		Operating Limits (IROLs). APPA Comments: APPA believes that criteria 1.9 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). SDT Proposed:1.10. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3. APPA Comments: APPA does not have a comment on criteria 1.10 at this time. SDT Proposed:1.11. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements. APPA Comments: APPA does not have a comment on criteria 1.11 at this time. SDT Proposed:1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). APPA Comments: APPA understands there are utilities within the NPCC region that have SPS type 3 systems that only protect local areas. We seek verification from the SDT that the SPS they refer to in criteria 1.12 is for wide area protection only. SDT Proposed:1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. APPA Comments: APPA believes the SDT's change in wording of criteria 1.13 will inadvertently bring in all SCADA systems with the capability of shedding load even if such SCADA systems are in fact not planned or operated to perform load shedding. As written, this criteria designates as a critical asset various control systems that by themselves could not cause instability or uncontrolled separation of the BES.APPA offers the following alternatives for rewording 1.13:1.13 Common control system(s) configured to perform automatic load shedding of 300 MW or more within 15 minutes. APPA can accept the bright-line of 300 MW if the wording is changed to that stated above, but we still see this bright-line as an arbitrary threshold based on a quantity that has no BES operational significance. Rather, 300 MW is a DOE threshold for electric event reporting. SDT Proposed:1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. APPA Comments: APPA is concerned that criteria 1.14 is overly broad because it includes all BA and TOP

Organization	Yes or No	Question 2 Comment
		control centers regardless of size. We understand the critical nature of control centers and the need to protect against loss of control of major sections of the BES. However, we ask that the SDT revise this criteria to include a bright-line with similar impact as those in 1.1 and 1.15. APPA offers the following revised wording:1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator with a minimum of 1500 MW of resources under its control. APPA cannot support this standard revision without some form of bright line cutoff to exclude small BAs and TOPs that cannot cause instability or uncontrolled separation of the BES. However, we will support inclusion of "ALL BA and TOP control centers" when this standard is revised to provide for a tiered (High, Medium and Low) categorization of Critical Assets, such as the SDT's draft CIP-010-1 proposal. SDT Proposed:1.15. Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. APPA Comments: In the NERC Draft CIP-002-4 webinar it was stated that a control center in criteria 1.15 is understood to be controlling multiple units. APPA recommends that the SDT clarify the wording in criteria 1.15 to coincide with this understanding: 1.15 Each control center or backup control center used to control multiple generation units identified as Critical Assets designated under criterion 1.3 or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. SDT Proposed:1.16. Any additional assets that the Responsible Entity deems appropriate to include. APPA Comments: APPA believes that 1.16 should be removed from the Attachment 1 criteria. We expect that registered entities may voluntarily protect assets above and beyond the ones listed in these criteria. However, we just do not see the reliability benefit of imposing a compliance liability to those self identified critical assets. We feel that the NERC and Regional compliance staff will waste valuable time and resources evaluating entity compliance with cyber security controls for assets that are outside of the scope of this standard.

Response: Thank you for your comments.

Item 1.1 – The SDT notes your concern that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. The drafting team used time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used. The 12 month time period was used so that seasonal ratings would not be an issue for generating plants that operate near the 1500 MW bright line.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the

Organization	Yes or No	Question 2 Comment
		Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources. Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5 "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started" where the Transmission Operator can choose between the next Facilities on the BES to energize. This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.7 – The SDT agrees to change "stations" to "stations or substations." The SDT does not believe that power flow based bright-line criteria that is based on MW flows into or out of a substation would meet the objective of uniform application of Critical Asset identification across all entities. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.8 – The SDT agrees to change "stations" to "stations or substations." According to FAC-014-2 IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. The present wording is appropriate. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 - The SDT agrees to change "stations" to "stations or substations." This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.12 – Since this item only applies to SPSs that have IROLs associated with them, local area SPSs are not included. This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11

Organization	Yes or No	Question 2 Comment
		or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.15 – This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.
IRC Standards Review Committee	No	See comments to Question 1 above, and the proposed Attachment 1. (Below copied from question 1) The assets that should be subject to protection under the NERC CIP Standards should not be driven by the physical assets that are implicated in maintaining physical system reliability from an operations and planning perspective. There is not a direct relationship between assets that are subject to protection under the CIP standards and assets that form the basis for the current NERC understanding of planning and operating reliability. Nor should the scope of cyber assets be determined by the identification of physical asset by third parties. Under the current and proposed CIP Standards, the scope of jurisdictional cyber assets is driven by an entity's Critical Assets, which are physical assets that impact system reliability from an operations/planning perspective (i.e. Critical Assets are defined as: Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.). In addition, the proposed standards include third party identification of critical assets. The Standards Drafting Team should take this opportunity to eliminate all of these inappropriate relationships. As an initial matter, the SDT should remove the term "Critical Assets" from the standard. This term should be replaced with a general term, such as "Assets Subject to Cyber Security Protection". This change will eliminate the inappropriate cause and effect relationship between physical system reliability - i.e. operations and planning - and cyber security. Instead, the general term directly links the driver of asset identification to cyber security. The next step should focus on the explicit identification of assets that fall within this category. The identification should be based on an objective list of assets. This mitigates the problems that arise from the application of a subjective identification methodology. Attached to these comments is a proposed list, which is intended to be used as a starting point (see proposed Attachment 1 below). The SRC believes this list includes asset types that should be subject to the CIP standards. However, at this point, the list is illustrative and is not intended to be exhaustive. This approach enables the identification of assets that are subject to cyber security protection irrespective of their relationship to the definition of "Critical Asset". By decoupling the assets subject to cyber protection from the subjective "Critical Asset" terminology, the proposed approach actually expands the number of assets that are subject to the CIP standards. This

Organization	Yes or No	Question 2 Comment
		approach is a relative improvement because it provides certainty to the regulated community and the regulators by removing the subjectivity associated with the use of terms such as “critical” or “reliability”. In addition to the above recommendations, the SDT should also revise Attachment 1 to explicitly clarify which functional entities are responsible for the relevant asset types. A revised version of Attachment 1 that reflects the above recommendations is provided below. CIP-002-4 - Attachment 1 Assets Subject to Cyber Security Protection The following are assets subject to Cyber Security Protection: 1. By the Generation Owner (GO): 1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. 1.2. Each resource asset that the GO’s Planning Coordinator identifies that if that asset is destroyed, degraded, misused or otherwise rendered unavailable, will violate one or more Interconnection Reliability Operating Limits (IROLs). 1.3. Each Blackstart Resource identified in the GO’s Transmission Operator's restoration plan. 1.4. Each control center, control system, backup control center, or backup control system used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. 1.5. Each GO’s Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). 2. By the Transmission Owner (TO): 2.1. Transmission Facilities operated at 500 kV or higher. 2.2. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. 2.3. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater. 2.4. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. 2.5. Each resource asset that the TO’s Planning Coordinator identifies that if that asset is destroyed, degraded, misused or otherwise rendered unavailable, will violate one or more Interconnection Reliability

Organization	Yes or No	Question 2 Comment
		Operating Limits (IROLs). 2.6. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. 2.7. Each TO's Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). 2.8. Transmission Facilities identified by a nuclear asset owner as essential to meeting Nuclear Plant Interface Requirements. 2.9. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.4. 2.10. Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). 3. By the Reliability Coordinator 3.1. Each control center, control system, backup control center, or backup control system used to perform the RC functional obligations 4. By the Transmission Operator 4.1. Each control center, control system, backup control center, or backup control system used to perform the TOP functional obligations 4.2. Each TOP's Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). 5. Balancing Authority 5.1. Each control center, control system, backup control center, or backup control system used to perform the BA functional obligations
Response: Thank you for your comments. The drafting team agrees that the issue of Cyber Security and Cyber Security protection is extremely complicated. The Attachment 1 criteria were under development for CIP-010 when the team was asked to use the criteria for the basis of a new CIP Version 4 set of standards. The team expects to continue its work on a functional approach after Version 4. The SDT feels that the current format for Attachment 1 is sufficient.		

Organization	Yes or No	Question 2 Comment
Bonneville Power Administration	Yes	Make it clear that substations are the facilities to be identified as Transmission Critical Assets, not lines, transformers, reactive equipment, etc. Another alternative would be to identify all facilities that operate at a specified certain kV level would be determined to be Critical Assets. The different categories identified in Attachment 1 still allow utilities to justify most of what they have already declared as Critical Assets.
Response: Thank you for your comments. Substations are not the only Facilities identified as Critical Assets. Lines, transformers, reactive equipment, and other Facilities can be classified as a Critical Asset if they meet any of the criteria in Attachment 1. Please refer to the guidance document posted on the project page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf for additional clarification.		
PSEG Companies	Yes	In Attachment 1, item 1.4 the blackstart units deemed critical should be only those identified by the TOP as specified to meet the minimum critical blackstart requirement. The TOP may choose to list all its area blackstart capable units in its plan for informational purposes, but a subset of that list may be what is required for blackstart and only those should be considered critical. PSEG suggests that 1.4 be reworded as follows:"Each Blackstart Resource identified in the Transmission Operator's restoration plan required to meet the minimum critical blackstart requirement." For item 1.5, please provide a definition of "initial switching requirements" in the item language. For all other items in Attachment 1, PSEG concurs with and hereby incorporates by reference the comments filed by Edison Electric Institute ("EEI") in this matter.
Response: Thank you for your comments. Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources. Item 1.5 – The term "initial switching requirements" came from EOP-005-2 R1.5 "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started." This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan."		
Pepco Holdings, Inc - Affiliates	Yes	PHI supports the comments of EEI for Attachment 1. In particular, we believe that the Planning Coordinator and Transmission Planner should be added to the applicability list. Also note that the terms "single plant

Organization	Yes or No	Question 2 Comment
		location" (1.1) and "single station location" (1.5) are undefined. EEI has also made clarifying language changes.
Response: Thank you for your comments. Since there is no Requirement that applies to the Planning Coordinator or the Transmission Planner, it is not appropriate to include them in the Applicability section. Please refer to the response to EEI's comments.		
MRO's NERC Standards Review Subcommittee	Yes	Item 1.4 Item 1.4 uniformly identifies all Blackstart Resources listed in the Transmission Operator's restoration plan as being Critical Assets with regards to the Bulk Electric System. Currently, many utilities include multiple Blackstart resources in the restoration plans they provide to the Transmission Operator. Including numerous resources makes the plan much more robust and reliable, as it provides well documented options should any problems occur. As currently written, Item 1.4 inadvertently provides incentive to utilities to remove resources from the restoration plan, reducing the plan's overall effectiveness. Therefore, we believe there should be a hierarchy for Blackstart Resources, similar to nearly all other elements being considered, that would allow them to remain listed in the restoration plan without uniformly being identified as critical. To implement this approach, we believe it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just its simple inclusion. A 10 MW Blackstart Resource that directly supports restoration of a critical generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies localized load during an outage. Therefore, we would propose judging the relative importance of a Blackstart Resource by the relative importance of the facilities it directly supports.We would recommend rewording item 1.4 as follows, leveraging the existing language of Item 1.15 and the capacity bright line of Item 1.13:"Each Blackstart Resource identified in the Transmission Operator's restoration plan as used to directly start generation identified as a Critical Asset, or identified in the Transmission Operator's restoration plan as used to directly start generation greater than an aggregate of 300 MW."We believe this approach should provide a better sense of a Blackstart Resource's true impact on the Bulk Electric System, resulting in Critical Assets that adequately address system reliability in a practical manner. It also addresses the inadvertent incentive for removing blackstart resources from the restoration plan. Item 1.7 We believe this bright line is overly simplistic, and does not provide an accurate measuring stick for defining critical Transmission Facilities. Per NERC TPL-001, we believe the Planning Coordinator or Transmission Planner already perform an annual near-term assessment that could be leveraged to provide a more accurate bright line. We would recommend rewording Item 1.7 as follows, leveraging the existing language of Item 1.7 and the capacity bright line of Item 1.1:"Each Transmission Facility operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher where the Planning Coordinator or Transmission Planner identifies the sum of the incoming power flows or the sum of the outgoing power flows to exceed 1500 MW."It would be our intention that this particular assessment be based on the forecasted

Organization	Yes or No	Question 2 Comment
		peak conditions using Category A of Table 1 of the TPL-001 standard. Item 1.13 We believe this item needs to be clarified to confirm that it applies to a single common control system only, and not multiple but separate "like" systems that in aggregate are capable of load shedding up to 300 MW. Also, we believe this item needs to be clarified to confirm that it applies to systems "configured" for automatic load shedding, not simply just "capable" of load shedding. This should only apply to firm load and not demand side management (DSM).Therefore, we believe this bright line should be reworded as follows:"A single common control system configured for performing automatic load shedding of 300 MW or more of firm load within 15 minutes." Item 1.14 We do not believe all control center/systems and backup control centers/systems performing the functional obligations of the Balancing Authority or Transmission Operator should uniformly be considered critical to the Bulk Electric System. We believe the previously proposed CIP-010 criteria 1.13 and 1.14 delineations based on MW or voltage levels should be maintained to provide a more accurate bright line for identifying critical systems. Items 1.8, 1.9, & 1.12 Criteria 1.8, 1.9, and 1.12 should be modified because loss of facilities does not cause an IROL violation. An IROL includes a limit and a time constant Tv. In order for an IROL violation to occur, the limit must be exceeded for at least the time constant Tv. Tv is usually 30 minutes. Thus, when we consider the impact on the loss of facilities on an IROL, an operator will have enough time to adjust the system to prevent an IROL violation. For 1.8, the criterion should be modified to reflect that the facilities that comprise an IROL should be considered critical. The drafting team may also wish to consider loss of any facilities that set up the need for the IROL as well or cause the actual limit to change. For criterion 1.9, it is not clear why FACTs devices need to be singled out. Are they not covered in criterion 1.8 under Transmission Facilities? Inclusion of 1.9 is redundant and just causes confusion because it causes the reader to infer that the drafting team intended for them to be treated differently when in fact the criterion is the same as 1.8. For criterion 1.12, it would be more appropriate to assess the impact of an SPS, RAS, or automated switching system on the IROL. If loss of the SPS, RAS, or automated switching system causes an IROL to decrease, then the SPS, RAS, or automated switching system should be considered critical. Contrary to the companion draft guidance document statement in the second paragraph on page 11, most SPS, RAS and automated switching systems are not used to prevent disturbances that would result in IROLs. In fact, some regions consider generation runback schemes to be an SPS even when it is used to simply resolve a generation outlet issue for loss of a line out of a plant. This is a common and economically effective way to avoid the expense of building more transmission lines. This paragraph from the draft guidance document should be

Organization	Yes or No	Question 2 Comment
		removed. Item 1.16 Recommend removal of this criterion, this criterion is arbitrary and doesn't constitute a bright line.
Response: Thank you for your comments. Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT believes that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources. We will consider your suggested language in a future version when the topic of prioritization is addressed. Item 1.7 – The SDT does not feel that a power flow analysis would lead to a consistent application of the criterion, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. We thank you for your proposal and will take it under consideration for future revisions. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 – FACTS devices were singled out to ensure that there was no confusion as to whether or not they were considered Critical Assets. Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
Santee Cooper	Yes	We believe the Attachment 1 criteria is too prescriptive and would add unnecessary economic and resource burdens. For example, we have made investments to ensure that redundant blackstart resources as well as redundant cranking paths are available where needed for restoration, and therefore any one blackstart

Organization	Yes or No	Question 2 Comment
		resource or cranking path is not critical to the viability of our restoration plans. Therefore, considering any one such blackstart resource or cranking path critical diminishes the value of our original investment in redundancy. We also believe the SDT's change in wording of criteria 1.13 may inappropriately apply to all SCADA systems with the capability of shedding load greater than 300 MW. Such a requirement should only apply to common control systems that are "configured" to perform automatic load shedding of 300 MW or more. We believe 1.16 in Attachment 1 should be deleted since it is not consistent with the "bright line" concept.
Response: Thank you for your comments Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
Dominion	Yes	Dominion has the following comments: 1.1 While we understand the SDT's reasoning for using net Real Power capability, we prefer the use of a more 'stable' value such as generator value (pMax, nameplate rating, etc.) used in the interconnection planning process. We have seen that the net Real Power capability fluctuates annually and have found that using such a value in compliance may not in the best interest of reliability. We began using the value cited in the interconnection planning process because it doesn't change often and any change is usually accompanied by change management process includes extensive communication between the Transmission Planner and Generator Owner. For this reason, we believe that this is a superior value to use. 1.15 Dominion believes the second criteria is overly conservative and is not necessary for reliability. We cite the following observations:(1) It is likely that many of the generators that will be designated critical assets will be nuclear (due to the typical large size of individual generators and the fact that there are usually more than one unit at each location). However, control and monitoring of nuclear generation is vastly different than other forms of generation (coal, oil, gas, and hydro). Nuclear units are typically either on-line (at very near rated

Organization	Yes or No	Question 2 Comment
		output) or are off-line. Therefore the 'control' of the units consists typically of outage coordination and reporting. The data used to monitor these units (typically mW and mVAr) may or may not be transmitted directly to the TOP. Where the data is transmitted directly to the TOP, the generation control center function consists primarily of outage coordination and reporting. This does not, in our view, warrant critical designation of the control center itself since this coordination and reporting can occur without such center.(2) Where other types of generators (peaking CTs, hydro, etc.) are operated in a manner similar to nuclear (on line at near rated output or off line), we view the control center function as being almost identical to that described above and therefore do not agree that such center should be designated as critical..(3) Where the generator output is not being controlled in a very dynamic manner (such as when proving ancillary services; regulation or spinning reserve), 'control' often consists of manual (verbal) dispatch to follow load (I.E. lower output during off-peak hours, higher during on-peak hours and near maximum during peak hours). It is not critical that such generator be dispatched from a designated location (control center), it could be done from almost anywhere that has the necessary communications infrastructure. Where this is true, we do not agree that the control center needs to be designated as critical. (4) We do not believe there is sound technical basis for the 1500 mw threshold. In ERCOT, this value represents approximately 1.4% of the total generation in that Interconnection. In the Western it represents 0.6% and in the Eastern, it represents .02%. We therefore suggest that this criterion be revised in a manner similar to one of the examples shown below: "Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of; Example 1 - Based upon some ratio or multiple of frequency response for each Interconnection. This would involve more analysis but would set threshold based on the presumption that misuse could result in loss of all generators controlled by the generation control center and the impact of such loss could result in a drop in frequency of that interconnection to an 'unacceptable value' (perhaps that value is .02 Hz, .05 Hz, etc). Acceptance of this proposal might require such value be re-determined on a regular basis (annual, 5 year, ?) or based upon some trigger (large increase or decrease in total generation or frequency response within that interconnection). Example 2 - Set mw threshold based upon some percentage total generation in the interconnect, but insure that the resulting threshold is less than the sum of all load included in UFLS and UVLS programs within that Interconnect. For example, if UFLS and UVLS are based on 30% of system load, set this threshold at say 5-20% of total generation (verifying that the percentage chosen results in a threshold than is less than the sum of load shed programs.
Response: Thank you for your comments. Item 1.1 –The drafting team used time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest		

Organization	Yes or No	Question 2 Comment
value was used. The 12 month time period was used so that seasonal ratings would not be an issue for generating plants that operate near the 1500 MW bright line. Item 1.15 – A control center function includes Bulk Power System (BPS) and system status monitoring and processing for reliability and asset management purposes, such as providing information used by Responsible Entities to make operational decisions regarding the reliability and operability of the BPS. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. Your proposal to use frequency response or percent of total load in an interconnection is similar to an approach taken by the SDT to use reserve sharing for the threshold for generation. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. The SDT believes that the same threshold should be used for generation control systems.		
Edison Mission Marketing and Trading	Yes	* Specify for who (function) the Requirements apply to as do other NERC Reliability Standards.* Replace the term 'Critical Assets' with 'Assets subject to Cyber Security Protection'.
Response: Thank you for your comments. The Applicability section of the standard specifies what NERC Registered Entities the standard applies to. All Requirements apply to all Entities listed in the Applicability section. Critical Asset is a defined NERC term and has been used for CIP Versions 1 to 3.		
Florida Municipal Power Agency	Yes	1.1 Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. FMPA Comments: FMPA commends the SDT for their attempted to come to agreement on a nationwide bright line for generating units based on an operationally significant threshold. However, FMPA continues to have the comment we submitted in CIP-010-1 standard as having arbitrary bright lines for generating units and requested that these bright line numbers have justification or have them based on the Contingency Reserve of each Reserve Sharing Group region. FMPA is concerned that the use of the “Real Power Capability of the preceding 12 months” would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. To alleviate this volatility we suggest that generation owners should use the facility ratings which are calculated and communicated under FAC-009-1 R2. SDT Proposed:1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater. FMPA Comments: FMPA believes that this “bright line” is arbitrary and instead suggests combining this with 1.9. There is no significant difference between the MVARs provided by FACTs devices and those provided by a power plant and it makes sense to treat them both in the same fashion. SDT Proposed:1.3. Each generation Facility that the Planning Coordinator or Transmission Planner

Organization	Yes or No	Question 2 Comment
		designates as required for reliability purposes. FMPA Comments: FMPA commends the SDT on including the criteria in 1.3, which gives the PC and TP the ability to designate as critical any generating facilities for reliability purposes. This will cover critical units that are not captured within the bright line of criteria 1.1 without drawing in all units of a certain size that are not considered critical elsewhere on the system. FMPA suggests that the designation of facilities be based on studies conducted under the TPL standards to justify the designation. Also, the use of NERC Glossary of term: "Adverse Reliability Impacts" will help clarify which units should be in this category. We are also concerned that the PC or TP will be looking at local vs. wide area reliability. There are some cases where the PC can designate Must Run units for temporary situations so this must be clarified within the criteria. FMPA proposes the following rewording of criteria 1.3:"1.3 Each generation Facility that the Planning Coordinator or Transmission Planner designates as required to avoid BES Adverse Reliability Impacts for 1 year or longer." SDT Proposed:1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. FMPA Comments: FMPA is concerned that designating all Blackstart Resources as critical will divert limited resources to protect blackstart facilities that are only used to restore localized load. We believe it is the intent of the drafting team to identify the truly critical blackstart units (taking from the CIP-010-1 draft; only high impact facilities). FMPA understands that criteria 1.4 uniformly identify all Blackstart Resources listed in the Transmission Operator's restoration plan as being Critical Assets with regards to the Bulk Electric System. Currently, many utilities include multiple Blackstart resources in the restoration plans provided to the Transmission Operator. Including numerous resources makes the plan much more robust and reliable as it provides additional well documented restoration options should unforeseen problems occur. As currently written, Item 1.4 inadvertently incentivizes utilities to remove blackstart resources from the restoration plan if these resources are not critical to an effective restoration plan, reducing the plan's overall robustness. Therefore, we believe there should be a threshold for Blackstart Resources, similar to nearly all other elements being considered in Attachment 1. This would allow utilities the freedom to include numerous resources in the Transmission Operators restoration plan without being swept into being identified as a critical asset.To implement this approach, we believe it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just its simple inclusion. For example, a 10 MW Blackstart Resource that directly supports restoration of a critical generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies local load during an outage. Therefore, FMPA would propose judging the criticality of a Blackstart Resource by the relative importance of the generating unit(s) it directly supports. We would recommend rewording item 1.4 as follows, leveraging the existing language of criteria 1.15 and the capacity bright-line of criteria 1.13:1.4 Each Blackstart Resource identified in the Transmission Operator's restoration plan, which meet either of the following criteria:1.4.1 Used to directly start generation identified as a Critical Asset in criteria 1.1 or 1.3, 1.4.2 Used to directly start generation greater than an aggregate of 300 MW. We believe this approach should provide a better measure of a Blackstart Resource's potential impact on the Bulk Electric System, resulting in Critical Assets that adequately address

Organization	Yes or No	Question 2 Comment
		system reliability in a practical manner. It also mitigates the likelihood that registered entities may decide to retire certain small blackstart units, thereby removing valuable but not critical blackstart resources from the Transmission Operator's restoration plan. SDT Proposed:1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. FMPA Comments: FMPA commends the SDT on differentiating between a single Cranking Path as a critical facility and multiple Cranking Paths as having redundancy in the BES and thus being less critical. Having this criteria stated in 1.5 incentivizes the entity to build in redundancy in infrastructure to lower criticality of a single asset. This truly does reward infrastructure reliability through a standard. FMPA suggests that the SDT change "switching requirements" to "switching equipment." SDT Proposed:1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. FMPA Comments: FMPA believes that criteria 1.7 is rather arbitrary and suggests use of TPL-004-0 Category D testing and to combine 1.7 with 1.8. Does loss of a substation result in an IROL or Adverse Reliability Impacts? Doing so can also remove the voltage class limit. It is also unclear from the working whether the entire substation is a Critical Asset, or whether each Facility connected to that substation is a Critical Asset. FMPA suggests the entire substation. It is also unclear for substations that have two voltage levels (e.g., a 345 kV to 115 kV substation), whether the entire substation should be considered, or just one voltage level. FMPA suggests one voltage level as discussed in the existing TPL-004 standard. SDT Proposed:1.8. Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). FMPA Comments: FMPA believes that criteria 1.8 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). Also the use of term Adverse Reliability Impact would be beneficial. Proposed rewording of criteria 1.8:1.8. Transmission Facilities at a single station or substation that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs) or can cause an Adverse Reliability Impact as a result of extreme contingency loss of substation testing as part of the TPL standards or as determined by the Reliability Coordinator. SDT Proposed:1.9. Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). FMPA Comments: FMPA believes that criteria 1.9 should be reworded to "station or substation" instead of just

Organization	Yes or No	Question 2 Comment
		"station" so that it is not implied that it only applies to power plants (station). Also the use of term Adverse Reliability Impact would be beneficial. SDT Proposed:1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). FMPA Comments: FMPA believes that adding the phrase “or can cause an Adverse Reliability Impact” would be beneficial. SDT Proposed:1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. FMPA Comments: FMPA believes that the 300 MW is arbitrary and seems based more on reporting requirements than on true reliability impacts. Also, it should not matter whether loss of load is caused by an “automatic” system or not. In addition, the power system is more resilient to loss of load than loss of generation; hence, by using the same threshold as is used in 1.1, we are actually being quite conservative. FMPA offers the following alternatives for rewording 1.13:1.13 Common control system(s) that can result in a loss of load equal to or greater than the reserve sharing requirements of the Reserve Sharing Group within 15 minutes. SDT Proposed:1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. FMPA Comments: FMPA is concerned that criteria 1.14 is overly broad because it includes all BA and TOP control centers regardless of size. We understand the critical nature of control centers and the need to protect against loss of control of major sections of the BES. However, we ask that the SDT revise this criteria to include a bright-line with similar impact as those in 1.1 and 1.15.FMPA offers the following revised wording:1.14. Each control center, control system, backup control center, or backup control system that can:1.14.1 Cause a loss of generation or load greater than the reserve sharing requirements of the Reserve Sharing Group1.14.2 That if manipulated, can cause an Adverse Reliability Impact as determined through planning studies. FMPA cannot support this standard revision without some form of bright line cutoff to exclude small BAs and TOPs that cannot cause instability, cascading or uncontrolled separation of the BES. SDT Proposed:1.15. Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. FMPA Comments: With the proposed revision to 1.14, this 1.15 would no longer be required.

Organization	Yes or No	Question 2 Comment
		SDT Proposed:1.16. Any additional assets that the Responsible Entity deems appropriate to include. FMPA Comments: FMPA believes that 1.16 should be removed from the Attachment 1 criteria. We expect that registered entities may voluntarily protect assets above and beyond the ones listed in these criteria. However, we just do not see the reliability benefit of imposing a compliance liability to those self identified critical assets. We feel that the NERC and Regional compliance staff will waste valuable time and resources evaluating entity compliance with cyber security controls for assets that are outside of the scope of this standard.

Response: Thank you for your comments.

Item 1.1 – The SDT notes your concern that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. The drafting team used time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used. The 12 month time period was used so that seasonal ratings would not be an issue for generating plants that operate near the 1500 MW bright line. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. In addition, the scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method.

Item 1.2 – The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality. FACTS devices in 1.9 are specifically related to IROLs, whereas the reactive resources in 1.2 are not limited to IROL applications.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.

Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5 "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started" where the Transmission Operator can choose between the next Facilities on the BES to energize. This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan."

Item 1.7 –The SDT does not believe that power flow based bright-line criteria (i.e. using TPL-004-0) would meet the objective of uniform application of Critical Asset identification across all entities. The term Transmission Facilities can be applied to either the entire substation or each Facility or group of Facilities connected to that substation, as determined by the entity. This would allow an entity which has multiple voltage levels at a single substation to either declare the

Organization	Yes or No	Question 2 Comment
		entire substation as a Critical Asset or only the portion of the substation that qualifies under criterion 1.7. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.8 –The SDT agrees to change "stations" to "stations or substations." The SDT does not believe that power flow based bright-line criteria (i.e. using TPL standards) would meet the objective of uniform application of Critical Asset identification across all entities. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 - The SDT agrees to change "stations" to "stations or substations." This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.12 – By limiting the scope of Criterion 1.12 to IROLs, Adverse Reliability Impacts are covered as well. This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.15 – This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.
PNGC Power	Yes	We associate ourselves with NRECA comments: 1. We're concerned that designating all Blackstart Resources as critical will divert limited resources to protect blackstart facilities that are only used to restore localized load. We believe it is the intent of the drafting team to identify the truly critical blackstart units (taking from the CIP-010-1 draft; only high impact facilities). We understands that criteria 1.4 uniformly identify all Blackstart Resources listed in the Transmission Operator's restoration plan as being Critical Assets with regards to the Bulk Electric System. Currently, many utilities

Organization	Yes or No	Question 2 Comment
		include multiple Blackstart resources in the restoration plans provided to the Transmission Operator. Including numerous resources makes the plan much more robust and reliable as it provides additional well documented restoration options should unforeseen problems occur. As currently written, Item 1.4 inadvertently incentivizes utilities to remove blackstart resources from the restoration plan if these resources are not critical to an effective regional restoration plan, reducing the plan's overall effectiveness. Therefore, we believe there should be a threshold for Blackstart Resources, similar to nearly all other elements being considered in Attachment 1. This would allow utilities the freedom to include numerous resources in the Transmission Operators restoration plan without being swept into being identified as a Critical Asset. To implement this approach, we believe it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just its simple inclusion. For example, a 10 MW Blackstart Resource that directly supports restoration of a critical generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies local load during an outage. Therefore, we would propose judging the criticality of a Blackstart Resource by the relative importance of the generating unit(s) it directly supports. 2. In item 1.7 the statement regarding "three or more other transmission stations" is confusing. A better explanation is needed -- does this mean stations upstream, downstream, networked or radial? 3. In item 1.14 the term "control center" must be defined, especially when dealing with the significance of the requirements of this standard. Using an undefined term here is inappropriate. 4. In item 1.14 its states that all RC, BA and TOP control centers, etc., are Critical Assets. While NRECA agrees with this as it relates to RCs, we do not agree with this as it relates to all BAs and TOPs. In the draft CIP-010 there was high, medium and low criteria which in many instances appropriately matching CIP requirements to the level of risk certain assets potentially present to the BPS. NRECA strongly believes that the CIP-002-4 standard requirements for smaller BAs and TOPs should match the lower level of risk to BPS reliability that these smaller BAs and TOPs potentially present. Similar to the 1500MW size criteria that is included in item 1.15 for generator control centers, there should be size criteria for the smaller BAs and TOPs. The drafting team should modify item 1.14 to state that all control centers with a peak demand above 2000MW (same as medium criteria in draft CIP-010) shall be designated as a Critical Asset. This is the lowest NRECA could support and also recommend its members to support. We firmly believe that this would capture all of the control centers that truly have a material impact on the reliability of the BPS. 5. Related to the Critical Asset Criteria, there should be a provision in the standard that provides a process for an entity to technically demonstrate that even though the criteria identifies some of their assets as Critical Assets, their assets (or a portion thereof) do not meet the definition of a Critical Asset and should be excluded from applicability of CIP-003 through CIP-009.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT believes that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources. Item 1.7 – The intent of criterion 1.7 is to classify as a Critical Asset Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation-only substations are not counted in this criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.14 - At this time, the SDT is choosing not to add control center to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." The SDT believes that having an exception process to the criteria presents the same challenges associated with a risk-based assessment in external review and oversight.		
WECC		No specific recommended changes, but some stakeholders have indicated the criteria will lead to the identification of FEWER Critical Assets. Please reveiw for appropriateness.
Response: Thank you for your comments.		
Southern Company	Yes	Southern recommends the following changes: 1.6. Transmission Facilities operated at 500 kV or higher Voltage alone is not a sufficient criterion to determine whether or not an asset is critical to the bulk electric system. Southern believes that the way the asset is interconnected should also be included as a portion of the criteria. Accordingly, Southern suggests the SDT delete Section 1.6 based on the comments stated in this paragraph and the protections offered

Organization	Yes or No	Question 2 Comment
		under Section 1.7. Southern agrees with the SDT's proposed language for criterion 1.11 and believes it is important for this criterion to continue to incorporate the language from NUC-001-2 (i.e., "identified as essential to meeting Nuclear Plant Interface Requirements"). To make Section 1.14 consistent with the language in Section 1.15, Southern recommends the following changes to Section 1.14: 1.14. Each control center and , backup control center used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. Southern recommends the following change to Section 1.16: 1.16. Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include.
Response: Thank you for your comments. Item 1.6 – The drafting team believes all Transmission Facilities operated at 500 kV or higher do not require any further qualification for their role as components of the backbone on the interconnected BES. Item 1.11 – Thank you for your comment. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
Encari, LLC	No	
Arizona Public Service	No	
Edison Electric Institute	Yes	EEI offers the following suggestions for Attachment 1: 1.1 EEI Comment: The phrase "single plant location" is undefined. It is unclear if this means at a single street address or within some number of miles. 1.3 Substitute Text: Each generation Facility that the Planning Coordinator or Transmission Planner has

Organization	Yes or No	Question 2 Comment
		designated as required to avoid one or more reliability criteria violations. 1.3 EEI Comment: The purpose of these changes is to facilitate the Planning Coordinator or Transmission Planner the opportunity to identify Generation Facilities that have been historically required to support the BES. This criteria is not meant to create the need for new or different planning models to be used by the Planning Coordinator or Transmission Planner. 1.5 Substitute Text: The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where two or more path options exist. 1.8 Substitute Text: Transmission Facilities at a single station location that the Planning Coordinator or Transmission Planner has designated that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations. 1.8 EEI Comment: The phrase “single station location” is undefined. It is unclear if this means at a single street address or within some number of miles. The Planning Coordinator and Transmission Planner determine and communicate IROLs in the planning time horizon per NERC reliability standard FAC-014. The subject Transmission Facilities are the contingency facilities communicated by the PC and TP per requirement R5 of FAC-014. This criteria is not meant to create the need for new or different planning models to be used by the Planning Coordinator or Transmission Planner. Rather, they should continue to use the legacy planning models as specified in FAC-010, FAC-011 and FAC-014. 1.9 Substitute Text: Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limit (IROLs) violations. 1.11 Substitute Text: Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements. 1.12 Substitute Text: Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROLs) violations for failure to operate as designed. 1.14 Substitute Text: Each control center, or backup control center, used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. 1.14 EEI Comment: Made consistent with 1.15 1.16 Substitute Text: Any additional assets owned by the Responsible Entity that the Responsible Entity

Organization	Yes or No	Question 2 Comment
		deems appropriate to include.
Response: Thank you for your comments. Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 – This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements. Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
Tennessee Valley Authority	Yes	1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. The language

Organization	Yes or No	Question 2 Comment
(TVA)		appears to require us to designate "Each" component in the System Restoration plan as CA. Because we currently have black start procedures which include at least 2 paths for black start of most generation plants in the system, the proposed language would require the extension of CA designation to a large number of components which otherwise would not be included by other criteria. The flexibility provided by our robust transmission infrastructure and the large number of black start capable plants serves to ensure reliable operation of the BES, but designating as a CA each component that could participate in the total paths possible doesn't seem consistent with the intent of the standard. Recommendation: Revise language to allow entities to limit CA designation to those components participating in the primary black start path. 1.10. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3.There isn't a clear definition of the term "directly connected." Without this definition there are many way to interpret this requirement. Is this language meant to describe a facility where the substation is co-located with a generation facility? Also, does the language this mean total loss of substation or only partial? Recommendation: For the purpose of this standard revise language to clearly define "directly connected."
Response: Thank you for your comments. Item 1.4 – The SDT used the word "primary" in its initial posting of CIP-010-1, but received industry feedback that the term was confusing and it is not a defined NERC Glossary term, nor is it used in EOP-005-2. A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources. Item 1.10 – The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any transmission Facility the loss of which would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset. That might include the partial or total loss of a substation. This criterion has been changed to "Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3."		
PacifiCorp	Yes	: PacifiCorp suggests improvements to several of the current Critical Asset criteria in Attachment 1: Criteria 1.8, 1.9, and 1.12 currently refer to certain assets that could violate one or more Interconnection

Organization	Yes or No	Question 2 Comment
		Reliability Operating Limits (IROLs). However, the term "IROL" is not generally utilized within the Western Electricity Coordinating Council (WECC). Instead, WECC uses the term System Operating Limits (SOLs). The Standards Drafting Team should supplement these criteria to reflect this distinction. PacifiCorp suggests the following language: "...violate one or more Interconnection Reliability Operating Limits (IROLs), or, for WECC members, System Operating Limits (SOLs) for the transfer paths identified in the most current list of Major WECC Transfer Paths in the Bulk Electric System." Criterion 1.9 currently refers to "Flexible AC Transmission Systems (FACTS) at a single station location," but NERC offers no uniform definition for this term. Such a scenario could lead to confusion among responsible entities, as many devices could be considered FACTS, including static VAR compensators (SVC), D-VAR (Dynamic VAR), synchronous condensers, series caps, STATCOM, and phase shifters. As such, a definition for FACTS should either be included in Attachment 1 or added to the NERC Glossary of Terms.
Response: Thank you for your comments. Items 1.8, 1.9, and 1.12 – According to FAC-014-2 IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. Criterion 1.8 has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Criterion 1.9 has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Criterion 1.12 has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.9 - FACTS is defined by IEEE as "Alternating Current Transmission Systems incorporating power electronics-based and other static controllers to enhance controllability and power transfer capability." Commonly accepted terms and definitions do not require an insertion in the NERC Glossary.		
OGE	Yes	(In General) Clarify Attachment 1 criteria to minimize the interpretation variance. (1.1) Add more specificity to the term "location".(1.1) Refer to MOD-024 within the standard. For the 1500 MW "bright line"; it needs to be perfectly clear which units are included. (1.3) This criteria is open for auditors to interpret; standards should not be this open-ended. Use language that requires that the facilities be formally designated as "required for reliability purposes", in advance. (1.4) Change to "Each resource designated as a Blackstart Resource in the Transmission Operator's restoration plan as required in EOP-005." If a resource is "also mentioned" and/or is "Blackstart capable", it is not necessarily a Critical Asset. (1.5) This criteria conflicts with the NERC Glossary definition for the term "Cranking Path". The glossary does

Organization	Yes or No	Question 2 Comment
		not specify multiple path options, yet the criteria indicates "up to the point on the Cranking Path where multiple path options exist". By NERC definition, the cranking path may connect two generation resources and never have multiple options. Include in the criteria "Where multiple path options do not exist, the entire Cranking Path is included."(1.5) Should this criteria include a time element? Must this be a permanent "Cranking Path"? (1.6) The criteria compounds the NERC Glossary terms "Transmission" and "Facilities" which is inappropriate. A new "local" definition for the term "Transmission Facilities" should be derived for use in this standard and proposed as an addition to the NERC glossary.(1.6) The criteria appears to include transmission lines as Critical Assets. The overhead associated with tracking all 500+ kV transmission line segments, breakers, busses, and other equipment is excessive.(1.6) Consider using capacity instead of nominal voltage level as the bright line. Dual 345kV lines may be used in place of a single 765kV line. Although there may be independent cyber assets, the loss of either will have a similar impact to the BES. (1.7) The criteria compounds the NERC Glossary terms "Transmission" and "Facilities" which is inappropriate. A new "local" definition for the term "Transmission Facilities" should be derived for use in this standard and proposed as an addition to the NERC glossary.(1.7) Locally define and explicitly exclude "Generation Interconnection Facilities" from this criteria. This term is used in the NERC document, "Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface" located at http://www.nerc.com/files/GO-TO_Final_Report_Complete_2009Nov16.pdf. (1.10) See [1.7] comment "Locally define..." (1.13) Define "automatic" within the standard.(1.13) Use the same "bright line" as generation, 1500 MW. While understood it is a reporting threshold, it is difficult to understand how the loss of 300 MW has a significant impact to the reliable operation of the BES. (1.15) Distinguish between Control Center and Control Room within the Standard or attachment.

Response: Thank you for your comments.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant. It is NERC's practice not to directly refer to other standards by name in developing standard language.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the

Organization	Yes or No	Question 2 Comment
System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." Based on the glossary term Blackstart Resource, the SDT has determined that the reference to EOP-005 is unnecessary. It is NERC's practice not to directly refer to other standards by name in developing standard language. Item 1.5 – Cranking Path is defined as "A portion of the electric system that can be isolated and then energized to deliver electric power from a generation source to enable the startup of one or more other generating units." It does not specify multiple paths, but it also does not exclude them. This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.6 – The SDT appropriately uses the phrase "Transmission Facilities." The SDT is referring to Facilities that comprise Transmission. The issue with using capacity (or rating) instead of voltage level does not meet the objective of uniform application of Critical Asset identification across all entities. Item 1.7 – The SDT appropriately uses the phrase "Transmission Facilities." The SDT is referring to Facilities that comprise Transmission. It should be noted that connections to generators or generation-only substations are not counted in this Criterion. The source to a radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.10 – The SDT appropriately uses the phrase "Transmission Facilities." The SDT is referring to Facilities that comprise Transmission. This criterion has been changed to "Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.15 – Control centers generally perform control functions for multiple BES assets. These Facilities are evaluated as a control center. Facilities that perform control functions for a single BES asset should be evaluated as part of BES asset (e.g., control room for a single generation plant or transmission substation).		
FMPA	Yes	1.1 Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. FMPA Comments: FMPA commends the SDT for their attempted to come to agreement on a nationwide bright line for generating units based on an operationally significant threshold. However, FMPA continues to have the comment we submitted in CIP-010-1 standard as having arbitrary bright lines for generating units and requested that these bright line numbers have justification or have them based on the Contingency Reserve of each Reserve Sharing Group region. FMPA is concerned that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to

Organization	Yes or No	Question 2 Comment
		certain groups of generating units. To alleviate this volatility we suggest that generation owners should use the facility ratings which are calculated and communicated under FAC-009-1 R2. SDT Proposed:1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater. FMPA Comments: FMPA believes that this “bright line” is arbitrary and instead suggests combining this with 1.9. There is no significant difference between the MVARs provided by FACTs devices and those provided by a power plant and it makes sense to treat them both in the same fashion. SDT Proposed:1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes. FMPA Comments: FMPA commends the SDT on including the criteria in 1.3, which gives the PC and TP the ability to designate as critical any generating facilities for reliability purposes. This will cover critical units that are not captured within the bright line of criteria 1.1 without drawing in all units of a certain size that are not considered critical elsewhere on the system. FMPA suggests that the designation of facilities be based on studies conducted under the TPL standards to justify the designation. Also, the use of NERC Glossary of term: “Adverse Reliability Impacts” will help clarify which units should be in this category.We are also concerned that the PC or TP will be looking at local vs. wide area reliability. There are some cases where the PC can designate Must Run units for temporary situations so this must be clarified within the criteria. FMPA proposes the following rewording of criteria 1.3:”1.3 Each generation Facility that the Planning Coordinator or Transmission Planner designates as required to avoid BES Adverse Reliability Impacts for 1 year or longer.” SDT Proposed:1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. FMPA Comments: FMPA is concerned that designating all Blackstart Resources as critical will divert limited resources to protect blackstart facilities that are only used to restore localized load. We believe it is the intent of the drafting team to identify the truly critical blackstart units (taking from the CIP-010-1 draft; only high impact facilities). FMPA understands that criteria 1.4 uniformly identify all Blackstart Resources listed in the Transmission Operator’s restoration plan as being Critical Assets with regards to the Bulk Electric System. Currently, many utilities include multiple Blackstart resources in the restoration plans provided to the Transmission Operator. Including numerous resources makes the plan much more robust and reliable as it provides additional well documented restoration options should unforeseen problems occur. As currently written, Item 1.4 inadvertently incentivizes utilities to remove blackstart resources from the restoration plan if these resources are not critical to an effective restoration plan, reducing the plan’s overall robustness. Therefore, we believe there should be a threshold for Blackstart Resources, similar to nearly all other elements being considered in Attachment 1. This would allow utilities the freedom to include numerous resources in the Transmission Operators restoration plan without being swept into being identified as a critical asset.To implement this approach, we believe it is imperative to consider the Blackstart Resource’s actual

Organization	Yes or No	Question 2 Comment
		role in the restoration plan, not just its simple inclusion. For example, a 10 MW Blackstart Resource that directly supports restoration of a critical generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies local load during an outage. Therefore, FMPA would propose judging the criticality of a Blackstart Resource by the relative importance of the generating unit(s) it directly supports.We would recommend rewording item 1.4 as follows, leveraging the existing language of criteria 1.15 and the capacity bright-line of criteria 1.13:1.4 Each Blackstart Resource identified in the Transmission Operator's restoration plan, which meet either of the following criteria:1.4.1 Used to directly start generation identified as a Critical Asset in criteria 1.1 or 1.3, 1.4.2 Used to directly start generation greater than an aggregate of 300 MW.We believe this approach should provide a better measure of a Blackstart Resource's potential impact on the Bulk Electric System, resulting in Critical Assets that adequately address system reliability in a practical manner. It also mitigates the likelihood that registered entities may decide to retire certain small blackstart units, thereby removing valuable but not critical blackstart resources from the Transmission Operator's restoration plan. SDT Proposed:1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. FMPA Comments: FMPA commends the SDT on differentiating between a single Cranking Path as a critical facility and multiple Cranking Paths as having redundancy in the BES and thus being less critical. Having this criteria stated in 1.5 incentivizes the entity to build in redundancy in infrastructure to lower criticality of a single asset. This truly does reward infrastructure reliability through a standard. FMPA suggests that the SDT change "switching requirements" to "switching equipment." SDT Proposed:1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. FMPA Comments: FMPA believes that criteria 1.7 is rather arbitrary and suggests use of TPL-004-0 Category D testing and to combine 1.7 with 1.8. Does loss of a substation result in an IROL or Adverse Reliability Impacts? Doing so can also remove the voltage class limit. It is also unclear from the working whether the entire substation is a Critical Asset, or whether each Facility connected to that substation is a Critical Asset. FMPA suggests the entire substation. It is also unclear for substations that have two voltage levels (e.g., a 345 kV to 115 kV substation), whether the entire substation should be considered, or just one voltage level. FMPA suggests one voltage level as discussed in the existing TPL-004 standard. SDT Proposed:1.8. Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). FMPA Comments: FMPA believes that criteria 1.8 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). Also the use of term Adverse

Organization	Yes or No	Question 2 Comment
		Reliability Impact would be beneficial. Proposed rewording of criteria 1.8:1.8. Transmission Facilities at a single station or substation that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs) or can cause an Adverse Reliability Impact as a result of extreme contingency loss of substation testing as part of the TPL standards or as determined by the Reliability Coordinator. SDT Proposed:1.9. Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). FMPA Comments: FMPA believes that criteria 1.9 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). Also the use of term Adverse Reliability Impact would be beneficial. SDT Proposed:1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). FMPA Comments: FMPA believes that adding the phrase “or can cause an Adverse Reliability Impact” would be beneficial. SDT Proposed:1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. FMPA Comments: FMPA believes that the 300 MW is arbitrary and seems based more on reporting requirements than on true reliability impacts. Also, it should not matter whether loss of load is caused by an “automatic” system or not. In addition, the power system is more resilient to loss of load than loss of generation; hence, by using the same threshold as is used in 1.1, we are actually being quite conservative. FMPA offers the following alternatives for rewording 1.13:1.13 Common control system(s) that can result in a loss of load equal to or greater than the reserve sharing requirements of the Reserve Sharing Group within 15 minutes. SDT Proposed:1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. FMPA Comments: FMPA is concerned that criteria 1.14 is overly broad because it includes all BA and TOP control centers regardless of size. We understand the critical nature of control centers and the need to protect against loss of control of major sections of the BES. However, we ask that the SDT revise this criteria to include a bright-line with similar impact as those in 1.1 and 1.15.FMPA offers the following revised wording:1.14. Each control center, control system, backup control center, or backup control system that

Organization	Yes or No	Question 2 Comment
		can:1.14.1 Cause a loss of generation or load greater than the reserve sharing requirements of the Reserve Sharing Group1.14.2 That if manipulated, can cause an Adverse Reliability Impact as determined through planning studies. FMPA cannot support this standard revision without some form of bright line cutoff to exclude small BAs and TOPs that cannot cause instability, cascading or uncontrolled separation of the BES. SDT Proposed:1.15. Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. FMPA Comments: With the proposed revision to 1.14, this 1.15 would no longer be required. SDT Proposed:1.16. Any additional assets that the Responsible Entity deems appropriate to include. FMPA Comments: FMPA believes that 1.16 should be removed from the Attachment 1 criteria. We expect that registered entities may voluntarily protect assets above and beyond the ones listed in these criteria. However, we just do not see the reliability benefit of imposing a compliance liability to those self identified critical assets. We feel that the NERC and Regional compliance staff will waste valuable time and resources evaluating entity compliance with cyber security controls for assets that are outside of the scope of this standard.
Response: Thank you for your response. Please refer to the response to comments of Florida Municipal Power Agency.		
South Carolina Electric and Gas	No	
Pinellas County Resource Recovery Facility	No	
Central Lincoln	Yes	The standard needs a definition of “Control Center.” The guidance document contains one, but is not part of the standard. And the one in the guidance document could be interpreted to apply to any laptop or PDA that could be used to control more than one BES asset. Suggest that “Control Center” be defined to be a fixed location.
Response: Thank you for your comments. At this time, the SDT is choosing not to add control center to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect.		
Edison Mission Marketing and Trading	Yes	CIP-002-4 Attachment 1-1.1 what is the basis for the 1500 MW versus what used to be Output exceeds Reserve Sharing Group obligation or Output exceeds Contingency Reserve obligation?

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. Item 1.1 - Prior drafts had wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The team conducted an informal survey of the regions, and identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions.		
SPS Consulting Group Inc.	Yes	Criteria 1.3 states: "Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes." The term "designates" should be deleted and replaced with "demonstrates through independently verified engineering assessments". The problem with the current ability to simply designate a generator as a critical asset is that not all Planning Coordinators and Transmission Planners are independent. There is a significant competitive incentive for the non-independent PCs and TPs to label a competitor as "critical", thereby increasing their cost of operation and decreasing their competitiveness. No entity should be able to simply "designate" another as having critical assets.
Response: Thank you for your comments. Item 1.3 – The burden for identifying Critical Assets is with the Responsible Entity that is the asset owner. This criterion has been reworded to “Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.” If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, then that unit must be classified as a Critical Asset. If an entity feels that they have an asset that has been unjustly classified as “required for reliability reasons,” there are NERC appeals processes that can be used. The Planning Authority and/or Transmission Planner are not designating the asset as critical for CIP purposes; they are determining the unit to be necessary to avoid Adverse Reliability Impacts based on other NERC reliability standards.		
Tacoma Power	Yes	Comments: For Section 1.1, Tacoma Power commends the SDT’s attempt to set a bright line for generating units based on a significant operational threshold. However, the bright line criterion of 1500 MW for all regions is not realistic. The bright line criterion should be determined based on the requirements of each region. Tacoma Power also agrees with APPA’s suggestion of using the FAC-009-1 R2 facility ratings. Therefore, Tacoma Power suggests Section 1.1 be changed to read, “Each group of generating units (including nuclear generation) at a single plant location with an aggregate FAC-009-1 facility rating equal to or exceeding the MW value set by the Regional Reliability Organization.” For section 1.2, Tacoma Power agrees with the need to set a bright line limit but suggests that the bright line limit again be set by the Regional Reliability Organization based on the regional system. Therefore, Tacoma Power suggests the following language, “Each reactive resource or group of resources at a single location (excluding Generation Facilities) having an aggregate net Reactive Power nameplate rating at or above the

Organization	Yes or No	Question 2 Comment
		value set by the Regional Reliability Organization." For section 1.3, Tacoma Power commends the SDT for adding a criterion for including generation facilities that do not fall under the section1.1 criterion. However, Tacoma recommends the language be changed to read, "Any generation Facility that the Planning Coordinator or Transmission Planner designates, provides justification for and receives concurrence from the RRO as required for reliability." For Section 1.4, Tacoma Power has no comments. For Section 1.5, Tacoma Power has no comments. For Section 1.6, Tacoma Power has no comments. For Section 1.7, Tacoma Power has no comments. For Section 1.8, Tacoma Power has no comments. For Section 1.9, Tacoma Power has no comments. For Section 1.10, Tacoma Power has no comments. For Section 1.11, Tacoma Power has no comments. For Section 1.12, Tacoma Power has no comments. For Section 1.13, Tacoma Power concurs with APPA's comments when they said, "APPA believes the SDT's change in wording of criteria 1.13 will inadvertently bring in all SCADA systems with the capability of shedding load even if such SCADA systems are in fact not planned or operated to perform load shedding. As written, this criteria designates as a critical asset various control systems that by themselves could not cause instability or uncontrolled separation of the BES.APPA offers the following alternatives for rewording 1.13:1.13 Common control system(s) configured to perform automatic load shedding of 300 MW or more within 15 minutes. APPA can accept the bright-line of 300 MW if the wording is changed to that stated above, but we still see this bright-line as an arbitrary threshold based on a quantity that has no BES operational significance. Rather, 300 MW is a DOE threshold for electric event reporting." For section 1.14, Tacoma power concurs with APPA's comments when they say:"APPA is concerned that criteria 1.14 is overly broad because it includes all BA and TOP control centers regardless of size. We understand the critical nature of control centers and the need to protect against loss of control of major sections of the BES. However, we ask that the SDT revise this criteria [sic] to include a bright-line with similar impact as those in 1.1 and 1.15.APPA offers the following revised wording: 1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator with a minimum of 1500 MW of resources under its control. APPA cannot support this standard revision without some form of bright line cutoff

Organization	Yes or No	Question 2 Comment
		to exclude small BAs and TOPs that cannot cause instability or uncontrolled separation of the BES. However, we will support inclusion of "ALL BA and TOP control centers" only when this standard is revised to provide for a tiered (High, Medium and Low) categorization of Critical Assets, such as the SDT's draft CIP-010-1 proposal." For Section 1.15, Tacoma Power has no comments. For Section 1.16, Tacoma Power has no comments.
Response: Thank you for your comments. Item 1.1 - The drafting team used time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used. The 12 month time period was used so that seasonal ratings would not be an issue for generating plants that operate near the 1500 MW bright line. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. The issue with using different MW values in each region is that it does not meet the objective of uniform application of Critical Asset identification across all entities. Item 1.2 – The issue with using different MVAR values in each region is that it does not meet the objective of uniform application of Critical Asset identification across all entities. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."		
Green Country Energy	No	
Illinois Municipal Electric Agency	Yes	IMEA recommends that Criterion 1.8 be continued with the following language: "...(IROLs) as demonstrated by the Reliability Coordinator." If the RC is not appropriate, it may be necessary to add the appropriate functional enttity, for demonstrating IROLs, to Applicability section 4.1. This additional language will clarify that the TO, LSE, etc. is not responsible for demonstrating IROLs.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. Item 1.8 – According to FAC-014-2 IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."		
Minnkota Power Cooperative	Yes	1.12: MPC agrees with criteria 1.12, however the guidance document states that "Since the purpose of SPS and RAS is to prevent disturbances that would result in excursions beyond IROLs.... it is expected that all such systems and schemes will be designated as Critical Assets." MPC disagrees with the statement that this is the purpose of all SPS and RAS.
Response: Thank you for your comments. Please refer to the updated guidance document.		
Horizon Wind Energy	Yes	Criteria 1.15 in attachments A includes generation control centers used to control generation greater than an aggregate of 1500 MWs in a single interconnection. It is true that the span of control of the generation control center may cross multiple BA or RSG areas. In the unlikely event of a common mode failure of such a generation control center that would lead to a loss of all generation, the loss of generation in the multiple BAs or RSGs could fall significantly below the criteria of the 1500 MWs threshold used in criteria 1.1 for generating units at a single plant location, therefore not affecting the reliability and operability of the BES system. There seems to be a disconnect in criteria 1.1 for generation and 1.15 for generation control centers, hence 1500 MWs in a single plant location vs. 1500 MWs aggregate in a single interconnection for generation control centers. Secondly, some generation control centers collect data from generators via SCADA for monitoring purposes and can manually send set points to lower generation if the need would arise. Does this type of arrangement fall under the description of control generation or was it the intent to include, in the description, generation that is controlled to maintain sufficient Contingency Reserve (BAL - 002) and Resource and Demand Balancing (BAL - 003)? Suggest adding language to 1.15 that is more in line with the criteria in 1.1 and clarifying what is meant by control generation.
Response: Thank you for your comments. Item 1.15 – Thank you for your comment. This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection." Generation control centers that collect data from generators via SCADA for monitoring purposes and have the ability to manually send set points to lower generation if the need would arise and meet the specifications of criterion 1.15 would be considered Critical Assets. For further information, please refer to the updated guidance document.		

