters that do not clearly fall within these guidelines should be reviewed

with NERC's General Counsel before being discussed.

APPENDIX # 4
CSO 706 SDT MEETING SCHEDULE
OPTIONS 1 AND 2

Appendix X
CIP VERSION 4 PARKING LOT (JUNE, 2010)

Issue (Reference)	Raised By	Date Raised	Sub-Team Assigned	Resolution (Date)
Review clarity of item 1.1, Attachment 2 – Generation Facilities and criteria for Contingency Reserve and Reserve Sharing	Rich Kinas	4/29	CIP-002	**AI:** Revise item 1.1 with input from the industry through the informal comments received.
Shouldn't there be delegations made by the Senior Manager for any exceptions (CIP-011 R2 & R3)	Jackie Collett	4/29	Governance	**Resolved** by the revised CIP-011 text that was posted.
User type access (R3) 3.2 Review the need for network device training (Operators, etc.)	Jim Brenton	4/29	Physical/Cyber & Access Control	Possibly regarding the level of access for outward facing and inward facing devices. What type of user training is required for each level? **Add role-based access (e.g., admin vs. application level access) – physical access & training requirements. Awareness training for everyone, and role-based training as required.**
Combine tables for electronic and physical access control systems (R6, R20, & R22)	Philip Huff	4/29	Physical and System Security	**AI:** Double-check that the proper requirements are incorporated in the respective tables.
Remove ~~Training~~ Termination for physical	Doug	4/29	Physical	

Issue (Reference)	Raised By	Date Raised	Sub-Team Assigned	Resolution (Date)
access to Low Impact (R9)	Johnson			
What do the blank cells mean in the tables in instances where a timeframe is given? (R9)	Jackie Collette	4/29	Howard Gugel	Do they mean there is no requirement at that particular level? **AI:** Double-check the table entries to ensure that the entries are indicative of the requirement. Possibly a statement should be added to the Guidance Document that describes what is meant by a blank entry in a table.
Monitoring the baseline configuration means monitoring the physical location as written. (R23)	Rob Antonishen	4/29	Change Management (Dave Revill)	**AI:** Is baseline the right term? What do we mean by changing physical location?
What timeframe for issuing alerts (Table entry 18.2)	Jackie Collett	4/29	System Security	**AI:** What is the response time requirement? In what timeframe should the alerts be issued?
Need to address what disciplinary actions are? Should physical or cyber access be revoked?	Jackie Collett	5/11	Disciplinary actions (physical/cyber access)	AI:
Combine the revocation of physical and electronic access requirements (including remote access) into one topical area of the standard	Phil Huff	5/11/2010	Personnel access (Sharon Edwards)	**AI:** Need to investigate possible alternatives. Have a requirement to develop a procedure for handling

Issue (Reference)	Raised By	Date Raised	Sub-Team Assigned	Resolution (Date)
				revocation of access.
Review "objective" statements to ensure they do not implicate requirements	FERC	5/27/2010	All	
Make requirements text consistent throughout the Standard	FERC	5/27/2010	All	
Global review of adjectives like "sufficient", "appropriate", etc.	FERC	5/27/2010	All	
Baseline for Low level of Impact	Drafting Teams	6/10/2010	ALL	**Completed on 6/10/2010**
Description of Timing (e.g., annual, months, etc.)	Howard	6/10/2010	NERC	
Protection requirements for electronic and physical access control systems	Doug/Phil	6/10/2010	ALL	
Broad Application of TFE Statement	SDT	6/9/2010	ALL	
Gantt Chart for Compliance Deadlines	Varnell	6/9/2010	Howard	
Exclusion for Entities that don't own cyber systems	Doug	6/10/2010	Full SDT	

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix #5 SDT Consensus Procedures
CYBER SECURITY FOR ORDER 706 STANDARD DRAFTING TEAM
Proposed Refined Consensus Guidelines (May, 2010)

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

Consensus Defined. Consensus is a participatory process whereby, on matters of substance, the Team strives for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for posting CIP standards documents for industry comment or balloting, and the Team finds that 100% acceptance or support of the members present is not achievable, decisions to adopt standards documents for balloting will require at least ~~75%~~ 2/3rds favorable vote of all members present and voting. This super majority decision rule underscores the importance of actively developing a Team consensus on substantive issues ~~which the industry will need to approve by a 2/3's vote.~~

Quorum Defined. The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 2/3 (18 members) of the 26 appointed members being present in person or by telephone.

Electronic Mail Voting. Electronic voting will only be used when a decision needs to be made between regular meetings under the following conditions:

- It is not possible to coordinate and schedule a conference call for the purpose of voting, or;
- Scheduling a conference call solely for the purpose of voting would be an unnecessary use of time and resources, and the item is considered a small procedural issue that is likely to pass without debate.

Electronic voting will not be used to decide on issues that would require a super majority vote or have been previously voted on during a regular meeting or for any issues that those with opposing views would feel compelled to want to justify and explain their position to other team members prior to a vote. The Electronic Voting procedure shall include the following four steps:

1. The SDT Chair or Vice-Chair in his absence will announce the vote on the SDT mailing list and include the following written information: a summary of the issue being voted on and the vote options; the reason the electronic voting is being conducted; the deadline for voting (which must be at least 4 hours after the time of the announcement).
2. Electronic votes will be tallied at the time of the deadline and no further votes will be counted. If quorum is not reached by the deadline then the vote on the proposal will not pass and the deadline will not be extended.
3. Electronic voting results will be summarized and announced after the voting deadline back to the SDT+ mailing list.
4. Electronic voting results will be recapped at the beginning of the next regular meeting of the SDT.

Consensus Building Techniques and Robert's Rules of Order. The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Only Team members may participate in consensus ranking or votes on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Chair, Vice Chair or Facilitator. The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure)*, as modified by the Team's adopted procedural guidelines, to make and approve formal motions. However, the 2/3rds super-majority voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision-making on substantive motions and amendments to motions. The Team will develop substantive written materials and options using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once the Chair determines that a facilitated discussion is completed.

Cyber Security Order 706 SDT — Project 2008-06

August 10, 2010 | 8:00 AM to 5:00 PM CDT
August 11, 2010 | 8:00 AM to 5:00 PM CDT
August 12, 2010 | 8:00 AM to 5:00 PM CDT
August 13, 2010 | 8:00 AM to 12:00 PM CDT

Exelon Corporation
10 S. Dearborn Street
Chicago, IL, 48th Floor

NOTE: 1. Agenda Times May be Adjusted as Needed during the Meeting
NOTE: 2. Drafting Sub-team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- To review the adopted CSO706 SDT 2010 Work Plan and Schedule for CIP-002-4 in 2010
- To review and adopt a Work Plan and Schedule for completing CIP-010 & 011 in 2011
- To review and discuss the results and implications of SDT member companies' data survey results for the CIP 002-4 draft.
- To review, clarify, refine and adopt CIP-002-4 standard proposal for NERC staff review
- To review CIP-010 & 011 sub-teams draft responses to industry and Dallas workshop
- To agree on next steps and assignments

Tuesday, August 10, 2010 8:00 a.m. - 5:00 p.m.

- Introduction, welcome, and opening and guest remarks -*(Morning)*
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review of CSO706 SDT Work plan and schedule for CIP 002-4 *(Morning)*
- Review of CSO706 Draft SDT Work plan and schedule for CIP 010 & 011 *(Morning)*
- "Lunch and Learn"- Forensics U.S. CERT *(Lunch)*
- Overview of NERC Survey Development and Industry Comments *(Afternoon)*

- Review and refine draft CIP 002-4 standard and related documents *(Afternoon)*

Wednesday, August 11, 2010 8:00 a.m. -5:00 p.m.

- Review and discuss the SDT member survey responses and their implications for CIP 002-4 drafting *(Morning)*
- Review and refinement of CIP-002-4 documents including implementation plan for NERC staff review *(Afternoon)*

Thursday, August 12, 2010, 8:00 a.m. - 5:00 p.m.

- Adoption of CIP 002-4 documents for NERC staff review *(Morning)*
- Adoption of CIP 010 & 011 Draft Schedule *(Morning)*
- CIP-010 and 011 Sub-teams present draft summary responses to Industry Comments and Workshop input *(Morning and Afternoon)*
- Agree on schedule for incorporating draft responses to Industry Comments and Workshop input into a single response document. *(Afternoon)*

Friday, August 13, 2010, 8:00 a.m. - 12:00 p.m.

- Review directions and next steps to CIP-010 and 011 Sub-teams – *as needed (Morning)*
- Address CIP-002-4 planning for September Webinar *(Morning)*
- Review SDT September 8-10, 2010 Winnipeg Meeting Agenda (*Late Morning)*

Cyber Security Order 706 SDT- Project 2008-06
25TH MEETING
August 10-13, 2010
Chicago, IL

EXECUTIVE SUMMARY

On Tuesday morning, John Lim, Chair & Phil Huff, Vice Chair of the CSO 706 SDT welcomed members and other participants to Chicago and thanked Doug Johnson for hosting the meeting. Doug reviewed the logistics for the meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. Mr. Bucciero also reviewed the need to comply with NERC's Antitrust Guidelines each day of the meeting, and reminded all participants that the meeting has been publicly noticed and is open to the public. John Lim reviewed the proposed meeting objectives and agenda.

On Thursday morning, the SDT unanimously adopted the July 13-16 Pittsburgh meeting summary with edits presented by John Van Boxtel.

The Chair noted the opportunity of the SDT to hear from Allen Mosher, Chair of the NERC Standards Committee on the SDT's efforts and progress. Allen Mosher addressed the SDT noting the atypical external pressures on the Team related to the nature of the CIP changes the Team has been charged to develop and the level of scrutiny due to the high degree of interest in Washington among agencies and congress in cyber security. He urged the SDT to preserve the two-track approach to developing the CIP standards noting this is an important opportunity to prove to political and regulatory interests that the industry can produce effective cyber security standards and do it promptly. Completing the CIP 002-4 process by the end of this year will help demonstrate to Congress that the industry is capable of self-regulation. Mr. Mosher reiterated that he believed that CIP-010 and CIP-011were the right model, and he hoped the SDT would be focusing again soon on that task. He acknowledged that the CIP 002-4 approach was not a risk based assessment, but stressed the importance of analyzing the data rewquest results regarding "bright lines" to determine whether there will be an increased number of CAs and CCAs. At the end of the day on Tuesday, Allen Mosher thanked the SDT for what it is doing in working as a drafting team to develop consensus. He suggested the SDT is making significant progress on something that is very hard to do.

On Thursday morning, John Lim introduced Herb Schrayshuen, the new NERC Vice President and Director of Standards, who joined the SDT meeting on Thursday morning. He thanked each member for their service and understood and welcomed their questions, recognizing the tensions in the process and feelings about how the SDT has been treated over the past couple months. He took questions from SDT members on: what is success for CIP 002-4; system vs. assets approaches; physical security; and the present culture of

compliance and standards. He noted that process is important but so is delivery. Responding to a question of what success looks like for the SDT's work, he suggested that a standard that helps the industry deal with deficiencies in the current standards and delivers results that improve the cyber security framework of the grid could be characterized as success. He promised to help the SDT secure the necessary resources and assistance to get their job done successfully. The culture of compliance versus the culture of reliability is an on-going debate on how to approach cyber security. He noted that we cannot comply our way to reliability. Mr. Schrayshuen noted that NERC will soon release a new reliability standards approach, including how to prioritize the work to be accomplished.

On Wednesday morning, NERC staff (Howard Gugel) reviewed with the SDT the industry's comments and the NERC responses and changes on the draft NERC Data Request. Howard also presented a summary of the inputs received from the six entities that volunteered, as SDT members, to provide an early unofficial response to the Data Request. This very small sample of inputs included data from some large and small entities. Although this represented a very insignificant sampling as a statistical analysis, it did show a net gain in the number of assets being classified as critical. No one entity showed fewer assets as critical by using the bright line criteria included in the draft Data Request.

On Tuesday morning, John Lim provided an overview of the work by the CIP-002-4 sub-team in refining the CIP 002-4 draft taking into account the inputs received during the Pittsburgh meeting. He noted that following its review and refinement at the Chicago meeting, the SDT will seek to adopt the revised draft CIP-002-4 standard and provide a draft to NERC staff for their review and proposed edits. In Winnipeg, the SDT will review and analyze industry's responses to the NERC Data Request, review NERC staff edits to the draft CIP 002-4 standard text, and review and refine several associated documents including: an implementation plan, a guidance document (including rationales for Attachment 1 criteria), and a summary of industry informal comments on CIP 010 Attachment 2 from which CIP-002-4 Attachment 1 is drawn.

The SDT reviewed and refined each section of the draft CIP 002-4 standard text, and as needed, conducted straw polls on the acceptability of the proposed language. The SDT reviewed, refined, and tested the criteria listed in Attachment 1 of the draft CIP-002-4 standard text, which was prepared in advance of the Chicago meeting. On Thursday morning the SDT unanimously adopted the draft CIP-002-4 standard text as revised for review by NERC staff before the Winnipeg session.

NERC staff (Scott Mix) presented a proposed approach for the CIP-002-4 Implementation Plan to the SDT, which is based on utilizing the currently FERC approved CIP V3 "Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities" document. Since the SDT isn't making any significant changes to the CIP-003 through CIP-009 standards, the only significant addition would be to determine the

implementation for CIP-002-4, which was proposed as the start of the first quarter following FERC approval. Based on the assumptions discussed in the meeting, the starting date for this plan would be July 1, 2011.

This approach was presented to the SDT at the Pittsburgh meeting and then refined based on that discussion. Scott noted that the schedule assumes a FERC order on the last day of a calendar quarter, and therefore the proposed schedule is aggressive, but achievable, and probably meets FERC's expectations. He suggested that a 24-month implementation schedule in all cases would likely not be acceptable to FERC based on past experience. The Chair suggested that following the review and testing of alternative approaches he would look to forming a drafting sub-team to develop a proposed implementation plan for review and adoption in Winnipeg. (See Appendix #7 for the full set of discussion notes).

SDT Member and participant discussion comments on the proposed implementation plan approach touched on: the importance of a communication plan to the industry; the possibilities for FERC approval of the plan; the impact of bright lines on implementation timing questions; the ability to budget for these changes in a timely manner; whether the NERC Data Request information will help guide the implementation plan draft; and the implementation timing regarding nuclear generation facilities.

Following the discussion of the proposed approach, a revised implementation plan concept statement was presented by Scott Mix. The discussion of the revised implementation concept included: clarifying its approach as covering the one time exemption/override for 24 months for newly identified CCAs at newly identified CAs but with all other requirements being consistent with the currently approved implementation plan; factoring in Order 706B requirements and the timing requirements for filing TFEs; and clarifying how this implementation plan would impact or be impacted by the new Urgent Action SAR on CIP 005 that is being drafted. A straw poll on the acceptability of this implementation plan concept did not gain a supermajority of support (2/3s) from the SDT.

Following the straw poll the SDT identified and discussed the following potential alternative approaches:

a. Implementation plan would require identification of CAs within 1 quarter and CCAs within 4 quarters of its approval. Existing Newly Identified CCA Plan could be used, but the clock would not start for these new CCAs until 4 quarters (12 months) after approval
b. Develop a new implementation plan that allows:
    1. 24 months for implementation of Newly Identified CCAs at New CAs and
    2. Uses the existing implementation plan criteria for the Newly Identified CCAs for New CCAs at existing CAs

c. Keep the existing Newly Identified CCA Implementation Plan but add one quarter to Scott Mix's original plan for the effective date

d. Develop a one-shot/one time exception of 18 months (for specific circumstances) with a sunset to the existing implementation plan schedule
e. Provide six months to identify new CCAs and 24 months to implement compliance for the Newly Identified CCAs.

SDT Member and participant discussion of the potential alternatives included: clarifying the impact and pros and cons of each alternative approach in terms of the possibility of delaying FERC's approval; the observation that the issues affect mostly generation with some transmission; considering these options from an audit enforcement perspective; the visibility of a clear date for compliance is critical to show movement forward on implementation; and less effort to justify changes if tied to the already FERC approved implementation plan. The consensus was that the SDT had reached general agreement on the implementation plan concepts, but hadn't settled on the length of time allowed for compliance. Building on this discussion, the following revised concept was presented:

- For the initial application of the "bright lines" in CIP 002-4, CCAs at newly identified CAs will be compliant at 24 months from identification (includes 706B items and TFEs)

- By the effective date of the CIP-002-4 standard (the first day of the second full calendar quarter after regulatory approval), the registered entity will need to identify its CAs and CCAs and has xx months from that date to be compliant with CIP-003 through CIP-009

- For subsequent application of the "bright lines" in CIP-002-4, CCAs at newly identified CAs will be compliant according to the existing Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

- For all implementations of Newly Identified CCAs at existing CAs, the existing Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities will apply as it currently exists.

The Chair and Vice Chair suggested that there was now enough input for a drafting sub-team to prepare a new implementation plan proposal, and volunteers for a drafting sub-team were solicited to develop a plan and bring it back for the SDT's consideration in September. The following members agreed to join the implementation plan drafting sub-team: Sharon Edwards, Phil Huff, Dave Norton, Dave Revill, Scott Rosenberg, and Kevin Sherlin. Mike Keane (FERC) and Scott Mix also asked to participate. Joe Bucciero will facilitate the discussions.

On Tuesday morning, Phil Huff presented a draft project schedule for CIP-010 and CIP-011, which had been circulated to the SDT prior to the meeting, and asked Allen Mosher to provide the Team with any preliminary feedback prior to its fuller discussion and proposed adoption on Thursday. Phil reviewed the draft project schedule that includes a

posting for 45-day formal comment period in late May 2011 and with no informal postings between January and May anticipated. This approach is based on the SDT's experience and feedback from industry earlier this year with CIP-010 & CIP-011. Mr. Mosher suggested the SDT may still want to consider an informal comment period. The Chair noted the SDT's hope and expectation is that if NERC can develop a good communication plan, it can help prevent or minimize the industry's confusion and reduce the anxieties as well as allow for some informal feedback. The SDT will be focused on providing clear requirements for the standards, along with an explanation of the rationale, and build on multiple rounds of formal comment. The draft schedule proposes three rounds of comment and balloting.

On Thursday afternoon, the SDT took up the review of the schedule and tasks for completing its work on the CIP 010 & 011 standards. There was an extended SDT member and participant discussion that covered three broad issues: agreeing on the SDT schedule; preliminary work on next phase; and a deeper issue of the approach to drafting during the next phase.

The discussion on Thursday afternoon covered the following topics: schedule; industry confusion vs. communication; clarification of SDT deliverables- short and long term; sub-team role in setting out proposed approach for full SDT review; SDT organization and management in 2011; clarification of the SDT's overall approach to CIP and validating the work to date; the role of security and costs in designing the CIP standards approach; clarification of FERC's direction to the SDT; clarification of the problem the SDT is addressing- including reviewing the original SAR; NERC's investment and expectations of the SDT in getting the job done; conflicting industry and regulator expectations; and the need for a high level of communication with the industry in 2010 and 2011.

On Friday morning, John Lim reminded SDT members of the importance of working together as a team. Phil Huff offered two new motions describing a process for moving forward on foundational concepts based on Thursday's discussion. The first motion was approved by a voted of 16-1, and the second motion was unanimously approved by a vote of 17-0.

1. The CSO706 SDT will prepare a complete package for initial posting to the industry for consideration and ballot in July 2011, in response to FERC Order 706, with the expectation of ballot body approval and filing to FERC by the end of the year 2011. This is contingent upon the SDT being allowed to complete this work without major redirection of SDT efforts.

2. The CSO706 SDT will form a sub-team to develop a framework for presenting and scoping cyber security requirements for preliminary delivery in October 2010 and completion in December 2010. This deliverable would include the form of the standards and the basis by which the requirements are written and applied. The output of this team would go before the full SDT for review and

approval. This task would not include the actual development of security requirements.

The Chair asked for volunteers for the Framework Sub-Team and the following members responded: Dave Norton (Lead), Joe Doetzl, Phil Huff, Doug Johnson, Dave Revill, Jon Stanford, and John Van Boxtel. In addition, Mike Keane and Scott Mix will join and Joe Bucciero will serve as facilitator. It was agreed that Joe Bucciero would send a note to those members of the SDT not present asking for others who might want to volunteer.

Following the vote, the SDT agreed on the following direction to the current CIP-011 Sub-Teams: the sub-teams need to prepare and finalize the responses to industry comments on CIP-010 & CIP-011 as well as the workshop comment summaries so these documents can be posted in October and recognize industry's investment into those comments.

On Friday, Scott Mix provided an overview of the CIP 005 Urgent Action SAR and the process to date. He urged individual members to provide their comments when the SAR is posted and raise issues they discussed at this meeting.

The Chair and Vice Chair discussed with the SDT the Winnipeg agenda that will start on Wednesday morning, September 8 through mid-morning Friday, September 10. The meeting will include the final adoption by the SDT for posting of CIP-002-4, a review of the NERC Data Request results to determine whether any criteria need changes, review of a CIP 002-4 comment response document drawn from the relevant comments on Attachment 2 of the CIP-010 informal posting, and preparation for the September 23 webinar. Brian Newell has offered to create a database that the SDT can use to calculate Data Request question totals. This will be sent around for the SDT to review in advance of the Winnipeg meeting. Herb Schrayshuen, NERC, noted the discussion of whether additional project management service is needed. The Chair suggested that the SDT develop a better clarification of scope for CIP 010 and 011 after December, 2010 discussions of the Framework sub-team and that a review for such a requirement be made at that time.

The Chair asked Joe Bucciero to send out a recurring meeting invitation to put on everyone's schedule for four hours during the fourth week of each month. The first session will be scheduled for Thursday, August 26, from 12-4 p.m., Eastern time. The Chair and Vice Chair thanked Doug Johnson for the excellent hosting and accommodations, especially the Blue Angels demonstration.

Meeting adjourned at 11:15 a.m.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

25TH DRAFT MEETING SUMMARY
Cyber Security Order 706 SDT- Project 2008-06
Chicago, IL
August 10-13, 2010

I. AGENDA REVIEW, UPDATES, WORKPLAN, SCHEDULE AND REVIEW OF NERC DATA REQUEST

A. Agenda Review and Meeting Logistics

John Lim, Chair & Phil Huff, Vice Chair of the CSO 706 SDT welcomed members and other participants to Chicago and thanked Doug Johnson for hosting the meeting who reviewed the logistics for the meeting. Joe Bucciero conducted a roll call (See Appendix #2) and reviewed the antitrust and public meeting guidelines (See Appendix #3) with the meeting participants. On Thursday morning, the SDT unanimously adopted the July 13-16 meeting summary with edits presented by John Van Boxtel. The Chair announced that Frank Kim has resigned from the SDT for professional and personal reasons but will follow the SDT progress and contribute comments where possible. This means that there are 25 SDT members resulting in a quorum rule of 17 members to conduct business. The meeting began with a quorum 17 members in the room and 2 members participating by phone/ready talk.

John Lim reviewed the proposed meeting objectives noting the following three outcomes needed at this meeting: 1. Adopt draft CIP 002-4 – everyone agreeing with language and criteria and utilizing the data request responses of some of the member companies as a guide; 2. Agree on a schedule for CIP 010 and 011 to deliver to the Standards Committee; and 3. review the Sub-team summaries of informal comments and the workshop input. The facilitator Bob Jones reviewed and the SDT agreed to the proposed timed agenda.

The Chair noted the opportunity of the SDT to hear from Allen Mosher, Chair of the Standards Committee on the SDT's efforts and progress.

B. Updates on other related cyber security initiatives- *NERC Staff and SDT Members*

Scott Mix provided the SDT an update on the urgent action CIP 005 SAR. Once the Standards Committee approves then it will go out to ballot for SDT formation. The proposed revisions may land about the same time as this groups work on CIP 002. It may be helpful to post together or at the same time. The intention is to include a compliance guidance document that is still being developed with input from companies of differing levels. They are still putting together the SAR

Member Comments

- I would like this group to have a look at this before it is pushed through – within the rules but think this group should look at it.
- When is the CAN is issued? When is it guidance versus compliance? It seems multiple people are now writing requirements.
- Allan Mosher noted that compliance is written by NERC staff, reviewed with regions and others – it is compliance guidance to regional staff for understanding for compliance purposes. The Standards Committee is working on setting up a one-stop shop for interpreting standards though interpretations could still be formal or informal.
- This seems like a back door approach to compliance requirements.
- Response to unofficial request for interpretation that was pulled without interpretation – I will submit request in the near future – need formal guidance.
- The CAN process is causing concerns for the industry as a whole. Even if it provides guidance for auditors, it seems that it adds requirements not necessarily in the standard.
- The new SAR seems closely related to our activities.
- There is a different definition of "critical." NERC needs a methodology for what is most critical for reliability – not sure what the background is for that SAR.
- Note that regional entities do not own "assets."
- If it is "critical" it needs to be uniform across industry with a common list. Industry would support unifying such a list to limit confusion and number of compliance officers.
- Unlikely that industry would support lining up critical assets with critical facilities at this point.

Keith Stouffer reported that latest version of the NISTER report was released last week for review. The person leading that effort has moved to FERC. Dave Norton noted that a recent report of insider incidents showed that they were up 28% last year.

C. Standards Committee Chair Comments to the SDT

Allen Mosher addressed the SDT noting the atypical external pressures on the Team related to the nature of the CIP changes the Team has been charged to develop and the level of scrutiny due to the high degree of interest in Washington among agencies and congress in Cyber security. He noted the industry's high level of concern regarding compliance issues as NERC is in the midst of trying to revamp its compliance system and culture.

He urged the SDT to preserve the two-track approach to developing the CIP standards noting this is an important opportunity to prove to political and regulatory interests that the industry can produce effective cyber security standards and do it promptly. Completing the CIP 002-4 process by end of this year will help demonstrate to Congress that the industry

capable of self-regulation. There is no dispute about the need for a higher degree of regulation of cyber security or statutory authority, though some still question how far that authority should go. By being successful on CIP 002-4 we can take some of the wind out of the sails of those arguing to simply drop the NIST into the CIP security standards. This would cost industry billions of dollars without a guarantee of better security for the grid. We need to provide an effective industry developed alternative or the continued deference to industry self-regulation in terms of NERC's standards process will be in question. If we fail here, it may mean loss of authority in other areas – cyber security is just the initial test.

SDT Member Questions:

Members expressed frustration with the SDT's re-direction on CIP 002-4 noting that a political problem has been assigned to a technical group to solve. There was discussion of the perception of some in the industry and those observing this effort that political drivers have resulted in a deadline to identify more critical assets but that CIP 002-4 is not enough.

Mr. Mosher reiterated that he believed that CIP 010 and 011were the right model and he hoped the SDT would be focusing soon on that task. He acknowledged the CIP 002-4 approach was not a risk based assessment, but stressed the importance of analyzing the results of the data request regarding "bright lines" in September to determine whether there will be an increased number of CAs and CCAs. He also acknowledged SDT and industry concerns about creating a workable transition to CIP-010 and 011 and the concerns with compliance and auditing confusion with multiple CIP versions in play. The SDT also discussed that for cyber security the size of the asset may not be the controlling factor. There was also acknowledgement of the need for uniformity of an industry approach. Finally a phase-in period for a risk-based system anticipated by CIP 010 and 011 should be developed to allow the industry to get controls in place.

Mr. Mosher noted his target and focus is on the CIP 010 and 011. He noted that the industry needs an interim step to fix the most egregious gaps in identifying assets in current CIP system but it does not make sense for the SDT to stop at 002-4. The hope is the NERC Data Request results will help guide the team in determining what percentage of increased assets is the right amount or target. It was noted that NERC President Gerry Cauley stated that success in the short term for the SDT would be that industry adopts bright line criteria that can be technically supported. Technical justification for each bright line will be an important part of the SDT discussions going forward vs. the exact number of CAs.

In the last meeting the SDT adopted plan to complete 002-4 as soon as possible and no later than December in order to get back to work of CIP 010-011 development.

At the end of the day on Tuesday, Allan Mosher thanked the SDT for what it is doing in working as a drafting team to develop consensus. He suggested it is making significant progress on something that is very hard to do. He urged them not to fix it for a member's sector or company, but for the industry as a whole, i.e. a set of criteria driven by reliability

that you can justify with engineering. He acknowledged the heartburn on CIP 002-4, but suggested it will make it easier for the SDT to do CIP 010 and 011. Many in the industry are concerned about the big jump to the latter. However, it is the path we are on and you can make it work by explaining why we are doing it and advocating for its adoption.

D. NERC Vice President and Director of Standards Comments to the SDT

John Lim introduced Herb Schrayshuen, the new NERC Vice President and Director of Standards, who joined the SDT on Thursday morning. He thanked each member for their service and understood and welcomed their questions, recognizing the tensions in the process and feelings about how the SDT has been treated over the past couple months. He noted that process is important but so is delivery. Responding to a question of what success looks like for the work of SDT, he suggested a standard that helps the industry deal with deficiencies in the current standards and delivers results that improve the cyber security posture for the grid. He promised to help the Team secure the necessary resources and assistance and help them get their job done successfully. In response to a question of whether there was some number required to be covered in terms of critical assets under CIP 002-4, Mr. Schrayshuen suggested that the NERC Data Request results will provide some guidance but that there will need to be a technological basis for number of assets covered. He urged the SDT to keep in mind the industry frame within which they are working and the reality that the SDT is going to get more "help" than you may want and that the SDT is on a pragmatic schedule spurred by industry input, although not an ideal schedule from the SDT perspective.

He noted that some members of the SDT have superior knowledge in terms of security clearances and may have concerns about what security approaches work and don't work, e.g. data on frequency issue. This may create an uneven base of knowledge which impedes progress on problem solving. On another SDT, the dynamic within the team led to failure at the ballot. Issues were voiced in drafting team process but not resolved so members left the Team prepared to vote no in the ballot. The drafting team had thought their job was done by simply voicing concerns and then expressing opinions to the industry and voting no on the resulting proposed standard. The lesson is that it is a breakdown of the process for a team not take an issue and try to resolve it here, and when all is said an done, make a team decision informed by this problem solving.

The culture of compliance versus culture of reliability is an important debate on how to approach cyber security. He noted that we cannot comply our way to reliability. Quality control plan training has started and we are looking for conflicts between standards. My last job was compliance manager and I got a zero finding showing it can be done. Experience with the audit process should influence results but not at the expense of lowering the bar. The SDT should try to use it to inform and improve standards.

Mr. Schrayshuen noted that NERC will soon release a new standards approach, including how to prioritize. We are trying to put everyone in the same room, including FERC, to create one list of priorities moving forward in an effort to avoid redirects.

Member Comments on the SDT's Challenges

- **What is success for CIP 002-4?** We were on a process to deliver broad coverage, when the team was redirected to a bright line criteria –with a challenge to deliver by end of this year something that the industry must support and regulators have to see as a real "improvement." Do we have a certain number of assets identified to equal "success"?
- Taking your position at an interesting point – this is a whole new thing and responding in an atmosphere of fear – trying to address 100 years of effort with new threats – cyber security overlay with two parts for generation and for transmission worlds resulting in a complex puzzle. Mr. Schrayshuen noted he understand distinctions between them.
- Industry in better shape now from standards and compliance. However, standards Committee and CCC don't have substantive expertise on cyber issues. Also need better subject matter quality control on auditor hires.
- **System vs. Assets Approaches.** The SDT has struggled with two different approaches: a systems focus versus an assets and sites focus. In essence, by analogy, we are being asked to say which airports are the most important vs. protecting the air traffic control system. Mr. Schrayshuen noted he favors an incremental progress to improvement – don't go for "the bridge too far" but don't preclude improved approaches in the future. There may be a need to prioritize in terms of timing – not everything can be important at the same time – build toward a better long term approach.
- Size matters for impact optics, but vulnerability can come from smaller venues.
- **Physical Security.** We are hearing that many are interested in physical security and concerns about how that issue can rearrange priorities. Physical securities over the next five years. That is not within scope. Prioritization is predicated by someone writing a SAR. Since no SAR has been submitted yet on physical security, we cannot assess priority.
- **Culture of Compliance and Standards.** There is a disconnect between standards writing and the nits of compliance. The latter doesn't add security but it does add huge expense. We have to worry about how an auditor will interpret, rather than focus on most reasonable interpretations, (e.g. antivirus on a switch when there has never been a virus on a switch because auditors are asking for it).
- There is growing unrest in the industry about compliance which will need to be addressed sooner rather than later. Inconsistency between regions is one aspect. FERC participation in audits is new as well. The industry looks to requirements as the yardstick, but now having to look at things from FERC that may not yet be in the

requirements. It is increasingly hard to figure out what the yardstick is for measuring compliance.

- Auditing process needs to be better coordinated – need to know the limits, auditors can go anywhere and we can't standardize our compliance programs
- Compliance with TFE process is not equal to the return of effort – cited for insufficient senior manager designation – that is not helpful.
- Many SDT members have gone through audits during the drafting process and they return with a heightened concern about the wording of standards.
- No matter what words are used in the standards, compliance agonizes over the words rather than the intent – examples of the absurd and the pain level and frustration of industry is immense –
- Affects reliability if just focused on paper work.

E. Briefing on the NERC Data Request

On Wednesday morning, NERC staff Howard Gugel reviewed with the Team the industry comments and the NERC responses and changes on the draft NERC Data Request *(See Appendix #4)/*
He then presented a summary document showing the results of the six entities whose SDT members responded which included some large and small entities. Although this is a very insignificant sampling as a statistical analysis, it does show a net gain in cyber assets. No one entity showed fewer assets by using the bright line requirement. The SDT will need to categorize by type for the full set in September. The Chair encouraged members to think of questions we could ask of the data that would help our analysis of CIP 002-4.

Member Comments

- Looking at high category as equal to "critical." The SDT would be interested in seeing what would be "medium" as a distinction with 010-011 versus CIP-4. This should include high and medium and be a positive number.
- We need to see if we can find the number of "high" – how many more sites would be subject to the standard as a "high?" A: the data from the Data Request should help define that – but does not identify "cyber" assets.
- We will need to document the technical justification for each element of our work
- Responses are in numbers not text to allow for quick compilation in spread sheet form for analysis
- No one listed anything new in category 1.2 – nothing new additional under bright line – none of the six members listed nuclear, though some have nuclear facilities.
- Catch data on switchyards to nuclear? Yes, as the interface which is important to us.
- Generation control centers only exist in "high" or "low" - not "medium" – intended?

II. SDT CIP 002-4 STRAWMAN DOCUMENT REVIEW

A. Overview

John Lim provided an overview of the work by a sub-team in refining the CIP 002-4 draft following the Pittsburgh meeting. *(See, Appendix # 6)* He noted that following its review and refinement at this meeting, the SDT will seek to adopt it to provide a draft to the NERC staff for their review and proposed edits. In Winnipeg the SDT will review and analyze industry responses to the Data Request, review the NERC staff edits to the CIP 002-4 with the VSLs and VRFs, and review and refine several associated documents including: an implementation plan, a guidance document including rationales for Attachment 1 and a summary of industry informal comments on CIP 010 Attachment 2, on which CIP 002-4 Attachment 1 is based.

Phil Huff and Howard Gugel took notes on possible rationales and justification and checked with the SDT periodically following discussions to clarify the justifications. Their notes will be used to develop the justification draft following this meeting.

B. Review and Refinement of the Strawman CIP 002-4

The SDT reviewed each section of the CIP 002-4 strawman, and as needed, conducted straw polls on the acceptability of the language. The final adopted text is included in Appendix #5 and a full set of SDT comments and polls is included in Appendix #6.

1. Applicability

Distribution Provider

***Straw Poll*: Support removing distribution provider from the applicability section. Yes-15 No-4 (74%)**

SDT comments included: helps to improve possible industry acceptance in balloting; Version 3 did not have this; wait for CIP 010 and 011 to re-introduce as responsive to Order 706 and could be an attack vector will need protection

4.2: SDT question: What was the rationale for taking out this section? It is covered under 706b – no longer exempt.

4.2.1 - last sentence added
***Straw Poll*: Favor removing "However all access points to the ESP are not exempt.": Yes-16 No – 0 (100%)**

The SDT discussion before the straw poll included the following points: this comment belongs to the requirements; this clause is already in CIP003; why include one item here but not serial dial up; and, clarifying what is on or off a list, not the protections required.

2. CIP 002-4 Requirements

John Lim noted that the SDT agreed in Pittsburgh to delete the original R1. This is modified version of the original R2 in Version 3 which was accepted in Pittsburgh.

R1. Critical Asset Identification — Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the ~~create, maintain and review on an annual basis, a list of its Critical Assets identified according to the~~ criteria contained in *CIP-002-4 Attachment I – Critical Asset Criteria*. The Responsible Entity shall review this list at least annually, and update it as necessary.

Re-insert the original R1 language on annual review
***Straw Poll*:** support using the original language (underlined above):
Yes - 17 No – 0

Discussion before the straw poll resulted in some edits to make the statement clearer. Other comments before the straw poll included: whether to leave "annual" as it is here or whether to stick with the original R1 language; should acquisition of new assets be included here; and should this address including new asset as a CA and not waiting until the end of the annual period

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets. ~~essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real time power system modeling and real time inter utility data exchange.~~ For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

Member comments on R2 included: changes made in R2 need to be consistent with Attachment 1; change "essential to operation" because it may leave too much flexibility

for entities; NERC Glossary definition of CA includes "essential" to operations; worried about how rather than what they are doing; moving it is a way of mitigating the risk; examples and definitions should not be in the requirement; and add a box explaining it is redundant and is covered by definition.

The SDT tested the following changes with straw polls:

***Straw Poll*:** Remove "essential to operation of the Critical Assets":
Yes - 13 No – 6 (68%)

***Straw Poll*:** Remove Examples sentence –
Yes - 15 No – 4 (79%)

- Opposed. The SDT should take minimalist approach to editing so as to avoid comments on why language is removed. We can address many of these in CIP 010-011.

***Straw Poll*: Put Last sentence above**
Yes 19 No- 0

- M1 was removed earlier and needs to be noted in the final redline

3. Critical Assets Criteria- Attachment 1

The SDT reviewed, refined and tested the criteria listed in the CIP-002-4 strawman prepared in advance of the Chicago meeting. As a result of the Chicago discussion, straw polling and refinements to the criteria taking place on Tuesday and Wednesday *(See Appendix 6 for the SDT discussion notes and straw polls)*, the following 16 criteria were adopted unanimously by the SDT on Thursday morning for review by NERC staff before the Winnipeg session:

1.1. A generating unit or group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability in the preceding 12 months exceeding the lowest Contingency Reserve identified over the preceding 12 months by the Reserve Sharing Group or the Balancing Authority if it is not a member of a Reserve Sharing Group, at the time the CIP-002 is reviewed.

1.2. Any reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater.

1.3. Generation Facilities that the Planning Coordinator or Transmission Planner designated as required for reliability purposes.

1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan.

1.5. The Facilities comprising the Cranking Paths and initial switching requirements identified in the Transmission Operator's restoration plan.

1.6. Transmission Facilities operated at 500 kV or higher.
1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with four or more other stations in the Eastern Interconnection or the Western Interconnection.
1.8. Transmission Facilities operated at 200 kV or higher at stations interconnected at 200 kV or higher with four or more other stations in the Texas Interconnection or the Quebec Interconnection.
1.9. Transmission Facilities that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).
1.10. Flexible AC Transmission Systems (FACTS), that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).
1.11. Transmission Facilities providing the generation interconnection required to directly transmit generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified in Attachment 1, criteria 1.1 or 1.3.
1.12. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.
1.13. Special Protection Systems (SPS), Remedial Action Schemes (RAS) or automated switching systems that operate BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).
1.14. Common control system(s) that are capable of performing automatic load shedding of 300 MW or more.
1.15. Any control center or control systems, and backup control center or backup control systems, used to perform the functional obligations of the Reliability Coordinator or Balancing Authority or Transmission Operator.
1.16. Any control center, or backup control center, used to control generation that is identified as a Critical Asset, or used to control generation greater than an aggregate of 2300 MWs in a single Interconnection.

C. CIP 002-4 Implementation Plan

1. Initial Proposed Approach

Scott Mix reviewed the a proposed approach for the Implementation Plan with the SDT which is based on utilizing the currently FERC approved CIP implementation plan and included the following components:

Proposed Effective Date Language

- "The first day of the first full calendar quarter after applicable regulatory approvals have been received; or, the first day of the second full calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required."
- *Assuming* FERC acts within one quarter, issuing an order on March 31, 2011, the effective date would be July 1, 2011 in both the US and Canada.
- Outreach to inform industry to start identification process upon filing.

The Rest of the Standards

- Since we aren't making changes to CIP-003 through CIP-009, the currently approved "Implementation Plan for newly Identified Critical Cyber Assets and Newly Registered Entities" would apply
- This plan was designed to apply to "Newly registered Entities", and was modeled after the Version 1 Table 4.
- Assuming the previous timeline, the starting date for this plan would be July 1, 2011.

Newly Identified CCA Plan Recap

- The Newly Identified CCA Plan allows:
- •24 months for entities without any Version-3 CCAs
- •For entities with Version-3 CCAs:
- Immediate for Policy, Leadership, Exceptions (CIP-003), Awareness (CIP-004)
- 6 months for Information Protection, Access Control, Change Control (CIP-003), Incident Reporting and Response (CIP-008), Recovery Plans, Backup & Restore, Testing Backup Media (CIP-009)
- 12 months for Electronic Security Perimeter (CIP-005), Physical Security (CIP-006), Systems Security Management (CIP-007), Exercises, Change Control (CIP-009)
- 18 months for Training, Personnel Risk Assessment, Access (CIP-004)

This approach was presented in Pittsburgh to the SDT and then refined based on that discussion. He noted the schedule assumes for a FERC order on the last day of a quarter and suggested the proposal is aggressive achievable and probably meets FERC's expectations. He suggested that 24 months would not be acceptable to FERC based on past experience. The Chair suggested that following the review and testing of approaches he would look to forming a drafting team to develop a proposal for review and adoption in Winnipeg. (See Appendix #7 for the full set of discussion notes.

Member and participant discussion comments on the approach touched on: the importance of a communication plan**;** the likelihood of FERC Approval of the plan; the impact of bright lines on timing questions; the ability to budget for these changes; whether the information from the NERC Data Request will help guide the implementation plan draft; the newly identified CCA plan; and nuclear generation.

2. Revised Approach Concept

Following the discussion of the approach above a revised concept statement was presented by John Lim and Scott Mix providing:

> "For the initial implementation of CIP 002-4, CCAs at newly identified CAs will be 24 months (i.e., follow Milestone Category 1 in Table 2, Implementation Milestones for Newly Identified Critical Cyber Assets) in the IPFNICCAANRE (Add 706B items and TFEs)
>
> For subsequent implementations of CIP 002-4 at newly identified CAs, the IPFNICCAANRE will be followed as written
>
> For all implementation of newly identified CCAs at existing CAs will follow the IPFNICCAANRE as written."

The discussion of the revised implementation concept included: clarifying its approach as covering the one time exemption/override for 24 months for newly identified CCAs at newly identified CAs but with everything else is consistent with existing effort; factoring in 706b and when to file TFEs; clarifying how this implementation plan would impact or be impacted by the new CIP 005 version; covering the need for outages to implement.

Straw Poll on Proposal
Favoring proposed approach to drafting implementation plan
Yes=9 Oppose=4 Abstain=5

3. Alternative Approaches to Developing the Implementation Plan

Following the poll the SDT identified and discussed the following potential alternative approaches:

a. Implementation plan that requires identification of CAs within 1 quarter and CCAs in 4 quarters. Existing Newly Identified CCA Plan could be used (but the clock would not start for these new CCAs until 4 quarters (12 months) after approval

Or

b. Develop a new implementation plan that allows
   1. 24 months for Newly Identified CCAs and New CAs and
   2. Uses the existing Newly Identified CCAs for New CCAs at existing CAs
   3. Keep the newly identified CCA

Or

c. Add one quarter to Scott Mix's original plan for effective date.

Or

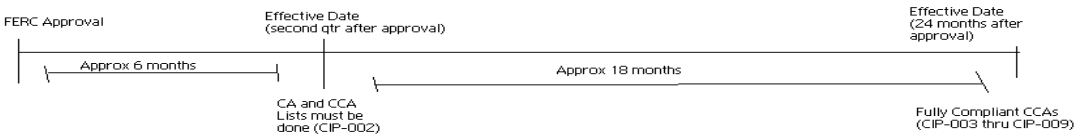
d. Develop a one-shot/one time exception (for specific circumstances) with a sunset to the existing implementation plan schedule.

Or
e. Provide six months for identifying and 24 months to comply.

Member discussion of potential alternatives included: clarifying the impact and pros and cons of each option in terms of the possibility of opening up the implementation plan and delaying FERC's approval; the observation that the issues affect mostly generation with some transmission; consider these options from an audit enforcement perspective; the visibility of a clear date is critical to show moving forward on implementation; It will be easier to justify if tied to the a already FERC approved implementation; general agreement on the concept but we haven't settled on the length for compliance. Following this discussion, over lunch John Lim and Scott Mix drafting the following revised concept:

For the initial application of the "bright lines" in CIP 002-4, CCAs at newly identified CAs will be compliant at 24 months from identification (add 706B items and TFEs)

The effective date of the standard (upon the regulatory approval) the registered entity will need to identify CAs and CCAs within six months and xx months to be compliant with 003-009



4. Implementation Plan Drafting Team

The Chair and Vice Chair thought there was enough input for a drafting team to develop a new proposal and solicited volunteers for a drafting team to bring back for the SDT's consideration in September.

Implementation Plan Drafting Team Volunteers: Sharon Edwards, Dave Revell, Kevin Sherlin, Scott Rosenberg, Mike Keene (FERC), Dave Norton and Phil Huff and Scott Mix.

III. REVIEW AND DISCUSSION OF CSO 706 SDT CIP 010 & 011 DRAFT WORK PLAN AND SCHEDULE

A. Initial Review and Discussion of CIP 010 & 011 Schedule and Workplan

On Tuesday morning, Phil Huff presented a strawman draft 010-011 schedule circulated to the SDT prior to the meeting and asked Allen Mosher to provide the Team with any feedback prior to its fuller discussion and adoption on Thursday. Phil reviewed meeting schedule with approval for posting for 45 day formal comment in late May and with no informal postings between anticipated based on experience and feedback earlier this year with CIP 011 & 012.

Mr. Mosher suggested the SDT may still want to consider an informal comment period. John Lim noted that we have tended to get the same comments for both informal and formal postings and the industry has been confused when the informal draft is incomplete. They might appreciate dealing with as complete a package as possible. He noted the SDT's hope and expectation is that if NERC can develop a good communication plan, it can prevent or minimize the confusion and reduce the anxieties as well as allow for some informal feedback. The Team should be providing what is the standard, along with an explanation of the rationale and build in multiple rounds of formal comment. The draft schedule proposes at least three rounds to build expectation and understanding allowing the SDT to refine and focus on the key issues for industry acceptance.

One company has estimated $150 million to implement CIP 010 and 011 and the chance for companies to provide informal input is vital now that it is mandatory with huge fines potentially. The visibility of this effort is high as is the industry anxiety. For example, one potential unintended consequence may be that companies would shut down marginal plants rather than implement the new cyber security requirements.

Investments in cyber security should be aimed at highest benefit. Some entities are hiring compliance officers to check boxes focusing on the trivial. This is a problem in current CIP 002-009 standards. Cyber security is not vegetative management. Rather it is fundamentally different effort in terms of enforcement. The industry may need a system of certification. There is anger out among entities about compliance with CIP 002-009. We may need to look at the FSMA model for certification methodology and lessons learned.

How do we agree on a schedule if we do not have general acceptance of our approach to CIP 010-011?

B. 2nd Review and Refinement of Workplan and Schedule for CIP 010-011

On Thursday, the SDT took up the review of the schedule and tasks for completing its work on the CIP 010 & 011. Phil Huff reviewed with the Team the key highlights of the draft schedule:

- First posting for Formal Comment is proposed for May 31, 2011.
- This assumes an aggressive NERC industry communication campaign to support the effort prior to posting for formal comment.
- By December the SDT will turn its full time attention to CIP 010 & 011.
- By March the SDT will send a package for review with NERC staff, compliance and legal.
- Review in April any edits and Approve in May.

There was and extended SDT member and participant discussion that covered many issues (*See Appendix #7 for a detailed version of the comments).* Stu Langton suggested there was an important discussion of three distinct issues: schedule; preliminary work on next phase; and deeper issue of approach to drafting during the next phase. We may need someone to work on and present a suggestion on the drafting approach for the next phase in Winnipeg.

The discussion on Thursday afternoon covered the following topics:

- Schedule & industry confusion and communication
- Clarifying SDT deliverables- short and long term
- Sub-team role in setting out proposed approach for full team SDT review.
- SDT organization and management in 2011
- Clarifying the SDT's overall approach to CIP and validating the work to date
- The role of security and costs in designing the CIP standards approach
- Clarifying FERC's direction to the SDT
- Clarifying the problem the SDT is addressing- including reviewing the SAR
- NERC's investment and expectations of the SDT getting the job done.
- Conflicting industry and regulator expectations
- The need for high level of communication with the industry in 2010 and 2011.

On Friday morning, John Lim reminded team members of importance of working together as a team. He then withdrew his motion on the proposed CIP 010-011 schedule from day before for the sake of inviting another motion that may be clearer and reflect the good discussion points from yesterday.

Phil Huff offered two motions (seconded by Dave Norton) that describe a process for moving forward on foundational concepts discussed yesterday. In general, the motion moves the posting date for formal comments back to July, 2011 and suggests taking time in front end to set foundation before launching into the requirements in January 2011. This will provide for at least three more months for the foundation discussion. In the course of

discussion of the motion, there were several amendments to the language of motion accepted by the maker and the following motion was adopted with 16 members in favor and 1 opposed:

1st Motion for CSO706 SDT Project Schedule

> **The CSO706 SDT will prepare a complete package for initial posting to the industry for consideration and ballot in July 2011, in response to FERC Order 706, with the expectation of ballot body approval and filing to FERC by the end of the year 2011. This is contingent upon the SDT being allowed to complete this work without major redirection of SDT efforts.**

Phil Huff offered his second motion (seconded by Dave Norton) that established a framework sub-team to be chaired by Dave Norton and will report back to the SDT in October for initial input and then in December for review, refinement and adoption of the CIP 010 & 011 approach. The discussion that followed noted that the motion draws on the essence from Phil's initial proposal (*See Appendix 8).* The following motion was adopted unanimously with 17 members in favor and none opposed:

2nd Motion Process for Implementing CIP 010-011 Schedule- Framework Sub-Team

> **The CSO706 SDT will form a sub-team to develop a framework for presenting and scoping cyber security requirements for preliminary delivery in October 2010 and completion in December 2010. This would include the form of the standards and the basis by which the requirements are written and applied. The output of this team would go before the full-team for review and approval. This task would not include the actual development of security requirements.**

The Chair asked for volunteers for the Framework Sub-Team and the following members responded: Dave Norton (Lead), Joe Doetzl, Phil Huff, Doug Johnson, Dave Revill, Jon Stanford and John Van Boxtel. In addition, Mike Keane and Scott Mix will join and Joe Bucciero will serve as facilitator. It was agreed that Joe Bucciero would send a note to those members of the SDT not present asking for others who might want to volunteer.

Following the vote the SDT agreed on the following direction to the current CIP-011 Sub-Teams: We need the output from the sub-teams on responses to industry comments and workshop comment summaries so they can be posted in October and recognize industry's investment into those comments.

IV. DISCUSSION OF URGENT ACTION SAR FOR CIP 005

Scott Mix provided an overview of the SAR and process to date. He noted the following link in the Board of Trustees packet that has the SAR information: http://www.nerc.com/docs/standards/sc/sc_081210a_complete_agenda_draft.pdf

He noted the draft Removes R2.4 and a new requirement R6 on remote access controls – attempts to capture what you do with cyber stuff from outside that needs access inside for remote maintenance and support. This an attempt to bring sanity to the issue and discusses process, procedures and who can do what. The 6.3 protocols for access through ESP still need a guidance document to explain the architecture. R6.5 was deleted – list of technical requirements of what you need to do to those remote sites to secure them. Next steps in urgent action will post the SAR and proposed modifications for comment but not sure if informal or for ballot and formal comment.

Member Comments

- Have not seen SAR – concern about requirements in CIP 006 that send you back to CIP 005 – would SAR allow us to clarify R2 and R3 to say you do not have to create an ESP, and would anything here create difficulty with physical access control?
- Effort was to narrowly address issue in the SAR, not open it up to broader issues. You would protect like an ESP without necessarily creating an ESP.
- Physical access control spans geography – treat like an ESP but not create one –
- Send me an email of your and others experience in audits and can look at CAN interpretation.
- Huge issue for our budget and WECC auditors have a different interpretation.
- Multiple ways to address the issues in R6 draft – guidance to auditors will be important
- It says what ought to be done, not how to do it – expectation that multiple correct answers to get the results – auditors need to understand there are multiple possible answers and not just the one they would have done themselves
- R 6.5 – original team intent – meant that outside device needed protections – if R 6.5 is out then need support contracts should require support to follow rules.
- How do you audit it if it is not in the standard?
- Put into guidelines at a minimum – also 6.3.1, host inside the end point or something else? Could create problems as written.
- Can't look at encrypted info as it crosses?
- Members should consider providing comments to spur team to look at the issue
- We are making conforming edits – is that included here or vice versa?

- NERC staff proposes references 005 to this posting. NERC will have to conform the two so not to complicate this teams work and avoid auditing confusion
- Any of the language from CAN or our work make it into this version? Do we need to do something in our version to incorporate the CAN? Would the CAN end up defining the requirement?
- This process will potentially create implementation and audit questions – what can we live with from an operational perspective – CAN addresses something we did not get to yet – not sure we have time and ability to fix it now, but may when we go back to 010-011 may need to consider it as input to that later work.
- How does this integrate with 004? Does it creates double jeopardy? CIP 003 lays out the governance, CIP 004 says who can have access, CIP 005 says how they can have access.
- CIP 004 seems to overlap with changes presented here – should we look at cleaning up the potential mess of remote access?
- SDT members should use the process for providing comment to get the new group to look at it – official documentation to ensure they look at it.
- Does the SAR allow them to look at CIP 004 to address?
- When will it be posted? Not sure of the mechanics of the posting, but the NERC BOT has authorized to post and the announcement may be soon, sometime new week.
- Who is working on conforming these two efforts? The industry will not care who it comes from. This should be put on the webinar call in September to educate the industry. It is a very complex topic.
- There will be comments on CANs too.
- Need to keep focus more narrow – and suggest Ed Goth as author of the SAR participate in the webinar and provide a one page summary *(Scott Mix will reach out to Ed)*
- Looking at interactive remote access or any remote access – the controls offered here all seem aimed at interactive remote access – does not say support and maintenance
- File a comment for clarification

V. NEXT STEPS AND ASSIGNMENTS

The Chair and Vice Chair discussed with the SDT the Winnipeg agenda. The meeting will start Wednesday morning, September 8 through mid-morning Friday, September 11. The meeting will include the final adoption by the SDT for posting of 002-4, a review of the results from the NERC Data Request and their tabulated database results to determine whether any criteria need changes, and review of a CIP 002-4 comment response document drawn from the relevant comments on Attachment 2 of CIP 010 informal posting.

Brian Newell has offered to create a database that the SDT can use to calculate the NERC Data Request question totals. This will be sent around for the SDT to review in advance of Winnepeg.

Herb Schrayshuen, NERC, noted the discussion of whether additional project management service is needed. The Chair suggested that the SDT will develop better clarification of scope for CIP 010 and 011 after December, 2010 discussions of the Framework sub-team and that a review of the need would be performed at that time.

The chair also noted the need to start working on planning for theSDT CIP 002-4 webinar to be conducted on September 23rd from 11:00-1:00 EST. It makes sense that the CIP 002-4 subteam lead the webinar presentation(s) with other SDT members providing technical support and NERC and others to provide industry support. A proposal going forward will be reviewed and adopted the Winnipeg meeting.

The Framework sub-team is planning to meet approximately twice a week on Monday and Thursday afternoons starting the week of August 23 for approximately 90 minutes to accomplish its objectives. Joe Bucciero will be sending out a scheduling tool to select the best meeting times for most people to participate.

Stu Langton noted that last month the SDT talked about setting aside a once a month conference call midway between their meetings which could be cancelled if not needed. The Chair asked Joe Bucciero to send out a recurring invitation to put on everyone's schedule for four hours. The first session will be scheduled for Thursday, August 26, from 12-4 p.m., EDT.

The Chair and Vice Chair thanked Doug Johnson for the excellent hosting and accommodations, especially the Blue Angels demonstration.

Meeting adjourned at 11:15 a.m.

Appendix # 1— Meeting Agenda

Project 2008-06 Cyber Security Order 706 SDT
Draft 25th Meeting Agenda
August 10, 2010, Tuesday- 8:00 AM to 5:00 PM CDT
August 11, 2010 Wednesday- 8:00 AM to 5:00 PM CDT
August 12, 2010 Thursday- 8:00 AM to 5:00 PM CDT
August 13, 2010 Friday- 8:00 AM to 12:00 PM CDT
Exelon Corporation
10 S. Dearborn Street, 48th Floor , Chicago, IL
NOTE: 1. Agenda Times May be Adjusted as Needed during the Meeting
NOTE: 2. Drafting Sub-team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- To review the adopted CSO706 SDT 2010 Work Plan and Schedule for CIP-002-4 in 2010
- To review and adopt a Work Plan and Schedule for completing CIP-010 & 011 in 2011
- To review and discuss the results and implications of SDT member companies' data survey results for the CIP 002-4 draft.
- To review, clarify, refine and adopt CIP-002-4 standard proposal for NERC staff review
- To review CIP-010 & 011 sub-teams draft responses to industry and Dallas workshop
- To agree on next steps and assignments

Tuesday, August 10, 2010 8:00 a.m. - 5:00 p.m.

- Introduction, welcome, and opening and guest remarks -*(Morning)*
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review of CSO706 SDT Work plan and schedule for CIP 002-4 *(Morning)*
- Review of CSO706 Draft SDT Work plan and schedule for CIP 010 & 011 *(Morning)*
- "Lunch and Learn"- Forensics U.S. CERT *(Lunch)*
- Overview of NERC Survey Development and Industry Comments *(Afternoon)*
- Review and refine draft CIP 002-4 standard and related documents *(Afternoon)*

Wednesday, August 11, 2010 8:00 a.m. -5:00 p.m.

- Review and discuss the SDT member survey responses and their implications for CIP 002-4 drafting *(Morning)*
- Review and refinement of CIP-002-4 documents including implementation plan for NERC staff review *(Afternoon)*

Thursday, August 12, 2010, 8:00 a.m. - 5:00 p.m.

- Adoption of CIP 002-4 documents for NERC staff review *(Morning)*
- Adoption of CIP 010 & 011 Draft Schedule *(Morning)*
- CIP-010 and 011 Sub-teams present draft summary responses to Industry Comments and Workshop input *(Morning and Afternoon)*
- Agree on schedule for incorporating draft responses to Industry Comments and Workshop input into a single response document. *(Afternoon)*

Friday, August 13, 2010, 8:00 a.m. - 12:00 p.m.

- Review directions and next steps to CIP-010 and 011 Sub-teams – *as needed (Morning)*
- Address 002-4 planning for September Webinar *(Morning)*
- Review SDT September 8-10, 2010 Winnipeg Meeting Agenda (*Late Morning)*

Appendix # 2 Attendees List
August 10-13, 2010, Chicago IL

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation
2. Jim Brenton	ERCOT
3. Jay S. Cribb	Southern Company Services
4.Joe Doetzl	Kansas City Pwr. & Light Co
5. Sharon Edwards	Duke Energy
6.Gerald S. Freese	America Electric Pwr.
7. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
8. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
9. Doug Johnson	Exelon Corporation – Commonwealth Edison
10. Patricio Leon	Southern California Edison
11. John Lim, Chair	Consolidated Edison Co. NY
12. David Norton	Entergy
13. David S. Revill	Georgia Transmission Corporation
14. Scott Rosenberger	Luminant Energy (T/W/Th)
15. Kevin Sherlin	Sacramento Municipal Utility District
16. Jonathan Stanford	Bonneville Power Administration
17. Keith Stouffer	National Institute of Standards & Technology
18. John Van Boxtel	WECC
Herb Schrayshuen	*NERC Vice President and Director of Standards (Th/F)*
Scott Mix	*NERC*
Howard Gugel	*NERC*
Joe Bucciero	*NERC/Bucciero Consulting, LLC*
Robert Jones	*FSU/FCRC Consensus Center*
Stuart Langton	*FSU/FCRC Consensus Center*
Hal Beardall	*FSU/FCRC Consensus Center*

SDT Members Attending via ReadyTalk and Phone

19. John D. Varnell	Technology Director, Tenaska Power Services Co. (T/W)
20.Rich Kinas	Orlando Utilities Commission (T/W)
21. William Gross	(W/Th/F)
22. Tom Stevenson	Constellation (T/Th/)

SDT Members Not Participating

Jackie Collett	Manitoba Hydro (W/Th/F)
William Winters	Arizona Public Service, Inc.