Organization	Yes or No	Question 2 Comment
Union Power Partners LP	Yes	I suggest the inclusion of the "common mode" concept, for without a CM system, an outside intruder absolutely cannot obtain control of the entire generating capability at one time. I also, believe there should be some type of exceptions for small companies that do not have the financial capacity to implement all requirements. Are there some requirements that are more important than others which could provide a "floor" of physical & cyber security?
Response: Thank you for your comments. The "common mode" concept is reflected in the identification of Critical Cyber Assets in Requirement R2. Once an asset is identified as a Critical Cyber Asset, it must be compliant with all of the requirements in CIP-003 to CIP-009.		
MidAmerican Energy Company	Yes	MidAmerican Energy Company would like to provide the following suggestion for Critical Asset criteria 1.9 in Attachment 1:Criterion 1.9 does not define "Flexible AC Transmission Systems (FACTS)." A definition for FACTS should either be included in Attachment 1 or added to the NERC Glossary of Terms.
Response: Thank you for your comments. Item 1.9 – FACTS is defined by IEEE as: "Alternating Current Transmission Systems incorporating power electronics-based and other static controllers to enhance controllability and power transfer capability." Commonly accepted terms and definitions do not require an insertion in the NERC Glossary.		
North Carolina Membership Corporation	Yes	NCEMC agrees with the following NRECA Comments: 1. What is the technical justification for the proposed criteria? The "Rationale and Implementation Reference Document" does not provide technical justification, but rather provides more of an opinion of the drafting team. To the extent possible, there should be technical justification for the proposed criteria that stakeholders can review. 2. In item 1.7 the statement regarding "three or more other transmission stations" is confusing. A better explanation is needed -- does this mean stations upstream, downstream, networked or radial? 3. In item 1.14 the term "control center" must be defined, especially when dealing with the significance of the requirements of this standard. Using an undefined term here is inappropriate. 5. Related to the Critical Asset Criteria, there should be a provision in the standard that provides a process for an entity to technically demonstrate that even though the criteria identifies some of their assets as Critical Assets, their assets (or a portion thereof) do not meet the definition of a Critical Asset and should be excluded from applicability of CIP-003 through CIP-009.
Response: Thank you for your comments.		

Organization	Yes or No	Question 2 Comment
The SDT believes information provided in the guidance document (posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf) provides sufficient technical justification for each criterion. Item 1.7 - The intent of Item 1.7 is to classify as a Critical Asset any Transmission Facility operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation-only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.14 - At this time, the SDT is choosing not to add control center to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. The SDT believes that having an exception process to the criteria presents the same challenges associated with a risk-based assessment in external review and oversight.		
Hydro One Networks Inc.	No	2. We do not agree with criteria 1.6 and 1.7 in Attachment 1 as written. Application of these criteria would result in the inclusion of facilities that will have no impact on the BES reliability. We believe that the list of applicable facilities should be determined following an impact-based assessment to be performed by the Reliability Coordinator. If necessary, an additional requirement that requires the RC to have a risk-based assessment methodology and to conduct/review the assessment should be included. We therefore propose the following wording to replace 1.6 and 1.7 in Attachment 1: 1.6 Transmission facilities operated at 500 kV or higher, unless the annual review performed by the RC determines that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages.1.7 Transmission Facilities operated at 300 kV or higher to less than 500 kV at stations interconnected at 300 kV or higher with three or more other transmission stations, unless the annual review performed by the RC determines that destruction, degradation or unavailability of those assets will not have impact outside the local area and will not cause BES instability, separation, or cascading outages.
Response: Thank you for your comments. Items 1.6 and 1.7 – The SDT does not feel that a power flow analysis (impact-based or risk-based) would lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. We thank you for your proposal and will take it under consideration for future revisions. Criterion 1.7 has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations."		

Organization	Yes or No	Question 2 Comment
Dynegy Inc.	Yes	For 1.1 and 1.15, why is 1500 MW the new value? Each draft document that comes out has had different criteria/values. How does the recent survey fit into this? I realize the Rationale and Implementation Reference Document mentions the Contingency Reserve concept mentioned in previous drafts but it does not seem right that one size (i.e. 1500 MW) should fit all Regions. Suggest a better fit by Region. For 1.3, the Rationale and Implementation Guidance Document uses the term "local area" to help determine if a unit is designated as this type of Critical Asset but it is unclear what "local" means. Please provide additional guidance. For 1.15, the draft Standard and Rationale and Implementation Guidance Document uses the term "control generation" to help determine if a unit is designated as this type of Critical Asset but it is unclear what "control generation" means. Please provide additional guidance.
Response: Thank you for your comments. Item 1.1 - Prior drafts had wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The team conducted an informal survey of the regions, and we identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. Item 1.3 –This criterion has been reworded to “Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.” Item 1.15 –This criterion has been changed to “Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection.”		
Matrikon Inc.	Yes	The approval of CIP-002-4 is expected to bring in more Critical Assets that are subject to NERC CIP compliance. With this will be organizations that have never experienced CIP and will have a steep learning curve ahead of them. Guidance documents such as the one created unofficially by the SDT for CIP-002-4, as well as compilation of Q&A from Technical Webinars similar to the original FAQ attached to CIP version 1 is highly recommended. There is going to be many organizations looking to clarify how their assets are classified as per Attachment 1, and examples will be helpful.
Response: Thank you for your comments. The SDT is continuing to develop and refine the documents mentioned in your comments.		
Northeast Utilities	Yes	CIP-002-1 Attachment 1 criterion 1.3 reads: “Each generation facility that the planning coordinator or transmission planner designates as required for reliability purposes”. We believe that as stated, this criterion (1.3) is subject to interpretation. Specifically, “for reliability purposes” can be interpreted as “must-run” units,

Organization	Yes or No	Question 2 Comment
		required for black start (although that could be duplicative to criteria 1.4), or as any generator containing BPS elements. Suggest more clearly defining "for reliability purposes" or restating the criterion. The terminology used in the recent NERC data request appeared to be clearer - that is: "Any generation facility that the planning coordinator identifies as Reliability 'must run' assigned units". CIP-002-1 Attachment 1 criterion 1.10 reads: "Transmission facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3." We believe that as stated, this criterion (1.10) could be interpreted to mean not only generators owned by the responsible entity but also those not owned by but interconnected to the Transmission Owner's system. Clarification of criterion 1.3 should serve to clarify criterion 1.10 as well.
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.10 – The SDT agrees that not only generators owned by the Responsible Entity but also those not owned by but interconnected to the Transmission Owner's system are subject to criterion 1.10. This criterion has been changed to "Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3."		
CenterPoint Energy	Yes	CenterPoint Energy believes the proposed criteria contained in Attachment 1 are generally reasonable. CenterPoint Energy is concerned that designation of assets under criteria 1.3 relies upon a risk-based assessment in the same manner that designation under the existing requirements of CIP-002-3 relies upon a risk-based assessment. Stated otherwise, criteria 1.3 does not appear to be a true "bright line" criteria. CenterPoint Energy is also concerned that requirements 1.8, 1.9, and 1.12 may create confusion among industry practitioners and inconsistent application by reliability auditors. Notwithstanding these concerns, CenterPoint Energy can support the requirements provided in Attachment 1 except criteria 1.11. As CenterPoint Energy understands it, the SDT believes criteria 1.11 is a "bright line" because NUC-001-2 Requirement 9.2.2 requires identification of facilities needed to meet the Nuclear Plant Interface Requirements (NPIRs). Therefore, Transmission Facilities designated as being essential to meeting NPIRs under NUC-001-2 Requirement 9.2.2 would be designated as Critical Assets under CIP-002-4.However, like proposed criteria 1.3, this criteria is not a true "bright line" because it requires a negotiated risk-based assessment to determine NPIRs pursuant to NUC-001-2 Requirement 2 and then to determine the facilities essential to meeting the NPIRs pursuant to NUC-001-2 Requirement 9.2.2. Therefore, it suffers the same flaw as the alleged flaw in CIP-002-3 and the previously noted flaw reflected in criteria 1.3 in

Organization	Yes or No	Question 2 Comment
		Attachment 1 of CIP-002-4. Additionally, unlike criteria 1.3, criteria 1.11 is not based upon BES reliability considerations. As indicated in the Purpose section of NUC-001-2, the requirements contained in NUC-001-2 are based upon ensuring safe operation and shutdown of nuclear plants. However, as indicated in the Purpose section of CIP-002-4, the "bright line" criteria contained in Attachment 1 is supposed to be criteria related to BES reliability, not criteria related to the safe operation and shutdown of nuclear plants. Therefore, it is misleading and inappropriate to include criteria 1.11 in Attachment 1. CenterPoint Energy is not suggesting that physical and cyber security of facilities required to ensure safe operation and shutdown of nuclear plants is not important. Physical and cyber security of such facilities is an important consideration and is already addressed under NUC-001-2 Requirement 9.3.6.In the context of CIP-002-4, where critical assets are determined based on BES reliability considerations, CenterPoint Energy is concerned that the inclusion of criteria 1.11 will create unnecessary confusion. One point of confusion is that facilities essential to meeting NPIRs under NUC-001-2 R9.2.2 are not necessarily limited to transmission facilities as indicated in CIP-002-4 Attachment 1, criteria 1.11. For example, a NPIR might be that voltage at a substation interconnecting nuclear plants needs to be maintained in a specified range under certain operating conditions. Since voltage control is provided by generators (by regulating reactive power output) in coordination with operation of transmission facilities, it is possible that one or more generating units (particularly the nuclear generating units and nearby generating units) might be designated as facilities essential to meeting the NPIR. The same is true for NPIRs relating to maintaining short circuit current below a specified level. If criteria 1.11 had merit, there is no logical reason why generating facilities potentially identified pursuant to NUC-001-2 R9.2.2 as being essential to meeting NPIRs would not be identified as Critical Assets yet under criteria 1.11 only transmission facilities would be so designated.The point is that proposed criteria 1.11 is an unnecessary criteria that inappropriately and incorrectly mixes the BES reliability considerations in CIP-002-4 with the nuclear plant safety considerations addressed in NUC-001-2. CenterPoint Energy is concerned that the confusion resulting from this inappropriate and incorrect blend of CIP and NUC related matters runs afoul of the stated goal of CIP-002 version 4 to create a clear, unconfusing "bright line" criteria. As a practical matter, besides physical and cyber security of NPIR-related assets being addressed by NUC-001-2 R9.3.6, the nuclear plant and associated switchyard would likely be designated as Critical Assets under CIP-002-4 Attachment 1 criteria 1.1 and 1.10 and possibly under one or more of the other criteria contained in Attachment 1. In summary, criteria 1.11 is an unnecessary, inexact, and confusing attempt to duplicate the concepts found in NUC-001-2 R9.2.2 and R9.3.6. As such, criteria 1.11 should be deleted in its entirety. Alternatively, if the SDT feels compelled to maintain proposed criteria 1.11 in Attachment 1, CenterPoint Energy proposes re-wording criteria 1.11 along the lines of proposed criteria 1.10, such as "Transmission Facilities providing the generation connection required to directly connect nuclear plant generator output to the transmission system." Although this alternative would still inappropriately mix the nuclear plant safety considerations found in NUC-001-2 with the BES reliability considerations that are the alleged basis for Critical Asset determination in CIP-002-4, this alternative would at least provide a "bright line" criteria. CenterPoint Energy could support either of these alternatives, but cannot support criteria 1.11 as it is currently

Organization	Yes or No	Question 2 Comment
		written.
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Items 1.8, 1.9, and 1.12 – According to FAC-014-2 IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. Criterion 1.8 has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Criterion 1.9 has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Criterion 1.12 has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.11 – Designating facilities already determined necessary for another standard (i.e. NUC-001-2) does not constitute a risk-based approach to the identification of Critical Assets. Once those facilities have been identified, a bright line exists for inclusion as a Critical Asset. This is similar to the approach taken for IROLs.		
LCEC	Yes	Attachment 1: Paragraph 1.14 includes the Transmission Operator (TOP) function in addition to the Reliability Coordinator (RC) and Balancing Authority (BA) functions. In CIP10 the concept of a true "risk based" approach to the application of security requirements was proposed in the purpose section of the document as follows: Purpose: To identify and categorize BES Cyber Systems that execute or enable functions essential to reliable operation of the BES, for the application of cyber security requirements commensurate with the adverse impact that loss, compromise or misuse of those BES Cyber Systems could have on the reliability of the BES. The concept of matching security controls with risk is common practice that is found in NIST and ISO guidelines for risk management. These best practices should be leveraged when considering the implementation of CIPv4 and the development of future standards such as CIP10 and CIP11 that will include requirements for medium and low risk BES Cyber Systems. In the draft release of CIP10, the Balancing Authority (BA), Reliability Coordinator (RC) and Transmission Operator (TOP) functions were listed separately and with additional qualifying criteria. This is a much better approach that is well aligned with best practices and future standard development. When considering the proposed CIPv4 criteria, the control centers for the Transmission Operator (TOP) function should only be included as Critical Assets if they operate transmission facilities that meet the critical asset bright line criteria listed in paragraph 1.6 (above 500kV) or 1.7 (300Kv or

Organization	Yes or No	Question 2 Comment
		higher at stations interconnected at 300kV or higher with three or more other transmission stations). Not including these criteria will result in Non-Critical Assets being identified as Critical Assets. In addition, the standards will go against established best practices and be in conflict with the already released draft of the CIP10 and CIP11 standards. Suggested change to Attachment 1 paragraph 1.14:Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator or Balancing Authority. Suggested change to Attachment 1 (Add paragraph 1.x):Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Transmission Operator for Transmission Facilities meeting the criteria in 1.6 or 1.7.
Response: Thank you for your comments. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."		
Xcel Energy	No	We believe that 1.3 needs better definition. Specific criteria for designating generation facilities as required for reliability should be identified.
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."		
Great River Energy	No	1.3 The criteria needs to be more clear on what is meant by "required for reliability purposes" 1.4 We suggest additional qualifying criteria such as "blackstart resources identified as critical to restoration in a regions restoration plan" 1.5 Suggest additional qualifying criteria "BES elements/facilities comprising the Cranking Paths..." For instance if there are multiple distribution subs within the Cranking Path are these now critical assets? Suggest additional qualifying criteria such as "Cranking Paths to critical units as identified in a region's restoration plan" 1.7 Is there a specific engineering basis for three? A better explanation is needed - does this mean upstream, downstream, radial, networked, etc.?

Organization	Yes or No	Question 2 Comment
		1.9 Please add to the standard the commonly accepted definition of a FACTS system and include it as a newly defined term since the definition of FACTS is not currently in the Glossary. 1.11 Please clarify who decides what "essential" is.
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.4 – NERC standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan as well as requirements to test these Resources. This criterion designates only those generation Blackstart Resources that have been designated as such in the Transmission Operator's restoration plan. There is no longer any NERC requirement to have a region restoration plan. Item 1.5 **–** There is no longer any NERC requirement to have a region restoration plan. Any substation may be considered a Critical Asset if it is in the Cranking Path. This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.7 – In order to be more accurate in terms of the impact, the Drafting Team thought that it was more appropriate to refer to the number of connected transmission substations instead of lines connected to any particular transmission substation. The intent was to get away from the double-circuit conditions and to include facilities that are actually more a part of the network than simple substations with double circuits between them. This includes upstream, downstream, radial and networked substations. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.9 – FACTS is defined by IEEE as: "Alternating Current Transmission Systems incorporating power electronics-based and other static controllers to enhance controllability and power transfer capability." Commonly accepted terms and definitions do not require an insertion in the NERC Glossary. Item 1.11 – This is defined in NUC-001-2 Requirement 9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs."		
ITC Holdings	No	
Public Utility District No. 1 of Clark County	Yes	Attachment 1, part 1.14 would make a control center performing the functional obligation of a TOP a Critical Asset. This apparently would be the case even if a TOP's control center only performed these functions on facilities that are not critical. Small entities have in some cases been forced by Balancing Authorities and former Transmission Operators to register as TOPs. Many of these small entity TOPs operate systems with no assets that qualify as Critical Assets under any of the other Attachment 1 criterion. Some of these TOPs operate systems that do not qualify as Bulk Electric System facilities. It is unreasonable to designate these utilities dispatch centers as Critical Assets unless these dispatch centers actually control or operated Critical

Organization	Yes or No	Question 2 Comment
		Assets. Part 1.14 should be modified as follows:1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator over any facilities determined to be Critical Assets as determined in Attachment 1, criterion 1.1 through 1.13.
Response: Thank you for your comments. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."		
TransAlta	Yes	It is an improvement using the bright-line approach to identify the critical asset instead of the RBAM. But there are some concerns in the criteria as described below. We will vote affirmative until the following concerns are properly addressed in the next draft. For the criterion 1.1, it mentions "generating units (including nuclear generation) at a single plant location". It is not clear what will be defined as a single plant location. Can the drafting team provide guidance for this to help the registered entity to classify the generating units properly? For the criterion 1.3, the Planning Coordinator or Transmission Planner can unilaterally decide the generation facility as required for reliability purposes without input from the registered entity. The registered entity has not option but comply with. The consequence would be the registered entity would spend a large amount of resources to comply with. We understand that there are some discussions in NERC about the cost recovery for the compliance, which may address this concern in the future. But at this stage, the registered entity has obligation to identify the critical asset. Neither the Planning Coordinator nor Transmission Planner has this accountability. Thus, to address this issue, one option is that the registered entity should be given the right to agree or disagree on any generation facility to be required for reliability purposes if the Planning Coordinator or Transmission Planner plans to do this. For this option, it is recommended adding "to which has been agreed by the responsible entity" at the end of this criterion. Another option is to clearly define "reliability purposes" in the standard, which the Planning Coordinator, Transmission Planner, and registered entity will all have to follow. For the criteria 1.6 and 1.7, transmission facilities should exclude the Generator Interconnection Facilities which was defined in this nerc project http://www.nerc.com/filez/standards/Project2010-07_GOTO_Project.html. The reason is that Generation Interconnection Facilities are the sole-use facility for the purpose of connecting the generating unit(s) to the transmission grid. Its criticality is directly related to the

Organization	Yes or No	Question 2 Comment
		criticality of the generation resources which are assessed against Criteria 1.1, 1.3. The criticality of these facilities should be differentiated from other transmission facilities. This issue was discussed in the draft guidance document. We think the appropriate wordings to clarify this should be put in to the standard, instead of addressing this in the guidance document, http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf. For the criterion 1.15, control center is not a defined term in the NERC glossary. In all existing FERC approved standard except CIP-002, all requirements with the control center wordings are applicable to BA, TOP, and RC. In the NERC CIPC approved guideline, "Security Guideline for the Electricity Sector: Identifying Critical Assets", there is a definition of control center. The draft guidance document http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf talks about the generation control center consideration. But we are still not clear what kind of facilities will be considered as the generation control center. We would like the drafting team to clarify the control center used for the generation.

Response: Thank you for your comments.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Item 1.3 – The burden for identifying Critical Assets resides with the Responsible Entity that is the asset owner. The Planning Authority and/or Transmission Planner are not designating the asset as critical for CIP purposes; they are determining the unit to be necessary to avoid Adverse Reliability Impacts based on other NERC reliability standards. This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.6 –The drafting team believes "Transmission Facilities operated at 500 kV or higher" does not require any further qualification to clarify their role as components of the backbone on the Interconnected BES.

Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset any Transmission Facility operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation-only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations."

Item 1.15 – At this time, the SDT is choosing not to add control center to the NERC Glossary. We feel defining this term under this proposed version of the

Organization	Yes or No	Question 2 Comment
Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect.		
Exelon	No	The revised criteria are acceptable in the sense that all generation is now treated equally, regardless of fuel type, and the specific cyber assets of concern are those with the potential for shutdown of multiple units in real-time.
Response: Thank you for your comments.		
N.W. Electric Power Cooperative, Inc.	Yes	CIP-002-4 - Attachment 1 Critical Asset Criteria The following are considered Critical Assets: 1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. There is no technical basis or justification provided for the 1500MW criteria. If an entity has 4000 MW and is capable of proving that a loss of the 4000MW plant does not cause the BES to become unstable it should not be a Critical Asset. Therefore, suggested wording is: Each group of generating units (including nuclear generation) at a single plant location with its aggregate highest rated net Real Power capability of the preceding 12 months that through either testing or simulation can prove that a loss of the generating units causes an IROL. IF a Bright Line criteria is required than something more reasonable that has an impact on the BES should be considered such as 4000MW. 1.6. Transmission Facilities operated at 500 kV or higher. There is no basis for this. It should state Transmission Facilities operated at 500 kV or higher that if rendered unavailable violate one or more Interconnection Reliability Operating Limits (IROLs). Bright Line criteria - Transmission Facilities that operate at 500KV or higher with greater than 4,000 MW of flow. 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. There is no technical basis for this requirement. Suggestion: Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations that if rendered inoperable violate one or more Interconnection Reliability Operating Limits (IROLs). Bright Line criteria - Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations that have greater than 4,000 MW of flow into the facility. 1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. Based on the way this is written there are Local Control Centers that perform functional obligations for the TOP. I am basing functional obligations as those that are defined in the NERC functional model for a TOP.Suggestion: Add a note that if through testing or simulation a control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability

		Transmission Operator. that control greater than 4,000MW.
NW Electric Power Cooperative, Inc.	Yes	CIP-002-4 - Attachment 1 Critical Asset Criteria The following are considered Critical Assets: 1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. There is no technical basis or justification provided for the 1500MW criteria. If an entity has 4000 MW and is capable of proving that a loss of the 4000MW plant does not cause the BES to become unstable it should not be a Critical Asset. Therefore, suggested wording is: Each group of generating units (including nuclear generation) at a single plant location with its aggregate highest rated net Real Power capability of the preceding 12 months that through either testing or simulation can prove that a loss of the generating units causes an IROL. IF a Bright Line criteria is required than something more reasonable that has an impact on the BES should be considered such as 4000MW. 1.6. Transmission Facilities operated at 500 kV or higher. There is no basis for this. It should state Transmission Facilities operated at 500 kV or higher that if rendered unavailable violate one or more Interconnection Reliability Operating Limits (IROLs). Bright Line criteria - Transmission Facilities that operate at 500KV or higher with greater than 4,000 MW of flow. 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. There is no technical basis for this requirement. Suggestion: Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations that if rendered inoperable violate one or more Interconnection Reliability Operating Limits (IROLs). Bright Line criteria - Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations that have greater than 4,000 MW of flow into the facility. 1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. Based on the way this is written there are Local Control Centers that perform functional obligations for the TOP. I am basing functional obligations as those that are defined in the NERC functional model for a TOP.Suggestion: Add a note that if through testing or simulation a control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator is completely destroyed and all breakers on the BES are opened and a violation of one or more Interconnection Reliability Operating Limits (IROLs) does not occur this control center, control system, backup control center, or backup control system can be exempted. Bright Line is required than Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. Item 1.1 - The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method by providing bright line criteria. Prior drafts had wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The team conducted an informal survey of the regions, and identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. Items 1.6 and 1.7 – The SDT does not feel that a power flow analysis (impact-based or risk-based) to determine line flows for the bright line criteria will lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. We thank you for your proposal and will take it under consideration for future revisions. Criterion 1.7 has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."		
LCRA Transmission Services Corporation	Yes	1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. If a multiple path option exists from the Black Start Resource to a Next Start unit, does a Critical Path have to be designated? To clarify, the criteria states "The Facilities comprising the Cranking Paths... up to the point where multiple path option exist." If LCRA has multiple paths originating directly at the Black Start Resource, either path could be used as a cranking path. Therefore, neither path would be considered critical. Could this be clarified? 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. 1) Does this includes radial interconnections? This is a question because a 345 kV station could be interconnected to 3 other stations, but one of the interconnections could be a radial 345 kV line connected to a generator.2) Is there a distance requirement for the interconnection? This is a question because a 345 kV station could be interconnected to 3 other stations, but one of the interconnections could be a 345kV bus connected to another station a few feet away.
Response: Thank you for your comments. Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5 "Identification		

Organization	Yes or No	Question 2 Comment
of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started" where the Transmission Operator can choose between the next Facilities on the BES to energize. Based on your example, neither path would be identified as a Critical Asset. This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation-only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. There is no distance requirement in the criterion. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations."		
United Illumiinating	Yes	Change 1.3 to Each generation Facility that the Planning Coordinator or Transmission Planner has designated as required to avoid one or more reliability criteria violations. Change 1.8 to Transmission Facilities at a single station location that the Planning Coordinator or Transmission Planner has designated that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations. The reason for the change is that destruction or misuse of equipment does not violate an IROL, the destruction causes the IROL on another interface to be violated. Also since TPL and PC are not listed as applicable entities to the standard, we feel it appropriate to specifically state that it is the PC and TPL that determine these facilities and no the Transmission Owner; Transmission Owners do not conduct the studies required to determine IROL. Change 1.11 to Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements. NPIR is a broad based document with many requirements. IT would be helpful if the standard brightly identified what is critical to a nuclear plant. We believe it is the preservation of off site power for plan safety. Change 1.12 to Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROLs) violations for failure to operate as designed. The reason for the change is that the misuse of an SPS would cause an IROL to be violated, and not all SPS are required to protect for IROL so the the standard should only apply to those that are installed to protect for IROL violations.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements. Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed."		
Constellation Energy Commodities Group	Yes	Has there been any discussion about the enforcement of criteria versus a requirement in relation to the version 4 draft? The standard describes Attachment 1 as criteria that are to be applied by an entity to develop a Critical Asset list. Criteria have historically been viewed, in my experience, as guides but not Requirements. Has the drafting team stated why they are not clearly documenting that an entity that operates assets meeting the description in Attachment 1 is required to be on the entities Critical Asset list? Failure to define terms that are used in the Attachment will also continue to create confusion: Transmission Facility, control center, and control system need to be defined to ensure consistent application of the criteria in the attachment. 1.5 In an effort to add clarity, it should be changed to read "The facilities comprising the Cranking Path and initial switching requirements from the Blackstart Resource to the first interconnection point of the generation facility to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. 1.11 Should be removed. Criticality of facilities should not be fuel specific. 1.13 The threshold should be consistent with that in 1.1. Automatic should be defined as requiring no human interaction to enact load shedding. 1.14 The current use of the term "control center" assumes that every control center fits into a certain box (i.e. remote breaker operations, remote generation start up/shut down, and load shed), but is applied to centers with little to no impact on system reliability. If there is an asset that can affect limits that are critical to the RC and TOP footprint then the protections should be in place. However, for generation assets and their interconnection facilities that do not have the ability to create SOL or IROL conditions, it is not practical to require CIP control measures. The role of such a control center in this case is generally just to capture a data

Organization	Yes or No	Question 2 Comment
		point for producing better system models. Such data is not for contingency planning or real time operational response awareness. A complete loss of data does not modify how the RC and TOP respond to the customers therefore, likewise a manipulation of the data would not trigger a BES reliability concern. For systems that cannot operate equipment remotely, applying CIP controls would be costly and provide only marginal reliability improvement at best. 1.15 Defining the area as 'in a single interconnection' is extremely broad and should be narrowed down to a maximum area of Balancing Authority. What other control centers /back-up control centers does the drafting team expect to capture that would not be captured under 1.14? How will they define generator control? The "control generation greater than an aggregate of 1500 MWs" criteria should be restricted to the amount of generation that could be controlled in a 10 minute period (NERC Control Performance Standard). The MW change occurs using pre-determined ramp capability limits.

Response: Thank you for your comments.

CIP-002-4 Requirement R1 states "Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in CIP-002-4 Attachment 1 – Critical Asset Criteria. The Responsible Entity shall review this list at least annually, and update it as necessary." Attachment 1 starts with "The following are considered Critical Assets:" The combination of these two make the criteria in Attachment 1 part of the requirement. Any asset meeting any criterion in Attachment 1 must be listed as a Critical Asset.

At this time, the SDT is choosing not to add Transmission Facility, control center, and control system to the NERC Glossary. We feel defining these term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. These terms are used in other approved NERC standards already in effect.

Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan."

Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." Since these facilities were deemed so important that a NERC standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets.

Item 1.13 – This criterion has been changed to "System(s) or facilities that perform automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."

Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the

Organization	Yes or No	Question 2 Comment
Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.15 – This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection.". Criterion 1.14 does not include generation control centers and generation backup control centers		
Sierra Pacific Power d/b/a NV Energy	No	We appreciate the efforts of the drafting team to identify in Att 1 those Assets that would be deemed Critical. There are a few areas for which we would like the SDT to reconsider: 1.3 Reliability Must-Run Generation - The language here appears to lack precision. For instance, a Transmission Planner may designate a particular generating plant to be required for reliability purposes during specific system conditions, such as above a certain demand level or path flow level. These sorts of occasional must-run situations should not be treated as Critical Generation. Critical should be reserved for instances where the reliability must-run condition is prescribed by the Planner on a perpetual basis. 1.4 The inclusion of "Each Blackstart Resource" identified in the TOP restoration plan may be overboard. In many instances, entities will include multiple options for blackstart resources in their restoration plans, and with this language, all of the blackstart resources that are even mentioned in one's plan will be deemed Critical. Suggest changing this parameter to the "primary blackstart resource identified in the TOP restoration plan." The point is that not every one of these blackstart resources should be deemed Critical. 1.7 We would like to see some discussion of the rationale for including 300kV and above stations with three or more connections. Consider the scenario where one or more of these "connections" is radial. Would this station really rise to the level of Critical in that case? We suggest raising the criterion to four or more non-radial connections. 1.15 Need some explicit criteria for what constitutes a "control center" vs a "control room" with respect to generating stations.
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT believes that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart		

Organization	Yes or No	Question 2 Comment
Resources. Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation-only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.15 – Thank you for your comment. This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection."		
SDG&E	Yes	Comment on 1.3: Need to ensure PC or TP have notified Transmission Operator and Generator Owner. Suggested wording additions "... designates to the Transmission Operator and Generation Owner as ...". Comment on 1.4: As worded, the language will discourage a TOP from having additional backup Blackstart Resource. Suggested wording additions "Each primary Blackstart resource identified in the Transmission Operator's restoration plan." Comment on 1.5: As worded, the language will discourage a TOP from having additional backup Blackstart Resource. Suggested wording addition "The Facilities comprising the Cranking Paths and initial switching requirements from the primary Blackstart Resource ..." Comments on 1.14. Suggest rewording to avoid confusion at Control Centers. Change wording to "Each control center, backup control center, or other facility housing control systems used to perform...."
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT believes that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources. No Transmission Operator is required to designate any "primary" Blackstart Resource. Therefore the language cannot be changed to your suggestion. Item 1.5 – No Transmission Operator is required to designate any "primary" Blackstart Resource. Therefore the language cannot be changed to your suggestion.		

Organization	Yes or No	Question 2 Comment
This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."		
Central Lincoln	No	1.1 Central Lincoln supports the APPA Comments:APPA and others commented on the CIP-010-1 standard as having arbitrary bright lines for generating units and requested that these bright line numbers have justification or have them based on the Contingency Reserve of each Reserve Sharing Group region. APPA commends the SDT for their attempted to come to agreement on a nationwide bright line for generating units based on an operationally significant threshold. The use of an average of the Contingency Reserve numbers from all the regions bases the bright-line on what the regions consider operationally significant. We understand that NERC standards are a minimum requirement and regions can look at their own operating criteria and determine if they need additional protection at lower Megawatt bright-lines. APPA is concerned that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. To alleviate this volatility we suggest that generation owners should use the facility ratings which are calculated and communicated under FAC-009-1 R2. 1.2 Central Lincoln supports the APPA Comments:APPA does not have a comment on criteria 1.2 at this time. 1.3 Central Lincoln supports the APPA Comments:â€,APPA commends the SDT on including the criteria in 1.3, which gives the PC and TP the ability to designate as critical any generating facilities for reliability purposes. This will cover critical units that are not captured within the bright line of criteria 1.1 without drawing in all units of a certain size that are not considered critical elsewhere on the system. APPA suggests that the designation of facilities be based on studies conducted under the TPL standards to justify the designation. Also, the use of NERC Glossary of term: "Adverse Reliability Impacts" will help clarify which units should be in this category.We are also concerned that the PC or TP will be looking at local vs. wide area reliability. There are some cases where the PC can designate Must Run units for temporary situations so this must be clarified within the criteria. APPA proposes the following rewording of criteria 1.3:"1.3 Each generation Facility that the Planning Coordinator or Transmission Planner designates as required to avoid BES Adverse Reliability Impacts for 1 year or longer."

Organization	Yes or No	Question 2 Comment
		1.4 Central Lincoln supports the APPA Comments:APPA is concerned that designating all Blackstart Resources as critical will divert limited resources to protect blackstart facilities that are only used to restore localized load. We believe it is the intent of the drafting team to identify the truly critical blackstart units (taking from the CIP-010-1 draft; only high impact facilities). APPA understands that criteria 1.4 uniformly identify all Blackstart Resources listed in the Transmission Operator's restoration plan as being Critical Assets with regards to the Bulk Electric System. Currently, many utilities include multiple Blackstart resources in the restoration plans provided to the Transmission Operator. Including numerous resources makes the plan much more robust and reliable as it provides additional well documented restoration options should unforeseen problems occur. As currently written, Item 1.4 inadvertently incentivizes utilities to remove blackstart resources from the restoration plan if these resources are not critical to an effective regional restoration plan, reducing the plan's overall effectiveness. Therefore, we believe there should be a threshold for Blackstart Resources, similar to nearly all other elements being considered in Attachment 1. This would allow utilities the freedom to include numerous resources in the Transmission Operators restoration plan without being swept into being identified as a critical asset.To implement this approach, we believe it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just its simple inclusion. For example, a 10 MW Blackstart Resource that directly supports restoration of a critical generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies local load during an outage. Therefore, APPA would propose judging the criticality of a Blackstart Resource by the relative importance of the generating unit(s) it directly supports.We would recommend rewording item 1.4 as follows, leveraging the existing language of criteria 1.15 and the capacity bright-line of criteria 1.13:1.4 Each Blackstart Resource identified in the Transmission Operator's restoration plan, which meet either of the following criteria:1.4.1 Used to directly start generation identified as a Critical Asset in criteria 1.1 or 1.3, 1.4.2 Used to directly start generation greater than an aggregate of 300 MW.We believe this approach should provide a better measure of a Blackstart Resource's potential impact on the Bulk Electric System, resulting in Critical Assets that adequately address system reliability in a practical manner. It also mitigates the likelihood that registered entities may decide to retire certain small blackstart units, thereby removing valuable but not critical blackstart resources from the Transmission Operator's restoration plan. We further support inclusion of "ALL Blackstart Resources" only when this standard is revised to provide for a tiered (High, Medium and Low) categorization of Critical Assets, such as the SDT's draft CIP-010-1 proposal. 1.5 Central Lincoln supports the APPA Comments:APPA commends the SDT on differentiating between a single Cranking Path as a critical facility and multiple Cranking Paths as having redundancy in the BES and thus being less critical. Having this criteria stated in 1.5 incentivizes the entity to build in redundancy in infrastructure to lower criticality of a single asset. This truly does reward infrastructure reliability through a standard. APPA does request clarification of criteria 1.5: Where does this point of multiple paths lay in the electrical system? Does this include only the Generator Step-up Transformer, or does it include the whole substation where multiple transmission paths depart to a single generator? Also, APPA suggests that the

Organization	Yes or No	Question 2 Comment
		SDT change “switching requirements” to “switching equipment.” 1.6 Central Lincoln supports the APPA Comments:APPA does not have a comment on criteria 1.6 at this time. 1.7 Central Lincoln supports the APPA Comments:APPA believes that criteria 1.7 should be reworded to "stations or substations" instead of just "stations" so that it is not implied that it only applies to power plants (stations).APPA also supports the MRO standard review team proposal to adopt a power flow based bright-line rather than whether the station is connected to three or more other stations:Under TPL-001, the Planning Coordinator or Transmission Planner already performs annual near-term power flow assessment and this particular assessment would be based on the forecasted peak conditions using Category A of Table 1 of the standard.Proposed rewording of criteria 1.7:1.7. Each Transmission Facility operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher where the TPL peak load studies of the Planning Coordinator or Transmission Planner identifies the sum of the incoming power flows or the sum of the outgoing power flows to exceed 1500 MW. 1.8 Central Lincoln supports the APPA Comments:APPA believes that criteria 1.8 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). 1.9 Central Lincoln supports the APPA Comments:APPA believes that criteria 1.9 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). 1.10 Central Lincoln supports the APPA Comments:APPA does not have a comment on criteria 1.10 at this time. 1.11 Central Lincoln supports the APPA Comments:APPA does not have a comment on criteria 1.11 at this time. 1.12 Central Lincoln supports the APPA Comments:APPA understands there are utilities within the NPCC region that have SPS type 3 systems that only protect local areas. We seek verification from the SDT that the SPS they refer to in criteria 1.12 is for wide area protection only. 1.13 Central Lincoln supports the APPA Comments:APPA believes the SDT’s change in wording of criteria 1.13 will inadvertently bring in all SCADA systems with the capability of shedding load even if such SCADA systems are in fact not planned or operated to perform load shedding. As written, this criteria designates as a critical asset various control systems that by themselves could not cause instability or uncontrolled separation of the BES.APPA offers the following alternatives for rewording 1.13:1.13 Common control system(s) configured to perform automatic load shedding of 300 MW or more within 15 minutes.APPA can accept the bright-line of 300 MW if the wording is changed to that stated above, but we still see this bright-line as an

Organization	Yes or No	Question 2 Comment
		arbitrary threshold based on a quantity that has no BES operational significance. Rather, 300 MW is a DOE threshold for electric event reporting. 1.14 Central Lincoln supports the APPA Comments:APPA is concerned that criteria 1.14 is overly broad because it includes all BA and TOP control centers regardless of size. We understand the critical nature of control centers and the need to protect against loss of control of major sections of the BES. However, we ask that the SDT revise this criteria to include a bright-line with similar impact as those in 1.1 and 1.15.APPA offers the following revised wording:1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator with a minimum of 1500 MW of resources under its control. APPA cannot support this standard revision without some form of bright line cutoff to exclude small BAs and TOPs that cannot cause instability or uncontrolled separation of the BES.However, we will support inclusion of "ALL BA and TOP control centers" only when this standard is revised to provide for a tiered (High, Medium and Low) categorization of Critical Assets, such as the SDT's draft CIP-010-1 proposal.Additional Central Lincoln Comments: The terms "control center," "control system," "backup control center," and "backup control system" all need to be clearly defined. While there is guidance on the subject, guidance cannot be audited to. Some of the guidance would suggest a cell phone capable of receiving text message alarms from two or more BES elements qualifies as a CCA and subject to CIP-003 through 009. 1.15 Central Lincoln supports the APPA Comments:In the NERC Draft CIP-002-4 webinar it was stated that a control center in criteria 1.15 is understood to be controlling multiple units. APPA recommends that the SDT clarify the wording in criteria 1.15 to coincide with this understanding: 1.15 Each control center or backup control center used to control multiple generation units identified as Critical Assets designated under criterion 1.3 or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. 1.16 Central Lincoln supports the APPA Comments:APPA believes that 1.16 should be removed from the Attachment 1 criteria. We expect that registered entities may voluntarily protect assets above and beyond the ones listed in these criteria. However, we just do not see the reliability benefit of imposing a compliance liability to those self identified critical assets. We feel that the NERC and Regional compliance staff will waste valuable time and resources evaluating entity compliance with cyber security controls for assets that are outside of the scope of this standard.

Response: Thank you for your comments.

Item 1.1 – The SDT notes your concern that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. The drafting team used time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used. The 12 month time period was used so that seasonal ratings would not be an issue for generating plants

Organization	Yes or No	Question 2 Comment
		that operate near the 1500 MW bright line. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources. Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5 "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started" where the Transmission Operator can choose between the next Facilities on the BES to energize. This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.7 – The SDT agrees to change "stations" to "stations or substations." The SDT does not believe that power flow based bright-line criteria that is based on MW flows into or out of a substation would meet the objective of uniform application of Critical Asset identification across all entities. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.8 – According to FAC-014-2 IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. The present wording is appropriate. The SDT agrees to change "stations" to "stations or substations." This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 - The SDT agrees to change "stations" to "stations or substations." This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.12 – Since this item only applies to SPSs that have IROLs associated with them, local area SPSs are not included. This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."

Organization	Yes or No	Question 2 Comment
Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.15 –This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
National Rural Electric Cooperative Association (NRECA)	Yes	1. A general comment is that there is no technical justification provided for the proposed criteria. The "Rationale and Implementation Reference Document" does not provide technical justification, but rather provides more of an opinion of the drafting team. To the extent possible, there should be technical justification for the proposed criteria that stakeholders can review. 2. NRECA is concerned that designating all Blackstart Resources as critical will divert limited resources to protect blackstart facilities that are only used to restore localized load. We believe it is the intent of the drafting team to identify the truly critical blackstart units (taking from the CIP-010-1 draft; only high impact facilities). NRECA understands that criteria 1.4 uniformly identify all Blackstart Resources listed in the Transmission Operator's restoration plan as being Critical Assets with regards to the Bulk Electric System. Currently, many utilities include multiple Blackstart resources in the restoration plans provided to the Transmission Operator. Including numerous resources makes the plan much more robust and reliable as it provides additional well documented restoration options should unforeseen problems occur. As currently written, Item 1.4 inadvertently incentivizes utilities to remove blackstart resources from the restoration plan if these resources are not critical to an effective regional restoration plan, reducing the plan's overall effectiveness. Therefore, we believe there should be a threshold for Blackstart Resources, similar to nearly all other elements being considered in Attachment 1. This would allow utilities the freedom to include numerous resources in the Transmission Operators restoration plan without being swept into being identified as a Critical Asset.To implement this approach, we believe it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just its simple inclusion. For example, a 10 MW Blackstart Resource that directly supports restoration of a critical generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies local load during an outage. Therefore, NRECA would propose judging the criticality of a Blackstart Resource by the relative importance of the generating unit(s) it directly supports. 3. In item 1.7 the statement regarding "three or more other transmission stations" is confusing. A better

Organization	Yes or No	Question 2 Comment
		explanation is needed -- does this mean stations upstream, downstream, networked or radial? 4. In item 1.14 the term "control center" must be defined, especially when dealing with the significance of the requirements of this standard. Using an undefined term here is inappropriate. 5. In item 1.14 its states that all RC, BA and TOP control centers, etc., are Critical Assets. While NRECA agrees with this as it relates to RCs, we do not agree with this as it relates to all BAs and TOPs. In the draft CIP-010 there was high, medium and low criteria which in many instances appropriately matching CIP requirements to the level of risk certain assets potentially present to the BPS. NRECA strongly believes that the CIP-002-4 standard requirements for smaller BAs and TOPs should match the lower level of risk to BPS reliability that these smaller BAs and TOPs potentially present. Similar to the 1500MW size criteria that is included in item 1.15 for generator control centers, there should be size criteria for the smaller BAs and TOPs. The drafting team should modify item 1.14 to state that all control centers with a peak demand above 2000MW (same as medium criteria in draft CIP-010) shall be designated as a Critical Asset. This is the lowest NRECA could support and also recommend its members to support. We firmly believe that this would capture all of the control centers that truly have a material impact on the reliability of the BPS. 6. Related to the Critical Asset Criteria, there should be a provision in the standard that provides a process for an entity to technically demonstrate that even though the criteria identifies some of their assets as Critical Assets, their assets (or a portion thereof) do not meet the definition of a Critical Asset and should be excluded from applicability of CIP-003 through CIP-009.

Response: Thank you for your comments.

The SDT believes information provided in the guidance document (posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf) provides sufficient technical justification for each criterion.

Item 1.4 – A Blackstart Resource is defined as “A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s restoration plan.” EOP-005-2 R1.4 states that the restoration plan must include “Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit.” The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.

Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation-only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. This criterion has been reworded to “Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other

Organization	Yes or No	Question 2 Comment
transmission stations or substations." Item 1.14 – At this time, the SDT is choosing not to add control center to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." The SDT believes that having an exception process to the criteria presents the same challenges associated with a risk-based assessment in external review and oversight.		
Tampa Electric	No	
MEAG Power	Yes	MEAG supports the APPA's comments submitted to the NERC CIP standard drafting team.
Response: Thank you for your comments. Please refer to the response to APPA's comments.		
FirstEnergy Corp	Yes	Overall FE agrees with the fundamental concepts of the Attachment 1 Critical Asset Criteria. In our view, some of the criteria are vaguely written and subject to interpretation - specifically criteria 1.8 and 1.11 - and we offer suggestions for improving expectations and compliance certainty. Additionally, we suggest less substantive changes to criteria 1.5 and 1.14 for clarity and consistency. 1) Criterion 1.8 currently states "Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)." Clarity needed: A.) It is not evident who is responsible for identifying the applicable transmission facilities covered by 1.8. B.) Item 1.8 should rely on review/analysis that is regularly performed by industry in meeting other NERC reliability standards. Item 1.8 should be based on IROL determinations made from planning horizon studies and information communicated to responsible entities via FAC-010/FAC-014.C.) A possible misinterpretation of Attachment 1, Item 1.8 is that it is intended to review a complete loss of substation. However the words say "Transmission Facilities at a single station location ..." not all transmission facilities at a single substation location. Based on the above items, FirstEnergy proposes the following for item 1.8:"1.8. Transmission Facilities designated by the Planning Coordinator or Transmission Planner that, if destroyed, degraded, misused or otherwise rendered unavailable, demonstrates

Organization	Yes or No	Question 2 Comment
		the need for an Interconnection Reliability Operating Limit (IROL)."The Planning Coordinator and Transmission Planner determine and communicate IROLs in the planning time horizon per NERC reliability standard FAC-014. The subject Transmission Facilities are the contingency Transmission Facilities communicated by the PC and TP per requirement R5 of FAC-014. The 1.8 criterion should not appear to require any new study or analysis by the TP or PC. 2) Criterion 1.11 currently states "Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements" Clarity needed: The term "essential" is vague and open to interpretation. FE suggests that the SDT focus on Transmission Facilities identified in Nuclear Plant Interface Requirements identified as providing offsite power supply for nuclear plant safety requirements. We propose the following change for 1.11:"1.11 Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements." 3) Criterion 1.5 currently states "The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist." FirstEnergy suggests replacing the word "multiple" with "two or more" for clarity. 4) Criterion 1.14 currently states "Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator." FirstEnergy suggests removing the text "control system" and "or backup control system" for consistency to criteria 1.15. If the intent is to ensure coverage of offsite data centers or telecommunication centers that support the "control center" then the SDT should provide a separate criterion in Attachment 1. To extend coverage of 1.14 and not 1.15 is inconsistent and the use of the phrase "control system" is vague.

Response: Thank you for your comments.

Item 1.8 – According to FAC-014-2, IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements.

Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan."

Organization	Yes or No	Question 2 Comment
Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."		
Minnesota Power	Yes	Criterion 1.1: The phrase "single plant location" is undefined. It is unclear if this means at a single street address or within some number of miles. Criterion 1.3: Criterion 1.3 should be modified to clarify that it is not meant to create the need for new or different planning models to be used by the Planning Coordinator or Transmission Planner. Rather, the verbiage should be clear that the Planning Coordinator or Transmission Planner has the opportunity to identify Generation Facilities that have been historically required to support the BES. Criterion 1.10: The phrase "loss of the assets" in criterion 1.10 is vague, leaving open for interpretation to what level a "loss of the assets" might mean. Criterion 1.10 also specifies "Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system..." where such assets are included in Criterion 1.1 or 1.3. In reality, there may be multiple paths from an aggregate station to the transmission system. To accommodate the above concerns, Minnesota Power suggests eliminating criterion 1.10 and modifying criterion 1.3 as follows: "1.3 Each generation Facility or Transmission Facility providing the generator interconnection that the Planning Coordinator or Transmission Planner has designated as required to avoid one or more reliability criteria violations." Criterion 1.8: The phrase "single station location" is undefined. It is unclear if this means at a single street address or within some number of miles. In addition, criterion 1.8 should be clear that it is not meant to require the Planning Coordinator or Transmission Planner to create new or different planning models. Rather, they should continue to use the legacy planning models as specified in FAC-010, FAC-011 and FAC-014. Minnesota Power recommends the following language for criterion 1.8, with further clarification of the term "single station location"."1.8 Transmission Facilities at a single station location that the Planning Coordinator or Transmission Planner has designated that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limits (IROLs) violations." To maintain consistency with the suggested changes to criterion 1.8, Minnesota Power recommends changing criteria 1.9 and 1.12 as follows: "1.9 Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limits (IROLs) violations.""1.12 Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection

Organization	Yes or No	Question 2 Comment
		Reliability Operating Limits (IROLs) violations for failure to operate as designed." Criterion 1.14: Minnesota Power recommends rewording criterion 1.14 as follows for consistency with criterion 1.15: "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator."

Response: Thank you for your comments.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.10 – The intent is to ensure the availability of Facilities necessary to support those generators classified as Critical Assets. Any Transmission Facility the loss of which would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset. This criterion has been changed to "Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3."

Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Item 1.9 – This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed."

Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."

Organization	Yes or No	Question 2 Comment
Manitoba Hydro	Yes	Comments: Criterion 1.5: Suggest changing wording from "... and initial switching.." to " ... which meet the initial switching ...". It is unclear what "multiple path" means. Criterion 1.13: Distribution Provider is not included in the Applicability section, and therefore 1.13 does not apply to Distribution control systems, including Distribution Control Centres. Please clarify what "automatic" means, whether operator initiated or not operator initiated. It is unclear if the 300MW is shed simultaneously or in blocks over time. The loss of generation or the loss of load are analogous in their reliability impact on the BES, thus criterion 1.13 using a 300 MW threshold seems inconsistent with criterion 1.1 using a 1500 MW threshold.
Response: Thank you for your comments. Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."		
American Transmission Company	Yes	ATC offers the following suggestions for Attachment 1: 1.1 Support EEI's suggestion. The phrase "single plant location" is undefined. Suggest the term be defined by the SDT. 1.2 Similar to 1.1; define "single location". Does this include reactive resources connected to the same kV class or across kV classes in a single substation? 1.3 Support EEI's suggestion. Modify requirement to indicate the facilities that have been historically required to support the BES. 1.4 None 1.5 None 1.6 None 1.7 If the interconnection to another substation consists of a transformer to a lower kV class, does the language "interconnection at 300 kV" apply to the high side winding voltage of the transformer or the low side winding voltage of the transformer?

Organization	Yes or No	Question 2 Comment
		1.8 Support EEI's suggestion. "...single station location" is undefined. Add clarity by indicating the Planning Coordinator and Transmission Planner determine and communicate IROL's in the planning horizon per FAC-014. Also, recommend adding the word "All BES" before "Transmission Facilities" at the beginning of the sentence if this is the intent of the language to avoid ambiguity. 1.9 Support EEI's minor word changes. Clarification should be made if this covers all FACTS devices in a substation even if they connect at different points or are at different kV levels. 1.10 Clarification should be made if this item covers only the Transmission Facilities defined as "Interconnection Facilities" in the Midwest ISO tariff or if more than that is covered. If clarification is not made, entities may misunderstand the terms used in this item. 1.11 Support EEI's suggestion. Remove the ambiguous term "essential" and insert Transmission Facilities "providing offsite power requirements as identified in the" NPIR. 1.12 Support EEI's suggestion. Revise wording so that SPS...that "would cause" one or more IROL "violations for failure to operate as designed." 1.13 None 1.14 None 1.15 None 1.16 Support EEI's suggestion. Insert "Any additional assets owned by the Responsible Entity.

Response: Thank you for your comments.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Item 1.2 – Please see response to Item 1.1 for clarification on "single location."

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.7 – The "interconnection at 300 kV" would not apply to any substation connected at less than 300 kV. In addition, any lines leaving a substation at less than 300 kV would not be classified as a Critical Asset per criterion 1.7. In short, language applies to any transformer winding 300 kV or more. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other

Organization	Yes or No	Question 2 Comment
transmission stations or substations." Item 1.8 – Please see response to Item 1.1 for clarification on "single location." FAC-014-2 requires all Reliability Coordinators and Planning Authorities to establish IROLs consistent with its SOL methodology. They are the only ones who can establish IROLs. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 – This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.10 – Please refer to the NERC Glossary definitions of Transmission and Facility. Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements. Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
Ameren	Yes	We believe that impact on the BES should be evaluated for the Critical Asset using the performance requirement contained in the existing mandatory standards. This would provide consistency between CIP-002 and other standards. In this regard, we suggest that for the facilities identified in the bright line criteria, perform powerflow and stability simulations to assess the impact to the BPS of the outage of these facilities, similar to the tests performed for TPL-003 and 004. If there is an impact (that is not meeting the performance criteria), then the facility is to be considered as critical. If there is no such impact, then the facility is not be considered as critical. If there is a concern for a multi-prong attack, then similar reliability assessment should be performed for such scenarios. We offer some comments/suggestions and also have some questions to the bright line criteria (Attaachment 1): The term "Facilities" should be changed to "substations and switchyards" throughout Attachment 1 as NERC glossary of terms include "lines" in the definition also. Is it SDT's intention to include hundreds of miles of lines as critical asset? The term "single station location" and "single plant location" used throughout Attachment 1 need to be defined to avoid confusion whether a single location mean one building or several buildings or stations within a defined geographical boundary or a fenced area. 1.1 - Are there any reliability impact studies to support 1500 MW? We believe that several events larger than this number have occurred and the BES has performed as designed, without any loss of load, or significant

Organization	Yes or No	Question 2 Comment
		impact on reliability. 1.6 - We disagree that all transmission facilities operated at 500 kV or greater are “critical”. Again, system studies should be conducted to take into account the impact that the asset has on the reliable operation of the BES before determining that an asset is a Critical Asset. 1.7 - We disagree that all transmission facilities that are operated at 300 kV or above and are interconnected with three or more transmission substations are “critical. System studies should be conducted to take into account the impact that the asset has on the reliable operation of the BES before determining that an asset is a Critical Asset. 1.8 - Wording for this criterion should be changed to “Transmission substations and switchyards that the Planning Coordinator or Transmission Planner designates that, if destroyed, degraded, misused or otherwise rendered unavailable, demonstrates the need for an Interconnection Reliability Operating Limit (IROL). This change would make this criterion consist with FAC-010/FAC-014.1.12 - We believe that the criterion reads ok, but the rationale document for this criterion implies that purpose of SPS/RAS is to prevent disturbance that would result in excursion beyond IROLs. This may not be true in all cases. 1.13 - Wording for this criterion should be changed to “Common control system(s) capable of performing automatic load shedding of 300 MW or more with a single operation”. 1.15 - Same comments as for 1.1 above. 1.16 - Wording for this criterion should be changed to “Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include.”

Response: Thank you for your comments.

The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The SDT does not feel that a power flow analysis (impact-based or risk-based) would lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry.

A transmission Line can be considered a Critical Asset if it meets the criteria in Attachment 1. It would then be evaluated for possible Critical Cyber Assets, which would be afforded the cyber security protection outlined in CIP-003 to CIP-009. It is not the Critical Asset that falls under CIP-003 to CIP-009, but the Critical Cyber Asset.

The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual “plant” using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a

Organization	Yes or No	Question 2 Comment
single plant. Item 1.1 - Prior drafts had wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The team conducted an informal survey of the regions, and identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. Items 1.6 and 1.7 – You propose to add the criteria that the Responsible Entity can determine through a risk based evaluation that destruction, degradation or unavailability of certain assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. The SDT does not feel that a power flow analysis (impact-based or risk-based) would lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. We thank you for your proposal and will take it under consideration for future revisions. Criterion 1.7 has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.15 –In the development of this criterion, the drafting team used 1500 MW as a bright line for aggregate generation controlled based on the bright-line used in Part 1.1. The drafting team specified a single Interconnection because it is more likely that the span of control of the generation control center may cross multiple BA or RSG areas or even regions and Interconnections. Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
BGE	Yes	There is more clarity in the definition of Critical Asset through the 16 criteria. Specific improvement items:- Clearly state in the Guidance Document the basis for each of the first 15 criteria (1.1 to 1.15), Responsible Entity should define 1.16. The acceptable methods of "deeming appropriate" should be described in the Guidance Document. In 1.8, 1.9 and 1.12 define the IROLs as those determined in year-out planning studies Criteria for common control system (1.13) based on system reliability, not a NERC reporting figure. This needs to be consistent with the criteria in 1.1 (1500 MW). Clarification is required in the Guidance Document on the definition of "automatic load shedding". Term clearly states "no human intervention".
Response: Thank you for your comments.		

Organization	Yes or No	Question 2 Comment
The SDT believes information provided in the guidance document (posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf) provides sufficient technical justification for each criterion. Items 1.8, 1.9, and 1.12 – According to FAC-014-2 IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. They are the only ones who can establish IROLs. Criterion 1.8 has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Criterion 1.9 has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."		
Beaches Energy Services (of City of Jacksonville Beach, FL)	Yes	1.1 Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. BES Comments: BES commends the SDT for their attempt to come to agreement on a nationwide bright line for generating units based on an operationally significant threshold. However, we continues to have the comment FMPA submitted in CIP-010-1 standard as having arbitrary bright lines for generating units and requested that these bright line numbers have justification or have them based on the Contingency Reserve of each Reserve Sharing Group region. BES is concerned that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. To alleviate this volatility we suggest that generation owners should use the facility ratings which are calculated and communicated under FAC-009-1, R2. SDT Proposed:1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater. BES Comments: BES believes that this "bright line" is arbitrary and instead suggests combining this with 1.9. There is no significant difference between the MVARs provided by FACTs devices and those provided by a power plant and it makes sense to treat them both in the same fashion. SDT Proposed:1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes. BES Comments: BES commends the SDT on including the criteria in 1.3, which gives the PC and TP the ability to designate as critical any generating facilities for reliability purposes. This will cover critical units that are not captured within the bright line of criteria 1.1 without drawing in all units of a certain size that are not considered critical elsewhere on the system. We suggest that the designation of facilities be based on studies conducted under the TPL Standards to justify the designation. Also, the use of NERC Glossary of

Organization	Yes or No	Question 2 Comment
		term: “Adverse Reliability Impacts” will help clarify which units should be in this category.We are also concerned that the PC or TP will be looking at local vs. wide area reliability. There are some cases where the PC can designate "Must Run" units for temporary situations, so this must be clarified within the criteria. BES proposes the following rewording of criteria 1.3:”1.3 Each generation Facility that the Planning Coordinator or Transmission Planner designates as required to avoid BES Adverse Reliability Impacts for 1 year or longer.” SDT Proposed:1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. BES Comments: BES is concerned that designating all Blackstart Resources as critical will divert limited resources to protect blackstart facilities that are only used to restore localized load. We believe it is the intent of the drafting team to identify the truly critical blackstart units (taking from the CIP-010-1 draft; only high impact facilities). We understand that criteria 1.4 uniformly identify all Blackstart Resources listed in the Transmission Operator’s restoration plan as being Critical Assets with regards to the Bulk Electric System. Currently, many utilities include multiple Blackstart resources in the restoration plans provided to the Transmission Operator. Including numerous resources makes the plan much more robust and reliable as it provides additional well documented restoration options should unforeseen problems occur. As currently written, Item 1.4 inadvertently incentivizes utilities to remove blackstart resources from the restoration plan if these resources are not critical to an effective restoration plan, reducing the plan’s overall robustness. Therefore, we believe there should be a threshold for Blackstart Resources, similar to nearly all other elements being considered in Attachment 1. This would allow utilities the freedom to include numerous resources in the Transmission Operators restoration plan without being swept into being identified as a critical asset.To implement this approach, we believe it is imperative to consider the Blackstart Resource’s actual role in the restoration plan, not just its simple inclusion. For example, a 10 MW Blackstart Resource that directly supports restoration of a critical generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies local load during an outage. Therefore, we would propose judging the criticality of a Blackstart Resource by the relative importance of the generating unit(s) it directly supports.We would recommend rewording item 1.4 as follows, leveraging the existing language of criteria 1.15 and the capacity bright-line of criteria 1.13:1.4 Each Blackstart Resource identified in the Transmission Operator’s restoration plan, which meet either of the following criteria:1.4.1 Used to directly start generation identified as a Critical Asset in criteria 1.1 or 1.3, 1.4.2 Used to directly start generation greater than an aggregate of 300 MW. We believe this approach should provide a better measure of a Blackstart Resource’s potential impact on the Bulk Electric System, resulting in Critical Assets that adequately address system reliability in a practical manner. It also mitigates the likelihood that registered entities may decide to retire certain small blackstart units, thereby removing valuable but not critical blackstart resources from the Transmission Operator’s restoration plan. SDT Proposed:1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan

Organization	Yes or No	Question 2 Comment
		up to the point on the Cranking Path where multiple path options exist. BES Comments: BES commends the SDT on differentiating between a single Cranking Path as a critical facility and multiple Cranking Paths as having redundancy in the BES and thus being less critical. Having this criteria stated in 1.5 incentivizes the entity to build in redundancy in infrastructure to lower criticality of a single asset. This truly does reward infrastructure reliability through a standard. We suggest that the SDT change “switching requirements” to “switching equipment.” SDT Proposed:1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. BES Comments: BES believes that criteria 1.7 is rather arbitrary and suggests use of TPL-004-0 Category D testing and to combine 1.7 with 1.8. Does loss of a substation result in an IROL or Adverse Reliability Impacts? Doing so can also remove the voltage class limit. It is also unclear from the wording whether the entire substation is a Critical Asset, or whether each Facility connected to that substation is a Critical Asset. We suggest the entire substation. It is also unclear for substations that have two voltage levels (e.g., a 345 kV to 115 kV substation), whether the entire substation should be considered, or just one voltage level. We suggest one voltage level as discussed in the existing TPL-004 standard. SDT Proposed:1.8. Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). BES Comments: BES believes that criteria 1.8 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). Also the use of term Adverse Reliability Impact would be beneficial. Proposed rewording of criteria 1.8:1.8. Transmission Facilities at a single station or substation that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs) or can cause an Adverse Reliability Impact as a result of extreme contingency loss of substation testing as part of the TPL standards or as determined by the Reliability Coordinator. SDT Proposed:1.9. Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). BES Comments: BES believes that criteria 1.9 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). Also the use of term Adverse Reliability Impact would be beneficial. SDT Proposed:1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered

Organization	Yes or No	Question 2 Comment
		unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). BES Comments: BES believes that adding the phrase “or can cause an Adverse Reliability Impact” would be beneficial. SDT Proposed:1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. BES Comments: BES believes that the 300 MW is arbitrary and seems based more on reporting requirements than on true reliability impacts. Also, it should not matter whether loss of load is caused by an “automatic” system or not. In addition, the power system is more resilient to loss of load than loss of generation; hence, by using the same threshold as is used in 1.1, we are actually being quite conservative. BES offers the following alternatives for rewording 1.13:1.13 Common control system(s) that can result in a loss of load equal to or greater than the reserve sharing requirements of the Reserve Sharing Group within 15 minutes. SDT Proposed:1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. BES Comments: BES is concerned that criteria 1.14 is overly broad because it includes all BA and TOP control centers regardless of size. We understand the critical nature of control centers and the need to protect against loss of control of major sections of the BES. However, we ask that the SDT revise this criteria to include a bright-line with similar impact as those in 1.1 and 1.15.BES offers the following revised wording:1.14. Each control center, control system, backup control center, or backup control system that can:1.14.1 Cause a loss of generation or load greater than the reserve sharing requirements of the Reserve Sharing Group1.14.2 That if manipulated, can cause an Adverse Reliability Impact as determined through planning studies. BES cannot support this standard revision without some form of bright line cutoff to exclude small BAs and TOPs that cannot cause instability, cascading or uncontrolled separation of the BES. SDT Proposed:1.15. Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. BES Comments: With the proposed revision to 1.14, this 1.15 would no longer be required. SDT Proposed:1.16. Any additional assets that the Responsible Entity deems appropriate to include. BES Comments: BES believes that 1.16 should be removed from the Attachment 1 criteria. We expect that registered entities may voluntarily protect assets above and beyond the ones listed in these criteria. However, we just do not see the reliability benefit of imposing a compliance liability to those self identified critical assets.

Organization	Yes or No	Question 2 Comment
		We feel that the NERC and Regional compliance staff will waste valuable time and resources evaluating entity compliance with cyber security controls for assets that are outside of the scope of this standard.

Response: Thank you for your comments.

Item 1.1 – The SDT notes your concern that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. The drafting team used time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used. The 12 month time period was used so that seasonal ratings would not be an issue for generating plants that operate near the 1500 MW bright line.

Item 1.2 – The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality. FACTS devices in 1.9 are specifically related to IROLs, whereas the reactive resources in 1.2 are not limited to IROL applications.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.

Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan."

Item 1.7 – The SDT agrees to change "stations" to "stations or substations." The SDT does not believe that power flow based bright-line criteria (i.e. using TPL-004-0) would meet the objective of uniform application of Critical Asset identification across all entities. The term Transmission Facilities can be applied to either the entire substation or each Facility or group of Facilities connected to that substation, as determined by the entity. This would allow an entity which has multiple voltage levels at a single substation to either declare the entire substation as a Critical Asset or only the portion of the substation that qualifies under criterion 1.7. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations."

Item 1.8 –The SDT agrees to change "stations" to "stations or substations." This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Item 1.9 - The SDT agrees to change "stations" to "stations or substations." This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of

Organization	Yes or No	Question 2 Comment
Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.12 – By limiting the scope of Criterion 1.12 to IROLs, Adverse Reliability Impacts are covered as well. This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.15 –This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
We Energies	Yes	We suggest that the functional entities Planning Coordinator and Transmission planner be added to the applicability section. Feedback on specific criteria as follows: 1.1, We request clarification on the phrase "single plant location". This phrase is not defined and it is not clear what level of proximity of generators would be considered a "single plant location". Rather than discuss this in terms of geography (location), we feel it would be better to discuss in terms of "Each group of generating units (including nuclear generation), operated using common cyber control systems other than the Control Centers identified in 1.14 and 1.15, with an aggregate...". 1.3, We suggest the wording: "Each generation facility designated by the Planning Coordinator or Transmission Planner as required to avoid one or more reliability criteria violations". 1.4, The blackstart units deemed critical should be only those identified by the Transmission Operator to meet the minimum critical blackstart requirement. The resulting suggested wording would be: "Each Blackstart Resource identified in the Transmission Operator's restoration plan required to meet the minimum critical blackstart requirement". 1.8, We suggest the wording: "Transmission Facilities at a single location that the Planning Coordinator or

Organization	Yes or No	Question 2 Comment
		Transmission planner has designated that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations". 1.9, We suggest similar wording: "...unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations". 1.11, We suggest the following wording: "Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements". 1.12, We suggest the following wording: "...unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed". 1.14, We suggest this be made consistent with 1.15, i.e. "Each control center, or backup control center, used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator". 1.16, We suggest the following wording: "Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include".

Response: Thank you for your comments.

Since there is no Requirement that applies to the Planning Coordinator or the Transmission Planner, it is not appropriate to include them in the Applicability section.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT believes that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources.

Item 1.8 – According to FAC-014-2 IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of

Organization	Yes or No	Question 2 Comment
Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 – This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements. Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
City Utilities of Springfield, MO	Yes	SPRM agrees with the comments by the APPA Task Force, incorporated herein by reference. SPRM has additional specific comments as noted below. 1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. SPRM agrees with the comments from the APPA Task Force. 1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater. SPRM does not have a comment on criteria 1.2 at this time. 1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes. SPRM agrees with the comments from the APPA Task Force and will add an additional request for the drafting team to consider using this criterion to identify critical transmission. SPRM proposes the following rewording of criteria 1.3:1.3 Each transmission or generation Facility that the Planning Coordinator or Transmission Planner designates as required to avoid BES Adverse Reliability Impacts for 1 year or longer. 1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. SPRM generally

Organization	Yes or No	Question 2 Comment
		agrees with the comments from the APPA Task Force. However, SPRM proposes the following exception to the APPA rewording of criteria 1.4:1.4 Each Blackstart Resource identified in the Transmission Operator's restoration plan used to directly start generation identified as a Critical Asset in criteria 1.1 or 1.3. 1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. SPRM agrees with the comments from the APPA Task Force and additionally will suggest the following rewording of criteria 1.5:1.5. The Facilities comprising the Cranking Paths and initial switching equipment from the Blackstart Resource identified in 1.4. to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. 1.6. Transmission Facilities operated at 500 kV or higher. SPRM would like to recommend that the drafting team verify that all transmission operated at 500 kV or higher is truly critical. Otherwise, SPRM will suggest that our proposed changes in criteria 1.3.would identify all transmission, regardless of voltage, that is critical to the reliable operation of the Bulk Electric System. 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. SPRM generally agrees with the comments from the APPA Task Force and additionally would like to recommend that the drafting team verify that all transmission identified in this criteria is truly critical. Otherwise, SPRM will suggest that our proposed changes in criteria 1.3 would identify all transmission, regardless of voltage or interconnections, that is critical to the reliable operation of the Bulk Electric System. 1.8. Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs).SPRM agrees with the comments from the APPA Task Force. 1.9. Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). SPRM agrees with the comments from the APPA Task Force. 1.10. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3. SPRM would like the drafting team to clarify if the "Transmission Facilities" is the line connecting the generator to the bus in the substation, or is it the whole substation where the generator is connected? 1.11. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements. SPRM would like to recommend that the drafting team verify that all transmission identified in this criteria is truly

Organization	Yes or No	Question 2 Comment
		critical. Otherwise, SPRM will suggest that our proposed changes in criteria 1.3. would identify all transmission, regardless of voltage or interconnection, that is critical to the reliable operation of the Bulk Electric System. 1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). SPRM agrees with the comments from the APPA Task Force. 1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. SPRM agrees with the comments from the APPA Task Force. 1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. SPRM agrees with the comments from the APPA Task Force. 1.15. Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. SPRM agrees with the comments from the APPA Task Force. 1.16. Any additional assets that the Responsible Entity deems appropriate to include. SPRM agrees with the comments from the APPA Task Force.

Response: Thank you for your comments. Please refer to the response to APPA's comments.

Item 1.1 – The SDT notes your concern that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. The drafting team used time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used. The 12 month time period was used so that seasonal ratings would not be an issue for generating plants that operate near the 1500 MW bright line.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT believes that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources.

Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart

Organization	Yes or No	Question 2 Comment
Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.6 –The drafting team felt that Facilities operated at 500 kV or higher did not require any further qualification for their role as components of the backbone on the Interconnected BES. Item 1.7 – This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.10 – The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any Transmission Facility the loss of which would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset. That might include a substation or the line connecting the generator to the bus in the substation. This criterion has been changed to "Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3." Item 1.11 – This is defined in NUC-001-2 Requirement 9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs."		
National Grid	Yes	National Grid proposes to include the class of assets - generation, transmission, and control centers against each criterion in attachment 1. This will help entities to clearly identify which requirements fall under different classes of assets. For example - 1.5 The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. (Generation, transmission)
Response: Thank you for your comments. The Applicability section of the standard specifies what NERC Registered Entities the standard applies to. All Requirements apply to all Entities listed in the Applicability section.		
Lincoln Electric System	Yes	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
Response: Thank you for your comments. Please refer to the response to MRO NERC Standards Review Subcommittee comments.		
Southwest Power Pool Regional Entity	Yes	Black start overall is not well understood. Black start should be defined as starting the entity's generation resources to the point that load can be served (not to be confused with bringing on load to balance generation during the black start sequencing). This is often more than starting the first "black start" combustion turbine unit to start a thermal unit. Unless that black start unit has sufficient capacity to start individually every other generation resource in the entity's footprint that is not self-starting, additional generation is required even if not specifically identified as a black start resource in the entity's restoration plan.

Organization	Yes or No	Question 2 Comment
		Consider declaring DC Tie substations as Critical Assets. Automated load shedding systems capable of shedding 300 MW or more should be considered Critical Assets regardless of the time it takes for the system to shed the load. Defining a 15 minute window is unnecessary and could result in disagreement between the entity and the auditor over whether the impact could occur within the fifteen minute versus a longer period. Removing the 15 minute criteria resolves that potential ambiguity. Additionally, please accept and consider the following comments that do not directly apply to any of the questions in the comment form. I have no other way to bring these comments to the drafting team's attention. M1: Measure M1 should be modified to state “The Responsible Entity shall make available its approved list of Critical Assets as specified in Requirement R1.” (addition of the word "approved") M2: Measure M2 should be modified to state “The Responsible Entity shall make available its approved list of Critical Cyber Assets as specified in Requirement R2.” (addition of the word "approved") M3: Measure M3 states “The Responsible Entity shall make available its approval records of annual approvals as specified in Requirement R3.” This measure should be modified to state “The Responsible Entity shall make available its approval records as specified in Requirement R3.” (Removes expectation of annual-only approval and requires any modification to the CA or CCA list to be approved) The Compliance Enforcement Authority obligations (Section D.1.1) fail to identify who is the Compliance Enforcement Authority for Responsible Entities that do perform delegated tasks for their Regional Entity. The Responsible Entity data retention requirement (Section D.1.4.1) should be modified to require records to be kept since the effective date of the standard or the most recent scheduled audit of this version of the standard, whichever is a shorter period of time. This is in keeping with NERC Compliance Process Bulletin #2009-005 'Current In-Force Document Data Retention Requirements for Registered Entities'. A similar modification should be made to CIP-003-4 through CIP-009-4. (Entities are already expected to retain all evidence in support of the annual, or in the case of the CIP standards to date, semi-annual self certification, so this is not an undue burden. Retention of records with the exception of specific information with a prescribed shorter retention, such as logs, will allow the CEA to verify sustained compliance with the standards over the full audit period. And, in the case of the logs, the entity will need to maintain some sort of evidence that logs were retained for at least 90 days, although retention of the actual logs is not required.)
Response: Thank you for your comments. Item 1.4 – A Blackstart Resource is defined as “A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s		

Organization	Yes or No	Question 2 Comment
restoration plan." The SDT believes that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources. Concerning DC Tie substations, we thank you for your proposal and will take it under consideration for future revisions. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." M1 – There is no requirement in R1 to have the list approved M2 – There is no requirement in R2 to have the list approved M3 – Has been modified to "The Responsible Entity shall make available its records of approvals as specified in Requirement R3." CEA info – Thank you for your comment. The appropriate clarification has been made. Data retention – Thank you for the comment. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The suggested changes to the data retention requirement will be made in a subsequent version of the CIP standards.		
Indianapolis Power & Light	Yes	Regarding 1.13, "Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes". Our understanding of that criterion seemed clear until we read the rational and implementation reference document that states that "Control Systems that provide a "one-button push" capability of shedding 300 MW or more would also qualify as Critical Assets". That reference adds manual actuation with automatic therefore allowing additional interpretation of the meaning of the criterion. We also suggest replacing "capable of" with "purposed and programmed for" performing automatic load shedding of 300 MW or more within 15 minutes." A control system could be capable if programmed to do so but should not be included if that functionality is not its purpose.
Response: Thank you for your comments. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."		
Constellation Power Generation	Yes	Constellation Power Generation believes that in general, the criteria in Attachment #1 have drawn clear bright lines that will assist the industry in identifying critical assets. However, criterion 1.1, 1.5, and 1.11 need some further clarification and changes. Criterion 1.1 attempts to identify generation assets larger than 1500 MW. Constellation Power Generation (CPG) requests further clarification as to what constitutes a "single plant location." Would this include the aggregation of separated assets in separate structures with no shared resources other than being physically

Organization	Yes or No	Question 2 Comment
		located on a shared footprint? Constellation proposes the following changes to Criterion 1.1: Each group of generating units sharing a physical boundary with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. CPG also seeks clarification regarding the technical justification of the 1500 MW threshold. The SDT released a guidance document which did not fully explain the derivation of 1500 MWs. If this bright line was the average of reserve sharing in each of the 8 regions, than the value should be 1700 MWs, not 1500 MWs. CPG requests that the SDT reach out to the technical teams that exist within each region to obtain the correct reserve sharing thresholds. This data should be published, preferably in the guidance, to technically justify the seemingly arbitrary MW threshold. Criterion 1.5 attempts to identify cranking path equipment critical to a TOP's restoration plan. CPG is concerned that this criterion could be interpreted to include transformers and breakers associated with "the unit(s) being started." This implies that specific equipment at a generation asset may be critical while the asset itself may not be critical. This criterion would thus bring more equipment to scope that has little to no impact on the reliability of the BES. Constellation proposes the following changes to Criterion 1.5: 1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the interconnection point of the generation asset to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. In addition, Item 1.11 should be removed from Attachment 1. Assets should not be deemed critical simply because they are associated with a nuclear facility. NRC regulations govern the safety and security of nuclear power plants. Rather, critical assets should be defined based upon reliability related criteria, independent of fuel type.

Response: Thank you for your comments.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Item 1.1 - Prior drafts had wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The team conducted an informal survey of the regions, and identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions.

Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan."

Organization	Yes or No	Question 2 Comment
Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." Since these facilities were deemed so important that a NERC standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets.		
Independent Electricity System Operator	Yes	We do not agree with criteria 1.6 and 1.7 as written since some of the facilities identified as Critical Assets by applying them may have no impact on the BES. We therefore believe the list of relevant transmission facilities developed by the Responsible Entity, should be subject to an impact-based assessment by the Reliability Coordinator who has the wide-area view of the system. If necessary, an additional requirement that requires the RC to have a risk-based assessment methodology and to conduct the assessment should be included. We therefore propose the following specific wording: 1.6 Transmission facilities operated at 500 kV or higher, unless the annual review performed by the Reliability Coordinator (new requirement) demonstrates that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. 1.7 Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations, unless the annual review performed by the Reliability Coordinator (new requirement) demonstrates that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages.
Response: Thank you for your comments. Items 1.6 and 1.7 – You propose to add the criteria that the RC can determine through a risk based evaluation that destruction, degradation or unavailability of certain assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. The inclusion of a risk-based evaluation by any entity would not meet the objective of uniform application of Critical Asset identification across all entities. Criterion 1.7 has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations."		
American Electric Power (AEP)	No	AEP would contend that there are regional differences that would be relevant to determine a MW threshold for each responsible entity. We support the concept that was contained in the last draft that made the determination based on the capacity reserves. However, the prior language would need to be revisited to ensure that the value was fixed for a period of time. When do newly identified items in item 1.3. become in scope? During the annual review or does another review need to be done between annual reviews. Since many PA and TP are also Reliability Coordinators, Section 1.3 should be modified to contain "...required for long-term reliability purposes in the planning horizon." This should not include temporary seasonal reliability needs within the current year. Need a

Organization	Yes or No	Question 2 Comment
		requirement for the TP and PA to perform the analysis and have process for posting. Section 1.13 should be explicitly focused on BES elements and exclude distribution feeder interruptions. Would this include large industrial customers that can interrupt their loads? Net real power capability testing is defined in MOD-024 standards that have yet to be FERC approved. Furthermore, not all of the regions have defined the parameters for the capability testing. What would be the basis for defining the parameters for net real power capability determination? It is unclear in section 1.1 if what constitutes "single plant location." Is the physical location important or is it units that have common systems that could disrupt multiple units? AEP contents that it would not be logical to base the requirement on geographic address, but other factors such as voltage it is connect and the relationship of the units at the plant.
Response: Thank you for your comments. Item 1.1 - Prior drafts had wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The team conducted an informal survey of the regions, and identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. Item 1.3 – Newly identified Critical Assets come into scope at the time they are designated by the Planning Coordinator or Transmission Planner. Any associated newly identified Critical Cyber Assets would follow the "Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities." This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.1 – CIP-002-4 does not require net real power capability testing. Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.		
Orlando Utilities Commission	Yes	SDT Proposed: 1.1 Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or

Organization	Yes or No	Question 2 Comment
		exceeding 1500 MW. OUC Comments: OUC believes that any system that has the ability to shed sufficient generation to cause system frequency to decline to the point of under-frequency relay protection tripping must be protected. OUC urges the drafting team to consider this aspect and re-design this requirement appropriately. This could probably be drafted as: "Any group of generating units at a single plant location that consist of more than 5% of the generation within a Balancing Authority" SDT Proposed: 1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater. OUC Comments: 1000MVAR is an arbitrary bright line suggest changing criteria to "Any reactive resource identified as a remedy, mitigation or strategy within a long range plan to address either real-time or contingency events. - or- Any reactive resource that if lost or destroyed while in service would result in a voltage change of more than 5% or a change in transmission loading that would result in an overload of a transmission element of more than 125% SDT Proposed: 1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. 1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. OUC Comments: Combine 1.4 and 1.5 path into single criteria to prevent expected interpretations and entity miss-understandings. In order to clearly identify "what's in and what's out" re-write the criteria as: "All facilities identified within a Transmission Operators restoration plan, required to establish a least one synchronized tie with a neighbor" The simplicity of this re-write is that it truly meets the requirements of rebuilding the BPS after an event. SDT Proposed: 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. OUC Comments: OUC believes that criteria 1.7 should be reworded to "stations or substations" instead of just "stations" so that it is not implied that it only applies to power plants (stations). SDT Proposed: 1.8. Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). OUC Comments: OUC believes that criteria 1.8 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). SDT Proposed: 1.9. Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection

Organization	Yes or No	Question 2 Comment
		Reliability Operating Limits (IROLs). OUC Comments: OUC believes that criteria 1.9 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). SDT Proposed: 1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. OUC Comments: OUC believes that any system that has the ability to shed sufficient load to cause frequency to increase to the point of over-frequency protection tripping must be protected, this includes system traditionally know as manual load shedding. OUC urges the drafting team to consider this aspect when re-designing this requirement. This could probably be drafted as: "Any system that can be configured to automatically drop 5% of load within a Balancing Authority based on either an automatic or manual initialization" SDT Proposed: 1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. OUC Comments: OUC understands the inter-connectedness of control centers and the risk even a small control center could pose to larger control centers, however this is the reason that strong security controls must exist for control centers that meeting the bright line criteria. However OUC is concerned that criteria 1.14 is overly broad because it includes all BA and TOP control centers regardless of size. We understand the critical nature of control centers and the need to protect against loss of control of major sections of the BES. However, we ask that the SDT revise this criteria to include a bright-line with similar impact as those in 1.1 and 1.15. OUC offers the following revised wording: 1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator with a minimum of 1500 MW of resources under its control. SDT Proposed: 1.16. Any additional assets that the Responsible Entity deems appropriate to include. OUC Comments: OUC believes that 1.16 should be removed from the Attachment 1 criteria. We expect that registered entities may voluntarily protect assets above and beyond the ones listed in these criteria. However, we just do not see the reliability benefit of imposing a compliance liability to those self identified critical assets. We feel that the NERC and Regional compliance staff will waste valuable time and resources evaluating entity compliance with cyber security controls for assets that are outside of the scope of this standard.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. Item 1.1 - Prior drafts had wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The team conducted an informal survey of the regions, and identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. Item 1.2 – The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality. The SDT does not feel that a power flow analysis (impact-based or risk-based) would lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. Items 1.4 and 1.5 – NERC standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan as well as requirements to test these Resources. NERC standard EOP-005-2 R1.5 requires the Transmission Operator to identify Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started. The Facilities identified in compliance with this standard would be the Facilities classified as Critical Assets for Criteria 1.4 and 1.5. Criterion 1.5 has been reworded to “The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan.” Item 1.7 – The SDT agrees to change “stations” to “stations or substations.” This criterion has been reworded to “Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.” Item 1.8 –The SDT agrees to change “stations” to “stations or substations.” This criterion has been changed to “Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.” Item 1.9 - The SDT agrees to change “stations” to “stations or substations.” This criterion has been changed to “Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.” Item 1.13 – This criterion has been changed to “Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.” Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to “Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator.” A new criterion 1.16 has been added which states “Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.” A new criterion 1.17 has been added which states ” Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection.” Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		

Organization	Yes or No	Question 2 Comment
Oglethorpe Power Corporation	Yes	In general the criteria are very clear and concise and do not require additional explanations. It may however be appropriate, possibly in a separate document to provide some background on how these criteria were arrived at - especially criteria 1.1, 1.2 1.7, 1.13, and 1.15 which rely on seemingly arbitrary limits to determine the inclusion or exclusion of Assets. Additionally, some examples for criterion 1.16 may be a good idea.
Response: Thank you for your comments. Please refer to the draft guidance document posted on the Project 2008-06 page http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf		
Brazos Electric Power Cooperative, Inc.	Yes	In criterion 1.2 the use of the term "nameplate rating" should be replaced with "capability" and add "in the preceeding 12 months" at the end similar to criterion in 1.1. The use of the term "misused" in criterion 1.8, 1.9, 1.10 and 1.12 should be dropped as it leads to interpretation problems and doesn't improve reliability posture.
Response: Thank you for your comments. Item 1.2 – The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The term “misused” is in the criteria in response to FERC Order 706.		
Midwest ISO	No	Criteria 1.8, 1.9, and 1.12 should be modified because loss of facilities does not cause an IROL violation. An IROL includes a limit and a time constant Tv. In order for an IROL violation to occur, the limit must be exceeded for at least the time constant Tv. Tv is usually 30 minutes. Thus, when we consider the impact on the loss of facilities on an IROL, an operator will have enough time to adjust the system to prevent an IROL violation. For 1.8, the criterion should be modified to reflect that the facilities that comprise an IROL should be considered critical. The drafting team may also wish to consider loss of any facilities that set up the need for the IROL or cause the actual limit to change. For criterion 1.9, it is not clear why FACTs devices need to be singled out. Are they not covered in criterion 1.8 under Transmission Facilities? Inclusion of 1.9 is redundant and just causes confusion because it causes the reader to infer that the drafting team intended for them to be treated differently when in fact the criterion is the same as 1.8. For criterion 1.12, it would be more appropriate to assess the impact of an SPS, RAS, or automated switching system on the IROL. If loss of the SPS, RAS, or automated switching system causes an IROL to decrease, then the SPS, RAS, or automated switching system should be considered critical. Contrary to the companion

Organization	Yes or No	Question 2 Comment
		draft guidance document statement in the second paragraph on page 11, most SPS, RAS and automated switching systems are not used to prevent disturbances that would result in IROLs. In fact, some regions consider generation runback schemes to be an SPS even when it is used to simply resolve a generation outlet issue for loss of a line out of a plant. This is a common and economically effective way to avoid the expense of building more transmission lines. This paragraph from the draft guidance document should be removed. In the first bulleted paragraph on page 7 of the companion draft guidance document, the paragraph appears to conclude that a substation is a Facility. We disagree that it is facility. Because a facility is defined as a set of equipment that operates as a single BES Element and Element is further defined as "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line." We believe facilities terminate in substations (i.e transmission line) or are wholly contained in a substation (i.e. transformer); however, we don't believe that a substation would fit the definition of facility as a result because it is not an electrical device with its own terminals that are connected to other electrical devices. The draft guidance document needs to be modified to reflect this. In the last paragraph on page 10 of the generation section draft guidance document, there is a discussion of Cranking Paths. Shouldn't this be moved to the transmission section?
Response: Thank you for your comments. Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 – FACTS devices were singled out to ensure that there was no confusion as to whether or not they were considered Critical Assets. Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." In the first bulleted paragraph on page 7 of the companion draft guidance document (posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf), the following is stated: "For example, for Transmission assets, the substation may be designated as the group of Facilities." Since the Cranking Path may contain both generation and Transmission Facilities, it is appropriate to discuss in both sections.		
Duke Energy	Yes	1.1 - Consistent with Criteria 1.8 and 1.9, this criterion should be conditioned by adding the phrase "unless planning studies are available to demonstrate that the loss of generation does not cause violation of one or more Interconnection Reliability Operating Limits (IROLs)." Related to the generation loss impact on Interconnection frequency and resource adequacy, Duke Energy disagrees with the arbitrary selection of the

Organization	Yes or No	Question 2 Comment
		generation loss MW amount for the following reasons: a) System inertia and frequency response factor into potential impact a generation loss could have on Interconnection frequency, and are different for each Interconnection. A 1,500 MW loss in the Eastern Interconnection is much less significant in terms of the initial frequency deviation than a similar loss within any other Interconnection. b) The limit fails to recognize the options available to the Balancing Authority to restore its balance within the existing criteria of the NERC reliability standards. For example, recovery from the loss of 1,500 MW within a 5,000 MW Balancing Authority may be quite different than recovery from a 1,500 MW loss within a 135,000 MW Balancing Authority in the Eastern Interconnection. PJM alone is about twice the size of ERCOT. 1.2 - We believe that 1000 MVAR may too large, and should be reduced to 500 MVAR. However criterion 1.2 could just be deleted, since any significant reactive resources would be picked up under criterion 1.8 1.3 - "Generation designated as required for reliability purposes" doesn't seem to be a very "bright line". We believe this criterion should be further clarified by including language from the "Rationale and Implementation Reference Document". 1.4 - Need to clarify that this criterion only includes the primary Blackstart Resources. Entities may include various alternative resources in their restoration plans which aren't Critical Assets, but which may not be clearly distinguished from the primary Blackstart Resources in the restoration plan. Add the phrase "that the entity intends to rely on for system restoration". 1.5 - The CIPDT is looking to the industry to define Critical Assets based on NERC definitions that are somewhat ambiguous and can be redefined by Standard Drafting Teams any time a group of standards is proposed. This could lead to Critical Assets being removed or added without proper analysis being performed on the impact to the system. Also, the definition of Cranking Path could be debated that it could be from a generating source that provides electricity to a larger resource during restoration. This source could be a small diesel that is sitting next to a large generator that provides the electricity to lift pumps, exciter field, or some other device that provides the means for a larger generator to become a Blackstart Resource. Or it could be argued that the cranking path is from a Blackstart Resource to fossil plants on the system that are used to facilitate the restoration of the system. Duke Energy requests that the Drafting team rewrite this requirement so that it does not use this term. Duke Energy also believes that the CIPDT should get input from those that are familiar with Restoration by requesting input from the Emergency Operations Drafting Team. We propose rewriting 1.5 as follows: The Facilities comprising the current carrying path from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan, up to the point where multiple path options exist. 1.8 & 1.9 - These two criteria need clarification. First, it should be made clear that this IROL evaluation is to be made in the planning timeframe, because the purpose is to identify Critical Cyber Assets that need to be protected, which is an activity that takes place in the planning timeframe. Also, including the word "destroyed" in the phrase "destroyed, degraded, misused or otherwise rendered unavailable" creates significant

Organization	Yes or No	Question 2 Comment
		uncertainty regarding what the IROL analysis is intended to encompass. Add the phrase "via cyber attack" after the word "unavailable". This will clarify that the evaluation only encompasses destruction, degradation or misuse that can be achieved via cyber attack, and not a physical attack on the station. For example, physical attack could imply multiple transmission lines shorted to ground, which entails a much different analysis than transmission lines removed from service via cyber attack. NOTE: The physical security provided by the CIP standards is focused on protection of the Critical Cyber Assets, not the Critical Assets. 1.10 - As with our comment on 1.8 & 1.9 above, add the phrase "via cyber attack" after the word "unavailable". We also have a concern that if an entity fails to identify a facility under 1.1 or 1.3, they will also be in violation for failing to identify the corresponding Transmission Facilities under 1.10 (i.e. the double jeopardy issue). Need to replace the phrase "described in" with the phrase "identified by an entity pursuant to". Alternatively, 1.10 could be folded into 1.1 and 1.3 by adding the phrase "and Transmission Facilities providing the generation interconnection" to those criteria. 1.11 - Need to clarify that these Transmission Facilities are those that are specifically identified in the Nuclear Plant Interface Requirements (NPIRs) in the Agreement developed between the Nuclear Plant Generator Operator and applicable Transmission Entities pursuant to NUC-001-2. At the end of this criterion add the phrase "in the Agreement(s) required by NUC-001 R2." 1.12 - As with our comment on 1.8 & 1.9 above, this criterion should be revised to clarify that this IROL evaluation is to be made in the planning timeframe, because the purpose is to identify Critical Cyber Assets that need to be protected, which is an activity that takes place in the planning timeframe. Also, the phrase "destroyed, degraded, misused or otherwise rendered unavailable" needs to be clarified by adding the phrase "via cyber attack" after the word "unavailable". 1.13 - Load control programs shouldn't be defined as Critical Assets but rather Critical Cyber Assets, since they are a function of the control center, which is already a Critical Asset. Replace the word "Common" with the phrase "Each control center or backup control center used to". Also, clarify the meaning of "automatic" by inserting the parenthetical (without human intervention) after the word "automatic". 1.14 - This criterion is far too broad because we don't have an approved NERC definition of control room, control system, backup control room or backup control system. Many switchyards and substations have control systems that could be used to perform transmission functions, but that doesn't mean that they are "Critical Assets". Remove control system and backup control system from this criterion and limit it to identifying the control centers and backup control centers associated with the Critical Assets on the transmission system, just as criteria 1.15 links identification of the control center or backup control center to the generation asset. We propose rewriting 1.14 as follows: Each control center or backup control center associated with the Critical Assets on the transmission system. 1.16 - A "catch-all" criterion seems inappropriate in a "bright line" list. You can always go beyond the

Organization	Yes or No	Question 2 Comment
		requirements of a standard and do more than what's required.

Response: Thank you for your comments.

Item 1.1 - Prior drafts had wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The team conducted an informal survey of the regions, and identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. The issue with using different MW values in each region is that it does not meet the objective of uniform application of Critical Asset identification across all entities.

Item 1.2 – The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.

Item 1.5 – NERC standard EOP-005-2 R1.5 "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started" designates that Cranking Paths must be identified. This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan."

Items 1.8 & 1.9 – Cyber analysis is contained in Requirement R2, not in the identification of Critical Assets. Criterion 1.8 has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Criterion 1.9 has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Item 1.10 – Cyber analysis is contained in Requirement R2, not in the identification of Critical Assets. There is no double jeopardy, since all of these criteria are contained in the same Requirement. This criterion has been changed to "Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3."

Item 1.11 – The SDT does not believe that adding the phrase "in the Agreement(s) required by NUC-001 R2" provides any clarification, since the defined NERC term Nuclear Plant Interface Requirements is "The requirements based on NPLRs and Bulk Electric System requirements that have been mutually agreed to by

Organization	Yes or No	Question 2 Comment
the Nuclear Plant Generator Operator and the applicable Transmission Entities." Item 1.12 – Cyber analysis is contained in Requirement R2, not in the identification of Critical Assets. This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.		
Seminole Electric Cooperative, Inc.	Yes	1. A general comment is that there is no technical justification provided for the proposed criteria. The "Rationale and Implementation Reference Document" does not provide technical justification, but rather provides more of an opinion of the drafting team. To the extent possible, there should be technical justification for the proposed criteria that stakeholders can review. 2. SEC is concerned that designating all Blackstart Resources as critical will divert limited resources to protect blackstart facilities that are only used to restore localized load. We believe it is the intent of the drafting team to identify the truly critical blackstart units (taking from the CIP-010-1 draft; only high impact facilities). SEC understands that criteria 1.4 uniformly identify all Blackstart Resources listed in the Transmission Operator's restoration plan as being Critical Assets with regards to the Bulk Electric System. Currently, many utilities include multiple Blackstart resources in the restoration plans provided to the Transmission Operator. Including numerous resources makes the plan much more robust and reliable as it provides additional well documented restoration options should unforeseen problems occur. As currently written, Item 1.4 inadvertently incentivizes utilities to remove blackstart resources from the restoration plan if these resources are not critical to an effective regional restoration plan, reducing the plan's overall effectiveness. Therefore, we believe there should be a threshold for Blackstart Resources, similar to nearly all other elements being considered in Attachment 1. This would allow utilities the freedom to include numerous resources in the Transmission Operators restoration plan without being swept into being identified as a Critical Asset.To implement this approach, we believe it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just its simple inclusion. For example, a 10 MW Blackstart Resource that directly supports restoration of a critical generating facility is much more important to the Bulk Electric System than a

Organization	Yes or No	Question 2 Comment
		10 MW Blackstart Resource that simply supplies local load during an outage. Therefore, SEC would propose judging the criticality of a Blackstart Resource by the relative importance of the generating unit(s) it directly supports. 3. In item 1.7 the statement regarding "three or more other transmission stations" is confusing. A better explanation is needed -- does this mean stations upstream, downstream, networked or radial? 4. In item 1.14 the term "control center" must be defined, especially when dealing with the significance of the requirements of this standard. Using an undefined term here is inappropriate. 5. In item 1.14 its states that all RC, BA and TOP control centers, etc., are Critical Assets. While SEC agrees with this as it relates to RCs, we do not agree with this as it relates to all BAs and TOPs. In the draft CIP-010 there was high, medium and low criteria which in many instances appropriately matching CIP requirements to the level of risk certain assets potentially present to the BPS. SEC strongly believes that the CIP-002-4 standard requirements for smaller BAs and TOPs should match the lower level of risk to BPS reliability that these smaller BAs and TOPs potentially present. Similar to the 1500MW size criteria that is included in item 1.15 for generator control centers, there should be size criteria for the smaller BAs and TOPs. The drafting team should modify item 1.14 to state that all control centers with a peak demand above 2000MW (same as medium criteria in draft CIP-010) shall be designated as a Critical Asset. This is the lowest SEC could support and also recommend its members to support. We firmly believe that this would capture all of the control centers that truly have a material impact on the reliability of the BPS. 6. Related to the Critical Asset Criteria, there should be a provision in the standard that provides a process for an entity to technically demonstrate that even though the criteria identifies some of their assets as Critical Assets, their assets (or a portion thereof) do not meet the definition of a Critical Asset and should be excluded from applicability of CIP-003 through CIP-009.

Response: Thank you for your comments.

The SDT believes information provided in the guidance document (posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf) provides sufficient technical justification for each criterion.

Item 1.4 – A Blackstart Resource is defined as “A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s restoration plan.” EOP-005-2 R1.4 states that the restoration plan must include “Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit.” The SDT believes that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.

Organization	Yes or No	Question 2 Comment
Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation-only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. This criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.14 - At this time, the SDT is choosing not to add control center to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." The SDT believes that having an exception process to the criteria presents the same challenges associated with a risk-based assessment in external review and oversight.		
Progress Energy	Yes	General Comments:The terms "degraded" and "misused" are subject to a wide range of interpretation, are not auditable and should not be used in bright line standards. Measurable values should be provided. Criterion 1.1: What is meant by "at a single plant location" should be clarified. Generating units that constitute a plant should be defined based on electrical connection. Criterion 1.5: Clarification is needed on what is included beyond blackstart generation units. Criterion 1.8: This requirement should be set aside from this version of the standard and be re-introduced in the next version with appropriate measureable parameters for High, Medium and Low Impact BES facilities. Criterion 1.9: Same comments as for Criterion 1.8. Criterion 1.11: The criteria should be: The local nuclear plant switchyards, the transmission lines connected to these switchyards, and the first out substations on the other ends of these transmission lines. These are the transmission facilities essential to meeting the NPIRs. Criterion 1.13: Distribution should be specifically excluded from this criterion because loss of distribution facilities does not affect the BES.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. The terms “degraded” and “misused” are in the criteria in response to FERC Order 706. Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. The document is posted on the Project 2008-06 page at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . Single plant location refers to a group of generating units occupying a defined physical footprint and designated as an individual “plant” using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant. Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator’s restoration plan per EOP-005-2 R1.5 “Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started” where the Transmission Operator can choose between the next Facilities on the BES to energize. This criterion has been reworded to “The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan.” Item 1.8 and Item 1.9 – Criteria 1.8 and 1.9 include those Transmission Facilities that would violate IROLs if they were rendered unavailable or degraded. By definition, IROLs are those operating limits that, if exceeded, would have a Wide Area reliability impact. Criterion 1.8 has been changed to “Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.” Criterion 1.9 has been changed to “Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.” Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 “Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.” Item 1.13 – This criterion has been changed to “Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.”		
New York Independent System Operator	Yes	The NYISO request that the NERC Glossary include definitions for all terms especially in Attachment 1. Examples to add to the NERC Glossary or the standard would be to define: control center, control system, backup control center, and backup control system
Response: Thank you for your comments. At this time, the SDT is choosing not to add terms to the NERC Glossary. We feel defining these terms under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. These terms are used in other approved NERC standards already in effect.		
Cowlitz County PUD	Yes	Further ‘red line’ criteria needs to be added to avoid inclusion of non-critical assets.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments.		
Kansas City Power & Light	No	Absent engineering analysis and study, this bright line proposal does not establish a sound basis for capturing the elements that should be included and those that should be excluded. Very concerned regarding the proposed criteria specified by criteria 1.4, 1.5, 1.13 and 1.14 as this criteria will identify assets as critical assets for smaller entities that have no regional reliability impact on the bulk electric system and will place an unnecessary compliance burden on them. These criteria need to either be considered for removal or modification such that an applicable application is achieved.
Response: Thank you for your comments. The SDT does not feel that engineering analysis (impact-based or risk-based) would lead to a consistent application of the criteria, due to the numerous factors which can impact the results of the analysis. Such studies would need to be rigorously defined for the industry. We thank you for your proposal and will take it under consideration for future revisions.		

3. Requirement R1 of draft CIP-002-4 states, "Critical Asset Identification — Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in CIP-002-4 Attachment 1 – Critical Asset Criteria. The Responsible Entity shall review this list at least annually, and update it as necessary." Do you agree with the proposed Requirement R1? If not, please explain why and provide specific suggestions for improvement.

Summary Consideration: The majority of commenters that disagreed with Requirement R1 suggested changes to wording that is present in the existing CIP-002-3. The SDT responded that the scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology mentioned exists in the existing CIP-002-3 standard. The SDT expects the phraseology to be resolved in the next version. Others stated that their objection was with the wording in Attachment 1. The SDT directed them to the responses offered to their comments in question 2.

Organization	Yes or No	Question 3 Comment
Northeast Power Coordinating Council	Disagree	Request an explicit definition of "annual." Because the "update as necessary" in R1 is not clear, the new assets effective date is in doubt. Should be it be part of "update as necessary" or part of the annual review? The standard clearly mentions the documentation required to comply with CIP-002-4. This includes - list of Critical Assets as specified in R1, list of Critical Cyber Assets as specified in R2, and approval records of annual approvals as specified in R3. However, in the Guidance document, Page 7, bullet point 2, second sentence, it states the following - "...Responsible Entity should document all criteria that qualify this asset as a Critical Asset..." The drafting team should clarify documentation requirements to avoid discrepancies. If it is expected that entities are to document, and retain documentation, of the criteria that supports the categorization of critical assets, this should be explicitly required by the standard. As the proposed standard is written, the only documentation registered entities must create and retain is the actual list of the assets.Agreement based on the assumption that the classifications in Attachment 1 are corrected.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version. The standard specifies the requirements that the Responsible Entity must comply with. The reference document is intended to provide guidance and does not specify any requirement for compliance.		
City of Garland	Agree	

Organization	Yes or No	Question 3 Comment
NRG Energy Inc.	Agree	
APPA CIP-002-4 Task Force	Agree	
IRC Standards Review Committee	Agree	The SRC agrees with the obligations prescribed by R1, subject to the SDT's acceptance of the proposed revisions described in response to Question 1.
Response: Thank you for your comments.		
Bonneville Power Administration	Agree	We agree with the "at least annually" aspect of the requirement. Annual review seems appropriate if a utility has not had any major changes or expansion to their grid since their last Critical Asset determination.
Response: Thank you for your comments.		
PSEG Companies	Agree	
Pepco Holdings, Inc - Affiliates	Agree	Requirement 3 should be modified: References to risk-based assessment methodology should be removed.
Response: Thank you for your comments. This requirement will modified prior to the next ballot.		
MRO's NERC Standards Review Subcommittee	Agree	We agree with the annual application of the criteria, however, we want to be clear that we do not agree with all of the criteria listed in Attachment 1. We have included suggested improvements to the criteria under question #2.For clarity, we suggest that the final sentence of this requirement be reworded as follows:"The Responsible Entity shall review this list at least annually, and update it as necessary based on the findings of this review."
Response: Thank you for your comments.		
Santee Cooper	Disagree	We would agree with requirement R1 if Attachment 1 is refined to be more reasonable.
Response: Thank you for your comments.		
Dominion	Agree	

Organization	Yes or No	Question 3 Comment
Edison Mission Marketing and Trading	Agree	
Florida Municipal Power Agency	Disagree	FMPA recommends avoiding the use of the term “Annual” due to the ambiguity of the term. Instead something like once a calendar year but no longer than 15 months may be more appropriate.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version.		
PNGC Power	Disagree	Please see criteria in answer to question #2. We do agree with annual review requirement.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version.		
WECC	Agree	
Southern Company	Agree	
Encari, LLC	Disagree	The Guidance document states a Critical Asset should be listed by only one Responsible Entity. We therefore question why Generator Operators and Transmission Operators are included as Responsible Entities subject to Requirement R1 of draft CIP-002-4
Response: Thank you for your comments. Generator Operators and Transmission Operators are listed as possible Responsible Entities to address cases where there may be a formal agreement for these Entity types to be responsible for compliance to the CIP requirements: In addition, control centers are typically owned by Generator Operators and Transmission Operators. We have modified the guidance document to reflect this.		
Arizona Public Service	Agree	
Edison Electric Institute	Agree	
Tennessee Valley Authority (TVA)	Agree	None.