Others Attending in Person

Jan Bargen	FERC
Joel Garmen	Next Era Energy (FPL) (T/W/Th)
David Batz	EEI (W)
Robert Preston Lloyd	Southern California Edison
Michael Keane	FERC
Jason Marshall	Midwest ISO
Bryn Wilson	OG & E
Brian Newell	American Electric Power
Mark Simon	Encari
Tom Alrich	Matrikon
Allen Mosher	APPA, Standards Committee Chair
Guy Zito	NPCC (T/W)

Others Attending via Readytalk and Phone

August 10, 2010, Tuesday

Peter	Kuebeck	FERC
Todd	Williams	MidAmerican
Larry	Camm	Schweitzer Engineering Laboratories, Inc.
Michael	Welch	Florida Power and LIght
Laura	Hussey	laura_hussey@mindspring.com
Thomas	Reina	FERC
David	Batz	Edison Electric Institute
Andres	Lopez	US Army Corps of Engineers
Justin	Kelly	FERC
Jerome	Farquharson	Burns & McDonnell
Roger	Fradenburgh	Network Security Technology, Inc
Rod	Hardiman	Southern Company
Nicholas	Snyder	FERC
Jacob	Van Wagoner	El Paso Electric
Amir	Hammad	Constellation Energy
Summer	Esquerre	NextEraEnergy, Florida Power and Light
Ingrid	Rayo	Constellation Energy
David	Gordon	Mass. Municipal Wholesale Electric Co.

August 11, 2010, Wednesday

Jacob	Van Wagoner	El Paso Electric
Justin	Kelly	FERC
Andres	Lopez	US Army Corps of Engineers

Appendix #3 NERC Antitrust Compliance Guidelines

See Antitrust Compliance Guidelines read at the beginning of each day's session at:

(NEED LINK)

The NERC reminder below was read at the beginning of each day's session.

NERC REMINDER FOR USE AT BEGINNING OF MEETINGS AND CONFERENCE CALLS THAT HAVE BEEN PUBLICLY NOTICED AND ARE OPEN TO THE PUBLIC

For face-to-face meeting, with dial-in capability:

Participants are reminded that this meeting is public. Notice of the meeting was posted on the NERC website and widely distributed. The notice included the number for dial-in participation. Participants should keep in mind that the audience may include members of the press and representatives of various governmental authorities, in addition to the expected participation by industry stakeholders.

Appendix #4 NERC CIP 002 Critical Asset Methodology Survey: NERC Responses to Comments Received

Summary of Comments Received Regarding Proposed CIP-002 Methodology Data Request:

NERC's proposed CIP-002 Methodology Data Request was posted for industry comment on July 7 for a nineteen-day public comment period. As a result of this public posting, NERC received comments from 65 entities. Summarized below are the overarching issued identified in these comments and NERC's position regarding the issues raised.

Issue Number 1: Nuclear issue

Several entities expressed concern about what appears to be an additional High Impact Rating criterion (1.1. Nuclear Generation Facilities), that has not been present in previous versions of the CIP-002 standard released for comment. Their concern is that this criterion does not seem to be based on any measurable Bulk Electric System impact, but rather on the type of generation fuel utilized, and that this criteria is not an effective method of reliably determining impact to the BES.

NERC response: The main purpose of the Data Request is to obtain information that the CIP Standard Drafting Team can use to determine what assets should be included in the bright line criteria for a proposed CIP-002-4. The Data Request is not proposing to define new criteria. It is merely collecting data so that new criteria can be defined at a later point by the standard drafting team to include in a proposed CIP-002 Version 4 standard.

Issue Number 2: Over counting assets

Several entities were concerned about how to count facilities that may meet multiple criteria. It was expressed that additional instructions for the survey would help to avoid potential erroneous "double counting" of assets that meet certain criteria. For example, facilities that have multiple owners should only be counted once. Facilities that serve multiple entities and/or serve an entity operating in multiple regions should only be counted once. In addition, there was a question about whether the Data Request should be filled out for each NERC Compliance Registry entry, or on an enterprise-wide basis.

NERC response: In response to these comments, the instructions were modified to clarify that each facility should only be counted one time in the survey responses. Furthermore, owners of jointly-owned facilities should coordinate their response so that those facilities are only counted once. The instructions were also modified to stipulate that the Data Request should be

responded to on an enterprise-wide basis, to ensure that internal facilities were also only counted once.

Issue Number 3: Estimate on Burden Imposed to Collect Data

Many entities stated that the time estimate to respond to the Data Request was not high enough. Almost all comments stated that the estimate to respond would take anywhere from 25 to 100 hours to complete.

NERC Response: The estimated time to complete the Data Request was modified to "less than 100 hours" total per entity.

Issue Number 4: Canadian entity issue

One entity noted that this data request is being proposed in accordance with Section 1600 of the NERC Rules of Procedure. This entity stated that "This section clearly states that, within the United States, NERC and regional entities may request data or information that is necessary to meet their obligations under Federal Power Act. This section does not apply to Canadian based entities and we suggest that in the future this is explicitly stated in the text to avoid confusion on the part of Canadian entities."

NERC Response: All NERC registered entities, including Canadian entities, are required to comply with the NERC Rules of Procedure. Section 100 of the NERC Rules provide:

> NERC and NERC members shall comply with these rules of procedure. Each regional entity shall comply with these rules of procedure as applicable to functions delegated to the regional entity by NERC or as required by an appropriate governmental authority or as otherwise provided. Each bulk power system owner, operator, and user shall comply with all rules of procedure of NERC that are made applicable to such entities by approval pursuant to applicable legislation or regulation, or pursuant to agreement.

Therefore, pursuant to applicable legislation, regulation, or agreement among NERC and Canadian provincial authorities, Canadian entities are required to comply with Section 1600 of the NERC Rules of Procedure, including responding to this Data Request upon it becoming mandatory by NERC Board of Trustees approval.

Issue Number 5: High vs. Medium

Several entities expressed concern that high and medium impact levels are included on the Data Request. The concern is that both high and medium impact Critical Assets would be used for CIP-002-4, and all of CIP-003 to CIP-009 would apply to both.

NERC Response: The reason that both high and medium impact levels are included in the Data Request is to assist the Standard Drafting Team in determining whether the bright line between high and medium is set at the correct level. The team intends to use only the high impact level for a bright line for determining Critical Assets that will then be used to determine Critical Cyber Assets. There is no intent to include a medium level in the proposed CIP-002-4.

Issue Number 6: Data use

Several entities questioned whether the following statement could be stated with certainty:

This data will not be used as a basis for determining compliance with the currently enforceable CIP-002 through CIP-009 reliability standards.

NERC Response: As noted in the Data request, the information being collected is only to be used prospectively by the drafting team to evaluate a proposed methodology to be used in a future version of the CIP-002 standard. Therefore, the data being collected will not be used as a basis for determining compliance with the currently enforceable CIP body of standards.

Changes Made to the Survey in Response to Comments and Standard Drafting Team input:

As a result of comments received and additional standard drafting team ("SDT") review, NERC made the following changes to the survey:

- Changed the references to "drafting team data request" to "NERC data request."
- Modified the reference to "Regional Reliability Organization" to "Regional Entity" based on the list of Responsible Entities in CIP-002-2.
- Changes the estimated number of hours to complete the data request from "less than 24" to "less than 100" based on comments received on the Data Request.
- Clarified that NERC registered entities should respond to the data request on an enterprise-wide basis, and that entities with jointly-owned facilities coordinate their responses for such facilities.
- An explanation of the requirements under the current CIP-002-2 standard was added to clarify the information requested in questions 1 and 2.
- A clarification was made to ensure that each element on the list should be counted only one time.
- A clarification was made that each Critical Asset should be counted only once.
- A modification was made that all NERC Compliance Registry (NCR) numbers for the enterprise-wide survey response be included.

- Question 1 and 2 were clarified to state that the responses should be based on each entity's existing Critical Asset list under the currently-effective CIP-002-2 standard.
- The third column heading was changed for the tables in question 2 and question 3 for consistency.
- Question 4 was added to require entities to report all NCR numbers for their enterprise-wide response.
- Attachment 1 Item 1.1 – "Generation" was changed to "generation" to reflect the fact that generation is not a NERC glossary term.
- Attachment 1 Item 1.2 – changed based on input from the Standard Drafting Team (STD).
- Attachment 1 Item 1.3 – changed based on industry comments and input from the SDT.
- Attachment 1 Item 1.4 – changed to add clarity based on industry comments and input from the SDT.
- Attachment 1 Item 1.5 – changed to add clarity based on industry comments and input from the SDT.
- Attachment 1 Item 1.7 – split into two items to add clarity based on input from the SDT.
- Attachment 1 Item 1.9 – changed to add clarity based on industry comments and input from the SDT.
- Attachment 1 Item 1.10 – split into two items to separate FACTS devices from other devices that prevent IROLs based on input from the SDT.
- Attachment 1 Item 1.12 – changed to simplify wording and add clarity based on input from the SDT.
- Attachment 1 Item 1.15 – changed to limit scope to control systems for load shedding based on industry comments and input from the SDT.
- Attachment 1 Item 1.16 – modified to add clarity based on input from the SDT.
- Attachment 1 Item 1.17 – modified to provide MW levels in order to provide the SDT with data to determine bright line levels, if applicable.
- Attachment 1 Item 1.18 – modified to provide kV levels in order to provide the SDT with data to determine bright line levels, if applicable.
- Attachment 1 Item 1.19 – changed to add clarity based on input from the SDT.
- Attachment 1 Item 1.20 – added to allow entities to include additional assets as Critical Assets based on input from the SDT.
- Attachment 1 Item 2.1 – modified to provide consistency with Item 1.2.
- Attachment 1 Item 2.2 – modified to provide consistency with Item 1.3.
- Attachment 1 Item 2.3 – deleted based on modifications to Item 1.4.
- Attachment 1 Item 2.3 (new) – modified to provide consistency with Item 1.7.

- Attachment 1 Item 2.4 – modified to provide consistency with Item 1.8.
- Attachment 1 Item 2.6 – changed to add clarity based on input from the SDT.
- Attachment 1 Item 2.7 – changed to add clarity based on input from the SDT.
- Attachment 1 Item 2.8 – changed to add clarity based on input from the SDT.
- Attachment 1 Low Impact Rating – changed “Critical Assets” to “BES Elements” based on industry comments in order to add clarity.

Appendix # 5- CIP 002-4 Adopted Draft (8-12-10)

Introduction

1. **Title:** Cyber Security — Critical Cyber Asset Identification
2. **Number:** CIP-002-4
3. **Purpose:** NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

   These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

   Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

   Standard CIP-002-4 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of the criteria in Attachment 1.
4. **Applicability:**
   - **4.1.** Within the text of Standard CIP-002-4, "Responsible Entity" shall mean:
     - **4.1.1** Reliability Coordinator.
     - **4.1.2** Balancing Authority.
     - **4.1.3** Interchange Authority.
     - **4.1.4** Transmission Service Provider.
     - **4.1.5** Transmission Owner.
     - **4.1.6** Transmission Operator.
     - **4.1.7** Generator Owner.
     - **4.1.8** Generator Operator.
     - **4.1.9** Load Serving Entity.
     - **4.1.10** NERC.
     - **4.1.11** Regional Entity.
   - **4.2.** The following are exempt from Standard CIP-002-4:
     - **4.2.1** Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.
5. **Effective Date:** The first day of the third calendar quarter after applicable regulatory approvals have been received (or the

Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

Requirements

R1. Critical Asset Identification — Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment I – Critical Asset Criteria*. The Responsible Entity shall review this list at least annually, and update it as necessary.

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

R 2.1 The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
R 2.2 The Cyber Asset uses a routable protocol within a control center; or,
R 2.3 The Cyber Asset is dial-up accessible.

R3. Annual Approval — The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2, the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

Measures

M1. The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R1.

M2. The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R2.

M3. The Responsible Entity shall make available its approval records of annual approvals as specified in Requirement R3.

Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting
Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-002-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None.

2. Violation Severity Levels (To be developed later.)

Regional Variances

None identified.

VERSION HISTORY

Version	Date	Action	Change Tracking
1	January 16, 2006	R3.2 — Change "Control Center" to "control center"	03/24/06
2		Modifications to clarify the requirements and to bring the compliance elements into	

		conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update
4	09/?/2010	Modified to provide bright-line criteria for the identification of Critical Assets.	

CIP-002-4 - Attachment I

CRITICAL ASSET CRITERIA

The following are considered Critical Assets:

1.1 A generating unit or group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability in the preceding 12 months exceeding the lowest Contingency Reserve identified over the preceding 12 months by the Reserve Sharing Group or the Balancing Authority if it is not a member of a Reserve Sharing Group, at the time the CIP-002 is reviewed.

1.2 Any reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater.

1.3 Generation Facilities that the Planning Coordinator or Transmission Planner designated as required for reliability purposes.

1.4 Each Blackstart Resource identified in the Transmission Operator's restoration plan.

1.5 The Facilities comprising the Cranking Paths and initial switching requirements identified in the Transmission Operator's restoration plan.

1.6 Transmission Facilities operated at 500 kV or higher.

1.7 Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with four or more other stations in the Eastern Interconnection or the Western Interconnection.

1.8 Transmission Facilities operated at 200 kV or higher at stations interconnected at 200 kV or higher with four or more other stations in the Texas Interconnection or the Quebec Interconnection.

1.9 Transmission Facilities that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).

1.10 Flexible AC Transmission Systems (FACTS), that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).

1.11 Transmission Facilities providing the generation interconnection required to directly transmit generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified in Attachment 1, criteria 1.1 or 1.3.

1.12 Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

1.13 Special Protection Systems (SPS), Remedial Action Schemes (RAS) or automated switching systems that operate BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).

1.14 Common control system(s) that are capable of performing automatic load shedding of 300 MW or more.

1.15 Any control center or control systems, and backup control center or backup control systems, used to perform the functional obligations of the Reliability Coordinator or Balancing Authority or Transmission Operator.

1.16 Any control center, or backup control center, used to control generation that is identified as a Critical Asset, or used to control generation greater than an aggregate of 2300 MWs in a single Interconnection.

Appendix # 6- CIP 002-4 8-10-12, 2010 Discussion Notes and Straw Polls

In Pittsburgh the SDT, after consideration and debate, agreed to delete Criteria 1 related to nuclear industry generation facilities. The SDT in Chicago looked once again at the possible justifications for restoring this deleted criteria and including nuclear generation facilities. Some argued that if one nuclear plant were subject to an attack then all plants might be shut down until they can prove that they do not have the same reliability issue. This would be a fleet issue unique to nuclear generation and reaction to one incident. In addition once a nuclear plant comes off line it will not get it back in 24 hours – investigation will take time and may take out a big block of production. It is also a symbolic target beyond other system assets that plays in Congress or the New York Times and risk protection strategies need to recognize a higher level of scrutiny and perception.

SDT Member and Participant Comments

- **Nuclear facilities.** Agree if higher "value" target then should have more protection, but not because of loss of capacity. No question these plants have high political visibility. However, U.S. has a better, more diverse system of nuclear operation systems. Problems encountered in the past have not shut down all plants.
- We also have the survey to identify which components in nuclear are safety and subject to NRC and which are reliability for NERC – some argue designating all as safety for NRC regulation – may want to designate it all as "high" to avoid issues with NERC.
- NRC has a huge program around cyber security and we are not addressing their issues in the CIP as we are focused on reliability
- Still a fuel question
- Support including – it is optics – high impact, very low probability – but must have standard to address it – exception to calling out a fuel type because of optics
- Communication team needs to explain it was not exempted before but included here – what difference if it is on CA list make any difference in NRC shutting them all down – take exemption out will not affect NRC shutting them down or not for safety
- Would NRC close them all down? Even if they did would do it so as not to affect system reliability – the cyber equipment varies between the nuclear plants, not a common load failure question – this is not a reliability question, only an optics or political question
- We are addressing "impact based" criteria in CIP 002-4 – Hard to reconcile the risk basis for a higher profile for nuclear generation where everything else is impact based, not risk based. This represents a different framework for criteria.
- Political reality – the communication efforts need to point out that we took out the exception for nuclear – if there is a reliability basis, that should be in there – not because it is a nuclear plant.
- Shouldn't matter what the fuel but rather what is the impact on the system. There is a lot of work going on to address the issue within the nuclear industry already.

- Nuclear excluded in Pittsburgh but if exclude 1.1 then may need to add back in – optics must be considered – not mentioning nuclear anywhere will look bad.
- Cyber requirements being developed for nuclear as part of its licensing structure – even though aimed at radiation releases, it is broad and in depth covering the same components for reliability.
- To be consistent it has to be reliability based – but optics that "nuclear" is different or special to those outside the industry.
- How can we focus on reliability of BES but somehow recognize "nuclear"?
- Agree on objectives but how do we get there and arm representatives in Washington – again, in 010-011 some nuclear plants may fall into "low" category – that will not sell – if not including all nuclear then need to explain that NRC is covering under "safety" or other reason – also still believe fleet of nuclear is different and subject to broader potential shut down.
- We will need a clear explanation why any are not included as "critical"
- If use bright line – then many nuclear units will not be included and it will be difficult to defend.
- If put in all nuclear plants now then put in tiered approach later, we may cause confusion – prefer removing exemption and consider the same as others.
- Transmission owner controls substations – most of the nuclear substations are critical even if the generator is not.
- Think we can still say in the next round that all nuclear are "critical"?
- All nuclear generation is addressed by NRC and we say all controls are "high" in our system.
- 1.12 has language already addressing the issue. Nuclear exclusion not there, transmission facilities covered in 1.12 and no distinction by fuel.
- Clarify the shared component is cyber and not just a fence –
- 706b speaks to the issue – anything not covered by NRC is subject to the NERC standards – order by FERC sets out the division of responsibility – no need here to call out the fuel.
- Does not answer if nuclear plant is a CA or a CCA which is necessary to determine 002-009 coverage.
- Either identifying everything inside a common fence, or the common cyber connections
- May help with optics – but the point is to get a list of CCAs – isn't the end result the same – is this plant critical – yes, if it has shared critical cyber asset.
- Have to justify the bright lines you pick to the Commission.
- Trying to in a single section work through an "if, then" set of logic? Single asset for common failure threat or by cyber connection? Just trying to get into the first bucket of identifying as CAs then determine the process for protecting – you seem to be wrestling with both at the same time with the same criteria.
- Will need to show why or how the bright line approach provides better protection
- Any of the alternative language will be "fudgy" and imperfect

- The language in the yellow should be “generation plants” instead of “generation units”?
- Prefer keeping language the same or close to the current CIP version 3
- “For each group of generating units (including nuclear generation) at single plant location identified in Attachment 1 ….”
- Are we saying “only” Cyber Assets that must be considered …? Only shared assets?
- Still needs to be connected by routable protocols – also FERC referred to not enough assets identified, is there a study for that?
- Want to limit the scope to cyber system that controls more than one unit – need to recognize many systems may be interconnected, beyond just the control systems
- In CIP 10 we refocus on cyber systems that impact bright line in 1.1 – here, the clarification smoothes that transition – if we bring everything else in the plant that changes the dynamic – leave this here as is.
- Is there is a concrete definition of adverse impact within 15 minutes – fuzzy, may need discussion later
- Units may talk to each other over some connection – are we considering that a shared system and the only thing we are protecting – what if it is an Ethernet cable without other connections? If it has a switch? What are we trying to get at here? Do we want to protect a cable inside a plant? Are we only looking at “shared”? Does that mean we are protecting cables and switches?
- Tied more to shared systems – it is a connectivity question.
- Shared switch in the middle currently has to be within a protected perimeter.
- Plants surrounded by a fence to be critical only if shared system that impacts the whole site – fence does not define as a critical asset.
- That is not what the standards says – identify those critical to operation of the plant.
- Today protecting assets critical to the unit, not the plant – only those that are shared.
- Can have one cyber asset affecting one unit that then impacts other units – it is the impact on the aggregate of the plant – looking for cyber assets that link the physical assets together – that is what CIP 10 intends to do, but CIP 002-4 does not – find critical assets first through aggregate that exceeds bright line, then for the shared systems.
- Shared systems, not the physical fence
- We should not rely just on the compliance document.
- We had this discussion under “target of production” thirteen months ago
- We should keep the language here or take it out altogether.
- Why does highlighted language not address the issue.
- Switch on the shared network? What needs to be protected? Just the switch?
- Similar problem with EMS – call our control systems as critical.
- How is industry digesting the ambiguity?
- 010-011 addresses the issue, the CIP 002-4 does not.

- The single location is the problem here – I have separated systems and protections even where they are in the same physical location – now trying to introduce a single plant location.
- Delete everything in color – figure out the iron impacted and protect the routable protocols – cannot write something to every entity in the country.
- But we set bright lines and will be held to audits.
- Frustrated because we are trying to define critical asset list when we should focus on the critical cyber asset – this language makes the audits so much more painful.
- Where should we identify the critical asset impact – not critical because it is in the fence but because it impacts reliability.

***Straw Poll*:** Putting in Nuclear as Separate Criteria
Yes – 3 No – 13

- 706b already addresses the issue

***Straw Poll*:** Keep the yellow shaded language in R1remain? (For each group of ...)
Yes – 8 No – 9

Comments after Poll

- Note we did not say we did not want the language but do not want it here.
- Ramification of putting language in the attachment?
- Putting into attachment loop CAs into determination of CCAs
- If in attachment then the plant is not identified as CA lowering the number identified

Criteria 1.1 (newly numbered)

- Wording in 1.1(a) revised to delete 1.1b – (b) was the value if not in a group –
- Value in b sets at smallest value of (a) fluctuating value as a floor.
- (a) was suppose to be RSG and b is if BA is independent – were separated originally
- Thought we said everyone has to be in a group in "a" and eliminated a, b and c
- Can this be accurately explained in a quick manner? Looks as if plants would fluctuate in and out of qualifying
- Is it the lesser of or the greater of? Need to clarify.
- Contingency reserve set differently by region – with guidance from another standard
- Has to be based on a formula
- Standards says there will be a contingency reserve but not prescribe how
- delete "a" and "b"?
- contingency reserve means something to operators – the 2000 is a default number
- Options: delete b, or take 2000 out

- Do we need to put qualifying language back into "a" that was pulled out to make "b"?
- Trying to limit the tracking of different values
- Update as necessary?

***Straw Poll*:** Delete "b", with a and c remaining.
Yes – 15 No– 0

- How do we set how determine the value if it fluctuates?
- Reword "a" – "The lowest contingency reserve identified by the reserve sharing group or balancing authority if it is not a member of a Reserve Sharing Group, at the time the CIP002 is reviewed , or….."
- Why set at lowest level? That is the worst case.
- Those are the periods when most vulnerable as units are most likely down for maintenance.
- The lower the contingency reserve the more units are brought in – the contingency reserve is intended to protect your system.
- What is the current level? About 1800, with lowest around 1400-1500

***Straw Poll*:** Support reworded "a":
Yes – 17 No – 0

- Some areas that do not have contingency reserves? If required why have "c"

***Straw Poll*: Delete "c"?**
Yes - 10 No - 0 Abstain - 6

- Abstainers need to be educated to know how to vote.
- This was intended to catch any entity that was not in a BA or a RSG
- Everyone has to be in a reserve sharing group.
- A plant can be divided up into four regions – but if so, then it may not be critical – do you need a critical value
- Do we still need to keep the 2000 threshold?

1.2

- What group of Facilities within 15 minutes? Need to fix.
- Seems inconsistent with the previous section – this says reactive resource – put comma between compensator and that so we get intent of not associated with Generation Facilities - "any reactive resource not associated with Generation Facilities ….
- If control center controls distribution of cap banks? Combination of all of them could exceed 1000 –
- It makes individual cap banks a CA

- Excluding control centers? It is not a common cyber asset; not sure this sentence says that – change group of facilities to operation of the reactive resources
- Why did we add the "shares a common Cyber Asset or common Cyber Assets"?
- Put period after Cyber Asset and start new sentence?
- Talking about Cyber Assets? Figure out CCAs later
- Any reactive resource at a single location? Excluding generation facilities?
- Any reactive resource or group of reactive resources at a single location (excluding generation Facilities) having aggregated rated net Reactive Power capability of greater or equal to 1000 MVAR
- If no routable protocol or dial up then don't need to worry about shared
- "Nameplate rating"? put back in place of greater or equal to
- Any reactive resource or group of reactive resources at a single location (excluding generation Facilities) having aggregated net Reactive Power name plate rating of 1000 MVARs or greater.
- Take out first "rated"
- Where did we get the 1000 MVARs? Arbitrarily half of 2000 formerly in R1?

1.2 Any reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater.

***Straw Poll*:** Accept 1.2 as revised above.
Yes – 16 No – 0

1.3

- "Must run"? It has a specific meaning in certain markets. Planning coordinator doesn't determine reliability "must-run" – not sure who still uses the term. Is there a standard for "must-run"? It is a market thing in our area. There are references on NERC site for "must-run" contracts but it is not an official term.
- If planning coordinator says needed for reliability – may need to change the term – "Generation Facilities that the Planning Coordinator identifies as required to be available for reliability purposes."
- "to be available"? "identify as required for reliability purposes."
- Is the planning coordinator the right entity? (yes)
- Planning coordinator can tell you it is a critical asset?
- Think about possible blow-back if saying cannot retire units for purposes of reliability – if cheaper to retire than pay mortgage but now saying cannot take off line?
- Do we run into challenges of PC determining short term operations by requiring continuing for reliability.
- Every bit critical before you decide to retire the unit than after you decide to retire it – why is it not critical before deciding to retire it?

- Not restricting beyond reliability requirement – what if WEC is the designator and the auditor? Is the RRO designating and auditing Critical Assets?
- What is added here not captured in 1.1.
- WEC does have designated "must-runs"
- How do I know what has been identified under this provision? By contract? Then formally designated.
- May not be just a retirement issue.
- Change to "designated" and drop formally?
- What is the time frame? Past, future or current?
- Think it is current when you are audited – that is the way written now.
- Concerned about WEC designating and auditing – seems a conflict of interest, but willing to let industry ballot and comment.
- Add Transmission Planner?
- Care less about who and more about how designated.
- Identified assets we think is critical – let industry decide who and how designated – put out to ballot as written here

"Generation Facilities that the Planning Coordinator or Transmission Planner designated as required to be available for reliability purposes."
Support for 1.3 as revised above:

Straw Poll: Yes: 13 No: 1 Abstaining: 1

1.3

- Transmission operators plan identifies all Blackstart capable units – is that what we intended, to bring in every Blackstart capable unit?
- Need to see what the requirements are for TO to come up with the plan.
- Blackstart is a NERC defined term that may limit – though Blackstart plan includes other resources not included in the term "Blackstart Resources"
- These are not necessarily units you go to first – may need to reach out to drafters of standard to identify the critical assets and not the small units that may be listed in the plans
- "Essential to system restoration" – not everything, but what you would go to first to restore the system – the starting points – restoration plans include anything capable – This needs clarification
- Read NERC definition of Blackstart Unit as background.
- Requirement to test to see if units capable of performing Blackstart function – scheduled test.
- Blackstart units listed to kick in big units – seems clear.
- Large number of permutations for bringing supply back on line? Plan is set out to assure enough capacity is available – blackstart units are declared in current plans.

- Why was "primary" dropped from 1.4? Because there is not distinction or requirement for a "primary" blackstart unit or resource.
- Are we providing incentive to remove assets as blackstart units?

1.4-1.6

- How would Blackstart unit know it is included – need to clarify
- The plan is a catalogue of everything capable of serving as a Blackstart Resource
- Definition of Blackstart Resource is not every capable unit
- There are actual contracts out there for Blackstart Resources and contingencies – we have are resources designated.
- How about "contained" versus "identified"?

1.3 Any Blackstart Resource contained in the Transmission Operator's restoration plan.
1.4 The Facilities comprising Cranking Paths contained in the Transmission Operator's restoration plan.

- Phil Huff will check with Rich Kinas this evening who drafted this section at the last meeting.
- Can we say any Blackstart Resource in the plan is in?
- We had "primary" still in the survey? Significant difference between any and primary – may preliminary survey responses may be all wrong
- Can compile and provide quick overview along with some of the initial industry comment in response to the language in the survey

On Thursday morning, the SDT review any final outstanding issues before seeking to adopt CIP 002-4 for NERC staff review.

- **Criteria 1.1**. Regarding yesterday's question about voltage differences between regions – Scott Mix thought there was a reference possible to an existing standard. After some research it does not seem to be any accepted standard we can rely on for justification for differences by region.
- The idea is to identify where the bulk of BES occurs and hope that if you draw bright lines you will capture the highest impact facilities so the cyber assets connected to them will be protected.
- If bright line is from Vegetation, then it is 200 across regions.
- Trying to provide a clear understanding to a complex situation is something like fitting a square peg into a round hole.
- The 200 level gets both worlds with one standard.
- Losing sight of the fact we need three lines for h-m-l – but not a distinction between regions – lowering to the lesser one may not address need for three later on – ultimately will need more than one bright line.

- This does give us room to pick a medium later.
- Do we need three bright lines? This may be a misapplication of the NIST model. Could we get around this if we do high and everything else? Have been vigorous and gone fairly deep with high here, down into the mediums. Some think high should be much higher than here, more included here than many had expected.
- Suggest sticking with what we have at this point – need additional expertise in the room to help determine the appropriate level.
- Still have capability to tier even if we go with 200 cutoff here.
- Distinctions between interconnection on megawatts but different for voltage levels of transmission
- Went with the number based on Texas using 230 – need to confirm what Texas and Quebec use. Most of Quebec is over 300
- Looking at voltage class – may need to look at capabilities
- Allen Mosher suggested looking at getting subject matter experts from other teams to review our product to make sure it makes sense and help with the justifications
- Want a simple to understand bright line solution or appropriate solution to a complex issue – bright lines do not always fit cleanly or provide perfect solutions
- Do not have enough operational expertise on this group – we got review from others in the past – need to do so again – still think we need to draw clean lines the best we can – comment period will allow experts to weigh in on the line
- Anecdotal evidence says we do not need 1.8 – ask Rod Hardiman for advice
- Justification for separate voltage thresholds for Texas and Quebec? Strike criteria if not, and go with one standard. Quebec has said they want 500.
- Justification for distinction between 1.7 and 1.8? Pointing back to a document that cannot be found. I am nervous to make that distinction without more knowledge. From the southeast perspective I am comfortable for deleting 1.8.There is no justification for the distinction
- Threshold may be important – 300 may be justified

Straw Poll: Test whether to strike 1.8, and Eastern-Western from 1.7?
Favor=15 Oppose=0 Abstain=3

Motion to forward CIP 002-4 with attachment 1 to NERC for staff review
(Huff, Norton 2nd)
Yes=18 No=0

Appendix #7 CIP 002-4 Implementation Plan Discussion Notes

Scott Mix reviewed the a proposed approach for the Implementation Plan with the SDT which is based on utilizing the currently FERC approved CIP implementation plan and included the following components:

Proposed Effective Date Language

- "The first day of the first full calendar quarter after applicable regulatory approvals have been received; or, the first day of the second full calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required."
- *Assuming* FERC acts within one quarter, issuing an order on March 31, 2011, the effective date would be July 1, 2011 in both the US and Canada.
- Outreach to inform industry to start identification process upon filing.

The Rest of the Standards

- Since we aren't making changes to CIP-003 through CIP-009, the currently approved "Implementation Plan for newly Identified Critical Cyber Assets and Newly Registered Entities" would apply
- This plan was designed to apply to "Newly registered Entities", and was modeled after the Version 1 Table 4.
- Assuming the previous timeline, the starting date for this plan would be July 1, 2011.

Newly Identified CCA Plan Recap

- The Newly Identified CCA Plan allows:
- •24 months for entities without any Version-3 CCAs
- •For entities with Version-3 CCAs:
- Immediate for Policy, Leadership, Exceptions (CIP-003), Awareness (CIP-004)
- 6 months for Information Protection, Access Control, Change Control (CIP-003), Incident Reporting and Response (CIP-008), Recovery Plans, Backup & Restore, Testing Backup Media (CIP-009)
- 12 months for Electronic Security Perimeter (CIP-005), Physical Security (CIP-006), Systems Security Management (CIP-007), Exercises, Change Control (CIP-009)
- 18 months for Training, Personnel Risk Assessment, Access (CIP-004)

Scott Mix reviewed the above proposed approach for the Implementation Plan with the SDT which is based on utilizing the currently FERC approved CIP implementation plan. This approach was presented in Pittsburgh to the SDT and then refined based on that discussion. He noted the schedule assumes for a FERC order on the last day of a quarter and suggested the proposal is aggressive achievable and probably meets FERC's expectations. He suggested that 24 months would not be acceptable to FERC based on past experience.

The Chair suggested that following the review and testing of approaches he would look to forming a drafting team to develop a proposal for review and adoption in Winnepeg.

Member and Participant Discussion Comments on the Proposed Approach

- **Communication plan.** Is there a communication plan for this? Communication is very important

- **FERC Approval**
- Also concerned about FERC approving but asking for changes. Multiple industry avenues to get the information out should be part of the communication plan.
- The SDT is asking FERC to recognize the potential difficulty for implementation if there is an approval that also requests changes. If the industry doesn't know until March 31, then there may be only 3 months to analyze and identify critical assets.
- Can FERC staff take this concept back and ask if this approach is reasonable – can FERC approve in the first quarter of 2011 in order to implement by July 1, 2011.
- FERC staff agreed to discuss and see what other staff (not the Commission) thinks. Still need to address justifications for bright lines, that is the focus of FERC review.
- FERC staff appreciates reliance on already vetted plan – changing effective date to second and third quarter gets us to the current proposal of two full quarters.
- FERC staff suggested that adjusting quarters is a good idea – careful not to open a new can of worms and push approval back past 3-31-1l. Recognize the importance of budget cycles but those are plans, you already have to have every one of the processes listed, just adding items to the process
- This is just for CIP-002 which is only one change. Date could be different than CIP 003-009. Could it be different for CAs and CCAs?
- Can we stagger the implementation of CAs and CCAs? We will significantly increase the number identified and if an entity misses one will they have to self report on July 1?
- Could adjust to second and third full quarters – lock in the end date with interim steps?
- The NERC Board of Trustee approval starts the clock – if FERC request changes, then pushes this back at least 6 months. The pre-work by industry should not be affected. It should be a six-month effort with a nod half way through that the July date is still good.

- **Impact of Bright Lines on Timing.** In terms of the methodology for identifying new assets, we did not anticipate the level of new assets. If an entity identifies a new asset, you have to put new security in place and that will take longer than six months.
- The proposed plan addresses assets that become critical under the new methodology.

- If we propose 24 months for newly identified CAs, this will invalidate the current FERC approved CIP implementation plan.
- In essence, the proposal is the industry gets one year, six months for the approval and six months to implement.
- This may involve implementing a whole new program, not just extending existing program and may be very difficult for the industry to implement.
- As a result of the proposed bright lines, the Industry may have a large increase of CAs and then CCAs. We may need more time for addressing that impact.
- The effective date of any other standard is when you can demonstrate you are in compliance which would be a signed list of CAs and CCAs.
- The six months accounts not just for equipment but also personnel

- **Budgeting for Changes.** Under the existing risk-based approach, you can plan and budget for when an asset comes on or off list. Assuming CIP 002-4 is adopted and approved, you may have to be compliant before you can go through a single budget
  cycle. We should consider allowing for more time in order to budget for compliance.
- We have a fiscal policy but not an unchanging budget. Optically, I believe we cannot push out more than two quarters.
- Understand concern about the budgets, but it sounds like we are afraid because we don't know yet what the impact will be and hopefully will know more once survey results come in, we will have a clearer idea of the impacts.
- Our company is partially regulated in Canada. In the past that we have to wait for approved standards before we can include them in the budget. 12-months may be too dicey

- **Survey Information.** To what extent will completion of survey give industry a heads up? It will tell you something is happening but not what to budget for. The survey does not imply money and there is not implementation plan to reference in completing the survey
- Entities cannot budget based on survey results. The bright lines will require upgrades that may require an outage cycle along with budgeting. Compliance within the timeframe proposed may be very difficult.
- The proposal says time starts once the CA is identified which is July 1, 2011. Having a single date simplifies audits.

- **Newly Identified CCA Plan.** Can we put in the existing implementation in modifications for CCAs? Raises the question of whether we use the newly identified CCA plan or not – if not, then have to redo with new dates.

- **Nuclear Generation.** How do we factor in the nuclear industry? If we address implementation for them, we could leverage that to include new sites.

- If unplugging is detrimental to reliability, we do not want to create reverse incentive to undermine reliability.
- Unplugging may work in some cases but we estimate that we are adding up to twenty plants and possibly $150 million for our company under this proposal. The budget cycle then implementation cycle follows including outages. Unscheduled outages are disruptive, and scheduled outages take time. This is primarily a generation issue with some transmission impacts.
- Consider language similar to the nuclear plans, "no later than X date."
- Need to look at exceptions – what new TFEs need to be in place or filed
- The SDT assign a team to draft new implementation plan and address timing in light of these comments?

1. Implementation Plan Proposed Concept- Revised

Following the discussion above the a revised concept statement was presented by John Lim and Scott Mix:

For the initial implementation of CIP 002-4, CCAs at newly identified CAs will be 24 months (i.e., follow Milestone Category 1 in Table 2, Implementation Milestones for Newly Identified Critical Cyber Assets) in the IPFNICCAANRE (Add 706B items and TFEs)

For subsequent implementations of CIP 002-4 at newly identified CAs, the IPFNICCAANRE will be followed as written

For all implementation of newly identified CCAs at existing CAs will follow the IPFNICCAANRE as written.

Discussion of Revised Concept:

- This covers the one time exemption for 24 months for newly identified CCAs at newly identified CAs – everything else is consistent with existing effort.
- Is implementation the appropriate word? Good intent but is it the right word.
- Still need to factor in 706b and when to file TFEs
- Not changing the newly identified CAs – just a one shot in this particular table
- The other implementation plan is already approved and this represents a one shot /one time exception. Not changing the plan but providing a one-time override? How does this play with the new CIP 005 version?
- Does this cover the need for outages to implement?
- It gives them 24 months to incorporate
- In theory the existing plan did not include that either, this gives more time.
- If not changing plan, do we have flexibility to just say 24 months to give people a clear date?

- Today I have zero time for something new – if build something new, do I have 24 months from commission?
- If did not plan for it to be CA but not online yet but will be a CA once commissioned.
- Suggesting 24 months to bring everything into compliance.
- Concerned if some of us are still confused – once turned over to NERC regions, they may interpret differently – needs to be spelled out as simply as possible to limit the potential interpretation confusion
- Second paragraph – next subsequent application is July 2 as part of update as needed – may need to clarify it is the next annual application, not the "as needed during the first year."
- How do you handle a new CA going into service within the 24 month window – if building it now

Straw Poll on Proposal
Favor proposed approach to drafting implementation plan
Yes=9 Oppose=4 Abstain=5

2. Alternative Approaches to Developing the Implementation Plan

Following the poll the SDT identified and discussed the following potential alternative approaches:

a. Implementation plan that requires identification of CAs within 1 quarter and CCAs in 4 quarters. Existing Newly Identified CCA Plan could be used (but the clock would not start for these new CCAs until 4 quarters (12 months) after approval

Or

b. Develop a new implementation plan that allows
   1. 24 months for Newly Identified CCAs and New CAs and
   2. Uses the existing Newly Identified CCAs for New CCAs at existing CAs
   3. Keep the newly identified CCA

Or

c. Add one quarter to Scott Mix's original plan for effective date.

Or

d. Develop a one-shot/one time exception (for specific circumstances) with a sunset to the existing implementation plan schedule.

Or

e. Provide six months for identifying and 24 months to comply.

Member Discussion of Potential Alternatives

- Don't remember modifying process in 002 to identifying CCAs. The proposal did not modify the definition.

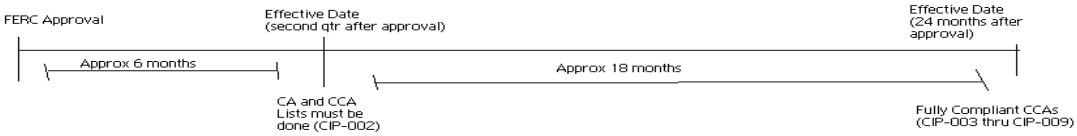
- **Alternative a.** gives a window for plant that does not have a plan.
- in #1 does it buy any time – concerned most about CCA list and identifying when that list has to be in place – having it on the CA list does not necessarily mean it will have CCAs
- **Alternative b.** gives entities time for newly identified, not existing identified assets.
- It uses existing criteria.
- Has to be compliant on day one
- b1.? Does this override one aspect or mean change approved document –
- If 10 and 11 comes in the middle may create issue of overlapping schedules
- FERC staff is nervous about opening up the implementation plan again – would the simple answer be that non-nukes use one plan and nukes another – with exception for more time in specified circumstances?
- Need to leave nuclear open – may come up with a procedure approach
- Concern is mostly about generation rather than transmission? Several transmission stations will also be brought into the mix
- We could move forward with what we have with an addition for exceptions, or build time up front
- What is the time frame for CA and CCA identification and then the time for implementation – when does the race start and how long do you have to finish
- Abstained from the poll because I do not have assets at risk.
- Might also consider from an audit enforcement perspective
- If we do not want to open the implementation plan up then b. and e. are out
- Don't like 24 months which bumps up to the next version and will not fly optically with regulators
- Implementation plan should use the IPFNICCAANRE as it currently exists
- Whatever we use, the visibility is critical to show moving forward on implementation – i.e. a plan that shows we are moving forward with visible dates that can be easily understood.
- What about 18 months? Consider possible TFE for shut down issue?
- Whatever is proposed will need to be justified. It will be easier to justify if tied to something already approved by FERC.
- There seems to be agreement on the concept but we haven't settled on the length for compliance.
- Implementation plain remains as is with a one-time one-shot exception for 18 months, Alternative d. The other half is when to fire the start gun – six months?
- What benefit do we get from all this rather than go with existing plan? Build in buffer
- Use existing implementation plan with process for exceptions if need more time
- Putting in an exception process may take long time to get through legal.
- NERC staff needs some words to take back to compliance director and legal department to see if we can put that into the implementation plan

- Keep in mind time is short to reach agreement on everything to be posted following your September meeting.
- This is offering a one time shot exception – first application of bright line
- Adding in "compliant at 24 months from identification" helps.
- We are talking about CIP 002-009 not just CIP002.
- Should be a date legislators can easily understand and see.

Proposal:

For the initial application of the "bright lines" in CIP 002-4, CCAs at newly identified CAs will be compliant at 24 months from identification (add 706B items and TFEs)

The effective date of the standard (upon the regulatory approval) the registered entity will need to identify CAs and CCAs within six months and xx months to be compliant with 003-009



Discussion Comments

- Effective date is the date FERC approves? It is based on the approval
- There is the issuance date and then effective date. Effective date is the day after auditor can ask for compliance – the date you must have a list with signatures.
- We are looking for the list six months after FERC approval, then 24 months to bring into compliance.
- Move away from the number of months and be sure we have the concept

The Chair and Vice Chair thought there was enough input for a drafting team to develop a new proposal and solicited volunteers for a drafting team to bring back for the SDT's consideration in September.

Implementation Plan Drafting Team Volunteers: Sharon Edwards, Dave Revell, Kevin Sherlin, Scott Rosenberg, Mike Keene (FERC), Dave Norton and Phil Huff

Appendix #8- CIP 010 & 011 Sub-Team Proposal *(Phil Huff)*

Proposal for Sub-Team to Develop Foundational Principles of CIP-011
This proposal was initially presented on Tuesday and discussed in greater detail on Thursday.

The process for the informal comment posting provided little time in developing foundational concepts to applying security controls and industry guidance. Drafting sub-teams must make decisions on applicability according to impact, connectivity and operating environment, but they do not have a common basis for doing so. As CIP-002-4 lacked technical justification for bright-line thresholds, so now CIP-011 lacks a solid basis for determining whether or not a security requirement is appropriate.

Proposal
Form a sub-team to further develop concepts in presenting and scoping cyber security requirements for CIP-011. This would include the form of CIP-011 and basis by which sub-teams write and apply requirements. This would NOT include the actual development of security requirements.
Ideally, team members not heavily involved in the drafting of CIP-002-4 could contribute to this effort. The output of this team would go before the full-team for review and approval once CIP-002-4 has been successfully balloted. The objective of this sub-team would be to further develop concepts in CIP-011 and improve the efficiency of CIP-011 sub-teams.

Issues to Consider
- Impact – what types of security requirements apply at what level?
- Connectivity – How does connectivity factor into applying security requirements?
- Operational Environment – How do different operating environments factor into applying security requirements?
- Type of System Considerations – How do types of systems factor into applying security requirements?
- Technical Feasibility Exceptions – Propose an improved process to allow entities to apply appropriate controls while still satisfying the requirements for transparency and oversight.
- Format – Technically present the Standard in a way that communicates to owners and operators of the BES

Deliverables
- CIP-011 Format Proposal
- Guidance/rationale preamble to CIP-011
  - Description and basis for scoping filters
  - Guidance in reading the CIP-011 format

- Proposal for Technical Feasibility Exceptions

Timeframe: December 2010 Meeting

Appendix # 9 SDT Discussion Notes of CIP 010-011 Schedule and Approach

SDT Member and Participant Comments

On Tuesday the SDT reviewed initially with Allan Mosher the proposed CIP 010-011 schedule and approach. On Thursday, the SDT took up the review of the schedule and tasks for completing its work on the CIP 010 & 011. Phil Huff reviewed with the Team the key highlights of the draft schedule:

- First posting for Formal Comment is proposed for May 31, 2011.
- This assumes an aggressive NERC industry communication campaign to support the effort prior to posting for formal comment.
- By December the SDT will turn its full time attention to CIP 010 & 011.
- By March the SDT will send a package for review with NERC staff, compliance and legal.
- Review in April any edits and Approve in May.

SDT Member and Participant Comments

Stu Langton suggested there was an important discussion of three distinct issues: schedule; preliminary work on next phase; and deeper issue of approach to drafting during the next phase. We may need someone to work on and present a suggestion on the drafting approach for the next phase in Winnipeg.

Schedule & Industry Confusion and Communication

- If we ballot on this schedule and approval in 2012 – period of 2012-13 will be confusing for compliance – anything in this schedule help smooth this for the industry.
- We will be hitting them with ballots just when 002-4 becomes effective
- FERC staff expressed concerns about how aggressive the schedule is – still talking about a draft ready for compliance and legal review by March.
- Howard Gugel noted he is reaching out to communication manager to develop plan – considering series of webinars that look at key components with more focused discussions.
- Are webinars being designed as a one way or two way information process? Allow informal comment or feedback mechanism in the webinars. Once in the ballot phase, it is more difficult to change – you are a representative body of the industry – informal comment lets you hear from the industry and gives you a chance to fix it – need better feedback mechanism from industry.
- Concern with the schedule – did not see any milestone for dealing with inertia of the response to CIP 002-4 – switching back to 010-011 may be a big issue and

difficult sell to industry. Didn't see that dynamic noted in the schedule. As of today, not sure the team is fully behind the change to 010-011. We will need the SDT to come together and a convincing communication plan with the industry of the value to moving toward 010-011.

SDT Deliverables- Short and Long Term

- April 1 is the date that sticks out – that is the last day before turning it over to NERC staff? This version has built in three reviews with the NERC staff.
- This may be aggressive but we have not fully defined the concept. There are bigger issues than just revising standards.

Sub-team Setting Out Proposed Approach for Full Team SDT Review.

- Phil Huff noted he wanted to propose getting a new sub-team to work on material issues between now and December, for example, impact, connectivity, operational environment, type of system considerations, TFEs and format. It could deliver CIP 011 format proposal, guidance and preamble for 011 and a proposal on TFEs for review at the December SDT meeting. They would not look at requirements.
- Understand concept but may also need to consider the overlap of new CIP 005 team. Also heard concerns about potential overlap with 002-4 implementation plan and how aggressive that schedule appears.
- The concept is good idea to compensate for the divergence of CIP 002-4. However still concerned about the fragmentation of the SDT. Once we come together in December we need to reconsider the model of using sub-teams. WE need to go through the requirements as a full team. The results of the proposed effort could give us a start – let this sub-team take a first cut at requirements and house keeping, then starting in December we should focus on full team review given the aggressive schedule – need momentum – feeling numb and disconnected by the current sub-team approach.
- We will need to continue to make changes between meetings – may need to continue a sub-team after December to get pen to paper. The proposal is not to break into subteams during SDT meetings and anticipate full SDT review of work done between meetings.
- Consider using full team webinars between meetings after December.
- Suggest functional areas be assigned for expert drafting to pull together into a strawman that all can review in calls and full team meetings.

SDT Organization in 2011

- As an observer, it appears that the team is good at policy but not at putting pen to paper – use the SDT as a policy group and hire someone to draft the first draft for review by the full group.
- In Sacramento the SDT discussed the need for time. The resulting deal was to work on CIP 002-4 now to December then take another year for 010-011. This draft schedule does that by working back from December 2011 delivery.

- We need to develop and review a more detailed schedule in terms of making sure the resources available. WE cannot manage this project at such a high level of generality and be assured of success.
- We should clarify and adopt clear guidelines for any subteams going forward. Sub-team assignments should be made clear in terms of what to produce and when return to full team.
- Tuesday and Wednesday's work on CIP 002-4 were very productive for this team – everyone understood how we got there.

Overall Approach to CIP

- Dave Norton offered the following thoughts for the SDT to consider in thinking through its schedule for the CIP 010 & 011.
- We are searching for elegant language that covers everything – do not think it is possible to write language that covers our legacy assets and anticipates all the coming changes and challenges. Our product needs to be amenable to changes we have not even seen –
- Our friendly regulator is concerned that we have written one requirement that applies in a binary way based on the size of the iron and not on the risk based approach of NIST which applies no matter the size, then adds more specific language for specific challenges such as data centers. FERC staff urged us to have base layers and add specific requirements for serial, wireless, routability, etc.. That is, protect bastions with physical security, but parse the problem – not one issue with a binary solution. If we don't do this, NERC should expect to face remand.
- Our largest organizations, IOUs, have a weighted impact in terms of ballots as they have the largest investments in the most complex programs, policies and compliance programs in place that have been oriented to the existing 003-009 categories. They are not happy about putting it all into a single 011 standard. Access control is an example.
- The SDT also needs to address "defense in depth" – there is network defense and host defense – more elegant to address access control holistically but most in industry are not prepared to do so. There is a fear that industry will vote it down because they don't like it. An incremental change would be to use the current structure and build off of that.
- 33% of requirements apply to low end is a challenge for FERC review. We need to focus on routable as the vector that needs the most protection – regulator doesn't like 011 and industry doesn't like 011 – schedule is relevant only to extent you identify the path.
- Politics not addressed are the quality of the product you put out – bad optics if industry rejects but almost as bad if you are simply self-reporting constantly – this is too complicated not to have a base for discussion and editing – too long to argue over every word – need to run this as a project – fix it right the first time or just do 706 in the 003-009 frame.

- Have to break this down – this is only drafting team that has to formally use tents – originally intended to break this group into multiple teams – many say they will never create a team this big – cannot solve this problem with everyone sitting in the room – have to have teams break off and use ballot body to comment.
- The question is whether 011 is the right product in FERC's view. There are two core problems with current 002 model: 1) the initial mistake to eliminate the communication links which has now have created islands and failing standards. You don't know what you are protecting – in federal framework we are protecting base and work from there – working backwards from sites and assets. We need clarity on what we are protecting – fix what we are protecting. We may be on the wrong path and facing remand. We haven't clarified what are we protecting against. We have to move to a new model.
- Clearly, as a team, we have problems with the underlying concepts for some on the team, but that doesn't mean we should just scrap work to date. There are still some key questions for team to work out before jumping back into the requirements. Yet we still need to provide a schedule.
- Is the team ready to agree on a schedule? If we don't know what we can deliver how can we know when.
- We've heard and had the same arguments before regarding approaches.
- After robust debate, we agreed on the concept and worked on it. We are now close to where the whole team can work on requirements. All this was forged through a stringent voting requirement that got us to this point. We should consider whether to move on to finish the product or scrap it?
- We are still not looking at security protection and industry view. The major driver is keeping the financial cost and risk low – not on what should we be protecting.
- Cost, however, is a legitimate part of the SDT's consideration.
- We don't know what it will cost in a risk based system.
- We should focus on 706 orders and incremental improvements in the past – but is the product out of date and do we need something completely different? What we have today does not address the problem. We may need to build a new product that works – redefine the problem before we can set the schedule
- Members have to make proposals and if it does not get team support then you have to move forward with the team. It is good to discuss and test these, but we have to move forward as a team – once argument is made and then direction chosen then have to move forward.
- FERC staff: Mike Peters speaks for himself, not the FERC commission or staff – staff and commission said the NERC/SDT should create a baseline then consider specialized protection as needed. CIP 011 is a step in the right direction to applying appropriate protections to different levels. There is no reason the CIP 011 structure cannot fit. One statement cannot fit all – what it is, where it is and how it is protected. I think team can do it, has been productive in Pittsburgh and here in fleshing out Attachment 1 which was, by the way, drafted by a small group. Our

observation is that the small group approach is a valid approach as long it comes back for review, refinement and adoption by the SDT.

- Need to attack our task ahead as a project. We have had no one place to draw on as a source. CIP 003-009 can still work as a base or root stock and we can apply the sub-team work to that frame, use 706 to provide incremental improvement – and we can absolutely make it work by mid year.
- Team is split into I.T. and power engineers – problem in philosophy and finding a mutual mid point we can agree on.
- Take what we have and fix based on 706 request – two glaring issues with current: doesn't cover enough and doesn't cover communications. We are working on the former with CIP 002-4 and the latter can be added by this group. We can do it, it is aggressive but doable. If we don't in six months it will be taken away from us.
- We keep working through different perspectives and appreciate each others talents – still think there are foundational issues that a sub-team can look at between now and December to give us the starting point.
- We have some issues – sub-team needs figure it out and then six months to work as full team
- In Sacramento we said March was doable. With the CIP 002-4 delay, I think that May is doable
- From NERC's perspective, there has been a considerable investment of money and time in developing consensus around 011. The SDT was then were diverted from outside. The SDT needs to decide if investment can be applied to create value. You need to give us a schedule on a solution not just CIP 010-011. You need to ask yourselves if CIP 010-011 is the right approach, and if yes, then go forward and bring it to the industry. If not, then the SDT needs to develop an alternative plan and get to the job.
- Feedback we are receiving from industry to posting is that the High/Medium/Low represents a significant change. Regulators seem to say you need a baseline to build on. Appears that the industry and regulators are at odds and team is trying to walk the line and please both. Taking away 003-009 was too much for industry to digest. Learning to making changes to 003-009 based on 706 – from day one with this team we developed camps about protecting systems. Somehow we keep coming back to feeling among some that the validity of there position has not been addressed.
- This is the elephant in the room – keep 003-009 or come up with a new solution – if we have a quorum, lets decide and move forward.
- We have a target audience and regulators with different expectations and the SDT is between a rock and hard spot – trying to build a consensus between big iron and systems – need to tailor approaches up from a base up, not a top down approach because we continue to get different results from the two models.
- We did vote on the concept, and with less than the 75% support decided to go with 010-011 in order to get the industry comment, refined and got simple majority again/

- Thought we got over hump of the systems approach – don't quite get if we apply 10-11 approach, where are we missing the point, a flawed approach?
- The substance in CIP 011 is not wrong but what is the gain? Is it cosmetic only?
- To clarify issue. If what we have in 011 today is wrong in terms of its content, then we have a threshold issue and problem. On the other hand, if it is the issue of format and having it all in one standard, that should be much easier issued to resolve.
- Concerned about motions and deciding this evening. The proposal to form a team to look at this was a correct approach. Its like we voting against taxes and then asking a team to develop a tax plan.
- In discussing the schedule we didn't start by figuring out requirements and resources then agree on a schedule, instead we have been told what date will be done. However we need to take the date seriously or the job will be taken away not just from the SDT but from the industry.
- The SDT is still not discussing what to protect – format is not substantial issue – we do not have glue between 010 and 011 – still don't have an approach to controls – break up controls based on how they are applied, not by the existing standards – if whole new paradigm then break them out – schedule is good because we do not have any choice
- FERC and congress would be happy with control centers and protect BES and be done. continue the CIP 002 approach that leads to a test program. We worked on and got super majority (75%+) on not using CIP 003-009 structure. There was simple majority support on 011, important concepts in there – naysayers continue to wait and continue to revisit – we can't go back to what we have. However, not in favor of a yea/nay vote today.
- Is there problem with the work on 011 so far? I am pleased with much of that work – keep in mind how far we can move the industry and still move toward the objective – do not want to lose that work, still needs to be vetted – I voted against 010-011, but as a team player I support moving forward and retain good work so far.
- We have power plants that do not affect the system – we would shut them down rather than spend the money to protect them – unintended consequence of protecting everything – some equipment doesn't need to be protected – ask industry what they think – you asked them a million questions and got a million answers –
- FERC staff perspective: industry and regulators may sound like opposites, but not sure that is true. The problem may be more about how to write these concepts into the standards – much of your work facilitates getting the basics out there. John Van Boxtel's format model may offer unique opportunities as the tables did not have sufficient detail. His model proposed making the tables the minimum and then look at extra schedules for specific elements. The SDT is poised to make a necessary paradigm shift to a protection culture. O10 & 011 are looking for protections of assets appropriate to the risk of reliability of BES with appropriate

controls to be applied to address risk to BES. It is less important if in one clump or separate pots.

- My urge for a motion today is just to move forward is born out of frustration of revisiting issue at end of a long day. In Atlanta, we did have super majority (75%) to abandon the CIP 003-009 going forward and we made that call despite industry reaction. The separation of transmission, generation and control centers is not the issue, rather it is the control systems across all of them. The technology based system controls are the issues we need to look at, but we are being told, and have agreed, to provide in the interim a bright line that not a risk based system.
- The SDT was put together to address order 706 and to look at and consider NIST as we modify existing standards based on 706 as a base for future changes. We decided to go to High-Medium-Low. The industry may not yet be ready for a change.
- NERC staff is facilitating rather than managing. Maybe we need to manage, first nail down scope – we have been subject to "scope creep", of plan B and multiple versions to address outside issues. We looked at the structural problems presented by multiple standards and chose to move toward combining into one. We still need a common lexicology too – we should focus on function technological system approach – on h-m-l looking at control systems. Congress does not distinguish between different systems whether corporate, market or control systems . We need to move toward a result based system – compliance and fear of costs is currently driving our process. Going back to to CIP 002-009 will not solve the problem. The industry's comfort with the old system and the sunk costs should not drive our process.
- Many of these comments highlight the issue of communication with the industry – much higher potential for external entry from a connected 25 mw unit than an older 1000 mw unit without connection – communication allows you to tunnel to fifty sites – it is about the control, not the size of the unit.
- So the result may be that the weak link will be shut down as not economic and you may have just degraded the reliability of the network and the grid.
- Some things being proposed still fit into the existing system. We have disagreements on approaches and formats but there has been good quality work to date.
- Back to the discussion of the schedule the proposed schedule on the table to post 010-011 at end of May and passed by end of the year by Board of Trustees

On Friday morning, John Lim reminded team members of importance of working together as a team. He then withdrew his motion on the CIP 010-011 schedule from day before for sake of offering another motion that may be clearer and reflect the good discussion points. Phil Huff noted he will put two motions forward that will describe a process for moving forward on foundational concepts discussed yesterday. The motion moves the posting date for formal comments back to July, 2011 and suggests taking time in front end to set foundation before launching into the requirements in January 2011 providing three more

months for the foundation discussion. Phil Huff made the following motion which was seconded by Dave Norton:

1st Motion for CSO706 SDT Project Schedule

The CSO706 SDT will prepare a complete package for initial posting to the industry for consideration and ballot in July 2011, in response to FERC Order 706, ~~including the requirements, implementation plan, guidance documentation, and other related documents and~~ with the expectation of ballot body approval and filing to FERC by the end of the year 2011. This is contingent upon the SDT being allowed to complete this work without major redirection of SDT efforts. ~~ancillary assignments.~~

16 in Support; 1 opposed (94%)

- Concerned regarding the management of the Team's effort moving forward

Discussion of Motion

- Finite amount of time – before setting out on work take a check point on where we are – a check point restart
- Agree need to review but concerned about targeting completion in middle of next year – resources set for this effort, schedule set, then only thing to adjust is scope – seems a little backwards
- Concern we do not know where we are going and are setting a date – don't know yet what success looks like – make industry happy or the government.
- Politically and optically we need to deliver timely or this process will not exist – time and resources are finite
- We said we would do it right – responsive to 706 and industry – we can put package together by July but not FERC by end of year – we don't control last half of the year.
- Have to deliver something. This is a reasonable motion to move us forward.
- This is not throwing away all the work to date – but still foundational issues to tackle – this reflects time to do that.
- Two paragraphs are tightly linked – need foundation set by December – also concerned that this hits at same time 002-4 adopted in mid summer.
- Why pick a date before we know what we are going to do? Standards Committee requested a date for completing the project – may know better in December the actual date.
- We took a year to do other work – then hit by "plan B" by end of year – that is why we are dealing with this – now they want a stake in the ground for completion – we should focus on 010-011 (if no more curves can we finish?) – Yes, but concerned that 002-4 will set industry into its ways and bolster opposition to 010-011.

- Do I think team can meet July deadline? Yes but we have to educate the industry with a communication plan before presenting for ballot?
- I can provide my time as necessary but what is the scope and time demand on members – a yes vote is a commitment to make this happen – can others meet that commitment.
- Need to provide by end of 2011 – 002-4 will further entrench current methodology – concerned this proposal will support return to 003-009.
- Does not mean we have chosen which direction – second part of motion says we will look at direction – sub-team will not be looking at 011.
- Are we freezing 003-009 in place? Uncomfortable with that possibility.
- Look at language offered here and IT seems going back to earlier discussions of format – are we going back to revisit that? Implying 011 does not stand, revisiting the issue?
- Phil Huff noted that was not the intent. Not about redeveloping concepts but there are many we have not looked at yet.
- Looked at catalogue and developed concept – language here implies sub-teams rewrite sections – some here think fractious conversation is due to lack of full team review – resetting in January?
- If commit to dates and SC. They must make a commitment not to throw us any more curves. Recount to them how many diversions they have made for us. They need to leave us alone to do our work – bilateral commitment.
- Second issue – why take until December to line up our ducks – I volunteer to lead it in two months.
- We have to respond to comments to 002-4 – December the first chance to devote full time to the next stage. We may have time in October to look at it too?
- On the second motion – sub-teams have come back with different formats and content including factors on controls – need more uniform method of targeting those – not redoing the controls but improve targeting to hit those most important.
- July is the team's concern – after July it is on NERC and industry trade associations – critical for NERC to educate the industry on the concepts for industry support. Team can produce quality by July and fails due to lack of communication then that rests with NERC and industry trade associations. We can deliver quality product for industry review in July.
- What we are doing about 002-4 now? What is the communication plan for that? There is confusion in the industry as to what we are doing and why- the ask what happened to 010-011, also, risk to schedule is March 31 response from FERC on 002-4 that asks us to do something else with it.
- Concerned about filing to FERC by end of 2011 – make it "with the expectation of ballot body approval and filing to FERC …." – we control up this up to July, 2011.
- Put period after July 2011 then new sentence: "This schedule would provide the industry with the opportunity to …"
- PH – concerned about the last suggestion – still part of the schedule even if not in our control

- Still responding to the formal comments – prefer "with expectation"
- Complete package implies the subparts will be included – "initial posting to the industry for consideration and ballot in July 2011 with the expectation of ballot body approval and filing to FERC by the end of the year 2011. This is contingent upon the SDT being allowed to complete this work without any ancillary assignments.
- Concern about setting end date you do not control if FERC asks for more in March
- Language assumes FERC does not ask for any additional work on CIP 002-4.
- Question about assignments and distractions – need to include communication or NERC leadership on what we are doing and going – turbulent waters will get muddy in January when CIP 002-4 is posted, also say we want communications that have been missing.
- NERC hears this loud and clear but this team cannot dictate. If this team produces a standard proposal in July, 2011, the ballot body approval will not happen without communication. Communication does not impact team's work but assignments would.
- If additional risks pop up, we should assume it will throw us off schedule.
- Keep struck words referring to 706.
- We know what ancillary assignments are but will others – "without additional major redirection of teams effort."
- Last time it was a request to redirect not an ancillary assignment
- Sounds a little catty – we accepted last assignment and did it and rescheduled
- We have become a standing committee on anything cyber – yes, nested and have to hang together – but this group is not the normal approach to standards development – let us finish before giving us anything else – take out additional to avoid catty?

Phil Huff proposed and Dave Norton seconded a second motion (second paragraph)

2nd Motion Process for Implementing CIP 010-011 Schedule- Framework Sub-Team

The CSO706 SDT will form a sub-team to develop a framework for presenting and scoping cyber security requirements for preliminary delivery in October 2010 and completion in December 2010. This would include the form of the standards and the basis by which the requirements are written and applied. The output of this team would go before the full-team for review and approval. This task would not include the actual development of security requirements.

In Favor of the Motion
Yes=17 No=0 Unanimous

Member Discussion of the Motion before the Vote

- Agree with the intent it should be clear to those writing the requirements as to how to write them. Go together as a framework that will need joint discussion. The Sub-team should take an initial stab at writing initial requirements.
- Should it take it to point of filing in the blanks? By October should present the direction to the SDT and then finalize in December. Cut and paste what we have and let full group redirect in October and December as needed
- Concerned about waiting with the current Sub-teams. We cannot afford to wait – would continue subteam work on requirements then full team review –
- Drop "sub-teams" and just say "by which the requirements are written and applied."
- This proposal draws on the essence from Phil's first proposal (*See Appendix 8)*. Much of that detail is in the original to set framework for hanging the requirements – it offered specific suggestion of issues to look at from our earlier questions – something of a quality check-list.
- We need to talk about the fundamental framework and logic for attacking the requirements. –A style guide is a good description but may need some refinement first.
- Concern with first half – we often break down when concepts brought back to full group an get lost in the woods of word-smithing deferring the more foundational discussion which now must happen in order to set our core message.
- Specific deliverable for this Sub-team should not be a concept paper. Perhaps it should say framework. A**c**cept amendment for framework instead of concept
- Intent is to "develop a framework" not "further"
- The intent is it incorporate and not disregarding the raw material have worked on to date – preliminary delivery in October to the full team and presentation to the full SDT in December for refinement and adoption.

The Chair asked for volunteers for the Framework Sub-Team and the following members and participants responded.:

- Dave Norton (Lead)
- John von Boxtel
- Joe Doetzl
- Dave Revill
- Doug Johnson
- Phil Huff
- Jon Stanford

Other volunteers included:

- Mike Keane
- Scott Mix
- Joe Bucciero (Facilitator)

It was agreed that Joe Bucciero would send a note to those members of the SDT not present asking for others who might want to volunteer

Following the vote the SDT agreed on the following direction to the current CIP-011 Sub-Teams: We need the output from the sub-teams on responses to industry comments and workshop comment summaries so they can be posted in October and recognize industry's investment into those comments.

Minutes
Cyber Security Order 706 SDT — Project 2008-06

August 26, 2010 |12:00 p.m. - 2:00 p.m.

Joe Bucciero welcomed members and other participants, took roll call and provided the Anti-trust guidance. 14 members of the SDT joined on the call. Chair John Lim set forth the agenda noting it was not a decision-making meeting but a review of progress on the CIP 002-4 documents that need to be reviewed and adopted by the Team for posting.

Dave Revill provided an overview of the CIP 002-4 Implementation Plan sub-team's work since the Chicago meeting and answered questions regarding the proposal. John Lim provided an overview of the draft of the CIP 002-4 Guidance Document that will be refined for presentation at the CSO706 SDT meeting in Winnipeg. Joe Doetzl suggested that a different title for the CIP 002-4 Guidance Document be considered as to avoid confusion with the "Identifying Critical Cyber Assets" guidance document that was recently released by CIPC and approved.

John Lim noted the CIP 002-4 NERC standards and legal edits have been circulated. It was noted an additional criteria in Attachment 1, 1.16 (Any facility declared critical by a regulatory agency) was added by NERC staff and will need to be reviewed as part of the document approval process in Winnipeg to determine whether it will remain in the standard text as part of the posting. Also the control center vs. control room discussion, including their geographical locations, which is part of the CIPC guidance document should be considered.

Jackie Collett noted she was developing the Summary Response for Attachment 2, CIP-010 for the purpose of filing with the CIP-002-4 documents and would circulate a draft in advance of Winnipeg. Updates from each of the CIP-011 Sub-team Leads (Phil Huff for Jay Cribb, Sharon Edwards, David Revill, Doug Johnson, Tom Stevenson for Scott Rosenberger) were provided, and each discussed their progress regarding preparation of a summary response to the Industry Comments and Dallas Workshop Comments. It was agreed that the sub-teams will complete the review of the Dallas Workshop transcript by the Winnipeg meeting, so that it can be posted on the NERC project site for Project 2008-06 (CSO706). The sub-teams will also complete the summary response to the Industry comments received with the informal posting of CIP-010, since these requirements are very close to those in CIP-002-4. The SDT will continue to work on the responses to the CIP-011 comments, and will finalize the summary response to those comments following the adoption of the Framework sub-team's work for CIP-011. The target is to post these responses to comments along with the posting of the revised CIP-010 and CIP-011 standards in 2011.
The Framework sub-team, appointed in Chicago and led by Dave Norton, reported on their first meeting noting they have established a meeting schedule and will be ready to present their preliminary approach

at the October meeting in Toronto. He noted that the SDT will need to clarify early on what protecting ourselves means. What are we trying to protect, and what are we trying to protect against?

Howard Gugel and Scott Mix provided an update on the CIP 005-4 Urgent Action SAR Posting & Status. Pre-ballot review of the SAR is scheduled to complete on September 17, 2010.

It was noted that the Chicago draft meeting summary has been circulated to the SDT and will be reviewed in Winnipeg. The Winnipeg agenda will be circulated following the Leadership Team Call scheduled for next Tuesday (August 31).

The meeting adjourned at 1:55 p.m.

CSO706 SDT September 8-10, 2010 Meeting Summary Contents

Cyber Security Order 706 SDT- Project 2008-06
26TH MEETING
September 8-10, 2010
Winnipeg, Manitoba

EXECUTIVE SUMMARY

On Wednesday morning, John Lim, Chair & Phil Huff, Vice Chair of the CSO 706 SDT welcomed members and other participants to Winnipeg and thanked Jackie Collett and Manitoba Hydro for hosting the meeting. Jackie reviewed the logistics for the meeting. Joe Bucciero conducted a roll call of members and participants in the room and on the conference call. Mr. Bucciero also reviewed the need to comply with NERC's Antitrust Guidelines each day of the meeting, and reminded all participants that the meeting has been publicly noticed and is open to the public. The meeting began with a quorum of 15 members in the room and 3 members participating by ReadyTalk conference call. John Lim reviewed the proposed meeting objectives; facilitator Bob Jones reviewed and the SDT agreed to the proposed timed agenda.

On Thursday morning, the SDT unanimously adopted the August 10-13, 2010 Chicago SDT meeting summary and the August 26, 2010 SDT Conference Call Summary.

Vice Chair Phil Huff reviewed the note that the SDT leadership sent to Standards Committee Chair, Allen Mosher, regarding the schedule for CIP 010 & CIP-011, which was adopted by the SDT during the Chicago meeting in August 2010. The note calls for a NERC-led communications and industry outreach effort along with a posting of the CIP-010/CIP-011 standards in July 2011 and adoption of the standards by the NERC Board of Trustees in December 2011.

He also reviewed the CIP 002-4 schedule noting a Webinar has been scheduled for September 29, a week after the scheduled CIP 002-4 posting for a 45 day formal comment period. The SDT reviewed the Webinar preparation on Friday morning. In October the SDT will meet in Toronto and will be taking an initial look at the work of the Framework Sub-Team led by David Norton. During the November meeting in Baltimore, the SDT will be reviewing and responding to industry comments and determining what changes to make to CIP 002-4 before posting for the 2nd ballot. In December, the SDT will be reviewing the recommendations from the Framework Sub-Team and determining the course for the further development of the CIP standards in 2011.

The SDT heard industry updates and discussed the following: the process for the urgent action CIP 005; the CAN 7 revision and review; the formation of a national electric sector cyber security organization called NESCSO at NETL; the final release of the NIST IR7628 (termed as a "guideline" but treated in the Federal sector like a standard); the DHS Cyber Security Roadmap for critical infrastructure activities; and the October NERC annual standards meeting in St. Louis.

John Lim provided an overview of the work done by the CIP-002-4 drafting sub-team in refining the draft CIP 002-4 standard text following the Chicago meeting. The SDT reviewed and analyzed industry responses to the NERC Data Request as input to Attachment 1 of the CIP-002-4 standard, and reviewed and refined several associated documents including: an implementation plan, a guidance/reference document including rationales for Attachment 1 and a summary of industry informal comments on CIP-010 Attachment 2, on which CIP-002-4 Attachment 1 is based. Howard Gugel reviewed the process for posting CIP-002-4.

The SDT discussed the schedule for urgent action CIP-005, and it was clarified that it will be balloted separately, but will run in parallel with CIP-002-4. The revision to CIP-005-3 was posted for a 30-day pre-ballot review on August 18, 2010, and the draft CIP-005-4 standard is scheduled for a 10-day ballot period beginning on September 17, 2010. No recirculation ballot is planned.

On Wednesday morning, NERC staff (Howard Gugel) reviewed with the SDT the initial analysis of industry responses to the draft NERC Data Request. Following some further clarification and discussion with several Data Request respondents, Howard reviewed with the SDT on Thursday the adjusted results in the number of assets in the low impact category (from around 1300 to around 530).

The SDT reviewed each section of the CIP 002-4 draft, and as needed, conducted straw polls on the acceptability of the language.

CIP 002-4 SDT Straw Polling and Decisions on Motions	***Yes***	***No***	***Abstain***	***%***
Requirements				
R2 as proposed by the Drafting Team	**20**	**0**		**100%**
Attachment 1 Criteria				
1.1 as proposed by the Drafting Team	10	5	4	
1.1 Alternative ("…aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 2000 MW."	13	6	2	
1.1 Choice #1 ("Use a numerical MW value that approximates the reserve sharing for each NERC region.")	7	9		44%
1.1 Choice #2 ("Use numerical MW value that approximates an average of the reserve sharing amounts across all regions")	12	6		67%
1.1 Choice #3 (Use the Reserve Sharing concept, rather than a MW value, but include additional descriptions supplied by Control Center experts	13	4		76%
1.1 Choice #4 ("Use the Reserve Sharing concept, rather than a number, as it was proposed at the start of this meeting.")	10	5	4	
1.1 "Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW.	**19**	**0**		**100%**
1.2 Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes."	**13**	**2**	**4**

VSLs/VRFs as revised	**19**	**0**		
Cover Letter and Comment Form as revised	**19**	**0**		

The SDT reviewed a draft agenda and proposed assignments for an industry webinar on September 29 from 11:00 a.m. -1 p.m. on the CIP 002-4 filing, which the Chair outlined. Allen Mosher, Chair of the NERC Standards Committee will provide some introductory remarks in terms of the context and recent history of the SDT's efforts. It was noted that the presentations would be at a relatively high level with the intention of leaving sufficient time of the Webinar devoted to Q & A. There will also be a short presentation by an industry representative member of the CIP 005 urgent action work group on the substance and procedure for that draft standard.

Dave Norton, Sub-Team lead, reported on the two meetings the Framework Sub-Team has convened. He suggested the context is that some in the industry stakeholders did not like what they saw with CIP-011, and the regulator doesn't think we have approached things consistently with the NIST 800-53 framework, thereby establishing a baseline at the outset. The Sub-Team has agreed that the SDT needs to answer the question, "what are we protecting and from who?" There are threats, vulnerabilities and impacts to consider but threats are hard to be clear on, and impacts have a lot of permutations. The Sub-Team is initially focusing on known vulnerabilities in the open information sources and posing the question: how can we use known vulnerabilities to link to specific standards (e.g., NIST IR volume 3, Chapter 7 treatment of vulnerabilities). The original CIP standard team learned that it is very difficult to write CIP requirements that address the old and new at the same time,

resulting in overkill for the old and leaving modern vulnerabilities unaddressed. The output should be a justification and rationale underpinning the standards, not the standards themselves. They are starting with a framework for the CIP standards, and not a format. Ultimately this should lead to a format.

Dave Revill noted that when the SDT developed CIP-011, we identified requirements at the high impact level and forced the scoping elements on them. The Framework Sub-Team's idea is to start from the bottom and work up.

The Chair noted that the Framework Sub-Team will have a significant amount of agenda time during the Toronto SDT Meeting in October to bring the SDT up to date and engage them in discussion of the key issues. These discussions should provide guidance as the Sub-Team continues its efforts to bring back a framework that the SDT can review, refine, and adopt at its December 2010 meeting that will guide its work in 2011.

On Friday morning, the SDT reviewed the progress being made by the CIP-010 and CIP-011 sub-teams in summarizing industry responses and the Dallas workshop comments. The Chair thanked those sub-groups who had completed their tasks and asked all the sub-groups to complete their summaries by the SDT October meeting

The Chair reviewed the schedule for a SDT conference call meeting on Wednesday, September 15 from 10:00 a.m.-12:00 p.m. (eastern time) to review the final documents for posting that were not adopted at this meeting and to determine whether the SDT members, following review with their corporate senior management, wanted to revisit the SDT's previous decisions on whether to specifically include all nuclear generation as a criterion for assessment in CIP-002-4 Attachment 1.

The Toronto agenda was discussed and SDT member and host Rob Antonishen described the Toronto, Ontario venue for the meeting.

Meeting adjourned at 9:45 a.m. Friday, September 10, 2010

_____

Cyber Security Order 706 SDT- Project 2008-06
26TH MEETING SUMMARY
September 8-10, 2010
Winnipeg, Manitoba

I. AGENDA REVIEW, WORKPLAN SCHEDULE AND UPDATES

A. Agenda Review and Adoption of Meeting SDT Summaries

John Lim, Chair & Phil Huff, Vice Chair of the CSO 706 SDT welcomed members and other participants to Winnipeg and thanked Jackie Collett and Manitoba Hydro for hosting the meeting. Jackie covered logistics and noted a tour of the new energy efficient Manitoba Hydro building at the end of the day. Joe Bucciero conducted a roll call *(See Appendix #2)* and reviewed the antitrust and public meeting guidelines *(See Appendix #3)* with the meeting participants at the outset on each day. On Thursday morning, the SDT unanimously adopted the August 10-13, 2010 Chicago meeting summary and the August 26 SDT Conference Call Summary. The meeting began with a quorum of 15 members in the room and 3 members participating by Readytalk conference call. John Lim reviewed the proposed meeting objectives, the facilitator Bob Jones reviewed and the SDT agreed to the proposed timed agenda.

B. Update on the CIP 002-4 and the 010 and 011 Development Schedule

Vice Chair Phil Huff reviewed the note that the SDT leadership sent to Standards Committee Chair, Allen Mosher, regarding the schedule for CIP 010 & CIP-011, which was adopted by the SDT during the Chicago meeting in August 2010. The note calls for a NERC-led communications and industry outreach effort along with a posting of the CIP-010/CIP-011 standards in July 2011 and adoption of the standards by the NERC Board of Trustees in December 2011.

He also reviewed the CIP 002-4 schedule noting a Webinar has been scheduled for September 29, a week after the scheduled CIP 002-4 posting for a 45 day formal comment period. The SDT reviewed the Webinar preparation on Friday morning. In October the SDT will meet in Toronto and will be taking an initial look at the work of the Framework Sub-Team led by David Norton. During the November meeting in Baltimore, the SDT will be reviewing and responding to industry comments and determining what changes to make to CIP 002-4 before posting for the 2nd ballot. In December, the SDT will be reviewing the recommendations from the Framework Sub-Team and determining the course for the further development of the CIP standards in 2011.

C. Updates on other related cyber security initiatives- *NERC Staff and SDT Members*

The SDT discussed the schedule for urgent action CIP-005, and it was clarified that it will be balloted separately, but will run in parallel with CIP-002-4. The revision to CIP-005-3 was posted for a 30-day

pre-ballot review on August 18, 2010, and the draft CIP-005-4 standard is scheduled for a 10-day ballot period beginning on September 17, 2010. No recirculation ballot is planned.

Scott Mix also noted that the CAN 7 was under review and was being prepared for review by NERC legal staff next week. Jim Brenton noted that CAN 5 is on track for implementation in October and that there are likely to be a lot of concern in the industry about this CAN.

The SDT heard industry updates and discussed the following: the process for the urgent action CIP 005; the CAN 7 revision and review; the formation of a national electric sector cyber security organization called NESCSO at NETL; the final release of the NIST IR7628 (termed as a "guideline" but treated in the Federal sector like a standard); the DHS Cyber Security Roadmap for critical infrastructure activities; and the October NERC annual standards meeting in St. Louis.

Keith Stouffer reported that last Thursday the NIST IR 7628 was finalized and is now available on the website for down load. He noted that while it is termed as a "guideline" it is treated in the Federal sector like a standard.

Gerry Freese noted the DHS Cyber Security Roadmap which provides guidance for critical infrastructure activities has been released for comment and indicated some concerns with load issues, interdependencies and other issues. It was noted that it was on the agenda for discussion at next week's CIPSE meeting. Sharon Edwards had read it and suggested there is some overlap with the work of the SDT. Scott Mix noted that Section 215 addresses the areas for which NERC can write enforceable standards.

Howard Gugel noted that at the October NERC annual standards meeting in St. Louis, he will make a presentation on the evolving work of the SDT on CIP-010 and CIP-011.

II. SDT CIP 002-4 DOCUMENT REVIEW

A. Overview and Process

John Lim provided an overview of the work done by the CIP-002-4 drafting sub-team in refining the draft CIP 002-4 standard text following the Chicago meeting. The SDT reviewed and analyzed industry responses to the NERC Data Request as input to Attachment 1 of the CIP-002-4 standard, and reviewed and refined several associated documents including: an implementation plan, a guidance/reference document including rationales for Attachment 1 and a summary of industry informal comments on CIP-010 Attachment 2, on which CIP-002-4 Attachment 1 is based. Howard Gugel reviewed the process for posting CIP-002-4.

Howard Gugel reviewed the process for posting CIP-002-4:

- The documents will be posted for 45-day formal comment period during which the first 30 days a ballot pool will be formed. On the 35th day, there will be a concurrent ballot for 10 days.
- Any comments received will require responses. With the short turnaround, NERC staff will assist the SDT in drafting strawman response document.
- The SDT will review the responses and determine whether to change any provision CIP-002-4 in Baltimore in November. NERC standards and legal staff will review and the response document will be posted.
- The 2nd ballot period will run for 10 days.
- The Team will respond to comments and post for a 3rd ballot in December

The SDT discussed the schedule and clarified whether urgent action CIP 005 will be a part of the CIP 002-4 etc posting. There will be a separate ballot on urgent action CIP 005-4 which will run parallel with CIP-002-4 and the ballot will open on September 20 for 10 days with no recirculation. If CIP-005 is turned down, then NERC would publish CIP 005-3 with conforming changes from CIP-002-4.

B. Briefing on the NERC Data Request Results

On Wednesday morning, NERC staff (Howard Gugel) reviewed with the SDT the initial analysis of industry responses to the draft NERC Data Request. *(See Appendix #4)* Following some further clarification and discussion with several Data Request respondents, Howard reviewed with the SDT on Thursday the adjusted results in the number of assets in the low impact category (from around 1300 to around 530). He also pointed out the new provision added to the Attachment #1 (the new 1.16) would be supported by the number of assets included in this category in the survey.

C. Review and Refinement of the CIP 002-4

The SDT reviewed each section of the CIP 002-4 draft, and as needed, conducted straw polls on the acceptability of the language. The final adopted text is included in Appendix #5. Below is a list of the straw polls and decisions reached by the SDT on the CIP 002-4 documents:

CIP 002-4 SDT Straw Polling and Decisions on Motions	*Yes*	*No*	*Abstain*	*%*
Requirements				
R2 as proposed by the Drafting Team	**20**	**0**		**100%**
Attachment 1 Criteria				
1.1 as proposed by the Drafting Team	10	5	4	
1.2 Alternative ("…aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 2000 MW."	13	6	2

1. CIP 002-4 Requirements

R1. Critical Asset Identification — Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment I – Critical Asset Criteria*. The Responsible Entity shall review this list at least annually, and update it as necessary.

SDT Comments

- R1 and R2- "updated as necessary"? What is the metric? "Where appropriate"? "Based on the annual review." A: "one calendar quarter after discovery of a new asset."
- "Annual" has been a thorn for the SDT for a long time.
- We should keep it the way it is using the "minimalist" rule for CIP 002-4.
- This also appears and would need to be changed in CIP 003-009.
- It is frustrating when we can make a simple change and improve the standards but don't.
- Have language in CIP 10 as well. Identified and addressed.
- Note that the SDT voted last time 17-0 to accept this language.
- The SDT should be careful of scope creep: on 002-4. Will fix and do correctly.

Howard Gugel 9/28/10 4:36 PM
Comment: Actually, we addressed the low hanging fruit initially.

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets. The Responsible Entity shall review this list at least annually, and update it as necessary. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

R2.1 The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,

R2.2The Cyber Asset uses a routable protocol within a control center; or,

R 2.3The Cyber Asset is dial-up accessible.

SDT Comments on R2

- The drafting team added back" performing a function essential to the operation of the Critical Asset."
- R2 "Each" Place qualification ("within 15 minutes) at R2.4
- 15-minute criteria only applies to generation units.

- One of the following characteristics- place in a footnote? 'the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1 criterion 1.1 within 15 minutes.
- Intent of sub requirements- applied to the asset's identify at the generator. If below or equal they won't apply.
- A change will require changing all the numbering.
- All comfortable with proceeding with it as proposed?

SDT Straw Poll on R2 As Written

Yes	***No***	***Abstain***
20	**0**	**0**

2. Attachment 1 Criteria

Criterion 1.1

John Lim reviewed the minor changes made in 1.1 since Chicago. The SDT discussed and were polled for their support for 1.1 as written.

> **1.1. A generating unit or group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability in the preceding 12 months exceeding the lowest Contingency Reserve identified over the preceding 12 months by the Reserve Sharing Group or the Balancing Authority if it is not a member of a Reserve Sharing Group, at the time the CIP-002 is reviewed.**

SDT Straw Poll on 1.1 As Written

Yes	***No***	***Abstain***
10	**5**	**4**

The SDT's initial discussion of the proposed language in 1.1 noted concerns about: utilizing the concept of reserve sharing as a threshold value; the unintended consequence of placing pressure on entities to no carry additional reserve; referencing a term that will fluctuate over time; the difficulty to finding the number as demonstrated in the NERC date request responses; and introducing a new operational term ("planned Contingency Reserve") that does not appear in other standards.

Several potential options were identified including: gigawatt hours per year produced; tie to name plate ratings but address capacity using the test results required to run to demonstrate capacity referencing proposed Mod 24 standard); use contingency reserve to come up with a defensible number, but don't tie the 1.1 to a contingency reserve.

Following the ranking, the SDT discussed that if the contingency reserve is the value we are comparing then it needs clarification in terms of what it is and how it is determined and how to define a "group of generating units."

The SDT then reviewed concerns and support for the following alternative 1.1 language including: this is using the concept to derived a value; this figure is based on disturbance not reliability; having a bright line across each region may not make sense; this is an indirect way to identify critical assets; and bright lines should be readily available and clear for each entity. The SDT then polled support for the following:

> **Alternative 1.1: "Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 2000 MW."**

SDT Straw Poll on 1.1 As Re-written

Yes	***No***	***Abstain***
13	**6**	**2**

Sharon Edwards agreed to draft options for the SDT consideration on Thursday based on the discussion on Wednesday. She summarized the following four options for the SDT's consideration and recommended consideration of Options 1 and 3 to begin with. It was suggested that the SDT needs to make a decision on this and seek industry input through the comment and balloting process.

Choice #1 – Use a numerical MW value that approximates the reserve sharing for each NERC region: Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding the amount designated in the following table:

FRCC	900 MW	MW Value approximates the Reserve Sharing amount for that region *(Kinas)*
MRO	2200 MW	MW Value approximates the Reserve Sharing amount for that region (Collect)
NPCC	1200 MW	MW Value approximates the Reserve Sharing amount for that region *(Lim)*
RFC	2000 MW	MW Value approximates the Reserve Sharing amount for that region *(Marshall)*
SERC	1200 MW	MW Value approximates the Reserve Sharing amount for that region *(Revill)*
SPP	TBD *(KP)*	MW Value approximates the Reserve Sharing amount for that region *(Perry)*
ERCOT	2300 MW	MW Value approximates the Reserve Sharing amount for that region *(Brenton)*
WECC	TBD*(JVB)*	MW Value approximates the Reserve Sharing amount for that region

Sharon noted that this option allows regional flexibility in setting specific MW value but it is difficult to calculate for each region. The table figures were presented as initial approximations for region based on available information.

SDT Straw Poll on Choice #1

Yes	***No***	
7	**9**	**= 44%**

Comments on Choice #1before Poll

- The numbers are set by Reserve Sharing Group not by regions.
- The NPCC # doesn't reflect number for other areas within the NPCC.
- Need a number that does not change over time. Choice # 3 is more preferable if we can get away from new terms not seen yet by the industry.
- Concerns raised by members may make this problematic. Is 900 MW always critical?
- The table is intended to offer average approximations that can serve as the basis for bright lines. They do not represent an average of every BA in the region.
- 2300 may not be the ERCOT number.
- In favor of the table yesterday. Would still vote for that approach.

Choice #2 – Use numerical MW value that approximates an average of the reserve sharing amounts across all regions: Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW.

SDT Comments on Choice #2 before poll

- This is similar to approach with 2000MW. 1500-1600 MW table in Choice 1. Question of the values served by this. Over 900 doesn't work in Florida.
- 1500 MW will capture about 1/3 of generation in US.
- We have used 2000 so far here and elsewhere?
- To address the concern regarding FRCC, it can adopt a more stringent value based on their regional need.

SDT Straw Poll- Choice #2

Yes	***No***	
12	**6=**	**67%**

Comments after poll

- What is the basis of the table. It is a way of drawing a line in the sand.
- Here's how we drew the line.
- Get number out to industry to get reaction.

Choice #3 – Use the Reserve Sharing concept, rather than a MW value, but include additional descriptions supplied by Control Center experts. (*Note: No new definitions are being proposed.)* Each ~~generating unit or~~ group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability in the preceding 12 months within the Reserve Sharing Group, or a Balancing Authority if it is

not a member of a Reserve Sharing Group, exceeding the lowest planned contingency reserve (Spinning plus Operating Reserves plus additional reserves) over the preceding 12 months at the time the Responsible Entity reviews its list of Critical Assets.

SDT Comments on Choice #3 before the poll

- Based on the SDT discussion yesterday, a little clarification/information (spinning plus) was added to the reserve sharing concept.
- There is a problem with ("spinning plus operating reserves). Concerned with defining this term.

SDT Straw Poll on Choice #3

Yes	***No***	
13	**4=**	**76%**

Comments on Choice #3 after poll

- Why can't we use the nameplate rating here? A: Nameplate is not always the operating capacity.
- How much precision do we need?
- Nameplate is like horsepower of a car.

Choice #4 – Use the Reserve Sharing concept, rather than a number, as it was proposed at the start of this meeting: Each ~~generating unit or~~ group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability in the preceding 12 months exceeding the lowest Contingency Reserve identified over the preceding 12 months by the Reserve Sharing Group or the Balancing Authority if it is not a member of a Reserve Sharing Group, at the time the Responsible Entity reviews its list of Critical Assets.

SDT Comments on Choice #4 before the poll

- This is the proposal reviewed and polled at start of meeting yesterday with the following results:

Yes	***No***	***Abstain***
10	**5**	**4**

The facilitators noted that both Choice #2 and Choice #3 garnered more than 2/3's support from the SDT. The SDT then voted between their preference as between Choice # 2 and Choice #3 and Choice #2 received greater than 2/3s of the members votes. The SDT agreed that the following should become 1.1:

> **1.1 *(Final)* Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW.**

Criterion 1.2
- No changes

Criterion 1.3

"Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes."

SDT Comments before Polling
- Since Chicago the drafting team developed editorial changes.
- EEI suggested language "maintaining the stability and reliability of the BES."
- Does this refer to all units? Broad brush statement will confuse planning and coordination planners
- It needs to be more specific or it shouldn't be incorporated.
- Concept was to try to keep the idea in here.
- 12 units classified reliability must run up to 43 for Data Request Q3.
- Shutting down for security? No for reliability. They want to retire it and you'll require them to
- Go to R&R then goes to market. If it falls out of R&R, will shut down
- Unintended consequence may be a less reliable BES.
- This may work in a market but not in a non-market area. Have to be careful. Some language that- "retirement delayed" Auditors may ask, "Where is your study for every unit?"

Howard Gugel 9/28/10 4:49 PM
Comment: Not sure it is appropriate to include this

SDT Straw Poll on 1.3 As Written

Yes	***No***	***Abstain***	
13	**2**	**4=**	**68%**

Criterion 1.4
- No changes

Criterion 1.5:

"The Facilities comprising the Cranking Paths and initial switching requirements identified in the Transmission Operator's restoration plan."

SDT Straw Poll on 1.5 As Written

Yes	***No***	***Abstain***
11	**3**	**5=**

The SDT comments before polling touched on the following issues: seeking to get to the more the primary or initial cranking path; cranking path can be anything to get to any unit; data request indicated that 438 that will be identified as critical assets with 53 additional sub-stations; will this

bring in a disincentive to designate black start with multiple cranking paths; 1.5 and 1.9 taken together will bring in 627 transmission facilities + 250 generators as critical assets; concern every resource mentioned in operators restoration plan; does the current language enable a stop from 5 to 20 MW; and, generating facilities (keeping the turbine generator on and turning gear going) will have to come off of turning gear.

Following the poll, the SDT discussed: the problem with moving from low MW up to several higher levels; the term "facilities" is not specific to transmission or generation; the fact that 1.5 picks up from 1.4 and follows cranking paths till it reaches multiple path options. An ad hoc drafting group brought back the following language after a lunch break which the SDT agreed to:

> **1.5** *(Rewritten)***The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist.**

SDT Straw Poll on 1.5 As Re-written

Yes	***No***	***Abstain***
16	**1**	**3**

The Chair agreed to review draft alternative language that Rich Kinas offered to develop. The following language was reviewed on Thursday by the SDT.

> **1.5 Alternative** *(Rich Kinas)* **"All facilities (transmission and generation) identified in the Transmission Operator's restoration required to start generation and re-establish a minimum of one synchronized tie with a neighbor."**

SDT Straw Poll on Alternative 1.5

Yes	***No***	***Abstain***
1	**17**	**0**

Criterion 1.7

"Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with four or more other stations."

SDT Comments

- There is a substantial drop in CA (70%) when at 4. Drop to 3.
- Dropping the phrase "or generating" addresses his issues.

Howard Gugel 9/28/10 5:18 PM
Comment: Who is his?

SDT Straw Poll

Yes	***No***	***Abstain***
17	**0**	**2**

Criterion 1.8

"Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)."

SDT Straw Poll

Yes	***No***	***Abstain***
17	**0**	**3**

Comments on 1.8

- Need to protect bus breakers on both ends of that line, i.e. at 2 stations not one. Take out "at a single station"?
- Without this we will have compliance issues, could have to deal with multiple locations. Don't believe the SDT has words on 1.8 right. Not going to violate an IROL. Jason Marshall will take a crack at different words for the SDT to consider.
- The Chair suggested we would come back to alternative language if it can improve its acceptability.

*Jason Marshall's alternative 1.8 language reviewed on 9-9. "***Transmission facilities that if destroyed, degraded, misused, or otherwise rendered unavailable, cause a reduction in an IROL magnitude or cause a new IROL to be identified."**

SDT Straw Poll

Yes	***No***
0	**18**

SDT Comments before the poll

- Do I have to evaluate all transmission facilities? That was why we had the language "at a single station location."
- How are TOP and planners to make these determinations? We may need examples for each of the key functions?
- We can go back to highlight resources we used initially in the drafting team in the guidance document. Works for ISOs.
- TOP and other transmission people may have trouble with this.

Criterion 1.9

"Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)."

SDT Comments

- No changes
- There were 0 assets on the survey.
- Intent to capture future- criticality for BES. If no purpose do we need this? Why called out? A: Because they have huge cyber systems which are easy to attack.
- **SDT Agreed to leave 1.9 in Attachment #1**

Criterion 1.10

"Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3."

SDT Straw Poll

Yes	*No*	*Abstain*
18	**0**	**3**

SDT Comments

- For criteria 9,10 and 12, "Misuse" different from the others
- "Misuse" –in order to cause a problem with the IROL. This is already covered.
- **SDT Agreed to leave 1.10 in Attachment #1**

Criterion 1.11

"Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements."

SDT Comments

- No changes
- This is a nuclear safety deal, vs. reliability issue.
- Tied to Nuc 001- in terms of safety.
- **SDT Agreed to leave 1.11 in Attachment #1**

Criterion 1.12

"Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)."

SDT Comments

- Consistency editorial change by the Drafting Group.
- **SDT Agreed to leave 1.12 in Attachment #1.**

Criterion 1.13.

"Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes."

SDT Comments before polling

- The SDT found the NERC edits acceptable.
- "common"= shared?
- Language was taken out of Version 3.
- Because of the development of smart grid this is a bigger issue than it was in Version 1, 2 and 3.
- Put in 15 minute or real time. It is now pre-programmed into the device in the firm ware of the thermostat.
- This could be a problem without a time element.
- "Simultaneous" or "within a 15 minute period"?
- Issues with the smart grid are longer term. For this CIP 002-4 interim standard let's keep it simple.
- Used 15 minute in other criteria. "within 15 minutes"?
- "Under frequency" vs. "automatic" load shedding confusion. This doesn't apply to "manual load shedding."
- We may have a hard time in the future changing
- "designated for" vs. "responsible for."
- Used capable- due to compromise or misuse
- Is "capable through misuse" designated for automatic?
- Smart grid- distribution providers are out of scope? Going forward we will be better able to define it.
- Automatic load shed not manually initiated load shed.
- "Capability"- support keeping that concept in this criterion.
- "If misused could shed 300 mw or more within 15 minutes.
- Consider pulling automatic out- discrepancy between 2000 and 300 MK.
- The justification for 300MW is in DOE 317, Version 2.

Howard Gugel 9/28/10 5:21 PM
Comment: ??

SDT Straw Poll on 1.13 as written

Yes	***No***	***Abstain***
18	**2**	**0**

Comments after the rating

- Jim Bretton disagreed with putting time in.
- Bring in all DMS systems with removal of automatic if they have load-shedding capability.

- Rich Kinas noted this significantly changes the number of assets and prompts us to lose focus as to why we are here.
- Manual initiated operation- of cyber device- protection. EMS already considered.

Criterion 1.14

"Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator."

SDT Straw Poll

Yes	***No***	***Abstain***
16	**2**	**2**

Comments before Polling

- The drafting team and NERC offered only editorial changes.
-
- Should we drop this one?
- Control systems in 1.14.
- If combined we don't have a criteria of 2300 MW. Will be covering a lot of entities without the bright line.
- New advanced persistent threats at layer 7 at application layers are a concern. These are not being picked up by firewalls. Understand this creates a burden on these small entities but they and we need protection at the same level. Size doesn't matter when it comes to attack vectors.
- Control systems need to be protected.
- On control center criteria- don't understand survey results and why it didn't result in dropping a lot off the list? How did we lose 5 RCs? While these are close enough they are not reliable data figures and need more analysis.
- "Connectivity and size doesn't matter." IP is everything and everywhere. Controls should be inadequate for the control system. Can't buy the argument that connectivity is all that matters.
- Look at just this standard. If you put them all in it will be a huge impact. Can't solve all the problems with this standard.
- Consider changing "every" to "each"?
- Can't afford to ignore. Can't imagine that FERC would allow us to get away with 2300. It is there and it is a vulnerability.
- We are mixing 1.14 and 1.15 in our discussion. Threshold for control generation- control centers = 2 of more physical assets.
- Entities as GOPs are designating. GOP in 1.14?
- That is an "or" in 1.15.
- Can't worry about connectivity. Worried about letting it come into language. Some GOPs have control centers controlling few MW and 1 or 2 plants.

Howard Gugel 9/28/10 5:22 PM
Comment: Does not pertain to this language

Howard Gugel 9/28/10 5:23 PM
Comment: Not sure what this means.

Howard Gugel 9/28/10 5:25 PM
Comment: Not sure of context

Howard Gugel 9/28/10 5:26 PM
Comment: Context?

Howard Gugel 9/28/10 5:26 PM
Comment: What does this mean?

- 1.14 is based on EOP 008 which doesn't include GOP.
- We don't have a definition of control centers in 002-4.
- 1.14- can't rely on EOP 008- not required to have a back up control center. Lots of ways of meeting standards. It may be problematic to call this out as a reason.
- This is because we don't have concrete definition for control center. Focus on the control systems.
- Back up control centers- doesn't say you have to have a back up center, but if you do you must secure.
- EOP 008 doesn't have qualifications so we don't need them either. We need a justification.
- EOP 008 not referenced in the guidance.

Criterion 1.15:
"Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 2300 MWs in a single Interconnection."

SDT Straw Poll on 1.15 as presented.

Yes	*No*	*Abstain*	
15	**2**	**2=**	**79%**

The SDT discussed the criterion which links back to 1.1 and discussed it as presented and identified the following concerns: this will probably get this sent back from FERC; need to clarify why 1.1 uses 2000 MW and this uses 2300 MW; should "control systems" be added to be consistent with 1.15; there may be control systems that are computerized but that are not connected; control centers appear in CIP versions 1, 2 & 3 so removing the focus on control centers would need to be justified; this is a transition to a function focus of CIP 010 & 011; control room vs. control center doesn't have to be analyzed separately from asset it controls; control centers operated by generation operators with no transmission but just control and dispatch; what about renewables or variable generation; and what does control generation mean? 1.15: centers being used to control generation- don't control breakers, just establishing a set point. Easy for it to be taken off until they are sure it is the right signal they should be following. 2300 explanation good break point.

Howard Gugel 9/28/10 5:27 PM
Comment: Should this be in here?

SDT Straw Poll- delete "in a single interconnection"

Yes	*No*	*Abstain*	
6	**12**	**1=**	**32%**

Criterion 1.16
"Any facility declared by a regulatory agency to be critical to national security."

Howard Gugel presented the criterion that was not proposed by the SDT CIP 002-4 drafting team but proposed by NERC staff. He noted the NERC data request showed that only 17 nuclear generation facilities are included in the existing risk-based methodology. If nuclear generation is added as a specific criterion, that number rises to 88. The SDT reviewed the statement noting the following concerns: this is a overbroad statement and a back handed way to get nuclear in; NERC is a reliability

Howard Gugel 9/28/10 5:29 PM
Comment: Not sure this should be a matter of record

organization and the SDT is working on a reliability standard; other regulators have their own processes, this doesn't belong here; there are 57 bills in the U.S. Congress giving power to the President and others to declare emergency, but until the industry get these directives from Congress and then FERC and NERC it is premature to address.

The SDT unanimously decided not to include this criterion statement in Attachment 1.

Criterion 1.17
"Any additional assets that the Responsible Entity deems appropriate to use."

The SDT discussed adding this statement back into Attachment 1 that had been removed in Chicago. The NERC data request shows 307 critical assets would be identified under this criteria. While this may be primarily an optics issues there would be no down side and it might help fund some security investment.

Howard Gugel 9/28/10 5:34 PM
Comment: Not sure the discussion considered funding. It revolved arould justifying existing Critical Asset methodology that captured assets not identified in the new criteria.

SDT Straw Poll

17	**3**	**0**

Nuclear Generation Criterion

John Lim noted that the NERC president, Gerry Cauley, met with EEI executives who agreed that it would be a prudent thing to add nuclear generation as a critical asset criterion. Given the timing, the Chair proposed that members consult with their management to get additional feedback and that this issue would be up for review and possible adoption by the SDT at its September 15 conference call. It was noted that lowering 1.1 to 1500 MW will bring in more nuclear generation facilities.

A motion to adopt Attachment 1 as revised was offered by Sharron Edwards and seconded by Doug Johnson.

SDT Member Vote on Attachment #1 as Revised

Yes	**No**	
18	**1=**	**95%**

Jim Brenton voted no and offered the following explanation of his vote. "Draft CIP 002 Version 4, Attachment 1, does not require that nuclear generation plants be designated as Critical Assets per CIP-002-4. Generation Operator Control Centers and Control Systems are not designated as Critical Assets per Draft CIP 002 Version 4, Attachment 1. Many of these facilities are interconnected via real time network connections and cyber security exploits at

the application level can transverse between trusted nodes only protected at Layer 4 (firewalls and Router ACL). An insufficient number of Generation Units will be designated as Critical

Assets with the criteria in Attachment 1, Criterion 1.1 set at 1500 MW. The draft CIP 002 Version 4, Attachment 1 language related to IROLs is vague and will cause problems for TOP, TP and other registered entities in making CA determinations—it is not a bright line or a deterministic metric—since the values may change dynamically. I generally support the language provided. However, the team had an opportunity but failed to address the nuclear generation issue and the need for including sufficient generation facilities under the proposed standards, both of which I consider show stoppers, as I articulated to all during the meeting.

Howard Gugel, NERC staff, noted he would check with NERC management but that he agrees with the SDT's approach to delay the vote until members can check with their management team. If, however, the SDT agreed to post without nuclear generation included as critical assets in it, the public document posting will occur in the middle of election season in the U.S.

Howard Gugel 9/28/10 5:36 PM
Comment: I do not believe that I stated that I agreed with the approach to not include nuclear.

D. CIP -002-4 Implementation Plan

Following the Chicago meeting, SDT member Dave Revill led a lead a team (Sharon Edwards, Phil Huff, Dave Norton, Scott Rosenberg, and Kevin Sherlin. Mike Keane FERC and Scott Mix NERC, Joe Bucciero, facilitator) to develop a new draft of the implementation plan based on the Chicago input. It was presented to the SDT on the August 26 conference call. He noted the proposed sliding 18 month window for new assets not identified in the first application that are identified as a result of an update ("update as necessary") during the first 12 months. This in effect meant entities may have anywhere from 12 to 30 months to be compliant. R2 locks in which cyber assets we are talking about and those "critical cyber assets "associated with" critical assets newly identified by CIP 002-4.

The SDT discussed regarding the proposal including: confusion between FERC approval vs. effective date; given the doubling the generation and transmission facilities in scope (not Version 2 and 3 didn't anticipate the doubling of assets) 18 months is not that long a time; if we can't meet schedules because vendors are not ably to supply we must self report unless there is an exception process; if newly identified asset or control entity that hasn't dealt with before -24 months; in accelerating schedule for few requirements we have made this more complicated without really gaining much; we will also be introducing concept of CIP 010 and 011 during same period; consider a phased approach given the number of assets that need to be addressed; can regional entities deal with an exceptions process; if we just make it 24 months across the board then simplify some of these exceptions; and the regulator perspective may be that 18 months is too long a timeframe.

Following the discussion the drafting group met over lunch and came back with a proposal for a timeline which intended to provide an 18 month plus 6 months window and removed the 12 month window and made it instead a separate exception. They noted that they were not recommending an exception process because of the challenge in standing it up for this interim standards with the appropriate oversight, change the NERC rules of procedure and difficulty of implementing at the regional level. From 2006-2009 the industry identified over 4500 critical assets in 3 years with no

previous experience. This proposal would add around another 2000 critical assets (or an additional 50%) in two years. This could also be part of the feedback from the industry in the comment form.

The SDT and participants discussed the proposal offering the following points and concerns: just because it would be hard to create an exception process, doesn't justify setting the industry up for failure; power plants are very different and more complex than substations; Q 1.2 responses from the NERC data request suggests about 370 generation or a 93% increase nearly doubling existing numbers; this generation asset doubling may provide justification for the 24 vs. 18 months; version 1-FERC 706 beginning of 2008 was in essence a 24 month implementation plan; the implementation timeline for nuclear assets is 2 years with allowance for outages; though each Province varies, in general, NERC standards for Canadian entities are effective upon NERC board approval, however the effective implementation takes place upon FERC approval; should generation assets get 24 months and all others 18 months.

The SDT then polled the following implementation timeline:

Implementation Timeline- Overall 24 months (6 months for identification of critical assets and 18 months for critical assets in compliance)

Straw Poll on Timeline

Yes	No	Abstain
18	**0**	**0**

Motion to Approve the Implementation Plan as Revised with friendly amendments *("18 months after effective date") (See Appendix #)* Dave Revill with Sharon Edwards 2nd.

Yes	*No*
18	**0**

E. CIP 002-4 Reference (Guidance) Document

The Reference Document (formerly "guidance document") was initially reviewed at the August 26 SDT conference call and on Wednesday afternoon. On Thursday afternoon the SDT reviewed the reference document noting that there will be conforming edits based on the agreements reached by the SDT on CIP 002-4 and Attachment 1 and on the implementation plan. The SDT and participant discussion of the document included the following points: put some of the survey results into the guidance document supporting how this is protecting the public; use "reliable operation" which is from the standard vs. the terms "reliability or operability"; change facilities to "designated as a facility"; stay away from the term control room/facilities; guidance for CIP 2 1-3.Where does that guidance fit relative to CIP 4? Is it going away, should be considered and mentioned; critical asset identificaiton guideline becomes largely irrelevant because of the removal of the risk based approach; Critical Assset identification guidelines are still relevant; John did a good job explaining without

expanding; take out the "one button" in the rationale for 1.13 to avoid confusion with automatic load shedding."

Following the SDT review and discussion Sharon Edwards made a motion to accept the Reference Document as revised and David Revill seconded the motion with the proviso that this will be brought back to the SDT conference call on September 15 for final adoption.

Yes	No	Abstain
18	0	1

F. VSLs/VRFs

Howard Gugel reported on the draft VSLs and VRFs. He noted in the interest of minimal changes, the subR format is still being used here.

Howard Gugel 9/28/10 5:40 PM
Comment: These were not reviewed in Chicago

Members offered the following points in the review of the draft VSLs: add R2- "performing a function essential"; delete "list" and "as per requirement after operation of the Critical Asset; consider changing to bullets; consider rolling up the SubRs under severe R2; and, without an exception process as discussed yesterday in the implementation plan, how many in violation when entity did a self-reporting.

Members offered the following points in the review of the draft VRS; keep these as separate sub Rs on this table because they have different impact levels; is it a double jeopardy issue if you are in violation of a lower and a high when you have separate Sub Rs; when you have a high level requirement R2 that has a VRF with it and the Sub Rs have vrfs are at a lower level, if there is a violation of 2.1 is it also a violation of R2; auditors can't discuss VRF and VRS, they simply find a violation and findings on an audit are always rolled up to the highest level; then it becomes an enforcement issue determined by an enforcement team at a sub component; there are many requirements wrapped into R2; take the definitional parts and have as bullet points.

The SDT unanimously approved the VSL and VRS documents as revised.

G. Cover Letter and Comment Form

Howard Gugel reviewed with the SDT a draft Cover Letter and Comment form. The Vice Chair drafted and the SDT agreed to add two paragraphs that referenced the CIP 010 and 011 development and its relation to the CIP 002-4. Howard clarified that the CIP 003-009 version 4 package would be posted with CIP 002-4 with conforming references and applicability section changes. It was suggested that VSLs and VRFs be referenced as 2 separate questions.

Doug Johnson made a motion and Jay Cribb seconded to adopt the Cover Letter and Comment Form as revised for posting with CIP 002-4.

Yes	No
19	0

H. Preparation for CIP 002-4 September 29, 2010 Webinar

The SDT reviewed a draft agenda and proposed assignments for an industry webinar on September 29 from 11:00 a.m. -1 p.m. on the CIP 002-4 filing, which the Chair outlined. Allen Mosher, Chair of the NERC Standards Committee will provide some introductory remarks in terms of the context and recent history of the SDT's efforts. It was noted that the presentations would be at a relatively high level with the intention of leaving sufficient time of the Webinar devoted to Q & A. There will also be a short presentation by an industry representative member of the CIP 005 urgent action work group on the substance and procedure for that draft standard.

There will also be a short presentation by an industry representative member of the CIP 005 urgent action work group on the substance and procedure for that draft standard. It was agreed that a power point template would be circulated and a dry run will take place on September 20 with the slides to NERC by September 22.

III. PROGRESS REPORT ON CIP FRAMEWORK SUB-TEAM

Dave Norton, Sub-Team lead, reported on the two meetings the Framework Sub-Team has convened (See, Appendix 8). He suggested the context is that some in the industry stakeholders did not like what they saw with CIP-011, and the regulator doesn't think we have approached things consistently with the NIST 800-53 framework, thereby establishing a baseline at the outset. The Sub-Team has agreed that the SDT needs to answer the question, "what are we protecting and from who?" There are threats, vulnerabilities and impacts to consider but threats are hard to be clear on, and impacts have a lot of permutations. The Sub-Team is initially focusing on known vulnerabilities in the open information sources and posing the question: how can we use known vulnerabilities to link to specific standards (e.g., NIST IR volume 3, Chapter 7 treatment of vulnerabilities). The original CIP standard team learned that it is very difficult to write CIP requirements that address the old and new at the same time, resulting in overkill for the old and leaving modern vulnerabilities unaddressed. The output should be a justification and rationale underpinning the standards, not the standards themselves. They are starting with a framework for the CIP standards, and not a format. Ultimately this should lead to a format.

The Sub-team is currently pulling nuggets out from others have done before. The output should be a justification and rationale underpinning the standards, not the standards themselves. They are starting with a framework not a format. Ultimately this should lead to a format.

Dave Revill noted that when the SDT developed CIP-011, we identified requirements at the high impact level and forced the scoping elements on them. The Framework Sub-Team's idea is to start from the bottom and work up.

Member and Participant Comments

- Think about differences between serial line with an operating system vs. embedded software systems on serial lines. Different vulnerabilities. We have to think of the differences- need people who understand on how the code works.
- CIP 11 security controls lacked a basis to come back to what the measure of success was.
- We should identify threats and ask is it "appropriate" based on operating environment and the characteristics of the device.
- As a model of identifying a baseline and incorporating appropriate NIST features, can you get there without dealing with the issue with the present compliance model? If no reward system in addition to the punitive system of compliance will this work?
- As far as possible, it will be advantageous to maintain the current structure and modify a bit, then we can be responsive to that faction in the ballot pool.
- What ever appears to work will come naturally if we start at what are we trying to protect and let the structure come to that.
- E.g. on format, big middle and little. Impact classes of assets within each a category of cyber assets?
- Acknowledge the differences between a generation vs. transmission mindset.
- Agree on the "appropriate" mantra, but need to pin down what this means. Have to drill down.
- The model that we have may be ok. The implementation of the model (over zealousness of some of the audit staff and unevenness of the quality) is where the problem arises. The industry is not complaining about audits, but about the process as implemented that is not true to standards and fair and equitable across the regions.
- The Sub-teams hope is that they can get to more granular statements that are specific to technology so we can minimize TFEs.
- VRF/VSLs- 0 tolerance is problem for compliance. Gradual incremental improvement.
- From NERC and FERC the view is that self-reports are a good thing or at least a better thing than hiding it. Industry executives don't view it that way.
- FERC is looking for the industry to define what appropriate is. It doesn't mean none, has to meet some rational tests.
- In a compliance based standard context, lawyers and management see it differently from those who are trying to fix things and make them more secure. Impossible to write a standard that covers everything. FERC order 693 requires audit to the requirements.
- The Sub-team will be reviewing again what exactly does 706 say to do.

The Chair noted that the Framework Sub-Team will have a significant amount of agenda time during the Toronto SDT Meeting in October to bring the SDT up to date and engage them in discussion of the key issues. These discussions should provide guidance as the Sub-Team continues its efforts to bring back a framework that the SDT can review, refine, and adopt at its December 2010 meeting that will guide its work in 2011.

IV. NEXT STEPS AND ASSIGNMENTS

On Friday morning the SDT reviewed the progress being made by the CIP 010 and 011 sub-teams in summarizing industry responses and the Dallas workshop comments. The Chair thanked those sub-groups who had completed their tasks and asked all the sub-groups to complete their summaries by the SDT October meeting

The Team reviewed the preparations for the CIP 002-4 Webinar *(see Section II. H above)* which will take place on September 29 from 11:00 a.m.- 1:00 p.m.

The Chair reviewed the schedule for a SDT conference call meeting on Wednesday, September 15 from 10:00 a.m.-12:00 p.m. (eastern time) to review the final documents for posting that were not adopted at this meeting and to determine whether the SDT members, following review with their corporate senior management, wanted to revisit the SDT's previous decisions on whether to specifically include all nuclear generation as a criterion for assessment in CIP-002-4 Attachment 1.

The Toronto agenda was discussed and SDT member and host Rob Antonishen described the Toronto, Ontario venue for the meeting.

The meeting adjourned at 9:45 a.m. on Friday, September 10.

Appendix # 1— Meeting Agenda
Project 2008-06 Cyber Security Order 706 SDT
Draft 26th Meeting Agenda
September 8, 2010, Wednesday- 8:00 AM to 6:00 PM CDT
September 9, 2010 Thursday- 8:00 AM to 6:00 PM CDT
September 14, 2010 Friday- 8:00 AM to 10:00 AM CDT
Manitoba Hydro Place
360 Portage Ave., Winnipeg, Manitoba, Canada

NOTE: 1. Agenda Times May be Adjusted as Needed during the Meeting
NOTE: 2. Drafting Sub-team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- To review, clarify, refine and adopt the draft CIP-002-4 standard, Implementation Plan and Guidance Document for posting
- To review and discuss the implications of the NERC Mandatory Data Request results for the CIP 002-4 draft
- To review agenda and assignments for CIP-002-4 September 29 Webinar
- To review progress of the Frameworks Sub-team, and the sub-teams draft responses to industry and Dallas workshop comments
- To agree on next steps and assignments

Wednesday, September 8, 2010 8:00 a.m. - 6:00 p.m.

- Introduction, welcome, and opening and guest remarks -*(Morning)*
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review NERC comments on draft CIP-002-4 standard *(Morning)*
- Review and refine draft CIP 002-4 standard and related documents (including CIP-002-4, VSL/VRFs, Implementation Plan, Guidance document for CIP 002-4) *(Morning)*
- Review of NERC Data Request responses for consideration in CIP-002-4 Attachment #1 Criteria *(Afternoon)*

Thursday, September 9, 2010 8:00 a.m. - 6:00 p.m.

- Finalize draft of CIP 002-4 standard *(Morning)*
- Discuss related documents (including VSL/VRFs, Implementation Plan, and Guidance document for CIP 002-4, Comment Form, Cover Letter) *(Morning and Afternoon)*
- Adoption of CIP 002-4 documents for posting *(Afternoon)*
- Review Summary Response Documents for Attachment 2, CIP-010 *(Afternoon & Evening)*

Friday, September 10, 2010, 8:00 a.m. - 10:00 a.m.

- Review Preparation for CIP 002-4 September 29 Webinar *(Morning)*
- Review Progress report on CIP Framework sub-team (*Morning)*
- Review progress reports on Sub-teams' draft summaries of industry and Dallas workshop comments
- Review SDT October12-14, 2010 Toronto Meeting Agenda (*Morning)*

Appendix # 2 Attendees List
September 8-10, 2010 Winnipeg

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation
2. Jim Brenton	ERCOT
3. Jackie Collett	Manitoba Hydro
4. Jay S. Cribb	Southern Company Services
5.Joe Doetzl	Kansas City Pwr. & Light Co
6. Sharon Edwards	Duke Energy
7.Gerald S. Freese	America Electric Pwr.
8. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
9. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
10. Doug Johnson	Exelon Corporation – Commonwealth Edison
11. John Lim, Chair	Consolidated Edison Co. NY
12. David Norton	Entergy
13. David S. Revill	Georgia Transmission Corporation
14. Tom Stevenson	Constellation
15. Keith Stouffer	National Institute of Standards & Technology

SDT Members Attending via ReadyTalk and Phone

16. Scott Rosenberger	Luminant Energy (W/Th)
17.Rich Kinas	Orlando Utilities Commission (W/Th)
18. John D. Varnell	Technology Director, Tenaska Power Services Co. (W/Th)
19. John Van Boxtel	WECC (W)
20 William Winters	Arizona Public Service, Inc. (W/Th)
21.William Gross	Nuclear Energy Institute (W/Th)
22.Kevin Sherlin	Sacramento Municipal Utility District (Th)
Scott Mix	*NERC*
Howard Gugel	*NERC*
Brian Harrell	*NERC*
Roger Lampila	*NERC*
Joe Bucciero	*NERC/Bucciero Consulting, LLC*
Robert Jones	*FSU/FCRC Consensus Center*
Stuart Langton	*FSU/FCRC Consensus Center*

Howard Gugel 9/28/10 5:42 PM
Comment: I do not think these entries belong in this table. We were in person, not on ReadyTalk

SDT Members Not Participating

Patricio Leon	Southern California Edison
Jonathan Stanford	Bonneville Power Administration

Others Attending in Person

Justin Kelly	FERC
Greg Fraser	G.J. Fraser Consulting
Joel Garmen	Next Era Energy (FPL) (T/W/Th)
Robert Preston Lloyd	Southern California Edison
Michael Keane	FERC
Nathan Mitchell	APPA
Brian Newell	American Electric Power
Mark Simon	Encari
Tom Alrich	Matrikon
Guy Zito	NPCC (T/W)

Howard Gugel 9/28/10 5:57 PM
Comment: Allen did not attend this meeting

Others Attending via Readytalk and Phone

Appendix #3 NERC Antitrust Compliance Guidelines

See Antitrust Compliance Guidelines read at the beginning of each day's session at:

(NEED LINK)

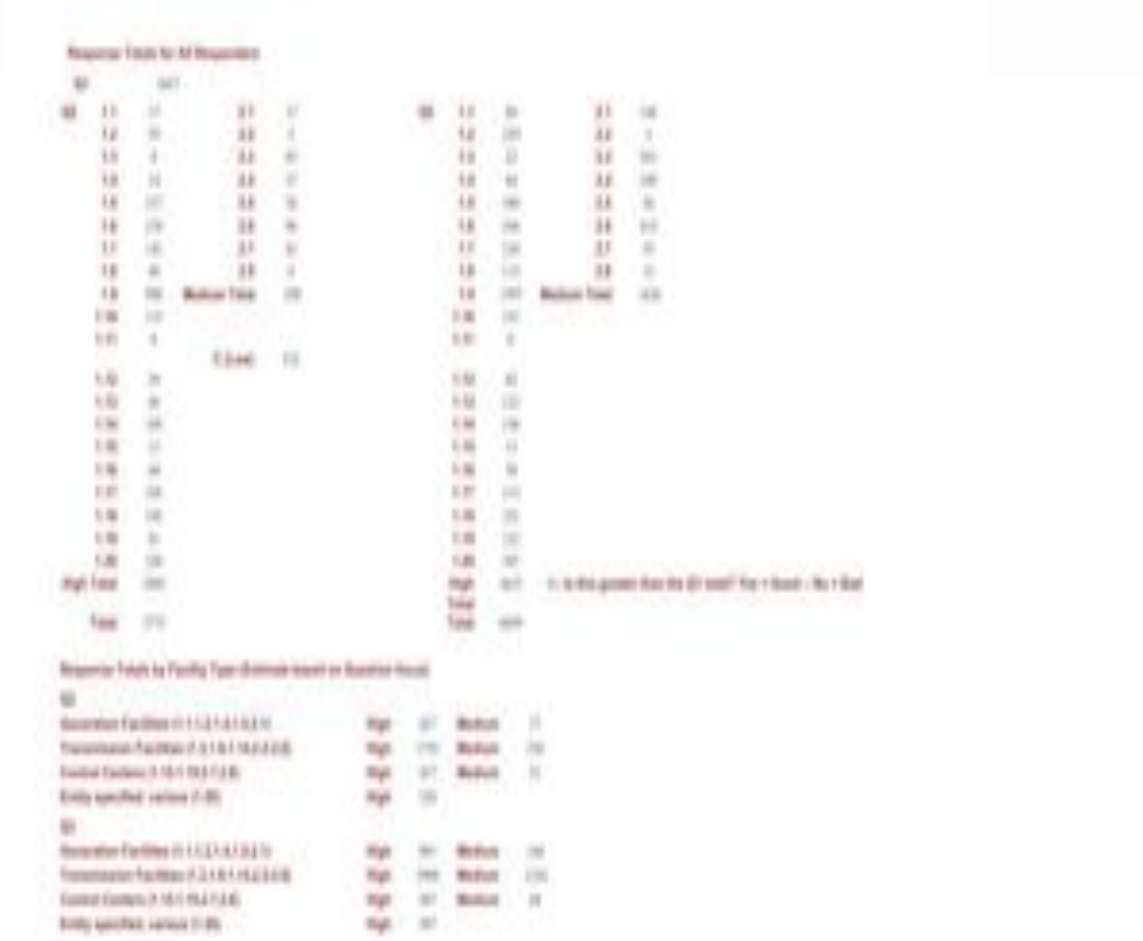
The NERC reminder below was read at the beginning of each day's session.