Organization	Yes or No	Question 3 Comment
PacifiCorp	Agree	
OGE	Agree	
FMPA	Disagree	FMPA recommends avoiding the use of the term “Annual” due to the ambiguity of the term. Instead something like once a calendar year but no longer than 15 months may be more appropriate.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
South Carolina Electric and Gas	Agree	
Pinellas County Resource Recovery Facility	Agree	
Central Lincoln	Agree	
Edison Mission Marketing and Trading	Disagree	The same question for this one. CIP-002-4 Attachment 1-1.1 what is the basis for the 1500 MW versus what used to be Output exceeds Reserve Sharing Group obligation or Output exceeds Contingency Reserve obligation
Response: Thank you for your comments. Please refer to the response to your comment in Question 2.		
SPS Consulting Group Inc.	Disagree	While I agree with the development of a list and the annual application of the criteria, the "update as necessary" phrase is ambiguous. This is the kind of language that has led to multiple interpretation requests and should never be in a reliability standard requirement. Suggest deleting "and update it as necessary." Annual review should be sufficient to insure protection.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
Tacoma Power	Agree	Tacoma Power agrees with the SDT using a defined list for identifying Critical Assets. However, Tacoma Power recommends that the SDT make the recommended changes noted in Question 2

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comments.		
Green Country Energy	Agree	
Illinois Municipal Electric Agency	Agree	
Minnkota Power Cooperative	Agree	
Horizon Wind Energy	Agree	Agree with the annual application of the criteria, but provided comments below on the actuall criteria used.Criteria 1.15 in attachments A includes generation control centers used to control generation greater than an aggregate of 1500 MWs in a single interconnection. It is true that the span of control of the generation control center may cross multiple BA or RSG areas. In the unlikely event of a common mode failure of such a generation control center that would lead to a loss of all generation, the loss of generation in the multiple BAs or RSGs could fall significantly below the criteria of the 1500 MWs threshold used in criteria 1.1 for generating units at a single plant location, therefore not affecting the reliability and operability of the BES system. There seems to be a disconnect in criteria 1.1 for generation and 1.15 for generation control centers, hence 1500 MWs in a single plant location vs. 1500 MWs aggregate in a single interconnection for generation control centers. Secondly, some generation control centers collect data from generators via SCADA for monitoring purposes and can manually send set points to lower generation if the need would arise. Does this type of arrangement fall under the description of control generation or was it the intent to include, in the description, generation that is controlled to maintain sufficient Contingency Reserve (BAL - 002) and Resource and Demand Balancing (BAL - 003)? Suggest adding language to 1.15 that is more in line with the criteria in 1.1 and clarifying what is meant by control generation.
Response: Thank you for your comments. Please refer to the response to your comment in Question 2.		
Union Power Partners LP	Agree	With consideration of the responses to questions 1 & 2.
Response: Thank you for your comments.		
MidAmerican Energy Company	Agree	
North Carolina Membership Corporation	Disagree	Because NCEMC does not currently agree with all of the provisions in Attachment 1 - Critical Asset Criteria, we cannot at this time agree with this question.

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comments.		
Hydro One Networks Inc.	Agree	
Dynegy Inc.	Agree	
Matrikon Inc.	Agree	
Northeast Utilities	Agree	
CenterPoint Energy	Agree	CenterPoint Energy has no concerns with the verbiage in Requirement R1 but, as noted in our previous comments, CenterPoint Energy recommends deletion of proposed Criteria 1.11 in Attachment 1.
Response: Thank you for your comments.		
LCEC	Agree	Agree with the concept but not the criteria. See response to questions 1 & 2.
Response: Thank you for your comments.		
Xcel Energy		
Great River Energy	Disagree	Does not allow for individual interpretation and application
Response: Thank you for your comments. The changes to CIP-002-4 specifically address issues of uniform application across all entities.		
ITC Holdings	Agree	
Public Utility District No. 1 of Clark County	Agree	This is a reasonable expectation of Responsible Entities.
Response: Thank you for your comments.		
TransAlta		

Organization	Yes or No	Question 3 Comment
Exelon	Disagree	If as expected the NRC accepts the exception process proposed by NERC as part of resolving the Bright-Line Survey, regulation of BOP cyber assets will be by NRC. However, FERC Order 706B remains in force, resulting in the need for Nuclear GO/GOP entities to comply with CIP-002 and annually determine CAs, and then reiterate to NERC that all BOP cyber assets are regulated by NRC. Nuclear makes the comment that with NRC regulation of BOP cyber assets, the annual CIP-002-4 R1 CA determination is unnecessary and we recommend that Nuclear GO/GOP again be exempted from each of the NERC CIP Reliability Standards CIP-002 thru -009.
Response: Thank you for your comments. The proposed standards are drafted with the current regulatory regime in effect and cannot be drafted on any speculation on future outcomes in this area.		
AECI	Agree	
N.W. Electric Power Cooperative, Inc.	Agree	
Central Electric Power Cooperative	Agree	
Central Electric Power Cooperative	Agree	
M & A Electric Power Cooperative	Agree	
LCRA Transmission Services Corporation	Agree	
Sho-Me Power Electric Cooperative	Agree

Constellation Energy Commodities Group	Agree	
Associated Electric Cooperative, Inc.	Agree	
KAMO Electric Cooperative	Agree	
Northeast Missouri Electric Power Cooperative	Agree	
NW Electric Power Cooperative, Inc.	Agree	
Sierra Pacific Power d/b/a NV Energy	Agree	
Sho-Me Power Electric Cooperative	Agree	
SDG&E	Agree	SDG&E generally agrees with R1 given the comments outlined in question #2 above are incorporated
Response: Thank you for your comments.		
Central Lincoln	Disagree	Central Lincoln believes that “annually” should be further clarified. It could be interpreted to either be once in a calendar year or once every twelve months. If the later is intended, suggest specifying a maximum interval to allow for review dates that could otherwise fall on weekends, holidays, or during emergencies. We suggest a maximum interval of 15 months. It remains unclear how assets that are newly discovered to be critical during these reviews are to be treated, as discussed below.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
Northeast Missouri Electric	Agree	

Organization	Yes or No	Question 3 Comment
Power Cooperative		
National Rural Electric Cooperative Association (NRECA)	Disagree	Since NRECA disagrees with the current CIP-002-4 Attahcment 1 -- Critical Asset Criteria document, we could not select "Agree" here. If requested modifications are made to Attachment 1, then we could agree with R1.
Response: Thank you for your comments.		
Tampa Electric	Agree	
M&A Electric Power Cooperative	Agree	
MEAG Power	Agree	
Associated Electric Cooperative, Inc.	Agree	
Associated Electric Cooperative, Inc.	Agree	
FirstEnergy Corp	Agree	
Minnesota Power	Agree	
Manitoba Hydro	Agree	
American Transmission Company	Agree	
Ameren	Disagree	We would agree to review the critical asset list as least annually but we do not agree with the bright line criteria in Attachment 1, see comments for question 2.
Response: Thank you for your comments. Please refer to response to comment in question 2.		
BGE	Agree	Pending the suggested changes to the Attachment 1 and clarify wording as follows: “Critical Asset

Organization	Yes or No	Question 3 Comment
		Identification - Each Responsible Entity shall develop a list of its Critical Assets determined through an annual application of the criteria contained in CIP-002-4 Attachment 1 - Critical Asset Criteria. The Responsible Entity shall review its Assets at least annually by applying the criteria contained in CIP-002-4 Attachment 1 Critical Asset Criteria, and update the Critical Asset list as necessary."
Response: Thank you for your comments. There is not a compelling reason offered to remove the word "identified" from R1. Additionally, the word is in the previous three versions.		
Beaches Energy Services (of City of Jacksonville Beach, FL)	Disagree	We recommend avoiding the use of the term "Annual" due to the ambiguity of the term. Instead something like "Once a calendar year, but no longer than 15 months" may be more appropriate.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
We Energies	Agree	
City Utilities of Springfield, MO	Agree	SPRM agrees with the proposed Requirement.
Response: Thank you for your comments.		
National Grid	Agree	The standard clearly mentions the documentation required to comply with CIP-002-4 which includes - list of Critical Assets as specified in R1, list of Critical Cyber Assets as specified in R2, and approval records of annual approvals as specified in R3. However, in the Guidance document, Page 7, bullet point 2, second sentence, it states the following - "...Responsible Entity should document all criteria that qualify this asset as a Critical Asset..." National Grid recommends that the drafting team clarifies the documentation requirements to avoid such discrepancies. If the standards drafting board expects entities to document, and retain documentation, of the criteria that supports the categorization of critical assets, this should be explicitly required by the standard. As the proposed standard is written, the only documentation registered entities must create and retain is the actual list of the assets.
Response: Thank you for your comments. The standard specifies the requirements that the Responsible Entity must comply with. The reference document is intended to provide guidance and does not specify any requirement for compliance.		
Lincoln Electric System	Agree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comments.		
Southwest Power Pool Regional Entity	Disagree	Clarify that the first application of the criteria contained in CIP-002-4 Attachment 1 - Critical Asset Criteria and the associated identification of Critical Assets must take place on or before the effective date of the approved standard. This affords the entity a minimum of six months to complete the required assessment. (The auditors will seek evidence based on this expectation, so placing it in the standard or accompanying guidance will remove any ambiguity such as that experienced with Version 1 of the standards)
Response: Thank you for your comments. The implementation plan (posted on the Project 2008-06 project page at http://www.nerc.com/docs/standards/sar/Project2008-06_Implementation_Plan_CIP_V4Standards.pdf) specifies the proposed compliance schedule of the standards and requirements.		
Indianapolis Power & Light	Agree	
Constellation Power Generation	Agree	
Independent Electricity System Operator	Disagree	While we don't disagree with Requirement R1 per se, we do have concerns about criteria 1.6 and 1.7. (See our response to Question 2 which includes a suggestion for a new requirement to be placed on the Reliability Coordinator.) Also, we do not agree with the removal from the Applicability Section, of the exclusion that applies to facilities regulated by the Canadian Nuclear Safety Commission. This explicit statement makes it clear that CIP standards do not apply to those facilities which would not be the case if it were removed.
Response: Thank you for your comments. The applicability section has been modified to address the current Canadian regulatory issue for nuclear facilities. Please see response to question 2.		
American Electric Power (AEP)	Agree	AEP suggests that parts of requirement 3 could be added to requirements 1 and 2 and then Requirement 3 could be removed.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues.		
Orlando Utilities Commission	Agree	
Oglethorpe Power Corporation	Disagree	An annual review of the CA and CCA lists is consistent with previous versions of the standards and in general this is a reasonable time frame for verifying that unplanned changes or changes outside the immediate

Organization	Yes or No	Question 3 Comment
		visibility of a given Registered Entity have not affected the status of the CA and/or CCA lists. However as the implementation plan points out, there are many changes (both corporate and technical) which are planned and for which entities should not wait for an annual review to determine whether they affect the entities' CA and CCA lists. The requirement should contain a reference to the implementation plan to ensure that such changes are made in a manner that maintains compliance throughout.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
Brazos Electric Power Cooperative, Inc.	Disagree	The proposed requirement needs to clarify what "update it as necessary" means.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
Midwest ISO	Agree	
Duke Energy	Disagree	Requirement R1 is acceptable except for the issues we've identified with Attachment 1 in our response to Question #2 above.
Response: Thank you for your comments. Please refer to response to question 2.		
Seminole Electric Cooperative, Inc.	Disagree	Must disagree based prior comments and disagreement with Attachment 1
Response: Thank you for your comments. Please refer to response to question 2.		
Progress Energy	Disagree	The term "annual" should be defined directly in the requirement. Alternatively, "annual application" could be replaced with "application of the criteria once every 12 months..." and "at least annually" could be replaced with "at least once every 12 months..." if that was the intention.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues.		

Organization	Yes or No	Question 3 Comment
The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
Orlando Utilities Commission	Agree	
New York Independent System Operator	Agree	The NYISO requests that the SDT be specific with respect to annual. The drafting team should consider using the phrase once every calendar year, or once every 15 months.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
Cowlitz County PUD	Agree	
Orlando Utilities Commission	Agree	
Kansas City Power & Light	Disagree	Do not disagree with annual review and updates for determination and identification of critical assets. The current bright line proposal lacks engineering and reliability assessment basis and is arbitrarily chosen to achieve a predetermined number of critical assets that may appear as valid, but in fact, may be lacking or too strong.
Response: Thank you for your comments. Regarding the need for additional engineering studies, the SDT and volunteer industry participants have expended considerable effort to develop consistent Critical Asset Identification approaches. The team endeavored to include work already required by other standards, and provide some constraints for an entity's assessment. These approaches, in their various iterations, have been presented to industry for review and comment. The industry provided significant feedback for the need to simplify the Critical Asset identification approach. The Attachment 1 criteria were under development for CIP-010 when the team was asked to use the criteria for the basis of a new CIP Version 4 set of standards. NERC issued a data request in August of 2010 to assist the SDT in developing a consistent approach to Critical Asset identification. The results of this request were used to assist the team in developing the criteria in Attachment 1.		

4. Requirement R2 of draft CIP-002-4 states, "Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets performing a function essential to the operation of the Critical Asset. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Each Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics". The requirement then lists characteristics using the same text that is contained in the existing CIP-002-3 R3. Do you agree with the proposed Requirement R2? If not, please explain why and provide specific suggestions for improvement.

Summary Consideration: Of commenters that disagreed with Requirement R2, the majority suggested changes to wording that is present in the existing CIP-002-3. The SDT responded that the scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology mentioned exists in the existing CIP-002-3 standard. The SDT expects the phraseology to be resolved in the next version. Some commenters had questions about the 15 minute qualifier. The SDT's response is that this phrase is inserted to limit the scope to "real time" operations, which is not a NERC defined term. Several commenters had suggested wording to clarify the requirement. Based on the comments received, Requirement R2 has been reworded to:

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually.

For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1.

For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

- The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
- The Cyber Asset uses a routable protocol within a control center; or,
- The Cyber Asset is dial-up accessible.

Organization	Yes or No	Question 4 Comment
Northeast Power Coordinating Council	Disagree	In Attachment 1, Criterion 1.1, why is nuclear generation specifically mentioned? Does this have any implications for other fuel types? Refer to the response above for Question 3. If the intent is for entities to retain documentation of the basis for categorization, this should be explicitly stated in the standard. Otherwise the only documentation retained may be the list of assets. As noted in paragraph 236 of FERC Order 706, the proposed standard does not provide guidance on more accurate determination of critical cyber assets. The language regarding generation units adds confusion to the requirement for entities that are not involved in generation. It should be moved elsewhere such as a footnote or end note. The 15 minute criteria listed in R2 needs to be better described to avoid misinterpretation.
Response: Thank you for your comments. The phrase concerning nuclear generation does not change the scope. It is there to add clarification. Please see our response to Question 3. Please refer to the reference document (posted at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf) for guidance on documentation. The scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology. The language for generation units is necessary for determining the appropriate Critical Cyber Assets at generating plants and qualifies the immediately preceding requirement to identify Critical Cyber Assets. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impacts.		
City of Garland	Agree	
NRG Energy Inc.	Disagree	Need Clarification on routable path, discrete links and serial connections as it pertains to CIP-002-3 R3: Is a device considered to communicate outside the ESP using routable protocol if ANY portion of the communications path uses routable protocol? Need clarification concerning shared assets. Does it mean shared between a single device or same device on a network? R2 states that only shared cyber assets for a group of generating units at a single location identified in Attachment 1 criteria 1.1, namely the 1500 MWs brightline, that could impact reliable operation should be considered. Does this cyber asset identification only include assets meeting criteria 1.1 and

Organization	Yes or No	Question 4 Comment
		therefore exclude any cyber assets utilized for reliable operation of a designated critical asset such as a single blackstart resource? Please provide clarification in this requirement.
Response: Thank you for your comments. A response to the question regarding routable protocols depends on which part of the communication path you refer to. The guideline on identifying critical cyber assets provides an interpretation on various scenarios that might fit the case mentioned. The requirement refers to shared cyber assets that can have a reliability impact on the group of generating units. This qualifier only includes Critical Assets identified in criterion 1.1.		
APPA CIP-002-4 Task Force	Agree	
IRC Standards Review Committee	Disagree	See comments to Question 1 above and proposed Attachment 1.
Response: Thank you for your comments.		
Bonneville Power Administration	Disagree	The requirement as written continues and does not solve the ambiguity with the current Critical Cyber Asset identification requirement. Specifically: “essential to the operation of the Critical Asset” needs to be defined; “adversely impact the reliable operation” needs to be defined; and, it is not clear what “within 15 minutes” means in this context. The intent of the Standards Drafting Team needs to be made clear.
Response: Thank you for your comments. The scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology. The subjectivity involved in the Critical Cyber Asset identification requirement will be addressed in future releases of these Standards. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact.		
PSEG Companies	Agree	
Pepco Holdings, Inc - Affiliates	Agree	
MRO's NERC Standards Review	Agree	For clarity, we suggest this requirement be reworded as follows:For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets

Organization	Yes or No	Question 4 Comment
Subcommittee		that must be considered are those shared Cyber Assets that could within 15 minutes adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1.
Response: Thank you for your comments. Requirement R2 has been changed to reflect your suggested wording.		
Santee Cooper	Disagree	We believe R2 is confusing as written, and detracts from the “bright line” concept. Specifically, the 15 minutes is confusing and is not explained well in the CIP-002-4 -Cyber Security- Critical Cyber Asset Identification Rationale and Implementation Reference Document. Perhaps the “within 15 minutes” could be reworded in this manner: Those shared assets which are inoperable for 15 minutes or more, which could cause loss of large generation amounts, will have to be considered. Those shared assets which are inoperable for 15 minutes or more, and could be restored within a reasonable amount of time, and do not cause loss of large generation amounts, would not have to be considered.
Response: Thank you for your comments. Requirement R2 has been changed to clarify the issues presented.		
Dominion	Disagree	While Dominion agrees conceptually with the SDT, we believe that the language in R2 could be improved if the following revision was made; "Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. For each group of generating units identified as critical pursuant to Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of those units that in aggregate exceeds Attachment 1, criterion 1.1 within 15 minutes. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:”Additionally Dominion would like clarification of the 15 minute criteria. Does it apply to all cyber assets or just to the criteria of 1.1 and 1.13?
Response: Thank you for your comments. Requirement R2 has been changed to clarify the issues presented. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact.		
Edison Mission Marketing and Trading	Agree	"... within 15 minutes." What exactly has to happen within 15 minutes?
Response: Thank you for your comments. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time		

Organization	Yes or No	Question 4 Comment
reliability impact.		
Florida Municipal Power Agency	Disagree	FMPA believes that a similar “shared Cyber Assets” criterion needs to be applied at a substation for transmission Facilities emanating from that substation in a similar fashion as is described for power plants. For instance, if the entire substation is found to be a Critical Asset as a result of application of Attachment 1, a single microprocessor based relay isolated and only operating one non-critical transmission Facility should not be swept into the standards. Instead, only shared Cyber Assets controlling the entire critical substation should be a Critical Cyber Asset. FMPA recommends avoiding the use of the term “Annual” due to the ambiguity of the term. Instead something like once a calendar year but no longer than 15 months may be more appropriate.
Response: Thank you for your comments. The term Transmission Facilities can be applied to either the entire substation or each Facility or group of Facilities connected to that substation, as determined by the entity. This would allow an entity which has multiple voltage levels at a single substation to either declare the entire substation as a Critical Asset or only the portion of the substation that qualifies under any particular criterion. The shared cyber asset qualifier only applies to criterion 1.1 because it refers to a group of generating units. The phraseology you are concerned about (annual) exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
PNGC Power		
WECC		The requirement as written does not resolve the ambiguity with the current Critical Cyber Asset identification requirement. Specifically: “essential to the operation of the Critical Asset” needs to be defined; “adversely impact the reliable operation” needs to be defined. It is also unclear what "adversly impact the reliabile operation of any combination of units within 15 minutes means. Is this intended to mean that anything that could adversly impact these same units in 20 minutes is not a threat or that it could be protected by operator intervention?
Response: Thank you for your comments. The scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology. The subjectivity involved in the Critical Cyber Asset identification requirement will be addressed in future releases of these Standards. The 15		

Organization	Yes or No	Question 4 Comment
minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact.		
Southern Company	Agree	However, Southern recommends the following change, because this provision should not be limited to only criterion 1.1:"For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1,". In addition, the SDT should remove all references to "risk-based assessment" in R3, as this is no longer a Requirement under CIP-002-4 (this term was only partially removed from the revised 10-20-10 version). Importantly, the SDT should also add a provision which specifically excludes any Cyber Assets regulated by Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission. There is currently no reference to this exclusion in CIP-002-4.
Response: Thank you for your comments. The shared cyber asset qualifier only applies to criterion 1.1 because it refers to a group of generating units. The glossary definition for Transmission Facilities allows flexibility for defining the Critical Asset as one that operates as a single BES Element, in which case the relay operating a non-critical Transmission Facility would not be a CCA. All references to "risk-based assessment" will be removed prior to the next ballot. The Applicability section has been revised to address nuclear plants.		
Encari, LLC	Agree	
Arizona Public Service	Agree	
Edison Electric Institute	Agree	
Tennessee Valley Authority (TVA)	Agree	None.
PacifiCorp	Agree	
OGE	Agree	
FMPA	Disagree	FMPA believes that a similar "shared Cyber Assets" criterion needs to be applied at a substation for transmission Facilities emanating from that substation in a similar fashion as is described for power plants. For instance, if the entire substation is found to be a Critical Asset as a result of application of Attachment 1, a single microprocessor based relay isolated and only operating one non-critical transmission Facility should not be swept into the standards. Instead something like once a calendar year but no longer than 15 months may be

Organization	Yes or No	Question 4 Comment
		more appropriate.
Response: Thank you for your comments. The term Transmission Facilities can be applied to either the entire substation or each Facility or group of Facilities connected to that substation, as determined by the entity. This would allow an entity which has multiple voltage levels at a single substation to either declare the entire substation as a Critical Asset or only the portion of the substation that qualifies under any particular criterion. The shared cyber asset qualifier only applies to criterion 1.1 because it refers to a group of generating units. The phraseology you are concerned about (annual) is in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version.		
South Carolina Electric and Gas	Agree	
Pinellas County Resource Recovery Facility	Agree	I agree with the first and third sentences as written. I think the language in the second sentence is unclear. I agree with what I think it is saying! For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes.
Response: Thank you for your comments.		
Central Lincoln	Agree	
Edison Mission Marketing and Trading	Agree	
SPS Consulting Group Inc.	Disagree	See previous Question 3 concern about "as necessary" language. Also, I do not understand the reference to "within 15 minutes" in this requirement. Within 15 minutes of what? Of discovering a cyber intrusion? Of the inception of an actual breach of electronic security? Of a SCADA or EMS system (for example) being taken over by a hacker? This reference to 15 minutes also implies a time-stamped piece of evidence that would be extremely difficult to audit. One should put on their auditor hat and imagine sitting down with a Registered Entity and trying to verify compliance with this requirement. We need to do a better job of drafting requirements that are clear and do not put the auditors in the position of making ad hoc interpretations in order to complete the audit.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comments. The 15 minutes limiter refers to the reliability impact and not the inception of a breach. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact. The SDT believes the Responsible Entity can provide evidence demonstrating how certain systems in a generating plant will not have a reliability impact within 15 minutes.		
Tacoma Power	Disagree	Tacoma Power Commends the SDT for recognizing that not all cyber assets within a generation facility are necessarily critical. The wording of the requirement however creates ambiguities. Tacoma Power feels that the statement, “For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes, “needs clarification. Tacoma Power suggests that the statement read, “For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those Cyber Assets networked to a system that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes.”
Response: Thank you for your comments. Requirement R2 has been changed to clarify the issues presented.		
Green Country Energy	Agree	
Illinois Municipal Electric Agency	Agree	
Minnkota Power Cooperative	Agree	
Horizon Wind Energy	Agree	
Union Power Partners LP	Disagree	Would change the language to "those shared Cyber Assets accessible from outside malicious cyber intrusion that could adversely" in line 4.
Response: Thank you for your comment. The susceptibility of a Cyber Asset to malicious cyber intrusion is dependent on several factors, many of which are dynamic or		

Organization	Yes or No	Question 4 Comment
unknown, including the configuration of the Cyber Asset, the capability of the malicious threat and internal access. The set of CIP cyber security standards (CIP-002 to CIP-009) is a holistic approach to cyber security protection that applies to both internal and external threats.		
MidAmerican Energy Company	Agree	
North Carolina Membership Corporation	Disagree	Just as in question 3 NCEMC does not currently agree with all of the provisions in Attachment 1 - Critical Asset Criteria, we cannot at this time agree with this question.
Response: Thank you for your comment. Please refer to response to question 3 and question 2.		
Hydro One Networks Inc.	Disagree	
Dynegy Inc.	Disagree	For R2, it could be fine but needs further "specific" guidance on the Cyber Assets that could adversely.....impact....within 15 minutes". Suggest providing specific examples. For R3, remove the comment related to risk-based assessment methodology from the draft Standard.
Response: Thank you for your comment. Please refer to the guidance document posted at http://www.nerc.com/docs/standards/sar/Project_2008-06_CIP-002-4_Guidance_clean.pdf . References to the risk-based assessment will be removed prior to the next ballot.		
Matrikon Inc.	Disagree	I believe the original intent, yet never clearly documented, is that the "tampering and misuse" of cyber assets is also criteria to determine the relationship between the Critical Asset and its Cyber Assets. Is tampering and misuse the intent of this requirement? If so, it must be specifically stated, including a definition and direct statements if Entities are expected to use this criterion for identification of CCAs. Secondly, the 15 minute criterion is going to attract alot of attention and interpretation, further guidance is recommended in the form of scenarios, events and examples. Otherwise, inconsistency in interpretation across different regions, entities and their auditors will result.
Response: The scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology. The subjectivity involved in the Critical Cyber Asset identification requirement will be addressed in future releases of these Standards. The 15		

Organization	Yes or No	Question 4 Comment
minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve reliability impacts. The SDT believes the Responsible Entity can provide evidence demonstrating how certain systems in a generating plant will not have a reliability impact within 15 minutes.		
Northeast Utilities	Agree	
CenterPoint Energy	Agree	
LCEC	Disagree	This section of R2 makes the requirement very confusing: For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. If this is intended to be further clarification for generating units only, there should be a paragraph for this alone. In addition, the basis for "within 15 minutes" is not defined and could lead to subjectivity in the interpretation of this requirement.
Response: The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact. Please refer to the guidance document for the basis for the 15 minute limitation.		
Xcel Energy		
Great River Energy	Agree	
ITC Holdings	Disagree	New CIP-002-4 R2 Critical Cyber Asset Identification- The revisions made are introducing confusion while only identifying the inclusion of Cyber assets with delimited (arbitrarily) time for impact: "For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." Either a new qualification and characteristic of Critical Cyber Assets is created or the

Organization	Yes or No	Question 4 Comment
		existing characteristics shall be updated to explicitly address the type of Cyber Asset.
Response: The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact.

Sierra Pacific Power d/b/a NV Energy	Agree	
Sho-Me Power Electric Cooperative	Agree	
SDG&E	Disagree	Neither the mapping document nor the draft language contain the phrase "...performing a function...". That phrase has been added to this document and should be removed. The standard should focus on those cyber assets that are essential to the operation of the Critical Assets.
Response: Thank you for your comment. The phrase "…performing a function…" does not exist in the posted Standard.		
Central Lincoln	Disagree	Central Lincoln believes that "annually" should be further clarified. It could be interpreted to either be once in a calendar year or once every twelve months. If the later is intended, suggest specifying a maximum interval to allow for review dates that could otherwise fall on weekends, holidays, or during emergencies. We suggest a maximum interval of 15 months. It remains unclear how cyber assets that are newly discovered to be critical

Organization	Yes or No	Question 4 Comment
		during these reviews are to be treated, as discussed below.
Response: The phraseology you are concerned about is in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version.		
Northeast Missouri Electric Power Cooperative	Agree	
National Rural Electric Cooperative Association (NRECA)		
Tampa Electric	Agree	We agree with the proposed language, however if this version does not pass and changes need to be made, we would strongly recommend bright line criteria for Critical Cyber Assets and a CCA identification methodology. In the absence of such criteria and associated methodology we expect inconsistency across entities, and would recommend the language here be modified as follows: “the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units via common mode failure that in aggregate exceeds Attachment 1, criterion 1.1 within 15 minutes.”
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues.		
M&A Electric Power Cooperative	Agree	
MEAG Power	Agree	
Associated Electric Cooperative, Inc.	Agree	
Associated Electric Cooperative, Inc.	Agree	

Organization	Yes or No	Question 4 Comment
FirstEnergy Corp	Agree	
Minnesota Power	Agree	
Manitoba Hydro	Disagree	The term “this list” could be interpreted as referring only to the generation units in the previous sentence. Suggest changing to “the list of associated Critical Cyber Assets essential to the operation of the Critical Asset(s)”. The 15-minute “real-time” criterion should be applied to all Critical Cyber Assets, not just generation cyber assets.
Response: Thank you for your comments. Requirement R2 has been changed to clarify the issues presented. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact.		
American Transmission Company	Agree	
Ameren	Disagree	The word “associated” could mean anything to do with a Critical Assets which is too broad of a term and needs to be defined to avoid confusion. The phrase "could adversely impact the reliable operation" is unclear and vague. What magnitude of "adverse impact" should be considered? Also what is being defined as the Reliable Operation? This phrase should be more clearly defined, otherwise it could introduce different interpretations in the compliance audits.
Response: Thank you for your comments. The term “associated” is used in the same manner in the currently enforceable CIP-002-3. The phrase “adversely impact” limits the scope of the evaluation of Critical Cyber Assets to those that can affect the reliable operation of 1500MW or more of generation at a single plant location.		
BGE	Agree	Clarify wording by moving generation comments to the end of paragraphs, as follows: “Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets performing a function essential to the operation of the Critical Asset. Each Responsible Entity shall review this list at least annually, and update it as necessary .For each group of generating units identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any

Organization	Yes or No	Question 4 Comment
		combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:....."
Response: Thank you for your comment. Requirement R2 has been changed to clarify the issues presented.		
Beaches Energy Services (of City of Jacksonville Beach, FL)	Disagree	BES believes that a similar "shared Cyber Assets" criterion needs to be applied at a substation for transmission Facilities emanating from that substation in a similar fashion as is described for power plants. For instance, if the entire substation is found to be a Critical Asset as a result of application of Attachment 1, a single microprocessor-based relay isolated and only operating one non-critical transmission Facility should not be swept into the standards. Instead, only shared Cyber Assets controlling the entire critical substation should be a Critical Cyber Asset. FMPA recommends avoiding the use of the term "Annual" due to the ambiguity of the term. Instead something like "Once a calendar year, but no longer than 15 months" may be more appropriate.
Response: Thank you for your comments. The term Transmission Facilities can be applied to either the entire substation or each Facility or group of Facilities connected to that substation, as determined by the entity. This would allow an entity which has multiple voltage levels at a single substation to either declare the entire substation as a Critical Asset or only the portion of the substation that qualifies under any particular criterion. The shared cyber asset qualifier only applies to criterion 1.1 because it refers to a group of generating units. The phraseology you are concerned about (annual) is in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version		
We Energies	Agree	Although we agree with the proposed Requirement R2, We are concerned that the document "CIP-002-4 Cyber Security - Critical Cyber Asset Identification: Rationale and Implementation Reference Document" actually appears to provide more rationale and guidance on Critical Assets than Critical Cyber Assets.
Response: Thank you for your comments. The guidance document title was chosen based on the title of CIP-002-4.		
City Utilities of Springfield, MO	Agree	SPRM agrees with the proposed Requirement.
Response:		

Organization	Yes or No	Question 4 Comment
Thank you for your comments.		
National Grid	Agree	Same as for Q3. If the intent is for entities to retain documentation of the basis for categorization, this should be explicitly stated in the standard. Otherwise the only documentation retained may be the list of assets.
Response: Thank you for your comment. Please see our response to Question 3. Please refer to the posted reference document for guidance on documentation.		
Lincoln Electric System	Agree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
Response: Thank you for your comments.		
Southwest Power Pool Regional Entity	Disagree	The requirement states “the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes.” The requirement should be modified to state” the only Cyber Assets that must be considered are those shared Cyber Assets that if destroyed, degraded, misused or otherwise rendered unavailable, could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1.” The fifteen minute criterion is not necessary and could result in disagreement between the entity and the auditor over whether the impact could occur within the fifteen minute versus a longer period. Removing the fifteen minute window and clarifying that the entity must consider both loss and misuse removes that ambiguity. As with R1, the first instance of Critical Cyber Asset determination under CIP-002-4 needs to take place on or before the effective date of the standard. This affords the entity a minimum of six months to complete the required assessment. (The auditors will seek evidence based on this expectation, so placing it in the standard or accompanying guidance will remove any ambiguity such as that experienced with Version 1 of the standards) The current qualifying criterion R2.1 states “The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter.” Although well intentioned, this does not adequately address risk exposure. While a given Critical Cyber Asset might not communicate itself with Cyber Assets outside of the Electronic Security Perimeter, the network it is connected to may well have connectivity to external networks. That external connectivity offers a vector for compromise through an intermediary system that both the external network and the Critical Cyber Asset are connected to. This exclusion should only apply in the

Organization	Yes or No	Question 4 Comment
		instance where the network employing a routable protocol is completely isolated from any network not enclosed within the same Electronic Security Perimeter. Additionally, please accept and consider the following comments for Requirement R3. The comment form does not provide an opportunity for "other" considerations. R3: The requirement states "The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets." This statement should be modified to read "The senior manager or delegate(s) shall approve upon creation or modification, but at least annually if no changes were required, the list of Critical Assets and the list of Critical Cyber Assets." R3: The requirement includes the statement "...approval of the risk-based assessment methodology..." As a risk-based assessment methodology is no longer required, this reference needs to be removed.
Response: Thank you for your comments. The SDT believes the Responsible Entity can more easily demonstrate whether or not a system can impact the reliable operation within 15 minutes as opposed to "if destroyed, degraded, misused or otherwise rendered unavailable, could adversely impact the reliable operation." The approach taken by the SDT does not preclude the evaluation of CCA for "if destroyed, degraded, misused or otherwise rendered unavailable, could adversely impact the reliable operation." The implementation plan (posted on the Project 2008-06 project page at http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html) specifies the proposed compliance schedule of the standards and requirements. Regarding modifications to the routable protocol exception, the scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. Modifications to the Critical Cyber Asset list may be made as necessary but the list still only requires annual approval. The SDT believes the annual approval period provides the appropriate level of governance in the process. References to the risk-based assessment will be removed prior to the next ballot.		
Indianapolis Power & Light	Agree	
Constellation Power Generation	Agree	
Independent Electricity System Operator	Disagree	The "15 minutes" timeline outlined in the second sentence of R2 is not clear to us as the content was interpreted differently by different individuals within our environment; hence, we ask the drafting team to consider clarifying the wordings around this.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comments. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact. Requirement R2 has been changed to add clarity around the issue. Please refer to the guidance document posted on the Project 2008-06 project page at http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html for additional information.		
American Electric Power (AEP)	Disagree	The language used is a little difficult to follow. "...could adversely impact the reliable operation" suggest adding "if lost or disrupted through cyber attacks." In addition, R2.2 uses the term control center (also used in attachment 1) that is not a NERC defined term. This will introduce ambiguity to implementation. There has been ongoing confusion regarding the difference between "control centers" and "control rooms." We do not believe that a "control room" at a power plant or a substation would be considered a "control center." There is language in the NERC Security Guideline for Electricity Sector: Identifying Critical Assets document that the SDT should consider and incorporate into the NERC Glossary. We suggest that parts of Requirement 3 could be added to requirements 1 and 2 and then Requirement 3 could be removed.
Response: Thank you for your comments. The scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology. Please refer to the guidance document posted on the Project 2008-06 project page at http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html for clarification between "control center" and "control room." At this time, the SDT is choosing not to add terms to the NERC Glossary. We feel defining terms under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. These terms are used in other approved NERC standards already in effect.		
Orlando Utilities Commission	Disagree	There are many functions critical to reliable operations that are not essential to the operation of a particular critical asset. Situational awareness is one such example. It would appear that these assets would not be identified under the version of this requirement.
Response: Thank you for your comment. The scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology.		
Oglethorpe Power Corporation	Disagree	The wording requiring that adverse effect occur within 15 minutes is a good start, but at the moment, it appears to only pertain to generation related cyber assets. The requirement should be reworded to extend this to all cyber assets, as it makes sense that if 15 minutes is the criterion for generation, it should be the

Organization	Yes or No	Question 4 Comment
		criterion for other cyber assets, or if it is not, some other, explicit criterion should be included.
Response: Thank you for your comment. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact.		
Brazos Electric Power Cooperative, Inc.	Disagree	The sentences dealing with the generating unit cyber asset should be moved to a sub-requirement.
Response: Thank you for your comment. The SDT considered this and other proposals and changed the wording of R2 based on industry input.		
Midwest ISO	Agree	
Duke Energy	Agree	
Seminole Electric Cooperative, Inc.	Disagree	See prior comments on Attachment 1
Response: Thank you for your comment. See response to question 2.		
Progress Energy	Agree	
Orlando Utilities Commission	Agree	There are many functions critical to reliable operations that are not essential to the operation of a particular critical asset. Situational awareness is one such example. It would appear that these assets would not be identified under the version of this requirement.
Response: Thank you for your comment. The SDT agrees. The scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology.		
New York Independent System Operator		

Organization	Yes or No	Question 4 Comment
Cowlitz County PUD	Agree	
Orlando Utilities Commission	Disagree	Question 4 Comments:Â Â Â Â There are many functions critical to reliable operations that are not essential to the operation of a particular critical asset. Situational awareness is one such example. It would appear that these assets would not be identified under the version of this requirement.
Response: Thank you for your comment. The scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology.		
Kansas City Power & Light	Disagree	The phrase “within 15 minutes” introduces audit uncertainty and is subject to debate and disagreement between Registered Entities and Audit Teams. Recommend an improved delineation that is intended that is measurable and auditable.
Response: Thank you for your comment. The SDT believes the Responsible Entity can demonstrate whether or not a system can impact the reliable operation within 15 minutes. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact.		

5. Do you agree with the proposed implementation plan for the Version 4 standards? If not, please explain and provide specific suggestions for improvement.

Summary Consideration: In response to question 5, some commenters asked for new terms to be added to the NERC Glossary. At this time, the SDT is choosing not to add terms to the NERC Glossary since defining these terms would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. These terms are used in other approved NERC standards already in effect. APPA's review of the associated implementation plan for CIP-002-4 identified a potential inconsistency between the Implementation Plan and the Reliability Standard. The Reliability Standard clearly provides that updates to the Critical Asset list will be made at the time of the annual review. However, the Implementation Plan is not as clear. Requirements R1 and R2 were modified to clarify that the update is ongoing, and the review must occur at least annually. Several entities requested that the implementation plans be combined. A NERC Standard Implementation Plan address assets that are in place and applicable the date the standard becomes effective. It is retired once the Implementation Plan is completed. The Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities addresses assets that are identified in the future and future Registered Entities and is an ongoing plan that has no expected retirement date. Some entities asked for a provision for extensions to the implementation plan for good cause. The suggested modification proposes an exception process to a mandatory standard, and the SDT refers the entities to the discussion on technical feasibility exceptions in the FERC Order. Specifically, the oversight framework which must be in place is summarized in paragraph 222. Some commenters felt the implementation plan was too aggressive. The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC Approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset. Some entities requested a 24 month implementation after effective date of standard, and indicated that the proposed plan was too complicated. The SDT has simplified the implementation plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.

Organization	Yes or No	Question 5 Comment
Northeast Power Coordinating Council	No	Need a Control Center definition to clarify 1) control center, 2) control system, 3) backup control center, 4) backup control. Since the current, approved Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities addresses most of the criteria covered by CIP-002-4, request that relevant content be moved to that document. Creating a separate Implementation Plan is redundant and will cause confusion for entities trying to address appropriate timelines.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comments. At this time, the SDT is choosing not to add control center to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. A NERC Standard Implementation Plan address assets that are in place and applicable the date the standard becomes effective. It is retired once the Implementation Plan is completed. The Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities addresses assets that are identified in the future and future Registered Entities and is an ongoing plan that has no expected retirement date.		
City of Garland	Yes	
NRG Energy Inc.	Yes	
APPA CIP-002-4 Task Force	No	Proposed Implementation Plan APPA Comments: APPA's review of the associated Implementation Plan for CIP-002-4 has identified a potential inconsistency between the Implementation Plan and the Reliability Standard. The Reliability Standard clearly provides that updates to the Critical Asset list will be made at the time of the annual review. However, the Implementation Plan is not as clear. We would request modification to the Implementation Plan such that it reflects the intent of the Reliability Standard. The Implementation Plan does not adequately address when a "New Asset" that does meet the CIP-002-4 criteria for being a Critical Asset after its commissioning will need to be in compliance. APPA believes that the intent of the Reliability Standard indicates that the post-commissioned New Asset will become a Newly Identified Critical Asset upon the subsequent Annual Review and only at the time of this Annual Review. Further that the timeline associated with this Newly Identified Critical Asset starts with the date of the Annual Review. We raise this point because we are concerned about the potential impact for confusion associated with multiple review dates or continuous reviews of the assets contained within numerous CIP activities. If an entity has multiple Cyber Assets, the entity would likely have multiple Annual Reviews dates.
Response: Thank you for your comments. Requirements R1 and R2 were modified to clarify that the update is ongoing, and the review must occur at least annually. The text reference was removed from the Implementation Plan.		

Organization	Yes or No	Question 5 Comment
IRC Standards Review Committee	No	Since the current, approved Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities addresses most of the criteria covered by CIP-002-4, request that relevant content be moved to that document. Creating a separate Implementation Plan is redundant and will cause confusion for entities trying to address appropriate timelines.
Response: Thank you for your comments. A NERC Standard Implementation Plan address assets that are in place and applicable the date the standard becomes effective. It is retired once the Implementation Plan is completed. The Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities addresses assets that are identified in the future and future Registered Entities and is an ongoing plan that has no expected retirement date.		
Bonneville Power Administration	No	If this version requires more substations to be identified as Critical Assets, then we believe that the proposed implementation is too aggressive. Physical Security Perimeters are expensive and it may not be possible to fund these modifications in the short timeframe for compliance. A 3-year implementation period would be more appropriate.
Response: Thank you for your comment. The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC Approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.		
PSEG Companies	No	PSEG believes that overall, the proposed implementation plan for the Version 4 standards is appropriate and makes sense. PSEG does suggest the following addition: Reasonably unforeseen circumstances may occur that prevent strict compliance within the timeframes envisioned in the implementation plan. By allowing for Regional Entity review of the need for an extension of time, registered entities can be afforded necessary flexibility without unduly slowing the implementation. In the implementation plan insert before "Prior Version Standard Retirements" the following new section: Extension for Good Cause Critical Cyber Assets shall be compliant by the schedule set forth herein unless a Regional Entity grants prior approval of an extension for specified Critical Cyber Assets for good cause based on scheduling constraints or other constraints beyond the control of the Registered Entity.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. The suggested modification proposes an exception process to a mandatory standard. We refer to the discussion on technical feasibility exceptions in the FERC Order, specifically, to the oversight framework which must be in place that is summarized in paragraph 222. The SDT believes the effective date provides a reasonable timeframe for entities to become compliant with CIP-002-4 through CIP-009-4, which would preclude the need to implement a burdensome exception process for the industry.		
Pepco Holdings, Inc - Affiliates	No	We suggest the following addition: In the implementation plan insert before "Prior Version Standard Retirements" the following new section: Extension for Good Cause Critical Cyber Assets shall be compliant by the schedule set forth herein unless a Regional Entity grants prior approval of an extension for specified Critical Cyber Assets for good cause based on scheduling constraints or other constraints beyond the control of the Registered Entity.
Response: Thank you for your comment. The suggested modification proposes an exception process to a mandatory standard. We refer to the discussion on technical feasibility exceptions in the FERC Order, specifically, to the oversight framework which must be in place that is summarized in paragraph 222. The SDT believes the effective date provides a reasonable timeframe for entities to become compliant with CIP-002-4 through CIP-009-4, which would preclude the need to implement a burdensome exception process for the industry.		
MRO's NERC Standards Review Subcommittee	No	The implementation plan is overly complex and confusing. It is not clear when the “Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4” applies versus when the “Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities” applies. Does the former document apply only upon the approval of the CIP-002-4 and, then, subsequently, the latter implementation plan apply? The flow chart appears to show this. If this is the intention, we suggest that should be made clear somewhere in the document. As the document is written now, it is not clear.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
Santee Cooper	No	Eighteen months from the effective date of version 4 may not be a reasonable amount of time for certain entities. For example, if an entity recently produced a vulnerability/risk assessment under the current standard, the entity should be allowed up to 12 months before the criteria in Attachment 1 is applied. The

Organization	Yes or No	Question 5 Comment
		SDT should consider compliance being effective no earlier than 18 months after completion of the entity's most recent vulnerability/risk assessment (or application of Attachment 1 after the standard is approved for implementation).
Response: Thank you for your comment. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
Dominion	Yes	Dominion has the following comments: While we recognize that there will be a tremendous amount of effort and coordination required to protect large generation units and transmission facilities to implement the requirements, we agree with the current implementation plan. However we would be concerned of any shortening of the implementation schedule because the logistics required for design and procurement engineering, outage scheduling, and lead times for the acquisition of material, equipment and labor.
Response: Thank you for your comment.		
Edison Mission Marketing and Trading	Yes	
Florida Municipal Power Agency	No	Without knowing the outcome of CIP-005-4, we cannot support the implementation plan.
Response: Thank you for your comments. The implementation plan associated with the Urgent Action SAR for modifications to CIP-005-3 will be drafted as part of a separate ballot and is outside the scope of this SDT. If both ballots pass, then the SDT anticipates NERC will merge the documents for filing with FERC.		
PNGC Power	No	Again we associate ourselves with NRECA's request for a 24 month implementation after effective date of standard. Plus the ability to extend the deadline if conditions warrant.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		

Organization	Yes or No	Question 5 Comment
The SDT believes an additional provision to allow for extenuating circumstances carries the same oversight requirements as the TFE process.		
WECC		
Southern Company	No	However, the Implementation Plan (under the section titled "Critical Cyber Assets Associated with Critical Assets Newly Identified by CIP-002-4"), requires that Critical Cyber Assets "which are newly identified by CIP-002-4 R1 within the first 18 months following the Effective Date of CIP-002-4 shall be compliant with CIP-003-4 through CIP-009-4 18 months after the Effective Date of CIP-002-4." This requirement does not provide sufficient time for the Responsible Entity to achieve compliance. For example, under this provision, an asset that is identified on the last day of the 18 month period would only have 1 day to achieve compliance, which is not a sufficient amount of time for implementation. To allow Responsible Entities sufficient time to reach compliance, the SDT should consider deleting the section titled "Critical Cyber Assets Associated with Critical Assets Newly Identified by CIP-002-4." The result of this change would mean that all Critical Cyber Assets that are newly identified after the Effective Date of CIP-002-4 would be subject to compliance as set forth in the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities. Southern believes this streamlined approach will be easier to implement than having a separate timeline for Critical Cyber Assets that are newly identified within the first 18 months after the Effective Date of CIP-002-4.This suggestion is contingent upon the SDT's adoption of Southern's comments to Question 6 which establishes a uniform 24 month implementation schedule or a different implementation deadline granted by the Regional Entity for good cause, rather than different timelines for different requirements. Furthermore, it is impossible for large utilities to enumerate and verify all the CCAs within 6 months, due to the number of CAs requiring analysis of common systems.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval. The SDT believes an additional provision to allow for extenuating circumstances carries the same oversight requirements as the TFE process.		
Encari, LLC	Yes	
Arizona Public Service	No	Revising the set of Standards CIP-002 through CIP-009 to Version 4, as described in these drafts, seems to conflict with the (almost) concurrent SAR process to revise CIP-005-4. The ultimate outcome and impact to the proposed implementation plan is unclear. AZPS is unable to determine at this time which CIP-005-4 version is likely to be in effect for this proposed Version 4 implementation plan. It seems highly desirable to incorporate the intended changes to CIP-005-4, as indicated by the SAR revision, into the larger set of

Organization	Yes or No	Question 5 Comment
		Version 4 updates. The revision timelines and resulting implementation and auditability implications are of great concern. AZPS urges the 706 SDT team to consider reasonable adjustment in the implementation of the posted Standards CIP-002 through CIP-009 to Version 4 to ensure incorporation and synchronization of the Project 2010-15 â€• Urgent Action Revisions to CIP-005-3 (http://www.nerc.com/filez/standards/SAR-Urgent_Action_Revisions%20to%20CIP-005-3.html) â€• CIP-005 version changes in order to minimize confusion and potential implementation conflict to the industry.
Response: Thank you for your comments. The implementation plan associated with the Urgent Action SAR for modifications to CIP-005-3 will be drafted as part of a separate ballot and is outside the scope of this SDT. If both ballots pass, then the SDT anticipates NERC will merge the documents for filing with FERC.		
Edison Electric Institute	No	EEI believes that overall, the proposed implementation plan for the Version 4 standards is appropriate and makes sense. We suggest the following addition: In the implementation plan insert before "Prior Version Standard Retirements" the following new section: Extension for Good Cause Critical Cyber Assets shall be compliant by the schedule set forth herein unless a Regional Entity grants prior approval of an extension for specified Critical Cyber Assets for good cause based on scheduling constraints or other constraints beyond the control of the Registered Entity.
Response: Thank you for your comment. The suggested modification proposes an exception process to a mandatory standard. We refer to the discussion on technical feasibility exceptions in the FERC Order, specifically, to the oversight framework which must be in place that is summarized in paragraph 222. The SDT believes the effective date provides a reasonable timeframe for entities to become compliant with CIP-002-4 through CIP-009-4, which would preclude the need to implement a burdensome exception process for the industry.		
Tennessee Valley Authority (TVA)		
PacifiCorp	Yes	
OGE	Yes	
FMPA	No	Without knowing the outcome of CIP-005-4, we cannot support the implementation plan.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comments. The implementation plan associated with the Urgent Action SAR for modifications to CIP-005-3 will be drafted as part of a separate ballot and is outside the scope of this SDT. If both ballots pass, then the SDT anticipates NERC will merge the documents for filing with FERC.		
South Carolina Electric and Gas	Yes	
Pinellas County Resource Recovery Facility	Yes	
Central Lincoln	Yes	
Edison Mission Marketing and Trading	Yes	
SPS Consulting Group Inc.	No	I do not see an Implementation Plan on the Project site other than the one for Nuclear facilities that has already been approved by FERC.
Response: Thank you for your comment. The Implementation plan can be found on the 2008-06 project page under the version 4 documents. The Version 4 page is located at http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html		
Tacoma Power	No	Tacoma Power would like to identify the following as errors in the proposed implementation plan: Under Critical Cyber Assets Associated with Critical Assets Newly Identified by CIP-002-4 U.S. Nuclear Power Plant Facilities and also All Other Critical Cyber Assets, the implementation plan reads, “the latter of.” Tacoma Power believes the SDT meant to say “the later of.” Tacoma Power also suggests that the Category 2 timelines for compliance with CIP-005-4 through CIP-009-4 be extended to 24 months as these standards could require capital improvements necessary to comply with the standards.
Response:		

Organization	Yes or No	Question 5 Comment
Thank you for your comments. The text you reference has been removed. Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
Green Country Energy	Yes	
Illinois Municipal Electric Agency	No	IMEA supports comments submitted by the American Public Power Association.
Response: Thank you for your comments. Please see the SDT response to APPA comments.		
Minnkota Power Cooperative	No	CIP-005-4 is going through a bit of a different process, but its implementation plan is the same as the rest of the Version 4 standards. Based on the number of configuration changes that may be required for communications outside of the ESP for currently designated CCAs, we request a longer implementation plan for CIP-005-4 in terms of currently identified CCAs.
Response: Thank you for your comments. The implementation plan associated with the Urgent Action SAR for modifications to CIP-005-3 will be drafted as part of a separate ballot and is outside the scope of this SDT. If both ballots pass, then the SDT anticipates NERC will merge the documents for filing with FERC.		
Horizon Wind Energy	Yes	
Union Power Partners LP	Yes	
MidAmerican Energy Company	Yes	
North Carolina Membership Corporation	No	NCEMC agrees with NRECA comment “The proposed implementation plan is incredibly confusing and must be greatly simplified. NRECA recommends an implementation plan that requires compliance within 24 months of the effective date of the standard, with a provision that allows entities to request extensions of this deadline for extenuating circumstances. Additional confusion could come from the fact that CIP-002-4 and its implementation plan could be filed with FERC by the end of 2010 and then CIP-010 and CIP-011 and its implementation plan could be submitted to FERC some time in 2011. With two sets of changes to these standards and related implementation plans being filed with FERC within months, the required implementation of these standards could be very confusing and challangeing to navigate."

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comments. Please see our response to NRECA comments.		
Hydro One Networks Inc.	Yes	
Dynegy Inc.	No	This is way to hard to follow and understand. The Implementation Plan is 18 pages. Suggest doing it on one page. I can't tell with certainty when I am due to be compliant. This must be clear so entities don't miss their initial compliance due date because they misunderstood when they were supposed to be compliant.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
Matrikon Inc.		
Northeast Utilities	Yes	
CenterPoint Energy	Yes	
LCEC	Yes	
Xcel Energy	No	The proposed 18 months implementation is not realistic in all cases. Additional flexibility is needed to account for complex changes that can not be completed in that short of a timeframe.
Response: Thank you for your comments. The SDT believes there is precedent showing this implementation period is reasonable. The Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.		
Great River Energy	No	For newly identified Critical Assets of a given type (Control Center, Generation Plant, Substation) the entity will be given a longer period of time than if it is not the first instance for that entity.
Response:		

Organization	Yes or No	Question 5 Comment
Thank you for your comments. Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
ITC Holdings	Yes	
Public Utility District No. 1 of Clark County	Yes	
TransAlta		
Exelon	No	In the "Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4", although page 2 explicitly addresses CCA compliance for Nuclear generators as being 18 months after the CIP-002-4 effective date (with certain exceptions for refueling outages) the flow-chart logic on page 3 does not achieve the same result. That is, if a nuclear generator is not a CA for CIP-002-3 and thus has no CCAs, the second decision diamond would result in a "no" and exit to "Newly Identified CCAs and Newly Registered Entities" and not the 18-month compliance milestone. Suggest the second diamond be reworded to include the logic of no current CA's, or explicitly refer to nuclear GO/GOP.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
AECI	No	In some cases there could be a significant outlay of financial and staff resources and current budgets are not going to allow start of implementation of a project until the following year. Therefore, it should be 12 months to identify Critical Assets and 36 months to complete implementing CIPs 003-009. This will provide entities enough time to request financing and the additional staffing that may be required to perform the new requirements of the CIP standards.
Response: Thank you for your comments. The SDT believes there is precedent showing this implementation period is reasonable. The Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.