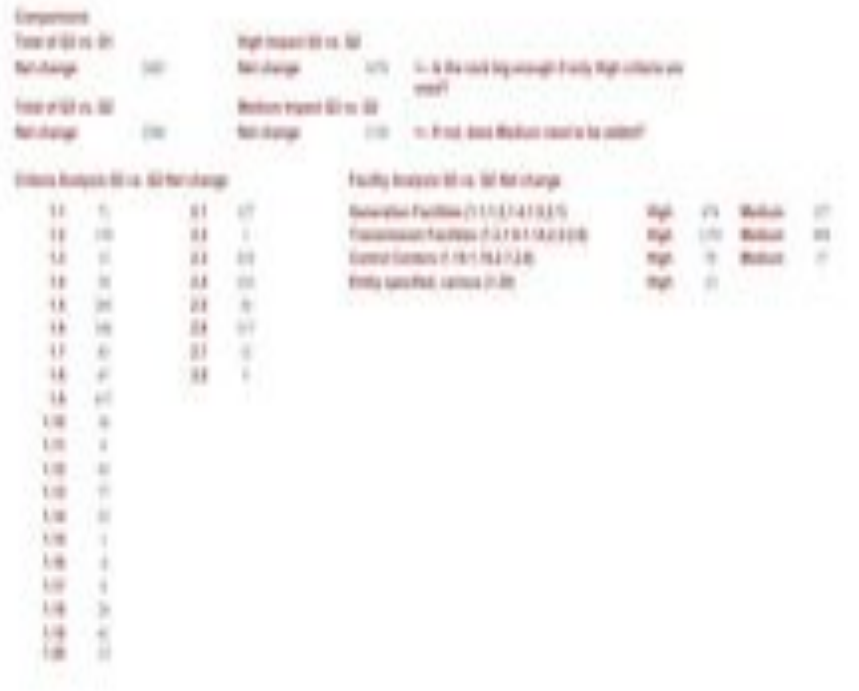
NERC REMINDER FOR USE AT BEGINNING OF MEETINGS AND CONFERENCE CALLS THAT HAVE BEEN PUBLICLY NOTICED AND ARE OPEN TO THE PUBLIC

For face-to-face meeting, with dial-in capability:

Participants are reminded that this meeting is public. Notice of the meeting was posted on the NERC website and widely distributed. The notice included the number for dial-in participation. Participants should keep in mind that the audience may include members of the press and representatives of various governmental authorities, in addition to the expected participation by industry stakeholders.

Appendix # 4- Raw Results- NERC Data Request





Appendix # 5- CIP 002-4 Adopted Draft (9-9-10)

Introduction

1. **Title:** Cyber Security — Critical Cyber Asset Identification

2. **Number:** CIP-002-4

3. **Purpose:** NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

   These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

   Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

   Standard CIP-002-4 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of the criteria in Attachment 1.

4. **Applicability:**

   4.1. Within the text of Standard CIP-002-4, "Responsible Entity" shall mean:

   4.1.1 Reliability Coordinator.

   4.1.2 Balancing Authority.

   4.1.3 Interchange Authority.

   4.1.4 Transmission Service Provider.

   4.1.5 Transmission Owner.

   4.1.6 Transmission Operator.

   4.1.7 Generator Owner.

   4.1.8 Generator Operator.

   4.1.9 Load Serving Entity.

   4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-4:

4.2.1 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. **Effective Date:** The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

Requirements

R1. Critical Asset Identification — Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment I – Critical Asset Criteria*. The Responsible Entity shall review this list at least annually, and update it as necessary.

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets performing a function essential to the operation of the Critical Asset. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Each Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

R2.1 The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
R2.2 The Cyber Asset uses a routable protocol within a control center; or,
R2.3 The Cyber Asset is dial-up accessible.

Annual Approval — The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

Measures

M1. The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R1.

M2. The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R2.

M3. The Responsible Entity shall make available its approval records of annual approvals as specified in Requirement R3.

Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-002-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None.

2. Violation Severity Levels (To be developed later.)

Regional Variances

None identified.

VERSION HISTORY

Version	Date	Action	Change Tracking
1	January 16, 2006	R3.2 — Change "Control Center" to "control center"	03/24/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update
4	09/20/10	Modified to provide bright-line criteria for the identification of Critical Assets.	

CIP-002-4 - Attachment I

CRITICAL ASSET CRITERIA

The following are considered Critical Assets:

1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW.

1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater.

1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes.

1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan.

1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist.

1.6. Transmission Facilities operated at 500 kV or higher.

1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations.

1.8. Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).

1.9. Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).

1.10. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3.

1.11. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).

1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes.

1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator.

1.15. Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection.

1.16. Any additional assets that the Responsible Entity deems appropriate to include.

CIP-002-4	R1.	Critical Asset Identification — Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in CIP-002-4 Attachment 1 – Critical Asset Criteria. The Responsible Entity shall review this list at least annually, and update it as necessary.	N/A	N/A	The Re Entity h develop Critical the list been re updatec as requ	
CIP-002-4	R2.	Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets performing a function essential to the operation of the Critical Asset. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Each Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:	N/A	N/A	The Re Entity h develop associa Cyber A perform functio to the o the Crit but the been re updatec as requ

Appendix #6 Implementation Plan (Final)

Implementation Plan for Version 4 of

Cyber Security Standards CIP-002-4 through CIP-009-4

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Applicable Standards

The following standards are covered by this Implementation Plan:
CIP–002–4 —Cyber Security — Critical Cyber Asset Identification
CIP–003–4 — Cyber Security — Security Management Controls
CIP–004–4 — Cyber Security — Personnel and Training
CIP–005–4 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–4 — Cyber Security — Physical Security
CIP–007–4 —Cyber Security — Systems Security Management
CIP–008–4 — Cyber Security — Incident Reporting and Response Planning
CIP–009–4 — Cyber Security — Recovery Plans for Critical Cyber Assets

These standards are posted for ballot by NERC together with this Implementation Plan. When these standards become effective, all prior versions of these standards are retired.

Compliance with Standards

Once these standards become effective, the Responsible Entities identified in the Applicability section of the standard must comply with the requirements. These Responsible Entities include:

- Reliability Coordinator
- Balancing Authority
- Interchange Authority
- Transmission Service Provider
- Transmission Owner
- Transmission Operator
- Generator Owner
- Generator Operator
- Load Serving Entity
- NERC
- Regional Entity

Proposed Effective Date for CIP-002-4

Responsible Entities shall be compliant with the requirements of CIP-002-4 on the Effective Date specified in the Standard.

Proposed Effective Date for CIP-003-4 – CIP-009-4

Critical Cyber Assets Already in Compliance with CIP-003-3 – CIP-009-3

Critical Cyber Assets identified by CIP-002-4 R2 that are already compliant with CIP-003-3 through CIP-009-3 shall be compliant with the requirements of CIP-003-4 through CIP-009-4 on the Effective Date specified in each version 4 Standard.

Critical Cyber Assets Associated with Critical Assets Newly Identified by CIP-002-4

U.S. Nuclear Power Plant Facilities

For Owners and Operators of U.S. Nuclear Power Plants, Critical Cyber Assets associated with U.S. Nuclear Power Plants identified as Critical Assets which are newly identified by CIP-002-4 R1 within the first 18 months following the Effective Date of CIP-002-4 shall be compliant with CIP-003-4 through CIP-009-4 by the latter of (i) 18 months after the Effective Date of CIP-002-4 or (ii) 6 months following the completion of the first refueling outage beyond 18 months from the Effective Date of CIP-002-4 for those requirements requiring a refueling outage.

All Facilities Other Than U.S. Nuclear Power Plant Facilities

For Responsible Entities who previously identified Critical Cyber Assets under CIP-002-1 R3, CIP-002-2 R3, or CIP-002-3 R3; Critical Cyber Assets associated with Critical Assets which are newly identified by CIP-002-4 R1 within the first 18 months following the Effective Date of CIP-002-4 shall be compliant with CIP-003-4 through CIP-009-4 18 months after the Effective Date of CIP-002-4.

All Other Critical Cyber Assets

For all cases not identified above, Critical Cyber Assets shall be compliant with the requirements of **CIP-003-4 through CIP-009-4** by the latter of (i) the Effective Date specified in each Version 4 Standard or (ii) the compliance milestones in the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* based on the earliest date of identification of the Critical Cyber Asset from CIP-002-1 R3, CIP-002-2 R3, CIP-002-3 R3, or CIP-002-4 R2.

Implementation Plan for Newly Identified Critical Cyber Assets and

Newly Registered Entities

Concurrently submitted with version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4 is a separate Implementation Plan document that would be used by the Responsible

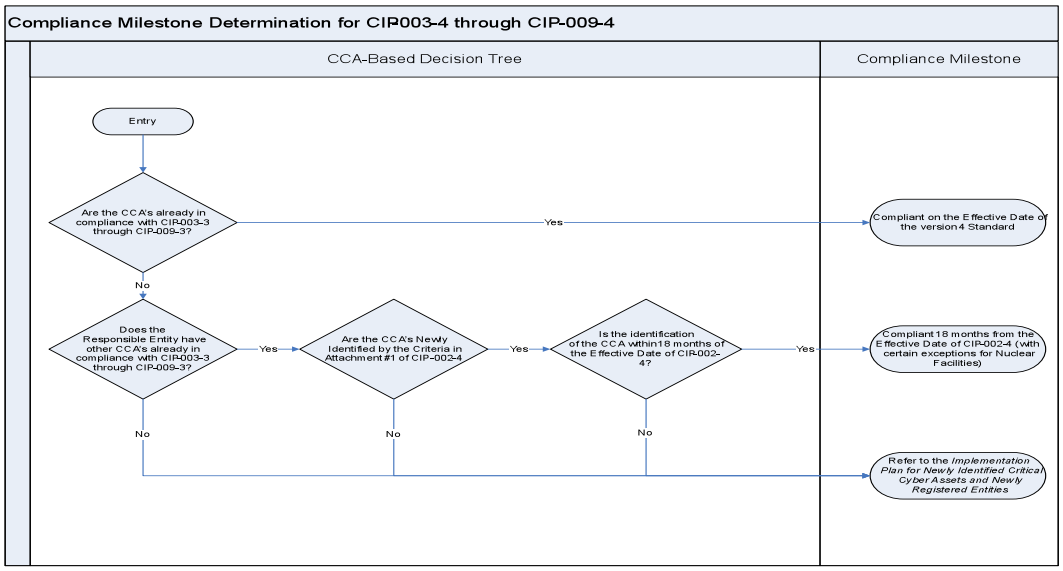
Entities to bring any newly identified Critical Cyber Assets into compliance with the Cyber Security Standards, as those assets are identified. This Implementation Plan would apply based on the situations identified in the above section, *Proposed Effective Date*. This Implementation Plan closes the compliance gap created in the Version 1 Implementation Plan whereby Responsible Entities were required to annually determine their list of Critical Cyber Assets, yet the implication from the Version 1 Implementation Plan was that any newly identified Critical Cyber Assets were to be immediately 'Auditably Compliant', thereby not allowing Responsible Entities the necessary time to achieve the Auditably Compliant state.

The Implementation Plan for newly identified Critical Cyber Assets provides a reasonable schedule for the Responsible Entity to achieve the 'Compliant' state for those newly identified Critical Cyber Assets.

The Implementation Plan for newly identified Critical Cyber Assets also addresses how to achieve the 'Compliant' state for: 1) Responsible Entities that merge with or are acquired by other Responsible Entities; and 2) Responsible Entities that register in the NERC Compliance Registry during or following the completion of the Implementation Plan for Version 4 of the NERC Cyber Security Standards CIP-002-4 to CIP-009-4.

Prior Version Standard Retirement

Standards CIP-002-3 – CIP-009-3 shall be retired upon the Effective Date of the corresponding Version 4 Standard.



NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Appendix #7 Letter and Comment Form

September 20, 2010

TO: INDUSTRY STAKEHOLDERS

RE: **REQUEST FOR COMMENTS REGARDING THE DRAFT OF CIP-002-4 THROUGH CIP-009-4**

Ladies and Gentlemen:

In 2008, FERC Order 706 paragraph 236 directed the ERO to develop modifications to Standard CIP-002-1 Cyber Security – Critical Cyber Asset Identification to address their concerns regarding: (1) the need for ERO guidance regarding the risk-based assessment methodology; (2) the scope of critical assets and critical cyber assets; (3) internal, management approval of the risk-based assessment; (4) external review of critical assets identification; and (5) interdependency analysis.

A Standards Drafting Team (SDT) was appointed by the NERC Standards Committee on August 7, 2008 to develop these modifications as part of Project 2008-06 – Cyber Security Order 706. The SDT has been charged to review each of the CIP reliability standards and address the modifications identified in the FERC Order 706. The SDT began meeting in October 2008.

Prior to this posting, the SDT developed CIP-002-2 through CIP-009-2 to comply with the near-term specific directives of FERC Order 706. This version of the Standards was approved by FERC in September of 2009 with additional directives to be addressed within 90 days of the order. In response, the SDT developed CIP-003-3 through CIP-009-3, which FERC approved in March 2010.

Throughout this period, the SDT has continued efforts to develop an approach to address the remaining FERC Order 706 directives. Most recently, CIP-010 and CIP-011were posted for informal comment in May of 2010. After reviewing and analyzing responses from the industry, the SDT determined it was infeasible to address all of the concerns and achieve industry consensus on CIP-010 and CIP-011 by the planned target date of December 2010. Consequently, the SDT limited the scope of requirements in this posting of CIP-002 through CIP-009 as an interim step to address the more immediate concerns raised in FERC Order 706, paragraph 236. The approach to address the remaining FERC Order 706 directives continues to be developed.

The SDT believes the NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System. These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Standard CIP-002-4 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of the "bright-line" criteria contained in *Attachment 1 – Critical Asset Criteria* of the draft CIP-002-4 standard.

The draft CIP-002-4 standard and requirements provide a foundation for effective cyber security to protect the systems that support a reliable Bulk Electrical System (BES). After months of deliberation and industry input, the SDT is continuing to evolve the Reliability Standards addressing cyber security by presenting a draft standard *CIP 002-4 – Cyber Security – Critical Cyber Asset Identification* that identifies BES Cyber Systems according to "bright-line" criteria associated with the impact on reliable operation of the BES. The *CIP-002-4 Cyber Security - Critical Asset Identification - Rationale and Implementation Reference Document* provides clarifying notes and rationale of the SDT. The draft CIP-003-4 through CIP-009-4 standards include conforming changes to match the versioning of CIP-002-4.

A separate ballot is being conducted on CIP-005-4, and if the proposed standard is approved it will be filed with CIP-003-4 to CIP-009-4. If the proposed CIP-005-4 is rejected, then the present CIP-005-3 will be modified with conforming changes and filed with CIP-003-4 to CIP-009-4. The team is continuing to work on subsequent cyber security standards that will establish impact levels and define associated cyber security controls at levels appropriate to their BES impact.

The Team is seeking industry feedback and suggestions on this draft of CIP 002-4. The industry feedback will be considered by the SDT in revising and refining CIP 002-4 requirements and related documents.

The SDT has provided a form for industry participants to offer their comments on this draft of CIP-002-4.

Questions

Your responses to the following questions will assist the SDT for Project 2008-06 Cyber Security Order 706 in finalizing the work for CIP-002-4 through CIP-009-4 relative to the proposed modifications summarized above. For each question, please indicate whether or not you agree with the modification being proposed. If you disagree with the proposed modification, please explain why you disagree and provide as much detail as possible regarding your disagreement including any suggestions for altering the proposed modification that would eliminate or minimize your disagreement. The SDT would appreciate responses to as many of these questions as you are willing to supply.

1. CIP-002-4 Attachment 1 contains criteria that define elements that must be classified as Critical Assets. Do you have any suggestions that would improve the proposed criteria? If so, please explain and provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:
2. Requirement R1 of draft CIP-002-4 states, "Critical Asset Identification — Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall review this list at least annually, and update it as necessary." Do you agree with the proposed Requirement R1? If not, please explain why and provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:
3. Requirement R2 of draft CIP-002-4 states, "Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets performing a function essential to the operation of the Critical Asset. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Each Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics". The requirement then lists characteristics using the same text that is contained in the existing CIP-002-3 R3. Do you agree with the proposed Requirement R2? If not, please explain why and provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:
4. Do you agree with the proposed Violation Risk Factors? If not, please provide suggested improvements on the proposed VRFs.

   ☐ Yes
   ☐ No
   Comments:

5. Do you agree with the proposed Violation Severity Levels? If not, please provide suggested improvements on the proposed VSLs.

☐ Yes
☐ No
Comments:

6. Do you agree with the proposed implementation plan? If so, please explain and provide specific suggestions for improvement.

☐ Yes
☐ No
Comments:

Appendix # 8 Framework Team September 2 Meeting Results

Structure and Composition of CIP Version 5

1) In order to be responsive to: 1) the industry in general; 2) a large industry voting block with far-reaching established programs; and, 3) FERC 706; we need to:

   a) Maintain a size-based paradigm for organizing grid assets. As such, we would define "Classes" of grid assets:
      i) Class A – large ("bright line" CIP-002-4; sans control/data centers)
      ii) Class B - medium sized assets (scope TBD)
      iii) Class C - small sized assets (scope TBD)
      iv) Class D – Control/ Data Centers

   b) Use the NIST paradigm for building requirement-sets; i.e., first establish minimum baseline requirements for all Asset Classes and Categories (see #2 below) for each subject area contained in the CIPs; then augment as criticality increases (i.e., for Class B Categories and Class A Categories)

2) To obtain granularity in requirements desired, establish "Asset Categories" within each Asset Class, and write Requirements appropriate for each:

   a) Generation Category – within each Class A, B, and C
   b) Transmission Category – within each Class A, B, and C
   c) Control/Data Center Category – within each Class A, B, and C
   d) Others?

   [Note movement of control/data centers out of CIP-002 for treatment as a Category]

Drafting Work Process

1) Initially, create separate sub-teams (STs) to work individually on the controls and technical issues that we need to address. Let's not address the governance issues at first, but hold them until we have the framework better defined. [If additional Standards are determined to be necessary, create additional STs.]

2) Define "*What are we defending against*?" As the first step in the process, each ST will research and specify generic known vulnerabilities that CIP Standards' requirements are aimed to mitigate. This is needed to provide foundational rationale for a more granular approach to Requirements-writing, with the aim of avoiding the pitfalls of a "one size fits all" approach under which we currently operate. This approach should reduce both the number of TFE and variability in interpretation.

3) With an eye toward the issues its working on, each ST conducts a review and captures:
   a) specific instructions contained in the CS_706 SAR
   b) specific FERC 706 directives, ensuring coverage of "Post V4" topics

4) Using the list of vulnerabilities from Item #2 work just above, and directives culled from work under Item #3 just above, each ST will begin crafting baseline Requirements for each Asset Category within each Asset Class, using the following resources:
   a) Draft CIP-011 language, regardless of prior organization of material
   b) DHS Catalog
   c) NIST SP800-53 and SP800-82
   d) ??? NISTIR V2 SG Cyber Security WG
   e) ??? ISA99

5) Using the same resources as in Item #4 just above, each ST would then augment the "Baseline Requirements" created under Item #4 just above, with more "Advanced Control and Countermeasure Requirements" as appropriate for each Asset Category beneath Asset Class B, and Asset Class A respectively.

6) As each ST creates Requirements, it must take note of the potential need for coordination/rationalization of language in the Standard it is working on with other Standards being worked by other ST. [CIP could remain "nested" to a certain degree]

7) After 'rationalization' of language across Standards, either task a new ST or have the entire SDT take up the umbrella governance issues.

II/III Outstanding items needing further consideration

1) Data Communications – Do we:
   a. Create a new Standard?
   b. Treat it as a Category of Asset beneath each Asset Class?
   c. Just enhance the existing approach?
2) Can "Baseline Requirements" be:
   a. Strictly "organizational controls" (largely processes and procedures)? Or,
   b. Also additionally technical countermeasures (equipment, SW, etc.)
3) Shall we have different "Baseline Requirements":
   a. Across each Asset Class? [Class A more rigorous than B, and B more than C]
   b. Across each Category within each Class? [Same logic as 3a.]
4) Other areas the Framework Team members want to discuss at this time?

How much farther than this do we want to go before gaining full SDT agreement in principle that this approach is acceptable?

Appendix #9 Sub-Team Roster

Sub-Team	
CIP 010 BES System Categorization	John Lim (Lead), Rich Kinas, Jim Brenton, Dave Norton *(Observer Participants: Rod Hardiman, Jim Fletcher) (FERC: Mike Keane, Peter Kuebeck)*
Personnel and Physical Security	Doug Johnson (Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin *(FERC: Drew Kittey)*
System Security and Boundary Protection	Jay Cribb (Lead), Jackie Collett, John Varnell, John Van Boxtel, Philip Huff *(Observer Participant: Brian Newell) (FERC: Justin Kelly)*
Incident Response and Recovery	Scott Rosenberger (Lead), Joe Doetzl, Tom Stevenson (*Observer Participant: Jason Marshall) (FERC: Dan Bogle)*
Access Control	Sharon Edwards (Lead), Jeff Hoffman, Jerry Freese, Bill Winters *(Observer Participants: Roger Fradenburgh, Robert Preston Lloyd) (FERC: Mike Keane)*
Change Management, System Lifecycle, Information Protection, Maintenance, and Governance	Dave Revill (Lead), Jon Stanford, Keith Stouffer, Bill Winters *(Observer Participant: Brian Newell) (FERC: Jan Bargen, Matthew Dale)*
CIP 002-4 Drafting Team	John Lim (Lead), Jim Brenton, Jackie Collett, Jay Cribb, Sharon Edwards, Doug Johnson, Rich Kinas, Dave Norton, Dave Revill, and Bill Winters *(Observer Participants: Rod Hardiman; Jim Fletcher; Bryn Wilson) (FERC: Mike Keane, Peter Kuebeck; NERC: Scott Mix)*
Implementation Plan CIP 002-4	Dave Revill (Lead), Sharon Edwards, Kevin Sherlin, Scott Rosenberg, Dave Norton and Phil Huff *(FERC: Mike Keane; NERC: Scott Mix)*
Framework CIP 010 &011	Dave Norton (Lead), Jim Brenton, Jay Cribb, Joe Doetzl, Phil Huff, Doug Johnson, Dave Revill, Jon Stanford, and John Van Boxtel. *(FERC: Mike Keane; NERC: Scott Mix)*

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 SDT - Project 2008-06

September 8, 2010 | 8:00 AM to 6:00 PM CDT
September 9, 2010 | 8:00 AM to 6:00 PM CDT
September 10, 2010 | 8:00 AM to 10:00 AM CDT

Manitoba Hydro Place
360 Portage Ave., Winnipeg, Manitoba, Canada

Proposed Meeting Objectives/Outcomes:

- To review, clarify, refine and adopt the draft CIP-002-4 standard, Implementation Plan and Guidance Document for posting
- To review and discuss the implications of the NERC Mandatory Data Request results for the CIP 002-4 draft
- To review agenda and assignments for CIP-002-4 September 29 Webinar
- To review progress of the Frameworks Sub-team, and the sub-teams draft responses to industry and Dallas workshop comments
- To agree on next steps and assignments

Wednesday, September 8, 2010 8:00 a.m. - 6:00 p.m.

- Introduction, welcome, and opening and guest remarks -*(Morning)*
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review NERC comments on draft CIP-002-4 standard *(Morning)*
- Review and refine draft CIP 002-4 standard and related documents (including CIP-002-4, VSL/VRFs, Implementation Plan, Guidance document for CIP 002-4) *(Morning)*
- Review of NERC Data Request responses for consideration in CIP-002-4 Attachment #1 Criteria *(Afternoon)*

Thursday, September 9, 2010 8:00 a.m. - 6:00 p.m.

- Finalize draft of CIP 002-4 standard *(Morning)*
- Discuss related documents (including VSL/VRFs, Implementation Plan, and Guidance document for CIP 002-4, Comment Form, Cover Letter) *(Morning and Afternoon)*
- Adoption of CIP 002-4 documents for posting *(Afternoon)*
- Review Summary Response Documents for Attachment 2, CIP-010 *(Afternoon & Evening)*

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

Friday, September 10, 2010, 8:00 a.m. - 10:00 a.m.

- Review Preparation for CIP 002-4 September 29 Webinar *(Morning)*
- Review Progress report on CIP Framework sub-team (*Morning)*
- Review progress reports on Sub-teams' draft summaries of industry and Dallas workshop comments
- Review SDT October12-14, 2010 Toronto Meeting Agenda (*Morning)*

Second page...

CSO706 SDT FULL TEAM CONFERENCE CALL SUMMARY
September 15, 2010
10:00 a.m. - 12:00 p.m. EDT
Adopted by the SDT on October 14, 2010

Following roll call and a review of the anti-trust guidelines, the Chair reviewed the objectives and agenda for the call. When a quorum of at least 17members was achieved, NERC Standards Committee Chair Allen Mosher addressed the SDT thanking them for their continuing efforts. He expressed appreciation for their sense of humor indicating he understood their frustration in doing this difficult job. He asked them to do the right thing for reliability of the BES while keeping in mind the different visions on what that is and the broader policy context of the CIP. He acknowledged the challenge for companies in the industry to address these high impact/low frequency events. He reminded members that CIP was different from other standards and was viewed through a different lens, noting both the significant external pressures felt within the industry and beyond as well as the heightened attention to the reality of being probed daily on cyber security threats.

Howard Gugel, NERC reported that there were no NERC staff edits of the CIP 002-4 that was adopted by the Team in Winnipeg. He mentioned that he had deleted one of the measures from the old requirement.

John Lim opened the SDT discussion on the possibility of adding a new criterion to CIP 002-4 Attachment 1 to include all nuclear generation facilities. He noted that in Winnipeg the Team agreed that members would discuss and receive input from their senior management in light of the EEI CEOs meeting of last week.

After extended discussion of a proposal for adding a new Attachment 1 criterion addressing nuclear generation and potential related changes for CIP 002-4 in the applicability and requirements sections, a motion was made by John Lim to test support for the following change to the Applicability Section, 4.2.1 failed to get a second:

> 4.2.1 Proposal: ~~All BES facilities under NERC jurisdiction those s~~Structures, components, equipment and systems ~~of facilities~~ within a nuclear generation plant ~~not~~ regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

Jim Brenton then made a motion that the following new criterion be included in Attachment 1, with Dave Norton seconding the motion with the friendly amendment substituting facility for unit:

> 1.1. "Each nuclear generation ~~facility~~ unit."

There was discussion following the motion and Jim Brenton and Dave Norton agreed that if the motion passed to include a new 1.1, there would be conforming changes to 1.2 and in 4.2 to reinstate the exclusion and make the following change in R2:

1.1. Each group of generating units (excluding ~~including~~ nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW.

"R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. For each group of generating units ~~(including nuclear generation)~~ at a single plant location identified in Attachment 1, criterion 1.~~1~~ 2, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.~~1~~ 2within 15 minutes. The Responsible Entity shall review this list at least annually, and update it as necessary."

Some members offered concerns that this language had not been reviewed in advance and vetted in terms of possible impacts or unintended consequences; that with the changes in Winnipeg the current R1.2 brings in many more nuclear facilities (e.g. all Duke's nuclear generation will come in as critical assets); why nuclear as a fuel is treated differently for reliability than other types of fuel (hydro, coal, etc) and that safety systems are regulated by other regulatory bodies (e.g. NRC); that inclusion of this criteria is purely an optic for criticality which establishes a bad precedent and is indefensible in terms of reliability; the possible impact of the changes on 1.11; that the SDT hasn't excluded nuclear and is covered in new last criterion added in Winnipeg; concern that the "unit" term take us to safety systems and possibly puts them in double jeopardy; this was excluded in Pittsburgh in order to avoid the FERC and NRC issue.

The chair called for a vote on the motion, noting there was a quorum present and that it would require at least 13 of the 19 members present support to pass with 2/3's support of the SDT:

- **In support of the motion= 9 members = 47%**
- **Opposed to the motion=10 members**

Following the vote there was discussion as to whether there was anything short of removing the criteria that might move those voting no to vote yes. Some members noted their reasons for not supporting the motion that included: the current 1.1 at 1500 MW and other changes in the criteria made in Winnipeg were sufficient; there needs to be a reliability basis for including nuclear generation; concern about the confusion in terms of NRC jurisdiction; better to submit the draft from Winnipeg to the industry and see what happens in balloting process; considering this a the last minute without the ability to sort out possible unintended consequences.

The Chair noted that based on this vote, the CIP 002-4 that had been approved by the SDT in Winnipeg would be posted for the 45 day formal comment period.

The Team agreed to post the Reference (formerly the Guidance) Document that had been revised and circulated to the Team on September 13 based on the Winnipeg input. Members editorial redline comments on the document would be considered following the review of the Industry comments and first ballot. Since the Summary Industry Response document for the relevant sections of Attachment 2, CIP-010 was not ready it would not be posted with CIP 002-4.

The Team briefly reviewed the preparation for the September 29 webinar and the meeting adjourned at 12:00 p.m.

Appendix #1 Agenda

CSO706 SDT Full Team Conference Call
September 15, 2010
10:00 a.m.- 12:00 p.m. EST

Objectives

- To review and consider acceptance of any NERC staff edits to CIP 002-4
- To review and consider adoption for a new Attachment #1 criterion on nuclear generation facilities
- To review and adopt the Reference Document for posting with CIP 002-4
- To review and adopt the Summary Response to relevant parts of Attachment 2, CIP 010 for posting with CIP 002-4; and
- To review next steps including the September 29 Webinar.

Draft Agenda

The agenda for today's conference call includes:

- Roll Call, Quorum Test (17 SDT members) and Objectives and Agenda Review
- Anti-Trust Guidelines
- Review of the CIP 002-4 Posting Schedule
- Review of CIP 002-4 NERC Staff Edits
- Discussion and Possible Motion to Add to Attachment #1 a new Criterion designating as Critical Assets all nuclear generation Facilities
- Review and Adopt the Reference Document for CIP-002-4 *(John Lim)*
- Review and Adopt Summary Response for Attachment 2, CIP-010 *(Jackie Collett)*
- Review of the September 29 Webinar on CIP 002-4
- Next Steps and Assignments

Appendix #2 Participant List
SEPTEMBER 15, 2010 SDT CONFERENCE CALL, 10 A.M- LLEREP.M. EST

SDT Members Participating

1. Rob Antonishen	Ontario Power Generation
2. Jim Brenton	ERCOT
3. Jackie Collett	Manitoba Hydro
4. Jay S. Cribb	Southern Company Services
5.Joe Doetzl	Kansas City Pwr. & Light Co
6. Sharon Edwards	Duke Energy
7. Gerald S. Freese	America Electric Pwr.
8.William Gross	Nuclear Energy Institute
9. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
10. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
11. Doug Johnson	Exelon Corporation – Commonwealth Edison
12. John Lim, Chair	Consolidated Edison Co. NY
13. David Norton	Entergy
14.Kevin Sherlin	Sacramento Municipal Utility District
15. Tom Stevenson	Constellation
16. Keith Stouffer	National Institute of Standards & Technology
17. Scott Rosenberger	Luminant Energy
18. John D. Varnell	Technology Director, Tenaska Power Services Co.
19 William Winters	Arizona Public Service, Inc.

Members Unable to Participate

Rich Kinas	*Orlando Utilities Commission*
Patricio Leon	*Southern California Edison*
David S. Revill	*Georgia Transmission Corporation*
Jonathan Stanford	*Bonneville Power Administration*
Brad Yates	
John Van Boxtel	*WECC*

Scott Mix	*NERC*
Howard Gugel	*NERC*
Joe Bucciero	*NERC/Bucciero Consulting, LLC*
Robert Jones	*FSU/FCRC Consensus Center*
Stuart Langton	*FSU/FCRC Consensus Center*

Ready Talk Participants (other than members)

Drew	Kittey	Drew.Kittey@ferc.gov
Andres	Lopez	andres.lopez@usace.army.mil
Herb	Schrayshuen	herb.schrayshuen@nerc.net

CSO706 SDT October 12-14, 2010 Meeting Summary Contents

Cyber Security Order 706 SDT- Project 2008-06
27TH MEETING
October 12-14, 2010
Toronto, Canada

EXECUTIVE SUMMARY

John Lim, Chair of the CSO 706 SDT welcomed members and other participants to Toronto and thanked Rob Antonishen at Ontario Power Generation for hosting the meeting. Howard Gugel, NERC, conducted a roll call and reviewed the antitrust and public meeting guidelines. On Wednesday morning, the SDT unanimously adopted the September 8-11, 2010 Winnipeg meeting summary and the September 15, 2010 SDT Conference Call Summary. On Wednesday at noon, the Chair, on behalf of the SDT, bid Jackie Collett a fond farewell and thanked her for her leadership and contributions. She will be taking a new position with Manitoba Hydro and will step down from the SDT in December 2010.

Bob Jones briefly reviewed the schedule for CIP 010 & CIP-011, which was adopted by the SDT during the Chicago meeting and sent to the Standards Committee in September. The schedule calls for a draft standard for formal comment to the industry by July 2011. In December, the SDT will be reviewing the recommendations from the Framework Sub-Team and determining the course for the further development of the CIP standards in 2011. He also reviewed the CIP 002-4 schedule. During the November meeting in Baltimore, the SDT will be reviewing and responding to industry comments and determining what changes to make to CIP 002-4 before posting for the 2nd ballot.

In updates, Scott Mix, NERC noted the comments received were substantial for CIP 005-4 (over 200 pages) and he summarized common themes. The SDT is treating the posting as an informal comment process and plans to have revisions to the proposed standard by next week and a guidance document was posted in the meantime during the ballot period. The intent is to have this out for ballot along with CIP 002-4. Scott also noted that Jim Brenton, a member of the CAN-5 team, was not able to participate in the Toronto meeting and offered a brief report on the efforts to date. Finally he noted that the CAN-7 is technically completed. Dave Norton reported on NESCSO/NETL this new organization that has been funded by DOE and formed to address best practices with an academic flavor. Apparently two organizations have received DOE 3- year funding: EPRI and Energy Sec a small organization that meets once a year and has established a portal and secure chat facility. Howard Gugel reported on the NERC annual standards meeting in St. Louis and his presentation on the CIP work of the SDT. He noted there were questions about protecting assets (E.g. 69 KV in swamp) and small entities expressed concerns about the thresholds and he suggested that the SDT consider including information on why were are making transition to protecting all cyber assets on this up front in their next posting. Scott Mix reported that FERC has issued an order accepting the TFEs with some clean up and additional obligations and NERC will file another compliance filing in the next 90 days (Docket # RR 10-1-001). Howard Gugel reported that CIP 002-1 Declaration of Critical Assets, Balloting for Interpretation had closed but results not yet available.

The SDT reviewed the questions posed regarding CIP 002-4 on the September 29 Webinar and reviewed and refined responses for each question as a way to prepare for the challenge in responding to industry comments on the first ballot of CIP 002-4 in November. Howard Gugel, NERC staff, reviewed with the SDT a few changes agreed to by the SDT in that were inadvertently left off of the formal 45 day comment filing and he proposed, and the SDT agreed, to post a new CIP 002-4 version with errata corrected for balloting.

Dave Norton provided a review of the Framework Team's efforts to date, including several conference call meetings since it was created at the August SDT Chicago meeting. Their charge was to develop a framework strawman for the CIP framework going forward in 2011. He noted that the Team has begun to develop some documents including: a draft communications plan (Dave Revill), a rationale paper (Phil Huff), a spreadsheet with current requirements (Jay Cribb and Phil Huff) and a set of critical issues (Dave Norton).

Dave Norton presented a power point with six draft premises designed to stimulate SDT discussion on a framework going forward. The Team discussed and provided some potential responses for each of the premises:

- Premise #1, focusing on whether to assess the threats and risks or applying best practices against known vulnerabilities included discussion of: what threats are we defending against; reliability standards; audit-ability the nature of the framework; controls and "considering" the NIST; requirements and controls; and risk Assessment. In discussing this premise, the SDT concluded their approach will continue to be apply best practices against known vulnerabilities.
- Premise #2, focused on whether to take a minimalist or a transformative approach to the CIP standards concluded that this is not "either/or" but rather "both/and."
- Premise #3, focused on how the Team should respond to the directive to "consider" the NIST security risk management framework, and the discussion covered topics of: requirements language, TFEs, programmatic approach to standards drafting; compensating measures and a lesson learned culture. The Team concluded that this, like premise #2, may not be "either/or" but rather "both/and" and that "consideration" of NIST is not the same as adoption of NIST. The industry and the SDT should consider what aspects of the NIST approach fit the requirements model and whether adopting a programmatic approach to drafting standards will help to address the consideration of NIST.
- Premise # 4 focused on categorization of critical assets and the SDT generally concluded that both electrical impact and cyber security views should inform the standards and that trying to distinguish between high, medium and low may not be the best approach to providing cyber protection of the BES. The differences between transmission, generation and control centers may prove be more important than distinguishing H/M/L.
- Premise #5, focused on characterization of asset classes for protection and the SDT discussed physical security and its relationship to the characterizations and generally conclude that the three set paradigm should be the one to build on for the CIP.
-

- Premise #6 focused on whether and how standards should address the different genre and age of control equipment in terms of vulnerability, device class or technology.

On Thursday the Team developed a set of framework guidance statements based on the discussion. Phil Huff offered an initial draft of statements which the Team reviewed, refined and agreed to. Below are the final statements.

Ultimately, we need more structure in the requirement drafting process. The Framework Sub-Team's deliverable in December should be very concrete and clear in the proposed direction moving forward.

1. The Framework Sub-Team will develop a framework (e.g. style guide) for writing program-based requirements, where appropriate. This framework should include:
   - Minimizing zero-defects in compliance requirements
   - Guidance for rationale statements for individual requirements that speak to the vulnerabilities they address.
2. The Framework Sub-Team will develop a high-level narrative to answer the foundational question of "What are we trying to protect against?"
3. The Framework Sub-Team will develop a model which applies a baseline set of requirements for all BES Cyber Systems which allows for enhanced requirements for:
   - High impact
   - Specifications for generation, transmission, and control centers
   - Specifications for legacy vs. state-of-the-art equipment
   - Connectivity considerations
4. The Framework Sub-Team will consider developing a framework for incorporating vulnerability assessments into the current standards for the purpose of allowing flexibility in applying security controls.

Following the discussion of the premises and prior to refining and finalizing the guidance statements, the SDT discussed the following issues related to the development of the framework: manage security like reliability; change the zero-defect approach; change the industry approach to self reports; improve uniformity of audits.

The Framework Team has been asked to provide a draft answer the question of the organization of the CIP going forward and has been developing a clearer documentation of the rationale for the changes reflected in the draft CIP 10 and 11. The Chair asked each SDT member, through a round-robin review, to describe their current thinking on the format for the CIP. He noted that at its Sacramento meeting the SDT was nearly evenly split on the format question. Several members noted they had changed their earlier position supporting the use the existing CIP 003-009 format and many now said that form should follow function and that either format approach, or even another format approach would be acceptable. The facilitate summarized the results of the exercise suggesting there was in evidence a lot more openness

around this issue than in Sacramento and a shared value of getting the requirements right first and then organizing the format and that the Framework Team could focus on the goal of eliminating or reducing cross-linking in the standard requirements and TFEs. The Chair suggested the Framework Team continue its efforts in preparing a strawman for the December, 2010 meeting in Orlando. He also noted that the communication plan for industry outreach and education that the Team is developing will be critical to the success of the SDT.

The Team reviewed the steps and assignments coming into the Baltimore meeting. The SDT agreed to engage in a series of conference call meetings (Monday-Friday, 11:00 a.m.-3:00 p.m.) the week before the Baltimore meeting to review industry comments and review and refine a set of strawman SDT responses to the comments. Tom Stevenson provided an overview of Constellation Energy's facility in Baltimore where the SDT will meet in November. The Chair thanked Rob Antonishen for his excellent hosting of the SDT in Toronto.

The meeting adjourned at 4:40 on Thursday

_____

Cyber Security Order 706 SDT- Project 2008-06
27TH MEETING SUMMARY
October 10-12, 2010
Toronto, Canada

I. AGENDA REVIEW, WORKPLAN SCHEDULE AND UPDATES

A. Agenda Review and Adoption of Meeting SDT Summaries

John Lim, Chair of the CSO 706 SDT welcomed members and other participants to Toronto and thanked Rob Antonishen at Ontario Power Generation for hosting the meeting. Rob covered logistics. Howard Gugel, NERC, conducted a roll call *(See Appendix #2)* and reviewed the antitrust and public meeting guidelines *(See Appendix #3)* with the meeting participants at the outset on each day. On Wednesday morning, the SDT unanimously adopted the September 8-11, 2010 Winnipeg meeting summary and the September 15, 2010 SDT Conference Call Summary. John Lim reviewed the proposed meeting objectives, the facilitator Bob Jones reviewed and the SDT agreed to the proposed timed agenda. On Wednesday at noon, the Chair, on behalf of the SDT, bid Jackie Collett a fond farewell and thanked her for her leadership and contributions. She will be taking a new position with Manitoba Hydro and will step down from the SDT in December, 2010.

B. Update on the CIP 002-4 and the 010 and 011 Development Schedule

Bob Jones briefly reviewed the schedule for CIP 010 & CIP-011, which was adopted by the SDT during the Chicago meeting and sent to the Standards Committee in September and calls for a draft standard for formal comment to the industry by July, 2011, meaning there are about 6 months starting in December for the SDT to complete this task. In December, the SDT will be reviewing the recommendations from the Framework Sub-Team and determining the course for the further development of the CIP standards in 2011.

He also reviewed the CIP 002-4 schedule. During the November meeting in Baltimore, the SDT will be reviewing and responding to industry comments and determining what changes to make to CIP 002-4 before posting for the 2nd ballot.

C. Updates on other related cyber security initiatives- *NERC Staff and SDT Members*

1. Update on Urgent Action CIP 005-4 process- *Scott Mix*

Scott Mix noted the comments were substantial on CIP 005-4 (over 200 pages). He summarized common themes. The SDT has had several conference calls to resolve issues (such as local definitions of remote access and other issues) and they are treating the posting as an informal comment process. He also noted that the new NERC version of standards development was recently approved by FERC

which removed urgent action and replaced it with an "expedited" process. The SDT plans to have revisions to the proposed standard by next week and a guidance document was posted in the meantime during the ballot period. The intent is to have this out for ballot along with CIP 002-4.

2. **Update on CAN 5-** ***Scott Mix***

Scott noted that Jim Brenton was not able to participate in the Toronto meeting. Scott offered a brief report on the efforts to date include a possible "misstatement" about operator laptop control.

3. **Update on CAN 7-** ***Scott Mix***

Scott noted that this CAN in technically completed.

4. **Update on NESCSO at NETL-** ***Dave Norton***

Dave Norton reported on this new organization that has been funded by DOE and formed to address best practices with an academic flavor. Apparently two organizations have received DOE 3- year funding: Energy Sec a small organization that meets once a year and has established a portal and secure chat facility; and EPRI. The conference was attended by a couple other SDT members (Jim Brenton and John Van Boxtel) and featured a presentation by Mike Assante on his work on professional certification.

5. **October NERC annual standards meeting in St. Louis-** ***Howard Gugel***

Howard Gugel reported on the NERC annual standards meeting in St. Louis and his presentation on the CIP work of the SDT. He noted there were questions about protecting assets (E.g. 69 KV in swamp) and small entities expressed concerns about the thresholds. He underscored the need to look at this from both an engineering and IT perspective and consider the threat of attack vectors and simultaneous attacks. He suggested that the SDT consider including information on why were are making transition to protecting all cyber assets on this up front in their next posting.

The SDT discussed what approach we are taking (bright lines or tailored protection), CIP 002-4 addressing the highest level of protection; the use of mutual distrust and small systems; and until the functional model changes, the SDT should write standards for what is in NERC's purview.

6. **Technical Feasibility Exceptions-** *Scott Mix*

Scott Mix reported that FERC has issued an order accepting the TFEs with some clean up and additional obligations and NERC will file another compliance filing in the next 90 days (Docket # RR 10-1-001). The SDT discussion covered: when will it take effect? A: after FERC approval; NERC has to file compliance filing to add those and other clean up. Until that 006 and 007 not subject; another

Appendix 4D filing will be done; how will the TFE process address applying a patch? A: Not sure yet lawyers are reviewing.

7. CIP 002-1 Declaration of Critical Assets, Balloting for Interpretation.

Howard Gugel reported on this ballot noting it has closed but results not yet available.

II. REVIEW OF CIP 002-4 WEBINAR QUESTIONS AND RESPONSES

The SDT reviewed the questions posed regarding CIP 002-4 on the September 29 Webinar and reviewed and refined responses for each question as a way to prepare for the challenge in responding to industry comments on the first ballot of CIP 002-4 in November. *See Appendix XX for the SDT discussion comments and final response statements.*

At the conclusion of the webinar, NERC offered to post the questions raised and responses offered as a resource for the industry to review in reflecting on CIP 002-4 when balloted. The SDT agreed to offer additional comments, where needed, to clarify any responses that team members offered during the course of the webinar.

Howard Gugel, NERC staff, reviewed with the SDT a few changes agreed to by the SDT in that were inadvertently left off of the formal 45 day comment filing including: deleting "senior officer"; deleting the exception for nuclear facilities in CIP 008; and 1.1 – "greater than 1500 MW" vs."1500 or more." which both should have been deleted. He proposed, and the SDT agreed, to post a new CIP 002-4 version with errata corrected for balloting. Members discussed the fact that the Guidance Document clarified that manually initiated was not automatic load shed and this should be consistent in CIP 002-4.

III. FRAMEWORK TEAM REPORT AND SDT DISCUSSION OF CRITICAL ISSUES

Dave Norton provided a review of the Framework Team's efforts, including several conference call meetings since it was created at the August SDT Chicago meeting. Their charge was to develop a framework strawman for the CIP framework going forward in 2011. Team members included: Dave Norton, Jim Brenton, Jay Cribb, Joe Doetzl, Phil Huff, Doug Johnson, Dave Revill, Jon Stanford, and John Van Boxtel. Mike Keane at FERC and Scott Mix at NERC also participated. He noted that the attendance has been spotty but the Team has begun to develop some documents including: a draft communications plan (Dave Revill), a rationale paper (Phil Huff), a spread sheet with current requirements (Jay Cribb and Phil Huff) and a set of critical issues (Dave Norton).

A. Review of Critical Issues and Premises

Dave Norton presented a power point with some framing premises designed to stimulate SDT discussion on a framework going forward. Howard Gugel noted that the Team had asked Keith Stouffer do a presentation on the NIST framework but he was unable to at this meeting. Keith agreed to do so at the December meeting or in a webinar format prior to that meeting. Jay Cribb suggested the question for the SDT was what "shade of gray are we going to choose?" Dave Norton noted his concern regarding the industry's ability to absorb these changes. The facilitator suggested that the goal of the review of these premises is not driving towards consensus but rather an opportunity for the SDT to flush out and discuss the issues.

Draft Premise #1`: Known vectors that threats can exploit are vulnerabilities. Risk is calculated impact measured as the product of financial loss X probability of exploitation. Risk is difficult to quantify in the case of widespread loss of critical electric infrastructure, except to conclude that it is unacceptable. Therefore:

1. Is rigorous formal syllogistic assessment of threats and risk a necessary prerequisite to drafting, or

2. Is prescription of generally accepted best practice controls and countermeasures for defending against known vulnerabilities satisfactory for writing CIP standards?

Dave Norton posed the following question: while the SDT won't write standards for unknown vulnerabilities, do we need to document how many bad things can happen? The SDT after an extended discussion concluded that it does not make sense, nor will it be possible for the Team to assess the threats and risks and that it should continue with the model of applying best practices against known vulnerabilities. Some consideration should be given to whether the SDT could add rigor to vulnerability threats by utilizing the knowledge of its members and going out to entities to take some informal sampling in order to reasonably conclude that the proposed controls are addressing known vulnerabilities.

Member and participant comments covered the following issues and questions:

- **What Threats are We Defending Against?** We need to clarify these.
- We have looked at threat vectors in building the CIP standards;
- Should we stay where we are with the application of standards protecting against vulnerability;
- The best practices approach makes sense since the top 10 threats have not changed that much from year to year.
- Should we protect for 90% and detect the rest?
- Some threats are not reliant on network connectivity.

- Current standards have threat and risk infused into them because if you have a requirement framework you must do this; in the NIST framework controls are set of tools not requirements, that provide guidance;
- We can't start with a threat assessment since we don't have ability to see every entity and determine which ones apply.
- Most of threats comes from inside which can be addressed by configuration management, awareness and training, Perimeter defenses are generally well designed but its the inner connectivity that gets us into trouble.
- For "advanced persistent threats", firewall defenses are not effective. There is lots of social engineering that goes into this.
- We have an opportunity since we still don't have a way of assessing risk. If we did, wouldn't be problems with these standards. Why not discuss a risk assessment methodology?
- Look at risk assessment for a sector- problem is models are wrong. DHS heavily terrorism focused.
- We are haunted by the risk of writing a cookbook for the bad guys if everything in the overall system is the same.
- We can identify the basis we are coming from and document our assumptions. The problem in over the past year, we have made decisions without a basis to go back to. The SDT needs to restate its assumptions when making applicability decisions.
- **Reliability Standards.** EPA 215 2005- one line: "reliability standard means a requirement". By law we have to focus on requirements and a NIST tailoring effort ultimately won't fit.
- Current CIP standards are not where they need to be and could be stronger. The SDT should make the changes in confines of the law.
- **Audit-ability** against the requirements needs to be addressed and how to address whether the current audit regime needs to be changed;
- Do auditable and measureable standards result in rigorously protecting from the threats;
- **The Framework.** The purpose of the framework is to develop risk assessment on behalf of the industry.
- NERC's framework didn't get the right things and left communication systems out.
- We should avoid an "all risks/all perils" as we can't protect everything. We should clarify what is the dividing bright line. Is it routable protocols?
- We need a narrative cover sheet laying out the elements of what we are doing. These controls map back to that exposure to risk.
- Not an organizational dynamic risk assessment. The narrative- should address this. Narrative to communicate this.
- We may have an opportunity to add rigor to our assessment of vulnerability threats by checking in with entities to informally test whether the proposed controls are addressing known vulnerabilities.
- If dealing with known vulnerabilities, we know that there will always be additional ones. Maybe focus on what to exclude and defend against everything else.
- **Controls and Considering the NIST.** We should talk about generally accepted core controls that apply to the risk and not apply the NIST catalogue. In the NIST catalogue there are too

many controls in the high category and many that shouldn't be in there. Take the NIST controls that have value and work well.

- **Requirements and Controls.** The value will come in providing requirements to apply in your environment that will address the risks without embarking on a NIST risk management approach.
- Need to continue with effort to allow and guide the industry to select controls that fit the environment. How do you determine this without assessing the risk? e.g. CIP 66. 1.1 Secure cabling within a center.
- The SDT needs a narrative (not scientific) map to allow tailoring of controls to the risks we are protecting against.
- We should firm up the under-penning of best practices and be more specific on technical areas where we need to.
- We have to use our collective experience look at the real risks to the BES. Not all threats are equal and too many controls is not a good thing. Currently we don't give enough guidance on how to tailor the controls in light of the weighing of risks.
- **Risk Assessment.** Is a formal assessment of risks a prerequisite? We may have this already ("coordinated means connectivity" from NERC's Report, Critical Infrastructure Strategic Roadmap)

Draft Premise #2: The first CIP SDT considered -003 thru -009 minimum requirements, and expected subsequent augmentative drafting efforts to improve them based on experience.

Should our fundamental approach be:

1. Minimalist: Treat existing standards language as "the" baseline and augment them per specific directives in Order 706, using SP800-53 for enhancement language? Or…

2. Transformative: Literally embrace the NIST paradigm and create new sets of controls for each technical subject area, likely organized differently from the current version?

How much change can the industry absorb? How fast?

Member and participant comments covered the following issues and questions:

- In discussing this premise, the SDT concluded that this is not "either/or" but rather "both/and."

Draft Premise #3: FERC directed the SDT to 'consider' use of the NIST Security Risk Management Framework, which permits use of alternative "compensating measures," and judges adequacy of controls and countermeasures in terms of overall "programmatic effectiveness."

1. Is it in the best interest of all concerned to transition to the NIST "risk management" approach to compliance? Or…
2. Is it better to continue with literal and binary requirement compliance language measurement? Can we infuse needed flexibility through careful crafting of VRF/VSL?

Member and participant comments covered the following issues and questions:

In discussing this premise, the SDT concluded that this, like premise #2, may not be "either/or" but rather "both/and." "Consideration" of NIST is not the same as adoption of NIST and the industry and the SDT should consider what aspects of the NIST approach fit the requirements model. Adopting a programmatic approach to drafting standards will help to address the consideration of NIST. Currently there are few rewards and clear punishment for self-reporting standards violations. This "fear of fines" should be addressed by both FERC and NERC to help develop a "lessons learned" culture within the industry. The standards should give the appropriate flexibility for companies to implement compensating measures like those in the NRC as well as the TFE process. - allows compensating measure and this is similar to TFE process. In drafting standards the SDT should focus on "overall programmatic effectiveness" which can create both technical (physical, electronic and technical) and procedural defense in depth.

Member and participant comments covered the following issues and questions:

- **Requirements language.** If we avoid making it a violation and find the right words for the requirements, we don't have to worry about assigning a VRF/VSL.
- The requirements language has to be binary. The requirements are the only thing the SDT has responsibility for. Industry does not vote for VRFs/VSLs.
- There probably isn't a framework for question #1.
- **TFE.** Industry can shed light on direction the SDT might consider going in terms of TFE. Which requirements should the TFE apply to. Compensating measures were asked for. This will require discussion with audit team.
- Note the "Safe harbor" provision in TFE- advanced knowledge and ability to predict what is happening in a compliance action.
- **Programmatic Approach.** A programmatic approach will make this easier and go a ways towards meeting the directive of "considering" the NIST.
- Does programmatic effectiveness = compensating measures?
- A program is not an approach. Documentation for compliance purposes to prove you are doing the steps and if you find a problem you have a feedback loop to catch, address and fix the problem.
- **Compensating measures** will be judged in an audit. Prove "as good as or comparable to."

- Feedback loop and requirements should be an iterative process. People are not supported and valued for doing it.
- **Lessons Learned Culture.** Write good clear standards and provide guidance to help. The system should support with a "lessons learned" culture and a change in the audit approach.
- The FERC 706 Order directs the Team to "consider NIST framework."
- In our first draft, lows had 30% of the requirements, which was not viewed well.
- Are we focusing on risk management vs. the NERC binary compliance model?
- Can we infuse any flexibility into VRF/VSL? To drive constant improvement?
- What is a program approach? If you miss something but other controls caught that and corrected. That is a program approach to defense in depth. More complicated and you are layering standards to compensating and mitigating.
- Agree with this but it is hard to write this in as a requirement. When requirements went from voluntary to mandatory and enforceable – lawyers and executives have been telling what these words meant.
- Model is based on fear in CIP 002 R1 and R2- $1 million a day fines. NERC and FERC have to help and get truth out to the regions.
- FERC has to help. Commission has to say we understand- tone this down. If everyone wasn't scared for penalties. That's why minimized everything out of CIP 002.
- We (NERC and FERC) need to help each other. 80/20%. Thinking outside the box moving the platform forward. How to move best practices forward. Provides more of a conversation. We will get more polarized if we go that route. Doesn't see the 215 language is quite as restrictive.
- The law shouldn't prohibit this expertise. For Versions 1-3 the requirement was for a risk-based methodology.
- The second option is on enforcement not audit side.
- Technical people at FERC are very grounded and balanced. We need a little more outreach to address the fact that the guy writing the "self report" gets fired.
- The Federal definition of IT is very expansive.
- Version 1 CIP- risk assessment- what is the risk to BES of the asset. Use judgment to decide what controls to add.
- The standards should give the appropriate flexibility for companies to implement compensating measures. E.g. NRC- allows compensating measure and this is similar to TFE process.
- Standards- "overall programmatic effectiveness" – this creates both technical and procedural defense in depth. Can be physical, electronic, technical, procedural
- 40,000 every 7 years. Built in compensation for extra level of risk and institute program for catching errors (feedback loop).
- Enforcement- $$ amounts. NERC website. Fines that have gone through the process. The magnitude should persuade this is not the problem it is made out to be. They are rational and reasonable.
- We need to look at how many ways can we look at the "consider"- different pieces of the NIST approach we might use without using all.

- FIPS 199 and 200. Starting with systems- from control to payroll and communications. Evaluate sensitivity of this system to your mission (confidentiality, integrity availability). Very different in the federal context.
- Electric is the hub of many other systems and we are charged to keep it going. This is up high in terms of criticality.
- Bonneville's only high is a control center.
- Mission is to keep the lights on for BES. Control security vs. information security
- CIP 10- take model of FIPS 199 and its impact to mission. Assumptions about mission and impact levels. It would be Electric power system customization of the FIPS 199 process. (not a CIA but an AIC mapping)

Premise #4 Categorization: Destabilization of the BES through cyber/hybrid means requires simultaneous, successfully debilitating attacks on CCA at multiple CA locales.

Critical Questions/Options

1. If so, is size-based CA categorization the key differentiator in cyber security engineering? And, if so, what are the 'bright line' size demarcations between High/Medium, and Medium/Low; or High/All Else?

2. If not, what is the key differentiator(s) in cyber security engineering for protection of the BES, and is categorization of this differentiator appropriate or necessary? How?

The SDT agreed that both electrical impact and cyber security views should inform the standards and trying to distinguish between high, medium and low may not be the best approach to providing cyber protection of the BES. The difference between transmission, generation and control centers may be more important than distinguishing H/M/L. Navigability to the control host may be the key and boundary protections and zone of control remain very important as a fundamental concept.

Member and participant comments covered the following issues and questions:

- We need to focus on how bad guys navigate in networks.
- **H/M/L.** When H/M/L came up before we discovered it was hard to put medium definitions in. Liked it as a concept but in talking with security people, they think it will be very difficult to implement.
- The problem the SDT has faced after high, is where is the medium and low.
- H/M/L may be too complex. Move to two tiered. Real difficult to say what is a medium.
- H/M/L – moderate/medium won't work well. Lows are getting controls inherited.
- High and other? Other will take care of your base programmatic controls. Works out better to standardize with one base and train to that.
- We have been focused on high to date. Now if we say in two tiered. Look again at controls
- "Scope of impact: "- 500 kv with lots of things. 100 69 kv connected IP. Combines both-engineering view of electrical impact and cyber security view of how much stuff could I do

because of connectivity, age of equipment. Might bring more under the tent. Will be a complicated method of arriving at where you need to do what.

- **Big iron** is used to assess impact. Limits you cyber security scope. In NIST is impact to your agency. Risks can be inherited. Interconnectivity.
- Look at defining violation levels. High= interconnectivity?
- Maybe a baseline with enhancement for high impact. Facilities by themselves with an impact vs. those in combination with others.
- How much change can people take each time? Every year? 3-5 year. Precedent of changing the structure. Have the high coming in and supplement. CIP 002-4 sets high mark. Come in next time to set baseline.
- **Complexity.** The SDT released its concept paper in mid-2009 which was 2 dimensional- BES and cyber impacts and the industry said too complex.
- In favor of keeping 10 in terms of impact.
- Same criteria as attachment 1? Baseline requirement- change management, password protection. What will be layered on that? This will increase in assets coming under scrutiny.
- Need to make sure there are some could have something that is not high. E.g. 69 kv. owned by one company. No impact on BES.
- There is something in low that is not apparent. Some apply to the RE and not to the asset. Lot of inefficiency of current standards. We could make apply uniformly to RE even if you have small assets. Programs for the future.
- What do you have for physical security, personnel security etc.
- Pin to a company or to their function in the functional model? NERC does not control certain aspects in industry. It should at least be tied to NERC functional model.
- We are looking to have a common set of controls that apply to all. If you are in set of entities that CIP standards apply to then you will implement common controls.
- BES cyber systems is the universe within which we need to develop standards.
- The difference between transmission, generation and control centers may be more important than H/M/L.
- Transmission communicates with a control center and locally and unmanned (except for maintenance)
- Generation- manned more often (generally). Different criteria with security already embedded. They talk with control centers or with other generation sites.
- Control centers talk the most with other entities and need layers of protection. Highest around controls around control center, less around field assets.
- Vulnerability back to control center- whether in swamp or big generator.
- This may be more effective than to think about high/medium/low.
- Navigability to the control host is the key.
- What about mini-data center in the substations- bunch of control centers. Scope of impact less. Creating new set of sub-stations.
- What should the entity consider in making decisions on selection of controls?
- Framework should provide the parameters for the drafters in putting together controls.

- Considered going through each of requirements and listing the parameters. Look at organizational security requirements that should provide across the board/ BES.
- Look then at operational and technical controls and consider some of the characteristics based on environment (generation, transmission, control centers) and make distinctions on how to apply.
- Does the size of the asset connected to control center determine whether and how to protect the center?
- Connectivity- it is an attack vector that the spot needs to address.
- We should focus on the sake of BES security and not for protecting computer systems.
- Boundary protections and zone of control remain very important. This is fundamental concept.
- Thinking about to my control hosts and syncro-phasers.

Premise #5- Characterization Asset Classes: The first CIP SDT considered -003 thru -009 to be foremost applicable specifically to control system hosts and operator consoles at work in data/control centers. They did not expect CIP V1 to be applied to field assets without adaptation.

Critical Questions/Options

1. Should we adopt a two tier paradigm; in essence writing <u>two sets</u> of standards as appropriate for:
   a. Bastion sites: generating plants and data/control centers, and,
   b. Distributed Field sites: Substations, dams, etc.?

2. Or, a <u>three set</u> paradigm, specific to each: 1) Generation 2) Transmission 3) Control Centers?

The SDT agreed that the three set paradigm should be the one to build on for the CIP.

Member and participant comments covered the following issues and questions:

- Generation, transmission and control centers set the paradigm. Define the baseline and break out three sets.
- This turns on physical security- use this a compensating measure. Does it give us an out?
- **Physical security** is most difficult issue we have to deal with. Many utilities use distribution personnel as first responders. Toughest nut to crack is to use as compensating measure to ensure you have access control, etc. Direction industry needs to go. Difficult going forward. Unintended reliability contact.
- How can we use this physical security as a tool
- Physical security- bastion/distributed field sites- makes sense.
- This should be a tool to mitigate risk. Some modicum of physical security should exist. E.g. security reviews on annual basis.
- CIP only addresses critical cyber asset. This level of security at the lows- puts at whole different level.
- We can bleed these together as a both/and: Bastion/distributed field and generation/transmission/control centers.
- This would make it more complicated as it is hybrid of the two- physical and electronic.

- Devil is in the details. Useful tool to include- G/T/CCs- with 3 different standards?
- Could bastion equate to high? Big substations as bastions/ high. Variations on 3 - G/T/CCs.
- Provide requirements in areas of physical security that describe what your are trying to protect against. Provide security controls. Have utility determine what compensating are equivalent.
- Remove high from geography. Don't care where it is sitting. Scope of impact. The most critical sub-stations. May not be a high- function.
- Cyber system focus-what is the cyber system and what it can do.
- What is the amount of protection required? Not impacted as much as this needs high level of protection. What level of protection do you want to apply physical/electronic?
- Some teams were writing in the G/T/CCs in this approach.
- Direction- we are in agreement with the direction heading in the first place.
- Do we need some granularity in terms of devices out there?
- In practice look at all requirements on CIP 10 and 11. Little differentiation in using these concepts. There is a difference in environments which should be taken into account.
- Is it really environmental or is it at the component level.
- Framework team to put some structure around this. Define a little better and structure it so it is more formal and consistent. Express those and formalize somewhat in a document to hand off to the sub-teams in order to get some uniformity.
- Reason this didn't get separated into G/T/CCs is it is missing the general narrative regarding what we are protecting against. Are we protecting against everything everywhere? This will lend it self to creating differences and nuances to different environments.
- Does the programmatic model lend itself to a more general approach
- Some programmatic areas depend on the organization and it won't matter in terms of context/environment and where it connects to the assets. Use enhancements only where needed.
- This isn't a fair characterization of Version 1 SDT.
- Expected the auditors to take care of this. Lawyers insisted it to be verified.

Premise #6 Different Genre/Age of Control Equipment: CIP V1 did not take into account differences in the genre and age of controls equipment; resulting in "one size fits all" requirements that are inadequate for protecting some subsets of CCA and overkill for others, and the apparent cause of the need for many TFE.

Critical Questions/Options

1. Do we need to write different standards requirements for different genre and ages of control system/IED?
2. If so, how shall we parse the different genre and ages of control system/IED? What are the 'bright lines'?

Member and participant comments covered the following issues and questions:

- The Sub-team has struggled this. CCA gets a package of stuff dumped. (or next to CCA).
- BES cyber system ("target of a "plop")

- What are the device classes we can make applicability judgments that make sense.
- It is the technology: routable, serial, type of communication vs. class of device?
- We should take care in "communications" Is it an issue of the type of system? What differentiation of a device that will determine the type of controls.
- Do we go to granular level on vulnerability issue regarding those devices?
- Do we have the sub-team do the more granular vulnerability assessment piece? Yes.
- We will need to address this at the controls level by each sub team.
- How do we determine the classes of device to apply the controls?
- We need a classification model from the Drafting Team.
- Fragility caused by complexity and connectivity.
- Better approach- consider the characteristics of each device applicable to each individual requirement. 'general purpose operating system.' (e.g. networking requirements- how device communicates, etc)
- Everything has such a system. Knowledge there just not readily available.
- We missed an opportunity to impose on vendors- they should participate in this. Entities trying to educate- kick. Need government to step in.
- Protect against pieces of equipment used for purposes other than they were designed to. What other things can be done with the piece of equipment.
- National SCADA test bed program. Procurement document. That won't help us here now on this one.
- Premises regarding V1- SDT- were addressed but implementation and crafting of final requirements.
- E.g. TFE came in as different ages of equipment. Wouldn't have been introduced.
- Didn't believe this was going to the field.
- Attempted to address and failed miserably. We got to fix next time around.

B. Final SDT Guidance Statements for the Framework Team

On Thursday the Team developed a set of framework guidance statements based on the discussion. Phil Huff offered an initial draft of statements which the Team reviewed, refined and agreed to. Below are the final statements.

Ultimately, we need more structure in the requirement drafting process. The Framework Sub-Team's deliverable in December should be very concrete and clear in the proposed direction moving forward.

1. The Framework Sub-Team will develop a framework (e.g. style guide) for writing program- based requirements, where appropriate. This framework should include:
   - Minimizing zero-defects in compliance requirements
   - Guidance for rationale statements for individual requirements that speak to the vulnerabilities they address.

2. The Framework Sub-Team will develop a high-level narrative to answer the foundational question of "What are we trying to protect against?"
3. The Framework Sub-Team will develop a model which applies a baseline set of requirements for all BES Cyber Systems which allows for enhanced requirements for:
    a. High impact
    b. Specifications for generation, transmission, and control centers
    c. Specifications for legacy vs. state-of-the-art equipment
    d. Connectivity considerations
4. The Framework Sub-Team will consider developing a framework for incorporating vulnerability assessments into the current standards for the purpose of allowing flexibility in applying security controls.

Following the discussion of the premises and prior to refining and finalizing the guidance statements, the SDT discussed the development of the framework. Some of those comments are noted below:

- **Manage security like reliability.** We need to manage our security posture the same way we continuously monitor the reliability of the grid.
- **Change the Zero-defect approach.** We have to change the "zero defect" approach to the enforcement of standards.
- Power to fix some of these in our hands, way to craft words. Requirements often written with zero defect approach. Maybe the real requirements- review every X month, fix. Can get us down the road fixing that.
- **Change the Industry approach to Self Reports.** We need to find ways to promote the feedback loop and self-correcting mechanism by giving rewards to detecting and fixing cyber security issues in a timely manner. We need to explore how we change current the self reporting syndrome. We could suggest adjusting the penalty range- automatically set at the floor if you have taken measures and self reported thereby starting at a lesser penalty.
- Look to other industries- e.g. FAA/pilots with anonymous database that can be reported and doesn't affect licensing.
- Jerry Cauley, President, NERC, has promoted a "lessons learned" process at NERC. NERC staff will look at all of the reports- incident, self, etc. and cull out lessons learned for the CIP.
- What kind of behavior do we want to incent? In the human resources area we "look monitor, find, fix and repeat."
- How do you cause good cyber security to occur?
- Self reports are not made public until they go to end of the enforcement process. CEII provisions protect details and names. Specific instances where self reports made public on CIP issues. NERC rules of procedures- protect details and identity.
- Remember everything that is public info- audit schedule is public information. Tenaska up for audit and include CIP.

- Model based on fear and politics. Entities deal with incoming from wall street, congress etc.
- Other problem with shielding self reports- industry gets no lessons learned for the industry. Information is shielded. Prevents this.
- **Uniformity of Audits.** We need to separate myths from facts and talk with the NERC audit people and test our assumptions.
- Address the issue of non-uniformity of audits across the region. When self reporting you could declare how you are fixing the issue to the region without it getting publicly reported, and go through a process of mitigation. Early cycle of correction in that method. Is something like that possible?
- This is a complex problem in that auditors are not uniformly sticking to the words in standards. Can the lack of consistency in application be fixed by CANs? May not be fixed by re-writing standards.
- **More granularity in standard writing-** access review list. Conduct a review, provide evidence you conducted a review. What are expectations? Won't go all the way in fixing a problem.
- Write programmatic requirements. Make a difference in how much effort. E.g. Requirement for training vs. awareness. Tracking training.
- Do we have a different set of requirements based on environment /equipment?
- Do we have multiple levels of requirements based on risk/impact (including communications)?

C. Organizing the CIP Format- Rember Round-Robin Perspectives on CIP Format

The Framework Team has been asked to provide a draft answer the question of the organization of the CIP going forward and has been developing a clearer documentation of the rationale for the changes reflected in the draft CIP 10 and 11. Following a question regarding guidance on the format by Dave Norton, the Chair asked each SDT member, through a round robin review, to describe their current thinking on the format for the CIP. He noted that at its Sacramento meeting the SDT was nearly evenly split on the format question. Several members noted they had changed their earlier position supporting the use the existing CIP 003-009 format and many now said that form should follow function and that either format approach, or even another format approach would be acceptable. The following summarizes the results of the round-robin review. Several members noted they were personally and not necessarily for their company:

- Those members open to creating a new standards format and not tweaking CIP 003-009 which could be a single CIP 11 or a sequence of separate standards (11,12,13, etc.) included: Rob Antonishen, Jackie Collett, Jon Stanford, Doug Johnson, Jay Cribb, Bill Winters, Bill Gross and Scott Rosenberger.

- Those members suggesting that form should follow function and were neutral on the format or could live with it either way consistent with the function, included: Tom Stevenson, Joe Doetzl, Kevin Sherlin, Dave Revill, Dave Norton Gerry Freese, John Lim, Phil Huff, Jeff Hoffman.

- Those favoring tweaking the existing 3-9 but may be willing to accept another formatting approach included: John Varnell.

- FERC representatives suggested the SDT focus on getting the requirements right and less on the format.

- Participants also offered perspectives on the changes and the format.

Stu Langton summarized the results of the exercise suggesting there was in evidence a lot more openness around this issue than in Sacramento and a shared value of getting the requirements right first and then organizing the format. The Framework Team could focus on the goal of eliminating or reducing cross-linking in the standard requirements and TFEs. The Chair suggested there was not a sense from the team for a basic shift in direction and asked the Framework Team to continue its efforts in preparing a strawman for the December, 2010 meeting in Orlando. He also noted that the communication plan for industry outreach and education that the Team is developing will be critical to the success of the SDT.

IV. NEXT STEPS AND ASSIGNMENTS

The Team reviewed the steps and assignments coming into the Baltimore meeting. The SDT agreed to engage in a series of conference call meetings (Monday-Friday, 11:00 a.m.-3:00 p.m.) the week before the Baltimore meeting to review industry comments and review and refine a set of strawman SDT responses to the comments. Howard Gugel will develop and circulate an initial strawman of responses to the industry comments drawing on the webinar responses reviewed in Toronto.

Tom Stevenson provided an overview of Constellation Energy's facility in Baltimore where the SDT will meet in November.

The Chair thanked Rob Antonishen for his excellent hosting of the SDT in Toronto.

The meeting adjourned at 4:40 on Thursday

Appendix # 1— Meeting Agenda
Project 2008-06 Cyber Security Order 706 EDT
Draft 27th Meeting Agenda
October 12, 2010, Tuesday- 8:00 AM to 6:00 PM EDT
October 13, 2010 Wednesday- 8:00 AM to 6:00 PM EDT
October 14, 2010 Thursday- 8:00 AM to 6:00 PM EDT
Toronto, Canada

NOTE: 1. Agenda Times May be Adjusted as Needed during the Meeting
NOTE: 2. Drafting Sub-team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- To review September 29 webinar questions and begin the development of a response document for industry posting
- To review and discuss and test acceptability of proposals for addressing key issues presented by the CIP Framework Team
- To review the Sub-team summaries of the CIP 010 & 011 and Workshop industry comments and discuss possible responses in light of the framework review
- To agree on next steps and assignments

Tuesday, October 12, 2010 8:00 a.m. - 6:00 p.m. EDT
- Introduction, welcome -*(Morning)*
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review meeting and milestone schedule for CIP 002-4 and CIP 010 and 011 *(Morning)*
- Review changes to CIP Version 4 prior to ballot (CIP-002-4 R3 and CIP-008-4 applicability)
- Review results of September 29 CIP 002-4 Webinar *(Morning)*
- Participate in ERC Event Process Analysis Webinar and discuss implications for CIP development
- Draft responses and consider any changes to CIP-002-4 based on September 29 webinar questions *(Afternoon)*

Wednesday, October 13, 2010 8:00 a.m. - 6:00 p.m. EDT
- Receive a report from the team assigned to work on the framework *(Morning)*
- Discussion of Framework Team key issues *(Morning)*
- Review and provide feedback on the acceptability of the presented approach *(Afternoon)*

Thursday, October 14, 2010, 8:00 a.m. - 6:00 p.m. EDT
- Continue discussion of prospective framework *(Morning)*
- Review Sub-teams summaries of industry and Dallas workshop comments on CIP 010 & 011
- Discuss potential responses in light of the framework
- Review Preparation for CIP 002-4 Team Organization for Responding to Industry Comments before and in Baltimore *(Afternoon)*
- Review SDT November, 2010 Baltimore Meeting Agenda (*Afternoon)*

Appendix # 2 Attendees List
October 12-14, 2010 Winnipeg

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation
2. Jackie Collett	Manitoba Hydro
3. Jay S. Cribb	Southern Company Services
4.Gerald S. Freese	America Electric Pwr.
5. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
6. Doug Johnson	Exelon Corporation – Commonwealth Edison
7. John Lim, Chair	Consolidated Edison Co. NY
8. David Norton	Entergy
9. David S. Revill	Georgia Transmission Corporation
10. Jonathan Stanford	Bonneville Power Administration
11. Tom Stevenson	Constellation
12. John D. Varnell	Technology Director, Tenaska Power Services Co. (W/Th)
13 William Winters	Arizona Public Service, Inc.

SDT Members Attending via ReadyTalk and Phone

14. Joe Doetzl	Kansas City Pwr. & Light Co
15.Sharon Edwards	Duke Energy
16. William Gross	Nuclear Energy Institute
17. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation (W/Th)
Rich Kinas	Orlando Utilities Commission (Tu/W)
18. Scott Rosenberger	Luminant Energy
19. Kevin Sherlin	Sacramento Municipal Utility District (Tu/W)
Scott Mix	*NERC*
Howard Gugel	*NERC*
Roger Lampila	*NERC*
Robert Jones	*FSU/FCRC Consensus Center*
Stuart Langton	*FSU/FCRC Consensus Center*

SDT Members Not Participating

Jim Brenton	ERCOT
Patricio Leon	Southern California Edison
Keith Stouffer	National Institute of Standards & Technology
John Van Boxtel	WECC

Others Attending in Person

Jan Bargen	FERC
Robert Preston Lloyd	Southern California Edison
Tom Alrich	Matrikon
Jim Fletcher	American Electric Power
Brian Newell	American Electric Power
Mark Simon	Encari
Jason Marshall	Midwest ISO
Roger Fradenburgh	NetSecTech

Others Attending via Readytalk and Phone
October 12, 2010, Tuesday

Wang, Anna	amwang@burnsmcd.com
le, vincent	vincent.le@ferc.gov
Hammad, Amir	amir.hammad@constellation.com
Wilson, Bryn	wilsonwb@oge.com
Rayo, Ingrid	ingrid.rayo@constellation.com
Kelly, Justin	Justin.Kelly@ferc.gov
Farquharson, Jerome	jfarquharson@burnsmcd.com
Hardiman, Rod	rchardim@southernco.com

October 13, 2010, Wednesday

Hardiman, Rod	rchardim@southernco.com
le, vincent	vincent.le@ferc.gov
Farquharson, Jerome	jfarquharson@burnsmcd.com
Wilson, Bryn	wilsonwb@oge.com
Kelly, Justin	Justin.Kelly@ferc.gov

October 14, 2010, Thursday

Name	Email
Rayo, Ingrid	ingrid.rayo@constellation.com
Wilson, Bryn	wilsonwb@oge.com
le, vincent	vincent.le@ferc.gov
Hardiman, Rod	rchardim@southernco.com
lopez, andres	andres.lopez@usace.army.mil
Hammad, Amir	amir.hammad@constellation.com

Appendix #3 NERC Antitrust Compliance Guidelines

See Antitrust Compliance Guidelines read at the beginning of each day's session at:

The NERC reminder below was read at the beginning of each day's session.

NERC REMINDER FOR USE AT BEGINNING OF MEETINGS AND CONFERENCE CALLS THAT HAVE BEEN PUBLICLY NOTICED AND ARE OPEN TO THE PUBLIC

For face-to-face meeting, with dial-in capability:

Participants are reminded that this meeting is public. Notice of the meeting was posted on the NERC website and widely distributed. The notice included the number for dial-in participation. Participants should keep in mind that the audience may include members of the press and representatives of various governmental authorities, in addition to the expected participation by industry stakeholders.

Appendix #4
Review and Discussion of Results of September 29,2010 CIP 002-4 Webinar

The SDT reviewed, discussed and reached agreement on the over 100 questions and the actual responses provided during the webinar. Webinar questions were offered verbally and by a chat function. Howard Gugel noted that the final question and response document will be posted for industry review on the NERC website as soon as the SDT reviewed and agreed with the responses. The SDT agreed to craft, where needed, additional clarification comments to the member responses offered during the Webinar.

1. **What are reasonable costs? Slide 10**

   Comments on Response
   - Alan Mosher presentation of context and response. Slide speaks to "reasonable" costs.
   - Generally speaking we should de personalize SDT responses but not this one since Alan is not speaking for the SDT but for the Standards Committee.

   Final Response: (Allen Mosher) The idea here is that we all are subject to our budget constraints. We want to use our resources effectively. The question is, can we craft controls that present reasonable costs to the industry to secure BES assets from cyber attacks, and what's the best use of the resources? We could spend a lot of money getting perfection in one area, but since we're trying to accomplish defense in depth, we need to have controls that are balanced across all the requirements so that in total we get an effective Cyber Security program. So there's a balance in both the cost of requirements and, in my mind, across this whole reliability budget that each utility and the industry faces.

2. **Was the fact that the Second Ballot overlaps the Thanksgiving Holiday discussed? This only gives 5 business days for the industry to respond.**

   Response Comments, Tuesday
   - OK with response. A participant pointed out this could mean the SDT may get less industry response and review.

   Final Response: Yes. Unfortunately, that's just the way the timing fell, and in order for us to prepare this as a filing to FERC by the end of the year, that's just an unfortunate part of the schedule.

3. **Slide 14: Is the plan in addressing the remaining 50 FERC directives still to keep the CIP-003 through CIP-009 nomenclature or will it be to combine into CIP-011?**

Response Comments, Tuesday

- Edit the redundant response. OK

Final Response: We received a lot of feedback on whether to keep CIP-10 and -11 and CIP-3 through -9 from the informal comment period. We're still dealing with that as a Drafting Team and trying to determine the best approach to present those requirements. What we come forward with in July of next year will reflect where we're going as a team.

4. **Slide 17: Will the data request results be provided external to the SDT (e.g. industry, FERC, others)?**

Response Comments, Tuesday

- Make this a NERC response to the data request. Howard made edits.

*Final Response: "*Yes, they will be posted by NERC at some point. NERC is in the process of scrubbing the responses and determining how to post a summary But certainly, the results of that would have to be provided to FERC and to the participants. Individual responses will not be posted publicly, so that any individual entity cannot be identified."

5. **What is the process to update the criteria in the future? will it go through industry voting? Is there something in the NERC ROP to accommodate this?**

Response Comments, Tuesday

- Delete 2nd line of draft response.

*Final Response: "*Attachment 1 is part of CIP standard 002-4. Any changes to the criteria will have to go through the Standard Development Process*."*

6. **Does the definition on slide 19 apply to the StruxNet LNK Recommendation? Do you expect entities to report on DCS or SCADA that are not critical to BES?**

Response Comments, Tuesday

- Critical Cyber Asset Identification Slide 19
- Answer to first quest is No.
- This is an alert to industry and has nothing to do with the CIP standards.
- This is a NERC Rules of Procedures alert process.

Final Response: (Scott Mix) The Stuxnet alert advisory came out independent of any Standards or compliance or auditing actions, and so anything that happens in the Standards world is not directly applicable to the alerts that come out. Stuxnet was a mandatory recommendation with a required response. And as such, it actually falls

under the NERC Rules of Procedure, not the compliance program or in response to a Standards action.
***Additional clarification from SDT*:** The answer to the first question is No. The answer to the second question is Yes.

7. **Slide 16 - If the intent is to replace the non-uniform risk based methodologies with the bright-line criteria in new attachment 1, why does the new R3 still require Sr Manager approval of the risk based methodology as shown in Draft 1 dated 9/20/2010? It seems that Sr. Manager approval of the CA and CCA lists would be sufficient.**

   Response Comments, Tuesday
   - Howard Gugel will make the changes regarding the errata
   - Is there a fiduciary level manager sign off?

   Final Response: (Howard Gugel) "This was an oversight, and at the time when the Standards will be balloted, we will be issuing an errata change to R3 to remove the reference to the approval of the risk based methodology. There is one other area that was missed in the editing process (CIP-008-4). These changes will be made before the balloting is performed and the ballot body will be notified of the changes."

8. **Second question - How can compliance be measured for "anything else the RE wants to include"? This kind if ambiguity is not appropriate in a Standard.**

   Response Comments- Tuesday
   - "Any asset as a critical"

   Final Response: "This particular criterion is not intended to be measurable; it is an option that allows a responsible entity to identify any asset as a Critical Asset, it can be anything the entity wants to include. So from the point of view of enforcement, there's really not much in terms of how you measure that. However, any Critical Asset that you include in that list would also have to be evaluated to determine if it has identified Critical Cyber Assets associated with it."

9. **What is "bright-lines"**

   Response Comments- Tuesday
   - 1500 does not apply to blackstart?
   - Reference to 1.1.?
   - There are other criteria that apply.

   Final Response: Generally, bright lines are those types of criteria that have a very well defined threshold that allows you to decide whether a BES Asset is qualified as a Critical Asset or not. There are usually very definite numeric values which are not subject to any kind of evaluation or subject to engineering studies and such.
   For example, Criterion 1.1 refers to aggregate generation at a single location of 1,500 megawatts. This is a bright line. So aggregate generation below 1,500 megawatts does

not have to be identified as a Critical Asset based on Criterion 1.1, and aggregate generation that is equal to or above 1500 megawatts has to be identified as a Critical Asset based on Criterion 1.1.

10. Slide 22- How was the 1500 MW criteria determined and or what was it based on?

Response Comments- Tuesday

- 1/3 generation would be captured. Average of a sampling
- Average of the sampling of the reserve sharing. Missing WECC.
- Argument for average is weak.
- Chose number because 1/3 of generation fell into that. Took an average of those numbers.
- "Desk survey"- informal-
- "Determined" – vs. supported
- Additional clarification statement agreed to. U.S. Energy Administration source of the data-base.

*Final Response: "*In prior versions we had wording about reserve sharing, and that was the threshold to be compared for critical threshold for generation. We got a lot of feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily.
So we did an informal survey of the regions, and we identified what the megawatt value of the reserve sharing would be for various groups, and then we took an average of those numerical values. And that 1,500 megawatts represents that numerical average of the values of the reserve sharing amounts."
Additional clarification from SDT: The 1500 MW level was supported by looking at the DOE Energy Information Administration database, and it was determined that approximately a third of the generation in the US would be classified as Critical Assets.

11. Slide 22: Will nuclear units under the 1500 MW units be classified as critical?

Response Comments- Tuesday

- "Units"- Wording in standard- reference aggregate generation at a single plant location.

Final Response: "The standard as it stands today does not specifically call out anything special about nuclear units. You apply the same criteria that are in Attachment 1 that apply to generation and determine whether these are Critical Assets or not.
Additional clarification from SDT: The wording of Criterion 1.1 refers to aggregate generation at a single plant location, not unit specific.

12. Slide 22 - I assume critical assets "designated" by Transmission Planners will be independently verified?

Final Response: "According to our understanding of the audit process, pre work that would be done by the audit team in preparation for doing an audit against the revised CIP 002-4 would be to contact the appropriate transmission planners and planning authorities to determine if there were any assets that had been designated and verify that those assets were included in the Critical Asset list. That is consistent with the way other Standards that have linkages between them are audited."

13. **Slide 21: If existing Critical Assets do not meet the bright line criteria and are not identified under the catch all, what would the effective date of retiring them as Critical Assets? Would the implementation plan address this or would they drop off the list when CIP-002-4 becomes effective?**

Response Comments- Tuesday

- 3-6 years. Is this longer than the standard requires.
- "May" be retired? Keeps open the CIP 010-11.
- Scott checked with Roger and approved the language with edits.

Response Comments- Wednesday

- Joe Doetzl offered draft language. "The post version 4 version 4 standards…..
- OK with new language.

Final Response. "The implementation plan for the Version 4 CIP Standards does not specifically address this scenario, but since the methodology that identified them as Critical Assets is only required under Version 3 of the Standards, they would be retired as Critical Assets upon the effective date of the Version 4 Standards, which is when you're required to be in compliance with the new version of CIP 002-4.
The post version 4 standards are still in development and may impact your decision to remove assets from the list. So even though it may be retired as a Critical Asset, it still may be included as either a medium impact or a low impact in the future.
From a compliance standpoint, the compliance scope is either three or six years, so you would need to maintain any evidence of compliance for that asset during the time that it was on the Critical Asset list."

14. **Are we to understand that reliability purpose in 1.3 is for long term only (RMR)?**

Response Comments- Tuesday

- We didn't answer during the webinar? Spoke about RMR. (on row 45 -answer provided is right. Reference: See line 45).

*Final Response: "*See answer to question 44. (line 45)"

15. **Does this include black start even if it is the 3rd or 4th path**

Response Comments- Tuesday

- Question is confusing. Talking about a unit in blackstart.

- Are we talking about path?
- Path is dealing with cranking path not black start unit.
- Does blackstart definition include units and paths? This is adequately answered.

Final Response: What we've done in the attachment is use the term "Blackstart Resource," which is a term that is defined in the NERC glossary. As the Standard is currently written, if it's identified as a Blackstart Resource, it would be included as a Critical Asset, regardless of whether it's the third or fourth path. If it's in the Transmission Operator's restoration plan, then it is a Critical Asset.

16. **Slide 22 Can we discuss the definition of Plants with group of units? (16)**

Response Comments- Tuesday

- OK

Final Response: "This is in reference to Criterion 1.1, which says, "Each group of generating units, including nuclear generation, at a single plant location." This is generally understood to be a single plant, whether it's a single unit or all the units in that plant. One thing to note is that "plant" is not a NERC-defined term, so we can't really refer to "plant" as a defined term within the Standards."

17. **Slide #24 In the Rational document, page 15, the following statement is made: "While it is clear that the primary and all backup control centers operated by RCs, BAs, and TOPs must be designated as Critical Assets". This statement not based on any Commission approved Standard and goes could be interpreted as an unjust interpretation. Recommend a qualification of a MW level be added to 1.14, as written in CIP-010. If not all BAs, TOP's and RC's regardless of size will automatically be designated as a Critical Asset.**

Response Comments- Tuesday

- OK

Final Response: "As discussed in the Reference Document, this requirement is sourced from EOP-008. Control centers performing these functional obligations are considered important enough to require mandatory backup requirements and warrant designation as Critical Assets."

18. **Assume that a power plant has four 400 MW units and is > 1500 MW power plant and therefore meets the definition of a Critical Asset in accordance with attachment 1. Let's assume also that there are no systems (other than the EMS) that impact more than one of the four units. How would one go about determining if any DCS's or digital relays at the plant are critical cyber assets or not since in this example no cyber asset (besides EMS) can impact more than 400 MW? There seems to be a lack of bright lines specific to cyber assets within a power plant or substation.**

Response Comments- Tuesday

- Didn't respond to this in webinar.
- Proposed language: "only"? "excluding blackstart resources"
- "Only shared"?
- Is this "communications"? Adds a whole new layer.
- Need to evaluate before agreeing to the assumption about DSC or digital relays not impacting more than 400 MW?
- Lack of bright lines for cyber assets.
- Bright lines focus was for critical assets not critical cyber assets.

Final Response: Requirement R2 states "For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." The focus of Version 4 was to provide bright lines for Critical Asset identification, not Critical Cyber Asset identification.

19. Please elaborate on the term functional obligations in 1.14

Response Comments- Tuesday

- Rewrote the response referencing functional obligations from the NERC functional model.

Final Response: "Functional obligations are determined from the NERC functional model. That term used here refers to the tasks those functional entities (e.g. RCs, BAs, and TOPs) perform, which is referred to in EOP-008."

20. Attachment 1, 1.15 A Black Start Unit should not by itself trigger a GOP Control Center as a Critical Asset - The Black Start Unit is under the TOP Control Center during Black Start conditions - not the GOP Control Center

Response Comments- Tuesday

- "Blackstart under" TOP?
- Verbal control from a GOP? Does the control center become a critical asset.
- Vulnerability in non black out condition.
- Disable it?
- Answers the question what has been posted.
- Is what has been posted what the SDT wants?
- Separate determination for a critical cyber asset?
- Is what the standard says what we intended?
- Are we reinforcing this?

Final Response: "As currently proposed, Criterion 1.15 states that each generation control center and backup control center used to control generation identified as Critical Assets, or used to control generation for an aggregate of 1,500 megawatts within a single Interconnection is a Critical Asset. So if a Black Start unit is designated as a Critical Asset and you have a control center that is used to control generation for that Critical Asset, then that generation control center is a Critical Asset."

21. Which guideline is being referred to?

Response Comments- Tuesday

- Several "guidance" references-all posted. Assume it is the "Guideline for identification for critical assets, etc"

Final Response: "The SDT notes that this is probably in reference to the difference between control centers and control rooms. This guidance can be found in *Security Guideline for the Electricity Sector: Identifying Critical Assets*, which can be found at http://www.nerc.com/fileUploads/File/Standards/Critcal_Asset_Identification_2009Nov19.pdf . Additional guidance documents can be found on the NERC Reliability Standards page under Critical Infrastructure Protection (CIP)."

22. Can you clarify what is meant by "automatic load shedding"? Would this include load management systems that have the ability to reduce loads by greater than 300 MWs?

Response Comments- Tuesday

- This was the answer of the member at the time.
- What we have in the response is not entirely clear.
- "language"- offered- for clarification.

Final Response: "We had a somewhat extended discussion in the Drafting Team about the term "automatic", and in the paper that we put out, we discussed what we mean by "automatic." It includes those assets, those systems that are in the transmission system that would automatically trigger load shed under certain conditions. So those are certainly in scope here. As far as computer systems, the criteria says, "common control systems capable of performing automatic load shedding of 300 megawatts or more." So if you have a single control system that is capable of performing automatic load shedding of 300 megawatts or more, that is in scope.
Additional clarification by the SDT: If you feel that additional clarification on the definition is needed, please provide that in your comments along with a proposed solution.

23. Could you please expand on what is meant by Control Generation in 1.15 Criteria.

Response Comments- Tuesday

- Expand on what we mean by control?
- "by which generation can be controlled?
- Can ISO send a zero set point?
- Use "supervisory control?" What does this mean?
- If GOP supervises a plant-
- Further discussion needed
- Need to do this now.
- Review "control center" definition.
- "display of data" is not critical. Had trouble with several things in the definition. This is on another team.
- Functional obligations of the GOP? Instead of singling out control center. Control centers performing functional obligations of the GOP…..?
- Part of comment period.
- Putting this out for comment.
- What does control generation mean?
- Provide us alternative language as part of their comments. E.g. given.
- Little time to respond to comments and no comments. If we do a better job of answering.
- Primary objectives- get the responses finalized. Use this time to come up with solutions.
- Taking the time.
- Go through get out in front. Get what we can resolved now. Get through the response document
- We haven't answered what was asked for. What do we mean when we say control generation. Guideline re control center- 1st aspect of control center.
- Howard Gugel will work on language.
- Struggling without common terms. Answer the question with the SDT's intent. We may need others to define. Other cyber contexts- years of discussion allow for.
- The webinar response was not correct reading of the standard language.
- As a team what do we want to say. Reset the common intent and common definitions.
- Some others not responded.
- Can we say in this standard what the term means- e.g. for the purpose of this requirement or standards… Each one has to have those words.

Response Comments- Wednesday

- "Monitoring and control?"
- Question focuses on control generation. 1.15.
- Version 1 FAQ- monitoring and operating control functions- covers the water front.
- Control = Seeing their display- picking up phone and telling them to do something.

- Operator is part of completing the control loop.
- Operator is a "filter"-
- Monitoring data that would affect the operation- considered in scope of control of the critical asset.
- Why not include monitoring? Monitor for maintenance, for trade,
- What was meant was monitoring for control" Control of generation includes Monitoring control.
- "Display of data" as a term is problematic.
- 1.15 Refers only to "control centers"
- Only looking for those with supervisory or automated control. Only consider for 1.15.
- Not one bullet vs. 5 but a non-binding definition.
- It means what it meant in Version 3.
- "supervisory control" used in SCADA. Is this different?
- In terms of the guidance document- meant in terms of SCADA
- Functional model- "as directed by BA and TOP" GOP receives that direction and makes changes.
- Identify critical asset, later further define. RE would further investigate to see if they have critical cyber assets. Possibly brings in your cyber equipment. If doing it by voice.
- Puts you on a critical asset list.
- Purpose not to include monitoring was to not to include qualification.
- New language- on functional model.
- Delete the 2nd paragraph. OK.

Final Response: There are a number of generation control centers that really just monitor, and if you need to actually do generation control, they don't actually have the capability of doing that, and they would have to call up the actual local control room to be able to effect those controls. For these, the discussion was that these types of control centers are not really in scope unless they have the ability of actually controlling generation.

Additional clarification by the SDT: Based on the language in the functional model, a Generator Operator is responsible to adjust "real and reactive power as directed by the Balancing Authority and Transmission Operator." A control center that provides this functionality *would be considered a Critical Asset if it meets the rest of Criterion 1.15.)*

24. CIP-002-4 attachment 1, 1.15 includes control centers that control critical assets, in addition to the 1500MW criteria. You didn't mention that - has that changed?

Response Comments- Tuesday

- Linked to the ones above.

Final Response: No, these are required to be designated as Critical Assets as well

25. Question about Comment stated during Slide 24: "Generation Control Centers are those locations which perform control of more than one location, while Generation Control Rooms perform control for one location." I would like confirmation that a Control Room controlling multiple Units, at the same location and fenced perimeter, is still considered a Generation Control Room, and not a Control Center.

Response Comments- Tuesday

- Good as is.

*Final Response: "*That is correct. We are targeting those that are controlling multiple generation locations. There is some discussion of that in the guideline for identification of Critical Assets for CIP Version 1 and 2. There is a discussion of control room and control center there, and this is what we mean by a control center in this criterion."

26. You need to provide guidance on control centers. There are some TOPs that operate only low voltage transmission. 46 kV, 69 kV and 115 kV are examples. None of these facilities qualify as Critical Assets from a transmission perspective. These facilities are often operated and monitored from a dispatch center using SCADA. Would the current CIP-002-004 language define these dispatch offices as "Control Centers?" Is there some NERC document that defines these dispatch offices as something other than a control center?

Response Comments- Tuesday

- Ok
- If you have a control center 115 KV but has load shedding capability, put that entire control center under scope.
- Criteria speaks to control systems.

Final Response: The NERC Guideline on Critical Asset Identification has a good discussion of Control Centers. For the purpose of the this standard, control centers that perform the functional obligations of Reliability Coordinators, Balancing Authorities or Transmission Operator are designated as Critical Assets. For generation, part 1.15 of Attachment 1 designates generation control centers that control generation for Critical Assets or that control generation for 1500 MW or more in a single Interconnection as Critical Assets.

27. How would the implementation plan address where we have a currently identified CA, but based on recently issued guidance, have now identified new CCA's in the CA?? Do we have 18 months to get the new identified CCA's into compliance?

Response Comments- Tuesday

- Ok

Final Response: "The assumption is that the question is referring to the guideline for identifying Critical Cyber Assets that was approved by the NERC Critical Infrastructure Protection Committee back in June. Specifically, we have not introduced additional language in the implementation plan to address this situation. Because we did not actually modify the way that Critical Cyber Assets were identified in Version 4, this situation is handled for Version 4 the way it would be handled in Version 3 in that an entity would need to refer to the Implementation Plan For Newly Identified Critical Cyber Assets and Newly registered Entities to determine the appropriate milestone that that plan identifies."

28. Slide 22: EOP-005-2 is not yet mandatory. Does the associated Blackstart definition only impact version 4 of the CIP standards (i.e. CIP-002-4)?

Response Comments- Tuesday
- OK

Final Response: The definition of Blackstart Resource was approved by the NERC Board of Trustees effective August 5, 2010.

29. On slide 38, it was noted that the key words were "support and maintenance". If those words are so key, how come they don't appear in the language of the requirements within the UASAR?

Response Comments- Tuesday
- Ok
- Doesn't occur in the SAR. In the revision history. Support and maintenance not mentioned. Its in the standard and in the SAR.

Final Response: has been communicated to the UASAR drafting team for consideration.

30. For Jim Brenton - slide 39 - is this the draft document that is posted on the project page? If so, how does the document move from the "draft" version to the "final" version?

Response Comments- Tuesday
- Will work with Jim.

Final Response: This document is posted on the Project 2010-15 web page. This document will be considered final upon approval of CIP-005-4. Until then, the document will continue to be modified based on comments received by the Project 2010-15 Drafting Team.

31. Will you be providing links to the documents mentioned in numerous slides i.e. slide 39 CIP-005 guidance document

Response Comments- Tuesday
- Ok

Final Response: They are posted at: http://www.nerc.com/filez/standards/SAR-Urgent_Action_Revisions%20to%20CIP-005-3.htm

32. When will the redline versions of the changes to CIP003-CIP009 be made availale to the industry?

Response Comments- Tuesday
- Ok

Final Response: They have been posted in the Project 2008-06 Phase II project page. http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html

33. Slide 22 - How is "initial plant for restoration" defined?

Response Comments- Tuesday
- Answer does say how it is defined. Did this come from EOP 005-2. “Initial plan for restoration.” Not defined as glossary term.
- Not defined. Is in an old standard.
- Misquoted on a slide- standard doesn’t use.
- Howard Gugel will draft new language

Final Response. The criterion calls for the term "Blackstart Resource," and as long as the facility is identified in the Transmission Operator's restoration plan as a Blackstart Resource, then it should be designated as a Critical Asset.
Additional Clarification from the SDT - initial plant for restoration is not a defined term. The slide was an attempt to frame a discussion around Blackstart Resources, specifically concerning initial switching requirements.

34. Please clarify when CCA is replaced by H/M/L?

Response Comments- Tuesday
- Ok

Final Response: The post version 4 standards are still in development.

35. There is no more CIP-10 AND CIP-11?

Response Comments- Tuesday
- Ok

Final Response: The post version 4 standards are still in development.

36. Has the drafting committee abandoned the H,M,L categorization method?

Response Comments- Tuesday
- Ok

Final Response: The post version 4 standards are still in development.

37. Regarding CIP 002 Attachment 1, 1.1. can you define the word capability

Response Comments- Tuesday
- Ok
- Howard Gugel has language: "the drafting team referred to MOD-024-1 when developing 1.1. Please refer to this standard when determining net Real Power capability.

Final Response: The drafting team referred to MOD-024-1 when developing Criterion 1.1. Please refer to this standard when determining net Real Power capability.

38. CIP 002-4 R3 includes verbiage for annual review of risk-based methodology

Response Comments- Tuesday
- The answer is yes.
- Already answered in question 6.

Final Response: Refer to answer for question 7 (line 8)

39. What version of the CIP standards are going to be audited against, version 1, 2, or 3?

Response Comments- Tuesday
- Audit for time frame based on which version enforced.
- Version 3- does not begin until January 15 2011.

Final Response: The answer is yes. It depends on the specific timeframe that the audit is addressing. Remember that the audits look back three years or six years, depending on the type of entity that you are, and you are expected to demonstrate compliance with the Standard that was in force at the time of the audit. So right now, if an entity is being audited today, as we speak, they would be expected to demonstrate compliance with Version 2 of the Standards going back to April 1, and Version 1 of the Standards going before April 1. After this week, next week, they would be required to demonstrate compliance with Version 3 for anything going back to October 1, Version 2 going back to April 1, and Version 1 moving back beyond that.

Assuming that the implementation timeframe for Version 4 comes in within the general timelines that were discussed in the presentation, it is possible that the three-year look-back period will have requirements that will have the expectation that you would have to demonstrate compliance for all four versions of the Standards, depending on which particular timeframe the auditors are looking at. And any further information on that, you would have to discuss with your particular audit team to determine exactly how they're going to request that kind of evidence and what they're going to be looking for.

40. How "robust" are the 1500 MWe and 15 minute limits in R1 Attachment for Generators, i.e. voting position may depend on these limits.

Response Comments- Tuesday
- The limit is what it is.
- Proposed limits. You are encouraged to submit comments.
- It is a politically motivated number addressing concern. Can't rationalize any number.
- Refer to question 10 (line 11)

Final Response: Please refer to the answer to question 10 (line 11).

41. Is it still acceptable to have critical assets with no CCA'a

Response Comments- Tuesday
- Use Howard Gugel's language-.

Final Response: "It is not necessary for a Critical Asset to have Critical Cyber Assets."

42. Question - It appears that NERC has addressed a common way to determine Critical Assets, but NERC did not define "essential to reliable operation of a Critical Asset" thus, the new CIP-002-4 standard does not seem to actual compell the Industry to protect any more devices.

Response Comments- Tuesday
- Issues of identifying critical assets"
- The point of standard to identify critical cyber assets.

Final Response: 'The scope of the changes to CIP-002−4 is directed at resolving a certain number of issues of identifying Critical Assets.'

43. Question regarding control centers at the distribution side with automatic load shed capability of 100MW or more. Will these be expected to be evaluated under CIP 002-4?

Response Comments- Tuesday
- Flag to come back to.

Final Response: Currently the criteria says that you have to designate as Critical Assets those systems that are capable of load shedding automatically--automatically load shed--300 megawatts or more within 15 minutes.

***Additional clarification from the SDT*:** Please refer to the answer to question 22.

44. You mention required to run for reliability is not the same as RMR. Is the guidance to then simply request a determination from the Trans Planner?

Response Comments- Tuesday
- Tie to automatic load shed.
- OK. With edits.

*Final Response: "*The responsible entity has to check with his Planning Coordinator or Transmission Planner on whether his unit is designated, or what other units are designated as "must run for reliability reasons." In certain regions, the term "RMR" is used for different reasons."

45. Could you post or advise on the specific URL where CIP info is included?

Response Comments- Tuesday
- OK.

Final Response: They have been posted in the Project 2008-06 Phase II project page. http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html.

46. Will there be a formal comments period and ballot available for the changes being introduced for CIP003-CIP009?

Response Comments- Tuesday
- OK.

Final Response: The conforming changes to CIP-003-CIP-009 have been posted. The comment period and ballot are coincident with the CIP-002-4 standard.

47. Why wasn't "essential to reliable operation" addressed?

Response Comments- Tuesday
- OK.

Final Response: This is part of the definition for Critical Cyber Asset. The definition was not changed. Version 4 is narrowly scoped to address issues with Critical Assets.

48. Has FERC reviewed the proposed implementation schedules and are they in agreement?

Response Comments- Tuesday
- OK.

*Final Response: "*FERC approved the Version 3 Implementation Plans. The Implementation Plan for Version 4 will be submitted for FERC approval with Version 4 of the CIP standards."

49. If the revised CIP-005 refers to "guidelines" what is the risk that a utility interprets "guidelines" as optional and an auditor doesn't?

Response Comments- Tuesday
- CIP 005 doesn't refer to guidelines. No standard refers to guidelines.
- The auditor works to the requirements not the guidelines.

*Final Response: "*There is not a reference to a "guideline" in CIP-005-4. The auditor audits to the standards/requirements, not any guidelines."

50. In relation to R2.1, is there any intention to remove the serial exemption in the future? Previous draft version 4's have removed the serial exemption. Is this intended to be reintroduced into future revisions of the standard?

Response Comments- Tuesday
- OK.

*Final Response: "*The connectivity qualifications for Critical Cyber Assets still apply in CIP-002-4. Post Version 4 development is in progress, and connectivity is a consideration in the application of security controls."

51. Please provide additional clarification regarding the black start and cranking path brightliness associated with CIP-002 V4.

Response Comments- Tuesday
- Initial switching requirements and multiple path options are used in criteria?
- Lack of clarity comes from the sourced standards..
- Referring to the Transmission Operators restoration plan?
- What does multiple path mean?
- Is it the first load that you sync to?
- This was debated right before we posted.
- Is there a standard way of testing black start capability? Following the EOP? Testing the unit.
- Reference those are out of the EEI. Wording added. Consider including examples in guidance document.
- Jackie Collett and Doug Johnson will look at wording at what in standard. Address that language which isn't clear.

Response Comments-Wednesday
- Wish there was something about EOP.
- The SDT moved away from using the term "cranking path" because it wasn't defined.
- The proposed response language is consistent with what we have in the draft standard.

- EOP 005-2 requires testing everything in your plan for 3 years. Whatever you tested is critical, not what you have in the plan.
- "The choice of the next load" is key?
- First part of change reference cyber assets. Take the first reference out.

*Final Response: "*The intent of Criterion of 1.5 is to identify enough Cranking Path Facilities required during initial restoration as Critical Assets, up to the point where the entity has a choice of the next Facility or Facilities to use as part of the Cranking Path. The result is to provide protection for the constrained portions of the Cranking Paths, and to allow an entity some flexibility in defining their restoration sequence during an actual event."

52. Where can I find a document that summarizes only the differences between Rev 3 and the proposed 4?

Response Comments- Tuesday

- OK.

Final Response: The redline versions provide changes from Version 3 to Version 4. The mapping document also provides a review of changes.

53. Slide 16 - please explain the term "significantly mitigate" as it relates to oversight

Response Comments- Tuesday

- OK.

Final Response: The FERC directive really applies with respect to the previous Versions 1, 2, and 3 Standards where entities were using their self-defined risk-based assessment methodology to define Critical Assets. Paragraph 439 of Order 706 basically talked about the requirement for some oversight over that list of Critical Assets to ensure that it is adequate or not.
The opinion of the Drafting Team with respect to this particular directive from FERC is that by the use of bright line criteria in Attachment 1, there is no longer a need to verify the list, because it is a list derived from bright lines. A BES asset is either in or out, or the criteria are bright enough so that you can determine whether the Critical Asset qualifies or not, so there is no longer a need for oversight. "Significantly mitigated," means that, if not eliminated, there is significant mitigation of that requirement or of the issue by the use of bright line criteria.

54. For entities that have not claimed any CC's, 24 months could pose an extreme hardship both staffing and financially. Many entities have budgets that have been set for 2011 for both staffing levels and for finances. Could this implementation plan be expanded out to allow entities to plan financially and staffing wise?

Response Comments- Tuesday

- OK.

Final Response; The 24 month period to comply for entities who had not previously identified Critical Cyber Assets is the timeframe that's in the existing IPFNICCAANRE, or Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities. This is the currently approved implementation plan.

55. Item 1.6 on Attachment 1 of CIP-002-4 uses the term "Transmission Facilities". As defined in the NERC glossary this is a very broad definition covering lines, generators, shunt compensators, transformers, ETC. Facilities inside a substation enclosure can be protected but not miles of lines. Can you please clarify?

Response Comments- Tuesday

- Language okay substantively. Jackie will work with Howard for some editorial suggestions.

*Final Response; "*The standard does not require the protection of Critical Assets. It requires the protection of Critical Cyber Assets. So whether your cyber asset is in a centralized location within a substation, or a little away from the substation, that cyber asset would be subject to the requirements of the CIP Standards if it is essential to the operation of the Critical Asset."

56. Are isolated SCADA systems required to comply with these NERC reporting requirements

Response Comments- Tuesday

- Meet criteria for CAs and qualifications for CCAs?
- OK with Howard Gugel.

Final Response: Yes, if their associated BES asset meets the criteria for Critical Assets and the SCADA meets the qualifications for Critical Cyber Assets.

57. There are entities that have performed varies technical analysis to show that the requirements of attachment 1 do not affect the BES. Will these studies be considered to have an asset NOT defined a critical asset.

Response Comments- Tuesday

- Small coops- fall under this with possible expenses.
- Should we revisit this?
- Based on what we have out as CIP 002-4. They are critical asset if they meet.
- What is definition of a proper "authoritative study" to determine these and codify in the standard? Probably couldn't do.

- If we open any criteria up to evaluation to allow an exception it will produce a new "can of worms" and TFEs. Will this puts back on the table someone to review and approve a criteria?
- The ability to have custom user defined studies introduces the need for oversight which is what bright lines are trying to eliminate.

Final Response; No, if a BES Asset meets any of the criteria in Attachment 1, it must be designated as a Critical Asset. The ability to have user-defined technical analysis to exclude an asset that would meet the criteria of a Critical Asset would introduce the need for oversight, which defeats the purpose for bright line criteria.

58. What is meant by "single plant location" in criterion 1.1 of attachment 1? What about adjacent plants?

Response Comments- Tuesday

- We mean area encompasses a plant.
- We don't have the answer that what is a plant.
- Can a plant have multiple shipyards.
- Gerry Freese will draft a strawman response.

Final Response: Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

59. Was CAN-005 sent out via the NERC Alert system only?

Response Comments- Tuesday

- OK.

Final Response: No, CAN-005 was issued by compliance through a notice to NERC stakeholders.

60. Shouldn't the current CIP-005-3 have the same modifications as CIP-003 thru CIP-009 to prevent complications for Nuclear facilities?

Response Comments- Tuesday

- OK.
- Removed nuclear exclusion to be consistent with 706 B. Applied only to US jurisdictions not to Canadian facilities. Handled by CNSC.
- Not a conforming change, but an actual substantive change? No it is conforming.

Final Response: Conforming changes will be made upon filing.

61. Item 1.7 on Attachment 1 of CIP-002-4 was changed from "4 or more" to "3 or more". This has a tremendous impact on affected transmission facilities. Can you please explain the reasoning behind this change?

Response Comments- Tuesday
- Drafting team felt it was appropriate to refer to connected transmission substations to address parallel lines
- Not doing generating sub-stations.

Final Response: "In order to be more accurate in terms of the impact, the Drafting Team thought that it was more appropriate to refer to the number of connected transmission substations instead of lines connected to any particular transmission sub-station. The intent was to get away from the double-circuit conditions and to include facilities that are actually more a part of the network than simple substations with double circuits between them."

62. Will the regional entities push back if assets are removed from the CA lists because of the new criteria?

Response Comments- Tuesday
- SDT can't comment on this.

Final Response: The drafting team cannot comment on the possibility of push back.

63. Is the remote access Reference\Guidance document available yet?

Response Comments- Tuesday
- OK.

*Final Response: "*This document has been posted to the draft CIP-005-3 Modifications Urgent Action Standard page."

64. If the RE designates an entity as a CA, should the RE be responsible to communicate the determination or will the responsibility be on the entity to prove they were not designated as such for audit purposes?

Response Comments- Tuesday
- OK.

*Final Response: "*With the bright-line criteria, the responsible entity should be able to determine its own Critical Assets. Input from the RE or other registered entities may be required for that determination, in which case, the responsible entity is responsible for soliciting that information."

65. Will the Security Guideline for the Electricity Sector: Identifying Critical Cyber Assets be updated and included with the approved Version 4 CIP Standards posting?

Response Comments- Tuesday
- Guideline doesn't need to be updated since haven't changed critical cyber asset.

*Final Response: "*The SDT will discuss necessary changes with CIPC, since they own this document."

66. A SCADA system is capable of opening breakers that would shed 300+ MWs of load but is not presently programmed to perform automatic load shed. The SCADA owner is not a BA, RC or TOP. Is the SCADA system a critical asset under 1.13 of CIP-002-4 attachment 1?

Final Response: Please refer to the answer to question 22.

67. Will it take a SAR to change the 1500 when needed

Comments
- OK.

Final Response: The criteria in attachment 1 are part of the CIP-002-4 standard and must follow standard revision procedures.

68. So since there is no technical justification for generation; what is the justification for the transmission thresholds?

Comments
- OK

Final Response: The reference document outlines the rationale for the criteria.

69. Would David Revill repeat his comment regarding Effective Date as determined by NERC- vs. FERC-approval?

Comments
- In Canada vs. U.S.? In the presentation.

Final Response: (from Speaker Notes) All entities should be compliant with CIP-002-4 on the Effective Date of the Standard. The Effective Date is defined in the Standard to be the first day of the third calendar quarter after applicable regulatory approvals. For those that do not have an applicable regulatory approval, the Effective Date is the first day of the third calendar quarter after the NERC Board of Trustees adoption. For those in the U.S., this is at least 6 months following FERC approval.

70. Does Attachment 1 criteria 1.4 apply to all blackstart resources in the restoration plan or is it limited to those associated with primary restoration paths. For example, if a restoration plan lists several alternate paths in addition to the primary restoration path, would the resources associated with the alternate paths be considered critical assets.

Comments
- "primary restoration path?"
- OK with response.

Final Response: The criterion calls for the term "Blackstart Resource," and as long as the facility is identified in the Transmission Operator's restoration plan as a Blackstart Resource, then it should be designated as a Critical Asset.

71. Slide 24 / CIP2 R4 Attachment 1 paragraph 1.14. All TOP Control Centers and Backup Control Centers are being classified as High risk CA's. This is independent of the criteria for determining the criticality of the substations that they control (paragraph 1.6 & 1.7). Why are ALL of these control centers being included as high risk CA's via the bright line criteria?

Comments
- OK

Final Response: EOP-008 specifically requires control centers that perform the obligations of the RC, BA or TOP to have backups. As such, these control centers and backup control centers must be designated as Critical Assets, irrespective of size.

72. What is the new timeline associated with the development of CIP-010 and CIP-011?

Comments
- OK

Final Response: Posting for formal comment and first ballot in July 2011 and filing to FERC by the end of 2011.

73. Bright Line criteria question. In the case of generation controlled/dispatched by a "Control Center" for wholesale power marketing purposes, how do you determine the 1500MW value? Would that be an aggregate of the regulation/dispatch limits (since the entire output cannot be controlled) or the aggregate output of all generation under control?

Comments
- EOP 5? Doesn't deal with control centers but with units?
- 1.15- rated net real power capability?

- FLAG- DJ.
- Goes with 24-

Response Comments Wed.

- We expect to use the aggregate higher rate real power
- The aggregate output of
- Use the aggregate of the same criteria as 1.1.
- The answer to the question is th
- If you deviate from 1.1 criteria, the value changes on the fly.
- Nothing for reliability for control? Plant controlled for economics part of reliability of the BES.
- If this control system tied to anyone else?
- 2 sentences.?
- Encourage more people to vote no with comments.
- "Part of the reason for this is that data flowing through the control center to others is the full output of the center."
- Does having the ability to take them off line do that.
- Multiple scenarios out- do we allow generation control centers to use the smaller number, and potentially lose some of those that are a data source. Or more fancy words to try to lock those in.
- Use the larger of the values. Use the same as 1.1. Our standard doesn't distinguish between marketing and reliability.
- Nameplate minimum and maximum loads are known.
- Switched off of nameplate because of the variability.
- Respond to what the standard is today.
- Say we are doing this on a generation basis. Wholesale market is not part of reliability. "
- The control center is identified because it is performing generation control irrespective of market purpose.
- We need to come back to this when we get comments on the standard.

Final Response: We would expect to use the same criteria as in Criterion 1.1. This is the aggregate output of all generation under dispatch/control. The control center is considered a Critical Asset due to the fact that it is performing generation control, irrespective of whether it is performing wholesale power marketing functions.

74. For determination of critical assets, how was the 1000 MVAR threshold for reactive resources arrived at?

Response Comments

- OK

Final Response: This value was determined to be reasonable by the CIP-002 subteam, based on generation criteria.

75. Why is there a preoccupation with moving to CIP 10 and 11? CIP-002 - CIP-009 have some natural breaks in them that can make them easier to administer among departments and the industry is comfortable with them. Why can't the team just continue to add new versions of the existing standard numbers?

Response Comments
- OK

Final Response: The drafting team continues to consider structuring options based on comments and requirements.

76. Attachment 1, 1.3 - can specific criteria be added to 1.3 for more specificity?

Response Comments
- OK

Final Response: Please propose alternative language that would clarify the criterion without introducing terms that already have implied use in certain regions.

77. **What about TFE's? RFC is requesting vendor letters, such as CISCO, that states that their product does not meet xxsx standard. This seems rather archaic. Can NERC make some sense of this issue?**

Response Comments
- OK

Final Response: The issue of Technical Feasibility Exceptions is high on the SDT's consideration in drafting the next version of the standards.

78. In the future, does the SDT still plan to revise CIP-002 to have all BES Assets identified as High , Medium, or Low?

Response Comments
- OK

Final Response: The SDT is still developing the next version. This is a consideration in this development.

79. As part of CIP-002-4 initiative, will there be a "bright line" categorization for Critical Cyber Assets?

Response Comments
- OK

Final Response: There is no substantive change in Version 4 for categorizing/ qualifying Critical Cyber Assets.

80. GO/GOP in some cases, such as wind generation, utilize remote operations centers operated by third party operators for tasks such as restarts and generation curtailments. What should be considered in determining if this is a Control Center as opposed to a control room?

Response Comments

- Point back to critical asset guideline for distinction between control centers and control rooms- perimeter around 1 or multiple locations. Point to same criteria. Point to Line 24
- This is pointing to a specific example.
- "Security Guidance for Electricity Sector: Guideline provides a discussion on the difference…..

Final Response: These are considered generation control centers subject to the criteria for generation control centers. The document "Security Guideline for the Electricity Sector: Identifying Critical Assets" provides a discussion on the difference between control centers and control rooms.

81. What if those group of units at one plant location do not all have common, interconnected cyber systems?

Response Comments

- Point to criteria in Attachment-
- Row 19 language.

Final Response: The plant location should be considered for qualification as a Critical Asset per Criterion 1.1. The cyber assets to be considered for qualification as Critical Cyber Assets have a specific qualification in R2 of CIP002-4, which is "For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes."