FirstEnergy Corp	No	FirstEnergy believes that overall the Implementation Plan consisting of 15 pages is overly complex and could be greatly simplified. We recognize that for the most part the SDT attempted to make minimal conforming changes to an already approved Implementation Plan. However, much of the Implementation Plan discusses scenarios and examples of company mergers and a recognition that separate Critical Asset identification processes may exist between the companies and time is needed to assess a going-forward position on Critical Asset determinations. The discussion is applicable when companies developed and maintained their own unique Risk Based Assessment Methodologies, however, under the "bright-line" Critical Asset determinations performed with CIP-002-4 it should be expected that minimal differences will result, otherwise we have not achieved the industry consistency desired under this "bright-line" criteria. If the criteria in Attachment 1 are crisp and clear the only potential item open to asset owner subjectivity are the assets classified as Critical Assets under criterion 1.16 which reads "Any additional assets that the Responsible Entity deems appropriate to include." It is FE's view that the resulting merged Responsible Entity could adjust 1.16 based on what it "deems necessary" and any CIP-003 through CIP-009 compliance required of the resulting "newly identified Critical Cyber Assets" simply follow Category 1 or Category 2 as appropriate. To simplify the Implementation Plan we encourage the SDT to reconsider the need for material presented under the section titled "Newly Registered Entity Scenarios" on pages 8 through 11 and the continued need for Table 3. There are earlier references to "Newly Registered Entities and Table 3 that exist on page 2 that could potentially be removed as well.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8		

Organization	Yes or No	Question 5 Comment
calendar quarters after regulatory approval. The section on Newly Registered Entities scenarios has been revised to address your concerns.		
Minnesota Power	No	Minnesota Power believes that overall, the proposed implementation plan for the Version 4 standards is appropriate and makes sense. We suggest the following addition: In the implementation plan insert before "Prior Version Standard Retirements" the following new section:" Extension for Good Cause Critical Cyber Assets shall be compliant by the schedule set forth herein unless a Regional Entity grants prior approval of an extension for specified Critical Cyber Assets for good cause based on scheduling constraints or other constraints beyond the control of the Registered Entity."
Response: Thank you for your comment. The suggested modification proposes an exception process to a mandatory standard. We refer to the discussion on technical feasibility exceptions in the FERC Order, specifically, to the oversight framework which must be in place that is summarized . We refer to the discussion on technical feasibility exceptions in the FERC Order, specifically, to the oversight framework which must be in place that is summarized in paragraph 222. The SDT believes the effective date provides a reasonable timeframe for entities to become compliant with CIP-002-4 through CIP-009-4, which would preclude the need to implement a burdensome exception process for the industry.		
Manitoba Hydro	No	The proposed 18 month timeframe is too short for the industry to meet compliance for a group of new CCAs. Although the existing approved Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities provides up to 18 months to reach compliance for some requirements under an existing program, the identification of new CCAs would distributed over time, both throughout the entity and throughout the industry. This new CIP-002-4 compliance date could cause a sudden increase in the number of new CCAs throughout the industry, which may not have the resources to meet this sudden compliance burden. Some consideration should be given to the types of environments and their unique challenges when establishing compliance dates. The flowchart on page 3 needs to be revised, since the CAs are identified by the Criteria in Attachment #1, not the CCAs. Suggest changing to "Are the CCAs associated with CAs newly identified by the Criteria...".
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
American Transmission	No	ATC agrees the implementation schedule in general, should allow for sufficient time (18 months from effective date; 24 months from FERC approval date) for Category 2 entities to become compliant with CIP-003 through

Organization	Yes or No	Question 5 Comment
Company		CIP-009. However, we suggest an extension should be allowed for good cause if approved by the Regional Entity.
Response: Thank you for your comment. The suggested modification proposes an exception process to a mandatory standard. We refer to the discussion on technical feasibility exceptions in the FERC Order, specifically, to the oversight framework which must be in place that is summarized in paragraph 222. The SDT believes the effective date provides a reasonable timeframe for entities to become compliant with CIP-002-4 through CIP-009-4, which would preclude the need to implement a burdensome exception process for the industry.		
Ameren	No	Under All Facilities Other Than U.S. Nuclear Power Plants Facilities Page 2, Line 3, the words "within the first 18 months following the Effective Date of CIP-002-4" should be removed. The way that this paragraph is currently written if an Entity identifies a Critical Cyber Assets in the 17 month following the Effective Date of CIP-002-4, the Entity would have to be compliant with all of CIP Version 4 the next month (18 months after the Effective Date of CIP-002-4). In the CCA-Based Decision Tree the third diamond (Is the identification of the CCA within 18 months of the Effective Date of CIP-002-4) should be removed. Also, the implementation schedule should be changed to give an Entity at least 6 months following the Effective Date of CIP-002, R1 to comply with CIP-002, R2 and R3. This would allow an Entity time to inventory all its CCAs, especially for generation assets, this would give the Entity about a year to develop their inventory of CCAs.
Response: Thank you for your comments. The Implementation Plan has been modified to reference the Effective Date which is 8 calendar quarters after regulatory approval for CIP-002-4 through CIP-009-4.		
BGE	Yes	Strong need for clarifying wording: - Time line given should be clearly labeled that it is ONLY if the FERC approves the standard in the first quarter 2011. - Remove the words EXAMPLE and SAMPLE to describe the Scenarios, in the table and in the text. Perhaps a statement that this list of scenarios is not "ALL INCLUSIVE" would be correct in this situation. - With the time allowed in tables used for varying scenarios, it seems that a similar amount of time should be used for new Cyber Assets never before in service rather than requiring "Compliant upon Commissioning". There is a focused effort and many changes required to bring a Cyber Asset into compliance and there may be an impact on operability and reliability if delays occur in implementation.

Organization	Yes or No	Question 5 Comment
		- Is Scenario used in the text and the table to mean different things? - P. 11 uses a term bulk power system - is this to mean Bulk Electric System? - There is no table for Scenario 3. - Provide an explanation that Auditably Compliant is a term no longer used as all entities who must be compliant should expect that during any audit after approval of the standard, information will be reviewed for compliance
Response: Thank you for your comments. - The guidance document was modified to address the concerns about time line and list of scenarios not being all-inclusive. - The technical security requirements should be considered as part of the acquisition and commissioning process for a Critical Cyber Asset. - The implementation plan references scenarios for both newly registered entities and newly identified Critical Cyber Assets. The scenarios referenced in Table 1 of this document refer to Critical Cyber Assets. - The reference has been changed to Bulk Electric System - References to Auditably Compliant have been removed.		
Beaches Energy Services (of City of Jacksonville Beach, FL)	No	Without knowing the outcome of CIP-005-4, we cannot support the implementation plan.
Response: Thank you for your comments. The implementation plan associated with the Urgent Action SAR for modifications to CIP-005-3 will be drafted as part of a separate ballot and is outside the scope of this SDT. If both ballots pass, then the SDT anticipates NERC will merge the documents for filing with FERC.		
We Energies	Yes	
City Utilities of Springfield, MO	No	SPRM agrees with the comments from the APPA Task Force.
Response: Thank you for your comment. Please see the SDT response to APPA comments.		
National Grid	Yes	

Organization	Yes or No	Question 5 Comment
Lincoln Electric System	Yes	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
Response: Thank you for your comment. Please see the SDT response to MRO NERC Standards Review Subcommittee		
Southwest Power Pool Regional Entity	Yes	
Indianapolis Power & Light	Yes	
Constellation Power Generation	No	Constellation Power Generation believes that 18 months to implement these requirements is not enough time. Based on the number of self reports and compliance issues regarding the CIP standards, it is evident that not enough time was given to entities in the implementation phase. Therefore, Constellation Power Generation suggests that the SDT extend the implementation time to 24 months.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
Independent Electricity System Operator	Yes	
American Electric Power (AEP)	Yes	
Orlando Utilities Commission	Yes	
Oglethorpe Power Corporation	Yes	
Brazos Electric Power Cooperative, Inc.		
Midwest ISO	No	The implementation plan is overly complex and confusing. It is not clear when the “Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4” applies versus when the “Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities” applies.

Organization	Yes or No	Question 5 Comment
		Does the former document apply only upon the approval of the CIP-002-4 and, then, subsequently, the latter implementation plan apply? The flow chart appears to show this. If this is the intention, we suggest that should be made clear somewhere in the document. As the document is written now, it is not clear. Some of the paths in the flowchart in figure 1 of the draft guidance rationale and implementation reference document appear to be missing. We are placing our comment regarding R3 here because there are no other appropriate questions that ask about R3 or anything else that has not been covered in the other questions. R3 requires conforming changes. In the last sentence, it still refers to the Responsible Entity keeping a signed and dated record of the senior manager's approval of the risk-based methodology.
Response: Thank you for your comments. Your understanding of the implementation plan is correct. We will make changes to the guidance document to make this more evident. We will correct figure 1 on the guidance document. The issue you raise with R3 has been corrected.		
Duke Energy	Yes	
Seminole Electric Cooperative, Inc.	No	The proposed implementation plan is incredibly confusing and must be greatly simplified. SEC recommends an implementation plan that requires compliance within 24 months of the effective date of the standard, with a provision that allows entities to request extensions of this deadline for extenuating circumstances. Additional confusion could come from the fact that CIP-002-4 and its implementation plan could be filed with FERC by the end of 2010 and then CIP-010 and CIP-011 and its implementation plan could be submitted to FERC some time in 2011. With two sets of changes to these standards and related implementation plans being filed with FERC within months, the required implementation of these standards could be very confusing and challenging to navigate.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
Progress Energy	No	NERC needs to address what happens if an entity's annual assessment falls within 30-60 days of the approval date. That situation would require the entity to execute their version 3 Risk Based Assessment

Organization	Yes or No	Question 5 Comment
		Methodology, and then immediately (or concurrently) do an assessment using the version 4 criteria. A solution to the above problem is to make version 4 effective on the first day of the calendar quarter after regulatory approval, and then require compliance with CIP-002-4 and for CCAs previously identified 6 months after the effective date, and compliance for CIP-003-4 through CIP-009-4 for newly identified CCAs 24 months after the effective date.
Response: Thank you for your comments. The SDT does not believe that it is overly burdensome to have entities adjust the timing of their review to accommodate the transition to CIP version 4.		
Orlando Utilities Commission	Yes	
New York Independent System Operator		
Cowlitz County PUD	No	There will be some confusion between the Annual Assessment and Commissioning of new assets. The timeline for compliance should begin after the Annual Assessment is concluded finding the new added asset as critical.
Response: Thank you for your comments. Entities are expected to be compliant with CIP-002-4 to CIP 009-4 upon commissioning of a new Critical Cyber Asset.		
Orlando Utilities Commission	Yes	
Kansas City Power & Light	No	It should be 24 months to establish compliance with this proposed standard for any newly identified critical assets and newly identified cyber critical assets by the application of this proposed standard. Circumstances can change that are not predetermined but result in an asset qualifying as a critical asset.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		

6. Do you agree with the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities? If not, please explain and provide specific suggestions for improvement.

Summary Consideration: In response to question 6, some commenters noted conforming changes that needed to be made in the implementation plan for newly identified CCAs and Responsible Entities. The SDT made these changes and will post them in the next ballot. Most other comments were similar to those offered in question 5, for which the SDT offered the same responses.

Organization	Yes or No	Question 6 Comment
Northeast Power Coordinating Council	No	Agree as long as an Entity can request additional time due to a large increase in identified assets - something like a TFE with a mitigating plan. Throughout the Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities, Critical Asset identification is noted as a "Critical Asset identification process". Process should be stricken as it is not supported by the wording of the requirement R1. Request that the term "Bulk Electric System" be used in the document in place of "bulk power system". This is in keeping with the standard and the NERC glossary. The inclusion of CIP-005-4 R6 in the proposed changes is dependent upon concurrent industry, BOT, and FERC approval of CIP-005-4 and CIP-002-4. If these approvals do not occur at the same time, request removal of CIP-005-4 R6 from Table 2. Request clarification regarding the implementation plan for prior versions of the CIP standards. Will implementation plans of approved CIP standards remain in place until those standards are retired and audit periods have closed for those versions?

Response:

Thank you for your comments. The suggested modification proposes an exception process to a mandatory standard. We refer to the discussion on technical feasibility exceptions in the FERC Order, specifically, to the oversight framework which must be in place that is summarized in paragraph 222. The SDT believes the effective date provides a reasonable timeframe for entities to become compliant with CIP-002-4 through CIP-009-4, which would preclude the need to implement a burdensome exception process for the industry.

The requirements of CIP-002-4 R1 still require a process of Critical Asset Identification.

Agreed. The SDT has changed the reference from bulk power system to Bulk Electric System.

Organization	Yes or No	Question 6 Comment
Regarding CIP-005-4, NERC will make conforming changes dependent on the results of the CIP-005-4 Urgent Action SAR ballot. Upon the Effective Date for version 4 Standards, previous implementation plans are no longer in effect.		
City of Garland	Yes	
NRG Energy Inc.	Yes	
APPA CIP-002-4 Task Force	No	Proposed Implementation Plan APPA Comments: APPA's review of the associated Implementation Plan for CIP-002-4 has identified a potential inconsistency between the Implementation Plan and the Reliability Standard. The Reliability Standard clearly provides that updates to the Critical Asset list will be made at the time of the annual review. However, the Implementation Plan is not as clear. We would request modification to the Implementation Plan such that it reflects the intent of the Reliability Standard. The Implementation Plan does not adequately address when a "New Asset" that does meet the CIP-002-4 criteria for being a Critical Asset after its commissioning will need to be in compliance. APPA believes that the intent of the Reliability Standard indicates that the post-commissioned New Asset will become a Newly Identified Critical Asset upon the subsequent Annual Review and only at the time of this Annual Review. Further that the timeline associated with this Newly Identified Critical Asset starts with the date of the Annual Review. We raise this point because we are concerned about the potential impact for confusion associated with multiple review dates or continuous reviews of the assets contained within numerous CIP activities. If an entity has multiple Cyber Assets, the entity would likely have multiple Annual Reviews dates.
Response: Thank you for your comments. Requirements R1 and R2 were modified to clarify that the update is ongoing, and the review must occur at least annually. The text reference was removed from the Implementation Plan.		
IRC Standards Review Committee	No	See comments to Question 1 above and the proposed Attachment 1.
Response: Thank you for your comments. Please refer to response to Question 1.		

Organization	Yes or No	Question 6 Comment
Bonneville Power Administration	Yes	Yes, these look appropriate.
PSEG Companies	No	Although the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities reflect historical precedent in terms of FERC approval, PSEG believes that with the exception of nuclear facilities, it would be better to simply have a uniform 18 month implementation deadline for newly identified CCAs and Responsible Entities, rather than different timelines for different requirements. Nuclear timelines are subject to NRC requirements and the necessity of accomplishing some tasks only during refueling outages and thus are appropriately kept on a separate schedule. Other comment: As posted, the revised CIP-002-4 has the following language (Page 2):R3. Annual Approval -The senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R23 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.) Recommendation: References to risk-based assessment methodology should be removed.
Response: Thank you for your comments. Due to the limited scope of version 4, the SDT is only making conforming changes to the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities. The references to risk-based assessment have been removed.		
Pepco Holdings, Inc - Affiliates	No	Although the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities reflect historical precedent in terms of FERC approval, we believe that with the exception of nuclear facilities discussed under U.S. Nuclear Power Plant Facilities, it would be better to simply have a uniform18 month implementation deadline for newly identified CCAs and Responsible Entities, rather than different timelines for different requirements.
Response: Thank you for your comments. Due to the limited scope of version 4, the SDT is only making conforming changes to the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.		

Organization	Yes or No	Question 6 Comment
MRO's NERC Standards Review Subcommittee	No	For newly identified Critical Assets, a 24 month implementation is provided for Entities that have never identified a Critical Asset under the version 3 standards, with only 18 months provided for Entities with existing Critical Assets. We believe the SDT has developed a sound approach with this delineation. However, we also believe the 24 month implementation should be expanded to include Entities that may have existing Critical Assets, but have never identified a Critical Asset of a given type, i.e., generating unit, transmission facility, control center, etc. For example, if a company had a control center that was previously identified as critical, but version 4 results in their first generating unit being identified, then we would propose that they be given 24 months to become compliant as they are working on their first generating unit. Also, many sections of the new identified CCAs and responsible entities still reflect the former risk-based assessment methodology. For example, in the Implementation Milestone Categories on page 4, there is a discussion regarding a change in power flows causing non-critical assets to become Critical Assets. Under the new criteria, there is no evaluation of power flows. A better example would be referencing criterion 1.3 in CIP-002-4 Attachment 1 - "When a PC or TP newly identifies a generation Facility that is required for reliability purposes." In the section discussing mergers, there is discussion of how to combine Critical Asset identification processes. Again, this was written assuming entities needed to combine their risk-based assessment methodologies and resolve any differences. There is no need for discussion of combining these processes with bright line criteria. Furthermore, there are other statements in the merger section that need to be updated to reflect the bright line criteria as well. The paragraph from the merger section in 3 (a) that begins with "Registered Entities are encouraged when combining separate risk-based Critical Asset identification processes..." should be removed since there should be no reduction in Critical Assets from a merger with bright line criteria. For Table 3, how do we know which column applies? Is it based on category 1 and category 2 as shown in Table 2 and described in the Implementation Milestone Categories and Schedules? If so, then column headings should be added to Table 3 to clarify.

Response:

Thank you for your comments. The SDT believes the shorter timeframe for entities having Critical Cyber Assets in version 3 reflects the organizational knowledge and expertise in implementing the cyber security requirements. Also, all entities have 24 months from regulatory approval to implement the requirements of the CIP Cyber Security Standards.

The SDT agrees the text you reference still reflects the risk-based assessment methodology and have made those conforming changes.

Table 3 only applies to entities registered after the CIP-002-4 Effective Date. The column headings reflect 12 months and 24 months respectively after the date of registration.

Organization	Yes or No	Question 6 Comment
Santee Cooper	No	The implementation plans are confusing and long. The industry would probably prefer one document, with tables or charts that depict all possible scenarios, combining all elements of all implementation plans.
Response: Thank you for your comment. In the general case, a Responsible Entity has at least 6 months to comply with CIP-002-4 and 18 additional months to comply with CIP-003-4 through CIP-009-4. The SDT believes the additional specification is appropriate to provide Responsible Entities reasonable time to comply in the respective scenarios. A NERC Standard Implementation Plan address assets that are in place and applicable the date the standard becomes effective. It is retired once the Implementation Plan is completed. The Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities addresses assets that are identified in the future and future Registered Entities and is an ongoing plan that has no expected retirement date.		
Dominion	No	Certain Table 2 Milestone Category 2 time frames do not appear to give due consideration to the effort that may be involved with implementation. For example, providing training is allowed 18 months where as establishing physical and electronic security, which is likely to involve engineering and construction, is only allowed 12 months. Dominion suggests time frames for Category 2 physical and electronic security be changed to 18 months.
Response: Thank you for your comment. The 18 month time frame for training recognizes all other cyber security controls must be in place prior to training personnel.		
Edison Mission Marketing and Trading	Yes	
Florida Municipal Power Agency	No	Without knowing the outcome of CIP-005-4, we cannot support the implementation plan.
Response: Thank you for your comments. The implementation plan associated with the Urgent Action SAR for modifications to CIP-005-3 will be drafted as part of a separate ballot and is outside the scope of this SDT. If both ballots pass, then the SDT anticipates NERC will merge the documents for filing with FERC.		
PNGC Power	No	Same as #5

Organization	Yes or No	Question 6 Comment
WECC		
Southern Company	No	Southern believes the SDT should implement a uniform 24 month implementation deadline, or a different implementation deadline granted by the Regional Entity for good cause, rather than different timelines for different requirements.
Response: Thank you for your comment. The suggested modification proposes an exception process to a mandatory standard. We refer to the discussion on technical feasibility exceptions in the FERC Order, specifically, to the oversight framework which must be in place that is summarized in paragraph 222. The SDT believes the effective date provides a reasonable timeframe for entities to become compliant with CIP-002-4 through CIP-009-4, which would preclude the need to implement a burdensome exception process for the industry.		
Encari, LLC	Yes	
Arizona Public Service	Yes	
Edison Electric Institute	No	Although the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities reflect historical precedent in terms of FERC approval, we believe that with the exception of nuclear facilities, it would be better to simply have a uniform18 month implementation deadline for newly identified CCAs and Responsible Entities, rather than different timelines for different requirements. We have additional input: The Following Functional entities to be added to the applicability section: Planning Coordinator, Transmission Planner. Issue: As posted, the revised CIP-002-4 has the following language (Page 2):R3. Annual Approval -The senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 , R2, and R23 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.) Recommendation: References to risk-based assessment methodology should be removed.

Organization	Yes or No	Question 6 Comment
Response: Thank you for your comment. Because FERC has already approved this plan, and due to the limited scope, the SDT is only making conforming changes at this time. There are no requirements in version 4 of the CIP Cyber Security Standards for Planning Coordinators and Transmission Planners. References to the risk-based assessment methodology have been removed.		
Tennessee Valley Authority (TVA)		
PacifiCorp	Yes	: While PacifiCorp agrees with the proposed revisions to this implementation plan, the Company does suggest an alternative approach that may remove the complications that are created with the current multiple implementation schedules. It would be simpler if all responsible entities had 18 months from the effective date of CIP-002-4 to bring any newly identified Critical Cyber Assets (CCAs) into compliance with CIP-003-4 through CIP-009-4, regardless of the reason for which new CCAs are identified.
Response: Thank you for your comment. As written in the Implementation Plan, all entities have 18 months from the effective date of CIP-002-4 to bring new CCAs into compliance. Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
OGE	Yes	
FMPA	No	Without knowing the outcome of CIP-005-4, we cannot support the implementation plan.
Response: Thank you for your comments. The implementation plan associated with the Urgent Action SAR for modifications to CIP-005-3 will be drafted as part of a separate ballot and is outside the scope of this SDT. If both ballots pass, then the SDT anticipates NERC will merge the documents for filing with FERC.

Organization	Yes or No	Question 6 Comment
Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.		
SDG&E	Yes	
Central Lincoln	No	Central Lincoln supports the APPA Comments: APPA's review of the associated Implementation Plan for CIP-002-4 has identified a potential inconsistency between the Implementation Plan and the Reliability Standard. The Reliability Standard clearly provides that updates to the Critical Asset list will be made at the time of the annual review. However, the Implementation Plan is not as clear. We would request modification to the Implementation Plan such that it reflects the intent of the Reliability Standard. The Implementation Plan does not adequately address when a "New Asset" that does meet the CIP-002-4 criteria for being a Critical Asset after its commissioning will need to be in compliance. APPA believes that the intent of the Reliability Standard indicates that the post-commissioned New Asset will become a Newly Identified Critical Asset upon the subsequent Annual Review and only at the time of this Annual Review. Further that the timeline associated with this Newly Identified Critical Asset starts with the date of the Annual Review. Additional Central Lincoln Comments: Central Lincoln notes that the APPA comment regarding commissioning new equipment is not the only path to new CCAs, since an existing cyber asset may become critical due to other system changes. Immediate non-compliance with all CIP requirements and resulting enforcement action is not a way to encourage compliance.
Response: Thank you for your comments. Requirements R1 and R2 were modified to clarify that the update is ongoing, and the review must occur at least annually. The text reference was removed from the Implementation Plan. An existing cyber asset becoming critical due to other system changes would be a Category 2 Scenario if (i) the system change was not planned and (ii) the entity has an existing CIP Cyber Security program. If the system change were planned and implemented by the entity, then the Critical Cyber Asset implementation is part of the planning process.		
Northeast Missouri Electric Power Cooperative	No	In some cases there could be a significant outlay of financial and staff resources and current budgets are not going to allow start of implementation of a project until the following year. Therefore, it should be 12 months to identify Critical Assets and 36 months to complete implementing CIPs 003-009. This will provide entities enough time to request financing and the additional staffing that may be required to perform the new requirements of the CIP standards.

Organization	Yes or No	Question 6 Comment
Response: Thank you for your comments. The SDT believes there is precedent showing this implementation period is reasonable. The Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.		
National Rural Electric Cooperative Association (NRECA)	No	See answer to Question 5.
Response: Thank you for your comments. Please refer to response to question 5.		
Tampa Electric	Yes	
M&A Electric Power Cooperative	No	In some cases there could be a significant outlay of financial and staff resources and current budgets are not going to allow start of implementation of a project until the following year. Therefore, it should be 12 months to identify Critical Assets and 36 months to complete implementing CIPs 003-009. This will provide entities enough time to request financing and the additional staffing that may be required to perform the new requirements of the CIP standards.
Response: Thank you for your comments. The SDT believes there is precedent showing this implementation period is reasonable. The Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.		
MEAG Power	No	MEAG supports the APPA's comments submitted to the NERC CIP standard drafting team.
Response: Thank you for your comments.		
Associated Electric Cooperative, Inc.	No	In some cases there could be a significant outlay of financial and staff resources and current budgets are not going to allow start of implementation of a project until the following year. Therefore, it should be 12 months to identify Critical Assets and 36 months to complete implementing CIPs 003-009. The Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.		
FirstEnergy Corp	No	See our Question 5 response.
Response: Thank you for your comments.		
Minnesota Power	Yes	
Manitoba Hydro	No	Suggest changing wording in the first sentence of the fifth paragraph of page 1 "...application of the Critical Asset identification..." to " ... application of Critical Asset Criteria for the identification of Critical Assets...".
Response: Thank you for your comment. The SDT agrees to make that conforming change.		
American Transmission Company	No	Support EEI's comment. Although the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities reflect historical precedent in terms of FERC approval, we believe that, with the exception of nuclear facilities, it would be better to simply have a uniform18 month implementation

Organization	Yes or No	Question 6 Comment
		deadline for newly identified CCAs and Responsible Entities, rather than different timelines for different requirements.
Response: Thank you for your comment. Because FERC has already approved this plan, and due to the limited scope, the SDT is only making conforming changes at this time. The SDT believes the shorter timeframe for entities having Critical Cyber Assets in version 3 reflects the organizational knowledge and expertise in implementing the cyber security requirements. Also, all entities have 24 months from regulatory approval to implement the requirements of the CIP Cyber Security Standards.		
Ameren	No	This schedule is too aggressive and is also very confusing. In this regard, we suggest the following: The time frame for Entities to be compliant for Category 2 should be changed to 18 months for all periods instead of 6, 12, or 18 months. This would match the 18 month proposed period for the Version 4 implementation schedule which gives every requirement other than CIP-002 18 months instead of different time periods. This will also prevent requirements that are dependent on actions in other requirements to not have different time periods to be compliant, for example CIP-005 R1.5 and CIP-006 R2.2. Another example is CIP-004-4 R1 where an Entity will not know who needs on-going reinforcement in sound security practices if the Entity has not established a list of who has authorized cyber or physical access per the CIP-004-4 R4 requirement. Should the Category 1 Milestone and Category 2 Milestone for CIP-003-4 R2 match to be either N/A or existing?
Response: Thank you for your comments. The SDT believes the timeframes for Category 2 Critical Cyber Assets are appropriate given the preexisting cyber security program. Thank you for your comment. Because FERC has already approved this plan, and due to the limited scope, the SDT is only making conforming changes at this time. The SDT believes the shorter timeframe for entities having Critical Cyber Assets in version 3 reflects the organizational knowledge and expertise in implementing the cyber security requirements. Also, all entities have 24 months from regulatory approval to implement the requirements of the CIP Cyber Security Standards.		
BGE	No	See specific comments below:- Terms “Responsible Entity and Responsibility Entity” are capitalized and is not defined throughout the Implementation Plan. If these are NERC terms, please put their definition in the NERC Glossary of Terms - BGE believes that the difference in time in Milestone Category 1 and Milestone Category 2 in Table 2 should not exist as the implementation of developing an Electronic Security Perimeter and protecting new CCAs is equally as challenging for a company who already has CCAs that are protected. - Time line given should be clearly labeled that it is ONLY if the FERC approves the standard in the first

Organization	Yes or No	Question 6 Comment
		quarter 2011. - Remove the words EXAMPLE and SAMPLE to describe the Scenarios, in the table and in the text. Perhaps a statement that this list of scenarios is not "ALL INCLUSIVE" would be correct in this situation. - Does the "Compliant upon Commissioning" make sense for new Cyber Assets never before in service? - Is Scenario is used in the text and the table to mean different things. Please clarify.
Response: Thank you for your comments. The term "Responsibility Entity" has been corrected. While "Responsible Entity" is not a NERC Glossary term, it is acceptable to use the term in the Implementation Plan corresponding to the applicable standard. Because FERC has already approved this plan, and due to the limited scope, the SDT is only making conforming changes at this time. The SDT believes an entity that does not have existing CCAs must go through significantly more internal process changes and technical training than would an entity that already has an existing CIP Cyber Security Program. Your suggested modifications to the guideline have been incorporated. The SDT believes "Compliant upon Commissioning" makes sense for a new Cyber Asset which becomes a Critical Cyber Asset for an entity who has an existing CIP Cyber Security Program. The implementation plan references scenarios for both newly registered entities and newly identified Critical Cyber Assets. The scenarios referenced in Table 1 of this document refer to Critical Cyber Assets.		
Beaches Energy Services (of City of Jacksonville Beach, FL)	No	Without knowing the outcome of CIP-005-4, we cannot support the implementation plan.
Response: Thank you for your comments. The implementation plan associated with the Urgent Action SAR for modifications to CIP-005-3 will be drafted as part of a separate ballot and is outside the scope of this SDT. If both ballots pass, then the SDT anticipates NERC will merge the documents for filing with FERC.		
We Energies	No	We believe that it would be better to simply have a uniform 18 month implementation deadline for newly identified CCAs rather than have different timelines for different requirements. This will simplify reporting and streamline efforts to become fully compliant. We understand that nuclear timelines are subject to NRC requirements and the necessity of accomplishing some tasks only during refueling outages appropriately dictates a separate schedule for them.

Organization	Yes or No	Question 6 Comment
Response: Thank you for your comment. Because FERC has already approved this plan, and due to the limited scope, the SDT is only making conforming changes at this time. The SDT believes the shorter timeframe for entities having Critical Cyber Assets in version 3 reflects the organizational knowledge and expertise in implementing the cyber security requirements. Also, all entities have 24 months from regulatory approval to implement the requirements of the CIP Cyber Security Standards.		
City Utilities of Springfield, MO	No	SPRM agrees with the comments from the APPA Task Force.
Response: Thank you for your comments.		
National Grid	Yes	
Lincoln Electric System	Yes	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
Response: Thank you for your comments.		
Southwest Power Pool Regional Entity	No	Remove all references to the term "Auditably Compliant (AC)". FERC has held that the requirements are auditable and enforceable as of the Compliant (C) milestone date. The auditors are aware of the nuances of required data retention and other time-specific requirements and will seek evidence of compliance appropriately. The idea that entities have an entire year after the Compliant milestone date to actually become compliant has caused considerable issues with previous versions of the standard.
Response: Thank you for your comments. The SDT agrees that Auditably Compliant is no longer relevant to version 4 of the CIP Cyber Security Standards and references have been removed.		
Indianapolis Power & Light	Yes	
Constellation Power Generation	No	Constellation Power Generation believes that 18 months to implement these requirements is not enough time. Based on the number of self reports and compliance issues regarding the CIP standards, it is evident that not enough time was given to entities in the implementation phase. Therefore, Constellation Power Generation

Organization	Yes or No	Question 6 Comment
		suggests that the SDT extend the implementation time to 24 months.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
Independent Electricity System Operator	Yes	
American Electric Power (AEP)	Yes	AEP suggests a less complex approach if possible.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
Orlando Utilities Commission	Yes	
Oglethorpe Power Corporation	Yes	
Brazos Electric Power Cooperative, Inc.		
Midwest ISO	No	Many sections of the new identified CCAs and responsible entities still reflect the former risk-based assessment methodology. For example, in the Implementation Milestone Categories on page 4, there is a discussion regarding a change in power flows causing non-critical assets to become Critical Assets. Under the new criteria, there is no evaluation of power flows. A better example would be referencing criterion 1.3 in CIP-002-4 Attachment 1 - "When a PC or TP newly identifies a generation Facility that is required for reliability purposes." In the section discussing mergers, there is discussion of how to combine Critical Asset identification processes. Again, this was written assuming entities needed to combine their risk-based assessment methodologies and resolve any differences. There is no need for discussion of combining these processes with bright line criteria. The paragraph from the merger section in 3 (a) that begins with "Registered Entities are encouraged when combining separate risk-based Critical Asset identification processes..." should be removed since there should be no reduction in Critical Assets from a merger with bright line criteria.For Table 3, how do we know which column applies? Is it based on category 1 and category 2 as shown in Table 2 and described in the

Organization	Yes or No	Question 6 Comment
		Implementation Milestone Categories and Schedules? If so, then column headings should be added to Table 3 to clarify.
Response: The SDT agrees the text you reference still reflects the risk-based assessment methodology and have made those conforming changes. Table 3 only applies to entities registered after the CIP-002-4 Effective Date. The column headings reflect 12 months and 24 months respectively after the date of registration.		
Duke Energy	No	The implementation plan for newly identified Critical Cyber Assets is confusing. It appears that Critical Cyber Assets which are newly identified during the first 18 months following the Effective Date of CIP-002-4 must be compliant 18 months following the Effective Date of CIP-002-4 (or 6 months following refueling for items requiring a refueling outage to complete). However, if an entity identified a new Critical Cyber Asset near the end of the 18 month period, there might not be enough time left to achieve compliance. To allow for this possibility, the implementation plan for Critical Cyber Assets identified following the Effective Date of CIP-002-4 should require compliance at the latter of 18 months following the Effective Date of CIP-002-4, or the applicable Category 2 milestone date.
Response: Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.		
Seminole Electric Cooperative, Inc.	No	See response to 5 above.
Response: Thank you for your comment.		
Progress Energy	Yes	
Orlando Utilities Commission		
New York Independent System Operator		

Organization	Yes or No	Question 6 Comment
Cowlitz County PUD	Yes	
Orlando Utilities Commission	Yes	
Kansas City Power & Light	No	The Implementation Plan does not adequately address when a "New Asset" that does meet the CIP-002-4 criteria for being a Critical Asset after its commissioning will need to be in compliance. APPA believes that the intent of the Reliability Standard indicates that the post-commissioned New Asset will become a Newly Identified Critical Asset upon the subsequent Annual Review and only at the time of this Annual Review. Further that the timeline associated with this Newly Identified Critical Asset starts with the date of the Annual Review.
Response: Thank you for your comments. Requirements R1 and R2 were modified to clarify that the update is ongoing, and the review must occur at least annually. The text reference was removed from the Implementation Plan.		

END OF REPORT

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement
Initial Ballot Window Open
October 20-November 3, 2010

Now available at: https://standards.nerc.net/CurrentBallots.aspx

Instructions
Members of the ballot pool associated with this project may log in and submit their votes from the following page: https://standards.nerc.net/CurrentBallots.aspx

Two errors were discovered in the versions of the standards posted for comment and review on September 20, 2010 and these errors have been corrected in the clean and redline versions of the standard posted for ballot on October 20, 2010. To see the two errors, review the yellow highlighted text in the redline versions of the standards posted on October 20, 2010.

- In CIP-002-4 Requirement R3, the phrase, "approval of the risk-based methodology," was removed.
- In the applicability section of CIP-008-4, the "nuclear exclusion" was removed.

Project 2008-06 — Cyber Security 706
A set of proposed changes to CIP-002-3 - Cyber Security — Critical Cyber Asset Identification, associated implementation plans, and conforming changes to several other CIP standards have been posted for stakeholder ballot. These are considered, "Version 4 CIP Standards." The drafting team also developed and posted a mapping document to show the translation of requirements from CIP-002-3 to CIP-002-4, and a guidance document to assist in applying the proposed CIP-002-4 standard.

The proposed CIP-002-4 provides a significant improvement to CIP-002-3 by including a specific list of criteria for entities to use in identifying their critical assets.

The previously approved versions of CIP-002 relied on entities to develop their own critical asset identification methodology, and have led to unequal assessments of critical assets between entities in a region, and between regions. This subjectivity has led some external observers to question how assessments were produced, and has contributed to distrust of the entire critical asset identification process. The revised standard provides uniformity to the critical asset identification process for all entities as well as uniformity and predictability to the audit process. As envisioned, each entity will apply the criteria against its assets to determine exactly which side of the "bright line" they fall. The bright-line thresholds are justified based on overall impact to Bulk Electric System reliability, adding further clarity to the critical asset identification process. The bright-line criteria were developed based on stakeholder comments on CIP-010, which is currently under development.

Recognizing that protecting the cyber assets critical to the electric utility's infrastructure is also critical to national and international security, the revisions to CIP-002 are being advanced ahead of other improvements to the remaining set of CIP standards. The remaining CIP standards all rely on a complete and accurate identification of those assets that are critical to reliability. Because entities are so tightly interconnected, a vulnerability that seems

insignificant to a single entity can place the entire grid in a state of vulnerability.

Each of the CIP standards (CIP-003-3 through CIP-009-3) contains at least one reference to CIP-002-3. To maintain clarity, CIP-003-3 through CIP-009-3, have had conforming changes made so that all cross references within the set of standards are to "CIP Version 4" standards. *(CIP-005-4 - Cyber Security — Electronic Security Perimeter is posted separately, with a set of proposed revisions for Urgent Action under Project 2010-15. If CIP-005-4 is not approved as an Urgent Action, it will be returned to this set of CIP standards.)*

Transition from Reliability Standards Development Procedure Version 7 to Standard Processes Manual

Under the Reliability Standards Development Procedure Version 7, consensus was built with successive formal comment periods, followed by a 30-day pre-ballot review, followed by an initial ballot, and then a recirculation ballot. The intent was to use stakeholder views submitted through the formal comment periods to achieve consensus, and then to confirm that consensus during the balloting. This process did not allow a drafting team to make any changes to a standard between ballots, which incented teams to avoid making improvements once a standard had gone through an initial ballot. If a team made a change between ballots, then the standard was required to be posted for a new comment period and then another pre-ballot review and another initial ballot. Finally, if there were no more changes made to the standard, a recirculation ballot was conducted to confirm consensus.

Under the new Standard Processes Manual, consensus is achieved through parallel comment and ballot periods. Successive comment and ballot periods are conducted until there is consensus – and then a recirculation ballot is conducted to confirm that consensus. There is no 30-day pre-ballot review period, and drafting teams are encouraged to make revisions to the standard between successive ballots to improve the quality of the standard.

Next Steps

Voting results will be posted and announced after the ballot window closes.

Project Background

FERC Order 706 directed NERC to develop modifications to the CIP Reliability Standards. Due to the variety of changes directed in Order 706 and the complexity of the project, the drafting team adopted a multi-phase revision strategy. The initial phase involved modifying standards CIP-002-1 through CIP-009-1 to comply with the near-term directives included in Order 706. The resulting version 2 CIP standards were approved by the NERC Board of Trustees, and as part of its approval Order, FERC directed NERC to make changes to two standards and the associated implementation plan within 90 days. Those changes, along with necessary conforming cross-reference changes for the remaining six CIP standards, resulted in the version 3 CIP standards. The current phase (Phase II) involves the more complex FERC directives.

Further details are available on the project page:

Standards Announcement
Initial Ballot Results

Now available at: https://standards.nerc.net/Ballots.aspx

Project 2008-06 — Cyber Security 706

The initial ballot for the following Critical Infrastructure Protection (CIP) Version 4 Standards ended on November 3, 2010:

- CIP-002-4 - Cyber Security — Critical Cyber Asset Identification
- CIP-003-4 - Cyber Security — Security Management Controls
- CIP-004-4 - Cyber Security — Personnel & Training
- CIP-006-4 - Cyber Security — Physical Security of Critical Cyber Assets
- CIP-007-4 - Cyber Security — Systems Security Management
- CIP-008-4 - Cyber Security — Incident Reporting and Response Planning
- CIP-009-4 - Cyber Security — Recovery Plans for Critical Cyber Assets

Ballot Results for Standards
Voting statistics are listed below, and the Ballot Results Web page provides a link to the detailed results:

Quorum: 93.66 %
Approval: 43.33 %

Since there were negative ballots that included a comment, these results are not final. A successive ballot must be conducted.

Next Steps
The drafting team will post its consideration of all comments (those submitted with a comment form, and those submitted with a ballot) and conforming changes to the standard.

Project Background
FERC Order 706 directed NERC to develop modifications to the CIP Reliability Standards. Due to the variety of changes directed in Order 706 and the complexity of the project, the drafting team adopted a multi-phase revision strategy. The initial phase involved modifying standards CIP-002-1 through CIP-009-1 to comply with the near-term directives included in Order 706. The resulting version 2 CIP standards were approved by the NERC Board of Trustees, and as part of its approval Order, FERC directed NERC to make changes to two standards and the associated implementation plan within 90 days. Those changes, along with necessary conforming cross-reference changes for the remaining six CIP standards, resulted in the version 3 CIP standards. The current phase (Phase II) involves the more complex FERC directives.

Further details are available on the project page:

Consideration of Comments on Initial Ballot — Cyber Security 706 (Project 2008-06)
Date of Initial Ballot: October 20 – November 3, 2010

Summary Consideration: The majority of commenters either referred to their comments filed during the comment period or repeated those comments in the ballot. The summary responses for each question in the comment period are provided below:

Question 1: When reviewing the mapping document posted with the proposed CIP-002-4 standard, do you believe that the proposed standard will lead to an improvement in reliability when compared to the standard it proposes to replace?

Many of those that voted "No" contended their current risk-based methodology provided a more accurate list of Critical Assets and therefore the proposed criteria in Attachment 1 would not lead to an improvement in reliability. Often, those who commented this way also felt the criteria did not have rigorous system studies as a reliability basis.

The SDT appreciates these comments but believes that although some companies may have a very rigorous risk-based assessment, the implementation of Attachment 1 criteria will overall increase the consistency of Critical Asset identification. The Attachment 1 criteria were developed in response to an external oversight directive in the FERC Order 706. In consideration of this directive, the SDT decided there did not exist across all regions an appropriate third party to provide this type of oversight. Also, external review and oversight carries with it the compliance overhead and arbitration processes analogous to the TFE process. The "bright-line" criteria approach removes the variability of entity-defined methodologies that would prompt the need for external review.

Regarding the need for additional engineering studies, the SDT and volunteer industry participants have expended considerable effort to develop consistent Critical Asset Identification approaches. The team endeavored to include work already required by other standards, and provide some constraints for an entity's assessment. These approaches, in their various iterations, have been presented to industry for review and comment. The industry provided significant feedback for the need to simplify the Critical Asset identification approach. The Attachment 1 criteria were under development for CIP-010 when the team was asked to use the criteria for the basis of a new CIP Version 4 set of standards. The results of the recent NERC data request were used to assist the team in developing the criteria in Attachment 1.

A few commenters expressed concern that changes to these standards do not address other significant issues. The SDT agrees that other changes ultimately need to be made to the body of CIP cyber security standards, and expects to resume working on those in early 2011. The scope of the changes to the interim CIP-002-4 was deliberately to minimize the impact on the industry while addressing the identified consistency issues with the Critical Asset identification method.

Question 2: CIP-002-4 Attachment 1 contains criteria that define elements that must be classified as Critical Assets. Do you have any suggestions that would improve the proposed criteria? If so, please explain and provide specific suggestions for improvement.

In response to question 2, most commenters had suggestions for improvement to the criteria for critical assets listed in Attachment 1. The SDT appreciates these comments and incorporated many of them to improve clarity and consistency. Some of the comments reflected a misunderstanding of a specific criterion, and in those instances the SDT provided additional guidance in the response to comments and modified the associated guidance document for identifying Critical Assets. The SDT believes that the implementation of Attachment 1 criteria will increase the overall consistency of Critical Asset identification. Specific summary analysis of each criterion follows, along with a summary of responses.

Criterion 1.1 defines as Critical Assets "Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW." Commenters requested clarification on the phrase "single plant location." Clarity on this issue was provided in the posted guidance document. "Single plant location" refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Other commenters questioned why we no longer used Contingency Reserve in the criteria, and how the SDT arrived at the value of 1500 MW. In prior postings of CIP-002-4 and CIP-010-1 there was wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The SDT performed an informal survey of the regions and identified what the megawatt value of the reserve sharing would be for various groups. The SDT used 1500 MW as a number derived from the most significant Contingency Reserves operated in various Balancing Authorities in all regions.

Some commenters suggested the use of capacity factor in the criterion. The SDT debated whether to include it in this criterion. The reason the SDT ultimately chose not to include capacity factor is twofold. First, there is no consistent method to select an appropriate capacity factor, and low capacity factor units may be critical to the system at peak load conditions. Second, there was a concern that some units might fall below the line during major outage periods, taking them off the Critical Asset list one year and putting them back on the list the next year. After considering all of the comments, the SDT chose not change the wording of criterion 1.1.

Criterion 1.2 defines as Critical Assets "Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater." Some commenters questioned how the value of 1000 MVARs was derived. The value of 1000 MVARs used in this criterion was deemed reasonable for the purpose of determining criticality. Some commenters suggested combining criterion 1.2 with criterion 1.9. FACTS devices in 1.9 are specifically related to IROLs, whereas the reactive resources in 1.2 are not limited to IROL applications. Some commenters suggested that the limit should be set by each Regional Reliability Organization. The issue with using different MVAR values in each region is that it does not meet the objective of uniform application of Critical Asset identification across all entities. After considering all of the comments, the SDT chose not change the wording of criterion 1.2.

Criterion 1.3 defines as Critical Assets "Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes." Many commenters felt that this criterion places the responsibility for identifying the asset with the wrong entity (not the asset owner). Other commenters noted that the use of the NERC Glossary term "Adverse Reliability Impacts" would help clarify which units should be in this category. Others expressed concern that the criterion should mandate the coordination and approval process between the Transmission Planner and entity that have been designated critical by the Transmission Planner. Still others stated that this criterion is open for auditors to interpret. The SDT responded that the burden for identifying Critical Assets is with the Responsible Entity that is the asset owner. There is no burden or obligation placed on the Planning Coordinator or Transmission Planner to designate any unit as needed for reliability. Based on the comments received, this criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Criterion 1.4 defines as Critical Assets "Each Blackstart Resource identified in the Transmission Operator's restoration plan." Many commenters expressed concern that designating all Blackstart Resources as critical will divert limited resources to protect blackstart facilities that are only used to restore localized load. Others stated that blackstart units deemed critical should be only those identified by the TOP as specified to meet the minimum critical blackstart requirement. Some expressed concern that criterion 1.4 inadvertently provides incentive to utilities to remove resources from the restoration plan, reducing the plan's overall effectiveness.

The SDT specifically chose the NERC Glossary term “Blackstart Resources” to address the concerns expressed. A Blackstart Resource is defined as “A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s restoration plan.” EOP-005-2 R1.4 states that the restoration plan must include “Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit.” The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources. After considering all of the comments, the SDT chose not change the wording of criterion 1.4.

Criterion 1.5 defines as Critical Assets “The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist.” Some commenters stated that additional qualifying criteria should be added such as "Cranking Paths to critical units as identified in a region’s restoration plan." The SDT noted in its response that there is no longer any NERC requirement to have a region restoration plan. Others asked for clarity around where the point of multiple paths lies in the electrical system. The SDT noted in its response that the point where multiple paths exist in the Cranking Path is the step in the Transmission Operator’s restoration plan per EOP-005-2 R1.5 “Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started” where the Transmission Operator can choose between the next Facilities on the BES to energize. Some commenters expressed concern over the phrase “initial switching requirements.” Based on the comments received, this criterion has been reworded to “The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan.”

Criterion 1.6 defines as Critical Assets “Transmission Facilities operated at 500 kV or higher.” Commenters expressed that voltage alone is not a sufficient criterion to determine whether or not an asset is critical to the bulk electric system. They suggested that the SDT should consider using capacity or flows based on power flow studies instead of nominal voltage level as the bright-line. The SDT responded that all Transmission Facilities operated at 500 kV or higher do not require any further qualification for their role as components of the backbone on the Interconnected BES. Furthermore, the SDT does not feel that capacity or power flow analysis (impact-based or risk-based) would lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. The SDT will take this suggestion under consideration for future revisions. After considering all of the comments, the SDT chose not change the wording of criterion 1.6.

Criterion 1.7 defines as Critical Assets “Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations.” Some commenters provided the suggestion that criterion 1.7 should be reworded to "stations or substations" instead of just "stations" so that it is not implied that it only applies to power plants (stations). Others commented that the SDT should adopt a power flow-based bright-line rather than whether the station is connected to three or more other stations, similar to comments for criterion 1.6. Again, the SDT does not feel that power flow analysis (impact-based or risk-based) may lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. Still others commented that the statement regarding "three or more other transmission stations" is confusing. Does the criterion include stations upstream, downstream, networked or radial? Does the criterion include a radial 345 kV substation connected to a generator? The SDT response is that the intent of criterion 1.7 is to classify as Critical Assets all Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this criterion, since the criterion specifically states “three or more other transmission stations.” The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a

Critical Asset since by definition it cannot be connected to three or more transmission substations. Based on the comments received, this criterion has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations."

Criterion 1.8 defines as Critical Assets "Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)." Some commenters stated that this criterion should be modified because loss of facilities does not cause an IROL violation. An IROL includes a limit and a time constant T_v. In order for an IROL violation to occur, the limit must be exceeded for at least the time constant T_v. Others commented that additional language should be added to clarify that the TO, LSE, etc. is not responsible for demonstrating IROLs. The SDT responded that according to FAC-014-2, IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. Based on the comments received, this criterion has been reworded to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Criterion 1.9 defines as Critical Assets "Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)." Some commenters felt that the term FACTS should be added to the NERC Glossary. FACTS is defined by IEEE as: "Alternating Current Transmission Systems incorporating power electronics-based and other static controllers to enhance controllability and power transfer capability." Commonly accepted terms and definitions do not require an insertion in the NERC Glossary. Some questioned why FACTS devices were singled out in the criteria. FACTS devices were singled out to ensure that there was no confusion as to whether or not they were considered Critical Assets. Other comments followed a similar vein as criterion 1.8. Based on the comments received, this criterion has been reworded to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Criterion 1.10 defines as Critical Assets "Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3." Some commenters asked for clarity about the term "directly connected." Additional questions concerned whether the language means total loss of substation or only partial. The intent of this criterion is to ensure the availability of Facilities necessary to support generation Critical Assets. Any Transmission Facility that, if lost, would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3, would need to be classified as a Critical Asset. This might include the partial or total loss of a substation. Based on the comments received, this criterion has been reworded to "Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3."

Criterion 1.11 defines as Critical Assets "Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements." Some commenters stated that criterion 1.11 should be eliminated on the basis that is not based upon BES reliability considerations and that criticality of facilities should not be fuel specific. Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." Since these facilities were deemed so important that a NERC reliability standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets. Some felt that this criterion should be limited to Transmission Facilities providing offsite power requirements. Since NUC-001-2 is not limited to offsite power requirements, it did not seem appropriate to limit this criterion. After considering all of the comments, the SDT chose not change the wording of criterion 1.11.

Criterion 1.12 defines as Critical Assets "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection

Reliability Operating Limits (IROLs)." Comments similar to those for criterion 1.8 concerning IROLs were received on this criterion. Based on the comments received, this criterion has been reworded to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed."

Criterion 1.13 defines as Critical Assets "Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes." Some commenters stated that the wording of this criterion will inadvertently bring in all SCADA systems with the capability of shedding load even if such SCADA systems are in fact not planned or operated to perform load shedding. This was not the intent of the SDT. Other commenters stated that this item needs to be clarified to confirm that it applies to a single common control system only, and not multiple but separate "like" systems that in aggregate are capable of load shedding up to 300 MW. Also, the criterion needs to be clarified to confirm that it applies to systems "configured" for automatic load shedding, not simply just "capable" of load shedding. Still others stated that this criterion should use the same "bright-line" as generation, 1500 MW. This criterion was intended to include as Critical Assets regional Under Frequency Load Shedding and Under Voltage Load Shedding schemes. Based on the comments received, this criterion has been reworded to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."

Criterion 1.14 defines as Critical Assets "Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator." No commenter stated that this criterion was inappropriate for Reliability Coordinators. Several commenters stated that the term "control center" needs to be defined in the NERC Glossary. At this time, the SDT is choosing not to add control center to the NERC Glossary. The team felt that defining this term under this proposed version of the standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. Many commenters stated that control centers for Balancing Authorities (BA) and Transmission Operators (TOP) need bounds. It was stated that a small BA or TOP that does not have any other Critical Assets does not need all of the Requirements in CIP-003-4 to CIP-009-4 applied to them.

After considerable discussion, it was determined by the SDT that these "small" BAs and TOPs could be addressed in the next version of the standard. Based on the comments received, this criterion has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion 1.16 (the posted criterion 1.16 has been removed, see explanation below) has been added which states "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion 1.17 has been added which states "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."

Criterion 1.15 defines as Critical Assets "Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection." Comments received on this criterion were similar to those received on criterion 1.1 and criterion 1.14. Based on the comments received, this criterion has been reworded to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MWs in a single Interconnection."

Criterion 1.16 defines as Critical Assets "Any additional assets that the Responsible Entity deems appropriate to include." This criterion was placed in Attachment 1 to provide Responsible Entities the flexibility to include addition items on their Critical Asset list that did not meet any other

criterion in Attachment 1. Many commenters stated that this was contrary to providing a bright-line for Critical Asset identification. In addition, it has the potential of causing issues in compliance audits. For these reasons, criterion 1.16 in its current form was deleted from Attachment 1.

Question 3: Requirement R1 of draft CIP-002-4 states, "Critical Asset Identification — Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in CIP-002-4 Attachment 1 – Critical Asset Criteria. The Responsible Entity shall review this list at least annually, and update it as necessary." Do you agree with the proposed Requirement R1?

The majority of commenters that disagreed with Requirement R1 suggested changes to the wording that is present in the existing CIP-002-3. The SDT responded that the scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology mentioned exists in the existing CIP-002-3 standard. The SDT expects the phraseology to be resolved in the next version. Others stated that their objection was with the wording in Attachment 1. The SDT directed them to the responses offered to their comments in question 2.