82. For Section 1.3 of CIP-002-4, shouldn't the SDT add that the PC or TP needs to notify the GO/GOP that his generation is designated as critical?

Response Comments

- OK

Final Response: The responsible entity has to check with his Planning Coordinator or Transmission Planner on whether his unit is designated, or what other units are designated as "must run for reliability reasons." Again, not all RMR are--in certain regions, the term "RMR" is also used for units designated as "must run" for market stabilization reasons.

83. When will the standards development and implementation plan be available on the NERC website?

Response Comments
- Current schedules were slides in the webinar.

Final Response: The slides for the webinar (including a high level view of the schedule) are available on the NERC site at http://www.nerc.com/files/CIP002-004-092910.pdf. The Implementation Plan for Version 4 is posted in the CIP Version 4 standards area.

84. If the effective date is the first day of the 3rd quarter after approval, couldn't the effective date be July 1 if FERC approves during the 1st quarter?

Response Comments
- Answer -No. assuming approval anytime during the first quarter,….

Final Response: No. Approval at any time during the first quarter would make April 1 the first day of the first quarter after approval, July 1 the first day of the second quarter after approval, and October 1st the first day of the third quarter after approval.

85. For example if an analysis has been performed at a local control center that opens all BES breakers and the BES remains stable would this study prevent the LCC from being a critical asset?

Response Comments
- Delete "for example"
- Line 58./ Question 57

Final Response: No, if the control center satisfies the criterion for control centers. Bright-lines do not consider the responsible entity's analysis or studies. Please refer to the answer to question 57 for additional clarification.

86. If the cranking path from Black Start resource to the next start resource is within the same substation, do you have to include the additional substations to the interconnecting/synchronizing point as critical assets?

Response Comments- Tuesday
- Is the answer yes or no?
- Blackstart unit in same substation?
- JC can look at this language differently. "Choice" is left open.
- More discussion on intent
- Look outside the sub-station?
- EOP 005, R15- have to have a plan and if all is covered..
- Flag this for further discussion.

- Glossary definition of "cranking path"? Could be within the same plant? The cranking path becomes a bus.
- 1.4 and 5 cover cranking path.

Response Comments- Wednesday

- If this substation has more than 1 path, then you could stop there.
- If meeting the EOP 005 standard, they will have additional paths.
- Draws picture. Straight bus with three transmission generators.
- Is this more than what the definition requires?
- Determines what is the unit to be started.
- If you are going to meet the other standards- says to the next generator?
- Good points. Issues with the GOP standards? NERC's definition of cranking paths?
- Wanted to use "primary cranking paths"- but it isn't defined. Was intended to be a compromise to scope this down. Did we go too far?
- Depends on what your restoration plan says.
- Hold this thought for revision of the standard.
- Interconnect is already in and this may already be covered.
- 1.10 covers this- Add 1.4 to 1.10.
- Concerns are valid but not in the CIP standards.
- 1.4 is needed to be added. The sub is part of the cranking path- where the generator connects to get it somewhere.
- Choices for path are units in the station. Take out first sentence?
- The GSU and a piece of the bus would be the cranking path in her example.
- Does it have to get of interconnecting to the system-
- Leave the one sentence

Final Response: It depends on how the Cranking Path is defined in the Transmission Operator's restoration plan.

87. Attachment 1, 1.8 - Facilities whose loss can create IROL's varies in time depending on what other transmission facilities are in service? Under what conditions is this determination to be made - in the planning horizon or the operating horizon. Also, is 1.8 meant to assume the loss of an entire substation?

Response Comments- Tuesday

- This has fundamental issues with it. Loss of facility doesn't generally create an IROL. Will be getting comments on this.
- In the planning horizon or the operating horizon
- Impacts that happen are what we are focusing on. Plan for varying operating conditions that occur.
- Don't generally violate an IROL.
- Do you calculate IROL for loss of a substation?
- Document the contingency but not doing anything about.

- Class D is the floor? Does this relate to IROLs? Not necessarily. Impact of the contingency not what kind it is.

Final Response: The criterion applies to the planning horizon. Part 1.8 assumes the loss of any combination of facilities including the loss of the whole substation.

88. Attachment 1 now creates a uniform criteria for Critical Assets. Why was the original requirement for determining Critical Cyber Assets left as "essential to reliable operation" which will just create the same problems with uniformity and auditing we had previously with Critical Assets?

Response Comments

- This was John Van Boxtel's question.

Final Response: The scope of the changes to CIP-002–4 is really directed at resolving a certain number of issues on Critical Assets.

89. 1. What devices are considered FACTS? 2. Is series cap considered a reactive resource? 3. Any IROL in Western Interconnection?

Response Comments

- SVCs, series caps,
- HVDC? Not
- #2? Yes. But may not always be a FACTS device.
- Where is definition of FACTS? Direct them there.
- WECC doesn't use the "IROL" philosophy.
- Language in Pittsburgh
- #3; FAC 014-2 requires all Reliability Coordinators to establish IROLs. Planning coordinator does the same thing.
- Refer to IEEE definition?
- Talk with planning coordinator and RC to determine if there are any in the region.
- SOL methodology.

Final Response: 1. IEEE has established a definition for FACTS. 2. Yes, but it may not always be a FACTS device. 3. FAC-014-2 requires all Reliability Coordinators and Planning Authorities to establish IROLs consistent with its SOL methodology. Please refer to your Planning Coordinator or Reliability Coordinator.

90. Are AMI systems considered to be ALS if they are 300mw or larger?

Response Comments

- Automated/Advanced Metering Infrastructure.
- Need to discuss the 300MW in the future.
- 300 MW- DOE requirement. Triggered a reporting.
- Doesn't stand up to the 1500 for generation.

- AMI distribution level? In scope? Either distribution provider. Load shed done at distribution level.
- Some could be inside commercial facility.
- Most load shed- done automatically.
- 300 MW is what it is now and get comments to change the number.

Response Comments- Wednesday

- Refer to question 22/response?
- Does the AMI act on its own?
- AMI issue before- "within 15 minutes" clarification.
- "Furthermore, the response time must be within 15 minutes in order to qualify.
- Functional model. DP implements under the direction of the TO.
- Should be the DP not the LSE in the CIP standard.
- Haven't decided yet included in DP moving forward.

Final Response: Please see the answer to question 22. Furthermore, the response time must be within 15 minutes in order to qualify.

91. Is there a specific implementation plan for CIP-005-4? Upon FERC approval, when would a Registered Entity be required to comply with the changes in CIP-005-4?

Response Comments

- 12-18 months- There will be an implementation plan developed and posted in next round of balloting.

Final Response: There will be an Implementation Plan for CIP-005-4, which will be developed and posted by Project 2010-15.

92. What is the meaning of "location" in 1.1 of Attachment 1 to CIP-002-4? For example: If a new 20 MW CT is located at an existing 1500+ MW plant and the CT connects to a different substation than the existing plant, is the 20 MW CT a critical asset?

Response Comments-Wednesday

- Refer to question.
- Plant is a critical asset by hypothesis. Unit is part of critical asset.
- Since the plant already meets bright line criteria, additional units installed at that plant….?
- If had a common control system.

Final Response: The plant would be considered a Critical Asset because it exceeds the 1500 MW threshold at a single plant location. For additional clarification in location, please refer to question 58.

93. Just as a comment, the redline and clean version of CIP-008-4 does not have the Nuclear plant exception removed. Will this be re-posted?

Response Comments
- OK. Have to go back to make sure proper language in for Canadian.
- Refer to question #7 and question on (nuclear)

Final Response: Yes, as part of an errata prior to balloting. Please refer to the answer to question 7 and question 60.

94. Where in the NERC Website that I can locate the presentation slides for today webinar?

Response Comments
- OK

Final Response: They are available at: http://www.nerc.com/files/CIP002-004-092910.pdf

95. Also, CIP-005-4 does not have the Nuclear plant exception removed either. Will this be removed with the next ballot of CIP-005-4?

Response Comments
- OK same as 93

Final Response: Yes, as part of an errata prior to balloting. Please refer to the answer to question 7 and question 60.

96. I don't believe the WECC has IROLs - how does this impact 1.8, 1.9, 1.12 in attachment 1

Response Comments
- If you have no IROLs in your area, in essence NO to 1.8,1.9 and 1.12. Copied from earlier response.

Final Response: FAC-014-2 requires all Reliability Coordinators and Planning Authorities to establish IROLs consistent with its SOL methodology. Please refer to your Planning Coordinator or Reliability Coordinator. If no IROLs have been designated, then an entity would have no assets determined to be Critical Assets based on Criteria 1.8, 1.9, and 1.12.

97. Is the 300MW load shed applicable if loads are connected less than 100kV?

Response Comments- Wed.
- **Refer to question 22.**

Final Response: No. This issue has been forwarded to Project 2010-15.

98. As it applies to the new NERC requirement in CIP005, will the term "remote access" be added to the glossary of terms?

Final Response: The definition is approved by the NERC BOT, and is provided in the current NERC Glossary of Terms.

~~**99. Are these slides currently posted on the NERC site and if so where are they located?**~~
- Asked and answered.

~~**100. CIP-002-4, R3 - includes verbiage for annual review of risk-based methodology - to be removed in errata?**~~

Response Comments
- OK

101. Since the EOP-005-2 standard and the Blackstart Resource definition are not yet FERC approved, how will this be coordinated with the FERC approval of CIP-002-4 which utilizes the Blackstart Resource definition.

Response Comments
- OK

Final Response: This issue has been referred to Project 2010-15.

102. For the purpose of interpretation of CIP-005-3, R6, does NERC consider this case as a remote access? "A person is using a CCA within an ESP to access another CCA in another ESP for the maintenance purpose."

Response Comments
- This issue has been forwarded to Project 2010-15.

Final Response: This issue has been referred to Project 2010-15.

103. Regarding the Control Room versus Control Center issue. Would a location that communicates with 2 substations, but controls a singular transmission asset be a Control Room or Center, whether the transmission asset is CA or not?

Response Comments

- OK

Final Response: It would be considered a control center if it is at a remote location.

104. Since it has been said that CIP-010 and 011 will eventually be implemented and CIP-010 (as currently drafted) CCA level impacts are High, Med and Low. If under CIP-002-4 bright line criteria in Attachment 1, you are not a CA, yet under CIP-010 you are implied to be a low impact CCA -- shouldn't there be a "no impact" category under CIP-010?

Response Comments

- Use the stock answer about future work part of CIP 010 and 11.

Final Response: The post version 4 standards are still in development.

Appendix #5 SDT Sub-Teams

Sub-Team	
CIP 010 BES System Categorization	John Lim (Lead), Rich Kinas, Jim Brenton, Dave Norton *(Observer Participants: Rod Hardiman, Jim Fletcher) (FERC: Mike Keane, Peter Kuebeck)*
Personnel and Physical Security	Doug Johnson (Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin *(FERC: Drew Kittey)*
System Security and Boundary Protection	Jay Cribb (Lead), Jackie Collett, John Varnell, John Van Boxtel, Philip Huff *(Observer Participant: Brian Newell) (FERC: Justin Kelly)*
Incident Response and Recovery	Scott Rosenberger (Lead), Joe Doetzl, Tom Stevenson (*Observer Participant: Jason Marshall) (FERC: Dan Bogle)*
Access Control	Sharon Edwards (Lead), Jeff Hoffman, Jerry Freese, Bill Winters *(Observer Participants: Roger Fradenburgh, Robert Preston Lloyd) (FERC: Mike Keane)*
Change Management, System Lifecycle, Information Protection, Maintenance, and Governance	Dave Revill (Lead), Jon Stanford, Keith Stouffer, Bill Winters *(Observer Participant: Brian Newell) (FERC: Jan Bargen, Matthew Dale)*
CIP 002-4 Drafting Team	John Lim (Lead), Jim Brenton, Jackie Collett, Jay Cribb, Sharon Edwards, Doug Johnson, Rich Kinas, Dave Norton, Dave Revill, and Bill Winters *(Observer Participants: Rod Hardiman; Jim Fletcher; Bryn Wilson) (FERC: Mike Keane, Peter Kuebeck; NERC: Scott Mix)*
Implementation Plan CIP 002-4	Dave Revill (Lead), Sharon Edwards, Kevin Sherlin, Scott Rosenberg, Dave Norton and Phil Huff *(FERC: Mike Keane; NERC: Scott Mix)*
Framework CIP 010 &011	Dave Norton (Lead), Jim Brenton, Jay Cribb, Joe Doetzl, Phil Huff, Doug Johnson, Dave Revill, Jon Stanford, and John Van Boxtel. *(FERC: Mike Keane; NERC: Scott Mix)*

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 SDT - Project 2008-06

October 12, 2010 | 8:00 AM to 6:00 PM EDT
October 13, 2010 | 8:00 AM to 6:00 PM EDT
October 14, 2010 | 8:00 AM to 6:00 PM EDT
Toronto, Canada

Proposed Meeting Objectives/Outcomes:

- To review September 29 webinar questions and begin the development of a response document for industry posting
- To review and discuss and test acceptability of proposals for addressing key issues presented by the CIP Framework Team
- To review the Sub-team summaries of the CIP 010 & 011 and Workshop industry comments and discuss possible responses in light of the framework review
- To agree on next steps and assignments

Tuesday, October 12, 2010 8:00 a.m. - 6:00 p.m. EDT

- Introduction, welcome -*(Morning)*
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review meeting and milestone schedule for CIP 002-4 and CIP 010 and 011 *(Morning)*
- Review changes to CIP Version 4 prior to ballot (CIP-002-4 R3 and CIP-008-4 applicability)
- Review results of September 29 CIP 002-4 Webinar *(Morning)*
- Participate in ERC Event Process Analysis Webinar and discuss implications for CIP development
- Draft responses and consider any changes to CIP-002-4 based on September 29 webinar questions *(Afternoon)*

Wednesday, October 13, 2010 8:00 a.m. - 6:00 p.m. EDT

- Receive a report from the team assigned to work on the framework *(Morning)*
- Discussion of Framework Team key issues *(Morning)*
- Review and provide feedback on the acceptability of the presented approach *(Afternoon)*

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

Thursday, October 14, 2010, 8:00 a.m. - 6:00 p.m. EDT

- Continue discussion of prospective framework *(Morning)*
- Review Sub-teams summaries of industry and Dallas workshop comments on CIP 010 & 011
- Discuss potential responses in light of the framework
- Review Preparation for CIP 002-4 Team Organization for Responding to Industry Comments before and in Baltimore *(Afternoon)*
- Review SDT November, 2010 Baltimore Meeting Agenda (*Afternoon)*

CSO706 SDT November 16-18, 2010 Meeting Summary Contents

Cyber Security Order 706 SDT- Project 2008-06
28TH MEETING
November 16-18, 2010
Baltimore, Maryland

EXECUTIVE SUMMARY

John Lim, Chair of the CSO 706 SDT welcomed members and other participants to Baltimore and thanked Tom Stevenson and Maggie Powell at Constellation Energy for hosting the meeting. Howard Gugel, NERC, conducted a roll call and reviewed the antitrust and public meeting guidelines at the beginning of each day. On Thursday morning, the SDT unanimously adopted the October 12-14, 2010 Ontario meeting summary.

The chair outlined the objectives the SDT sought to accomplish by the end of the meeting and Bob Jones reviewed the timed agenda for each day The Chair and Vice Chair thanked the members who joined in the daily Readytalk conference calls during the prior week to bring strawman responses to industry comments for the SDT review at this meeting.

Phil Huff reviewed the milestone schedule noting that the SDT had agreed to prepare and submit the CIP XX Version 5 to industry by July, 2011. Mr. Huff noted that the proposed schedule may be adjusted slightly in the Spring based on SDT progress but will lead to a balloting of the Version 5 proposed CIP standards by mid-year. He also pointed out that currently the Team has agreed not to put preliminary drafts out for informal industry comment in 2011.

The Chair welcomed several industry groups and invited them to make comments on the CIP 002-4. Barry Lawson on behalf of NRECA noted that he supports the efforts of the SDT and hopes they can get to a consensus on some changes based on the industry comments. He noted he abstained from voting but he and NRECA members want to be able to vote in the affirmative on the next ballot. He summarized the association's concerns around control centers for balancing authorities and transmission operators and the bright line MW criteria as well as the Blackstart portions of the criteria. The NRECA hopes that SDT will address the question of whether this draft will "incentivize people to withdraw assets from blackstart plans." Nathan Mitchell, representing APPA noted that while they voted against the standard, they are not against what the SDT is doing overall. They hope the SDT will take a new look at and address a few areas of concern regarding control centers and blackstart units. He believed it was possible to pull in public power members with some modifications in these areas. David Batz, representing EEI, echoed the other trade association comments, noting that EEI appreciated the efforts of the SDT and the complexity of the job. He reinforced EEI members' interest in a successful balloting of CIP 002-4 and suggested there was an opportunity for the SDT to improve the product noting that it won't be perfect.

Mark Weatherford, VP/Chief Security Officer, NERC, introduced himself to the Team noting that he was relatively new at NERC and at the drafting process but wanted to see how the Team is functioning.

He assured the Team that he is a supporter of the process and appreciates that the SDT is working very hard to perform a needed service for the industry.

Scott Mix reported on the CIP 005-4 Urgent Action. The CIP 005 drafting team received numerous significant comments on the posted standard. The previous standard and its associated SAR were withdrawn and replaced by updated versions. The language for CIP 005-4 Requirement R6 has been significantly modified based on industry comment, and was approved for an abbreviated posting and ballot period by the Standards Committee. NERC has posted a summary of comments received, and summary of issues raised during the previous posting period. An updated guidance document was also posted. The goal of the team is to still file the revisions for concurrent consideration of a single "Version 4" package by regulators.

Many of the SDT members and other meeting participants participated in a tour of a Constellation Energy sub-station on site on Wednesday mid-day.

Howard Gugel reported that there was a 43% approval rating from the industry. He suggested that the way the ballot process is set up leads to a high negative first vote as industry entities want to be able to make comments for the SDT to consider in any redrafting for the next ballot. He offered that the industry ballot results and comments do not represent an insurmountable task for the SDT to respond to these comments, make appropriate changes in the standard and succeed in a new ballot. He suggested the largest concerns and strongest feelings surrounded the following three areas in the standards and Attachment 1: Control Centers; Blackstart Resources; and 1.3- Transmission planner reliability "must run" units. He noted that it was very helpful to have worked through and reached agreement of the SDT on responses to the September 29 webinar questions and comments at the Toronto SDT meeting many of which were presented as comments to the ballot. Mr Gugel offered his appreciation for the participation of many of the SDT members who set time aside for each day of the preceding week to help prepare strawman responses for consideration at the Baltimore meeting.

The SDT reviewed the industry comments and a strawman response document and conducted straw polls for a number of proposed changes to the standard. In general, if the proposal received greater than 2/3 support from the Team it was incorporated into the text of the standard. The SDT initially focused on Attachment 1 and the implementation plan documents and then returned to the standards document to make any changes consistent with the agreed upon changes in Attachment 1 and the implementation plans. The SDT reviewed strawman responses to each industry comment. At the conclusion of the meeting the SDT reviewed and amended the Guidance Document consistent with the changes in the standards documents and adopted a response document for posting.

The SDT reviewed the industry comments on the Implementation Plan and the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities and concluded that the effective date should be a 24-month period for all entities without exceptions to address the industry confusion on the first ballot proposal.

Below are displayed the results of the straw polls that formed the basis for the SDT refining and adopting a revised CIP 002-4 and related documents.

CYBER SECURITY — CRITICAL CYBER ASSET IDENTIFICATION CIP-002-4 SDT STRAW POLLS

A. INTRODUCTION-PROPOSED WORDING STRAW POLLS	Yes	No	Abstain	% Support
Applicability 4. 2				
Add: 4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.	**17**	**0**	**-**	**100%**
Add: 4.2.3 Cyber assets associated with Cyber Security Plans submitted to U.S. Nuclear Regulatory Commission pursuant to 10CFR73.54.	**17**	**0**	**-**	**100%**
Effective Date 5. "The first day of the eighth ~~third~~ calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becom effective the first day of the ninth ~~third~~ calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)"	**17**	**0**	**-**	**100%**
B. REQUIREMENTS-PROPOSED WORDING STRAW POLLS	**Yes**	**No**	**Abstain**	**% Support**
R.1 Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update ~~review~~ this list ~~at least annually, and update it~~ as necessary, and review it at least annually.	**17**	**0**	**-**	**100%**
R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1 ~~within 15 minutes The Responsible Entity shall review this list at least annually, and update it as necessary~~ For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics: R2.1 The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, R2.2 The Cyber Asset uses a routable protocol within a control center; or, R2.3 The Cyber Asset is dial-up accessible.	**17**	**0**	**-**	**100%**
R3. Annual Approval — The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the ~~risk-based assessment methodology~~ list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)	**17**	**0**	**-**	**100%**

ATTACHMENT #1-PROPOSED WORDING STRAW POLLS	Yes	No	Abstain	% Support
1.3 *Proposed Wording* Each generation Facility that the Planning Coordinator, Transmission Planner or Reliability Coordinator designates as required to avoid BES	**13**	**4**	**-**	**76%**
Adverse Reliability Impacts in the planning horizon.				
1.4 *Support for Strawman language:* "Each Blackstart Resource identified in the Transmission Operator's restoration plan."	**16**	**0**	**1**	**94%**
1.5 The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where ~~multiple~~ two or more path options exist, as identified in the Transmission Operator's restoration plan.	**15**	**1**	**-**	**94%**
1.7 *Support for Strawman Language plus addition*: "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.	**16**	**0**	**-**	**100%**
1.8 *Proposed Changes:* Transmission Facilities at a single station or substation location that ~~if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more~~ are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.	**17**	**0**	**-**	**100%**
1.9 *Proposed Changes:* Flexible AC Transmission Systems (FACTS) at a single station or substation location, that, ~~if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more~~ are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.	**16**	**0**	**-**	**100%**
1.10 *Proposed Changes:* Transmission Facilities providing the generation interconnection required to ~~directly~~ interconnect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by the ~~any Responsible Entity~~/Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3.	**15**	**1**	**-**	**94%**
1.12 *Proposed Language:* "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that ~~if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)~~ is identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."	**14**	**0**	**2**	**87%**
1.13 ~~Common control system(s) capable of performing~~ Each system or facility that perform automatic load shedding, without human operator ~~intervention~~ initiation, of 300 MW or more ~~within 15 minutes~~ implementing undervoltage load shedding (UVLS) or underfrequency load shedding (UFLS) as required by the regional load shedding program	**12**	**0**	**5**	**71%**

1.14 *Final Language:* Each control center, ~~control system,~~ or backup control center~~, or backup control system~~ used to perform the functional obligations of the Reliability Coordinator, ~~Balancing Authority, or Transmission Operator.~~	**15**	**2**	**-**	**88%**
1.15 *Final language* "Each control center or backup control center used to control generation at multiple plant locations for any generation Facility or group of generation Facilities identified in 1.1,1.3, and 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MWs in a single Interconnection."	**14**	**0**	**-**	**100%**
1.16 *Final draft:* Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.	**17**	**0**	**-**	**100%**
Original 1.16 *Original strawman wording:* ~~Any additional assets that the Responsible Entity deems appropriate to include.~~	**0**	**17**	**-**	
1.17 *Final Draft*: Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection.	**17**	**0**	**-**	**100%**
IMPLEMENTATION PLANS- PROPOSED WORDING STRAW POLL	**Yes**	**No**	**Abstain**	**% Support**
Create a 24 month implementation deadline for all CA and CCA assets and reflect this in the standard's effective date (A.5) and in the implementation plan language.	**15**	**2**	**-**	**88%**
OVERALL ADOPTION OF CIP 002-4 RESPONSE DOCUMENT	**Yes**	**No**	**Abstain**	**% Support**
Motion to approve adoption of the CIP 002-4 SDT response document as refined with direction to Howard Gugel to provide any needed Editorial Changes Consistent with the SDT's agreement on the responses.	**17**	**0**	**-**	**100%**
OVERALL ADOPTION OF CIP 002-4 AND RELATED DOCUMENTS AS REFINED	**Yes**	**No**	**Abstain**	**% Support**
Motion to approve overall adoption of CIP 002-4 and related Documents (Implementation Plans & Guidance Document) consistent with the SDT straw polling results.	**15**	**3**	**-**	**83%**

The Team reviewed the steps and assignments leading up to the Orlando meeting which member Rich Kinas will host once again at the OUC facilities. The Framework Sub-Group will be meeting several times in the interim to prepare documents for the SDT to review at the December meeting. The 2nd Ballot is expected to close on Friday, December 10 COB. NERC staff will prepare the ballot results and comments with strawman draft responses and send out as soon as possible following the close of the ballot in advance of the Orlando meeting the following Tuesday. The Orlando meeting agenda will include review and response to the 2nd ballot results and comments, an orientation and training session on the results-based standards process and a review, discussion and consensus testing of a framework for CIP Version 5. The Chair thanked Tom Stevenson and Margaret Powell for the excellent hosting of the SDT in Baltimore.

The meeting adjourned at 4:40 on Thursday

Cyber Security Order 706 SDT- Project 2008-06
28TH MEETING SUMMARY
November 16-18, 2010
Baltimore, Maryland

I. AGENDA REVIEW, WORKPLAN SCHEDULE, INTRODUCTORY REMARKS AND UPDATES

A. Agenda and Milestone Schedule Review

John Lim, Chair of the CSO 706 SDT welcomed members and other participants to Baltimore and thanked Tom Stevenson and Maggie Powell at Constellation Energy for hosting the meeting. Howard Gugel, NERC, conducted a roll call and reviewed the antitrust and public meeting guidelines at the beginning of each day. On Thursday morning, the SDT unanimously adopted the October 12-14, 2010 Ontario meeting summary.

The chair outlined the objectives the SDT sought to accomplish by the end of the meeting and Bob Jones reviewed the timed agenda for each day including starting with any proposed changes to the requirements and Attachment 1 criteria and then proceeding through each of the industry comments and draft responses. The Chair and Vice Chair thanked the members who joined in the daily Readytalk conference calls during the past week to bring strawman responses to industry comments for the SDT review at this meeting.

Phil Huff reviewed the milestone schedule noting that the SDT had agreed to prepare and submit the CIP XX-XX Version 5 to industry by July, 2011. Phil noted that the proposed schedule may be adjusted slightly in the Spring based on SDT progress but will lead to a balloting of the Version 5 proposed CIP standards by mid-year. He also pointed out that currently the Team is not planning to put preliminary drafts out for informal industry comment.

B. Introductory Remarks- Trade Associations

Barry Lawson on behalf of NRECA noted that he supports the efforts of the SDT and hopes they can get to a consensus on some changes based on the industry comments. He noted he abstained from voting but he and NRECA members want to be able to vote in the affirmative on the next ballot. He summarized the association's concerns around control centers for balancing authorities and transmission operators and the bright line MW criteria as well as the Blackstart portions of the criteria. The NRECA hopes that SDT will address the question of whether this draft will "incentivize people to withdraw assets from blackstart plans."

Nathan Mitchell, representing APPA noted that while they voted against the standard, they are not against what the SDT is doing overall. They hope the SDT will take a new look at and address a few

areas of concern regarding control centers and blackstart units. He believed it was possible to pull in public power members with some modifications in these areas.

David Batz, representing EEI, echoed the other trade association comments, noting that EEI appreciated the efforts of the SDT and the complexity of the job. He reinforced EEI members' interest in a successful balloting of CIP 002-4 and suggested there was an opportunity for the SDT to improve the product noting that it won't be perfect.

C. Introductory Remarks by Mark Weatherford, VP/Chief Security Officer, NERC

Mark introduced himself to the Team noting that he was relatively new at NERC and at the drafting process but wanted to see how the Team is functioning. He noted that he understood that CIP security efforts have been evolving rapidly and that Scott Mix has kept him in the loop. He assured the Team that he is a supporter of the process and appreciates that the SDT is working very hard to perform a needed service for the industry.

D. Related Cyber Security Initiative Update- CIP 005-4 Urgent Action

Scott Mix reported on the CIP 005-4 Urgent Action. The CIP 005 drafting team received numerous significant comments on the posted standard. That previous standard and its associated SAR were withdrawn and replaced by updated versions. The language for CIP 005-4 Requirement R6 has been significantly modified based on industry comment, and was approved for an abbreviated posting and ballot period by the Standards Committee. The comment and ballot period closes on 12/1/2010. Also posted was the summary of comments received, and summary of issues raised during the previous posting period. An updated guidance document was also posted. The goal of the team is to still file the revisions for concurrent consideration of a single "Version 4" package by regulators.

SDT Member Comments

- This is not the normal procedure in terms of comment and ballot.
- The Team and NERC are hoping to be able to request FERC to take action on the two filings together. The industry wants only one Version 4.
- Scott Mix has done an excellent job in facing and addressing the many challenges for this urgent action effort.

E. Field Trip to a Constellation Energy Sub-Station

Many of the SDT members and other meeting participants participated in a tour of a Constellation Energy sub-station on site on Wednesday mid-day.

II. REVIEW OF CIP 002-4 PROPOSED CHANGES

A. Overview of the Ballot Results

Howard Gugel reported that there was a 43% approval rating from the industry. He suggested that the way the ballot process is set up leads to a high negative first vote as industry entities want to be able to make comments for the SDT to consider in any redrafting for the next ballot. He offered that the industry ballot results and comments do not represent an insurmountable task for the SDT to respond to

these comments and make appropriate changes in the standard and succeed in a new ballot. He suggested the largest concerns and strongest feelings surrounded the following three areas in the standards and Attachment 1:

- Control Centers;
- Blackstart Resources; and
- 1.3- Transmission planner reliability "must run" units.

He noted that it was very helpful to have worked through and reached agreement of the SDT on responses to the September 29 webinar questions and comments at the Toronto SDT meeting many of which were presented as comments to the ballot. Finally Howard offered his appreciation for the participation of many of the SDT members who set time aside for each day of the preceding week to help prepare strawman responses for consideration at the Baltimore meeting.

B. Review and Consensus Building on Proposed Changes to CIP 002-4 and Related Documents

The SDT reviewed the industry comments and a strawman response document and conducted straw polls for a number of proposed changes to the standard. In general, if the proposal received greater than 2/3 support from the Team it was incorporated into the text of the standard. In calculating the percentage of members in support of a proposal, the abstentions were not included.

The SDT initially focused on Attachment 1 and the implementation plan documents and then returned to the standards document to make any changes consistent with the agreed upon changes in Attachment 1 and the implementation plans. The SDT reviewed strawman responses to each industry comment. At the conclusion of the meeting the SDT reviewed and amended the Guidance Document consistent with the changes in the standards documents.

CYBER SECURITY — CRITICAL CYBER ASSET IDENTIFICATION CIP-002-4 SDT STRAW POLLS

A. INTRODUCTION-PROPOSED WORDING STRAW POLLS	Yes	No	Abstain	% Support
Applicability 4. 2				
Add: 4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.	**17**	**0**	**-**	**100%**
Add: 4.2.3 Cyber assets associated with Cyber Security Plans submitted to U.S. Nuclear Regulatory Commission pursuant to 10CFR73.54.	**17**	**0**	**-**	**100%**
Effective Date 5. "The first day of the eighth ~~third~~ calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise become effective the first day of the ninth ~~third~~ calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)"	**17**	**0**	**-**	**100%**

B. REQUIREMENTS-PROPOSED WORDING STRAW POLLS	Yes	No	Abstain	% Support
R.1 Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update ~~review~~ this list ~~at least annually, and update it~~ as necessary, and review it at least annually.	**17**	**0**	**-**	**100%**
R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1 ~~within 15 minutes~~ ~~The Responsible Entity shall review this list at least annually, and update it as necessary~~ For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics: R2.1 The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, R2.2 The Cyber Asset uses a routable protocol within a control center; or, R2.3 The Cyber Asset is dial-up accessible.	**17**	**0**	**-**	**100%**
R3. Annual Approval — The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the ~~risk-based assessment methodology~~ list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)	**17**	**0**	**-**	**100%**

ATTACHMENT #1- PROPOSED WORDING STRAW POLLS	Yes	No	Abstain	% Support
1.3 *Proposed Wording* Each generation Facility that the Planning Coordinator, Transmission Planner or Reliability Coordinator designates as required to avoi Adverse Reliability Impacts in the planning horizon.	**13**	**4**	**-**	**76%**

1.3 *Add* "Reliability Coordinator designate"	0	17	-	
1.3 *Add* "Reliability Coordinator communicated as necessary"	0	17	-	
1.4 *Support for Strawman language:* "Each Blackstart Resource identified in the Transmission Operator's restoration plan."	**16**	**0**	**1**	**94%**
1.4 *Add* "Each generator identified as a Blackstart Unit in the Transmission Operator's restoration plan."	12	6	-	
1.4 *Add,* "Each generator identified as Blackstart resource"-	7	11	-	
1.4 *Add,* "If more than a single generator is identified, only the first three fall under this."	0	16	-	
1.5 The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where ~~multiple~~ two or more path options exist, as identified in the Transmission Operator's restoration plan.	**15**	**1**	**-**	**94%**
1.5 *Add,* "meeting the"	15	1	-	
1.5 *Add* "first interconnection point of the generation"	12	6	-	
1.5 *Delete* "~~multiple~~", *Add* "two or more"	15	1	-	
1.5 *Delete*- "~~to the point on the Cranking Path where multiple two or more path options exist .~~"	1	15	-	
1.7 *Support for Strawman Language plus addition*: "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.	**16**	**0**	**-**	**100%**
1.8 *Proposed Changes:* Transmission Facilities at a single station or substation location that ~~if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more~~ are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.	**17**	**0**	**-**	**100%**
1.9 *Proposed Changes:* Flexible AC Transmission Systems (FACTS) at a single station or substation location, that, ~~if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more~~ are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.	**16**	**0**	**-**	**100%**
1.10 *Proposed Changes:* Transmission Facilities providing the generation interconnection required to ~~directly~~ interconnect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by the ~~any Responsible Entity~~/Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3.	**15**	**1**	**-**	**94%**
1.12 *Strawman Language:* Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).	0	16		

1.12 *Proposed Language:* "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that ~~if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)~~ is identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."	**14**	**0**	**2**	**87%**
1.13 Common control system(s) capable of performing automatic load shedding, without human operator intervention, of 300 MW or more within 15 minutes.	12	3	0	
1.13 ~~Common control system(s) capable of performing~~ Each system or facility that perform automatic load shedding, without human operator ~~intervention~~ initiation, of 300 MW or more ~~within 15 minutes~~ implementing undervoltage load shedding (UVLS) or underfrequency load shedding (UFLS) as required by the regional load shedding program	**12**	**0**	**5**	**71%**
1.13 Support for 300 MW	6	-	-	
1.13 Support for 1500 MW	10	-	-	
1.13 Support for more than 1500 MW	2	-	-	
1.14 *Final Language:* Each control center, ~~control system,~~ or backup control center~~, or backup control system~~ used to perform the functional obligations of the Reliability Coordinator, ~~Balancing Authority, or Transmission Operator.~~	**15**	**2**	**-**	**88%**
1.15 Final "Each control center or backup control center used to control generation at multiple plant locations for any generation Facility or group of generation Facilities identified in 1.1,1.3, and 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MWs in a single Interconnection."	**14**	**0**	**-**	**100%**
1st Proposed Edit of Strawman: Each control center or backup control center used to ~~control~~ change generation output at multiple plant locations for any generation Facility or group of Facilities identified as a Critical Asset, or ~~used to control generation greater than an~~ aggregate generation ~~of~~ greater than 1500 MWs in a single Interconnection.	**12**	**2**	**-**	
2nd Proposed Edit of Strawman: "Each control center or backup control center used to control generation output at multiple plant, locations for any generation Facility or group of Facilities identified in 1.1.1.3. and 1.4 Each control center or backup control center used to control aggregate generation ~~greater than an aggregate~~ equal to or exceeding 1500 MWs in a single Interconnection."	**13**	**1**	**-**	
1.16 *Final draft:* Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.	**17**	**0**	**-**	**100%**
Original 1.16 *Original strawman wording:* ~~Any additional assets that the Responsible Entity deems appropriate to include.~~	**0**	**17**	**-**	
Original 1.16 *Alternative wording:* ~~Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include.~~	**0**	**17**	**-**	

1.17 *Final Draft*: Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection.	**17**	**0**	**-**	**100%**
1.17 *Alternative wording***.** Each control center or backup control used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.2, 1.3, 1.4, 1.14, for a generation greater than aggregate of 1500 MW in a single interconnection~~/in a single region/remove~~.	**11**	**4**	**-**	
(114 b "in a single interconnection")	**11**	**4**	**-**	
(114 b "in a single region")	**10**	**1**	**4**	

The SDT spent nearly two days reviewing the industry comments related to Attachment 1, a strawman Attachment 1 document for changes to the standards, and draft responses to the industry. They tested the level of support for existing, proposed and alternative wording. *(See, Appendix #5 for a summary of the Attachment 1 issues reviewed)*

IMPLEMENTATION PLANS- PROPOSED WORDING STRAW POLL	**Yes**	**No**	**Abstain**	**% Support**
Create a 24 month implementation deadline for all CA and CCA assets and reflect this in the standard's effective date (A.5) and in the implementation plan language.	**15**	**2**	**-**	**88%**

Implementation Plan Discussion Issues

The SDT reviewed the industry comments on the Implementation Plan and the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities. The SDT and participant discussion covered the following issues: apparent confusion over the complications for the proposed exceptions in the timing for implementation of IPFNICCANRE vs. a 24-month period for all entities without exceptions; affording time for budgeting for CIP 002-4 implementation; minimizing the need to take TFEs along with mitigation plans; balance the exceptions process with a simple, less confusing approach that has the optic of not getting the lists for 2 years; is it best to get an early report card regarding fewer or greater number of assets; and take CIP 002-4 into account when developing Version 5 (CIP 010….).

OVERALL ADOPTION OF CIP 002-4 RESPONSE DOCUMENT	**Yes**	**No**	**Abstain**	**% Support**
Motion to approve adoption of the CIP 002-4 SDT response document as refined with direction to Howard Gugel to provide any needed Editorial Changes Consistent with the SDT's agreement on the responses.	**17**	**0**	**-**	**100%**

OVERALL ADOPTION OF CIP 002-4 AND RELATED DOCUMENTS AS REFINED	Yes	No	Abstain	% Support
Motion to approve overall adoption of CIP 002-4 and related Documents (Implementation Plans & Guidance Document) consistent with the SDT straw polling results.	**15**	**3**	**-**	**83%**

The 3 SDT members voting no (*Jim Brenton, Dave Norton and Rich Kinas*) agreed on the following rationale statement explaining their votes:

- The 15 min criteria for real time is vague and should not apply to cyber assets:
- Attachment 1.1 The 1500 MW criteria for Generation is too high. ISO/RTOs recommended 300 MW for Generators. This criteria will miss too many generators and a lot of NUKES
- Attachment 1.5 We must include all blackstart restoration paths, not just primary path to the first sub with two transmission paths
- Attachment 1.13 Remove "without human intervention." This item originally addressed Load Serving Entities, not automatic load shedding. The revisions since last posting significantly change intent of this control.
- Attachment 1.15-1.17. All RC/BA/TOP/GOPs should be Critical Assets
- ISO/RTO position- We are not sure that many of the ISOs/RTOs will support this version as we have regressed in the level of cyber security included in CIP Version 4 when compared to that of CIP Version 3.
- NERC will be hard pressed to show these standards will improve security for the BES."

III. NEXT STEPS AND ASSIGNMENTS

The Team reviewed the steps and assignments leading up to the Orlando meeting which member Rich Kinas will host once again at the OUC facilities. The Framework Sub-Group will be meeting several times in the interim to prepare documents for the SDT to review at the December meeting. The 2nd Ballot is expected to close on Friday, December 10 COB. NERC staff will prepare the ballot results and comments with strawman draft responses and send out as soon as possible following the close of the ballot in advance of the Orlando meeting the following Tuesday.

The Chair thanked Tom Stevenson and Margaret Powell for the excellent hosting of the SDT in Baltimore.

The meeting adjourned at 4:40 on Thursday

Appendix # 1— Meeting Agenda
Project 2008-06 Cyber Security Order 706 SDT
Draft 28th Meeting Agenda
November 16, 2010, Tuesday- 8:00 AM to 6:00 PM CDT
November 17, 2010 Wednesday- 8:00 AM to 6:00 PM CDT
November 18, 2010 Thursday- 8:00 AM to 6:00 PM CDT
Baltimore, Maryland

NOTE: 1. Agenda Times May be Adjusted as Needed during the Meeting
NOTE: 2. Drafting Sub-team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- To review and test consensus on responses to industry comments on CIP 002-4 and on any changes for inclusion in the 2nd ballot.
- To review progress of the CIP Framework Team
- To agree on next steps and assignments

Tuesday, November 16, 2010 8:00 a.m. - 6:00 p.m.

- Introductions, welcome -*(Morning)*
- Introductory Remarks by Mark Weatherford, VP/Chief Security Officer, NERC
- Introductory Remarks by Trade Organizations – Allen Mosher, APPA, Barry Lawson, NRECA, and David Batz, EEI
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review meeting and milestone schedule for CIP 002-4 and CIP 010 and 011 *(Morning)*
- Review and Test Consensus on the Draft CIP 002-4 Response Document *(Morning and Afternoon)*

Wednesday, November 17, 2010 8:00 a.m. - 6:00 p.m.

- Continue Review and Consensus Testing on the Draft CIP 002-4 Response Document *(Morning)*
- *Local Sub-Station Tour (Mid-day)*
- Review and Test Consensus on possible CIP 002-4 Changes *(Afternoon)*

Thursday, November 18, 2010, 8:00 a.m. - 6:00 p.m.

- Review and Test Consensus on possible CIP 002-4 Changes *(Morning)*
- Adopt CIP-002-4 for 2nd Ballot and SDT Industry Response Document (*Afternoon)*
- Review progress on Framework Team (*Afternoon)*
- Review SDT December, 2010 Orlando Meeting Agenda (*Afternoon)*

Appendix # 2 Attendees List
November 16-18, 2010 Baltimore

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation
2. Jim Brenton	ERCOT
3. Jay S. Cribb	Southern Company Services
4. Joe Doetzl	Kansas City Pwr. & Light Co
5.Sharon Edwards	Duke Energy
6.Gerald S. Freese	America Electric Pwr.
7. Jeff Hoffman	U.S. Bureau of Reclamation, Denver
8. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation (W/Th)
9. Doug Johnson	Exelon Corporation – Commonwealth Edison
10.Rich Kinas	Orlando Utilities Commission (Tu/W)
11. John Lim, Chair	Consolidated Edison Co. NY
12. David S. Revill	Georgia Transmission Corporation
13. Kevin Sherlin	Sacramento Municipal Utility District (Tu/W)
14. Tom Stevenson	Constellation
15. Keith Stouffer	National Institute of Standards & Technology
16. John D. Varnell	Technology Director, Tenaska Power Services Co. (W/Th)
17. William Winters	Arizona Public Service, Inc.

SDT Members Attending via ReadyTalk and Phone

18. Jackie Collett	Manitoba Hydro
19. David Norton	Entergy
20. Scott Rosenberger	Luminant Energy
21. John Van Boxtel	WECC (Tu)
Scott Mix	*NERC*
Howard Gugel	*NERC*
Roger Lampila	*NERC*
Mallory Higgins	*NERC (W)*
Brian Harrell	*NERC (Tu)*
Laura Hussey	*NERC (W)*
Mark Weatherford	*NERC (Tu)*
Robert Jones	*FSU/FCRC Consensus Center*
Stuart Langton	*FSU/FCRC Consensus Center*

SDT Members Not Participating

William Gross	Nuclear Energy Institute
Patricio Leon	Southern California Edison
Jonathan Stanford	Bonneville Power Administration
Bradley Yeates	South Nuclear Operating Company

Others Attending in Person

Jan Bargen	FERC
John Bussman	AECI
Robert Preston Lloyd	Southern California Edison
Carey W. Flemming	Constellation Energy Nuclear Group (W)
Jim Fletcher	American Electric Power
CJ Ingersoll	Constellation Energy (Tu/W)
Barry Lawson	NRECA (Tu)
Andres Lopez	USACE
Nathan Mitchell	APPA (Tu)
Brian Newell	American Electric Power
Margaret Powell	Constellation Energy
Stan Rae	Constellation Energy (Tu)
Ingrid Rayo	Constellation Energy
Mike Rossman	Constellation Energy
Kevin Ryan	FERC (Tu/W)
Mark Simon	Encari

Others Attending via Readytalk and Phone

November 16, 2010, Tuesday

Chris	Ewing	chris_ewing@selinc.com
David	Batz	dbatz@eei.org
Drew	Kittey	Drew.Kittey@ferc.gov
Larry	Camm	larry_camm@selgs.com
Bryn	Wilson	wilsonwb@oge.com
Rod	Hardiman	rchardim@southernco.com
David	Gordon	dgordon@mmwec.org

November 17, 2010, Wednesday

Chris	Ewing	chris_ewing@selinc.com
Rod	Hardiman	rchardim@southernco.com
Barry	Lawson	barry.lawson@nreca.coop
Bryn	Wilson	wilsonwb@oge.com
Drew	Kittey	Drew.Kittey@ferc.gov
Anna	Wang	amwang@burnsmcd.com

November 18, 2010, Thursday

Drew	Kittey	Drew.Kittey@ferc.gov
Chris	Ewing	chris_ewing@selinc.com
Bryn	Wilson	wilsonwb@oge.com
Todd	Williams	trwilliams@midamerican.com
Barry	Lawson	barry.lawson@nreca.coop
Rod	Hardiman	rchardim@southernco.com

Appendix #3 NERC Antitrust Compliance Guidelines

See Antitrust Compliance Guidelines read at the beginning of each day's session at:

The NERC reminder below was read at the beginning of each day's session.

NERC REMINDER FOR USE AT BEGINNING OF MEETINGS AND CONFERENCE CALLS THAT HAVE BEEN PUBLICLY NOTICED AND ARE OPEN TO THE PUBLIC

For face-to-face meeting, with dial-in capability:

Participants are reminded that this meeting is public. Notice of the meeting was posted on the NERC website and widely distributed. The notice included the number for dial-in participation. Participants should keep in mind that the audience may include members of the press and representatives of various governmental authorities, in addition to the expected participation by industry stakeholders.

Appendix #4

Final SDT CIP 002-4 Documents for Posting

http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html

Appendix #5
Attachment 1 Summary of Issues Discussed by the SDT

During the course of the three-day meeting there were extended discussions and proposals for revision of Attachment 1 criteria to address industry comments that covered the following issues:

- 1.3 The SDT discussion and review of industry comments covered the following issues: clarifying the meaning of "adverse reliability impacts" and "planning horizon", forced retirement issues, explain long term planning in guidance document and including or excluding reliability coordinator.
- 1.4 Blackstart Resource**.** The SDT discussion and review of industry comments covered the following issues:: considering whether to include "each generation facility", the reference to EOP 5 restoration plans and distinguishing them from cyber issues, providing incentives to keep Blackstart resources in the transmission plan, considering a bright line limitor, and clarifying this criteria in the guidance document.
- 1.5 The SDT discussion and review of industry comments covered the following issues: delineating between generator and transmission responsibilities and clarify what "up to the unit being started" includes.
- 1.7 The SDT discussion and review of industry comments covered the following issues: criticality vs. reliability in protecting against distributed attacks, 500 KVand above as backbone of the BES,
- 1.8 The SDT discussion and review of industry comments covered the following issues: reference to FAC 014-2, the relationship between 1.7 and 1.8., and planning vs. operational IROLs.
- 1.9 The SDT discussion and review of industry comments covered the following issues: make clear that FACTs devices are included in standard.
- 1.10 The SDT discussion and review of industry comments covered the following issues: "directly" was intended to scope down this criteria but may add confusion, consider whether the generator interface may change in the near future, and focus on generator owners vs. responsible entity.
- 1.12 The SDT discussion and review of industry comments covered the following issues: is "operates" or "identified" the right action here, is it a failure to operate as designed, clarify who is testing and maintaining the SPS and the RAS, generator run back schemes focused internally on the generation system not externally on the BES. Blanket statements about these might not be appropriate.
- 1.13 The SDT discussion and review of industry comments covered the following issues: automatic load shed has been an ongoing SDT discussion; target was auto load shedding system for version 1; "capable of" vs. "configured to" vs. "limiting to underfrequency/underload"; "initiation" vs. "intervention;" reference to regional load shedding programs; consider the smart grid issues coming down the road; considering advanced persistent threats that can get into control systems and load malicious software

1500 MW would be too high; in some shops distribution SKADA system in different system than transmission system; should regional diversity be addressed; consider PRC 6.1 for planning coordinators, and PRC 007-0 & PRC 20-1; reference "under-frequency load shedding and under voltage load shedding systems; consider retaining 300 MW with caveat that this will be revisited in Version 5. *On Wednesday SDT 2nd review of redraft:* reference to human operator may confuse manual and automatic load shed; concern is with this function not being available when needed.

- 1.14 The SDT discussion and review of industry comments covered the following issues: definition and differences between control system lead to removing control system; what should the bright line be, 1500, 2000 or other; with cyber vulnerability threats to smaller entities (i.e. jumping point or gateway to other areas, size may not be the key factor; address all control centers in Version 5; CSO 706- paragraph 280 addresses control centers; bright line for BA and TOP needed now.
- *1.14- 1.17 New Wording*
- 1.14 New: *On Wednesday SDT 2nd review of redraft:* Break out the different actors and their responsibilities; reference asset(s) identified in previous applicable criteria for each actor (TO, BA, RC); cover reliability coordinator in this criteria.
- 1.15 New. The SDT 2nd review on Wednesday of this criteria and discussion of industry comments covered the following issues: this is consistent with CSO 706 paragraph 280; single region vs. single interconnection; interconnection deals with reliability and regions may change overtime; consider this as interim change before Version 5 addresses the appropriate level of controls needed; in an open standards process, if we can't validate information we can't use it;
- 1.6 the unknown level of threat is what we are protecting against and TOPs have a broader breadth of control compared to other systems;; is verbal communication the same as electronic control; careful not to bring in market groups.
- 1.16 New The SDT 2nd review on Wednesday of this criteria and discussion of industry comments covered the following issues:
- Original 1.16 The SDT discussion and review of industry comments covered the following issues: ("Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include.") Delete this criteria as there is no SDT support for retaining this criteria due to compliance and enforcement and other issues.

Appendix #5 SDT Sub-Teams

Sub-Team	
CIP 010 BES System Categorization	John Lim (Lead), Rich Kinas, Jim Brenton, Dave Norton *(Observer Participants: Rod Hardiman, Jim Fletcher) (FERC: Mike Keane, Peter Kuebeck)*
Personnel and Physical Security	Doug Johnson (Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin *(FERC: Drew Kittey)*
System Security and Boundary Protection	Jay Cribb (Lead), Jackie Collett, John Varnell, John Van Boxtel, Philip Huff *(Observer Participant: Brian Newell) (FERC: Justin Kelly)*
Incident Response and Recovery	Scott Rosenberger (Lead), Joe Doetzl, Tom Stevenson (*Observer Participant: Jason Marshall) (FERC: Dan Bogle)*
Access Control	Sharon Edwards (Lead), Jeff Hoffman, Jerry Freese, Bill Winters *(Observer Participants: Roger Fradenburgh, Robert Preston Lloyd) (FERC: Mike Keane)*
Change Management, System Lifecycle, Information Protection, Maintenance, and Governance	Dave Revill (Lead), Jon Stanford, Keith Stouffer, Bill Winters *(Observer Participant: Brian Newell) (FERC: Jan Bargen, Matthew Dale)*
CIP 002-4 Drafting Team	John Lim (Lead), Jim Brenton, Jackie Collett, Jay Cribb, Sharon Edwards, Doug Johnson, Rich Kinas, Dave Norton, Dave Revill, and Bill Winters *(Observer Participants: Rod Hardiman; Jim Fletcher; Bryn Wilson) (FERC: Mike Keane, Peter Kuebeck; NERC: Scott Mix)*
Implementation Plan CIP 002-4	Dave Revill (Lead), Sharon Edwards, Kevin Sherlin, Scott Rosenberg, Dave Norton and Phil Huff *(FERC: Mike Keane; NERC: Scott Mix)*
Framework CIP 010 &011	Dave Norton (Lead), Jim Brenton, Jay Cribb, Joe Doetzl, Phil Huff, Doug Johnson, Dave Revill, Jon Stanford, and John Van Boxtel. *(FERC: Mike Keane; NERC: Scott Mix)*

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda
Cyber Security Order 706 SDT - Project 2008-06

November 16, 2010 | 8:00 AM to 6:00 PM CDT
November 17, 2010 | 8:00 AM to 6:00 PM CDT
November 18, 2010 | 8:00 AM to 6:00 PM CDT

Baltimore, Maryland

Proposed Meeting Objectives/Outcomes:

- To review and test consensus on responses to industry comments on CIP 002-4 and on any changes for inclusion in the 2nd ballot.
- To review progress of the CIP Framework Team
- To agree on next steps and assignments

Tuesday, November 16, 2010 8:00 a.m. - 6:00 p.m.

- Introductions, welcome -*(Morning)*
- Introductory Remarks by Mark Weatherford, VP/Chief Security Officer, NERC
- Introductory Remarks by Trade Organizations – Allen Mosher, APPA, Barry Lawson, NRECA, and David Batz, EEI
- Receive updates on other related cyber security initiatives- *NERC Staff and SDT Members (Morning)*
- Review meeting and milestone schedule for CIP 002-4 and CIP 010 and 011 *(Morning)*
- Review and Test Consensus on the Draft CIP 002-4 Response Document *(Morning and Afternoon)*

Wednesday, November 17, 2010 8:00 a.m. - 6:00 p.m.

- Continue Review and Consensus Testing on the Draft CIP 002-4 Response Document *(Morning)*
- *Local Sub-Station Tour (Mid-day)*
- Review and Test Consensus on possible CIP 002-4 Changes *(Afternoon)*

Thursday, November 18, 2010, 8:00 a.m. - 6:00 p.m.

- Review and Test Consensus on possible CIP 002-4 Changes *(Morning)*
- Adopt CIP-002-4 for 2nd Ballot and SDT Industry Response Document (*Afternoon)*
- Review progress on Framework Team (*Afternoon)*
- Review SDT December, 2010 Orlando Meeting Agenda (*Afternoon)*

Agenda
Cyber Security Order 706 SDT - Project 2008-06

December 14, 2010 | 8:00 AM to 6:00 PM EST
December 15, 2010 | 8:00 AM to 6:00 PM EST
December 16, 2010 | 8:00 AM to 6:00 PM EST

Orlando Utilities Commission Offices
6113 Pershing Avenue
Orlando FL

Proposed Meeting Objectives/Outcomes:

- To review the results of the 2nd Ballot and test consensus on responses to industry comments on CIP 002-4 and, if needed, on any changes for inclusion in a CIP 002-4 3rd ballot.
- To review, refine and test support for recommendations of the CIP Version 5 Framework Team.
- To participate in a Results Based Standards Development Training
- To agree on next steps and assignments

Tuesday, December 14, 2010 8:00 a.m. - 6:00 p.m. EST

- Introduction, welcome -*(Morning)*
- Review meeting and milestone schedule for CIP 002-4 and CIP 010 and 011 *(Morning)*
- Review results of 2nd Ballot CIP-002-4*(Morning)*
- Draft responses to industry and consider any changes to CIP-002-4 *(Morning & Afternoon)*

Wednesday, December 15, 2010 8:00 a.m. - 6:00 p.m. EST

- Seek Motion to Adopt SDT Responses to Industry, and if needed, any changes for inclusion in the 3rd Ballot. *(Morning)*
- Overview of Results Based Standards Development and CIP Version 5- Howard Gugel NERC *(Morning)*
- Receive a Version 5 Framework report *(Morning)*
- Review Draft Strawman Documents and discuss key issues *(Afternoon)*
- Review and initial testing of the acceptability of the approach as refined *(Afternoon)*

Thursday, December 16, 2010, 8:00 a.m. - 6:00 p.m. EST

- Results Based Standards Training- Keith Heidrich, FRCC & Howard Gugel, NERC *(Morning & Afternoon)*
- Review Version 5 Framework in light of Results Based Approach

- Test SDT Support for the Version 5 Framework *(Afternoon)*
- Review Work plan for the Version 5 Framework *(Afternoon)*
- Review SDT January, 2011 Columbus Meeting Agenda (*Late Afternoon)*

Draft Timed Agenda

Tuesday	**December 14, 2010**	**8:00 a.m. - 6:00 p.m. EST**

8:00 a.m.	**Introduction, Welcome Opening and Host remarks**- *John Lim, Chair & Phil Huff, Vice Chair, Rich Kinas, Orlando Utilities Commission Host* Roll Call; NERC Antitrust Compliance Guidelines- *Howard Gugel*
8:15	**Review of meeting objectives, agenda and meeting guidelines**- *John Lim & Bob Jones*
8:20	**Review of CSO 706 SDT CIP milestone schedule for CIP 002-4 and CIP 010 & 011**: *Phil Huff & Stu Langton*
8:30	**NERC Presentation on CIP**- *Gerry Cauley*
9:00	**Overview of CIP 002-4 Industry Response & 2nd Ballot Results**- *Howard Gugel, NERC*
9:45	*Break*
10:00	**Review and Test Consensus on the Draft CIP 002-4 Response Document**
12:00	*Lunch*
1:00	***Continue,* Review and Test Consensus on the Draft CIP 002-4 Response Document**
3:00	*Break*
3:15	**Review any Drafting Team Work and Test Consensus on possible CIP 002-4 Changes**
5:50	**Review any drafting assignments and Wednesday's agenda**
6:00	*Recess*

Wednesday	**December 15, 2010**	**8:00 a.m. - 6:00 p.m. EST**

8:00	**Welcome and Agenda Review, Roll Call and Antitrust Guidelines**- *John Lim, Phil Huff, Howard Gugel* Facilitator review and SDT acceptance of November, 2010 Baltimore SDT meeting summary.
8:15	**Seek Motion to Adopt SDT Changes to CIP 002-4 and Responses to Industry, and if needed**, any changes for inclusion in the 3rd Ballot.
10:00	*Break*
10:15	Overview of Results Based Standards Development and CIP Version 5- Howard Gugel NERC *(Morning)*
12:00	Lunch
1:00	**Version 5 Framework Team report** Review Draft Strawman Documents and discuss key issues
3:30	*Break*
3:45	Review and initial testing of the acceptability of the approach as refined
5:50	**Review any drafting assignments and Thursday's agenda**
6:00	*Recess*

Thursday	**December 16, 2010**	**8:00 a.m. - 6:00 p.m. EST**
8:00	**Welcome and Agenda Review, Roll Call and Antitrust Guidelines**- *John Lim, Phil Huff, Howard Gugel*	
8:15	**Results Based Standards Training-** Keith Heidrich, FRCC & Howard Gugel, NERC	
10:15	*Break*	
10: 30	**Results Based Standards Training** *(Cont'd)*	
12;00	*Lunch*	
1:00	**Results Based Standards Training** *(Cont'd)*	
2:30	*Break*	
2:45	**Review Version 5 Framework in light of Results Based Approach**	
3:15	**Test SDT Support for the Version 5 Framework**	
4:45	**Review Work plan for the Version 5 Framework**	
5:45	**Review SDT January, 2011 Columbus Meeting Agenda**	
6:00	*Adjourn*

Meeting Schedule and Objectives

Meeting Location	Dates	Meeting Objective
Orlando, FL OUC	12/14 to 12/16/2010	CIP-002-4 – Review Ballot Results & Approve for SC CIP-010/CIP-011 – Framework proposal
Interim	12/16 to 01/18/2011	Designated individuals begin drafting assignments on CIP-010 and 011 with direction from SDT
Columbus, OH AEP	01/18 to 01/20/2011	Full review of CIP-011 requirements in response to industry comment (first of several development iterations for posting in late June)
Interim	1/20 to 2/15/2011	Designated individuals complete drafting assignments on CIP-011
Taylor, TX ERCOT	2/15 to 2/17/2011	Begin review of CIP-010, BES Cyber System Identification Full review of CIP-011 (requirements, measures, change rationale, guidance)
Interim	2/17 to 3/15/2011	Designated individuals complete drafting assignments on CIP-010 and CIP-011 Begin developing implementation plan
New York, NY ConEd	3/15 to 3/17/2011	Review of CIP-011 (requirements, measures, change rationale, guidance) Review of CIP-010 Initial review of implementation plan
Interim	3/17 to 4/12/2011	Designated individuals complete drafting assignments on CIP-010, CIP-011 and implementation plan
Pomona, CA SCE	4/12 to 4/14/2011	Review of CIP-010, CIP-011 and implementation plan
Interim	4/14 to 5/17/2011	Designated individuals complete drafting assignments on CIP-010, CIP-011 and implementation plan Sneak peak industry webinar in early May
Little Rock, AR AECC	5/17 to 5/19/2011	Review of industry feedback Review of change rationale and guidance
Interim	5/19 to 6/21/2010	Designated individuals complete drafting assignments on CIP-010, CIP-011 and implementation plan NERC begins QA
Portland, OR BPA	6/21 to 6/23/2011	SDT and NERC QA on document for posting
Interim	6/23 to 7/19/2011	Posting for comment Prepare for technical workshop?
TBD	7/19 to 7/21/2011	Technical Workshop?

Meeting Location	Dates	Meeting Objective
TBD	8/23 to 8/25/2011	Respond to comments
TBD	9/20 to 9/22/2011	Respond to comments and prepare for second posting and ballot
TBD	10/11 to 10/13	
Baltimore, MD Constellation	11/16 to 11/19/2010	CIP-002-4 – Response to Comments Revise for Ballot
Orlando, FL OUC	12/13 to 12/16/2010	CIP-002-4 – Review Ballot Results & Approve for SC CIP-010/CIP-011 – Framework proposal
Columbus, OH AEP	01/18 to 01/20/2011	Full review of CIP-011 requirements
Taylor, TX ERCOT	2/15 to 2/17/2011	Full review of requirements and Guidance
New York, NY ConEd	3/15 to 3/17/2011	Full review of requirements, Guidance, and Implementation plan
Pomona, CA SCE	4/11 to 4/15/2011	Perform full QA on documents to be posted
Little Rock, AR AECC	5/17 to 5/19/2011	
Webinar	*6/14/2011*	
Portland, OR BPA	6/21 to 6/23/2011	Discuss and respond to Webinar comments Approve documents for posting
TBD	7/19 to 7/21/2011	Review industry comments and develop responses
TBD	8/23 to 8/25/2011	Develop documents for second ballot
TBD	9/20 to 9/22/2011	Develop documents for third ballot
TBD	10/11 to 10/13	Prepare documents for BOT

CYBER SECURITY FOR ORDER 706 STANDARD DRAFTING TEAM

CSO 706 SDT Consensus Guidelines*)*

(Adopted, November, 2008, Revised June 2010, Revised July, 2010)

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

Consensus Defined. Consensus is a participatory process whereby, on matters of substance, the Team strives for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for posting CIP standards documents for industry comment or balloting, and the Team finds that 100% acceptance or support of the members present is not achievable, decisions to adopt standards documents for balloting will require at least 2/3rds favorable vote of all members present and voting.

Quorum Defined. The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 2/3 of the appointed members being present in person or by telephone.

Electronic Mail Voting. Electronic voting will only be used when a decision needs to be made between regular meetings under the following conditions:

- It is not possible to coordinate and schedule a conference call for the purpose of voting, or;
- Scheduling a conference call solely for the purpose of voting would be an unnecessary use of time and resources, and the item is considered a small procedural issue that is likely to pass without debate.

Electronic voting will not be used to decide on issues that would require a super majority vote or have been previously voted on during a regular meeting or for any issues that those with opposing views would feel compelled to want to justify and explain their position to other team members prior to a vote. The Electronic Voting procedure shall include the following four steps:

1. The SDT Chair or Vice-Chair in his absence will announce the vote on the SDT mailing list and include the following written information: a summary of the issue being voted on and the vote options; the reason the electronic voting is being conducted; the deadline for voting (which must be at least 4 hours after the time of the announcement).
2. Electronic votes will be tallied at the time of the deadline and no further votes will be counted. If quorum is not reached by the deadline then the vote on the proposal will not pass and the deadline will not be extended.

3. Electronic voting results will be summarized and announced after the voting deadline back to the SDT+ mailing list.
4. Electronic voting results will be recapped at the beginning of the next regular meeting of the SDT.

Consensus Building Techniques and Robert's Rules of Order. The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Only Team members may participate in consensus ranking or votes on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Chair, Vice Chair or Facilitator. The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure)*, as modified by the Team's adopted procedural guidelines, to make and approve motions. However, the 2/3's voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision-making on substantive motions and amendments to motions. The Team will develop substantive written materials and options using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once the Chair determines that a facilitated discussion is completed.

CSO706 SDT December 14, 2010 Meeting Summary Contents

Cyber Security Order 706 SDT- Project 2008-06
29TH MEETING
December 14-16, 2010
Orlando, Florida

EXECUTIVE SUMMARY

John Lim, Chair of the CSO 706 SDT welcomed members and other participants to Orlando and thanked member Rich Kinas at Orlando Utility Commission for hosting the meeting. Howard Gugel, NERC, conducted a roll call and reviewed the antitrust and public meeting guidelines at the beginning of each day. On Wednesday morning, the SDT unanimously adopted the November 16-18, 2010 Baltimore meeting summary. The chair outlined the objectives the SDT sought to accomplish by the end of the meeting that included review of and agreement on the response to industry comments as well any changes to CIP 002-4 and its related documents, initial review of strawman documents from the Framework team and training on results based standards development.

The Chair reported to that Team that the successive industry ballot on the CIP 002-4 received a quorum (86%) and received 77% support of the industry which was a significant improvement from the support for the first ballot (43%). Howard Gugel, NERC, reviewed the revised comment process clarifying the distinction between a successive ballot and a recirculation ballot. He suggested the SDT should consider and weigh whether any changes in the standard would help change a "no" vote to a "yes", would help to retain the "yes" votes, and keep from turning abstentions into "no" votes. He explained that the successive and recirculation ballots are part of the ANSI process intended to everyone give chance to reevaluate their votes based on the Team's clarifications and answers.

Gerry Cauley addressed the SDT by telephone at the beginning of its meeting. He started by congratulating the team for its hard work under pressure and in responding to his request to bring CIP 002-4 to the industry for balloting in 2010. He noted it has proved useful in discussions with Congressional staff and has had a positive impact on NERC's reputation and credibility in terms of standards development. He clarified his thinking on the path forward for the Team, consistent with its SAR in addressing the FERC Order 706 directives. He suggested that it might be possible to address those directives in the CIP 10-11 framework the SDT has been developing or within the CIP 003-009 framework. He noted that many CEOs have expressed to him concerns about shifting away from CIP 003-009 and the documentation necessary for compliance, but stated that it is up to the Team under the standards development process to bring the proposal to the industry for comment and balloting.

He reviewed his comments to CIPC the past week which he characterized as exploratory in terms of consideration of a more coordinated and comprehensive approach to the goal of security of the BES among efforts such as the CIP standards, the NIST smart grid initiative etc.. He noted he is considering possible approaches including putting together a team that might, in partnership with NIST, address this broader concept and that might lead to a comprehensive set or suite of voluntary "good practice" security guidelines over several years of work. In response to questions, he noted that the SDT needs to address directives and chose which path or framework, in consultation with the industry, is best for reliability and industry implementation. Getting CIP-002-4 will be a first step along the path and NERC will continue

to support the SDT efforts. For the foreseeable future we have to finish the SDT's efforts to address the FERC 706 directives. This other best practice guidelines effort is more long-term with the hope that over a few years we can develop consensus on a voluntary tool kit that will not replace the standards. We will have to wait on experience in developing the guidelines before moving towards any corresponding standards development. The Chair thanked Gerry Cauley and he thanked the Team again for its hard work. On Wednesday afternoon, the SDT discussed Gerry Cauley's comments in relation to future CIP framework for the Team. The comments focused on completing the Version 5 work and clarifying the nature of the parallel process Mr. Cauley outlined.

Scott Mix provided an update on the recent ballot for updates to CIP-005-4 regarding remote access. The ballot concluded with an 84.46% quorum, but a 42.89% approval rating. Approximately 100 pages of comments were filed from both the comment period and the ballot process. The team will be meeting to start responding to comments and modifying the requirement in response to comments. Mr. Mix is also looking into whether a Compliance Application Notice (CAN) can be written to address some of the "double jeopardy" issues identified in the comments (i.e., indicating that some "global" requirements in existing standards will need to be applied to remote access if they are not already). The desire is for the revised standard to be passed by industry and be submitted to FERC in time for the commission to act concomitantly with the CIP-002-4 action. Failing that, the guidance document developed for the standards revision will be handed over to NERC staff for posting as a document in support of the FOUO VPN Alert, and the standard requirement and industry comments will be turned over to the 706 team for its deliberation and consideration in the future version of the CIP standards.

Scott Mix noted that the CAN 005 Remote Access has been noticed as withdrawn and would be undergoing revisions and then reposted.

Howard Gugel reported that the successive ballot of the Cyber Security 706 CIP Version 4 standards was conducted from December 1-10, 2010 and achieved a quorum of 86.83% and a weighted segment approval of 77.04%. Howard provided information on the difference between a successive vs. a recirculation ballot.

During the course of the three-day meeting, the SDT reviewed each industry comment and considered and refined strawman responses and agreed on final responses and on any changes to the standard documents. Each response was either unanimously agreed to by the SDT or the level of consensus was tested with the use of straw polling that helped direct refinements that built sufficient consensus (i.e. support of at least a 2/3's of the SDT members). Below are the key straw polls that lead to refined responses.

On Thursday morning, the SDT, following input from NERC Counsel, moved *(Tom Stevenson with Doug Johnson as 2nd)* to accept the proposed nuclear language with the motion carrying unanimously. Following that, the SDT moved *(Sharon Edwards with Bill Winters as a 2nd)* to approve the package of CIP 002-4 documents (including, Cyber Security — Critical Cyber Asset Identification CIP 002-4, Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4, CIP-002-4 Rational and Implementation Reference Document, Consideration of Comments on Successive Ballot for Cyber Security 706 – CIP Version 4 Standards, and Consideration of Comments on Project 2008-06). The motion passed 17 - 0 with 1 abstention.

Phil Huff reviewed the work of the Framework Team since the SDT meeting in Chicago in August. Since the Baltimore meeting the Team has developed a strawman meeting schedule, a style guide, and a communication plan.

In terms of the overall schedule, Mr. Huff noted that the SDT will begin next month with a possible posting late June or in July. The Framework Team believes that continuing with a sub-team approach may not be the most effective way forwards. Instead they are recommending drafting assignments to Team members and utilizing the full team monthly meetings to review and refine strawman drafts.

The Framework Team has developed a "Style Guide" for drafting results based standards. The Framework Team is recommending a BES cyber system identification using several impact levels: A (high) and B (medium) and a baseline level for low. Part of the communication plan that NERC will work with the Team to implement will include a change document providing rationales for the proposed changes and mapping back to the existing CIP structure. Where possible the existing structure will be retained and justification will be provided for changes are needed. The following are the SDT areas of discussion of the Framework: Clarify Format and Organization; Clarify Proposed CIP 11 "Organization Requirements; Clarify How Many Levels of Impact; Clarify the Scope; and Consider Independent Certification Process.

In preparation for the Version 5 drafting challenges, the SDT engaged in a results based standards review and training conducted by Keith Heidrich FRCC, on Thursday of the meeting. Mr. Heidrich has participated on an ad hoc NERC team convened by Gerry Cauley which has been developing the concept of a results based standards approach. The training objectives were to: Identify and give examples of the elements that define a results-based standard; Analyze the current standards and requirements for weaknesses; Identify the needs, goals, and objectives for this; Create an initial draft of this standard and requirements using result-based methods; and Create measures and necessary supporting material for the standard and requirements. The training covered: Results-based standards/requirements – what are they and why they matter; Scope–what you need to know before writing requirements; Standard requirements – observations and improvements; and Where information is recorded – templates.

On Thursday, Phil Huff noted that based on the review and discussion at this meeting the Framework team would be proposing two impact levels with all other being those items falling outside BES system definition. The Team will present a refined proposal in January taking the SDT input into consideration. For those in those covered in one of these two levels there will be multiple types of controls to be applied. It will get down to the drafting requirements in a consistent format. We recognize detail still needs to be worked out.

The Chair and Vice Chair noted that the expectation is that following the January session the Framework Team would dissolve and an open set of SDT meetings will be used to refine the proposed framework through review of strawman drafts of requirements. The Framework Team will set up conference calls in January in advance of the Columbus meeting.

The Team reviewed the steps and assignments leading up to the Columbus meeting. The Framework Team will be meeting in early January 2011 to prepare documents for the SDT to review at the January 2011 meeting. The recirculation Ballot is expected to close on Friday, December 31 COB. NERC staff will notify the SDT of the ballot results. The Chair thanked Rich Kinas and the OAS for the hosting of the SDT in Orlando.

The meeting adjourned at 4:40 on Thursday, December 16, 2010

Cyber Security Order 706 SDT- Project 2008-06
DRAFT 29TH MEETING SUMMARY
December 14-16, 2010
Orlando, Florida

I. AGENDA REVIEW, WORKPLAN SCHEDULE, REMARKS AND UPDATES

A. Agenda, Milestone Schedule Review

John Lim, Chair of the CSO 706 SDT welcomed members and other participants to Orlando and thanked member Rich Kinas at Orlando Utility Commission for hosting the meeting. Howard Gugel, NERC, conducted a roll call and reviewed the antitrust and public meeting guidelines at the beginning of each day. On Wednesday morning, the SDT unanimously adopted the November 16-18, 2010 Baltimore meeting summary.

The chair outlined the objectives the SDT sought to accomplish by the end of the meeting that included review of and agreement on the response to industry comments as well any changes to CIP 002-4 and its related documents, initial review of strawman documents from the Framework team and training on results based standards development. Bob Jones reviewed the timed agenda which included reviewing ballot and comments on Tuesday, look at remaining 706 directives and the framework effort moving forward on Wednesday, and engaging in a training effort for members on result based approach on Thursday.

B. Overview of the Ballot Results

The Chair reported to that Team that the successive industry ballot on the CIP 002-4 received a quorum (86%) and received 77% support of the industry which was a significant improvement from the support for the first ballot (43%).

Howard Gugel, NERC, reviewed the revised comment process clarifying the distinction between a successive ballot and a recirculation ballot. He noted that if there were significant substantive changes made in Orlando, it would require a new ballot process. He suggested the SDT should consider and weigh whether any changes in the standard would help change a "no" vote to a "yes", would help to retain the "yes" votes, and keep from turning abstentions into "no" votes. He explained that the successive and recirculation ballots are part of the ANSI process intended to everyone give chance to reevaluate their votes based on the Team's clarifications and answers. The Team will need to draft responses to both the negative and positive comments.

C. NERC CEO Gerry Cauley Remarks to the SDT on Cyber Security

Gerry Cauley addressed the SDT by telephone at the beginning of its meeting. He started by congratulating the team for its hard work under pressure and in responding to his request to bring CIP 002-4 to the industry for balloting in 2010. He noted it has proved useful in discussions with Congressional staff and has had a positive impact on NERC's reputation and credibility in terms of standards development.

He wanted to clarify for the SDT what his thinking was on the path forward for the Team consistent with its SAR in addressing the FERC Order 706 directives. He suggested that it might be possible to address those directives in the CIP 10-11 framework the SDT has been developing or within the CIP 003-009 framework. He noted that many CEOs have expressed to him concerns about shifting away from CIP 003-009 and the documentation necessary for compliance, but stated that it is up to the Team under the standards development process to bring the proposal to the industry for comment and balloting.

He reviewed his comments to CIPC the past week which he characterized as exploratory in terms of consideration of a more coordinated and comprehensive approach to the goal of security of the BES among efforts such as the the CIP standards, the NIST smart grid initiative etc.. He noted he is considering possible approaches including putting together a team that might be in partnership with NIST to address this broader concept and that might lead to a comprehensive set or suite of voluntary "good practice" security guidelines over several years of work.

SDT Questions and Answers with Gerry Cauley

- The SDT is working under its SAR with directions to address FERC Order 706 directives. Is this still our charter?
- A: Yes, the SDT needs to address directives and chose which path or framework, in consultation with the industry, is best for reliability and industry implementation.
- The Team's concern is that every six months, we have had to change horses distracting us from addressing the core issues in FERC Order 706. Can you do anything to help us complete our task?
- A: That is consistent with my comments. Getting CIP-002-4 is a first step along the path and NERC will continue to support your efforts as a team.
- What will the collaboration with other areas of security look like?
- A: This is still in early discussions. It might involve forming a team to include industry, NIST, DOE, DHS and others under the NIST umbrella. The current CIP effort should continue and this is a longer-term prospect that will not conflict with the CIP effort. This possible set of guidelines might cover the entire electric system but would not supersede the CIP.
- The SDT has considered and tried to include aspects of the NIST approach. If the guidelines can bolster our effort, will they create the basis for a standard that has more credibility across the cyber security industry?
- A: Yes, both more credibility and acceptance. Your focus though presumes bulk power and the need to develop enforceable standards. I am suggesting a broader set of robust guidelines not limited to bulk power and enforceable standards.
- The SDT team has been frustrated by the limitations on standards writing in our efforts to address cyber security. Perhaps a more comprehensive set of guidelines would help industry.
- We need to ask if in five years whether we will have a more secure electric system? How will we get there? Our standards approach may be too narrow and leave industry exposed.
- How will a non-mandatory guidelines approach connect with 706 Order and compliance/audit system? Will the guidelines be subject to NERC audits?
- A: Nothing is enforceable under 215 unless it has gone through NERC standards process and approved by industry ballot and the BOT.
- The guideline may not be mandatory, but once written will it become industry practice and quasi-mandatory as best practice?

- A: This is a clear concern and a good point. We would rather have guidelines for good protection and address the audit/compliance fear through discussion with industry and improvements of our audit practice.
- Would NERC consider a certification model? There is concern about vendors implementing standards into products. There could be consideration of formal systems within the industry in parallel with the guidelines?
- A: Guidelines may help with the expectation of the industry to the vendors. There could be possible work with national labs on setting benchmarks for the vendors – exploring possibility of doing some testing through national labs to be sure vendors are meeting the expectations. This would be a separate initiative to investigate capabilities of the national lab – want vendors involved in developing the guidelines, then set up a testing system to ensure they are meeting the industry needs.
- We have fifty- plus directives in the order yet to be addressed in another version that will be out for industry review in the face of the implementation schedule for 002-4, assuming it is passed by the industry. Have you considered how all this will come together and address industry concern about changing landscape every year?
- A: For the foreseeable future we have to finish the SDT's efforts to address the FERC 706 directives. This other effort is more long-term with the hope that over a few years we can develop consensus on a voluntary tool kit that will not replace the standards. We will have to wait on experience in developing the guidelines before moving towards any corresponding standards development.
- There is a concern that once CIP 002-4 is approved by industry, FERC may direct us to answer additional questions. There is also a concern or perception that the industry may be more concerned about documenting compliance ("proper documentation") than in establishing better security. What happens if FERC remands 002-4?
- A: A dialogue with FERC would be a better approach as we have common purposes. Recent FERC orders have been clearer about their concerns with our standards and what we need to address, but we cannot rule out further questions about compliance. NERC hopes it will not be remanded, as it is far superior to the current standard.
- A NIST representative recently talked to an industry group about a new effort at collaboration – is this the same effort or different?
- A: Sounds possibly like the same concept.

The Chair thanked Gerry Cauley and he thanked the Team again for its hard work. The Chair asked members to reflect on this overnight and the Team can discuss further as needed on Wednesday.

On Wednesday afternoon the SDT discussed of Gerry Cauley's comments in relation to future CIP framework for the Team. The comments focused on completing the Version 5 work and clarifying the nature of the parallel process Mr. Cauley outlined. Below is a summary of the SDT comments:

SDT Version 5 Work and NERC Assistance

- The SDT needs to focus on and finish the Order 706 effort.
- The SDT believes that addressing the 706 directives will produce so many changes that if CIP 003-009 numbering were retained, that could be the only common feature remaining between the current CIP and Version 5.
- There is a lack of clarity on how the SDT could check with the industry other than developing the Version 5 and putting it out for comment and balloting.

- NERC needs to engage in a significant and serious marketing effort to rally the industry to whatever approach the SDT takes.
- The other issue is how to complete our work – apply appropriate and correct controls, no matter what we call it in terms of format. Now when we delete a requirement, it changes all the following numbers and that has been very confusing too.
  It is likely that after our 706 work, the only thing that will be left is the title. We are also trying to put in new items and address new issues. Simply putting new issues into a new 10 will confuse industry who now thinks 10 is a new High-Medium-Low strategy.
- We have the opportunity of announcing CIP 002-4's adoption by providing info on that and explaining the SDT's approach to the remainder with justification for the decision and the fact there will be heavy revisions to the current CIP. NERC should use this opportunity to begin preparing the industry for the SDT's release in the summer of 2011.
- Perception is everything, and we have a perceived problem with EEI who wants to stay with CIP 003-009. Members in the past have indicated the format is less critical than getting the substance correct.
- We are and will continue getting questions about what we are doing. We all, including NERC, need to help educate the industry.
- NERC should clarify the political support this group needs to get its job done.
- We have a NERC plan for communication which we should refine and send to him.

Potential Parallel Best Practice Initiative

- There is a need beyond the Team for NERC and FERC to review the proposed parallel effort;
- There are many excellent "best practice" guides that already exist in cyber security area that should not be reproduced through this effort.
- This needs further work and is presently confusing the industry and could district the SDT from its effort to complete the 706 work.
- Distinguish between national security concerns and standards development which has financial penalties attached;
- Gerry Cauley proposed two things in this parallel effort and we need to keep them separate. One addresses guidance and recommendations from retail metering to transmission. The other deals with how to secure it given perceived threat and vulnerabilities which NIST has done a good job of characterizing. The reality is that
  much of the good guidelines out there can be misapplied in the real world. The key question of what is right for our environment.
- The good news is that the puzzle is bigger than how NERC has approached this through standards. We need to move forward with producing the nitty-gritty cyber security standards. Focus on the detail work without worrying about the container. NSA and DHS have an agreement and there are several bills floating around Congress. The smart grid is being developed and the practical part is about to hit us on the head. We need broader thinking because of the financial realities – write good access controls and other baseline stuff. CIP 002-4 gave Congress perception of a broader scope. We need to get various parties talking to each other about the broader concept, while the SDT figures out what the requirements need to be.
- At recent conference a NIST representative suggested a new working group (not formed yet) will be looking for opportunities for coordination across standards for smart grid and its relationship to CIP standards. This should not change what we do – as far as CIP standards. We should not minimize the changes in the organization of the standards on the industry.

Companies now have multiple version folders trying to figure out what applies to what and when.
- For the last month and a half, there have been discussions about coordination between NIST and NERC. There is a shared interest by all parties in producing a more coordinated effort. They are looking at pretty much everything on the grid and the interactions needed to minimize inconsistencies. A working group may be formed at a December 15 meeting at NIST.
- Standards we are working on are trying to bolt security onto existing model. That may be different from the direction smart grid is working on. We are working with existing system focusing on reliability and there is the potential for big gaps between the approaches – FERC is most concerned about confidentiality – we need to understand their direction.
- For each interface NISTR defines what is the most important aspect and addresses from that perspective. There may be more in common than expected.

D. Related Cyber Security Initiative Update- CIP 005-4 Urgent Action

Scott Mix provided an update on the recent ballot for updates to CIP-005-4 regarding remote access. The ballot concluded with an 84.46% quorum, but a 42.89% approval rating. Approximately 100 pages of comments were filed from both the comment period and the ballot process. The team will be meeting to start responding to comments and modifying the requirement in response to comments.

Mr. Mix is also looking into whether a Compliance Application Notice (CAN) can be written to address some of the "double jeopardy" issues identified in the comments (i.e., indicating that some "global" requirements in existing standards will need to be applied to remote access if they are not already).

The desire is for the revised standard to be passed by industry and be submitted to FERC in time for the commission to act concomitantly with the CIP-002-4 action. Failing that, the guidance document developed for the standards revision will be handed over to NERC staff for posting as a document in support of the FOUO VPN Alert, and the standard requirement and industry comments will be turned over to the 706 team for its deliberation and consideration in the future version of the CIP standards.

Member Questions
- Will we file a CIP 005-4 in our next posting?
- A: Yes that had been the plan to include the conforming changes and request FERC to act on both petitions in the same order.

E. Related Cyber Security Initiative Update- CAN 005 Remote Access

Scott Mix noted that this has been noticed as withdrawn and would be undergoing revisions and then reposted.

Member Questions and Comments
- Mike Moon has indicated that the errors in the CAN needed to be fixed and that it is being withdrawn for redrafting.
- Heard several utilities are engaging lawyers to challenge the CAN.
- CIP 004 R4.2 CAN- problems noted include: it goes beyond the scope of requirement in CAN; revocation of access of secondary access systems- must be included in the revocation of access plan. Auditors audit to requirements and use the CANs in the audit.

II. REVIEW OF CIP-002-4 INDUSTRY COMMENTS AND SDT RESPONSES

Howard Gugel reported that the successive ballot of the Cyber Security 706 CIP Version 4 standards was conducted from December 1-10, 2010 and achieved a quorum of 86.83% and a weighted segment approval of 77.04%. Howard provided information on the difference between a successive vs. a recirculation ballot.

During the course of the three-day meeting, the SDT reviewed each industry comment and considered and refined strawman responses and agreed on final responses and on any changes to the standard documents. Each response was either unanimously agreed to by the SDT or the level of consensus was tested with the use of straw polling that helped direct refinements that built sufficient consensus (i.e. support of at least a 2/3's of the SDT members). Below are the key straw polls that lead to refined responses.

On Thursday morning, the SDT, following input from NERC Counsel, the SDT moved *(Tom Stevenson with Doug Johnson as 2nd)* to accept the proposed nuclear language with the motion carrying unanimously. Following that, the SDT moved *(Sharon Edwards with Bill Winters as a 2nd)* to approve the package of CIP 002-4 documents (including, Cyber Security — Critical Cyber Asset Identification CIP 002-4, Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4, CIP-002-4 Rational and Implementation Reference Document, Consideration of Comments on Successive Ballot for Cyber Security 706 – CIP Version 4 Standards, and Consideration of Comments on Project 2008-06). The motion passed 17 - 0 with 1 abstention.

III. REVIEW OF THE VERSION 5 FRAMEWORK

A. Framework Discussion and Review

Phil Huff reviewed the work of the Framework Team since the SDT meeting in Chicago in August. Since the Baltimore meeting the Team has developed a strawman meeting schedule, a style guide, and a communication plan. In terms of the overall schedule, Mr. Huff noted that the SDT will begin next month with a possible posting late June or in July. The Framework Team believes that continuing with a sub-team approach may not be the most effective way forwards. Instead they are recommending drafting assignments to Team members and utilizing the full team monthly meetings to review and refine strawman drafts.

The Framework Team has developed a "Style Guide" for drafting results based standards. It is recommending for the Team's consideration a BES cyber system identification using two impact levels: A (high) and B (medium) with a baseline level for low. Part of the communication plan that NERC will work with the Team to implement will include a change document that provides rationales for the proposed changes and mapping back to the existing CIP structure. Where possible the existing structure will be retained and justification will be provided for changes are needed. The following are the SDT comments seeking to clarify aspects of the Framework Team's proposal.

Clarifying Format and Organization

- Still remains to be seen what the whole package with explanatory boxes looks like as a package for filing – don't get hung up on the boxes or depend on them at this point for a final standard.

- Vegetation management is leading the charge on results based standards and establishing the format model
- Without assurance on how to use them, then they may be meaningless
- The idea is to establish a common style guideline the SDT can still use to consistently draft the requirements.

Clarifying Proposed CIP 11 "Organization Requirements

- CIP 11 are proposed as organization requirements that are not asset specific
- Everyone has to have a program. CIP 12 would look at asset impact levels of A, B and baseline – moving to a naming convention with critical assets in A, organizational in B and baseline everything else.
- Organization controls or include technical controls too in B?
- Organization controls but may need to adapt as we create. Everyone should review logs, but should access control be done on everything? This is a big issue for industry
- What about changing password? This gets into how we set and audit measures/
- The SDT will need help from enforcement to set language that is clear to both auditor and audited industry alike.
- The term "organizational" is used differently in CIP and industry depending on context.
- This proposal retains BES cyber system concept. Are we keeping critical cyber assets as a term? Are we pulling the term back?
- The idea is to make 11 level "agnostic." The bullets listed are related to the assets involved. Here you establish you must have a training program, then put details of what is required in the program in 12? Possibly.
- The list of examples here is illustrative not comprehensive. The examples here are organizational not baseline.
- Touch one system and you have touched a thousand more. The cost could be exponential for audit purposes. Keep in mind the distinction between organizational and baseline.
- The intent was organizational – across your organization, not asset specific – from audit standpoint what is the construct?
- Be sure the level of control is tied to type of asset
- Organizational focus replaces the old CIP 11 and there is no low.

Clarifying How Many Levels of Impact

- CIP 10 will identify the levels of impact
- Do we start from baseline and work up to high?
- We will have high and other? Everyone has to do the base or other even if they do not have CA's or CCA's – the high is divided into A and B as to what is required
- CIP 12+ is the devil in the details
- CIP 11 would apply to every entity
- Confused by levels A and B, and baseline. Should we have just high and other?
- Blending levels here? Organizational is not a level, it is all registered entities? Then have three impact levels of A, B and no impact with no regulatory requirement on the no impact level.
- Organizational requirements? Include controls to devices or just requirements for the organization.
- Does not suggest applying organization requirements to devices.

- Two threshold levels: high impact and those that impact reliability but are not critical assets. With a no impact level too.
- Identify every system or just A's and B's? Makes a difference for the scope of this effort.
- We need to establish a SDT consensus on levels and foundation before moving on without a common agreement.
- Level B system description – thought B was everything else that might impact A
- Need common understanding of what each level means
- As we draft controls – B is all the non-critical but some things may still need some controls.
- May help to look at specific examples. E.g. load shedding – we chose 300 mw, but in a low frequency event the end result may be it travels further than it should have and grows as it gets further from the event meaning more impact than it should have had from a cyber perspective.
- Still confused on the number of impact levels for systems? Are there three or two?
- It appears that baseline organizational requirements, may include some A's and some B's.
- This sounds like a compliance rather than a reliability concern.
- May need some baseline of control on all BES cyber systems with two levels of A (critical) and B (non-critical but connected) in terms of registered entities
- The team discussed the path of programmatic controls across programs without tying to assets. The reality is we are writing regulations, not guidance, with violations having penalties associated with them because of audits based compliance system.
- The team is thinking 2 versus 3 levels given our previous experience in trying to set medium level which was artificial. - in our business everything falls into a high that affects a lot of the BES and low that doesn't – level A is the critical or high, B is everything else in the organization.

Clarifying the Scope

- BES systems and non-BES systems – the latter not essential to running BES but the non-BES may be the avenue to attack the BES system.
- FERC does not have jurisdiction over the non-BES system such as email systems.
- CIP 10 is similar to 002-4 – anyone feel there is a need for distinction of non-BES system – favor two levels versus three levels? Just considering impact levels, not connectivity here.
- Working through three levels proved problematic – organizational level for everything and the more for high level – two level system
- We have to work off of a definition of BES system – that is the purview or scope of our work.
- What is the population of system in the scope? Those that impact the reliability of the BES system are the target, not every non-BES system.
- Connectivity determined level, but if not in the inventory of assets how do we ensure it is protected?
- Cyber system is not easily defined. It would be unfair to say it has to be defined to a common understanding. The industry will need flexibility (as cyber systems don't look alike in terms of age and functions) and security boundary is the foundation issue.
- If connected to BES cyber system then it becomes a BES cyber system component though it is not a cyber asset and it needs protection.
- It crosses a threshold that requires you to apply controls and makes it a component once connected
- That is the point in BES cyber system maintenance section in the old CIP 11.

- BES cyber systems have protections – outside cyber system there are components that need protection because they are attached to the system for purposes of maintenance but are not part of the system but a component for maintaining the system
- How are controls on system and controls on components on the system different?
- We can distinguish physical access to component but not the non-physical access.
- May have to break up into more granular level to assign appropriate protections.
- Most of the requirements are written for the cyber level – do we need a different term than "component" or at least for the ancillary ones that get plugged into the system
- Are we dealing with the physical location or type of equipment? The former may differ depending on location but the latter will not.
- Measures – the format is table with first column of requirements and next column with measures – bullets are the guidance for writing measures.
- Based on our discussion as far back as January 2010 (Tucker) we focused on what is the primary intent of the attack.
- Ultimately goes back to 10
- We assume in 002-4 that identified assets are targets in themselves as A and B's are either targets in combination with or avenues of attack to A's.
- Is it a BES cyber system if not connected to anything else – multisite attack?
- In 002-4 we based bright line on impact to BES of its loss so that A is based on impact to BES, B is combined impacts to BES, and others have no impact on BES
- We identified the high impact and those that support the high level. The rest should shake out to those in the BES system that require organizational control will be too difficult to test out all the lows in combination that may impact BES. It may be the right thing to do and appropriate, even if hard to audit. We have to allow entities the flexibility to determine. Already protecting systems to protect our assets, not just to comply with audits – mandatory compliance controls for high assets, limited controls on low and let companies figure out the middle

Independent Certification Process

- Should the SDT consider the option of standing up an independent certification body to establish what qualifies? If it doesn't fit within the SAR and scope of this SDT should we approach NERC about expanding scope to consider certification process?

B. Results Based Standards Training

In preparation for the Version 5 drafting challenges, the SDT engaged in a results based standards review and training conducted by Keith Heidrich FRCC, on Thursday of the meeting. Mr. Heidrich has participated on an ad hoc NERC team convened by Gerry Cauley which has been developing the concept of a results based standards approach.

He outlined the training objectives as:

- Identify and give examples of the elements that define a results-based standard
- Analyze the current standards and requirements for weaknesses
- Identify the needs, goals, and objectives for this
- Create an initial draft of this standard and requirements using result-based methods
- Create measures and necessary supporting material for the standard and requirements

The training covered: Results-based standards/requirements – what are they and why they matter; Scope–what you need to know before writing requirements; Standard requirements – observations and improvements; and Where information is recorded – templates.

Mr. Heidrich noted in a results based approach, the SDT needs to answer the question: *Who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome?* A Standard is a portfolio of requirements designed to achieve an overall defense-in-depth strategy and comply with the quality objectives with each requirement having a role in preventing system failures. Requirements within a standard should be complementary and reinforcing. He distinguished among performance based, risk based and competency based standards.

SDT Member Questions and Comments

- Is cost an appropriate or allowed consideration? A: Yes, but not as a driver – it is an issue in almost any TFE – it is "a consideration for smaller entities but not at consequence of less than excellence in operating system reliability"
- Do we have to establish caveats as to size or cost effectiveness? FERC Order 706 asked industry to establish reasonable and appropriate measures – reliability impact is a safer argument to make for smaller entities – but if everything is connected then smaller entity can impact the BES reliability. A: The CIP 005 team struggled with this issue too and came up with a range of solutions including less costly approaches to minimum levels of protection – can't compromise requirement for cost reasons but you can carve out subsets of applicability based on impact to the BES that cover smaller entities. This is difficult to do if entities are interconnected.

C. Next Steps for Developing the Framework

On Thursday, Phil Huff noted that based on the review and discussion at this meeting the Framework team would be proposing two impact levels with all other being those items falling outside BES system definition. The Team will present a refined proposal in January taking the SDT input into consideration. For those in those covered in one of these two levels there will be multiple types of controls to be applied. It will get down to the drafting requirements in a consistent format. We recognize detail still needs to be worked out.

Member Comments

- Just because we changed labels doesn't make it easier to fix the problems.
- Do NERC standards development requirements allow blank requirements? No
- We need to retain flexibility to make course correction if industry pushes back. We will still need controls regardless of the structure – spend time wisely developing controls then put into structure at the end.
- We need to get on with technical work and worry about style and format later.
- Agree we need to move forward to writing the requirements – guidance to date allows us to use a format to capture and write the controls.
- The Access Control sub-team continued to work and the SDT could use their work as a strawman to test as an example. The sub-team worked with three levels but struggled with

- "medium." Their work as our example may help understand how the propose "two level" system would work

The Chair and Vice Chair noted that the expectation is that following the January 2011 session the Framework Team would dissolve and an open set of SDT meetings will be used to refine the proposed framework through review of strawman drafts of requirements. The Framework Team will set up conference calls in January in advance of the Columbus meeting.

IV. NEXT STEPS AND ASSIGNMENTS

The Team reviewed the steps and assignments leading up to the Columbus meeting. The Framework Team will be meeting in early January 2011 to prepare documents for the SDT to review at the January 2011 meeting. The recirculation Ballot is expected to close on Friday, December 31 COB. NERC staff will notify the SDT of the ballot results.

The Chair thanked Rich Kinas and the OAS for the hosting of the SDT in Orlando.

The meeting adjourned at 4:40 on Thursday, December 16, 2010

Appendix # 1— Meeting Agenda
Project 2008-06 Cyber Security Order 706 SDT
Draft 29th Meeting Agenda
December 14, 2010, Tuesday- 8:00 AM to 6:00 PM EST
December 15, 2010 Wednesday- 8:00 AM to 6:00 PM EST
December 16, 2010 Thursday- 8:00 AM to 6:00 PM EST
Orlando Utilities Commission Offices
6113 Pershing Avenue
Orlando FL

NOTE: 1. Agenda Times May be Adjusted as Needed during the Meeting
NOTE: 2. Drafting Sub-team Meetings May Not Have Access to Telephones and Ready Talk

Proposed Meeting Objectives/Outcomes:

- To review the results of the 2nd Ballot and test consensus on responses to industry comments on CIP 002-4 and, if needed, on any changes for inclusion in a CIP 002-4 3rd ballot.
- To review, refine and test support for recommendations of the CIP Version 5 Framework Team.
- To participate in a Results Based Standards Development Training
- To agree on next steps and assignments

Tuesday, December 14, 2010 8:00 a.m. - 6:00 p.m. EST
- Introduction, welcome -*(Morning)*
- Review meeting and milestone schedule for CIP 002-4 and CIP 010 and 011 *(Morning)*
- Review results of 2nd Ballot CIP-002-4*(Morning)*
- Draft responses to industry and consider any changes to CIP-002-4 *(Morning & Afternoon)*

Wednesday, December 15, 2010 8:00 a.m. - 6:00 p.m. EST
- Seek Motion to Adopt SDT Responses to Industry, and if needed, any changes for inclusion in the 3rd Ballot. *(Morning)*
- Overview of Results Based Standards Development and CIP Version 5- Howard Gugel NERC *(Morning)*
- Receive a Version 5 Framework report *(Morning)*
- Review Draft Strawman Documents and discuss key issues *(Afternoon)*
- Review and initial testing of the acceptability of the approach as refined *(Afternoon)*

Thursday, December 16, 2010, 8:00 a.m. - 6:00 p.m. EST
- Results Based Standards Training- Keith Heidrich, FRCC & Howard Gugel, NERC *(Morning & Afternoon)*
- Review Version 5 Framework in light of Results Based Approach
- Test SDT Support for the Version 5 Framework *(Afternoon)*
- Review Work plan for the Version 5 Framework *(Afternoon)*
- Review SDT January, 2011 Columbus Meeting Agenda (*Late Afternoon)*

Appendix # 2 Attendees List
December 14-16, 2010 Orlando

Attending in Person — SDT Members and Staff

1. Rob Antonishen	Ontario Power Generation
2. Jim Brenton	ERCOT
3. Jay S. Cribb	Southern Company Services
4. Joe Doetzl	Kansas City Pwr. & Light Co
5.Sharon Edwards	Duke Energy
6.Gerald S. Freese	America Electric Pwr.
7. Phillip Huff, Vice Chair	Arkansas Electric Coop Corporation
8. Doug Johnson	Exelon Corporation – Commonwealth Edison
9.Rich Kinas	Orlando Utilities Commission
10. John Lim, Chair	Consolidated Edison Co. NY
11. David Norton	Entergy
12. David S. Revill	Georgia Transmission Corporation
13. Tom Stevenson	Constellation
14. Keith Stouffer	National Institute of Standards & Technology
15. John Van Boxtel	WECC
16. William Winters	Arizona Public Service, Inc.

SDT Members Attending via ReadyTalk and Phone

17. Jackie Collett	Manitoba Hydro
18. William Gross	Nuclear Energy Institute
19. Scott Rosenberger	Luminant Energy
20. Kevin Sherlin	Sacramento Municipal Utility District
21. John D. Varnell	Technology Director, Tenaska Power Services Co.
Gerry Cauley	*NERC (Tu)*
Scott Mix	*NERC*
Howard Gugel	*NERC*
Ralph Anderson	*NERC*
Robert Jones	*FSU/FCRC Consensus Center*
Stuart Langton	*FSU/FCRC Consensus Center*
Hal Beardall	*FSU/FCRC Consensus Center*

SDT Members Not Participating

Jeff Hoffman	U.S. Bureau of Reclamation, Denver
Patricio Leon	Southern California Edison

Jonathan Stanford	Bonneville Power Administration
Bradley Yeates	South Nuclear Operating Company

Others Attending in Person

Robert Preston Lloyd	Southern California Edison
Jim Fletcher	American Electric Power
Jason Marshall	Midwest ISO
Roger Fradenburgh	N&ST
Brian Newell	American Electric Power
Guy Zito	NPCC
Rob Wotherspoon	OUC
Mike Keane	FERC
Kevin Ryan	FERC (Tu/W)
Mark Simon	Encari

Others Attending via Readytalk and Phone

December 14
Matthew Adeleke, Vincent Le, Lawson, Rob Gross, William Bussman, John Hofstetter, Tom Kelly, Justin Doetzl, Joe Artz, Kevin Kittey, Drew Lopez, Andres Camm, Larry Wilson, Bryn Powell, Maggy Hasha, Christine Bargen, Jan Hardiman, Rod Hoffman

December 15
Scott Hoffman, Jeff Powell, Jim Bussman, Nathan Mitchell, NathanRyan, Kevin Sherlin, Kevin Le, vincent Antonishen, Rob bargen, jan Wilson, Bryn adeleke, matthew Barry Barry Lawson, Drew Kittey, Drew Hasha, Christine Rod Hardiman, Andres Lopez

December 16
Drew Kittey, Maggy Powell, Rod Hardiman, John Bussman, , Vincent Le, Bryn Wilson, Andres Lopez, Jan Bargen, Brian Newell, Barry Lawson

Appendix #3 NERC Antitrust Compliance Guidelines

See Antitrust Compliance Guidelines read at the beginning of each day's session at:

The NERC reminder below was read at the beginning of each day's session.

NERC REMINDER FOR USE AT BEGINNING OF MEETINGS AND CONFERENCE CALLS THAT HAVE BEEN PUBLICLY NOTICED AND ARE OPEN TO THE PUBLIC

For face-to-face meeting, with dial-in capability:

Participants are reminded that this meeting is public. Notice of the meeting was posted on the NERC website and widely distributed. The notice included the number for dial-in participation. Participants should keep in mind that the audience may include members of the press and representatives of various governmental authorities, in addition to the expected participation by industry stakeholders.

Appendix #4

Final SDT CIP 002-4 Documents

http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html

Appendix #5 SDT Sub-Teams

Sub-Team	
CIP 010 BES System Categorization	John Lim (Lead), Rich Kinas, Jim Brenton, Dave Norton *(Observer Participants: Rod Hardiman, Jim Fletcher)* *(FERC: Mike Keane, Peter Kuebeck)*
Personnel and Physical Security	Doug Johnson (Lead), Rob Antonishen, Patrick Leon, Kevin Sherlin *(FERC: Drew Kittey)*
System Security and Boundary Protection	Jay Cribb (Lead), Jackie Collett, John Varnell, John Van Boxtel, Philip Huff *(Observer Participant: Brian Newell)* *(FERC: Justin Kelly)*
Incident Response and Recovery	Scott Rosenberger (Lead), Joe Doetzl, Tom Stevenson (*Observer Participant: Jason Marshall)* *(FERC: Dan Bogle)*
Access Control	Sharon Edwards (Lead), Jeff Hoffman, Jerry Freese, Bill Winters *(Observer Participants: Roger Fradenburgh, Robert Preston Lloyd)* *(FERC: Mike Keane)*
Change Management, System Lifecycle, Information Protection, Maintenance, and Governance	Dave Revill (Lead), Jon Stanford, Keith Stouffer, Bill Winters *(Observer Participant: Brian Newell)* *(FERC: Jan Bargen, Matthew Dale)*
CIP 002-4 Drafting Team	John Lim (Lead), Jim Brenton, Jackie Collett, Jay Cribb, Sharon Edwards, Doug Johnson, Rich Kinas, Dave Norton, Dave Revill, and Bill Winters *(Observer Participants: Rod Hardiman; Jim Fletcher; Bryn Wilson)* *(FERC: Mike Keane, Peter Kuebeck; NERC: Scott Mix)*
Implementation Plan CIP 002-4	Dave Revill (Lead), Sharon Edwards, Kevin Sherlin, Scott Rosenberg, Dave Norton and Phil Huff *(FERC: Mike Keane; NERC: Scott Mix)*
Framework CIP 010 &011	Dave Norton (Lead), Jim Brenton, Jay Cribb, Joe Doetzl, Phil Huff, Doug Johnson, Dave Revill, Jon Stanford, and John Van Boxtel. *(FERC: Mike Keane; NERC: Scott Mix)*

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Cyber Security Order 706 SDT- Project 2008-06
30TH MEETING
January 18-20, 2011
Columbus, Ohio

EXECUTIVE SUMMARY

John Lim, Chair of the CSO 706 SDT welcomed members and other participants to Columbus and thanked Jerry Freese, Jim Fletcher and Brian Newell at American Electric Power for hosting the meeting. Howard Gugel, NERC, conducted a roll call and reviewed the antitrust and public meeting guidelines at the beginning of each day. On Tuesday morning, the SDT unanimously adopted the December 14-16, 2010 Orlando meeting summary. The chair outlined the objectives the SDT sought to accomplish by the end of the meeting that included reviewing the results of the Final Ballot for CIP Version 4, developing CIP Version 5 Need, Goals and Objectives in support of the SDT's decision to adopt the results based standards format in the development of CIP V5, reviewing the current status of CIP-010 and CIP-011, and developing a communication plan for CIP V5.

The Chair announced that the FSU consensus team would no longer be participating in SDT meetings. Robert Jones from the Florida Conflict Resolution Consortium addressed the group to express their pleasure in working with the SDT and best wishes for the project moving forward. In response, the chair expressed appreciation on behalf of the SDT for the exemplary services provided by Robert Jones, Stu Langton and Hal Beardall since the inception of this SDT and best wishes in their future endeavors.

The Chair reported to that team that four members had submitted their resignation from the SDT: Jackie Collett from Manitoba Hydro, Dave Norton from Entergy, Patricio Leon-Alvarado from Southern California Edison, and Bradley (Brad) Yeates from Southern Company. The team expressed its appreciation for the participation of these members. The Chair then asked that each member actively participate in the meetings. In particular, if a member is unable to attend a SDT meeting either in person or by phone, they are asked to inform the Chair so that any possible quorum issues can be addressed prior to the meeting. If a member consistently cannot meet team meetings, they are asked to resign from the team.

The Chair expressed appreciation for the SDT's considerable work over the last quarter of 2010 in developing an industry approved version of the CIP standards that replaced the previous risk based assessment methodology in CIP-002-3 with a bright line criteria contained in CIP-002-4. On December 31, 2010, the registered ballot body approved the version 4 set of CIP standards with a 90.49% quorum, and a 80.56 % approval rating.

Scott Mix provided an update on the recent ballot for updates to CIP-005-4 regarding remote access. The team for Project 2010-15 is continuing to develop responses to comments and modify the proposed requirement in response to comments. That team is still working toward the goal of submitting the approved revised CIP-005-4 to FERC in time for the commission to act in conjunction with the CIP-002-4 action.

Based on the decision of the team to adopt the results based standard model for the next version of the CIP standards, the team chose to spend time at this meeting developing Needs, Goals, and Objectives. After spending considerable time discussing each aspect, the team unanimously adopted the document in Appendix 3.

The team then discussed the approach to developing the standards. The merits and disadvantages concerning the sub-team approach that the team has used to date were fully vetted. The team decided to continue this approach, but has chosen not to break into sub-teams during face-to-face meetings. The current makeup of each sub-team is contained in Appendix 4. The team also had a discussion on the differences between a "CIP-003 to CIP-009" approach versus a "CIP-010 and CIP-011" approach. A document detailing that discussion is in Appendix 5. At this point the team is continuing to develop CIP-010 and CIP-011, with the understanding that they could break apart CIP-011 in the future if they choose.

On Thursday, Brian Newell provided the SDT a *Lunch and Learn* presentation on the implementation of CIP Cyber Security Standards within plant networks.

The latest meeting schedule is in Appendix 6. Further discussions were held on the communication plan, which is located in Appendix 7. The team then discussed the outstanding directives of FERC Order 706, which is located in Appendix 8. The SDT then made the following assignments:

- Philip Huff is to revise the style guide based on discussions of deliverables for the February meeting.
- Everyone is to perform a review of CIP-010.
- Each sub-team is to (1) develop/review rationale statements for each requirement in CIP-011, (2) document prior version references, (3) develop change justification for each table row, and (4) review and refine requirement language and applicability.
- Howard Gugel to reach out to Mike Moon and other NERC staff to provide input during the February meeting.
- Philip Huff is to create a CIP mapping document for the February face-to-face meeting.
- NERC staff to add interpretations and CANs to the *FERC Directives by Sub-Team* document

The Chair thanked Jerry Freese, Jim Fletcher, Brian Newell and AEP for the hosting of the SDT in Columbus.

The meeting adjourned at 4:40 on Thursday, January 20, 2011

Appendix # 1— Meeting Agenda
Project 2008-06 Cyber Security Order 706 SDT
Draft 30th Meeting Agenda
January 18, 2011 Tuesday - 8:00 AM to 6:00 PM EST
January 19, 2011 Wednesday - 8:00 AM to 6:00 PM EST
January 20, 2011 Thursday - 8:00 AM to 6:00 PM EST
American Electric Power Offices
1 Riverside Plaza, Columbus OH

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To review the results of the Final Ballot for CIP Version 4
- To review, refine and test support for CIP Version 5 Need, Goals and Objectives
- To review and discuss integration of results based standards format into CIP V5
- To agree on next steps and assignments

Tuesday, January 18, 2011 8:00 a.m. - 6:00 p.m. EST
- Introduction, welcome -*(Morning)*
- Review results of Ballot CIP Version 4 Final Ballot, comments and next steps and schedule *(Morning)*
- NERC staff support update (*Morning*)
- Industry review: (*Morning*)
    - Cyber Attack TF and Severe Impact Resilience TF
    - CIP-005-4 Update
    - Hill Update
- CIP V5 Needs, Goals and Objectives *(Afternoon)*

Wednesday, January 19, 2011 8:00 a.m. - 6:00 p.m. EST
- CIP-010 Group Review *(Morning)*
- Controls Review (*Afternoon*)

Thursday, January 20, 2011 8:00 a.m. - 6:00 p.m. EST
- Controls Review (*Morning*)
- Drafting assignments (*Morning/Afternoon*)
- Review SDT February, 2011 Taylor, TX Meeting Agenda (*Late Afternoon)*

Appendix # 2 Attendees List
January 18-20, 2011 Columbus

Attending in Person — SDT Members and Staff

1. Jay Cribb	Southern Company Services
2.Sharon Edwards	Duke Energy
3.Gerald S. Freese	America Electric Pwr.
4. Philip Huff, Vice Chair	Arkansas Electric Coop Corporation
5. Doug Johnson	Exelon Corporation – Commonwealth Edison
6. John Lim, Chair	Consolidated Edison Co. NY
7. David Revill	Georgia Transmission Corporation
8. Scott Rosenberger	Luminant Energy
9. Kevin Sherlin	Sacramento Municipal Utility District
10. Tom Stevenson	Constellation
11. John D. Varnell	Tenaska Power Services Co.

SDT Members Attending via ReadyTalk and Phone

12. Rob Antonishen	Ontario Power Generation (Tu, Th)
13. Jim Brenton	ERCOT
14. Joe Doetzl	Kansas City Pwr. & Light Co (Wed)
15. Jeff Hoffman	U.S. Bureau of Reclamation, Denver (Tu, Wed)
16.Rich Kinas	Orlando Utilities Commission (Wed)
17. William Winters	Arizona Public Service, Inc.
Scott Mix	*NERC*
Howard Gugel	*NERC*
Robert Jones	*FSU/FCRC Consensus Center (Tu)*

SDT Members Not Participating

Jonathan Stanford	Bonneville Power Administration
Bill Gross	NEI
Keith Stouffer	National Institute of Standards & Technology
John Van Boxtel	Portland General

Others Attending in Person

Robert Preston Lloyd	Southern California Edison
Jim Fletcher	American Electric Power
Jason Marshall	Midwest ISO
Roger Fradenburgh	N&ST
Brian Newell	American Electric Power
Dave Burtrum	AECI
Kevin Koloini	AMP (Tu)
Mike Keane	FERC
Tom Alrich	Matrikon
Jim Donahue	OVEC
Steven Parker	EnergySec
Nick Lauriat	N&ST

Others Attending via Readytalk and Phone

January 20
Maggy Powell, Vincent Le, Annette Johnston, Ingrid Rayo, Anna Wang, Jan Bargen, Christine Hasha, Chuck Abell, David Gordon, Andres Lopez, Larry Camm

Appendix #3

NEED, GOALS AND OBJECTIVES – PROJECT 2008-06 - CIP CYBER SECURITY STANDARDS V5

NEED

The need for Critical Infrastructure Protection (CIP) in North America has never been more compelling or necessary than it is today. This is especially true of the electricity sector. Electric power is foundational to our social and economic fabric, acknowledged as one of the most essential and among the most targeted of all the interrelated critical infrastructure sectors.

The Bulk Electric System (BES) is a complex, interconnected collection of facilities that increasingly uses standard cyber technology to perform multiple functions essential to grid reliability. These BES Cyber Systems provide operational efficiency, intercommunications and control capability. They also represent an increased risk to reliability if not equipped with proper security controls to decrease vulnerabilities and minimize the impact of malicious cyber activity.

Cyber attacks on critical infrastructure are becoming more frequent and more sophisticated. Stuxnet is a prime example of an exploit with the potential to seriously degrade and disrupt the BES with highly malicious code introduced via a common USB interface. Other types of attacks are network or Internet-based, requiring no physical presence and potentially affecting multiple facilities simultaneously. It is clear that attack vectors are plentiful, but many exploits are preventable. The common factors in these exploits are vulnerabilities in BES Cyber Systems. The common remedy is to mitigate those vulnerabilities through application of readily available cyber security measures, which include prevention, detection, response and recovery.

In the cyber world, security is truly only as good as its weakest implementation. The need to identify BES Cyber Systems and then protect them through effective cyber security measures are critical steps in helping ensure the reliability of the BES functions they perform.

In approving Version 1 of CIP Standards CIP-002-1 through CIP-009-1, FERC issued a number of directives to the ERO. Versions 2, 3 and 4 addressed the short term standards-related and Critical Asset identification issues from these directives. There are still a number of unresolved standards-related issues in the FERC directives that must be addressed. This version is needed to address these remaining directives in FERC Order 706.

GOALS AND OBJECTIVES

- **Goal 1:** To address the remaining Requirements-related directives from all CIP related FERC orders, all approved interpretations, and CAN topics within applicable existing requirements.
  - **Objective 1.** Provide a list of each directive with a description and rationale of how each has been addressed.
  - **Objective 2.** Provide a list of approved interpretations to existing requirements with a description of how each has been addressed.
  - **Objective 3.** Provide a list of CAN topics with a description of how each has been addressed.
  - **Objective 4.** Consider established security practices (e.g. DHS, NIST) when developing requirements.
  - **Objective 5.** Incorporate the work of Project 2010-15 Urgent Action SAR.
- **Goal 2:** To develop consistent identification criteria of BES Cyber Systems and application of cyber security requirements that are appropriate for the risk presented to the BES.
  - **Objective 6**: Transition from a Critical Cyber Asset framework to a BES Cyber System framework.
  - **Objective 7.** Develop criteria to identify and categorize BES Cyber Systems, leveraging industry approved bright-line criteria in CIP-002-4.
  - **Objective 8.** Develop appropriate cyber security requirements based on categorization of BES Cyber Systems.
  - **Objective 9.** Minimize writing requirements at the device specific level, where appropriate.
- **Goal 3:** To provide guidance and context for each Standard Requirement
  - **Objective 10.** Use the Results-Based Standards format to provide rationale statements and guidance for all of the Requirements.
  - **Objective 11.** Develop measures that describe specific examples that may be used to provide acceptable evidence to meet each requirement. These examples are not all inclusive ways to provide evidence of compliance, but provide assurance that they can be used by entities to show compliance.
  - **Objective 12.** Work with NERC and regional compliance and enforcement personnel to review and refine measures.
- **Goal 4:** To leverage current stakeholder investments used for complying with existing CIP requirements.

- **Objective 13.** Map each new requirement to the requirement(s) in the prior version from which the new requirement was derived.
- **Objective 14.** Justify change in each requirement which differs from the prior version.
- **Objective 15.** Minimize changes to requirements which do not address a directive, interpretation, broad industry feedback or do not significantly improve the Standards.
- **Objective 16.** Justify any other changes (e.g. removals, format)

- **Goal 5:** To minimize technical feasibility exceptions.
  - **Objective 17.** Develop requirements at a level that does not assume the use of specific technologies.
  - **Objective 18.** Allow for technical requirements to be applied more appropriately to specific operating environments (i.e. Control Centers, Generation Facilities, and Transmission Facilities). (also maps to Goal 2)
  - **Objective 19.** Allow for technical requirements to be applied more appropriately based on connectivity characteristics. (also maps to Goal 2)
  - **Objective 20.** Ensure that the words "where technically feasible" exist in appropriate requirements.
- **Goal 6:** To develop requirements that foster a "culture of security" and due diligence in the industry to complement a "culture of compliance".
  - **Objective 21.** Work with NERC Compliance Staff to evaluate options to reduce compliance impacts such as continuous improvement processes, performance based compliance processes, or SOX-like evaluation methods.
  - **Objective 22.** Write each requirement with the end result in mind, (minimizing the use of inclusive phrases such as "every device," "all devices," etc.)
  - **Objective 23.** Minimize compliance impacts due to zero-defect requirements.
- **Goal 7:** To develop a realistic and comprehensible implementation plan for the industry.
  - **Objective 24.** Avoid per device, per requirement compliance dates**.**
  - **Objective 25.** Address complexities of having multiple versions of the CIP standards in rapid succession.
  - **Objective 26.** Consider implementation issues by setting realistic timeframes for compliance.
  - **Objective 27.** Rename and modify IPFNICCAANRE to address BES Cyber System framework.

Appendix #4 SDT Sub-Teams

Sub-Team	
BES Cyber System Categorization	John Lim (Lead), Rich Kinas, Jim Brenton *(Christine Hasha ?)* *(Observer Participants: Rod Hardiman, Jim Fletcher, Robert Preston Lloyd, David Burtrum, Bryn Wilson)* *(FERC: Mike Keane,)*
Personnel and Physical Security	Doug Johnson (Lead), Rob Antonishen, Kevin Sherlin *(FERC: Drew Kittey)*
System Security and Boundary Protection	Jay Cribb (Lead), John Varnell, John Van Boxtel, Philip Huff *(Observer Participant: Brian Newell, David Burtrum)* *(FERC: Justin Kelly)*
Incident Response and Recovery	Scott Rosenberger (Lead), Joe Doetzl, Tom Stevenson (*Observer Participant: Jason Marshall)* *(FERC: Dan Bogle)*
Access Control	Sharon Edwards (Lead), Jeff Hoffman, Jerry Freese *(Observer Participants: Roger Fradenburgh, Robert Preston Lloyd)* *(FERC: Mike Keane)*
Change Management, System Lifecycle, Information Protection, Maintenance, Governance, and Vulnerability Assessments	Dave Revill (Lead), Jon Stanford, Keith Stouffer, Bill Winters *(Observer Participant: Brian Newell)* *(FERC: Jan Bargen, Matthew Dale)*
Implementation Plan CIP 002-4	Dave Revill (Lead), Sharon Edwards, Kevin Sherlin, Scott Rosenberg, Dave Norton and Phil Huff *(FERC: Mike Keane; NERC: Scott Mix)*

Appendix #5

CIP-002 to -009
Vs.
CIP-010 and 011

When we use these terms in comparison to one another, it can mean several things:

1) The *organization of requirements* split into the existing 8 standards or combined into 2 standards?

   Response: A downside of two standards is the optics of the reporting of violations for the "control" standard. "Existing eight standards" might also include one or two additional new standards.

2) The *change from a 'critical asset' method* of determining the cyber systems based on the BES asset's potential impact *to a focus on the cyber systems* themselves and their direct impact? (The 'BES Cyber System' approach – this is the 'big iron vs. cyber systems argument)

   Response: The focus is on BES Cyber Systems, scoped based on reliability functions. The issue is communicating the "position" we have adopted.

3) The *expansion of scope* from just critical assets and their associated CCA's *to all BES Cyber Systems*?

   Response: Remember, this is limited to BES Cyber Systems as scoped in "CIP-010." While we generally agree that there is a baseline of controls that need to be applied to all BES Cyber Systems, it is still to be determined what these controls are that will be proposed by the team. The challenge will be to create meaningful controls that can be practically implemented and reasonably audited for all BES Cyber Systems that will gain industry and regulatory acceptance.

4) *Leave CIP-002 to -009 as is* with changes to meet the remaining 706 directives.

   Response: Changes to the standards in response to FERC directives would be major changes that might leave only the numbers and titles intact.

Appendix 6

CSO706 SDT
Meeting Schedule and Objectives (January 2011)

Development Process

- Face-to-face meetings used to review/refine the entire Standard. Full team reviews Standards to raise issues, formulate concepts to address issues, ensure consistency across sub-teams and further develop work products.
- Sub-teams meet in open web conferences in between face-to-face meetings to address issues raised by the full team.
- Full team 2 hour web conference the 2nd Thursday from 12:00a – 2:00p after every full team meeting to receive sub-team status updates and provide initial feedback.