Question 4: Requirement R2 of draft CIP-002-4 states, "Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets performing a function essential to the operation of the Critical Asset. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Each Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics". The requirement then lists characteristics using the same text that is contained in the existing CIP-002-3 R3. Do you agree with the proposed Requirement R2?

Of commenters that disagreed with Requirement R2, the majority suggested changes to the wording that is present in the existing CIP-002-3. The SDT responded that the scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology mentioned exists in the existing CIP-002-3 standard. The SDT expects the phraseology to be resolved in the next version. Some commenters had questions about the 15-minute qualifier. The SDT's response is that this phrase is inserted to limit the scope to "real-time" operations, which is not a NERC defined term. Several commenters had suggested wording to clarify the requirement. Based on the comments received, Requirement R2 has been reworded to:

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually.

> For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1.
>
> For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

- The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
- The Cyber Asset uses a routable protocol within a control center; or,
- The Cyber Asset is dial-up accessible.

Question 5: Do you agree with the proposed implementation plan for the Version 4 standards?

In response to question 5, some commenters asked for new terms to be added to the NERC Glossary. At this time, the SDT is choosing not to add terms to the NERC Glossary since defining these terms would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. These terms are used in other approved NERC standards already in effect.

APPA's review of the associated implementation plan for CIP-002-4 identified a potential inconsistency between the Implementation Plan and the Reliability Standard. The Reliability Standard clearly provides that updates to the Critical Asset list will be made at the time of the annual review. However, the Implementation Plan is not as clear. Requirements R1 and R2 were modified to clarify that the update is ongoing, and the review must occur at least annually. Several entities requested that the implementation plans be combined. A NERC Standard Implementation Plan address assets that are in place and applicable the date the standard becomes effective. It is retired once the Implementation Plan is completed. The Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities addresses assets that are identified in the future and future Registered Entities and is an ongoing plan that has no expected retirement date.

Some entities asked for a provision for extensions to the implementation plan for good cause. The suggested modification proposes an exception process to a mandatory standard, and the SDT refers the entities to the discussion on technical feasibility exceptions in the FERC Order. Specifically, the oversight framework which must be in place is summarized in paragraph 222.

Some commenters felt the implementation plan was too aggressive. The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.

Some entities requested a 24-month implementation after the effective date of the standard, and indicated that the proposed plan too complicated. The SDT has simplified the implementation plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.

Question 6: Do you agree with the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities?

In response to question 6, some commenters noted conforming changes that needed to be made in the implementation plan for newly identified CCAs and Responsible Entities. The SDT made these changes and will post them in the next ballot. Most other comments were similar to those offered in question 5, for which the SDT offered the same responses.

If you feel that the drafting team overlooked your comments, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Voter	Entity	Segment	Vote	Comment
Kirit S. Shah	Ameren Services	1	Negative	1. (a) The proposed bright line criteria are not based on any studies or performance testing. (b) The proposed bright line criteria do not address proximity to load centers or the impact to system flows or voltages in those load centers. (c)Also, we believe that impact on the BES should be evaluated for the Critical Asset using the performance requirement contained in the existing mandatory standards. This would provide consistency between CIP-002 and other standards. In this regard, we suggest that for the facilities identified in the bright line criteria, perform powerflow and stability simulations to assess the impact to the BPS of the outage of these facilities, similar to the tests performed for TPL-003 and 004. If there is an impact (that is not meeting the performance criteria), then the facility is to be considered as critical. If there is no such impact, then the facility is not be considered as critical. If there is a concern for a multi-prong attack, then similar reliability assessment should be performed for such scenarios. (d)Further, the bright line criteria will include many more facilities as critical assets with minimal to no improvement to reliability and would require significant resource commitment to meet the proposed implementation schedule. 2. We offer some comments/suggestions and also have some questions/comments to the bright line criteria (Attaachment 1): (a) The term “Facilities” should be changed to “substations and switchyards” throughout Attachment 1 as NERC glossary of terms include “lines” in the definition also. Is it SDT’s intention to include hundreds of miles of lines as critical asset? (b) The term “single station location” and “single plant location” used throughout Attachment 1 need to be defined to avoid confusion whether a single location mean one building or several buildings or stations within a defined geographical boundary or a fenced area. (c) Specific comments to Attachment 1 : 1.1 - Are there any reliability impact studies to support 1500 MW? We believe that several events larger than this number have occurred and the BES has performed as designed,

[1] The appeals process is in the Reliability Standards Development Procedure: http://www.nerc.com/files/RSDP_V6_1_12Mar07.pdf.

Voter	Entity	Segment	Vote	Comment
				without any loss of load, or significant impact on reliability. 1.6 - We disagree that all transmission facilities operated at 500 kV or greater are “critical”. Again, system studies should be conducted to take into account the impact that the asset has on the reliable operation of the BES before determining that an asset is a Critical Asset. 1.7 - We disagree that all transmission facilities that are operated at 300 kV or above and are interconnected with three or more transmission substations are “critical. System studies should be conducted to take into account the impact that the asset has on the reliable operation of the BES before determining that an asset is a Critical Asset. 1.8 - Wording for this criterion should be changed to “Transmission substations and switchyards that the Planning Coordinator or Transmission Planner designates that, if destroyed, degraded, misused or otherwise rendered unavailable, demonstrates the need for an Interconnection Reliability Operating Limit (IROL). This change would make this criterion consist with FAC-010/FAC-014. 1.12 - We believe that the criterion reads ok, but the rationale document for this criterion implies that purpose of SPS/RAS is to prevent disturbance that would result in excursion beyond IROLs. This may not be true in all cases. 1.13 - Wording for this criterion should be changed to “Common control system(s) capable of performing automatic load shedding of 300 MW or more with a single operation”. 1.15 - Same comments as for 1.1 above. 1.16 - Wording for this criterion should be changed to “Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include.” 3. CIP-002-4, R2 : (a) The word “associated” could mean anything to do with a Critical Assets which is too broad of a term and needs to be defined to avoid confusion. (b)The phrase "could adversely impact the reliable operation" is unclear and vague. What magnitude of "adverse impact" should be considered? Also what is being defined as the Reliable Operation? This phrase should be more clearly defined, otherwise it could introduce different interpretations in the compliance audits. 4. The implementation plan is very confusing.

Response: Thank you for your comments.

(1) The SDT and volunteer industry participants have expended considerable effort to develop consistent Critical Asset Identification approaches. The team endeavored to include work already required by other standards, and provide some constraints for an entity’s assessment. These approaches, in their various iterations, have been presented to industry for review and comment. Significant feedback from the industry indicated the need to simplify the Critical Asset identification approach. We welcome your suggestions for improvement to the criteria. The Attachment 1 criteria were under development for CIP-010 when the team was asked to use the criteria for the basis of a new CIP Version 4 set of standards. The results of the recent NERC data request were used to assist the team in developing the criteria in Attachment

Voter	Entity	Segment	Vote	Comment
1. Bright-line criteria by its very nature may overreach in some areas and under-reach in others, with the end result being a more protected system on average. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The SDT does not feel that a power flow analysis (impact-based or risk-based) may lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. (2) a) A Transmission Line can be considered a Critical Asset if it meets the criteria in Attachment 1. It would then be evaluated for possible Critical Cyber Assets, which would be afforded the cyber security protection outlined in CIP-003 to CIP-009. It is not the Critical Asset that falls under CIP-003 to CIP-009, but the Critical Cyber Asset. b) The guidance document posted by the SDT provides direction on the location issue. “Single plant location” refers to a group of generating units occupying a defined physical footprint and designated as an individual “plant” using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant. c) Item 1.1 - In prior versions we had wording about reserve sharing for the threshold. We received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. We did an informal survey of the regions, and we identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. Items 1.6 and 1.7 – You propose to add the criteria that the Responsible Entity can determine through a risk-based evaluation that destruction, degradation or unavailability of certain assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. The SDT does not feel that a power flow analysis (impact-based or risk-based) may lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. We thank you for your proposal and will take it under consideration for future revisions. Criterion 1.7 has been reworded to “Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.” Item 1.8 – This criterion has been changed to “Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.” Item 1.13 – This criterion has been changed to “Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.” Item 1.15 –In the development of this criterion, the drafting team used 1500 MW as a bright-line for aggregate generation controlled based on				

Voter	Entity	Segment	Vote	Comment
the bright-line used in Part 1.1. The drafting team specified a single Interconnection because it is more likely that the span of control of the generation control center may cross multiple BA or RSG areas or even regions and Interconnections. Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot. (3) The phrase "associated" exists in the existing CIP-002-3 standard. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phrase "adversely impact" limits the scope of the evaluation of Critical Cyber Assets to those that can affect the reliable operation of 1500MW or more of generation at a single plant location. (4) The implementation plan is a modification of the implementation plan for version 3 of the CIP standards.				
Paul B. Johnson	American Electric Power	1	Negative	Overall, AEP is supportive of the efforts and the general concepts of this draft; however, there are a few refinements that will enhance the requirements and remove ambiguity. AEP encourages the SDT to consider the items below in a future draft of the standard: AEP would contend that there are regional differences that would be relevant to determine a MW threshold for generators. We support the concept that was contained in the last draft that made the determination based on the capacity reserves. However, the prior language would need to be revisited to ensure that value was fixed for a period of time. In addition, requirement 2.2 uses the term control center (also used in attachment 1) that is not a NERC defined term. This will introduce ambiguity to implementation. There has been ongoing confusion regarding the difference between "control centers" and "control rooms." We do not believe that a "control room" at a power plant or a substation would be considered a "control center." There is language in the NERC Security Guideline for Electricity Sector: Identifying Critical Assets document that the SDT should consider and incorporate into the NERC Glossary. Net real power capability testing is defined in MOD-024 standards that have yet to be FERC approved. Furthermore, not all of the regions have defined the parameters for the capability testing.
Response: Thank you for your comments. Item 1.1 - In prior versions we had wording about reserve sharing for the threshold. We received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. We did an informal survey of the regions, and we identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. At this time, the SDT is choosing not to add control center to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards				

Voter	Entity	Segment	Vote	Comment
already in effect. CIP-002-4 does not require net real power capability testing.				
John Bussman	Associated Electric Cooperative, Inc.	1	Negative	Please review the submitted comments.
Response: Thank you for your comments. Please refer to the response to comments document.				
Gordon Rawlings	BC Transmission Corporation	1	Negative	Critical Assets List comments 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations The present wording uses an arbitrary numbers of stations, the number of stations is immaterial BCH recommends the "Transmission Facilities operated at 300 kV or higher that if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). 1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. A clear definition of common control system(s) is required. Is under frequency or under voltage load shedding schemes considered control systems? The load shedding of 300 MW or more does it include firm or interruptible load or both? 1.16. Any additional assets that the Responsible Entity deems appropriate to include. To encourage reliability the additional assets deemed appropriate by a Responsible Entity should not be auditable.
Response: Thank you for your comments. Item 1.7 – In order to be more accurate in terms of the impact, the drafting team thought that it was more appropriate to refer to the number of connected transmission substations instead of using IROLs. The intent was to avoid double-circuit conditions and to include facilities that are actually more a part of the network than simple substations with double circuits between them. This includes upstream, downstream, radial and networked substations. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.

Tony Kroskey	Brazos Electric Power Cooperative, Inc.	1	Negative	See response submitted on the Comments Form.
Response: Thank you for your comments. Please refer to the response to comments document.				
Paul Rocha	CenterPoint Energy	1	Negative	CenterPoint Energy appreciates the work of the SDT and feels that the proposed Standard is very close. As stated in comments previously submitted, CenterPoint Energy belives criteria 1.11 in Attachment 1 is unnecessary and should be deleted or, if the SDT feels some criteria regarding nuclear facilities is needed then it should be limited to transmission facilities that directly connect the nuclear generator output to the transmission system. With either of these two changes CenterPoint Energy beleives it could support the proposed Standard.
Response: Thank you for your comments. Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2, "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." Since these facilities were deemed so important that a NERC standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets.				
Michael B Bax	Central Electric Power Cooperative	1	Negative	Please review submitted comments.
Response: Thank you for your comments. Please refer to the response to comments document.				

Voter	Entity	Segment	Vote	Comment
Jack Stamper	Clark Public Utilities	1	Negative	Attachment 1, part 1.14 would make a control centers performing the functional obligation of a TOP a Critical Asset. This apparently would be the case even if a TOP's control center only performed these functions on facilities that are not critical. Small entities have in some cases been forced by Balancing Authorities and former Transmission Operators to register as TOPs. Many of these TOPs operate systems with no assets that qualify as Critical Assets under any of the other Attachment 1 criterion. Some of these TOPs operate systems that do not have any Bulk Electric System facilities. It is unreasonable to designate these utilities dispatch centers as Critical Assets. Part 1.14 should be modified as follows: 1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator over any facilities determined to be Critical Assets as determined in Attachment 1, criterion 1.1 through 1.13.
Response: Thank you for your comments. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."				
John K Loftis	Dominion Virginia Power	1	Negative	Dominion conceptually supports bright line criteria for determining critical assets. However, we cannot vote in favor at this time because we believe that changes are needed in Table 2 that recognize the implementation for infrastructure (physical and electronic security) should be equal to, or longer than, that required for training. We also believe that the bright line criteria for generation control center needs further effort. Please see more specific comments/recommendations submitted by Dominion.
Response: Thank you for your comments. Please refer to the response to comments document.				
George S. Carruba	East Kentucky Power Coop.	1	Negative	EKPC would suggest rewording R2 to say: "For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those interconnected Cyber Assets that collectively could adversely

Voter	Entity	Segment	Vote	Comment
				impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes."
Response: Thank you for your comments. Requirement R2 has been changed based on industry comments received.				
Ralph Frederick Meyer	Empire District Electric Co.	1	Negative	EDE understand that NERC standards are a minimum requirement and regions can look at their own operating criteria and determine if they need additional protection at lower Megawatt bright-lines. EDE agrees with APPA in that they are concerned that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. To alleviate this volatility we agree that generation owners should use the facility ratings which are calculated and communicated under FAC-009-1 R2. EDE agrees with Cleco in that there is a dichotomy between 1.1. that states generation "equal to or exceeding 1500 MW" and 1.15. that states control centers that control generation "greater than an aggregate of 1500 MWs" There should be consistency between the two. EDE agrees with AAPA in that:APPA suggests that the designation of facilities be based on studies conducted under the TPL standards to justify the designation. Also, the use of NERC Glossary of term: "Adverse Reliability Impacts" will help clarify which units should be in this category. We are also concerned that the PC or TP will be looking at local vs. wide area reliability. There are some cases where the PC can designate Must Run units for temporary situations so this must be clarified within the criteria. APPA proposes the following rewording of criteria 1.3: 1.3 Each generation Facility that the Planning Coordinator or Transmission Planner designates as required to avoid BES Adverse Reliability Impacts for 1 year or longer. EDE agrees with AAPA in that Item 1.4 inadvertently incentivizes utilities to remove blackstart resources from the restoration plan if these resources are not critical to an effective regional restoration plan, reducing the plan's overall effectiveness. Therefore, we believe there should be a threshold for Blackstart Resources, similar to nearly all other elements being considered in Attachment 1. This would allow utilities the freedom to include numerous resources in the Transmission Operators restoration plan without being swept into being identified as a critical asset. EDE agrees with LES in that this language should be changed to "Each Blackstart Resource identified in the Transmission Operator's restoration plan as used to directly start

Voter	Entity	Segment	Vote	Comment
				generation identified as a Critical Asset, or identified in the Transmission Operator's restoration plan as used to directly start generation greater than an aggregate of 300 MW." 1.5 EDE does request clarification of criteria 1.5: Where does this point of multiple paths lay in the electrical system? Does this include only the Generator Step-up Transformer, or does it include the whole substation where multiple transmission paths depart to a single generator? EDE believes that criteria 1.8 and 1.9 should be reworded to "station or substation" instead of just "station" so that it is not implied that it only applies to power plants (station). EDE seeks verification from the SDT that the SPS they refer to in criteria 1.12 is for wide area protection only. EDE agrees with APPA suggested change in 1.13: 1.13. Common control system(s) configured to perform automatic load shedding of 300 MW or more within 15 minutes. EDE agrees with APPA in that we can accept the bright-line of 300 MW if the wording is changed to that stated above, but we still see this bright-line as an arbitrary threshold based on a quantity that has no BES operational significance. Rather, 300 MW is a DOE threshold for electric event reporting. EDE agrees with APPA in that criteria 1.14. is overly broad because it includes all BA and TOP control centers regardless of size. EDE asks that the SDT revise this criteria to include a bright-line with similar impact as those in 1.1 and 1.15. EDE agrees with APPA revised wording: 1.14. Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator with a minimum of 1500 MW of resources under its control. EDE agrees with AAPA in that we cannot support this standard revision without some form of bright line cutoff to exclude small BAs and TOPs that cannot cause instability or uncontrolled separation of the BES. However, we will support inclusion of "ALL BA and TOP control centers" only when this standard is revised to provide for a tiered (High, Medium and Low) categorization of Critical Assets, such as the SDT's draft CIP-010-1 proposal. In the NERC Draft CIP-002-4 webinar it was stated that a control center in criteria 1.15 is understood to be controlling multiple units. EDE agrees with APPA recommendation that the SDT clarify the wording in criteria 1.15 to coincide with this understanding: 1.15. Each control center or backup control center used to control multiple generation units identified as Critical

Voter	Entity	Segment	Vote	Comment
				Assets designated under criterion 1.3 or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. EDE agrees with AAPA in that 1.16 should be removed from the Attachment 1 criteria. We expect that registered entities may voluntarily protect assets above and beyond the ones listed in these criteria. However, we just do not see the reliability benefit of imposing a compliance liability to those self identified critical assets. We feel that the NERC and Regional compliance staff will waste valuable time and resources evaluating entity compliance with cyber security controls for assets that are outside of the scope of this standard For newly identified Critical Assets, a 24 month implementation is provided for Entities that have never identified a Critical Asset under the version 3 standards, with only 18 months provided for Entities with existing Critical Assets. We believe the SDT has developed a sound approach with this delineation. However, we also believe the 24 month implementation should be expanded to include Entities that may have existing Critical Assets, but have never identified a Critical Asset of a given type, i.e., generating unit, transmission facility, control center, etc. For example, if a company had a control center that was previously identified as critical, but version 4 results in their first generating unit being identified, then we would propose that they be given 24 months to become compliant as they are working on their first generating unit. EDE agrees with AAPA in that a review of the associated Implementation Plan for CIP-002-4 has identified a potential inconsistency between the Implementation Plan and the Reliability Standard. The Reliability Standard clearly provides that updates to the Critical Asset list will be made at the time of the annual review. However, the Implementation Plan is not as clear. We would request modification to the Implementation Plan such that it reflects the intent of the Reliability Standard. The Implementation Plan does not adequately address when a “New Asset” that does meet the CIP-002-4 criteria for being a Critical Asset after its commissioning will need to be in compliance. EDE agrees with APPA in that the intent of the Reliability Standard indicates that the post-commissioned New Asset will become a Newly Identified Critical Asset upon the subsequent Annual Review and only at the time of this Annual Review. Further that the timeline associated with this Newly Identified Critical Asset starts with the date of the Annual Review. We raise this point because we are concerned about the potential impact for confusion associated with multiple review dates or continuous reviews of the assets contained within numerous CIP activities. If an entity

Voter	Entity	Segment	Vote	Comment
				has multiple Cyber Assets, the entity would likely have multiple Annual Reviews dates.

Response: Thank you for your comments.

Item 1.1 – The SDT notes your concern that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. The drafting team used time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used. The 12-month time period was used so that seasonal ratings would not be an issue for generating plants that operate near the 1500 MW bright-line. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions.
Criterion 1.15 has been modified to conform to the MW wording in 1.1.

Item 1.3 – This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.

Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5, "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started," where the Transmission Operator can choose between the next Facilities on the BES to energize.

Items 1.8 & 1.9 - The SDT changed "stations" to "stations or substations."

Item 1.12 – Since this item only applies to SPSs that have IROLs associated with them, local area SPSs are not included.

Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."

Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset

Voter	Entity	Segment	Vote	Comment
identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.15 –This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot. Implementation Plan issues - Thank you for your comments. Requirements R1 and R2 were modified to clarify that the update is ongoing, and the review must occur at least annually. The text reference was removed from the Implementation Plan.				
George R. Bartlett	Entergy Corporation	1	Negative	Switchyards serving nuclear facilities should not be automatically classified as critical assets. - The fact that a BES switchyard serves a nuclear facility should not in itself qualify the switchyard as a critical asset. While nuclear units and their support facilities may qualify as critical assets under a separate set of criteria, they should not automatically be designated as critical to the BES without some measure of the impact of the loss of the facility on BES reliability. All blackstart units and associated cranking paths should not be automatically classified as critical assets. - Blackstart units may be useful in the restoration of the BES following a large scale outage, but they are not necessarily essential to the reliability of the BES under normal operation. Blackstart units should not automatically be designated as critical to the BES without some measure of the impact of the loss of the facility on BES reliability.
Response: Thank you for your comments. Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2, "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." Since these facilities were deemed so important that a NERC standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets. Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT feels that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources.

Dennis Minton	Florida Keys Electric Cooperative Assoc.	1	Negative	Cost prohibitive for small entities that have little to no material impact to the BES.
Response: Thank you for your comments. Cost is only one of many issues that must be considered in the cyber security of the BES.				
Gordon Pietsch	Great River Energy	1	Negative	GRE commented during the comment period and the drafting team should refer to those comments.
Response: Thank you for your comments. Please refer to the response to comments document.				
Ajay Garg	Hydro One Networks, Inc.	1	Negative	Hydro One is casting a negative vote for the following reasons: 1. We do not believe the standard will result in an improvement in reliability since the revisions merely replace the risk-based assessment methodology with a list of criteria that will ultimately result in inclusion of facilities on the Critical Assets list that are non-impactive on the BES. 2. We do not agree with criteria 1.6 and 1.7 in Attachment 1 as written. Application of these criteria would result in the inclusion of facilities that will have no impact on the BES reliability. We believe that the list of applicable facilities should be determined following an impact-based assessment to be performed by the Reliability Coordinator. If necessary, an additional requirement that requires the RC to have a risk-based assessment methodology and to conduct/review the assessment should be included. We therefore propose the following wording to replace 1.6 and 1.7 in Attachment 1: 1.6 Transmission facilities operated at 500 kV or higher, unless the annual review performed by the RC determines that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. 1.7 Transmission Facilities operated at 300 kV or higher to less than 500 kV at stations interconnected at 300 kV or higher with three or more other transmission stations, unless the annual review performed by the RC determines that destruction, degradation or unavailability of those assets will not have impact outside the local area and will not cause BES instability, separation, or cascading outages. 3. We do not agree with the removal of the exclusion that applies to facilities regulated by the Canadian Nuclear Safety Commission from the Applicability Section, This explicit statement makes it clear that CIP standards do not apply to those facilities

Voter	Entity	Segment	Vote	Comment
				which would not be the case if it were removed.
Response: Thank you for your comments. 1) The SDT believes that the implementation of Attachment 1 criteria will increase the consistency of Critical Asset identification over the existing entity defined risk-based methodology. 2) Items 1.6 and 1.7 – The SDT does not feel that a power flow analysis (impact-based or risk-based) may lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. We thank you for your proposal and will take it under consideration for future revisions. 3) The SDT is aware that the removal of the nuclear plant exclusion in response to a FERC order brought Canadian nuclear plants into the CIP standards. That was unintentional and will be corrected in the revised standards next posted for ballot.				
Bernard Pelletier	Hydro-Quebec TransEnergie	1	Negative	1- CIP-002-4, Attachment 1, as posted, is a simple list of assets that appears without mention of any performance based requirement. We believe that to be an effort to "cast a wider net" and capture more assets without qualifying their actual criticality. Attachment 1 inclusion criteria for critical assets should be based on critical functions of assets like: system restoration, voltage control, maintaining load/generation balance, maintaining flows within IROL/SOL, critical SPS. This list should not rely on substation voltages or amount of MW. 2- Also, the term "group of generating unit" in CIP-002-4, R2 and 1.1 of Attachment 1 is not clear. Does it mean a generating station? A group of units sharing the same transformer? 3- The 15 minutes delay of reliable operation referred in CIP-002-4, R2 is not clear too. How it will be determine that operations are not reliable after 15 minutes? Does this 15 minutes period is the Disturbance Recovery Period referred in BAL-002 Reliability Standard? 4- Hydro-QuÃ©bec does not agree with the removal of item (4.2.1) from the revised CIP002-4. We consider that the Canadian Nuclear Safety Commission should still be exempted from the standard CIP-002. 5- The cross references are still part of some CIP and it's sometimes makes the interpretation of the requirements more complex. For example CIP-007-4 R5.1.3 "Account Management" indicates the review should be done annually in accordance with CIP-004-4 E4 but the R4.1 indicates the review should be done quarterly. A table that explains the different requirements instead of a cross reference would be more useful.
Response: Thank you for your comments. 1) The SDT believes that the implementation of Attachment 1 criteria will increase the consistency of Critical Asset identification over the existing entity defined risk-based methodology.				

Voter	Entity	Segment	Vote	Comment
2) Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. "Single plant location" refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant. 3) The reference to 15 minutes was inserted to keep the scope to "real-time" operations, an undefined term. 4) The SDT is aware that the removal of the nuclear plant exclusion in response to a FERC order brought Canadian nuclear plants into the CIP standards. That was unintentional and will be corrected in the revised standards next posted for ballot.				
Walter Kenyon	KAMO Electric Cooperative	1	Negative	Please review submitted comments.
Response: Thank you for your comments. Please refer to the response to comments document.				
Stan T. Rzad	Keys Energy Services	1	Negative	The SDT is commended on making significant headway on the version 4 standards. However, there are significant additional improvement that should be made to make the criteria of Attachment 1 less arbitrary and that truly measures those assets that can have an Adverse Reliability Impact. Also, the standard is still unclear in several areas, such as how to identify CCAs at a substation if a substation is determined to be a CA that needs to be clarified. Please see FMPA's comments submitted through the formal comment process for more specific detail and proposed alternatives.
Response: Thank you for your comments. Please refer to the response to comments document.				
Larry E Watt	Lakeland Electric	1	Negative	LAK cannot support this standard revision without some form of bright line cutoff to exclude small BAs and TOPs that cannot cause instability, cascading or uncontrolled separation of the BES.
Response: Thank you for your comments. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."				
John W Delucca	Lee County Electric Cooperative	1	Negative	General Comments & Information Security Best Practices NERC distributed a questionnaire to responsible entities to gauge the impact of the proposed changes to CIP-002-4. The bright line criteria has changed since this

Voter	Entity	Segment	Vote	Comment
				assessment was performed and will result in the inclusion of additional assets being categorized as Critical Assets. Existing studies prove that many of these assets are not Critical Assets and do not impact the reliability of the BES. The existing CIP3 - CIP9 standards are not being modified with the version four release even though there are many opportunities to improve these standards. A good example can be seen with the Technical Feasibility Exception (TFE) process. Why are entities and regulatory agencies being forced to spend a significant amount of time processing TFE's because requirements don't make sense? A good example is the common TFE for routers and switches that do not and cannot run antivirus software. Expanding the scope of these labor intensive and non-value added processes will only deter entities from implementing effective security measures and best practices. A prudent approach would be to adjust the bright line criteria to ensure that the assets being included in the scope of the version four standards are truly Critical Assets. Once the security control standards are improved, the scope can be expanded to include medium and low impact cyber systems. Attachment 1 & Criteria Suggestions Attachment 1: o Paragraph 1.14 includes the Transmission Operator (TOP) function in addition to the Reliability Coordinator (RC) and Balancing Authority (BA) functions. In CIP10 the concept of a true "risk based" approach to the application of security requirements was proposed in the purpose section of the document as follows: Purpose: To identify and categorize BES Cyber Systems that execute or enable functions essential to reliable operation of the BES, for the application of cyber security requirements commensurate with the adverse impact that loss, compromise or misuse of those BES Cyber Systems could have on the reliability of the BES. The concept of matching security controls with risk is common practice that is found in NIST and ISO guidelines for risk management. These best practices should be leveraged when considering the implementation of CIPv4 and the development of future standards such as CIP10 and CIP11 that will include requirements for medium and low risk BES Cyber Systems. In the draft release of CIP10, the Balancing Authority (BA), Reliability Coordinator (RC) and Transmission Operator (TOP) functions were listed separately and with additional qualifying criteria. This is a much better approach that is well aligned with best practices and future standard development. When considering the proposed CIPv4 criteria, the control centers for the Transmission Operator (TOP) function should only be included as Critical Assets if they operate transmission facilities that meet the critical asset

Voter	Entity	Segment	Vote	Comment
				bright line criteria listed in paragraph 1.6 (above 500kV) or 1.7 (300Kv or higher at stations interconnected at 300kV or higher with three or more other transmission stations). Not including these criteria will cause Non-Critical Assets to be identified as Critical Assets. In addition, the standards will go against established best practices and be in conflict with the already released draft of the CIP10 and CIP11 standards. Suggested change to Attachment 1 paragraph 1.14: Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator or Balancing Authority. Suggested change to Attachment 1 (Add paragraph 1.x): Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Transmission Operator for Transmission Facilities meeting the criteria in 1.6 or 1.7. Requirement R2 Comments This section of R2 makes the requirement very confusing: For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. If this is intended to be further clarification for generating units only, there should be a paragraph for this alone. In addition, the basis for "within 15 minutes" is not defined and could lead to subjectivity in the interpretation of this requirement.

Response: Thank you for your comments.

The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues.

Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."

The requirement refers to shared cyber assets that can have a reliability impact on the group of generating units. This qualifier only includes Critical Assets identified in criterion 1.1. The 15-minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential

Voter	Entity	Segment	Vote	Comment
after a longer period of time but do not necessarily involve real-time reliability impact. We have updated the wording of R2 to clarify the meaning of this phrase.

Kevin White	Northeast Missouri Electric Power Cooperative	1	Negative	Please review submitted comments.
Response: Thank you for your comments. Please refer to the response to comments document.				
Robert Mattey	Ohio Valley Electric Corp.	1	Negative	Technical justification for "Bright line" criteria lacking.
Response: Thank you for your comments. The SDT believes information provided in the posted guidance document provides sufficient technical justification for each criterion.				
Brad Chase	Orlando Utilities Commission	1	Negative	SDT Proposed: 1.1 Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. APPA Comments: APPA and others commented on the CIP-010-1 standard as having arbitrary bright lines for generating units and requested that these bright line numbers have justification or have them based on the Contingency Reserve of each Reserve Sharing Group region. APPA commends the SDT for their attempted to come to agreement on a nationwide bright line for generating units based on an operationally significant threshold. The use of an average of the Contingency Reserve numbers from all the regions bases the bright-line on what the regions consider operationally significant. We understand that NERC standards are a minimum requirement and regions can look at their own operating criteria and determine if they need additional protection at lower Megawatt bright-lines. APPA is concerned that the use of the “Real Power Capability of the preceding 12 months” would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. To alleviate this volatility we suggest that generation owners should use the facility ratings which are calculated and communicated under FAC-009-1 R2. R2. The Transmission Owner and Generator Owner shall each provide Facility Ratings for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities to its associated Reliability Coordinator(s), Planning

Voter	Entity	Segment	Vote	Comment
				Authority(ies), Transmission Planner(s), and Transmission Operator(s) as scheduled by such requesting entities. SDT Proposed: 1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater. APPA Comments: APPA does not have a comment on criteria 1.2 at this time. SDT Proposed: 1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes. APPA Comments: APPA commends the SDT on including the criteria in 1.3, which gives the PC and TP the ability to designate as critical any generating facilities for reliability purposes. This will cover critical units that are not captured within the bright line of criteria 1.1 without drawing in all units of a certain size that are not considered critical elsewhere on the system. APPA suggests that the designation of facilities be based on studies conducted under the TPL standards to justify the designation. Also, the use of NERC Glossary of term: "Adverse Reliability Impacts" will help clarify which units should be in this category. We are also concerned that the PC or TP will be looking at local vs. wide area reliability. There are some cases where the PC can designate Must Run units for temporary situations so this must be clarified within the criteria. APPA proposes the following rewording of criteria 1.3: "1.3 Each generation Facility that the Planning Coordinator or Transmission Planner designates as required to avoid BES Adverse Reliability Impacts for 1 year or longer." SDT Proposed: 1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. APPA Comments: APPA is concerned that designating all Blackstart Resources as critical will divert limited resources to protect blackstart facilities that are only used to restore localized load. We believe it is the intent of the drafting team to identify the truly critical blackstart units (taking from the CIP-010-1 draft; only high impact facilities). APPA understands that criteria 1.4 uniformly identify all Blackstart Resources listed in the Transmission Operator's restoration plan as being Critical Assets with regards to the Bulk Electric System. Currently, many utilities include multiple Blackstart resources in the restoration plans provided to the Transmission Operator. Including numerous resources makes the plan much more robust and reliable as it provides additional well documented restoration options should unforeseen problems occur. As currently written, Item 1.4 inadvertently incentivizes utilities to remove blackstart resources from the restoration plan if these resources are not critical to an effective regional restoration plan, reducing the plan's overall

Voter	Entity	Segment	Vote	Comment
				effectiveness. Therefore, we believe there should be a threshold for Blackstart Resources, similar to nearly all other elements being considered in Attachment 1. This would allow utilities the freedom to include numerous resources in the Transmission Operators restoration plan without being swept into being identified as a critical asset. To implement this approach, we believe it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just its simple inclusion. For example, a 10 MW Blackstart Resource that directly supports restoration of a critical generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies local load during an outage. Therefore, APPA would propose judging the criticality of a Blackstart Resource by the relative importance of the generating unit(s) it directly supports. We would recommend rewording item 1.4 as follows, leveraging the existing language of criteria 1.15 and the capacity bright-line of criteria 1.13: 1.4 Each Blackstart Resource identified in the Transmission Operator's restoration plan, which meet either of the following criteria: 1.4.1 Used to directly start generation identified as a Critical Asset in criteria 1.1 or 1.3, 1.4.2 Used to directly start generation greater than an aggregate of 300 MW. We believe this approach should provide a better measure of a Blackstart Resource's potential impact on the Bulk Electric System, resulting in Critical Assets that adequately address system reliability in a practical manner. It also mitigates the likelihood that registered entities may decide to retire certain small blackstart units, thereby removing valuable but not critical blackstart resources from the Transmission Operator's restoration plan. We further support inclusion of "ALL Blackstart Resources" only when this standard is revised to provide for a tiered (High, Medium and Low) categorization of Critical Assets, such as the SDT's draft CIP-010-1 proposal. SDT Proposed: 1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. APPA Comments: APPA commends the SDT on differentiating between a single Cranking Path as a critical facility and multiple Cranking Paths as having redundancy in the BES and thus being less critical. Having this criteria stated in 1.5 incentivizes the entity to build in redundancy in infrastructure to lower criticality of a single asset. This truly does reward infrastructure reliability through a standard. APPA does request clarification of criteria 1.5: Where does this point of multiple paths lay in the electrical system?

Voter	Entity	Segment	Vote	Comment
				Does this include only the Generator Step-up Transformer, or does it include the whole substation where multiple transmission paths depart to a single generator? Also, APPA suggests that the SDT change "switching requirements" to "switching equipment." SDT Proposed: 1.6. Transmission Facilities operated at 500 kV or higher. APPA Comments: APPA does not have a comment on criteria 1.6 at this time. SDT Proposed: 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. APPA Comments: APPA bel
Response: Thank you for your comments. Item 1.1 – The SDT notes your concern that the use of the "Real Power Capability of the preceding 12 months" would bring in unnecessary volatility to applicability of this standard to certain groups of generating units. The drafting team used time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used. The 12-month time period was used so that seasonal ratings would not be an issue for generating plants that operate near the 1500 MW bright-line. Item 1.3 – This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources. Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5, "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started," where the Transmission Operator can choose between the next Facilities on the BES to energize.				
Richard J Kafka	Potomac Electric Power Co.	1	Negative	Pepco Holdings has submitted comments in the names of its affiliates, including Potomac Electric. Pepco would consider an affirmative vote if these issues are addressed.
Response: Thank you for your comments. Please refer to the response to comments document.				

Voter	Entity	Segment	Vote	Comment
Laurie Williams	Public Service Company of New Mexico	1	Negative	PNM Resources applauds the significant effort of the SDT in developing the revision to CIP-002-4, and conforming changes to CIP-003-4 through CIP-009-4. Although the most recent version of CIP-002-4 represents significant progress, PNM Resources must cast a negative vote with the following comments: The criteria related to blackstart resources do not consider the varying role of blackstart resources identified in restoration plans, and, as drafted, will require identification of any blackstart resource, or path, mentioned in a restoration plan to be identified as a Critical Asset. Entities in many regions may identify a significant number of Blackstart Resources in a restoration plan, representing primary and alternate resources allowing for a number of options for system restoration. PNM Resources recommends the following revisions to the criteria: 1.4. Each primary Blackstart Resource essential to the Transmission Operator's restoration plan. 1.5. The Facilities comprising the primary Cranking Paths and initial switching requirements from the primary Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist.
Response: Thank you for your comments. Items 1.4 and 1.5 – The SDT considered using the word "primary," but ultimately rejected it as it is not a defined NERC Glossary term in this instance, nor is it used in EOP-005-2. A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.				
Kenneth D. Brown	Public Service Electric and Gas Co.	1	Negative	Please see PSEG Companies' comments filed separately. The PSEG companies will change the vote to affirmative if the comments are adequately addressed by the drafting team.
Response: Thank you for your comments. Please refer to the response to comments document.				
Catherine Koch	Puget Sound Energy, Inc.	1	Negative	PSE supports this revision, however feels further clarity is necessary regarding Attachment 1, section 1.1, to recognize that a generation plant that is tripped as part of a Remedial Action Scheme (Special Protection System) in place to protect the Bulk Electric System should be exempted

Voter	Entity	Segment	Vote	Comment
				from Critical Asset designation. The inclusion of a generation plant in a RAS scheme infers that the plant is not critical to the operation of the BES. NERC included this same criteria in their guidance document "Security Guideline for the Electricity Sector: Identifying Critical Assets," page 10, table C-2.
Response: Thank you for your comments. Criterion 1.1 is based on plant size. Criterion 1.12 stipulates Facilities related to SPSs and RASs. Both criteria should be used to determine whether a generation plant qualifies as a Critical Asset.				
Tim Kelley	Sacramento Municipal Utility District	1	Negative	After reviewing the proposed version 4 language for CIP-002, R2, the placement of the additional text on generation is confusing. It appears to be trying to accomplish two different purposes. SMUD does not have any objections to the text itself, just the placement. SMUD proposes organizing the requirement as follows: R2. Critical Cyber Asset Identification- Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall review this list at least annually, and update it as necessary. R2.1 For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics: R2.1.1 The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, R2.1.2 The Cyber Asset uses a routable protocol within a control center; or, R2.1.3 The Cyber Asset is dial-up accessible. R2.2 For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1., the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Additionally, SMUD, as a member of APPA, would like to reflect its support to those CIP-002-4 Standard comments submitted by APPA staff.
Response: Thank you for your comments. Please refer to the response to comments document for responses to APPA comments. Requirement R2 has been changed to clarify the issues presented.				
Robert Kondziolka	Salt River Project	1	Negative	SRP believes that a bright line assessment methodology for determining Critical Assets is not in the best interest of reliability. This is especially true in the designation of substations and generating facilities. The attributes of these stations and their unique impact on Bulk Electric System reliability

Voter	Entity	Segment	Vote	Comment
				must be taken into account. There are several terms and phrases used within Requirement 2 of the proposed Standard that need to be better defined to eliminate ambiguity. These terms are: 1) essential to the operation of the Critical Asset, 2) adversely impact the reliable operation needs to be defined; and, 3) within 15 minutes. We believe the CIP-002-4 implementation plan for newly identified Critical Assets and associated Critical Cyber Assets provides inadequate time. SRP suggests the implementation timeframe be extended to 30 months after the effective date of the Standard.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about (annual) exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.				
Denise Stevens	Sho-Me Power Electric Cooperative	1	Negative	Please review submitted comments.
Response: Thank you for your comments. Please refer to the response to comments document.				
Rich Salgo	Sierra Pacific Power Co.	1	Negative	This is a negative vote due solely to disagreement over some of the elements in Attachment 1 of the Standard. Overall, the draft Standard promotes the necessary clarity over which Assets shall be Critical. Detail comments have been provided via the official comment response form. In general, we believe that Attachment 1 is overly inclusive of elements and facilities that may have no material impact on BES reliability. In particular, we believe that not all blackstart resources should be treated identically - perhaps only the primary blackstart resource of a TOP's restoration plan should be identified; the designation of a facility as "required for reliability purposes" by a Planning entity needs more precision and clarification that this shoudl be limited to those facilities that have a perpetual reliability need, not an occasional one; 300kV and higher facilities ought not to be

Voter	Entity	Segment	Vote	Comment
				included unless they connect to four or more non-radial 300kV+ stations; and need further clarification of the distinction between generation control rooms and control centers.
Response: Thank you for your comments. Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT feels that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources. Item 1.3 – This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset a Transmission Facility operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. Item 1.15 –This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection."				
Horace Stephen Williamson	Southern Company Services, Inc.	1	Negative	Comments were submitted via Comment Form: Project 2008-06 - Cyber Security 706
Response: Thank you for your comments. Please refer to the response to comments document.				
William G. Hutchison	Southern Illinois Power Coop.	1	Negative	I realize that the politically correct want all BES assets to have some level of criticality, but the truth still remains that there are assets on the BES that are not critical to the operation of the BES. This is another prime example of creating compliance standards that only create documentation compliance and do not provide performance based standards.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method.				

Voter	Entity	Segment	Vote	Comment
Larry Akens	Tennessee Valley Authority	1	Negative	Tennessee Valley Authority (TVA) appreciates the opportunity to comment on this CIP-002-4 draft. We fully support the standards development process and all the hard work and commitment by the drafting team members. For this draft, we have the following concerns which moved us to cast a Negative vote. Comments: Q1: Yes; no comment Q2: 1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. The language appears to require us to designate “Each” component in the System Restoration plan as CA. We currently include at least 2 paths for black start of every generation plant in the system, which would extend CA designation to a large number of components which otherwise would not be included by other criteria. The flexibility provided by our robust transmission infrastructure and large number black start capable plants serves to help ensure reliable operation of the BES, but designating as a CA each component that could participate in the total paths possible doesn’t seem consistent with the intent of the standard. Recommendation: Revise language to allow entities to limit CA designation to those components participating in the primary black start path. 1.10. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3. There isn’t a clear definition of the term “directly connected.” Without this definition there are many way to interpret this requirement. Is this language meant to describe a facility where the substation is co-located with a generation facility? Also, does the language this mean total loss of substation or only partial? Recommendation: For the purpose of this standard revise language to clearly define “directly connected.” Q3: Yes; no comment Q4: Yes; no comment Q5: abstain Q6: abstain

Response: Thank you for your comments.

Item 1.4 – The SDT considered using the word “primary,” but ultimately rejected it as it is not a defined NERC Glossary term, nor is it used in EOP-005-2. A Blackstart Resource is defined as “A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s restoration plan.” EOP-005-2 R1.4 states that the restoration plan must include “Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit.” The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.

Voter	Entity	Segment	Vote	Comment
Item 1.10 – The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any transmission Facility that, if lost, would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset. That might include the partial or total loss of a substation.				
James W. Beck	Transmission Agency of Northern California	1	Negative	TANC hereby submits a negative vote on this ballot and refers the project drafting team to comments submitted by the American Public Power Association.

Venkataramakrishnan Vinnakota	BC Hydro	2	Negative	1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations The present wording uses an arbitrary numbers of stations, the number of stations is immaterial BCH recommends the “Transmission Facilities operated at 300 kV or higher that if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). 1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. A clear definition of common control system(s) is required. Is under frequency or under voltage load shedding schemes considered control systems? The load shedding of 300 MW or more does it include firm or interruptible load or both? 1.16. Any additional assets that the Responsible Entity deems appropriate to include. To encourage reliability the additional assets deemed appropriate by a Responsible Entity should not be auditable.

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comments. Item 1.7 – In order to be more accurate in terms of the impact, the drafting team thought that it was more appropriate to refer to the number of connected transmission substations instead of using IROLs. The intent was to avoid double-circuit conditions and to include facilities that are actually more a part of the network than simple substations with double circuits between them. This includes upstream, downstream, radial and networked substations. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.				
Chuck B Manning	Electric Reliability Council of Texas, Inc.	2	Negative	ERCOT ISO has joined in the submission of the IRC SRC comments. Please see IRC SRC submission for details.
Response: Thank you for your comments. Please refer to the response to comments document.				
Kim Warren	Independent Electricity System Operator	2	Negative	We repeat the main reasons for our negative vote which are also stated in our comments on this project (submitted today). We do not agree with criteria 1.6 and 1.7 as written since some of the facilities identified as Critical Assets by applying them may have no impact on the BES. We therefore believe the list of relevant transmission facilities developed by the Responsible Entity, should be subject to an impact-based assessment by the Reliability Coordinator who has the wide-area view of the system. If necessary, an additional requirement that requires the RC to have a risk-based assessment methodology and to conduct the assessment should be included. We therefore propose the following specific wording: 1.6 Transmission facilities operated at 500 kV or higher, unless the annual review performed by the Reliability Coordinator (new requirement) demonstrates that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. 1.7 Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations, unless the annual review performed by the Reliability Coordinator (new requirement) demonstrates that destruction, degradation or unavailability of those assets will have no

Voter	Entity	Segment	Vote	Comment
				impact outside the local area and will not cause BES instability, separation, or cascading outages. Additionally, we do not agree with the removal from the Applicability Section, of the exclusion that applies to facilities regulated by the Canadian Nuclear Safety Commission. This explicit statement makes it clear that CIP standards do not apply to those facilities which would not be the case if it were removed.
Response: Thank you for your comments. Items 1.6 and 1.7 – You propose to add the criteria that the RC can determine through a risk-based evaluation that destruction, degradation or unavailability of certain assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. The inclusion of a risk-based evaluation by any entity would not meet the objective of uniform application of Critical Asset identification across all entities. The SDT is aware that the removal of the nuclear plant exclusion in response to a FERC order brought Canadian nuclear plants into the CIP standards. That was unintentional and will be corrected in the revised standards next posted for ballot.				
Jason L Marshall	Midwest ISO, Inc.	2	Negative	We are concerned that criterion 1.3 in Attachment 1 of CIP-002-4 could be construed as transferring the responsibility for identifying Critical Assets from Generation Owners to the Planning Coordiantors. We oppose this and believe the obligation rests with the asset owner. Furthermore, paragraph 328 of Order 706 makes clear that the asset owner cannot transfer its responsibility for identifying Critical Assets to a third party. We suggest this criteria should be removed. Criteria 1.8, 1.9, and 1.12 should be modified because loss of facilities does not cause an IROL violation. An IROL includes a limit and a time constant Tv. In order for an IROL violation to occur, the limit must be exceeded for at least the time constant Tv. Tv is usually 30 minutes. Thus, when we consider the impact on the loss of facilities on an IROL, an operator will have enough time to adjust the system to prevent an IROL violation. For 1.8, the criterion should be modified to reflect that the facilities that comprise an IROL should be considered critical. The drafting team may also wish to consider loss of any facilities that set up the need for the IROL or cause the actual limit to change. For criterion 1.9, it is not clear why FACTs devices need to be singled out. Are they not covered in criterion 1.8 under Transmission Facilities? Inclusion of 1.9 is redundant and just causes confusion because it causes the reader to infer that the drafting team intended for them to be treated differently when in fact the criterion is the same as 1.8. For criterion 1.12, it would be more appropriate to assess the impact of an SPS, RAS, or automated switching system on the IROL. If loss of the SPS,

Voter	Entity	Segment	Vote	Comment
				RAS, or automated switching system causes an IROL to decrease, then the SPS, RAS, or automated switching system should be considered critical.
Response: Thank you for your comments. Item 1.3 – The burden for identifying Critical Assets is still the Responsible Entity that is the asset owner. There is no burden or obligation placed on the Planning Coordinator or Transmission Planner to designate any unit as needed for reliability. This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 – FACTS devices were singled out to ensure that there was no confusion as to whether or not they were considered Critical Assets. Item 1.9 – This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed."				
Richard J. Mandes	Alabama Power Company	3	Negative	Comments were submitted via Comment Form: Project 2008-06 - Cyber Security 706
Response: Thank you for your comments. Please refer to the response to comments document.				
Raj Rana	American Electric Power	3	Negative	Overall, AEP is supportive of the efforts and the general concepts of this draft; however, there are a few refinements that will enhance the requirements and remove ambiguity. AEP encourages the SDT to consider the items below in a future draft of the standard: AEP would contend that there are regional differences that would be relevant to determine a MW threshold for generators. We support the concept that was contained in the last draft that made the determination based on the capacity reserves. However, the prior language would need to be revisited to ensure that value was fixed for a period of time. In addition, requirement 2.2 uses the term control center (also used in attachment 1) that is not a NERC defined

Voter	Entity	Segment	Vote	Comment
				term. This will introduce ambiguity to implementation. There has been ongoing confusion regarding the difference between “control centers” and “control rooms.” We do not believe that a “control room” at a power plant or a substation would be considered a “control center.” There is language in the NERC Security Guideline for Electricity Sector: Identifying Critical Assets document that the SDT should consider and incorporate into the NERC Glossary. Net real power capability testing is defined in MOD-024 standards that have yet to be FERC approved. Furthermore, not all of the regions have defined the parameters for the capability testing.
Response: Thank you for your comments. Item 1.1 - The issue with using different MW values in each region is that it does not meet the objective of uniform application of Critical Asset identification across all entities. At this time, the SDT is choosing not to add “control center” to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. CIP-002-4 does not require net real power capability testing.

Pat G. Harrington	BC Hydro and Power Authority	3	Negative	Critical Assets List comments 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations The present wording uses an arbitrary numbers of stations, the number of stations is immaterial BCH recommends the “Transmission Facilities operated at 300 kV or higher that if destroyed, degraded, misused or otherwise rendered unavailable, violate

Voter	Entity	Segment	Vote	Comment
				one or more Interconnection Reliability Operating Limits (IROLs). 1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. A clear definition of common control system(s) is required. Is under frequency or under voltage load shedding schemes considered control systems? The load shedding of 300 MW or more does it include firm or interruptible load or both? 1.16. Any additional assets that the Responsible Entity deems appropriate to include. To encourage reliability the additional assets deemed appropriate by a Responsible Entity should not be auditable.
Response: Thank you for your comments. Item 1.7 – In order to be more accurate in terms of the impact, the drafting team thought that it was more appropriate to refer to the number of connected transmission substations instead of using IROLs. The intent was to avoid double-circuit conditions and to include facilities that are actually more a part of the network than simple substations with double circuits between them. This includes upstream, downstream, radial and networked substations. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.

Linda R. Jacobson	City of Farmington	3	Negative	FEUS agrees with APPA's comments and proposed changes.
Response: Thank you for your comments. Please refer to the response to comments document.				
Gregg R Griffin	City of Green Cove Springs	3	Negative	FMPA commends the SDT on making significant headway on the version 4 standards. However, there are significant additional improvement that should be made to make the criteria of Attachment 1 less arbitrary and that truly measures those assets that can have an Adverse Reliability Impact. Also, the standard is still unclear in several areas, such as how to identify CCAs at a substation if a substation is determined to be a CA that needs to be clarified. Please see FMPA's comments submitted through the formal comment process for more specific detail and proposed alternatives.
Response: Thank you for your comments. Please refer to the response to comments document.				
Roger Powers	City Water, Light & Power of Springfield	3	Negative	While the "bright line" approach satisfies the FERC requirement for ERO guidance in the development of Risk-based Methodology, it does not allow for the flexibility to consider each responsible entity's individual circumstances as suggested in Paragragh 253 of FERC Order 706. It is not clear that a risk assessment was used to develop the "bright lines" contained in the standard.
Response: Thank you for your comments. Regarding the directives for external review and guidance in the FERC Order, the SDT believes the criteria in Attachment 1 are in response to FERC Order 706 paragraph 329. In consideration of this directive, the SDT decided there did not exist across all regions an appropriate third party to provide this type of oversight. Also, external review and oversight carries with it the compliance overhead and arbitration processes analogous to the TFE process. This "bright-line" approach removes the variability of entity defined methodologies that would prompt the need for external review.				
Russell A Noble	Cowlitz County PUD	3	Negative	Please refer to APPA's and my comments.

Michael F Gildea	Dominion Resources Services	3	Negative	Dominion conceptually supports bright line criteria for determining critical assets. However, we cannot vote in favor at this time because we believe that changes are needed in Table 2 that recognize the implementation for infrastructure (physical and electronic security) should be equal to, or longer than, that required for training. We also believe that the bright line criteria for generation control center needs further effort. Please see more specific comments/recommendation submitted by Dominion.

Response: Thank you for your comments. Please refer to the response to comments document.				
David L Kiguel	Hydro One Networks, Inc.	3	Negative	Hydro One is casting a negative vote for the following reasons: 1. We do not believe the standard will result in an improvement in reliability since the revisions merely replace the risk-based assessment methodology with a list of criteria that will ultimately result in inclusion of facilities on the Critical Assets list that are non-impactive on the BES. 2. We do not agree with criteria 1.6 and 1.7 in Attachment 1 as written. Application of these criteria would result in the inclusion of facilities that will have no impact on the BES reliability. We believe that the list of applicable facilities should be determined following an impact-based assessment to be performed by the Reliability Coordinator. If necessary, an additional requirement that requires the RC to have a risk-based assessment methodology and to conduct/review the assessment should be included. We therefore propose the following wording to replace 1.6 and 1.7 in Attachment 1: 1.6 Transmission facilities operated at 500 kV or higher, unless the annual review performed by the RC determines that destruction, degradation or unavailability of those assets will have no

Voter	Entity	Segment	Vote	Comment
				impact outside the local area and will not cause BES instability, separation, or cascading outages. 1.7 Transmission Facilities operated at 300 kV or higher to less than 500 kV at stations interconnected at 300 kV or higher with three or more other transmission stations, unless the annual review performed by the RC determines that destruction, degradation or unavailability of those assets will not have impact outside the local area and will not cause BES instability, separation, or cascading outages. 3. We do not agree with the removal of the exclusion that applies to facilities regulated by the Canadian Nuclear Safety Commission from the Applicability Section, This explicit statement makes it clear that CIP standards do not apply to those facilities which would not be the case if it were removed.
Response: Thank you for your comments. 1) The SDT believes that the implementation of Attachment 1 criteria will increase the consistency of Critical Asset identification over the existing entity defined risk-based methodology. 2) Items 1.6 and 1.7 – The SDT does not feel that a power flow analysis (impact-based or risk-based) may lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. We thank you for your proposal and will take it under consideration for future revisions. 3) The SDT is aware that the removal of the nuclear plant exclusion in response to a FERC order brought Canadian nuclear plants into the CIP standards. That was unintentional and will be corrected in the revised standards next posted for ballot.

Darl Shimko	Madison Gas and Electric Co.	3	Negative	The comments, below, are issues that the SDT should address before the next ballot. Q1 through Q6 refer to questions in the Unofficial Comment Form for Project 2008-06. Q1: We do not believe the proposed standard will lead to an improvement in reliability in all cases. If a bright line is used, it removes all engineering analysis the entity is currently performing with the current CIP-002-3 methodology. This may bring in or remove assets for this Standard. A bright-line approach may be useful to a smaller entity, but may not be in the best interest to larger entities. The SDT should consider a bright line with a MW threshold for physical unit size or MW loads for control centers, see comments below. Q2: Suggested improvements to Attachment 1: Criterion Number 1.5 -- Based on the Rationale Document, please clarify that Facilities within the Cranking Paths will be assigned the Critical Asset identification up to the point where multiple path options exist. Criterion Number 1.13 -- Based on the Rationale Document, please clarify that the 300 MW level applies to a single common control system and not multiple like systems such as those installed for UFLS protection (multiple identical or similar individual, but independent, relays that may shed 300 MW's or more in aggregate, but individually shed less than 300 MW). Criterion Number 1.14 -- Based on the Rationale Document, every RC, BA, and TOP's control center, control system, backup control center and backup control system is Critical due to EOP-008. EOP-008-0 is the FERC approved Standard for US entities. We note the purpose of EOP-008-0 is: "Each reliability entity must have a plan to continue reliability operations in the event its control center becomes inoperable". Furthermore, the SDT quoted EOP-008-1 in the Rational Document, which is not FERC approved. The SDT needs to consider this when writing a continental wide Standard. The phrase in the Rationale Document, "While it is clear that the primary and all backup control centers operated by RCs, BAs, and TOPs must be designated as Critical Assets", is unjustified. Assuming a BA controls no critical assets qualified as such by other criteria, a BA that, in aggregate, controls relatively small amounts of

Voter	Entity	Segment	Vote	Comment
				real and/or reactive power clearly has less of an effect on reliability than a BA that controls relatively large amounts of such resources. Indeed, the fact that "size matters" is recognized by Criteria 1.1, 1.2, 1.6, 1.7, 1.13, and 1.15. Criterion 1.14 should be modified to recognize this conclusion by including relevant quantitative thresholds. Thresholds that were proposed in CIP-010 Criteria 1.13 and 1.14 would be reasonable. In any event, the thresholds for the BA control center or control system should be no more inclusive than those used to qualify the individual assets controlled by the BA. To complicate matters, presently there are 28 Local Balancing Authorities (LBA's) that are part of the Midwest ISO BA Area (JRO00001). These entities do not perform all the BA functional obligations as stated in the Rationale Document (the MISO BA performs the majority of BAL-001 through BAL-005). Furthermore, the scopes of operation of the LBA's span a wide range from small to large and few too many resources. This underscores the need to not assume that any BA (or LBA) that performs or supports any BA function or part of a BA function is necessarily critical to BES reliability. Please provide the analysis and justification to how these entities fit into the BA requirement as stated in 1.14. If it is the intent of the SDT to capture the generation within the balancing functions of a BA, the SDT has that covered by Criteria 1.15. Q3: While we agree with the general requirement of R1, we do not agree with certain aspects of Attachment 1 - Critical Asset Criteria, as discussed in previous comments, above. Q4: We agree with R2. Q5: The implementation plan is clear and reasonable regarding entities that either in the past have identified they have CA's, or have never identified CA's. However, there is an issue when an entity has previously identified one type of asset as critical and then later identifies another type of critical asset. For example, a control center was previously identified as being a CA. Later, the entity identifies a cranking path or Blackstart generator as being a CA. It is recommended that if an asset dissimilar to previously identified critical assets is identified as a CA, that the entity is given 24 months to become compliant. This time is needed since the entity is now in an area that they may have not dealt with in the past. Q6: The implementation plan for newly identified CCAs should allow 24 months to become compliant when the newly identified CCAs are associated with newly identified critical assets of a type that was not previously identified as critical. See Comment Q5, above.

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comments. Q1: The SDT believes that the implementation of Attachment 1 criteria will increase the consistency of Critical Asset identification over the existing entity defined risk-based methodology throughout North America. Q2: Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5, "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started," where the Transmission Operator can choose between the next Facilities on the BES to energize. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." It is appropriate to refer to an industry-approved and NERC BOT-approved standard in a guidance document, even if it has not been accepted at FERC. Q3: Please refer to response to Q2 above. Q4: Thank you. Q5: The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset. Q6: The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.

John S Bos	Muscatine Power & Water	3	Negative	Just because a Balancing Authority or Transmission Operator has a control center or back-up control center should not automatically cast those control centers as Critical Assets. A BA or TOP with a small system (very small native system load, generation, and very minor transmission system) should not be forced into the CIP compliance world just because they have control centers. This is an incredible expense for a small utility. If control centers are to be determining factors for inclusion of a small BA or TOP under CIP-002 V4, there should be criteria developed based on the size of the utility. For instance, a BA or TOP with control centers serving a native system of greater than X MW would be considered for inclusion. Or a BA or TOP with control centers and a transmission system of greater than X miles would be considered for inclusion. Or a BA or TOP with control centers and greater than X MW of generation on their system would be considered for inclusion. Forcing small vertically-integrated utilities with exceedingly minor impact on the BES into the CIP compliance world is not equitable.
Response: Thank you for your comments. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."

Response: Thank you for your comments. Please refer to the response to comments document.				
Rick Keetch	NRG Energy Power Marketing, Inc.	3	Negative	Pertaining to CIP-002-4 R1, the following need to be addressed in Attachment 1: 1.1 - Add capacity factor as a qualifier for exclusion below an established low threshold. 1.3 - Mandate coordination/approval process between the Transmission Planner and entity that have been designated critical by the Transmission Planner. These classifications and approvals need to take into consideration 5 year forecasts for planning and budgeting purposes.. 1.5 - TOP needs to define the cranking path in restoration plan to the affected entities to adequately secure these restoration paths.. 1.9 - Please explain FACTS - need definition 1.10 - Need coordination between TOP & GO to identify critical assets. 1.15 - How is the 1500 MW aggregate determined? Is it an aggregate of generator name plates or the sum of controllable megawatts between a unit's high and low limits? General: Attachment 1 needs to have defined terms for capability, plant, control center Requirement 2 needs to clarify the following items: 1) Need Clarification on routable path, discrete links and serial connections as it pertains to CIP-002-3 R3: Is a device considered to communicate outside the ESP using routable protocol if ANY portion of the communications path uses routable protocol? 2)Need clarification concerning shared assets. Does it mean shared between a single device or same device on a network? 3)R2 states that only shared cyber assets for a group of generating units at

Voter	Entity	Segment	Vote	Comment
				a single location identified in Attachment 1 criteria 1.1, namely the 1500 MWs brightline, that could impact reliable operation, should be considered. Does this cyber asset identification only include assets meeting criteria 1.1 and therefore exclude any cyber assets utilized for reliable operation of a designated critical asset such as a single blackstart resource? Please provide clarification in this requirement.
Response: Thank you for your comments. Item 1.1 – The SDT debated whether to include capacity factor in this criterion. The reason we ultimately chose not to include capacity factor is twofold. First, there is no consistent method to select an appropriate capacity factor, and low capacity factor units may be critical to the system at peak load conditions. Second, there was concern that some units might fall below the line during major outage periods, taking them off the Critical Asset list one year and putting them back on the list the next year. Item 1.3 –This criterion has been reworded to, "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.5 – Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan." Item 1.9 – FACTS is defined by IEEE as "Alternating Current Transmission Systems incorporating power electronics-based and other static controllers to enhance controllability and power transfer capability." Item 1.10 – The assets would be identified by the asset owners. It is agreed that communication between GOs and TO/TOPs will be required. Item 1.15 – This is the aggregate highest rated net Real Power capability output of all generation under dispatch/control. At this time, the SDT is choosing not to add "capability," "plant," or "control center" to the NERC Glossary. We feel defining these terms under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. These terms are used in other approved NERC standards already in effect. The requirement refers to shared cyber assets that can have a reliability impact on the group of generating units. This qualifier only includes Critical Assets identified in criterion 1.1.

Ballard Keith Mutters	Orlando Utilities Commission	3	Negative	See comments submitted on behalf or Orlando Utilities Commission.
Response: Thank you for your comments. Please refer to the response to comments document.				
Richard H. Chapman	Owensboro Municipal Utilities	3	Negative	There is too much ambiguity in Attachment 1 1.14, the Critical Control Center definition needs further clarification controlling either a specified load or specified voltage level.
Response: Thank you for your comment. Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, also has been added which states, " Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."				
Michael Mertz	PNM Resources	3	Negative	PNM Resources applauds the significant effort of the SDT in developing the revision to CIP-002-4, and conforming changes to CIP-003-4 through CIP-009-4. Although the most recent version of CIP-002-4 represents significant progress, PNM Resources must cast a negative vote with the following comments: The criteria related to blackstart resources do not consider the varying role of blackstart resources identified in restoration plans, and as drafted, will require identification of any blackstart resource, or path, mentioned in a restoration plan to be identified as a Critical Asset. Entities in many regions may identify a significant number of Blackstart Resources in a restoration plan, representing primary and alternate resources allowing for a number of options for system restoration. PNM Resources recommends the following revisions to the criteria: 1.4. Each primary Blackstart Resource essential to the Transmission Operator's restoration plan. 1.5. The Facilities comprising the primary Cranking Paths and initial switching requirements from the primary Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on

Voter	Entity	Segment	Vote	Comment
				the Cranking Path where multiple path options exist.
Response: Thank you for your comments. Items 1.4 and 1.5 – The SDT considered using the word "primary," but ultimately rejected it as it is not a defined NERC Glossary term in this instance, nor is it used in EOP-005-2. A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.				
Jeffrey Mueller	Public Service Electric and Gas Co.	3	Negative	Please see PSEG Companies' comments filed separately. The PSEG companies will change the vote to affirmative if the comments are adequately addressed by the drafting team.
Response: Thank you for your comments. Please refer to the response to comments document.				
James Leigh-Kendall	Sacramento Municipal Utility District	3	Negative	After reviewing the proposed version 4 language for CIP-002, R2, the placement of the additional text on generation is confusing. It appears to be trying to accomplish two different purposes. SMUD does not have any objections to the text itself, just the placement. SMUD proposes organizing the requirement as follows: R2. Critical Cyber Asset Identification- Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall review this list at least annually, and update it as necessary. R2.1 For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics: R2.1.1 The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, R2.1.2 The Cyber Asset uses a routable protocol within a control center; or, R2.1.3 The Cyber Asset is dial-up accessible. R2.2 For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1., the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Additionally, SMUD, as a member of APPA, would like to reflect its support

Voter	Entity	Segment	Vote	Comment
				to those CIP-002-4 Standard comments submitted by APPA staff.
Response: Thank you for your comments. Please refer to the response to comments document for responses to APPA comments. Requirement R2 has been changed to clarify the issues presented.				
John T. Underhill	Salt River Project	3	Negative	SRP believes that a bright line assessment methodology for determining Critical Assets is not in the best interest of reliability. This is especially true in the designation of substations and generating facilities. The attributes of these stations and their unique impact on Bulk Electric System reliability must be taken into account. There are several terms and phrases used within Requirement 2 of the proposed Standard that need to be better defined to eliminate ambiguity. These terms are: 1) essential to the operation of the Critical Asset, 2) adversely impact the reliable operation needs to be defined; and, 3) within 15 minutes. We believe the CIP-002-4 implementation plan for newly identified Critical Assets and associated Critical Cyber Assets provides inadequate time. SRP suggests the implementation timeframe be extended to 30 months after the effective date of the Standard.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about (annual) exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version Thank you for your comment. The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.				
Scott Peterson	San Diego Gas & Electric	3	Negative	SDG&E has submitted suggested changes that it feels should be incorporated before it can vote in favor of the revision.

James R. Keller	Wisconsin Electric Power Marketing	3	Negative	1. When reviewing the mapping document posted with the proposed CIP-002-4 standard, do you believe that the proposed standard will lead to an improvement in reliability when compared to the standard it proposes to replace? 1 Yes 0 No Comments: We understand that the errata, which removes discussion of the "risk-based assessment methodology" from the proposed CIP-002-4 standard, would also apply to the mapping document. We appreciate the bright-line clarification to ensure consistent identification of Critical Assets throughout the industry. 2. CIP-002-4 Attachment 1 contains criteria that define elements that must be classified as Critical Assets. Do you have any suggestions that would improve the proposed criteria? If so, please explain and provide specific suggestions for improvement. 1 Yes 0 No Comments: We suggest that the functional entities Planning Coordinator and Transmission planner be added to the applicability section. Feedback on specific criteria as follows: 1.1, We request clarification on the phrase "single plant location". This phrase is not defined and it is not clear what level of proximity of generators would be considered a "single plant location". Rather than discuss this in terms of geography (location), we feel it would be better to discuss in terms of "Each group of generating units (including nuclear generation), operated using common cyber control systems other than the Control Centers identified in 1.14 and 1.15, with an aggregate...". 1.3, We suggest the wording: "Each generation facility designated by the Planning Coordinator or Transmission Planner as required to avoid one or more reliability criteria violations". 1.4, The blackstart units deemed critical should be only those identified by the Transmission Operator to meet the minimum critical blackstart requirement. The resulting suggested wording would be: "Each Blackstart Resource identified in the Transmission Operator's restoration plan required to meet the minimum critical blackstart requirement". 1.8, We suggest the wording: "Transmission Facilities at a single location that the Planning Coordinator or Transmission planner has designated that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL)

Voter	Entity	Segment	Vote	Comment
				violations". 1.9, We suggest similar wording: "...unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations". 1.11, We suggest the following wording: "Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements". 1.12, We suggest the following wording: "...unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed". 1.14, We suggest this be made consistent with 1.15, i.e. "Each control center, or backup control center, used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator". 1.16, We suggest the following wording: "Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include". 3. Requirement R1 of draft CIP-002-4 states, "Critical Asset Identification - Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in CIP-002-4 Attachment 1 - Critical Asset Criteria. The Responsible Entity shall review this list at least annually, and update it as necessary." Do you agree with the proposed Requirement R1? If not, please explain why and provide specific suggestions for improvement. 1 Agree 0 Disagree Comments: 4. Requirement R2 of draft CIP-002-4 states, "Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets performing a function essential to the operation of the Critical Asset. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Each Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics". The requirement then lists characteristics using the same text that is contained in the existing CIP-002-3 R3. Do you agree with the proposed Requirement R2? If not, please explain why and provide specific suggestions for improvement. 1 Agree 0 Disagree Comments: Although we agree with the

Voter	Entity	Segment	Vote	Comment
				proposed Requirement R2, We are concerned that the document "CIP-002-4 Cyber Security - Critical Cyber Asset Identification: Rationale and Implementation Reference Document" actually appears to provide more rationale and guidance on Critical Assets than Critical Cyber Assets. 5. Do you agree with the proposed implementation plan for the Version 4 standards? If not, please explain and provide specific suggestions for improvement. 1 Yes 0 No Comments: 6. Do you agree with the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities? If not, please explain and provide specific suggestions for improvement. 0 Yes 1 No Comments: We believe that it would be better to simply have a uniform 18 month implementation deadline for newly identified CCAs rather than have different timelines for different requirements. This will simplify reporting and streamline efforts to become fully compliant. We understand that nuclear timelines are subject to NRC requirements and the necessity of accomplishing some tasks only during refueling outages appropriately dictates a separate schedule for them.

Response: Thank you for your comments.

Q2. Since there is no Requirement that applies to the Planning Coordinator or the Transmission Planner, it is not appropriate to include them in the Applicability section.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. "Single plant location" refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT feels that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources.

Item 1.8 – According to FAC-014-2, IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or

Voter	Entity	Segment	Vote	Comment
Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 – This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements. Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot. Q4. Thank you for your comments. The SDT will reexamine the guidance document. Q5. Due to the limited scope of version 4, the SDT is only making conforming changes to the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.				
Allen Mosher	American Public Power Association	4	Negative	See group comments submitted by the APPA CIP Task Force.

Response: Thank you for your comments. Please refer to the response to comments document.				

Voter	Entity	Segment	Vote	Comment
David Frank Ronk	Consumers Energy	4	Negative	In Criteria 1.4, we would prefer to see Blackstart Resources for primary paths only specified. The way it is written, all Blackstart Resources, including those for alternate paths, would be included. This creates ambiguity as there are very many possible alternate cranking paths. We dislike Criteria 1.5 and the wording in the Rationale Document. Similar to 1.4, the words "primary path" are no longer used and depending on interpretation, additional resources on what are now alternate cranking paths could be brought into play. The Standard should be clear and not subject to interpretation.
Response: Thank you for your comments. Items 1.4 and 1.5 – The SDT considered using the word “primary”, but ultimately rejected it as it is not a defined NERC Glossary term in this instance, nor is it used in EOP-005-2. A Blackstart Resource is defined as “A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s restoration plan.” EOP-005-2 R1.4 states that the restoration plan must include “Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit.” The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.				
Rick Syring	Cowlitz County PUD	4	Negative	The Attachment will wrongfully include some assets as critical. Please refer to Cowlitz County PUD comments.
Response: Thank you for your comments. Please refer to the response to comments document.				
Frank Gaffney	Florida Municipal Power Agency	4	Negative	FMPA commends the SDT on making significant headway on the version 4 standards. However, there are significant additional improvement that should be made to make the criteria of Attachment 1 less arbitrary and that truly measures those assets that can have an Adverse Reliability Impact. Also, the standard is still unclear in several areas, such as how to identify CCAs at a substation if a substation is determined to be a CA that needs to be clarified. Please see FMPA's comments submitted through the formal comment process for more specific detail and proposed alternatives.
Response: Thank you for your comments. Please refer to the response to comments document.				

Voter	Entity	Segment	Vote	Comment
Thomas W. Richards	Fort Pierce Utilities Authority	4	Negative	FPUA commends the SDT on making significant headway on the version 4 standards. However, there are significant additional improvement that should be made to make the criteria of Attachment 1 less arbitrary and that truly measures those assets that can have an Adverse Reliability Impact. Also, the standard is still unclear in several areas, such as how to identify CCAs at a substation if a substation is determined to be a CA that needs to be clarified. Please see FMPA's group comments submitted on our behalf through the formal comment process for more specific detail and proposed alternatives.
Response: Thank you for your comments. Please refer to the response to comments document.				
Bob C. Thomas	Illinois Municipal Electric Agency	4	Negative	IMEA appreciates the SDT's efforts to simplify CIP-002. IMEA believes it will be in a position to affirm this proposed Reliability Standard revision after comments on Draft 1 and comments during balloting are addressed. IMEA supports comments submitted by the American Public Power Association. In addition, as IMEA commented, we recommend Criterion 1.8 be continued with the following language: "...(IROLs) as demonstrated by the Reliability Coordinator." If the RC is not appropriate, it will be necessary to add the appropriate functional entity, for demonstrating IROLs, to Applicability Secion 1.4. This addional language will clarify that the TO, LSE, etc. is not responsible for demonstrating IROLs.
Response: Thank you for your comments. Please refer to the response to comments document for responses to APPA's comments. Item 1.8 – According to FAC-014-2, IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."				
Christopher Plante	Integrys Energy Group, Inc.	4	Negative	We believe that a bright line criteria as proposed by the ballot will improve the reliability and safety of the BES. However, changes as provided by MRO's NSRS need to be incorporated into the proposed standard to eliminate the potential for arbitrary application and capricious enforcement of the standard.
Response: Thank you for your comments. Please refer to the response to comments document.				
Richard Comeaux	LaGen	4	Negative	Pertaining to CIP-002-4 R1, the following need to be addressed in Attachment 1:

Voter	Entity	Segment	Vote	Comment
				1.1 - Add capacity factor as a qualifier for exclusion below an established low threshold. 1.3 - Mandate coordination/approval process between the Transmission Planner and entity that have been designated critical by the Transmission Planner. These classifications and approvals need to take into consideration 5 year forecasts for planning and budgeting purposes.. 1.5 - TOP needs to define the cranking path in restoration plan to the affected entities to adequately secure these restoration paths.. 1.9 - Please explain FACTS - need definition 1.10 - Need coordination between TOP & GO to identify critical assets. 1.15 - How is the 1500 MW aggregate determined? Is it an aggregate of generator name plates or the sum of controllable megawatts between a unit's high and low limits? General: Attachment 1 needs to have defined terms for capability, plant, control center Requirement 2 needs to clarify the following items: 1) Need Clarification on routable path, discrete links and serial connections as it pertains to CIP-002-3 R3: Is a device considered to communicate outside the ESP using routable protocol if ANY portion of the communications path uses routable protocol? 2)Need clarification concerning shared assets. Does it mean shared between a single device or same device on a network? 3)R2 states that only shared cyber assets for a group of generating units at a single location identified in Attachment 1 criteria 1.1, namely the 1500 MWs brightline, that could impact reliable operation, should be considered. Does this cyber asset identification only include assets meeting criteria 1.1 and therefore exclude any cyber assets utilized for reliable operation of a designated critical asset such as a single blackstart resource? Please provide clarification in this requirement.

Response: Thank you for your comments.

Item 1.1 – The SDT debated whether to include capacity factor in this criterion. The reason we ultimately chose not to include capacity factor is twofold. First, there is no consistent method to select an appropriate capacity factor, and low capacity factor units may be critical to the system at peak load conditions. Second, there was concern that some units might fall below the line during major outage periods, taking them off the Critical Asset list one year and putting them back on the list the next year.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Voter	Entity	Segment	Vote	Comment
Item 1.5 – Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan." Item 1.9 – FACTS is defined by IEEE as "Alternating Current Transmission Systems incorporating power electronics-based and other static controllers to enhance controllability and power transfer capability." Item 1.10 – The assets would be identified by the asset owners. It is agreed that communication between GOs and TO/TOPs will be required. Item 1.15 – This is the aggregate highest rated net Real Power capability output of all generation under dispatch/control. At this time, the SDT is choosing not to add "capability," "plant," or "control center" to the NERC Glossary. We feel defining these terms under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. These terms are used in other approved NERC standards already in effect. The requirement refers to shared cyber assets that can have a reliability impact on the group of generating units. This qualifier only includes Critical Assets identified in criterion 1.1.				
Joseph G. DePoorter	Madison Gas and Electric Co.	4	Negative	The below are outstanding issues that the SDT should address before the next ballot. Comments are in line with the Unofficial Comment Form for Project 2008-06. Q1: No, If a brightline is used, it removes all engineering analysis the entity is currently performing with the current CIP-002-3 methodology. This may bring in or remove assets for this Standard. A brightline approach may be useful to a smaller entity but may not be in the best interest to larger entities. The SDT should consider a brightline with a MW threshold for physical unit size or MW loads for control centers, see comments below. Q2: Yes, Criteria number 1.5; Based on the Rationale Document, please clarify that Facilities within the Cranking Paths will be assigned the Critical Asset identification up to the point where multiple path options exist. Criteria number 1.13; Based on the Rationale Document, please clarify that the 300 MW level applies to a single common control system and not multiple like systems such as those installed for UFLS protection (multiple identical or similar individual, but independent, relays that may shed 300 MW's or more in aggregate, but individually shed less than 300 MW). Criteria number 1.14; Based on the Rationale Document, every RC, BA, and TOP's control center, control system, backup control center and backup control system is Critical due to EOP-008. EOP-008-0 is the FERC approved

Voter	Entity	Segment	Vote	Comment
				Standard for US entities. The purpose of EOP-008-0 is: “Each reliability entity must have a plan to continue reliability operations in the event its control center becomes inoperable”. The SDT quoted EOP-008-1 in the Rational Document, which is not FERC approved. The SDT needs to consider this when writing a continental wide Standard. The phrase in the Rationale Document: “While it is clear that the primary and all backup control centers operated by RCs, BAs, and TOPs must be designated as Critical Assets”, is unjustified. Assuming a BA controls no critical assets qualified as such by other criteria, a BA that, in aggregate, controls relatively small amounts of real and/or reactive power clearly has less of an effect on reliability than a BA that controls relatively large amounts of such resources. Indeed, the fact that "size matters" is recognized by Criteria 1.1, 1.2, 1.6, 1.7, 1.13, and 1.15. Criterion 1.14 should be modified to recognize this conclusion by including relevant quantitative thresholds. Thresholds that were proposed in CIP-010 Criteria 1.13 and 1.14 would be reasonable. In any event, the thresholds for the BA control center or control system should be no more inclusive than those used to qualify the individual assets controlled by the BA. To complicate matters, presently there are 28 Local Balancing Authorities (LBA’s) that are part of the Midwest ISO BA Area (JRO00001). These entities do not perform all the BA functional obligations as stated in the Rationale Document (the MISO BA performs the majority of BAL-001 through BAL-005). Furthermore, the scopes of operation of the LBA’s span a wide range from small to large and few too many resources. This underscores the need to not assume that any BA (or LBA) that performs or supports any BA function or part of a BA function is necessarily critical to BES reliability. Please provide the analysis and justification to how these entities fit into the BA requirement as stated in 1.14. If it is the intent of the SDT to capture the generation within the balancing functions of a BA, the SDT has that covered by Criteria 1.15. Q3: Disagree, While we agree with the general requirement of R1, we do not agree with certain aspects of Attachment 1 - Critical Asset Criteria, as discussed in responses to previous questions, above. Q4: Agree Q5: No, The implementation plan is clear on entities that either have in the past, identified they have CA’s or have not ever identified CA’s. The issue is present that what happens when an entity has only identified a control center as being a CA. But now they have identified a cranking path or Blackstart generator as being a CA. It is recommended that if non like items are identified as a CA, that the entity is given 24 months to become

Voter	Entity	Segment	Vote	Comment
				compliant. This will allow the entity enough time since they are now in an area that they may have not dealt with in the past. Q6: No, See question 5.

Response: Thank you for your comments.

Q1: The SDT believes that the implementation of Attachment 1 criteria will increase the consistency of Critical Asset identification over the existing entity defined risk-based methodology throughout North America.

Q2: Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5, "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started," where the Transmission Operator can choose between the next Facilities on the BES to energize.

Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."

Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." It is appropriate to refer to an industry approved and NERC BOT approved standard in a guidance document, even if it has not been accepted at FERC.

Q3: Please refer to response to Q2 above.

Q4: Thank you.

Q5: The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.

Q6: The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.

Voter	Entity	Segment	Vote	Comment
Mark Ringhausen	Old Dominion Electric Coop.	4	Negative	All of the following comments apply to the Attachment 1: General Comments: For the cases where any other entity (PC/TP) would declare that other entity has a Critical Asset, there must be a phase-in compliance process to allow the entity with the CA to get into compliance with the CIP requiorments. Also, there must be a due process procedure to allow the entity with the designated CA to challenge this at the Region or NERC level. 1.3: PC/TP must have a formal process to determine whether or not a generation faciltiy is needed for reliabiltiy or not. This process must be provided to each generation owner and operator under review by the PC/TPs. 1.5: The Cranking Paths adn initial switching requirements must be provided by the TOP to the TO in cases where these are two different entities. 1.10: You need to better described which facilities you are trying to cover here. Any transmission facility which if lost would result in the loss of >1500MWs or a PC/TP designated generation facility for reliability. 1.13: Should match 1.1, change 300MWs to 1500MWs. Impact of losing 1500MWs of generation is still greater than losing 1500MWs of load.

Response: Thank you for your comments.

The burden for identifying Critical Assets is with the Responsible Entity that is the asset owner. The Responsible Entity has to check with its Planning Coordinator or Transmission Planner on whether its unit is designated, or what other units are designated as required for reliability reasons. If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, then that unit must be classified as a Critical Asset. If an entity feels that they have an asset that has been unjustly classified as required for reliability reasons, there are appeals processes that can be used.

Item 1.3 – This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.5 – Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

Item 1.10 – The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any transmission Facility that, if lost, would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset. That might include the partial or total loss of a substation. This criterion has been changed to "Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1

Voter	Entity	Segment	Vote	Comment
or 1.3." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."				
John D. Martinsen	Public Utility District No. 1 of Snohomish County	4	Negative	The way CIP-002-4 attachment 1 - 1.13 is worded is a concern- would any RE with a load over 970 MW in the Western Interconnection have critical assets just because their UFLS scheme has armed 31% of their load-meeting the 300 MW threshold? There are already PRC standards to address these systems, so we don't believe that the 300 MW "bright line" threshold is reasonable.
Response: Thank you for your comments. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."				
Mike Ramirez	Sacramento Municipal Utility District	4	Negative	After reviewing the proposed version 4 language for CIP-002, R2, the placement of the additional text on generation is confusing. It appears to be trying to accomplish two different purposes. SMUD does not have any objections to the text itself, just the placement. SMUD proposes organizing the requirement as follows: R2. Critical Cyber Asset Identification- Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall review this list at least annually, and update it as necessary. R2.1 For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics: R2.1.1 The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, R2.1.2 The Cyber Asset uses a routable protocol within a control center; or, R2.1.3 The Cyber Asset is dial-up accessible. R2.2 For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1., the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Additionally, SMUD, as a member of APPA, would like to reflect its support to those CIP-002-4 Standard comments submitted by APPA staff.

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comments. Please refer to the response to comments document for responses to APPA comments. Requirement R2 has been changed to clarify the issues presented.				
Anthony Jankowski	Wisconsin Energy Corp.	4	Negative	Your responses to the following questions will assist the SDT for Project 2008-06 Cyber Security Order 706 in finalizing the work for CIP-002-4 through CIP-009-4 relative to the proposed modifications summarized above. For each question, please indicate whether or not you agree with the modification being proposed. If you disagree with the proposed modification, please explain why you disagree and provide as much detail as possible regarding your disagreement including any suggestions for altering the proposed modification that would eliminate or minimize your disagreement. The SDT would appreciate responses to as many of these questions as you are willing to supply. 1. When reviewing the mapping document posted with the proposed CIP-002-4 standard, do you believe that the proposed standard will lead to an improvement in reliability when compared to the standard it proposes to replace? 1 Yes 0 No Comments: We understand that the errata, which removes discussion of the “risk-based assessment methodology” from the proposed CIP-002-4 standard, would also apply to the mapping document. We appreciate the bright-line clarification to ensure consistent identification of Critical Assets throughout the industry. 2. CIP-002-4 Attachment 1 contains criteria that define elements that must be classified as Critical Assets. Do you have any suggestions that would improve the proposed criteria? If so, please explain and provide specific suggestions for improvement. 1 Yes 0 No Comments: We suggest that the functional entities Planning Coordinator and Transmission planner be added to the applicability section. Feedback on specific criteria as follows: 1.1, We request clarification on the phrase “single plant location”. This phrase is not defined and it is not clear what level of proximity of generators would be considered a “single plant location”. Rather than discuss this in terms of geography (location), we feel it would be better to discuss in terms of “Each group of generating units (including nuclear generation), operated using common cyber control systems other than the Control Centers identified in 1.14 and 1.15, with an aggregate...”. 1.3, We suggest the wording: “Each generation facility designated by the Planning Coordinator or Transmission Planner as required to avoid one or more reliability criteria violations”. 1.4, The blackstart units deemed critical should be only those identified by

Voter	Entity	Segment	Vote	Comment
				the Transmission Operator to meet the minimum critical blackstart requirement. The resulting suggested wording would be: "Each Blackstart Resource identified in the Transmission Operator's restoration plan required to meet the minimum critical blackstart requirement". 1.8, We suggest the wording: "Transmission Facilities at a single location that the Planning Coordinator or Transmission planner has designated that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations". 1.9, We suggest similar wording: "...unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations". 1.11, We suggest the following wording: "Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements". 1.12, We suggest the following wording: "...unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed". 1.14, We suggest this be made consistent with 1.15, i.e. "Each control center, or backup control center, used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator". 1.16, We suggest the following wording: "Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include". 3. Requirement R1 of draft CIP-002-4 states, "Critical Asset Identification - Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in CIP-002-4 Attachment 1 - Critical Asset Criteria. The Responsible Entity shall review this list at least annually, and update it as necessary." Do you agree with the proposed Requirement R1? If not, please explain why and provide specific suggestions for improvement. 1 Agree 0 Disagree Comments: 4. Requirement R2 of draft CIP-002-4 states, "Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets performing a function essential to the operation of the Critical Asset. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed

Voter	Entity	Segment	Vote	Comment
				Attachment 1, criterion 1.1 within 15 minutes. Each Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics". The requirement then lists characteristics using the same text that is contained in the existing CIP-002-3 R3. Do you agree with the proposed Requirement R2? If not, please explain why and provide specific suggestions for improvement. 1 Agree 0 Disagree Comments: Although we agree with the proposed Requirement R2, We are concerned that the document "CIP-002-4 Cyber Security - Critical Cyber Asset Identification: Rationale and Implementation Reference Document" actually appears to provide more rationale and guidance on Critical Assets than Critical Cyber Assets. 5. Do you agree with the proposed implementation plan for the Version 4 standards? If not, please explain and provide specific suggestions for improvement. 1 Yes 0 No Comments: 6. Do you agree with the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities? If not, please explain and provide specific suggestions for improvement. 0 Yes 1 No Comments: We believe that it would be better to simply have a uniform 18 month implementation deadline for newly identified CCAs rather than have different timelines for different requirements. This will simplify reporting and streamline efforts to become fully compliant. We understand that nuclear timelines are subject to NRC requirements and the necessity of accomplishing some tasks only during refueling outages appropriately dictates a separate schedule for them.

Response: Thank you for your comments.

Q2. Since there is no Requirement that applies to the Planning Coordinator or the Transmission Planner, it is not appropriate to include them in the Applicability section.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. "Single plant location" refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Voter	Entity	Segment	Vote	Comment
Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT feels that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources. Item 1.8 – According to FAC-014-2, IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. The present wording is appropriate. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.9 – This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements. Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot. Q4. Thank you for your comments. The SDT will reexamine the guidance document. Q5. Due to the limited scope of version 4, the SDT is only making conforming changes to the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.				

Voter	Entity	Segment	Vote	Comment
Brock Ondayko	AEP Service Corp.	5	Negative	Overall, AEP is supportive of the efforts and the general concepts of this draft; however, there are a few refinements that will enhance the requirements and remove ambiguity. AEP encourages the SDT to consider the items below in a future draft of the standard: AEP would contend that there are regional differences that would be relevant to determine a MW threshold for generators. We support the concept that was contained in the last draft that made the determination based on the capacity reserves. However, the prior language would need to be revisited to ensure that value was fixed for a period of time. In addition, requirement 2.2 uses the term control center (also used in attachment 1) that is not a NERC defined term. This will introduce ambiguity to implementation. There has been ongoing confusion regarding the difference between “control centers” and “control rooms.” We do not believe that a “control room” at a power plant or a substation would be considered a “control center.” There is language in the NERC Security Guideline for Electricity Sector: Identifying Critical Assets document that the SDT should consider and incorporate into the NERC Glossary. Net real power capability testing is defined in MOD-024 standards that have yet to be FERC approved. Furthermore, not all of the regions have defined the parameters for the capability testing.
Response: Thank you for your comments. Item 1.1 - In prior versions we had wording about reserve sharing for the threshold. We received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. We did an informal survey of the regions, and we identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. At this time, the SDT is choosing not to add control center to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. CIP-002-4 does not require net real power capability testing.				
Brad Haralson	Associated Electric Cooperative, Inc.	5	Negative	please see submitted comments

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comments. Please refer to the response to comments document.				
Clement Ma	BC Hydro and Power Authority	5	Negative	Critical Assets List comments 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations The present wording uses an arbitrary numbers of stations, the number of stations is immaterial BCH recommends the "Transmission Facilities operated at 300 kV or higher that if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs). 1.13. Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. A clear definition of common control system(s) is required. Is under frequency or under voltage load shedding schemes considered control systems? The load shedding of 300 MW or more does it include firm or interruptible load or both? 1.16. Any additional assets that the Responsible Entity deems appropriate to include. To encourage reliability the additional assets deemed appropriate by a Responsible Entity should not be auditable.
Response: Thank you for your comments. Item 1.7 – In order to be more accurate in terms of the impact, the drafting team thought that it was more appropriate to refer to the number of connected transmission substations instead of using IROLs. The intent was to avoid double-circuit conditions and to include facilities that are actually more a part of the network than simple substations with double circuits between them. This includes upstream, downstream, radial and networked substations. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.				
Francis J. Halpin	Bonneville Power Administration	5	Negative	Please refer to BPA comments submitted during the formal comment period on 10/26/10

Jeff Mead	City of Grand Island	5	Negative	I echo the MRO NSRS comments.
Response: Thank you for your comments. Please refer to the response to comments document.				
Alan Gale	City of Tallahassee	5	Negative	The City of Tallahassee supports APPA's comments.
Response: Thank you for your comments. Please refer to the response to comments document.				
James B Lewis	Consumers Energy	5	Negative	In Criteria 1.4, we would prefer to see Blackstart Resources for primary paths only specified. The way it is written, all Blackstart Resources, inlcuding those for alternate paths, would be included. This creates ambiguity as there are very many possible alternate cranking paths. We dislike Criteria 1.5 and the wording in the Rationale Document. Similar to 1.4, the words "primary path" are no longer used and depending on interpretation, additional resources on what are now alternate cranking paths could be brought into play. The Standard should be clear and not subject to interpretation.
Response: Thank you for your comments. Items 1.4 and 1.5 – The SDT considered using the word “primary”, but ultimately rejected it as it is not a defined NERC Glossary term in this instance, nor is it used in EOP-005-2. A Blackstart Resource is defined as “A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s restoration plan.” EOP-005-2 R1.4 states that the restoration plan must include “Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit.” The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.				
Bob Essex	Cowlitz County PUD	5	Negative	The Attachment is too inclusive. Please refer to Cowlitz County PUD and APPA comments.
Response: Thank you for your comments. Please refer to the response to comments document.				

Voter	Entity	Segment	Vote	Comment
Robert B Stevens	CPS Energy	5	Negative	I believe the standard is going the correct direction. However, I would modify one definition on the Attachment. The Attachment reads "generating units (including nuclear generation) at a single plant location" I would propose the same language but add "connected to transmission grid at one location or one buss", or something similar. The problem arises where you have multiple generating units at one plant location, but a set of plants feed into 345 switchgear and a set of plants feeds into 138 switchgear. You have two distinct reliability situations, thus the need to distinguish.
Response: Thank you for your comments. Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. "Single plant location" refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.				
Mike Garton	Dominion Resources, Inc.	5	Negative	Dominion conceptually supports bright line criteria for determining critical assets. However, we cannot vote in favor at this time because we believe that changes are needed in Table 2 that recognize the implementation for infrastructure (physical and electronic security) should be equal to, or longer than, that required for training. We also believe that the bright line criteria for generation control center needs further effort. Please see more specific comments/recommendation submitted by Dominion.
Response: Thank you for your comments. Please refer to the response to comments document.				
Stephen Ricker	East Kentucky Power Coop.	5	Negative	EKPC would suggest rewording R2 to say: "For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those interconnected Cyber Assets that collectively could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes."
Response: Thank you for your comments. Requirement R2 has been changed based on industry comments received.				
Stanley M Jaskot	Entergy Corporation	5	Negative	Switchyards serving nuclear facilities should not be automatically classified as critical assets. The fact that a BES switchyard serves a nuclear facility should not in itself qualify the switchyard as a critical asset. While nuclear units and their support facilities may qualify as critical assets under a

Voter	Entity	Segment	Vote	Comment
				separate set of criteria, they should not automatically be designated as critical to the BES without some measure of the impact of the loss of the facility on BES reliability. All blackstart units and associated cranking paths should not be automatically classified as critical assets. Blackstart units may be useful in the restoration of the BES following a large scale outage, but they are not necessarily essential to the reliability of the BES under normal operation. Blackstart units should not automatically be designated as critical to the BES without some measure of the impact of the loss of the facility on BES reliability. In addition, just using a MW or MVAR rating alone in determining critical assets is not enough. It needs to be coupled with a service factor because we have a large generating station thay runs very infrequently and should not be deemed critical based on its operation. In addition, Entergy presented many other comments and suggested changes during the development of this draft standard. Entergy continues to support those comments even though some were not incorporated into this standard.
Response: Thank you for your comments. Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." Since these facilities were deemed so important that a NERC standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets. Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT feels that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources. Item 1.1 – The SDT debated whether to include capacity factor in this criterion. The reason we ultimately chose not to include capacity factor is twofold. First, there is no consistent method to select an appropriate capacity factor, and low capacity factor units may be critical to the system at peak load conditions. Second, there was concern that some units might fall below the line during major outage periods, taking them off the Critical Asset list one year and putting them back on the list the next year.				
David Schumann	Florida Municipal Power Agency	5	Negative	FMPA commends the SDT on making significant headway on the version 4 standards. However, there are significant additional improvement that should be made to make the criteria of Attachment 1 less arbitrary and that truly measures those assets that can have an Adverse Reliability Impact. Also, the standard is still unclear in several areas, such as how to identify CCAs at a substation if a substation is determined to be a CA that

Voter	Entity	Segment	Vote	Comment
				needs to be clarified. Please see FMPA's comments submitted through the formal comment process for more specific detail and proposed alternatives.
Response: Thank you for your comments. Please refer to the response to comments document.				
Brent Hebert	Horizon Wind Energy	5	Negative	Part 1.15 designates generation control centers that control generation Facilities used to control generation greater than an aggregate of 1500 MW in a single interconnection and was based on the bright-line used in Part 1.1. Part 1.1 includes generation at a single plant location (with-in a single BA or RSG). Part 1.15 should be more in line with part 1.1 where the generation control center controlling generation with an aggregate of 1500 MW or more within a single BA or RSG be designated as critical. It is true that the span of control of a generation control center may cross multiple BAs or RSG, but the control of generation within a single BA or RSG could fall well below the 1500 MWs in Part 1.1. even if located in a single interconnection.
Response: Thank you for your comments. Item 1.15 –This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection."				
Dennis Florom	Lincoln Electric System	5	Negative	Please review the comments submitted by the MRO's NERC Standards Review Subcommittee for LES' reasons for a negative ballot.
Response: Thank you for your comments. Please refer to the response to comments document.				
Mike Laney	Luminant Generation Company LLC	5	Negative	Luminant Generation Company LLC (Luminant Generation) thanks the Standard Drafting Team (SDT) for their work on the NERC CIP Cyber Security Standards and for the opportunity to provide input into the standards development process. Although Luminant Generation has voted "Negative" on the current draft standard, Luminant Generation supports the SDT goal of completing the revision of CIP-002-4 by December 2010, and believes with some modification to the Attachment 1 Criteria, the goal is still achievable. Specifically, Luminant Generation is concerned that Criteria 1.3 has no defined basis for determining the reliability need of a generation Facility. As written, the Planning Coordinator or Transmission Planner could use any

Voter	Entity	Segment	Vote	Comment
				basis, or conversely, no basis, for designating a generation Facility as required for reliability purposes. For Criteria 1.8, 1.9, and 1.12, the SDT has appropriately used the violation of an Interconnection Reliability Operating Limit (IROL) as the basis for determining the reliability need of transmission Facilities. Luminant Generation believes this same basis is appropriate for application to generation Facilities in Criteria 1.3, and offers the following language for consideration by the SDT: 1.3 "Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes, by demonstrating that the generation facility, if destroyed, degraded, misused or otherwise rendered unavailable, would violate one or more Interconnection Reliability Operating Limits (IROLs)."
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."				
Steven Schultz	Madison Gas and Electric Co.	5	Negative	The below are outstanding issues that the SDT should address before the next ballot. Comments are in line with the Unofficial Comment Form for Project 2008-06. Q1: No, If a brightline is used, it removes all engineering analysis the entity is currently performing with the current CIP-002-3 methodology. This may bring in or remove assets for this Standard. A brightline approach may be useful to a smaller entity but may not be in the best interest to larger entities. The SDT should consider a brightline with a MW threshold for physical unit size or MW loads for control centers, see comments below. Q2: Yes, Criteria number 1.5; Based on the Rationale Document, please clarify that Facilities within the Cranking Paths will be assigned the Critical Asset identification up to the point where multiple path options exist. Criteria number 1.13; Based on the Rationale Document, please clarify that the 300 MW level applies to a single common control system and not multiple like systems such as those installed for UFLS protection (multiple identical or similar individual, but independent, relays that may shed 300 MW's or more in aggregate, but individually shed less than 300 MW). Criteria number 1.14; Based on the Rationale Document, every RC, BA, and TOP's control center, control system, backup control center and backup control system is Critical due to EOP-008. EOP-008-0 is the FERC approved Standard for US entities. The purpose of EOP-008-0 is: "Each reliability entity must have a plan to continue reliability operations in the event its

Voter	Entity	Segment	Vote	Comment
				control center becomes inoperable". The SDT quoted EOP-008-1 in the Rational Document, which is not FERC approved. The SDT needs to consider this when writing a continental wide Standard. The phrase in the Rationale Document: "While it is clear that the primary and all backup control centers operated by RCs, BAs, and TOPs must be designated as Critical Assets", is unjustified. Assuming a BA controls no critical assets qualified as such by other criteria, a BA that, in aggregate, controls relatively small amounts of real and/or reactive power clearly has less of an effect on reliability than a BA that controls relatively large amounts of such resources. Indeed, the fact that "size matters" is recognized by Criteria 1.1, 1.2, 1.6, 1.7, 1.13, and 1.15. Criterion 1.14 should be modified to recognize this conclusion by including relevant quantitative thresholds. Thresholds that were proposed in CIP-010 Criteria 1.13 and 1.14 would be reasonable. In any event, the thresholds for the BA control center or control system should be no more inclusive than those used to qualify the individual assets controlled by the BA. To complicate matters, presently there are 28 Local Balancing Authorities (LBA's) that are part of the Midwest ISO BA Area (JRO00001). These entities do not perform all the BA functional obligations as stated in the Rationale Document (the MISO BA performs the majority of BAL-001 through BAL-005). Furthermore, the scopes of operation of the LBA's span a wide range from small to large and few too many resources. This underscores the need to not assume that any BA (or LBA) that performs or supports any BA function or part of a BA function is necessarily critical to BES reliability. Please provide the analysis and justification to how these entities fit into the BA requirement as stated in 1.14. If it is the intent of the SDT to capture the generation within the balancing functions of a BA, the SDT has that covered by Criteria 1.15. Q3: Disagree, While we agree with the general requirement of R1, we do not agree with certain aspects of Attachment 1 - Critical Asset Criteria, as discussed in responses to previous questions, above. Q4: Agree Q5: No, The implementation plan is clear on entities that either have in the past, identified they have CA's or have not ever identified CA's. The issue is present that what happens when an entity has only identified a control center as being a CA. But now they have identified a cranking path or Blackstart generator as being a CA. It is recommended that if non like items are identified as a CA, that the entity is given 24 months to become compliant. This will allow the entity enough time since they are now in an area that they may have not dealt with in the past.

Voter	Entity	Segment	Vote	Comment
				Q6: No, See question 5.

Response: Thank you for your comments.

Q1: The SDT believes that the implementation of Attachment 1 criteria will increase the consistency of Critical Asset identification over the existing entity defined risk-based methodology throughout North America.

Q2: Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5, "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started," where the Transmission Operator can choose between the next Facilities on the BES to energize.

Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."

Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." It is appropriate to refer to an industry approved and NERC BOT approved standard in a guidance document, even if it has not been accepted at FERC.

Q3: Please refer to response to Q2 above.

Q4: Thank you.

Q5: The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.

Q6: The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.

Don Schmit	Nebraska Public Power District	5	Negative	NPPD comments are addressed by comments submitted through APPA.
Response: Thank you for your comments. Please refer to the response to comments document.				
Patricia A. Lynch	NRG Energy, Inc.	5	Negative	Pertaining to CIP-002-4 R1, the following need to be addressed in Attachment 1: 1.1 - Add capacity factor as a qualifier for exclusion below an established low threshold. 1.3 - Mandate coordination/approval process between the Transmission Planner and entity that have been designated critical by the Transmission Planner. These classifications and approvals need to take into consideration 5 year forecasts for planning and budgeting purposes.. 1.5 - TOP needs to define the cranking path in restoration plan to the affected entities to adequately secure these restoration paths.. 1.9 - Please explain FACTS - need definition 1.10 - Need coordination between TOP & GO to identify critical assets. 1.15 - How is the 1500 MW aggregate determined? Is it an aggregate of generator name plates or the sum of controllable megawatts between a unit's high and low limits? General: Attachment 1 needs to have defined terms for capability, plant, control center Requirement 2 needs to clarify the following items: 1) Need Clarification on routable path, discrete links and serial connections as it pertains to CIP-002-3 R3: Is a device considered to communicate outside the ESP using routable protocol if ANY portion of the communications path uses routable protocol? 2)Need clarification concerning shared assets. Does it mean shared between a single device or same device on a network? 3)R2 states that only shared cyber assets for a group of generating units at a single location identified in Attachment 1 criteria 1.1, namely the 1500 MWs brightline, that could impact reliable operation, should be considered. Does this cyber asset identification only include assets meeting criteria 1.1 and therefore exclude any cyber assets utilized for reliable operation of a designated critical asset such as a single blackstart resource? Please

Voter	Entity	Segment	Vote	Comment
				provide clarification in this requirement.
Response: Thank you for your comments. Item 1.1 – The SDT debated whether to include capacity factor in this criterion. The reason we ultimately chose not to include capacity factor is twofold. First, there is no consistent method to select an appropriate capacity factor, and low capacity factor units may be critical to the system at peak load conditions. Second, there was concern that some units might fall below the line during major outage periods, taking them off the Critical Asset list one year and putting them back on the list the next year. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.5 – Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan." Item 1.9 – FACTS is defined by IEEE as "Alternating Current Transmission Systems incorporating power electronics-based and other static controllers to enhance controllability and power transfer capability." Item 1.10 – The assets would be identified by the asset owners. It is agreed that communication between GOs and TO/TOPs will be required. Item 1.15 – This is the aggregate highest rated net Real Power capability output of all generation under dispatch/control. At this time, the SDT is choosing not to add "capability," "plant," or "control center" to the NERC Glossary. We feel defining these terms under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. These terms are used in other approved NERC standards already in effect. The requirement refers to shared cyber assets that can have a reliability impact on the group of generating units. This qualifier only includes Critical Assets identified in criterion 1.1.				
Colin Anderson	Ontario Power Generation Inc.	5	Negative	Section 4.2.1 in previous versions of CIP-002 used to exempt "Facilities regulated by the US Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission". This exemption has been removed in draft CIP-002 version 4. Canada has its own laws and regulations and all nuclear facilities within Canada are covered by them. The CNSC regulates the complete nuclear site and we are of the strong opinion that a single regulator (CNSC) should have jurisdiction over the full operating island of nuclear assets due to the over-riding concern for nuclear safety issues. The cyber security standards should be under the jurisdiction of the CNSC in Canada. As such, Section 4.2.1 in CIP-002-4 should continue to exempt the

Voter	Entity	Segment	Vote	Comment
				following; “Facilities regulated by the Canadian Nuclear Safety Commission”.
Response: Thank you for your comments. The SDT is aware that the removal of the nuclear plant exclusion in response to a FERC order brought Canadian nuclear plants into the CIP standards. That was unintentional and will be corrected in the revised standards next posted for ballot.				
Richard Kinas	Orlando Utilities Commission	5	Negative	comments submitted through online comment form
Response: Thank you for your comments. Please refer to the response to comments document.				
Richard J. Padilla	Pacific Gas and Electric Company	5	Negative	While we understand the need to have a consistent application across the BES, the brightline methodology does not provide enough flexibility to determine what is a critical asset. We recommend an additional attempt to develop guiding principles for determining critical facilities without unilateral declarations on what is critical. The standard development process is still too much in the infant stage with vague definitions. Flexibility is needed to allow entities to develop their CIP responses to meet their critical needs.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues.				
Tim Hattaway	PowerSouth Energy Cooperative	5	Negative	Primary concern that a blanket statement of “all blackstart resources” would effectively incentivize utilities to write out blackstart resources to avoid the protection involved, ultimately decreasing the reliability of the system. Perhaps a better requirement would be blackstart resources identified as primary restoration components in a region’s restoration plans.
Response: Thank you for your comments. Item 1.4 – A Blackstart Resource is defined as “A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s restoration plan.” The SDT feels that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources.

Jerzy A Slusarz	PSEG Power LLC	5	Negative	Project 2008-06: Cyber Security - Order 706 November, 2010
Response: Thank you for your comments.				
Thomas J. Bradish	RRI Energy	5	Negative	Criteria 1.6 and 1.7 are arbitrary without clarification and in relation to Criteria 1.10. Suggest adding the following clarification to the end of Criteria 1.6 and 1.7: ", unless the Transmission Facilities only provide the generation interconnection required to directly connect generator output to the transmission system." o Criteria 1.6, as modified, should read as follows: "Transmission Facilities operated at 500-kV or higher, unless the Transmission Facilities only provide the generation interconnection required to directly connect generator output to the transmission system." o Criteria 1.7, as modified, should read as follows: "Transmission Facilities operated at 300-kV or higher at stations interconnected at 300-kV or higher with three or more other transmission stations, unless the Transmission Facilities only provide the generation interconnection required to directly connect generator output to the transmission system." Clarifications such as the ones presented above and with respect to Criteria 1.6 and Criteria 1.7 would be unnecessary if the Drafting Team first acknowledged the technical distinction between “generator interconnection facilities” and “transmission facilities.” Without such a distinction, radial generator interconnection facilities are indistinguishable from parallel transmission facilities and, as a result, there are mis-applications of the registration criteria and mis-applications of Reliability Standards such as in the case of the Milford and Cedar Creek wind farms. The Drafting Team should take special aim at avoiding further codification of such technically deficient mis-applications in the CIP Reliability Standards.
Response: Thank you for your comments. Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset a Transmission Facility operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations.				