Meeting Location	Dates	Meeting Objective
Columbus, OH AEP	01/18 to 01/20/2011	Develop Needs, Goals and Objectives. Develop project plan.
Interim	1/20 to 2/15/2011	Sub-Teams to: (1) develop/review rationale statements for each requirement in CIP-011, (2) document prior version references, (3) develop change justification for each table row, and (4) review and refine requirement language and applicability.
Web meeting	2/3/2011	Update on work from subteams (12-2pm EST)
Taylor, TX ERCOT	2/15 to 2/17/2011	Full review of Standards requirements, rationale and change justification Discussion with NERC Compliance staff on programmatic requirements
Interim	2/17 to 3/15/2011	Sub-teams complete drafting assignments and develop measures and guidance statements.
Web meeting	3/3/2011	Update on work from subteams (12-2pm EPT)
New York, NY ConEd	3/15 to 3/17/2011	Full review of Standards requirements, measures and guidance Initial discussions on implementation plan.
Interim	3/17 to 4/12/2011	Sub-teams complete drafting assignments
Web meeting	3/31/2011	Update on work from subteams (12-2pm EPT)

Meeting Location	Dates	Meeting Objective
Sacramento, CA SMUD	4/12 to 4/14/2011	Review of Standards and implementation plan NERC and Regional audit staff review
Interim	4/14 to 5/17/2011	Sub-teams complete drafting assignments Sneak peak industry webinar(s) in early May
Web meeting	5/5/2011	Update on work from subteams (12-2pm EDT)
Little Rock, AR AECC	5/17 to 5/19/2011	Review of industry feedback Include additional NERC staff to begin quality review
Interim	5/19 to 6/21/2010	Sub-teams complete drafting assignments NERC continues quality review
Portland, OR BPA	6/21 to 6/23/2011	SDT and NERC staff quality review on documents for posting
Interim	6/23 to 7/19/2011	Posting for comment Prepare for technical workshop?
TBD	7/19 to 7/21/2011	Technical Workshop?
TBD	8/23 to 8/25/2011	Respond to comments
TBD	9/20 to 9/22/2011	Respond to comments and prepare for second posting and ballot
TBD	10/25 to 10/27	Respond to comments and prepare for third posting and ballot
TBD		
TBD		

Deliverables Needed for Posting

1. CIP Cyber Security Standards
2. Implementation Plan (Not started)
3. FERC Directives Summary (Last updated for informal comment posting)
4. CIP version 4 requirements mapping and change justification (obtained from Standards)
5. Informal Comment Summary (Reside with sub-team leads)
6. Comment Form (Not started)

Appendix 7

CSO706 SDT Communication Plan - 2011

- Develop a paragraph to be appended to communication about FERC filing for Version 4 that provides information on the SDT's plan for 2011 (1/31/2011)
- Develop a powerpoint presentation/talking points that can be used by SDT members to present information on the next version of the CIP standards to regional CIPC/Standards groups. (3/31/2011)
- Develop presentations for mini industry webinars that present various topics from "CIP-011" to solicit informal feedback prior to formal posting (4/30/2011)
- Develop information that can be included in the NERC News monthly publication (monthly in 2011)
- Develop a list of opportunities to meet with industry groups during 2nd and 3rd quarter 2011.

Appendix 8

FERC Specific directives from order 706:

The following table contains the status of all issues raised in the order that were either "direct"ed, specifically in the order, or "adopt"ed from the NOPR..

Note: Given the confusion over the SDT's inclusion of the change in CIP-008 ("Testing the Cyber Security Incident response plan does not require removing a component or system from service during the test") that the commission did not "direct", even though p 687 states: "In light of the comments received, the Commission clarifies that, with respect to full operational testing under CIP-008-1, such testing need not require a responsible entity to remove any systems from service," I did not include any issue that was not actively directed for change, such as those designated "should consider" or similar.

Paragraph	Text	Phase[1]
13	NERC is directed to develop a timetable for development of the modifications to the CIP Reliability Standards and, if warranted, to develop and file with the Commission for approval, a second implementation plan.	This compliance filing; and an implementation plan is filed with each submitted version of the standards
25	we direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of the NIST framework.	Version 5
47	The Commission adopts the CIP NOPR approach regarding NERC and Regional Entity compliance	Rules of Procedure

[1] Schedule phases in this column mean one or more of the following:
- "Version 2" – complete in filed version 2
- "Version 4" – complete in version 4
- "Version 5" – planned for next major version (12-18 months plus)
- "Guideline" – stand alone guidance started after corresponding requirement is determined
- "TFE Filing" – 2009 filing on TFE proposal and Appendix 4D to RoP
- "not scheduled" – beyond Version 4
- "CMEP" – part of an existing or ongoing compliance audit, self-report or other process
- "VRF Filing(s)" – one of several already-filed (or very soon to be filed in the case of Version 2) VRF and/or VSL filings

Phase may also be self-explanatory if not one of these entries

	with the CIP Reliability Standards.	statement
49	The Commission also adopts its CIP NOPR approach and concludes that reliance on the NERC registration process at this time is an appropriate means of identifying the entities that must comply with the CIP Reliability Standards	Compliance registry process
72	We adopt our proposal in the CIP NOPR that responsible entities must comply with the substance of a Requirement.	CMEP
75	we direct the ERO to develop modifications to the CIP Reliability Standards that require a responsible entity to implement plans, policies and procedure that it must develop pursuant to the CIP Reliability Standards	Version 2
86	The Commission adopts its CIP NOPR proposal and approves NERC's implementation plan and time frames for responsible entities to achieve auditable compliance.	CMEP
89	we direct the ERO to submit a work plan for Commission approval for developing and filing for approval the modifications to the CIP Reliability Standards that we are directing in this Final Rule	This compliance filing; and an implementation plan is filed with each submitted version of the standards
90	We direct the ERO, in its development of a work plan, to consider developing modifications to CIP-002-1 and the provisions regarding technical feasibility exceptions as a first priority, before developing other modifications required by the Final Rule.	TFE Filing
96	we direct the ERO to require more frequent, semiannual, self-certifications prior to the date by which full compliance is required	CMEP program and self-certifications
97	we adopt our CIP NOPR proposals that, while an	CMEP, self-

	entity should not be subject to a monetary penalty if it is unable to certify that it is on schedule, such an entity should explain to the ERO the reason it is unable to self-certify	certification process
106	the Commission adopts the CIP NOPR proposals and directs NERC to modify the CIP Reliability Standards through the Reliability Standards development process to remove the first two Terms ["reasonable business judgment," and "acceptance of risk"], and develop specific conditions that a responsible entity must satisfy to invoke the "technical feasibility" exception	Version 2 and TFE Filing
128	the Commission directs the ERO to develop modifications to the CIP Reliability Standards that do not include this term. We note that many commenters, including NERC, agree that the reasonable business judgment language should be removed based largely on the rationale articulated by the Commission in the CIP NOPR.	Version 2
138	the Commission directs the ERO to modify the CIP Reliability Standards through its Reliability Standards development process to remove references to reasonable business judgment before compliance audits begin.	Version 2
150	The Commission, therefore, directs the ERO to remove acceptance of risk language from the CIP Reliability Standards.	Version 2
156	the Commission directs the ERO to develop through its Reliability Standards development process revised CIP Reliability Standards that eliminate references to acceptance of risk.	Version 2
178	directs the ERO to develop a set of conditions or criteria that a responsible entity must follow when relying on the technical feasibility exception contained in specific Requirements of the CIP Reliability Standards	TFE Filing
186	the Commission adopts its proposal in the CIP	TFE Filing

	NOPR that technical feasibility exceptions may be permitted if appropriate conditions are in place.	
192	the Commission adopts the CIP NOPR proposal for a three step structure to require accountability when a responsible entity relies on technical feasibility as the basis for an exception. We address mitigation and remediation in this section and direct the ERO to develop: (1) a requirement that the responsible entity must develop, document and implement a mitigation plan that achieves a comparable level of security to the Requirement; and (2) a requirement that use of the technical feasibility exception by a responsible entity must be accompanied by a remediation plan and timeline for elimination the use of the technical feasibility exception.	TFE Filing
209	The Commission thus adopts its CIP NOPR proposal that use and implementation of technical feasibility exceptions must be governed by a clear set of criteria.	TFE Filing
211	direct the ERO to include approval of the mitigation and remediation steps by the senior manager (identified pursuant to CIP-003-1) in the course of developing this framework of accountability.	TFE Filing
212	the practical considerations pointed out by a number of the comments have convinced us to adopt an approach to the issue of external oversight different from the one originally proposed.	TFE Filing
218	we direct the ERO to design and conduct an approval process through the Regional Entities and the compliance audit process.	TFE Filing
219	we direct NERC, in developing the accountability structure for the technical feasibility exception, to include appropriate provisions to assure that governmental entities that are subject to Reliability Standards as users, owners or operators of the Bulk-Power System can safeguard sensitive	TFE Filing

	information.	
220	We direct the ERO to submit an annual report to the Commission that provides a wide-area analysis regarding use of the technical feasibility exception and the effect on Bulk-Power System reliability.	TFE Filing
221	we direct the ERO to control and protect the data analysis to the extent necessary to ensure that sensitive information is not jeopardized by the act of submitting the report to the Commission.	TFE Filing
222	we direct the ERO to develop a set of criteria to provide accountability when a responsible entity relies on the technical feasibility exceptions in specific Requirements of the CIP Reliability Standards.	TFE Filing
222	We direct the ERO to develop appropriate modifications, as discussed above.	TFE Filing
233	we direct the ERO to consult with federal entities that are required to comply with both CIP Reliability Standards and NIST standards on the effectiveness of the NIST standards and on implementation issues and report these findings to the Commission.	Ongoing discussions with Drafting Team Members from USBR, BPA, NIST; Development of Version 5
253	While we adopt our CIP NOPR proposal, we recognize that the ERO has already initiated a process to develop such guidance … leave to the ERO's discretion whether to incorporate such guidance into the CIP Reliability Standard, develop it as a separate guidance document, or some combination of the two.	Guideline / Version 5
254	direct the ERO to consider these commenter concerns [how to assess whether a generator or a blackstart unit is "critical" to Bulk-Power System reliability, the proper quantification of risk and frequency, facilities that are relied on to operate or shut down nuclear generating stations, and the consequences of asset failure and asset misuse by	Guideline / Version 5

	an adversary]when developing the guidance.	
255	we direct either the ERO or its designees to provide reasonable technical support to assist entities in determining whether their assets are critical to the Bulk-Power System.	Version 4
257	we direct the ERO to consider this clarification [the meaning of the phrase "used for initial system restoration," in CIP-002-1, Requirement R1.2.4] in its Reliability Standards development process.	Guideline / Version 4
272	the Commission directs the ERO, in developing the guidance discussed above regarding the identification of critical assets, to consider the designation of various types of data as a critical asset or critical cyber asset.	Guideline / Version 5
272	The Commission directs the ERO to develop guidance on the steps that would be required to apply the CIP Reliability Standards to such data and to consider whether this also covers the computer systems that produce the data.	Guideline / Version 5
282	the Commission directs the ERO, through the Reliability Standards development process, to specifically require the consideration of misuse of control centers and control systems in the determination of critical assets	Guideline / Version 5
285	we direct the ERO to consider the comment from ISA99 Team [ISA99 Team objects to the exclusion of communications links from CIP-002-1 and non-routable protocols from critical cyber assets, arguing that both are key elements of associated control systems, essential to proper operation of the critical cyber assets, and have been shown to be vulnerable – by testing and experience].	Version 5
294	The Commission adopts its CIP NOPR proposal and directs the ERO to develop, pursuant to its Reliability Standards development process, a modification to CIP-002-1 to explicitly require that a senior manager annually review and approve the	Version 2

	risk-based assessment methodology.	
294	the Commission directs the ERO to develop a modification to CIP-002-1 to explicitly require that a senior manager annually review and approve the risk-based assessment methodology.	Version 2
322	The Commission adopts its CIP NOPR proposal to direct that the ERO develop through its Reliability Standards development process a mechanism for external review and approval of critical asset lists.	Version 4 (Note: version 4 methodology obviates the need for external review)
329	the Commission directs the ERO, using its Reliability Standards development process, to develop a process of external review and approval of critical asset lists based on a regional perspective.	Version 4 (Note: version 4 methodology obviates the need for external review)
333	we direct the ERO, in developing the accountability structure for the technical feasibility exception, to include appropriate provisions to assure that governmental entities can safeguard sensitive information	TFE Filing
355	the Commission directs the ERO to provide additional guidance for the topics and processes that the required cyber security policy should address.	Guideline
376	the Commission adopts its CIP NOPR proposal and directs the ERO to clarify that the exceptions mentioned in Requirements R2.3 and R3 of CIP-003-1 do not except responsible entities from the Requirements of the CIP Reliability Standards.	Version 5
381	The Commission adopts its CIP NOPR interpretation that Requirement R2 of CIP-003-1 requires the designation of a single manager who has direct and comprehensive responsibility and accountability for implementation and ongoing	Version 2

	compliance with the CIP Reliability Standards	
386	The Commission adopts its CIP NOPR proposal and directs the ERO to develop modifications to Reliability Standards CIP-003-1, CIP-004-1, and/or CIP-007-1, to ensure and make clear that, when access to protected information is revoked, it is done so promptly.	Version 5
397	The Commission directs the ERO to develop modifications to Requirement R6 of CIP-003-1 to provide an express acknowledgment of the need for the change control and configuration management process to consider accidental consequences and malicious actions along with intentional changes.	Version 5 / Guideline
412	The Commission therefore directs the ERO to provide guidance, regarding the issues and concerns that a mutual distrust posture must address in order to protect a responsible entity's control system from the outside world.	Guideline
431	The Commission adopts the CIP NOPR's proposal and directs the ERO to develop a modification to CIP-004-1 that would require affected personnel to receive required training before obtaining access to critical cyber assets (rather than within 90 days of access authorization), but allowing limited exceptions, such as during emergencies, subject to documentation and mitigation.	Version 2
433	we direct the ERO to consider, in developing modifications to CIP-004-1, whether identification of core training elements would be beneficial and, if so, develop an appropriate modification to the Reliability Standard.	Version 5
434	The Commission adopts the CIP NOPR's proposal to direct the ERO to modify Requirement R2 of CIP-004-1 to clarify that cyber security training programs are intended to encompass training on the networking hardware and software and other issues of electronic interconnectivity supporting	Version 5

	the operation and control of critical cyber assets.	
435	Consistent with the CIP NOPR, the Commission directs the ERO to determine what, if any, modifications to CIP-004-1 should be made to assure that security trainers are adequately trained themselves.	Version 5
443	The Commission adopts with modifications the proposal to direct the ERO to modify Requirement R3 of CIP-004-1 to provide that newly-hired personnel and vendors should not have access to critical cyber assets prior to the satisfactory completion of a personnel risk assessment, except in specified circumstances such as an emergency.	Version 2
443	We also direct the ERO to identify the parameters of such exceptional circumstances through the Reliability Standards development process	Version 5
460	The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset for any reason (including disciplinary action, transfer, retirement, or termination).	Version 5
464	We also adopt our proposal to direct the ERO to modify Requirement R4 to make clear that unescorted physical access should be denied to individuals that are not identified on the authorization list, with clarification.	Version 5
473	The Commission adopts its proposals in the CIP NOPR with a clarification. As a general matter, all joint owners of a critical cyber asset are responsible to protect that asset under the CIP Reliability Standards. The owners of joint use facilities which have been designated as critical cyber assets are responsible to see that contractual obligations include provisions that allow the responsible entity to comply with the CIP	Version 5

	Reliability Standards. This is similar to a responsible entity's obligations regarding vendors with access to critical cyber assets.	
476	we direct the ERO to modify CIP-004-1, and other CIP Reliability Standards as appropriate, through the Reliability Standards development process to address critical cyber assets that are jointly owned or jointly used, consistent	Version 5
496	The Commission adopts the CIP NOPR's proposal to direct the ERO to develop a requirement that each responsible entity must implement a defensive security approach including two or more defensive measures in a defense in depth posture when constructing an electronic security perimeter	Not scheduled System Security
502	The Commission directs that a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process.	Not scheduled System Security
502	The Commission also directs the ERO to consider, based on the content of the modified CIP-005-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.	Not scheduled / Guideline System Security
503	The Commission is directing the ERO to revise the Reliability Standard to require two or more defensive measures.	Not scheduled System Security
511	The Commission adopts the CIP NOPR's proposal to direct the ERO to identify examples of specific verification technologies that would satisfy Requirement R2.4, while also allowing compliance pursuant to other technically equivalent measures or technologies.	Version 5
525	The Commission adopts the CIP NOPR proposal to require the ERO to modify CIP-005-1 to require	Version 5

	logs to be reviewed more frequently than 90 days	
526	the Commission directs the ERO to modify CIP-005-1 through the Reliability Standards development process to require manual review of those logs without alerts in shorter than 90 day increments.	Version 5
526	The Commission directs the ERO to modify CIP-005-1 to require some manual review of logs, consistent with our discussion of log sampling below, to improve automated detection settings, even if alerts are employed on the logs.	Version 5
528	the Commission clarifies its direction with regard to reviewing logs. In directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the ERO could provide, through the Reliability Standards development process, clarification that a responsible entity should perform the manual review of a sampling of log entries or sorted or filtered logs.	Version 5
541	we adopt the ERO's proposal to provide for active vulnerability assessments rather than full live vulnerability assessments.	Version 5
542	the Commission adopts the ERO's recommendation of requiring active vulnerability assessments of test systems.	Version 5
544	the Commission directs the ERO to revise the Reliability Standard so that annual vulnerability assessments are sufficient, unless a significant change is made to the electronic security perimeter or defense in depth measure, rather than with every modification.	Version 5
544	we are directing the ERO to determine, through the Reliability Standards development process, what would constitute a modification that would require an active vulnerability assessment	Version 5
547	we direct the ERO to modify Requirement R4 to	Version 5

	require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years	
560	the Commission directs the ERO to treat any alternative measures for Requirement R1.1 of CIP-006-1 as a technical feasibility exception to Requirement R1.1, subject to the conditions on technical feasibility exceptions.	TFE Filing / CMEP
572	The Commission adopts the CIP NOPR proposal to direct the ERO to modify this CIP Reliability Standard to state that a responsible entity must, at a minimum, implement two or more different security procedures when establishing a physical security perimeter around critical cyber assets.	Not scheduled Physical Security
575	The Commission also directs the ERO to consider, based on the content of the modified CIP-006-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.	Not scheduled / Guideline Physical Security
581	The Commission adopts the CIP NOPR proposal and directs the ERO to develop a modification to CIP-006-1 to require a responsible entity to test the physical security measures on critical cyber assets more frequently than every three years,	Version 5
597	Therefore, the Commission directs the ERO to eliminate the acceptance of risk language from Requirements R2.3 and R3.2.	Version 2
600	Commission therefore directs the ERO to revise Requirement R3 to remove the acceptance of risk language and to impose the same conditions and reporting requirements as imposed elsewhere in the Final Rule regarding technical feasibility.	Version 2 / TFE Filing
609	We therefore direct the ERO to develop requirements addressing what constitutes a "representative system" and to modify CIP-007-1	Version 5 / Guideline

	accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document.	
610	we direct the ERO to revise the Reliability Standard to require each responsible entity to document differences between testing and production environments in a manner consistent with the discussion above.	Version 5
611	the Commission cautions that certain changes to a production or test environment might make the differences between the two greater and directs the ERO to take this into account when developing guidance on when to require updated documentation to ensure that there are no significant gaps between what is tested and what is in production.	Version 5
619	The Commission adopts the CIP NOPR proposal with regard to CIP-007-1, Requirement R4. [The Commission proposed to direct the ERO to eliminate the acceptance of risk language from Requirement R4.2, and also attach the same documentation and reporting requirements to the use of technical feasibility in Requirement R4, pertaining to malicious software prevention, as elsewhere. The Commission discussed the issues of defense in depth, technical feasibility, and risk acceptance elsewhere in the CIP NOPR and applied those conclusions here. The Commission further proposed to direct the ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means]	Version 5 / not scheduled
622	Therefore, the Commission directs the ERO to eliminate the acceptance of risk language from Requirement R4.2	Version 2
622	The Commission also directs the ERO to modify Requirement R4 to include safeguards against	Version 5 / not

	personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means, consistent with our discussion above	scheduled
628	The Commission continues to believe that, in general, logs should be reviewed at least weekly and therefore adopts the CIP NOPR proposal to require the ERO to modify CIP-007-1 to require logs to be reviewed more frequently than 90 days, but leaves it to the Reliability Standards development process to determine the appropriate frequency, given our clarification below, similar to our action with respect to CIP-005-1	Version 5
629	The Reliability Standards development process should decide the degree to which the revised CIP-007-1 describes acceptable log sampling. The ERO could also provide additional guidance on how to create the sampling of log entries, which could be in a reference document.	Version 5 / guideline
633	The Commission adopts the CIP NOPR proposal to direct the ERO to clarify what it means to prevent unauthorized retrieval of data from a cyber asset prior to discarding it or redeploying it.	Version 4
635	the Commission directs the ERO to revise Requirement R7 of CIP-007-1 to clarify, consistent with this discussion, what it means to prevent unauthorized retrieval of data.	Version 4
643	The Commission adopts its proposal to direct the ERO to provide more direction on what features, functionality, and vulnerabilities the responsible entities should address when conducting the vulnerability assessments, and to revise Requirement R8.4 to require an entity-imposed timeline for completion of the already-required action plan.	Version 5 Hodge Podge

651	We direct the ERO to revise Requirement R9 to state that the changes resulting from modifications to the system or controls shall be documented quicker than 90 calendar days.	Version 2
660	The Commission adopts the CIP NOPR proposal to direct the ERO to provide guidance regarding what should be included in the term reportable incident. … we direct the ERO to develop and provide guidance on the term reportable incident.	Guideline
661	the Commission directs the ERO to develop a modification to CIP-008-1 to: (1) include language that takes into account a breach that may occur through cyber or physical means; (2) harmonize, but not necessarily limit, the meaning of the term reportable incident with other reporting mechanisms, such as DOE Form OE 417; (3) recognize that the term should not be triggered by ineffectual and untargeted attacks that proliferate on the internet; and (4) ensure that the guidance language that is developed results in a Reliability Standard that can be audited and enforced	Version 5 / Guideline
673	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.	Version 5 / Guideline
676	the Commission directs the ERO to modify CIP-008-1 to require a responsible entity to, at a minimum, notify the ESISAC and appropriate government authorities of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.	Version 5/ Guideline
686	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1, Requirement R2 to require responsible entities to maintain documentation of paper drills, full operational drills, and responses to actual incidents, all of	Version 5

	which must include lessons learned.	
686	The Commission further directs the ERO to include language in CIP-008-1 to require revisions to the incident response plan to address these lessons learned.	Version 5
694	For the reasons discussed in the CIP NOPR, the Commission adopts the proposal to direct the ERO to modify CIP-009-1 to include a specific requirement to implement a recovery plan.	Version 5
694	We further adopt the proposal to enforce this Reliability Standard such that, if an entity has the required recovery plan but does not implement it when the anticipated event or conditions occur, the entity will not be in compliance with this Reliability Standard.	Version 5
706	The Commission adopts, with clarification, the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to incorporate use of good forensic data collection practices and procedures into this CIP Reliability Standard.	Not scheduled Response & Recovery
710	Therefore, we direct the ERO to revise CIP-009-1 to require data collection, as provided in the Blackout Report.	Not scheduled Response & Recovery
725	The Commission adopts, with modifications, the CIP NOPR proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years.	Not scheduled Response & Recovery
731	The Commission adopts the CIP NOPR proposal to direct the ERO to modify Requirement R3 of CIP-009-1 to shorten the timeline for updating	Version 2

	recovery plans.	
739	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP- 009-1 to incorporate guidance that the backup and restoration processes and procedures required by Requirement R4 should include, at least with regard to significant changes made to the operational control system, verification that they are operational before the backups are stored or relied upon for recovery purposes	Version 5
748	The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to provide direction that backup practices include regular procedures to ensure verification that backups are successful and backup failures are addressed, so that backups are available for future use.	Version 5
757	Therefore, we will not allow NERC to reconsider the Violation Risk Factor designations in this instance but, rather, direct below that NERC make specific modifications to its designations.	VRF Filing(s)
759	Consistent with the Violation Risk Factor Order, the Commission directs NERC to submit a complete Violation Risk Factor matrix encompassing each Commission approved CIP Reliability Standard.	VRF Filing(s)
767	The Commission adopts the CIP NOPR proposal to direct the ERO to revise 43 Violation Risk Factors.	VRF Filing(s)

Project 2008-06 Cyber Security Order 706 SDT
Draft 30th Meeting Agenda
January 18, 2011 Tuesday - 8:00 AM to 6:00 PM EST
January 19, 2011 Wednesday - 8:00 AM to 6:00 PM EST
January 20, 2011 Thursday - 8:00 AM to 6:00 PM EST
American Electric Power Offices
1 Riverside Plaza, Columbus OH

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To review the results of the Final Ballot for CIP Version 4
- To review, refine and test support for CIP Version 5 Need, Goals and Objectives
- To review and discuss integration of results based standards format into CIP V5
- To review and discuss communication plan for CIP V5
- To agree on next steps and assignments

Tuesday, January 18, 2011 8:00 a.m. - 6:00 p.m. EST
- Introduction, welcome -*(Morning)*
- Review results of Ballot CIP Version 4 Final Ballot, comments and next steps and schedule *(Morning)*
- NERC staff support update (*Morning*)
- Industry review: (*Morning*)
    - Cyber Attack TF and Severe Impact Resilience TF
    - CIP-005-4 Update
    - Hill Update
- CIP V5 Needs, Goals and Objectives *(Afternoon)*

Wednesday, January 19, 2011 8:00 a.m. - 6:00 p.m. EST
- Adopt CIP V5 Needs, Goals and Objectives (*Morning*)
- Review CIP V5 Project Schedule (*Morning*)
- CIP-010 Group Review *(Afternoon)*
- Controls Review (*Afternoon*)

Thursday, January 20, 2011 8:00 a.m. - 6:00 p.m. EST
- Controls Review (*Morning*)
- Drafting assignments (*Morning/Afternoon*)
- Review/Discuss communication plan for CIP V5
- Review SDT February, 2011 Taylor, TX Meeting Agenda (*Late Afternoon)*

Project 2008-06 Cyber Security Order 706 SDT
Draft 30th Meeting Agenda
January 18, 2011 Tuesday - 8:00 AM to 6:00 PM EST
January 19, 2011 Wednesday - 8:00 AM to 6:00 PM EST
January 20, 2011 Thursday - 8:00 AM to 6:00 PM EST
American Electric Power Offices
1 Riverside Plaza, Columbus OH

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To review the results of the Final Ballot for CIP Version 4
- To review, refine and test support for CIP Version 5 Need, Goals and Objectives
- To review and discuss integration of results based standards format into CIP V5
- To review and discuss communication plan for CIP V5
- To agree on next steps and assignments

Timed Agenda

Tuesday January 18, 2011 8:00 a.m. - 6:00 p.m. EST

8:00 a.m.	**Introduction, Welcome Opening and Host remarks**- *John Lim, Chair & Phil Huff, Vice Chair, Jim Fletcher, AEP, Host* Roll Call; NERC Antitrust Compliance Guidelines- *Howard Gugel*
8:15	**Review of meeting objectives and Agenda**- *John Lim*
8:20	**Review results of CIP Version 4 Final Ballot results, comments and next steps and schedule** - *Howard Gugel, NERC*
9:00	**Meeting support** - *Howard Gugel, NERC*
9:15	**Industry review – Scott Mix and Others** o Industry Classified Briefing o Cyber Attack TF and Severe Impact Resilience TF o CIP-005-4 Update o Hill Update o Other member updates
10:00	*Break* o
10:15	**Review and discuss Needs, Goals and Objectives –** *John Lim*
12:00	*Lunch*
1:00	***Continue,* Review and discuss Needs, Goals and Objectives**
3:00	*Break*
3:15	**Finalize Needs, Goals and Objectives**
5:50	**Wednesday's agenda**
6:00	*Recess*

Project 2008-06 Cyber Security Order 706 SDT
Draft 30th Meeting Agenda
January 18, 2011 Tuesday - 8:00 AM to 6:00 PM EST
January 19, 2011 Wednesday - 8:00 AM to 6:00 PM EST
January 20, 2011 Thursday - 8:00 AM to 6:00 PM EST
American Electric Power Offices
1 Riverside Plaza, Columbus OH

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To review the results of the Final Ballot for CIP Version 4
- To review, refine and test support for CIP Version 5 Need, Goals and Objectives
- To review and discuss integration of results based standards format into CIP V5
- To review and discuss communication plan for CIP V5
- To agree on next steps and assignments

Wednesday January 19, 2011 8:00 a.m. - 6:00 p.m. EST

8:00	**Welcome and Agenda Review, Roll Call and Antitrust Guidelines**- *John Lim, Phil Huff, Howard Gugel*
8:15	**Test support for CIP V5 Needs, Goals and Objectives** – *John Lim*
9:00	**Review CIP V5 Project Schedule** – *Howard Gugel*
10:00	*Break*
10:15	**Review CIP-010** – *John Lim*
12:00	Lunch
1:00	**Integration of Results Based standards –** *Phil Huff*
2:00	**Review of CIP-011… controls –** *Phil Huff*
3:30	*Break*
3:45	***Continue***: **Review of CIP-011… controls –** *Phil Huff*
5:50	**Review any drafting assignments and Thursday's agenda**
6:00	*Recess*

Project 2008-06 Cyber Security Order 706 SDT
Draft 30th Meeting Agenda
January 18, 2011 Tuesday - 8:00 AM to 6:00 PM EST
January 19, 2011 Wednesday - 8:00 AM to 6:00 PM EST
January 20, 2011 Thursday - 8:00 AM to 6:00 PM EST
American Electric Power Offices
1 Riverside Plaza, Columbus OH

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To review the results of the Final Ballot for CIP Version 4
- To review, refine and test support for CIP Version 5 Need, Goals and Objectives
- To review and discuss integration of results based standards format into CIP V5
- To review and discuss communication plan for CIP V5
- To agree on next steps and assignments

Thursday January 20, 2011 8:00 a.m. - 6:00 p.m. EST

8:00	**Welcome and Agenda Review, Roll Call and Antitrust Guidelines**- *John Lim, Phil Huff, Howard Gugel*
8:15	***Continue***: **Review of CIP-011… controls –** *Phil Huff*
10:15	*Break*

CSO706 SDT
Meeting Schedule and Objectives (DRAFT 12-14-10)

Meeting Location	Dates	Meeting Objective
Columbus, OH AEP	01/18 to 01/20/2011	Full review of CIP-011 requirements in response to industry comment (first of several development iterations for posting in late June)
Interim	1/20 to 2/15/2011	Designated individuals complete drafting assignments on CIP-011
Taylor, TX ERCOT	2/15 to 2/17/2011	Begin review of CIP-010, BES Cyber System Identification Full review of CIP-011 (requirements, measures, change rationale, guidance)
Interim	2/17 to 3/15/2011	Designated individuals complete drafting assignments on CIP-010 and CIP-011 Begin developing implementation plan
New York, NY ConEd	3/15 to 3/17/2011	Review of CIP-011 (requirements, measures, change rationale, guidance) Review of CIP-010 Initial review of implementation plan
Interim	3/17 to 4/12/2011	Designated individuals complete drafting assignments on CIP-010, CIP-011 and implementation plan
Pomona, CA SCE	4/12 to 4/14/2011	Review of CIP-010, CIP-011 and implementation plan
Interim	4/14 to 5/17/2011	Designated individuals complete drafting assignments on CIP-010, CIP-011 and implementation plan Sneak peak industry webinar in early May
Little Rock, AR AECC	5/17 to 5/19/2011	Review of industry feedback Review of change rationale and guidance
Interim	5/19 to	Designated individuals complete drafting

Meeting Location	Dates	Meeting Objective
	6/21/2010	assignments on CIP-010, CIP-011 and implementation plan NERC begins QA
Portland, OR BPA	6/21 to 6/23/2011	SDT and NERC QA on document for posting
Interim	6/23 to 7/19/2011	Posting for comment Prepare for technical workshop?
TBD	7/19 to 7/21/2011	Technical Workshop?
TBD	8/23 to 8/25/2011	Respond to comments
TBD	9/20 to 9/22/2011	Respond to comments and prepare for second posting and ballot
TBD	10/11 to 10/13	

CYBER SECURITY FOR ORDER 706 STANDARD DRAFTING TEAM

CSO 706 SDT Consensus Guidelines*)*

(Adopted, November, 2008, Revised June 2010, Revised July, 2010)

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

Consensus Defined. Consensus is a participatory process whereby, on matters of substance, the Team strives for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for posting CIP standards documents for industry comment or balloting, and the Team finds that 100% acceptance or support of the members present is not achievable, decisions to adopt standards documents for balloting will require at least 2/3rds favorable vote of all members present and voting.

Quorum Defined. The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 2/3 of the appointed members being present in person or by telephone.

Electronic Mail Voting. Electronic voting will only be used when a decision needs to be made between regular meetings under the following conditions:

- It is not possible to coordinate and schedule a conference call for the purpose of voting, or;
- Scheduling a conference call solely for the purpose of voting would be an unnecessary use of time and resources, and the item is considered a small procedural issue that is likely to pass without debate.

Electronic voting will not be used to decide on issues that would require a super majority vote or have been previously voted on during a regular meeting or for any issues that those with opposing views would feel compelled to want to justify and explain their position to other team members prior to a vote. The Electronic Voting procedure shall include the following four steps:

1. The SDT Chair or Vice-Chair in his absence will announce the vote on the SDT mailing list and include the following written information: a summary of the issue being voted on and the vote options; the reason the electronic voting is being conducted; the deadline for voting (which must be at least 4 hours after the time of the announcement).
2. Electronic votes will be tallied at the time of the deadline and no further votes will be counted. If quorum is not reached by the deadline then the vote on the proposal will not pass and the deadline will not be extended.
3. Electronic voting results will be summarized and announced after the voting deadline back to the SDT+ mailing list.
4. Electronic voting results will be recapped at the beginning of the next regular

meeting of the SDT.

Consensus Building Techniques and Robert's Rules of Order. The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Only Team members may participate in consensus ranking or votes on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Chair, Vice Chair or Facilitator. The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure),* as modified by the Team's adopted procedural guidelines, to make and approve motions. However, the 2/3's voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision-making on substantive motions and amendments to motions. The Team will develop substantive written materials and options using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once the Chair determines that a facilitated discussion is completed.

Project 2008-06 Cyber Security Order 706 SDT
31st Meeting Agenda
February 15, 2011 Tuesday - 8:00 AM to 6:00 PM CST
February 16, 2011 Wednesday - 8:00 AM to 6:00 PM CST
February 17, 2011 Thursday - 8:00 AM to 6:00 PM CST
ERCOT
800 Airport Drive, Taylor, TX

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To agree on whether to post CIP Version 5 as a single standard or multiple standards
- To evaluate options with NERC compliance staff to minimize excessive compliance costs while improving cyber security
- To review and refine CIP Version 5 BES Cyber System identification and security requirements
- To agree on next steps and assignments

Timed Agenda

Tuesday February 15, 2011 8:00 a.m. - 6:00 p.m. CST

8:00 a.m.	**Introduction, Welcome Opening and Host remarks**- *John Lim, Chair & Phil Huff, Vice Chair, Jim Brenton, ERCOT, Host* Roll Call; NERC Antitrust Compliance Guidelines- *Howard Gugel, NERC*
8:15	**Review of meeting objectives and Agenda**- *John Lim*
8:20	**Industry Review**- *Scott Mix, NERC, Mike Keane, FERC and others* o DOE Audit Report o FERC Technical Conference o Cyber Attack TF and Severe Impact Resilience TF o CIP-005-4 Update
8:50	**Discussion on format for posting** – *John Lim*
10:00	*Break*
10:15	***Continue,* Discussion on format for posting**
11:30	**Motion on format for posting next version of CIP Cyber Security Standards**
12:00	*Lunch*
1:00	**Evaluate writing programmatic requirements –** *Mike Moon, NERC and other NERC compliance staff*
3:00	*Break*
3:15	**Evaluate minimizing zero-defect requirements –** *Mike Moon and compliance staff*
4:30	**Evaluate options for improving the TFE process -** *Mike Moon and compliance staff*
5:50	**Review any Drafting Assignments and Wednesday's agenda**
6:00	*Recess*

Project 2008-06 Cyber Security Order 706 SDT
31st Meeting Agenda
February 15, 2011 Tuesday - 8:00 AM to 6:00 PM CST
February 16, 2011 Wednesday - 8:00 AM to 6:00 PM CST
February 17, 2011 Thursday - 8:00 AM to 6:00 PM CST
ERCOT
800 Airport Drive, Taylor, TX

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To agree on whether to post CIP Version 5 as a single standard or multiple standards
- To evaluate options with NERC compliance staff to minimize excessive compliance costs while improving cyber security
- To review and refine CIP Version 5 BES Cyber System identification and security requirements
- To agree on next steps and assignments

Wednesday February 16, 2011 8:00 a.m. - 6:00 p.m. CST

8:00 a.m.	**Welcome and Agenda Review, Roll Call and Antitrust Guidelines** – *John Lim, Philip Huff, Howard Gugel*
8:15	**Review Project Schedule –** *Philip Huff*
8:40	**Review and Refine BES Cyber System Identification** – *John Lim*
10:00	*Break*
10:15	***Continue,* Review and Refine BES Cyber System Identification**
12:00	*Lunch*
1:00	**Review modifications to style guide for security requirements –** *Philip Huff*
1:30	**Review and Refine Security Policy, Change Management, Information Protection and Maintenance Requirements –** *Dave Revill, Georgia Transmission*
3:00	*Break*
3:15	***Continue,* Review and Refine Security Policy, Change Management, Information Protection and Maintenance Requirements**
3:30	**Review and Refine Personnel and Physical Security Requirements –** *Doug Johnson, ComEd*
5:50	**Review any Drafting Assignments and Thursday's agenda**
6:00	*Recess*

Project 2008-06 Cyber Security Order 706 SDT
31st Meeting Agenda
February 15, 2011 Tuesday - 8:00 AM to 6:00 PM CST
February 16, 2011 Wednesday - 8:00 AM to 6:00 PM CST
February 17, 2011 Thursday - 8:00 AM to 6:00 PM CST

NEED, GOALS AND OBJECTIVES – PROJECT 2008-06 - CIP CYBER SECURITY STANDARDS V5 – ADOPTED JANUARY 2011

NEED

The need for Critical Infrastructure Protection (CIP) in North America has never been more compelling or necessary than it is today. This is especially true of the electricity sector. Electric power is foundational to our social and economic fabric, acknowledged as one of the most essential and among the most targeted of all the interrelated critical infrastructure sectors.

The Bulk Electric System (BES) is a complex, interconnected collection of facilities that increasingly uses standard cyber technology to perform multiple functions essential to grid reliability. These BES Cyber Systems provide operational efficiency, intercommunications and control capability. They also represent an increased risk to reliability if not equipped with proper security controls to decrease vulnerabilities and minimize the impact of malicious cyber activity.

Cyber attacks on critical infrastructure are becoming more frequent and more sophisticated. Stuxnet is a prime example of an exploit with the potential to seriously degrade and disrupt the BES with highly malicious code introduced via a common USB interface. Other types of attacks are network or Internet-based, requiring no physical presence and potentially affecting multiple facilities simultaneously. It is clear that attack vectors are plentiful, but many exploits are preventable. The common factors in these exploits are vulnerabilities in BES Cyber Systems. The common remedy is to mitigate those vulnerabilities through application of readily available cyber security measures, which include prevention, detection, response and recovery.

In the cyber world, security is truly only as good as its weakest implementation. The need to identify BES Cyber Systems and then protect them through effective cyber security measures are critical steps in helping ensure the reliability of the BES functions they perform.

In approving Version 1 of CIP Standards CIP-002-1 through CIP-009-1, FERC issued a number of directives to the ERO. Versions 2, 3 and 4 addressed the short term standards-related and Critical Asset identification issues from these directives. There are still a number of unresolved standards-related issues in the FERC directives that must be addressed. This version is needed to address these remaining directives in FERC Order 706.

GOALS AND OBJECTIVES

- **Goal 1:** To address the remaining Requirements-related directives from all CIP related FERC orders, all approved interpretations, and CAN topics within applicable existing requirements.
    - **Objective 1.** Provide a list of each directive with a description and rationale of how each has been addressed.
    - **Objective 2.** Provide a list of approved interpretations to existing requirements with a description of how each has been addressed.
    - **Objective 3.** Provide a list of CAN topics with a description of how each has been addressed.
    - **Objective 4.** Consider established security practices (e.g. DHS, NIST) when developing requirements.
    - **Objective 5.** Incorporate the work of Project 2010-15 Urgent Action SAR.
- **Goal 2:** To develop consistent identification criteria of BES Cyber Systems and application of cyber security requirements that are appropriate for the risk presented to the BES.
    - **Objective 6**: Transition from a Critical Cyber Asset framework to a BES Cyber System framework.
    - **Objective 7.** Develop criteria to identify and categorize BES Cyber Systems, leveraging industry approved bright-line criteria in CIP-002-4.
    - **Objective 8.** Develop appropriate cyber security requirements based on categorization of BES Cyber Systems.
    - **Objective 9.** Minimize writing requirements at the device specific level, where appropriate.
- **Goal 3:** To provide guidance and context for each Standard Requirement
    - **Objective 10.** Use the Results-Based Standards format to provide rationale statements and guidance for all of the Requirements.

- **Objective 11.** Develop measures that describe specific examples that may be used to provide acceptable evidence to meet each requirement. These examples are not all inclusive ways to provide evidence of compliance, but provide assurance that they can be used by entities to show compliance.
- **Objective 12.** Work with NERC and regional compliance and enforcement personnel to review and refine measures.

- **Goal 4:** To leverage current stakeholder investments used for complying with existing CIP requirements.
  - **Objective 13.** Map each new requirement to the requirement(s) in the prior version from which the new requirement was derived.
  - **Objective 14.** Justify change in each requirement which differs from the prior version.
  - **Objective 15.** Minimize changes to requirements which do not address a directive, interpretation, broad industry feedback or do not significantly improve the Standards.
  - **Objective 16.** Justify any other changes (e.g. removals, format)
- **Goal 5:** To minimize technical feasibility exceptions.
  - **Objective 17.** Develop requirements at a level that does not assume the use of specific technologies.
  - **Objective 18.** Allow for technical requirements to be applied more appropriately to specific operating environments (i.e. Control Centers, Generation Facilities, and Transmission Facilities). (also maps to Goal 2)
  - **Objective 19.** Allow for technical requirements to be applied more appropriately based on connectivity characteristics. (also maps to Goal 2)
  - **Objective 20.** Ensure that the words "where technically feasible" exist in appropriate requirements.
- **Goal 6:** To develop requirements that foster a "culture of security" and due diligence in the industry to compliment a "culture of compliance".
  - **Objective 21.** Work with NERC Compliance Staff to evaluate options to reduce compliance impacts such as continuous improvement processes, performance based compliance processes, or SOX-like evaluation methods.
  - **Objective 22.** Write each requirement with the end result in mind, (minimizing the use of inclusive phrases such as "every device," "all devices," etc.)
  - **Objective 23.** Minimize compliance impacts due to zero-defect requirements.

- **Goal 7:** To develop a realistic and comprehensible implementation plan for the industry.
    - **Objective 24.** Avoid per device, per requirement compliance dates**.**
    - **Objective 25.** Address complexities of having multiple versions of the CIP standards in rapid succession.
    - **Objective 26.** Consider implementation issues by setting realistic timeframes for compliance.
    - **Objective 27.** Rename and modify IPFNICCAANRE to address BES Cyber System framework.

CYBER SECURITY FOR ORDER 706 STANDARD DRAFTING TEAM

CSO 706 SDT Consensus Guidelines*)*

(Adopted, November, 2008, Revised June 2010, Revised July, 2010)

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

Consensus Defined. Consensus is a participatory process whereby, on matters of substance, the Team strives for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for posting CIP standards documents for industry comment or balloting, and the Team finds that 100% acceptance or support of the members present is not achievable, decisions to adopt standards documents for balloting will require at least 2/3rds favorable vote of all members present and voting.

Quorum Defined. The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 2/3 of the appointed members being present in person or by telephone.

Electronic Mail Voting. Electronic voting will only be used when a decision needs to be made between regular meetings under the following conditions:

- It is not possible to coordinate and schedule a conference call for the purpose of voting, or;
- Scheduling a conference call solely for the purpose of voting would be an unnecessary use of time and resources, and the item is considered a small procedural issue that is likely to pass without debate.

Electronic voting will not be used to decide on issues that would require a super majority vote or have been previously voted on during a regular meeting or for any issues that those with opposing views would feel compelled to want to justify and explain their position to other team members prior to a vote. The Electronic Voting procedure shall include the following four steps:

1. The SDT Chair or Vice-Chair in his absence will announce the vote on the SDT mailing list and include the following written information: a summary of the issue being voted on and the vote options; the reason the electronic voting is being conducted; the deadline for voting (which must be at least 4 hours after the time of the announcement).
2. Electronic votes will be tallied at the time of the deadline and no further votes will be counted. If quorum is not reached by the deadline then the vote on the proposal will not pass and the deadline will not be extended.
3. Electronic voting results will be summarized and announced after the voting deadline back to the SDT+ mailing list.
4. Electronic voting results will be recapped at the beginning of the next regular

meeting of the SDT.

Consensus Building Techniques and Robert's Rules of Order. The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Only Team members may participate in consensus ranking or votes on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Chair, Vice Chair or Facilitator. The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure),* as modified by the Team's adopted procedural guidelines, to make and approve motions. However, the 2/3's voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision-making on substantive motions and amendments to motions. The Team will develop substantive written materials and options using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once the Chair determines that a facilitated discussion is completed.

Project 2008-06 Cyber Security Order 706 SDT
32nd Meeting Agenda
March 15, 2011 Tuesday - 8:00 AM to 6:00 PM EST
March 16, 2011 Wednesday - 8:00 AM to 6:00 PM EST
March 17, 2011 Thursday - 8:00 AM to 6:00 PM EST
Con Edison
4 Irving Place, New York, NY 10003

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To review and assess CIP V5 multiple standard format (CIP-002 – CIP-00X)
- To finalize concepts and number of impact levels
- To finalize concepts on minimum requirements and drafting level of requirements
- To review and refine CIP Version 5 BES Cyber System identification and security requirements
- To agree on next steps and assignments

Timed Agenda

Tuesday March 15, 2011 8:00 a.m. - 6:00 p.m. EST

8:00 a.m.	**Introduction, Welcome Opening and Host remarks**- *John Lim, Chair & Phil Huff, Vice Chair,* Roll Call; NERC Antitrust Compliance Guidelines- *Howard Gugel, NERC*
8:15	**Review of meeting objectives and Agenda**- *John Lim*
8:20	**Industry Review**- *Scott Mix, NERC, Mike Keane, FERC and others* o Cyber Attack TF Report o CIPC Report o CIP-005-4 Update o Other Cyber Security business
8:50	**Review of CIP V5 Multiple Standard Format** – *John Lim*
10:00	*Break*
10:15	**Discussion on CIP-002-5 impact levels**
12:00	*Lunch*
1:00	**Discussion on minimum requirements for all BES Cyber Systems**
3:00	*Break*
3:15	**Discussion on level of requirements (high level or detailed/prescriptive, environment, communication protocol)**
5:50	**Review any Drafting Assignments and Wednesday's agenda**
6:00	*Recess*

Project 2008-06 Cyber Security Order 706 SDT
32nd Meeting Agenda
March 15, 2011 Tuesday - 8:00 AM to 6:00 PM EST
March 16, 2011 Wednesday - 8:00 AM to 6:00 PM EST
March 17, 2011 Thursday - 8:00 AM to 6:00 PM EST
Con Edison
4 Irving Place, New York, NY 10003

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To review and assess CIP V5 multiple standard format (CIP-002 – CIP-00X)
- To finalize concepts and number of impact levels
- To finalize concepts on minimum requirements and drafting level of requirements
- To review and refine CIP Version 5 BES Cyber System identification and security requirements
- To agree on next steps and assignments

Wednesday February 16, 2011 8:00 a.m. - 6:00 p.m. EST

8:00 a.m.	**Welcome and Agenda Review, Roll Call and Antitrust Guidelines** – *John Lim, Philip Huff, Howard Gugel*
8:15	**Review Project Schedule –** *Philip Huff*
8:40	**Review and Refine BES Cyber System Identification (CIP-002-5)** – *John Lim*
10:00	*Break*
10:15	***Continue,* Review and Refine BES Cyber System Identification**
12:00	*Lunch*
1:00	**Review modifications to style guide for security requirements –** *Philip Huff*
1:30	**Review and Refine CIP-003-5 (Security Policy, Change Management, Information Protection and Maintenance Requirements) –** *Dave Revill, Georgia Transmission*
3:00	*Break*
3:15	***Continue,* Review and Refine CIP-003-5 (Security Policy, Change Management, Information Protection and Maintenance Requirements)**
3:30	**Review and Refine CIP-004-5 (Personnel) and CIP-006-5 (Physical Security Requirements) –** *Doug Johnson, ComEd*
5:50	**Review any Drafting Assignments and Thursday's agenda**
6:00	*Recess*

Project 2008-06 Cyber Security Order 706 SDT
32nd Meeting Agenda
March 15, 2011 Tuesday - 8:00 AM to 6:00 PM EST
March 16, 2011 Wednesday - 8:00 AM to 6:00 PM EST
March 17, 2011 Thursday - 8:00 AM to 6:00 PM EST
Con Edison
4 Irving Place, New York, NY 10003

NOTE: Agenda Times May be Adjusted as Needed during the Meeting

Proposed Meeting Objectives/Outcomes:

- To review and assess CIP V5 multiple standard format (CIP-002 – CIP-00X)
- To finalize concepts and number of impact levels
- To finalize concepts on minimum requirements and drafting level of requirements
- To review and refine CIP Version 5 BES Cyber System identification and security requirements
- To agree on next steps and assignments

Thursday February 17, 2011 8:00 a.m. - 6:00 p.m. CST

8:00 a.m.	**Welcome and Agenda Review, Roll Call and Antitrust Guidelines** – *John Lim, Philip Huff, Howard Gugel*
8:15	**Review and Refine CIP-004-5 (Electronic Access Control Requirements)** – *Sharon Edwards, Duke Energy*
10:00	*Break*
10:15	**Review and Refine CIP-005-4 and CIP-007-4 (System and Boundary Protection Requirements) –** *Jay Cribb, Southern Company*
12:00	*Lunch*
1:00	**Review and Refine (CIP-008-5) Response and CIP-009-4 (Recovery Requirements) –** *Scott Rosenberger, Future Holdings*
3:00	*Break*
3:15	**Review project schedule and agree to next steps**
4:30	**Review Communication Plan –** *Howard Gugel/Joe Bucciero*
5:00	**Review SDT April 2011 Sacramento, CA (SMUD) Meeting**
6:00	*Adjourn*

CSO706 SDT
Meeting Schedule and Objectives

Meeting Location	Dates	Meeting Objective
Columbus, OH AEP	01/18 to 01/20/2011	Full review of CIP-011 requirements in response to industry comment (first of several development iterations for posting in late June)
Interim	1/20 to 2/15/2011	Designated individuals complete drafting assignments on CIP-011
Taylor, TX ERCOT	2/15 to 2/17/2011	Begin review of CIP-010, BES Cyber System Identification Full review of CIP-011 (requirements, measures, change rationale, guidance)
Interim	2/17 to 3/15/2011	Designated individuals complete drafting assignments on CIP-010 and CIP-011 Begin developing implementation plan
New York, NY ConEd	3/15 to 3/17/2011	Review of CIP V5 (requirements, measures, change rationale, guidance) Initial review of implementation plan
Interim	3/17 to 4/12/2011	Designated individuals complete drafting assignments on CIP V5 and implementation plan
Sacramento, CA SMUD	4/12 to 4/14/2011	Review of CIP V5 and implementation plan
Interim	4/14 to 5/17/2011	Designated individuals complete drafting assignments on CIP V5 and implementation plan Sneak peak industry webinar in early May
Little Rock, AR AECC	5/17 to 5/19/2011	Review of industry feedback Review of change rationale and guidance
Interim	5/19 to 6/21/2010	Designated individuals complete drafting assignments on CIP V5 and implementation plan NERC begins QA

Meeting Location	Dates	Meeting Objective
????????	6/21 to 6/23/2011	SDT and NERC QA on document for posting
Interim	6/23 to 7/19/2011	Posting for comment Prepare for technical workshop?
TBD	7/19 to 7/21/2011	Technical Workshop?
TBD	8/23 to 8/25/2011	Respond to comments
TBD	9/20 to 9/22/2011	Respond to comments and prepare for second posting and ballot
TBD	10/11 to 10/13

NEED, GOALS AND OBJECTIVES – PROJECT 2008-06 - CIP CYBER SECURITY STANDARDS V5 – ADOPTED JANUARY 2011

NEED

The need for Critical Infrastructure Protection (CIP) in North America has never been more compelling or necessary than it is today. This is especially true of the electricity sector. Electric power is foundational to our social and economic fabric, acknowledged as one of the most essential and among the most targeted of all the interrelated critical infrastructure sectors.

The Bulk Electric System (BES) is a complex, interconnected collection of facilities that increasingly uses standard cyber technology to perform multiple functions essential to grid reliability. These BES Cyber Systems provide operational efficiency, intercommunications and control capability. They also represent an increased risk to reliability if not equipped with proper security controls to decrease vulnerabilities and minimize the impact of malicious cyber activity.

Cyber attacks on critical infrastructure are becoming more frequent and more sophisticated. Stuxnet is a prime example of an exploit with the potential to seriously degrade and disrupt the BES with highly malicious code introduced via a common USB interface. Other types of attacks are network or Internet-based, requiring no physical presence and potentially affecting multiple facilities simultaneously. It is clear that attack vectors are plentiful, but many exploits are preventable. The common factors in these exploits are vulnerabilities in BES Cyber Systems. The common remedy is to mitigate those vulnerabilities through application of readily available cyber security measures, which include prevention, detection, response and recovery.

In the cyber world, security is truly only as good as its weakest implementation. The need to identify BES Cyber Systems and then protect them through effective cyber security measures are critical steps in helping ensure the reliability of the BES functions they perform.

In approving Version 1 of CIP Standards CIP-002-1 through CIP-009-1, FERC issued a number of directives to the ERO. Versions 2, 3 and 4 addressed the short term standards-related and Critical Asset identification issues from these directives. There are still a number of unresolved standards-related issues in the FERC directives that must be addressed. This version is needed to address these remaining directives in FERC Order 706.

GOALS AND OBJECTIVES

- **Goal 1:** To address the remaining Requirements-related directives from all CIP related FERC orders, all approved interpretations, and CAN topics within applicable existing requirements.
    - **Objective 1.** Provide a list of each directive with a description and rationale of how each has been addressed.
    - **Objective 2.** Provide a list of approved interpretations to existing requirements with a description of how each has been addressed.
    - **Objective 3.** Provide a list of CAN topics with a description of how each has been addressed.
    - **Objective 4.** Consider established security practices (e.g. DHS, NIST) when developing requirements.
    - **Objective 5.** Incorporate the work of Project 2010-15 Urgent Action SAR.
- **Goal 2:** To develop consistent identification criteria of BES Cyber Systems and application of cyber security requirements that are appropriate for the risk presented to the BES.
    - **Objective 6**: Transition from a Critical Cyber Asset framework to a BES Cyber System framework.
    - **Objective 7.** Develop criteria to identify and categorize BES Cyber Systems, leveraging industry approved bright-line criteria in CIP-002-4.
    - **Objective 8.** Develop appropriate cyber security requirements based on categorization of BES Cyber Systems.
    - **Objective 9.** Minimize writing requirements at the device specific level, where appropriate.
- **Goal 3:** To provide guidance and context for each Standard Requirement
    - **Objective 10.** Use the Results-Based Standards format to provide rationale statements and guidance for all of the Requirements.

- **Objective 11.** Develop measures that describe specific examples that may be used to provide acceptable evidence to meet each requirement. These examples are not all inclusive ways to provide evidence of compliance, but provide assurance that they can be used by entities to show compliance.
- **Objective 12.** Work with NERC and regional compliance and enforcement personnel to review and refine measures.

- **Goal 4:** To leverage current stakeholder investments used for complying with existing CIP requirements.
  - **Objective 13.** Map each new requirement to the requirement(s) in the prior version from which the new requirement was derived.
  - **Objective 14.** Justify change in each requirement which differs from the prior version.
  - **Objective 15.** Minimize changes to requirements which do not address a directive, interpretation, broad industry feedback or do not significantly improve the Standards.
  - **Objective 16.** Justify any other changes (e.g. removals, format)
- **Goal 5:** To minimize technical feasibility exceptions.
  - **Objective 17.** Develop requirements at a level that does not assume the use of specific technologies.
  - **Objective 18.** Allow for technical requirements to be applied more appropriately to specific operating environments (i.e. Control Centers, Generation Facilities, and Transmission Facilities). (also maps to Goal 2)
  - **Objective 19.** Allow for technical requirements to be applied more appropriately based on connectivity characteristics. (also maps to Goal 2)
  - **Objective 20.** Ensure that the words "where technically feasible" exist in appropriate requirements.
- **Goal 6:** To develop requirements that foster a "culture of security" and due diligence in the industry to compliment a "culture of compliance".
  - **Objective 21.** Work with NERC Compliance Staff to evaluate options to reduce compliance impacts such as continuous improvement processes, performance based compliance processes, or SOX-like evaluation methods.
  - **Objective 22.** Write each requirement with the end result in mind, (minimizing the use of inclusive phrases such as "every device," "all devices," etc.)
  - **Objective 23.** Minimize compliance impacts due to zero-defect requirements.

- **Goal 7:** To develop a realistic and comprehensible implementation plan for the industry.
    - **Objective 24.** Avoid per device, per requirement compliance dates**.**
    - **Objective 25.** Address complexities of having multiple versions of the CIP standards in rapid succession.
    - **Objective 26.** Consider implementation issues by setting realistic timeframes for compliance.
    - **Objective 27.** Rename and modify IPFNICCAANRE to address BES Cyber System framework.

CYBER SECURITY FOR ORDER 706 STANDARD DRAFTING TEAM

CSO 706 SDT Consensus Guidelines*)*

(Adopted, November, 2008, Revised June 2010, Revised July, 2010)

The Cyber Security for Order 706 Standard Drafting Team (Team) will seek consensus on its recommendations for any revisions to the CIP standards.

Consensus Defined. Consensus is a participatory process whereby, on matters of substance, the Team strives for agreements which all of the members can accept, support, live with or agree not to oppose. In instances where, after vigorously exploring possible ways to enhance the members' support for posting CIP standards documents for industry comment or balloting, and the Team finds that 100% acceptance or support of the members present is not achievable, decisions to adopt standards documents for balloting will require at least 2/3rds favorable vote of all members present and voting.

Quorum Defined. The Team will make decisions only when a quorum is present. A quorum shall be constituted by at least 2/3 of the appointed members being present in person or by telephone.

Electronic Mail Voting. Electronic voting will only be used when a decision needs to be made between regular meetings under the following conditions:

- It is not possible to coordinate and schedule a conference call for the purpose of voting, or;
- Scheduling a conference call solely for the purpose of voting would be an unnecessary use of time and resources, and the item is considered a small procedural issue that is likely to pass without debate.

Electronic voting will not be used to decide on issues that would require a super majority vote or have been previously voted on during a regular meeting or for any issues that those with opposing views would feel compelled to want to justify and explain their position to other team members prior to a vote. The Electronic Voting procedure shall include the following four steps:

1. The SDT Chair or Vice-Chair in his absence will announce the vote on the SDT mailing list and include the following written information: a summary of the issue being voted on and the vote options; the reason the electronic voting is being conducted; the deadline for voting (which must be at least 4 hours after the time of the announcement).
2. Electronic votes will be tallied at the time of the deadline and no further votes will be counted. If quorum is not reached by the deadline then the vote on the proposal will not pass and the deadline will not be extended.
3. Electronic voting results will be summarized and announced after the voting deadline back to the SDT+ mailing list.
4. Electronic voting results will be recapped at the beginning of the next regular

meeting of the SDT.

Consensus Building Techniques and Robert's Rules of Order. The Team will develop its recommendations using consensus-building techniques with the leadership of the Chair and Vice Chair and the assistance of the facilitators. Techniques such as brainstorming, ranking and prioritizing approaches will be utilized. The Team's consensus process will be conducted as a facilitated consensus-building process. Only Team members may participate in consensus ranking or votes on proposals and recommendations. Observers/members of the public are welcome to speak when recognized by the Chair, Vice Chair or Facilitator. The Team will utilize Robert's Rules of Order *(as per the NERC Reliability Standards Development Procedure),* as modified by the Team's adopted procedural guidelines, to make and approve motions. However, the 2/3's voting requirement will supersede the normal voting requirements used in Robert's Rules of Order for decision-making on substantive motions and amendments to motions. The Team will develop substantive written materials and options using their adopted facilitated consensus-building procedures, and will use Robert's Rules of Order only for formal motions once the Chair determines that a facilitated discussion is completed.