Voter	Entity	Segment	Vote	Comment
Bethany Wright	Sacramento Municipal Utility District	5	Negative	After reviewing the proposed version 4 language for CIP-002, R2, the placement of the additional text on generation is confusing. It appears to be trying to accomplish two different purposes. SMUD does not have any objections to the text itself, just the placement. SMUD proposes organizing the requirement as follows: R2. Critical Cyber Asset Identification- Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall review this list at least annually, and update it as necessary. R2.1 For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics: R2.1.1 The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or, R2.1.2 The Cyber Asset uses a routable protocol within a control center; or, R2.1.3 The Cyber Asset is dial-up accessible. R2.2 For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1., the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Additionally, SMUD, as a member of APPA, would like to reflect its support to those CIP-002-4 Standard comments submitted by APPA staff.
Response: Thank you for your comments. Please refer to the response to comments document for responses to APPA comments. Requirement R2 has been changed to clarify the issues presented.				
Glen Reeves	Salt River Project	5	Negative	SRP believes that a bright line assessment methodology for determining Critical Assets is not in the best interest of reliability. This is especially true in the designation of substations and generating facilities. The attributes of these stations and their unique impact on Bulk Electric System reliability must be taken into account. There are several terms and phrases used within Requirement 2 of the proposed Standard that need to be better defined to eliminate ambiguity. These terms are: 1) essential to the operation of the Critical Asset, 2) adversely impact the reliable operation needs to be defined; and, 3) within 15 minutes. We believe the CIP-002-4 implementation plan for newly identified Critical Assets and associated Critical Cyber Assets provides inadequate time. SRP suggests the implementation timeframe be extended to 30 months after the effective date of the Standard.

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about (annual) exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version. Thank you for your comment. The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.				
George T. Ballew	Tennessee Valley Authority	5	Negative	Tennessee Valley Authority (TVA) appreciates the opportunity to comment on this CIP-002-4 draft. We fully support the standards development process and all the hard work and commitment by the drafting team members. For this draft, we have the following concerns which moved us to cast a Negative vote. Q1: Yes; no comment Q2: 1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. The language appears to require us to designate “Each” component in the System Restoration plan as CA. Because we currently include at least 2 paths for black start of most generation plants in the system, the proposed language would require the extension of CA designation to a large number of components which otherwise would not be included by other criteria. The flexibility provided by our robust transmission infrastructure and the large number of black start capable plants serves to ensure reliable operation of the BES, but designating as a CA each component that could participate in the total paths possible doesn’t seem consistent with the intent of the standard. Recommendation: Revise language to allow entities to limit CA designation to those components participating in the primary black start path. 1.10. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3. There isn’t a clear definition of the term “directly connected.” Without this definition there are many way to interpret this requirement. Is this language meant to describe a facility where the substation is co-located with a generation facility? Also, does the language this mean total loss of substation or only partial? Recommendation: For the purpose of this

Voter	Entity	Segment	Vote	Comment
				standard revise language to clearly define “directly connected.” Q3: Yes; no comment Q4: Yes; no comment Q5: abstain Q6: abstain
Response: Thank you for your comments. Item 1.4 – The SDT considered using the word “primary”, but ultimately rejected it as it is not a defined NERC Glossary term, nor is it used in EOP-005-2. A Blackstart Resource is defined as “A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator’s restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator’s restoration plan.” EOP-005-2 R1.4 states that the restoration plan must include “Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit.” The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources. Item 1.10 – The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any transmission Facility that, if lost, would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset. That might include the partial or total loss of a substation.				
Karl Bryan	U.S. Army Corps of Engineers Northwestern Division	5	Negative	The Standards Drafting Team has chosen to be prescriptive in determining Critical Assets. The Responsible Entity is responsible for identifying Critical Assets and FERC directed NERC to provide additional guidance in helping the Responsible Entity determine Critical Assets and for NERC to maintain flexibility for the Responsible Entity in the determination of Critical Assets. The prescriptive nature of the approach being used in the Ver 4 CIP Standard appears to be taking the responsibility of determining Critical Assets away from the Responsible Entity and the lack of flexibility may eliminate or preclude a system or component from being identified as a Critical Asset.
Response: Thank you for your comments. Regarding the directives for external review and guidance in the FERC Order, the SDT believes the criteria in Attachment 1 are in response to FERC Order 706 paragraph 329. In consideration of this directive, the SDT decided there did not exist across all regions an appropriate third party to provide this type of oversight. Also, external review and oversight carries with it the compliance overhead and arbitration processes analogous to the TFE process. This “bright-line” approach removes the variability of entity defined methodologies that would prompt the need for external review.				
Linda Horn	Wisconsin Electric Power Co.	5	Negative	1. When reviewing the mapping document posted with the proposed CIP-002-4 standard, do you believe that the proposed standard will lead to an improvement in reliability when compared to the standard it proposes to replace? 1 Yes 0 No Comments: We understand that the errata, which removes discussion of the “risk-based assessment methodology” from the

Voter	Entity	Segment	Vote	Comment
				proposed CIP-002-4 standard, would also apply to the mapping document. We appreciate the bright-line clarification to ensure consistent identification of Critical Assets throughout the industry. 2. CIP-002-4 Attachment 1 contains criteria that define elements that must be classified as Critical Assets. Do you have any suggestions that would improve the proposed criteria? If so, please explain and provide specific suggestions for improvement. 1 Yes 0 No Comments: We suggest that the functional entities Planning Coordinator and Transmission planner be added to the applicability section. Feedback on specific criteria as follows: 1.1, We request clarification on the phrase “single plant location”. This phrase is not defined and it is not clear what level of proximity of generators would be considered a “single plant location”. Rather than discuss this in terms of geography (location), we feel it would be better to discuss in terms of “Each group of generating units (including nuclear generation), operated using common cyber control systems other than the Control Centers identified in 1.14 and 1.15, with an aggregate...”. 1.3, We suggest the wording: “Each generation facility designated by the Planning Coordinator or Transmission Planner as required to avoid one or more reliability criteria violations”. 1.4, The blackstart units deemed critical should be only those identified by the Transmission Operator to meet the minimum critical blackstart requirement. The resulting suggested wording would be: “Each Blackstart Resource identified in the Transmission Operator’s restoration plan required to meet the minimum critical blackstart requirement”. 1.8, We suggest the wording: “Transmission Facilities at a single location that the Planning Coordinator or Transmission planner has designated that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations”. 1.9, We suggest similar wording: “...unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations”. 1.11, We suggest the following wording: “Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements”. 1.12, We suggest the following wording: “...unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed”. 1.14, We suggest this be made consistent with 1.15, i.e. “Each control center, or backup control center, used to perform the functional obligations

Voter	Entity	Segment	Vote	Comment
				of the Reliability Coordinator, Balancing Authority, or Transmission Operator". 1.16, We suggest the following wording: "Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include". 3. Requirement R1 of draft CIP-002-4 states, "Critical Asset Identification - Each Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in CIP-002-4 Attachment 1 - Critical Asset Criteria. The Responsible Entity shall review this list at least annually, and update it as necessary." Do you agree with the proposed Requirement R1? If not, please explain why and provide specific suggestions for improvement. 1 Agree 0 Disagree Comments: 4. Requirement R2 of draft CIP-002-4 states, "Using the list of Critical Assets developed pursuant to Requirement R1, each Responsible Entity shall develop a list of associated Critical Cyber Assets performing a function essential to the operation of the Critical Asset. For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes. Each Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics". The requirement then lists characteristics using the same text that is contained in the existing CIP-002-3 R3. Do you agree with the proposed Requirement R2? If not, please explain why and provide specific suggestions for improvement. 1 Agree 0 Disagree Comments: Although we agree with the proposed Requirement R2, We are concerned that the document "CIP-002-4 Cyber Security - Critical Cyber Asset Identification: Rationale and Implementation Reference Document" actually appears to provide more rationale and guidance on Critical Assets than Critical Cyber Assets. 5. Do you agree with the proposed implementation plan for the Version 4 standards? If not, please explain and provide specific suggestions for improvement. 1 Yes 0 No Comments: 6. Do you agree with the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities? If not, please explain and provide specific suggestions for improvement. 0 Yes 1 No Comments: We believe that it would be better to simply have a uniform 18 month

Voter	Entity	Segment	Vote	Comment
				implementation deadline for newly identified CCAs rather than have different timelines for different requirements. This will simplify reporting and streamline efforts to become fully compliant. We understand that nuclear timelines are subject to NRC requirements and the necessity of accomplishing some tasks only during refueling outages appropriately dictates a separate schedule for them.

Response: Thank you for your comments.

Q2. Since there is no Requirement that applies to the Planning Coordinator or the Transmission Planner, it is not appropriate to include them in the Applicability section.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. "Single plant location" refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT feels that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources.

Item 1.8 – According to FAC-014-2, IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology. The present wording is appropriate. This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Item 1.9 – This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements.

Voter	Entity	Segment	Vote	Comment
Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot. Q4. Thank you for your comments. The SDT will reexamine the guidance document. Q5. Due to the limited scope of version 4, the SDT is only making conforming changes to the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.				
Leonard Rentmeester	Wisconsin Public Service Corp.	5	Negative	WPS and UPPCO believe that a bright line criteria as proposed by the ballot will improve the reliability and safety of the BES. However, changes as provided by MRO's NSRS need to be incorporated into the proposed standard to eliminate the potential for arbitrary application and capricious enforcement of the standard.
Response: Thank you for your comments. Please refer to the response to comments document.				
Liam Noailles	Xcel Energy, Inc.	5	Negative	Please see our comments submitted during the concurrent comment period.
Response: Thank you for your comments. Please refer to the response to comments document.				
Edward P. Cox	AEP Marketing	6	Negative	Overall, AEP is supportive of the efforts and the general concepts of this draft; however, there are a few refinements that will enhance the requirements and remove ambiguity. AEP encourages the SDT to consider the items below in a future draft of the standard: AEP would contend that there are regional differences that would be relevant to determine a MW threshold for generators. We support the concept that was contained in the last draft that made the determination based on the capacity reserves.

Voter	Entity	Segment	Vote	Comment
				However, the prior language would need to be revisited to ensure that value was fixed for a period of time. In addition, requirement 2.2 uses the term control center (also used in attachment 1) that is not a NERC defined term. This will introduce ambiguity to implementation. There has been ongoing confusion regarding the difference between "control centers" and "control rooms." We do not believe that a "control room" at a power plant or a substation would be considered a "control center." There is language in the NERC Security Guideline for Electricity Sector: Identifying Critical Assets document that the SDT should consider and incorporate into the NERC Glossary. Net real power capability testing is defined in MOD-024 standards that have yet to be FERC approved. Furthermore, not all of the regions have defined the parameters for the capability testing.
Response: Thank you for your comments. Item 1.1 - In prior versions we had wording about reserve sharing for the threshold. We received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. We did an informal survey of the regions, and we identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. At this time, the SDT is choosing not to add "control center" to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. CIP-002-4 does not require net real power capability testing.				
Jennifer Richardson	Ameren Energy Marketing Co.	6	Negative	1. (a) The proposed bright line criteria are not based on any studies or performance testing. (b) The proposed bright line criteria do not address proximity to load centers or the impact to system flows or voltages in those load centers. (c)Also, we believe that impact on the BES should be evaluated for the Critical Asset using the performance requirement contained in the existing mandatory standards. This would provide consistency between CIP-002 and other standards. In this regard, we suggest that for the facilities identified in the bright line criteria, perform powerflow and stability simulations to assess the impact to the BPS of the outage of these facilities, similar to the tests performed for TPL-003 and 004. If there is an impact (that is not meeting the performance criteria), then the facility is to be considered as critical. If there is no such impact, then the facility is not be considered as critical. If there is a concern for a multi-prong attack, then similar reliability assessment should be performed for such scenarios. (d)Further, the bright line criteria will include many

Voter	Entity	Segment	Vote	Comment
				more facilities as critical assets with minimal to no improvement to reliability and would require significant resource commitment to meet the proposed implementation schedule. 2. We offer some comments/suggestions and also have some questions/comments to the bright line criteria (Attachment 1): (a) The term “Facilities” should be changed to “substations and switchyards” throughout Attachment 1 as NERC glossary of terms include “lines” in the definition also. Is it SDT’s intention to include hundreds of miles of lines as critical asset? (b) The term “single station location” and “single plant location” used throughout Attachment 1 need to be defined to avoid confusion whether a single location mean one building or several buildings or stations within a defined geographical boundary or a fenced area. (c) Specific comments to Attachment 1 : 1.1 - Are there any reliability impact studies to support 1500 MW? We believe that several events larger than this number have occurred and the BES has performed as designed, without any loss of load, or significant impact on reliability. 1.6 - We disagree that all transmission facilities operated at 500 kV or greater are “critical”. Again, system studies should be conducted to take into account the impact that the asset has on the reliable operation of the BES before determining that an asset is a Critical Asset. 1.7 - We disagree that all transmission facilities that are operated at 300 kV or above and are interconnected with three or more transmission substations are “critical. System studies should be conducted to take into account the impact that the asset has on the reliable operation of the BES before determining that an asset is a Critical Asset. 1.8 - Wording for this criterion should be changed to “Transmission substations and switchyards that the Planning Coordinator or Transmission Planner designates that, if destroyed, degraded, misused or otherwise rendered unavailable, demonstrates the need for an Interconnection Reliability Operating Limit (IROL). This change would make this criterion consist with FAC-010/FAC-014. 1.12 - We believe that the criterion reads ok, but the rationale document for this criterion implies that purpose of SPS/RAS is to prevent disturbance that would result in excursion beyond IROLs. This may not be true in all cases. 1.13 - Wording for this criterion should be changed to “Common control system(s) capable of performing automatic load shedding of 300 MW or more with a single operation”. 1.15 - Same comments as for 1.1 above. 1.16 - Wording for this criterion should be changed to “Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include.” 3. CIP-002-4, R2 : (a) The word “associated” could mean anything to do with a Critical Assets

Voter	Entity	Segment	Vote	Comment
				which is too broad of a term and needs to be defined to avoid confusion. (b)The phrase "could adversely impact the reliable operation" is unclear and vague. What magnitude of "adverse impact" should be considered? Also what is being defined as the Reliable Operation? This phrase should be more clearly defined, otherwise it could introduce different interpretations in the compliance audits. 4. The implementation plan is very confusing.

Response: Thank you for your comments.

(1) The SDT and volunteer industry participants have expended considerable effort to develop consistent Critical Asset Identification approaches. The team endeavored to include work already required by other standards, and provide some constraints for an entity's assessment. These approaches, in their various iterations, have been presented to industry for review and comment. Significant feedback from the industry was the need to simplify the Critical Asset identification approach. We welcome your suggestions for improvement to the criteria. The Attachment 1 criteria were under development for CIP-010 when the team was asked to use the criteria for the basis of a new CIP Version 4 set of standards. The results of the recent NERC data request were used to assist the team in developing the criteria in Attachment 1. Bright-line criteria by its very nature may overreach in some areas and under-reach in others, with the end result being a more protected system on average.

The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The SDT does not feel that a power flow analysis (impact-based or risk-based) may lead to a consistent application of the criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry.

2. a) A transmission Line can be considered a Critical Asset if it meets the criteria in Attachment 1. It would then be evaluated for possible Critical Cyber Assets, which would be afforded the cyber security protection outlined in CIP-003 to CIP-009. It is not the Critical Asset that falls under CIP-003 to CIP-009, but the Critical Cyber Asset.

b) The guidance document posted by the SDT provides direction on the location issue. "Single plant location" refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.
c) Item 1.1 - In prior versions we had wording about reserve sharing for the threshold. We received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. We did an informal survey of the regions, and we identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions.

Items 1.6 and 1.7 – You propose to add the criteria that the Responsible Entity can determine through a risk-based evaluation that destruction, degradation or unavailability of certain assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. The SDT does not feel that a power flow analysis (impact-based or risk-based) may lead to a consistent application of the

Voter	Entity	Segment	Vote	Comment
criteria, due to the numerous factors which can impact substation power flows. Such a study would need to be rigorously defined for the industry. We thank you for your proposal and will take it under consideration for future revisions. Criterion 1.7 has been reworded to "Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations." Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.15 –In the development of this criterion, the drafting team used 1500 MW as a bright-line for aggregate generation controlled based on the bright-line used in Part 1.1. The drafting team specified a single Interconnection because it is more likely that the span of control of the generation control center may cross multiple BA or RSG areas or even regions and Interconnections. Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot. (3) The phrase "adversely impact" limits the scope of the evaluation of Critical Cyber Assets to those that can affect the reliable operation of 1500MW or more of generation at a single plant location. (4) The implementation plan is a modification of the implementation plan for version 3 of the CIP standards.				
Brian Ackermann	Associated Electric Cooperative, Inc.	6	Negative	please review submitted comments
Response: Thank you for your comments. Please refer to the response to comments document.				
Brenda S. Anderson	Bonneville Power Administration	6	Negative	Please refer to BPA comments submitted during the formal comment period on 10/26/10
Response: Thank you for your comments. Please refer to the response to comments document.				
Brenda Powell	Constellation Energy	6	Negative	Constellation Energy Commodities Group could vote affirmative in the next ballot if specific comments submitted on the Comment Form for Project

Voter	Entity	Segment	Vote	Comment
	Commodities Group			2008-06-Cyber Security 706 were successfully addressed (also submitted 11/3/10).
Response: Thank you for your comments. Please refer to the response to comments document.				
Louis S Slade	Dominion Resources, Inc.	6	Negative	Dominion conceptually supports bright line criteria for determining critical assets. However, we cannot vote in favor at this time because we believe that changes are needed in Table 2 that recognize the implementation for infrastructure (physical and electronic security) should be equal to, or longer than, that required for training. We also believe that the bright line criteria for generation control center needs further effort. Please see more specific comments submitted using the NERC comment link for this project.
Response: Thank you for your comments. Please refer to the response to comments document.				
Larry W. Rodriguez	Entegra Power Services	6	Negative	There has been no consideration for "small shops" that will have an extreme financial impact. In addition, the only cyber security breach possibility is from Control Room employees, which is so very unlikly!
Response: Thank you for your comments. Cost is only one of many issues that must be considered in the cyber security of the BES. The set of CIP cyber security standards (CIP-002 to CIP-009) is a holistic approach to cyber security protection that applies to both internal and external threats.				
Terri F Benoit	Entergy Services, Inc.	6	Negative	Switchyards serving nuclear facilities should not be automatically classified as critical assets. The fact that a BES switchyard serves a nuclear facility should not in itself qualify the switchyard as a critical asset. While nuclear units and their support facilities may qualify as critical assets under a separate set of criteria, they should not automatically be designated as critical to the BES without some measure of the impact of the loss of the facility on BES reliability. All blackstart units and associated cranking paths should not be automatically classified as critical assets. Blackstart units may be useful in the restoration of the BES following a large scale outage, but they are not necessarily essential to the reliability of the BES under normal operation. Blackstart units should not automatically be designated as critical to the BES without some measure of the impact of the loss of the facility on BES reliability.

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comments. Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2, "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." Since these facilities were deemed so important that a NERC standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets. Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." The SDT feels that these units must be classified as Critical Assets. It should be noted that not all blackstart generators are Blackstart Resources.				
Richard L. Montgomery	Florida Municipal Power Agency	6	Negative	FMPA commends the SDT on making significant headway on the version 4 standards. However, there are significant additional improvement that should be made to make the criteria of Attachment 1 less arbitrary and that truly measures those assets that can have an Adverse Reliability Impact. Also, the standard is still unclear in several areas, such as how to identify CCAs at a substation if a substation is determined to be a CA that needs to be clarified. Please see FMPA's comments submitted through the formal comment process for more specific detail and proposed alternatives.
Response: Thank you for your comments. Please refer to the response to comments document.				
Thomas E Washburn	Florida Municipal Power Pool	6	Negative	Please see APPA's comments
Response: Thank you for your comments. Please refer to the response to comments document.				
Paul Shipps	Lakeland Electric	6	Negative	Several additional improvement that should be made to make the criteria of Attachment 1 less arbitrary and that truly measures those assets that can have an Adverse Reliability Impact. Also, the standard is still unclear in several areas, such as how to identify CCAs at a substation if a substation is determined to be a CA that needs to be clarified.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues.				

Voter	Entity	Segment	Vote	Comment
Eric Ruskamp	Lincoln Electric System	6	Negative	Please review the comments submitted by the MRO's NERC Standards Review Subcommittee for LES' reasons for a negative ballot.
Response: Thank you for your comments. Please refer to the response to comments document.				
Brad Jones	Luminant Energy	6	Negative	Luminant Energy Company LLC (Luminant Energy) thanks the Standard Drafting Team (SDT) for their work on the NERC CIP Cyber Security Standards and for the opportunity to provide input into the standards development process. Although Luminant Energy has voted "Negative" on the current draft standard, Luminant Energy supports the SDT goal of completing the revision of CIP-002-4 by the end of December 2010, and believes with some modification to the Attachment 1 Criteria, the goal is still achievable. Specifically, Luminant Energy is concerned that Criteria 1.3 has no defined basis for determining the reliability need of a generation Facility. As written, the Planning Coordinator or Transmission Planner could use any basis, or conversely, no basis, for designating a generation Facility as required for reliability purposes. For Criteria 1.8, 1.9, and 1.12, the SDT has appropriately used the violation of an Interconnection Reliability Operating Limit (IROL) as the basis for determining the reliability need of transmission Facilities. Luminant Energy believes this same basis is appropriate for application to generation Facilities in Criteria 1.3, and offers the following language for consideration by the SDT: 1.3 "Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes, by demonstrating that the generation facility, if destroyed, degraded, misused or otherwise rendered unavailable, would violate one or more Interconnection Reliability Operating Limits (IROLs)."
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."				
Jeffrey M Keebler	Madison Gas and Electric Co.	6	Negative	The below are outstanding issues that the SDT should address before the next ballot. Comments are in line with the Unofficial Comment Form for Project 2008-06. Q1: No, If a brightline is used, it removes all engineering analysis the entity is currently performing with the current CIP-002-3 methodology. This may

Voter	Entity	Segment	Vote	Comment
				bring in or remove assets for this Standard. A brightline approach may be useful to a smaller entity but may not be in the best interest to larger entities. The SDT should consider a brightline with a MW threshold for physical unit size or MW loads for control centers, see comments below. Q2: Yes, Criteria number 1.5; Based on the Rationale Document, please clarify that Facilities within the Cranking Paths will be assigned the Critical Asset identification up to the point where multiple path options exist. Criteria number 1.13; Based on the Rationale Document, please clarify that the 300 MW level applies to a single common control system and not multiple like systems such as those installed for UFLS protection (multiple identical or similar individual, but independent, relays that may shed 300 MW's or more in aggregate, but individually shed less than 300 MW). Criteria number 1.14; Based on the Rationale Document, every RC, BA, and TOP's control center, control system, backup control center and backup control system is Critical due to EOP-008. EOP-008-0 is the FERC approved Standard for US entities. The purpose of EOP-008-0 is: "Each reliability entity must have a plan to continue reliability operations in the event its control center becomes inoperable". The SDT quoted EOP-008-1 in the Rational Document, which is not FERC approved. The SDT needs to consider this when writing a continental wide Standard. The phrase in the Rationale Document: "While it is clear that the primary and all backup control centers operated by RCs, BAs, and TOPs must be designated as Critical Assets", is unjustified. Assuming a BA controls no critical assets qualified as such by other criteria, a BA that, in aggregate, controls relatively small amounts of real and/or reactive power clearly has less of an effect on reliability than a BA that controls relatively large amounts of such resources. Indeed, the fact that "size matters" is recognized by Criteria 1.1, 1.2, 1.6, 1.7, 1.13, and 1.15. Criterion 1.14 should be modified to recognize this conclusion by including relevant quantitative thresholds. Thresholds that were proposed in CIP-010 Criteria 1.13 and 1.14 would be reasonable. In any event, the thresholds for the BA control center or control system should be no more inclusive than those used to qualify the individual assets controlled by the BA. To complicate matters, presently there are 28 Local Balancing Authorities (LBA's) that are part of the Midwest ISO BA Area (JRO00001). These entities do not perform all the BA functional obligations as stated in the Rationale Document (the MISO BA performs the majority of BAL-001 through BAL-005). Furthermore, the scopes of operation of the LBA's span a wide range from small to large and

Voter	Entity	Segment	Vote	Comment
				few too many resources. This underscores the need to not assume that any BA (or LBA) that performs or supports any BA function or part of a BA function is necessarily critical to BES reliability. Please provide the analysis and justification to how these entities fit into the BA requirement as stated in 1.14. If it is the intent of the SDT to capture the generation within the balancing functions of a BA, the SDT has that covered by Criteria 1.15. Q3: Disagree, While we agree with the general requirement of R1, we do not agree with certain aspects of Attachment 1 - Critical Asset Criteria, as discussed in responses to previous questions, above. Q4: Agree Q5: No, The implementation plan is clear on entities that either have in the past, identified they have CA's or have not ever identified CA's. The issue is present that what happens when an entity has only identified a control center as being a CA. But now they have identified a cranking path or Blackstart generator as being a CA. It is recommended that if non like items are identified as a CA, that the entity is given 24 months to become compliant. This will allow the entity enough time since they are now in an area that they may have not dealt with in the past. Q6: No, See question 5.

Response: Thank you for your comments.

Q1: The SDT believes that the implementation of Attachment 1 criteria will increase the consistency of Critical Asset identification over the existing entity defined risk-based methodology throughout North America.

Q2: Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5, "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started," where the Transmission Operator can choose between the next Facilities on the BES to energize.

Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."

Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." It is appropriate to

Voter	Entity	Segment	Vote	Comment
refer to an industry approved and NERC BOT approved standard in a guidance document, even if it has not been accepted at FERC. Q3: Please refer to response to Q2 above. Q4: Thank you. Q5: The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset. Q6: The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.				
Daniel Prowse	Manitoba Hydro	6	Negative	Please see comments submitted by Manitoba Hydro in the formal comment period.
Response: Thank you for your comments. Please refer to the response to comments document.				
Joseph O'Brien	Northern Indiana Public Service Co.	6	Negative	As NIPSCO understands the current set of CIP standards CIP-002-4 - CIP-004-4 & CIP-006-4 - CIP-009-4 it appears that each of the proposed standards needs to be corrected to modify the purpose section, which references the entire set of standards CIP-002-4 - CIP-009-4 when in reality CIP-005-4 does not yet exist and is not being balloted in at this time. In addition CIP-003-4 R1, R2 make reference to the entire set of version 4 standards, which would also include the unapproved CIP-005-4. The unapproved CIP-005-4 is specifically identified as a compliance requirement within CIP-006-4 R2.2 and CIP-007-4 R7. The primary concern is that the industry is being asked to ballot on a set of standards that references a standard that does not yet exist. There is also concern for future applicability concerns in regards to effective dates with CIP-005-4 and implementation date overlap conditions that could occur when CIP-005-4 goes to ballot again and potentially get approved. This is a straightforward correction to the version 4 standards and would most easily be resolved by proposing a new CIP-005-4 that simply updates the versioning information within the standard in the same approach that was taken for CIP-003-4 - CIP-004-4 & CIP-006-4 - CIP-009-4. In CIP-002 Version 4 under Applicability we're not sure why NERC is listed. At the very least this should

Voter	Entity	Segment	Vote	Comment
				be replaced by ERO however it's still not clear how this entity fits in with the Functional Model.
Response: Thank you for your comments. The following information was provided with the posting of the CIP Version 4 standards: *(CIP-005-4 - Cyber Security — Electronic Security Perimeter is posted separately, with a set of proposed revisions for Urgent Action under Project 2010-15. If CIP-005-4 is not approved as an Urgent Action, it will be returned to this set of CIP standards.)* As for listing NERC in the Applicability section, NERC has historically been listed in this section for the CIP body of standards.				
Alan R. Johnson	NRG Energy, Inc.	6	Negative	Pertaining to CIP-002-4 R1, the following need to be addressed in Attachment 1: 1.1 - Add capacity factor as a qualifier for exclusion below an established low threshold. 1.3 - Mandate coordination/approval process between the Transmission Planner and entity that have been designated critical by the Transmission Planner. These classifications and approvals need to take into consideration 5 year forecasts for planning and budgeting purposes.. 1.5 - TOP needs to define the cranking path in restoration plan to the affected entities to adequately secure these restoration paths.. 1.9 - Please explain FACTS - need definition 1.10 - Need coordination between TOP & GO to identify critical assets. 1.15 - How is the 1500 MW aggregate determined? Is it an aggregate of generator name plates or the sum of controllable megawatts between a unit's high and low limits? General: Attachment 1 needs to have defined terms for capability, plant, control center Requirement 2 needs to clarify the following items: 1) Need Clarification on routable path, discrete links and serial connections as it pertains to CIP-002-3 R3: Is a device considered to communicate outside the ESP using routable protocol if ANY portion of the communications path uses routable protocol? 2)Need clarification concerning shared assets. Does it mean shared between a single device or same device on a network? 3)R2 states that only shared cyber assets for a group of generating units at a single location identified in Attachment 1 criteria 1.1, namely the 1500 MWs brightline, that could impact reliable operation, should be considered. Does this cyber asset identification only include assets meeting criteria 1.1 and therefore exclude any cyber assets utilized for reliable operation of a designated critical asset such as a single blackstart resource? Please

Voter	Entity	Segment	Vote	Comment
				provide clarification in this requirement.
Response: Thank you for your comments. Item 1.1 – The SDT debated whether to include capacity factor in this criterion. The reason we ultimately chose not to include capacity factor is twofold. First, there is no consistent method to select an appropriate capacity factor, and low capacity factor units may be critical to the system at peak load conditions. Second, there was concern that some units might fall below the line during major outage periods, taking them off the Critical Asset list one year and putting them back on the list the next year. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.5 – Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan." Item 1.9 – FACTS is defined by IEEE as "Alternating Current Transmission Systems incorporating power electronics-based and other static controllers to enhance controllability and power transfer capability." Item 1.10 – The assets would be identified by the asset owners. It is agreed that communication between GOs and TO/TOPs will be required. Item 1.15 – This is the aggregate highest rated net Real Power capability output of all generation under dispatch/control. At this time, the SDT is choosing not to add "capability," "plant," or "control center" to the NERC Glossary. We feel defining these terms under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. These terms are used in other approved NERC standards already in effect. The requirement refers to shared cyber assets that can have a reliability impact on the group of generating units. This qualifier only includes Critical Assets identified in criterion 1.1.				
James D. Hebson	PSEG Energy Resources & Trade LLC	6	Negative	Please see PSEG companies' comments filed separately. The PSEG Companies will change the vote to affirmative if the comments are adequately addressed by the drafting team.
Response: Thank you for your comments. Please refer to the response to comments document.				
Trent Carlson	RRI Energy	6	Negative	Criteria 1.6 and 1.7 are arbitrary without clarification and in relation to Criteria 1.10. Suggest adding the following clarification to the end of Criteria 1.6 and 1.7: ", unless the Transmission Facilities only provide the

Voter	Entity	Segment	Vote	Comment
				generation interconnection required to directly connect generator output to the transmission system." o Criteria 1.6, as modified, should read as follows: "Transmission Facilities operated at 500-kV or higher, unless the Transmission Facilities only provide the generation interconnection required to directly connect generator output to the transmission system." o Criteria 1.7, as modified, should read as follows: "Transmission Facilities operated at 300-kV or higher at stations interconnected at 300-kV or higher with three or more other transmission stations, unless the Transmission Facilities only provide the generation interconnection required to directly connect generator output to the transmission system."
Response: Thank you for your comments. Item 1.6 –The drafting team believes all Transmission Facilities operated at 500 kV or higher do not require any further qualification for their role as components of the backbone on the Interconnected BES. Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset a Transmission Facility operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations.				
Mike Hummel	Salt River Project	6	Negative	SRP believes that a bright line assessment methodology for determining Critical Assets is not in the best interest of reliability. This is especially true in the designation of substations and generating facilities. The attributes of these stations and their unique impact on Bulk Electric System reliability must be taken into account. There are several terms and phrases used within Requirement 2 of the proposed Standard that need to be better defined to eliminate ambiguity. These terms are: 1) essential to the operation of the Critical Asset, 2) adversely impact the reliable operation needs to be defined; and, 3) within 15 minutes. We believe the CIP-002-4 implementation plan for newly identified Critical Assets and associated Critical Cyber Assets provides inadequate time. SRP suggests the implementation timeframe be extended to 30 months after the effective date of the Standard.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues.				

Voter	Entity	Segment	Vote	Comment
The phraseology you are concerned about (annual) exists in the existing CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version Thank you for your comment. The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.				
Marjorie S. Parsons	Tennessee Valley Authority	6	Negative	Tennessee Valley Authority (TVA) appreciates the opportunity to comment on this CIP-002-4 draft. We fully support the standards development process and all the hard work and commitment by the drafting team members. For this draft, we have the following concerns which moved us to cast a Negative vote. Q1: Yes; no comment Q2: 1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. The language appears to require us to designate “Each” component in the System Restoration plan as CA. Because we currently include at least 2 paths for black start of every generation plant in the system, the proposed language would require the extension of CA designation to a large number of components which otherwise would not be included by other criteria. The flexibility provided by our robust transmission infrastructure and the large number of black start capable plants serves to ensure reliable operation of the BES, but designating as a CA each component that could participate in the total paths possible doesn’t seem consistent with the intent of the standard. Recommendation: Revise language to allow entities to limit CA designation to those components participating in the primary black start path. 1.10. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3. There isn’t a clear definition of the term “directly connected.” Without this definition there are many way to interpret this requirement. Is this language meant to describe a facility where the substation is co-located with a generation facility? Also, does the language this mean total loss of substation or only partial? Recommendation: For the purpose of this standard revise language to clearly define “directly connected.” Q3: Yes; no comment Q4: Yes; no comment Q5: abstain

Voter	Entity	Segment	Vote	Comment
				Q6: abstain
Response: Thank you for your comments. Item 1.4 – The SDT considered using the word "primary", but ultimately rejected it as it is not a defined NERC Glossary term, nor is it used in EOP-005-2. A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources. Item 1.10 – The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any transmission Facility that the loss of which would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset. That might include the partial or total loss of a substation.				
David F. Lemmons	Xcel Energy, Inc.	6	Negative	Please see our comments submitted during the concurrent comment period.
Response: Thank you for your comments. Please refer to the response to comments document.				
James A Maenner		8	Negative	The Applicability for CIP-002-4 seems to cast a wide enough net to find some entity responsible for determining assets as critical. The problem is that most of those listed in Section 4 have no ability or expertise to study or determine the criticalness of an asset on the BES. Ultimately, the identification of critical assets should be the responsibility of the Planning Coordinator or Transmission Planner with a notification (and explanation) to the critical asset owner who then creates the list of associated Critical Cyber Assets and performs all necessary steps to satisfy Standards CIP-003 through 009. I noticed NERC and the RE on the list. Is there a process for independent monitoring and auditing of those entities? Bullet 1.8 of Attachment 1 should identify the TP or PC as responsible.
Response: Thank you for your comments. The burden for identifying Critical Assets is with the Responsible Entity that is the asset owner. This is consistent with FERC order 706.				

Voter	Entity	Segment	Vote	Comment
The Compliance Monitoring and Enforcement section addresses NERC and the RE. Item 1.8 – According to FAC-014-2, IROLs are established by Transmission Operators, Transmission Planners, and Planning Authorities. The Reliability Coordinator ensures that IROLs are established and are consistent with its methodology.				
Nicholas Lauriat	Network & Security Technologies	8	Negative	The term "risk-based assessment methodology" still appears in the last sentence of R3.
Response: Thank you for your comments. That reference will be removed in the posting for the next ballot.				
Jim R Stanton	SPS Consulting Group Inc.	8	Negative	Critical Asset Criteria 1.3 states: "Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes." Here, reliability purposes is not defined so the criteria is intrinsically ambiguous, which will likely trigger rounds of interpretation requests. Also, Transmission Planners and Planning Coordinators are not uniformly independent. Non-independent entities, through the application of this criteria, could designate selected competitors as "required for reliability purposes" and do so, as written, without supporting studies and independent affirmation of the designation. Hence, the dramatic costs of compliance with CIP standards will be imposed on competitors, increasing their costs and blunting competition. This criteria fails the SAR condition that states: "A reliability standard shall not give any market participant an unfair competitive advantage." This criteria clearly gives Transmission Planners and Planning Coordinators an unfair competitive advantage. If the criteria is to remain in subsequent revisions, then it should also say that such designations will be supported by independently confirmed studies showing the need for the reliability designation, and subsequent exposure to the CIP standards.
Response: Thank you for your comments. Item 1.3 – The burden for identifying Critical Assets is still the Responsible Entity that is the asset owner. There is no burden or obligation placed on the Planning Coordinator or Transmission Planner to designate any unit as needed for reliability. This criterion has been reworded to “Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.” If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, then that unit must be classified as a Critical Asset. If an entity feels that they have an asset that has been unjustly classified as “required for reliability reasons,” there are appeals processes that can be used.				
James D Burley	Midwest Reliability	10	Negative	We do not see any added value in Requirement R1. This requirement requires the reponsible entity to develop a list of its critical assets and then

Voter	Entity	Segment	Vote	Comment
	Organization			from this list, requriement R2 requires the responsible entity to develop a list of critical cyber assets for each identified critical asset. We believe this methodology is flawed. A critical cyber asset may exist at a location not deemed a critical asset.We believe this is a serious flaw in the current standard and the suggest revision does nothing to remedy it.We recommend the drafting team write the requirment so the registered entities simply identify critical cyber assets.
Response: The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues.				
Larry D Grimm	Texas Reliability Entity	10	Negative	(1) Texas RE supports the addition of specific criteria for identifying Critical Assets, as shown in Attachment 1 of this draft. (2) In R3, the reference to "risk-based assessment methodology" is a carry-over from the prior version of CIP-002, and it no longer applies in this version of the standard. (3) In Attachment 1, items 1.14 and 1.15, the term "control center" should be defined or more specifically characterized in order to provide guidance as to exactly what facilities are included. (4) In section 1.3, Compliance Monitoring and Enforcement Processes, "Periodic Data Submittal" should be added to the list, because it is a process that will be useful in monitoring this revised standard.
Response: Thank you for your comments. 1) Thank you. 2) That reference will be removed in the posting for the next ballot. 3) At this time, the SDT is choosing not to add "control center" to the NERC Glossary. We feel defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. This term is used in other approved NERC standards already in effect. 4) Thank you for your comments. At this time the SDT is not choosing to add periodic data reporting to the CIP body of standards.				
Louise McCarren	Western Electricity Coordinating Council	10	Negative	We recognize and appreciate the efforts of the drafting team in developing a bright line set of criteria for identifying Critical Assets. This approach will lead to more uniformity and consistency across the continent in the identification of Critical Assets. However, some stakeholders have indicated that the bright line Criteria included in Attachment 1 of CIP-004-2 will lead to fewer Critical Assets being identified than their initial methodology that was required by older versions of CIP-002. We encourage the drafting team to review the thresholds for identifying Critical Assets to ensure that they are appropriate. We also believe a similar effort in identifying a bright

Voter	Entity	Segment	Vote	Comment
				line criteria for Critical Cyber Assets is necessary. Stakeholders have commented regarding the lack of clarity in the language of Requirement 2 of CIP-002. The language "essential to the operation of the Critical Asset" is subjective and could lead to the same lack of uniformity and consistency in identifying Critical Cyber Assets that drove the changes in identification of Critical Assets. A lack of a uniform and consistent identification of Critical Cyber Assets may prevent the desired level of reliability and security.
Response: Thank you for your comments. While some entities may have a few assets fall off of its Critical Asset list, it is expected that overall more BES assets in North America will be classified as Critical Assets. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects to correct this phraseology in the next version.				
Jason Shaver	American Transmission Company, LLC	1	Affirmative	ATC agrees the implementation schedule in general, should allow for sufficient time (18 months from effective date; 24 months from FERC approval date) for Category 2 entities to become compliant with CIP-003 through CIP-009. However, we suggest an extension should be allowed for good cause if approved by the Regional Entity.
Response: Thank you for your comments. The suggested modification proposes an exception process to a mandatory standard, and we refer to the discussion on technical feasibility exceptions in the FERC Order. Specifically, the oversight framework which must be in place is summarized in paragraph 222.				
John J. Moraski	Baltimore Gas & Electric Company	1	Affirmative	Affirmative ballot is contingent on successfully addressing specific comments submitted on the Formal Comment Form for Project 2008-06 Cyber Security 706.
Response:Thank you for your comments. Please refer to the response to comments document.				
Chang G Choi	City of Tacoma, Department of Public Utilities, Light Division, dba	1	Affirmative	Tacoma Power has submitted comments during the comment period for Version 4 of the CIP standards. If there is a subsequent future ballot for Project 2008-06, consideration of all submitted comments need to be reflected in such ballot.

Response: Thank you for your comments. Please refer to the response to comments document.				
Christopher L de Graffenried	Consolidated Edison Co. of New York	1	Affirmative	1. New Requirement R1: We request an explicit definition of "annual." In addition, it is not clear whether the "update as necessary" applies to updates to the list during the annual review. The language should be clarified to more definitely express the "update as necessary" to be applicable to the list during the annual review. 2. New Requirement R2: In addition, there is no reason for the parenthetical with the specific inclusion of nuclear generation. It should be removed. 3. Attachment 1/Requirement R2: We suggest the removal of "control system" and "backup control system" in Attachment 1, Part 1.14. These systems should be identified as part of new Requirement R2, Critical Cyber Asset Identification. 4. Attachment 1: Part 1.3 is extremely broad and is under defined. Either delete it or provide additional specificity delineating the limited range of circumstances when a PC or TP may designate a facility as critical. 5. Attachment 1: Part 1.10 uses the phrase "the loss of the assets" without describing the relevant time period. Are these assets losses for a few cycles, for a few minutes, for a few hours or for a few days? We recommend that the conclusion of Part 1.10 state "...would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3 for a period of xx hours (e.g., 24 hours) or more." 6. Implementation Plan: Agreed, so long as an Entity can have access to an exception process with an implementation plan to request additional time due to a large increase in identified assets, without a self-reported violation, within an implementation schedule.
Response: Thank you for your comments. 1) The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects to correct this phraseology in the next version. 2) The parenthetical statement about nuclear generation comes from Attachment 1 criterion 1.1. 3) Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the				

Voter	Entity	Segment	Vote	Comment
				functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." 4) Item 1.3 – This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." 5) The phrase "loss of assets" is not limited to any period of time. A trip and a 24 hour outage would both apply. 6) Thank you for your comments.
Robert Martinko	FirstEnergy Energy Delivery	1	Affirmative	FirstEnergy appreciates the CIP Standard Drafting Team's (SDT) careful consideration of our and other stakeholder feedback during prior comment periods and the SDT's decision to develop the CIP-002-4 bright-line standard. The development of CIP-002-4 and continued use of the CIP-003 through CIP-009 standards brings needed industry consistency in Critical Asset determinations while appropriately building upon prior industry efforts of implementing the CIP standards. FirstEnergy supports CIP-002-4 and is voting AFFIRMATIVE for the standard but believes changes are needed to better clarify Attachment 1. In our view, some of the criteria are vaguely written and subject to interpretation - specifically criteria 1.8 and 1.11 - and we offer suggestions for improving expectations and compliance certainty. Additionally, we suggest less substantive changes to criteria 1.5 and 1.14 for clarity and consistency. Lastly, we encourage the SDT to reconsider its Implementation Plan for the CIP version 4 standards. The Implementation Plan is a 15 page document which is overly complex and difficult to understand. Please refer to FE's comments submitted through the parallel comment period for suggestions for improvement and simplification. The following are FirstEnergy's proposed Attachment 1 changes: 1) Criterion 1.8 currently states "Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)." Clarity needed: A.) It is not evident who is responsible for identifying the applicable transmission facilities covered by 1.8. B.) Item 1.8 should rely on review/analysis that is regularly performed by industry in meeting other NERC reliability standards. Item 1.8 should be based on IROL determinations made from planning horizon studies and information communicated to responsible entities via FAC-010/FAC-014. C.) A possible misinterpretation of Attachment 1, Item 1.8 is that it is intended to review a complete loss of substation. However the words say "Transmission Facilities at a single station location ..." not all transmission facilities at a

Voter	Entity	Segment	Vote	Comment
				single substation location. Based on the above items, FirstEnergy proposes the following for item 1.8: "1.8. Transmission Facilities designated by the Planning Coordinator or Transmission Planner that, if destroyed, degraded, misused or otherwise rendered unavailable, demonstrates the need for an Interconnection Reliability Operating Limit (IROL)." The Planning Coordinator and Transmission Planner determine and communicate IROLs in the planning time horizon per NERC reliability standard FAC-014. The subject Transmission Facilities are the contingency Transmission Facilities communicated by the PC and TP per requirement R5 of FAC-014. The 1.8 criterion should not appear to require any new study or analysis by the TP or PC. 2) Criterion 1.11 currently states "Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements" Clarity needed: The term "essential" is vague and open to interpretation. FE suggests that the SDT focus on Transmission Facilities identified in Nuclear Plant Interface Requirements identified as providing offsite power supply for nuclear plant safety requirements. We propose the following change for 1.11: "1.11 Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements." 3) Criterion 1.5 currently states "The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist." FirstEnergy suggests replacing the word "multiple" with "two or more" for clarity. 4) Criterion 1.14 currently states "Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator." FirstEnergy suggests removing the text "control system" and "or backup control system" for consistency to criteria 1.15. If the intent is to ensure coverage of offsite data centers or telecommunication centers that support the "control center" then the SDT should provide a separate criterion in Attachment 1. To extend coverage of 1.14 and not 1.15 is inconsistent and the use of the phrase "control system" is vague.
Response: Thank you for your comments. Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits				

Voter	Entity	Segment	Vote	Comment
(IROLs) and their associated contingencies." Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements. Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.				
Michael Moltane	International Transmission Company Holdings Corp	1	Affirmative	ITC Votes "Affirmative" on this ballot as we consider it a great improvement over the existing Standard. However, we do have some concerns. Specifically, new CIP-002-4 R2 Critical Cyber Asset Identification- The revisions made are introducing confusion while only identifying the inclusion of Cyber assets with delimited (arbitrarily) time for impact: "For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." Either a new qualification and characteristic of Critical Cyber Assets is created or the existing characteristics shall be updated to explicitly address the type of Cyber Asset.
Response: Thank you for your comments The requirement refers to shared cyber assets that can have a reliability impact on the group of generating units. This qualifier only includes Critical Assets identified in criterion 1.1. The 15-minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact. We have updated the wording of R2 to clarify the meaning of this phrase.				

Voter	Entity	Segment	Vote	Comment
Michael Gammon	Kansas City Power & Light Co.	1	Affirmative	The bright-lines established by the proposed standard have not been established with a strong engineering basis and do not necessarily reflect a true measure of reliability impact to the bulk electric system. It is recommended to develop a process to determine a true reliability assessment and adjust the bright-line proposed here to a deliberate and supportable definition.
Response: Thank you for your comment. The SDT believes that the implementation of Attachment 1 criteria will increase the consistency of Critical Asset identification over the existing entity defined risk-based methodology.				
Martyn Turner	Lower Colorado River Authority	1	Affirmative	1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. If a multiple path option exists from the Black Start Resource to a Next Start unit, does a Critical Path have to be designated? To clarify, the criteria states "The Facilities comprising the Cranking Paths... up to the point where multiple path option exist." If a transmission owner/operator has multiple paths originating directly at the Black Start Resource, either path could be used as a cranking path. Therefore, neither path would be considered critical. Could this be clarified? 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. 1) Does this includes radial interconnections? This is a question because a 345 kV station could be interconnected to 3 other stations, but one of the interconnections could be a radial 345 kV line connected to a generator. 2) Is there a distance requirement for the interconnection? This is a question because a 345 kV station could be interconnected to 3 other stations, but one of the interconnections could be a 345kV bus connected to another station a few feet away. These questions need to be resolved; otherwise a negative may be considered for these standards in the future ballots.
Response: Thank you for your response Item 1.5 – The point where multiple paths exist in the Cranking Path is the step in the Transmission Operator's restoration plan per EOP-005-2 R1.5, "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started," where the Transmission Operator can choose between the next Facilities on the BES to energize. Based on your example, neither path would be identified as a Critical Asset.				

Voter	Entity	Segment	Vote	Comment
Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset a Transmission Facility operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. There is no distance requirement in the criterion.				
Saurabh Saksena	National Grid	1	Affirmative	1. First, the proposed standard will lead to an improvement in reliability for entities that are either newly registered or envision new assets coming under their CIP purview. However, based on a preliminary assessment, National Grid anticipates minimal impact of the proposed revisions for National Grid's registered entities. Because National Grid's current risk-based methodology for identifying critical assets is similar to the bright-line criteria proposed in the revision for CIP-002, National Grid's current critical asset list is very inclusive Hence, from National Gird's perspective, the proposed standard will not lead to a significant improvement in reliability with regard to National Grid's facilities because it will not result in a significant increase in the number of assets identified as critical. Second, the proposed revision to the standard aims to replace the existing risk-based methodology with the new bright-line criteria. However, R3 of the proposed standard (reproduced below) still refers to the risk-based methodology. National Grid proposes to delete the reference to the risk-based methodology in R3 for consistency and to reduce the possibility of confusion on the part of senior managers attempting to comply with R3. 2. National Grid proposes to include the class of assets - generation, transmission, and control centers against each criterion in attachment 1. This will help entities to clearly identify which requirements fall under different classes of assets. For example - 1.5 The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist. (Generation, transmission) 3. The standard clearly mentions the documentation required to comply with CIP-002-4 which includes - list of Critical Assets as specified in R1, list of Critical Cyber Assets as specified in R2, and approval records of annual approvals as specified in R3. However, in the Guidance document, Page 7, bullet point 2, second sentence, it states the following - "...Responsible Entity should document all criteria that qualify this asset as a Critical Asset..." National Grid recommends that the drafting team clarifies the

Voter	Entity	Segment	Vote	Comment
				documentation requirements to avoid such discrepancies. If the standards drafting board expects entities to document, and retain documentation, of the criteria that supports the categorization of critical assets, this should be explicitly required by the standard. As the proposed standard is written, the only documentation registered entities must create and retain is the actual list of the assets.
Response: Thank you for your comments. 1) Prior to the next round of balloting, the reference to risk-based methodology in R3 will be removed. 2) The Applicability section of the standard specifies to which NERC Registered Entities the standard applies. All Requirements apply to all Entities listed in the Applicability section. 3) The guidance document has been updated to delete the reference.				
David H. Boguslawski	Northeast Utilities	1	Affirmative	Regarding CIP-002-4 Attachment 1, please consider the following: CIP-002-1 Attachment 1 criterion 1.3 reads: "Each generation facility that the planning coordinator or transmission planner designates as required for reliability purposes". We believe that as stated, this criterion (1.3) is subject to interpretation. Specifically, "for reliability purposes" can be interpreted as "must-run" units, required for black start (although that could be duplicative to criteria 1.4), or as any generator containing BPS elements. Suggest more clearly defining "for reliability purposes" or restating the criterion. The terminology used in the recent NERC data request appeared to be clearer - that is: "Any generation facility that the planning coordinator identifies as Reliability 'must run' assigned units". CIP-002-1 Attachment 1 criterion 1.10 reads: "Transmission facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3." We believe that as stated, this criterion (1.10) could be interpreted to mean not only generators owned by the responsible entity but also those not owned by but interconnected to the Transmission Owner's system. Clarification of criterion 1.3 should serve to clarify criterion 1.10 as well.
Response: Thank you for your comments. Item 1.3 – This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." Item 1.10 – The SDT agrees that not only generators owned by the Responsible Entity but also those not owned by but interconnected to the				

Voter	Entity	Segment	Vote	Comment
Transmission Owner's system are subject to criterion 1.10.				
Pawel Krupa	Seattle City Light	1	Affirmative	Seattle City Light Subject Matter Expert (SME) supports the changes proposed for CIP-002-4 and recommends a "yes" vote despite imperfections with the language of draft Appendix A. SME recommends comments in the hope that the language yet will be clarified. Specifically, Seattle City Light commends the change to a "bright-line" approach to identifying Critical Assets as proposed in draft CIP-002-4. The use of nationwide criteria reasonably captures as Critical Assets the large generating units and high voltage transmission facilities essential to the reliable operation of the North American Bulk Power System. The flexibility afforded individual Planning Coordinators and Transmission Planners to specify additional facilities as Critical Assets important to local reliability furthers the objective of Bulk Power System reliability by allowing some smaller generating units and transmission facilities to be called out as Critical Assets without drawing in all assets of a certain size that are not critical elsewhere. These changes are consistent with Seattle City Light's philosophy towards Critical Assets, which always has been about stepping up and acknowledging the importance of identifying and protecting all Critical Assets essential to the reliability of the bulk power system. Ultimately CIP-002-4 as proposed promises to benefit the electricity industry, consumers, and North America by improving reliability through a certain and consistent application of the Critical Asset identification process. That said, Seattle City Light SME expresses concern that imperfections in the language of draft CIP-002-4 may frustrate its promise of bringing Critical Asset certainty and consistency. Imprecise language has been a recurring problem all throughout the short life of the NERC Mandatory Reliability Standards. Unnecessary compliance difficulties, tortured interpretations, and wasteful efforts have resulted. Lack of care with language threatens the existing regulatory regime by fostering distrust among industry, regulators, government, and the public at large. As such the comments below are offered as potential corrections to the details of draft and not as reflecting on the "bright-line" approach of proposed CIP-002-4. 1. Requirement 2 of draft CIP-002-4 states, "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable

Voter	Entity	Segment	Vote	Comment
				operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." Seattle City Light is finding the term 'shared Cyber Assets' unclear and suggests clarification as follows: "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those Cyber Assets networked to a system that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." 2. Critical Asset criterion 1.7 of CIP-002-4, Appendix A, identifies as Critical Assets "Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV of higher with three or more other transmission stations." Seattle City Light agrees with Lower Colorado River Authority that additional detail is needed about the nature of the specified interconnections. In particular, questions exist as to type (what about a radial line connected to a generator-does it count?) and distance (does a high-voltage bus count if connected to another substation a dozen feet away?). 3. Critical Asset criterion 1.13 indicates that "Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes" are Critical Assets. Seattle City Light concurs with the assessment of APPA and others that this wording may inadvertently include any SCADA system that controls 300 MW or more of load (and thus has 'capability' to shed it), and recommends wording similar to item 1.11 of draft CIP-010-1, "BES elements that perform automatic aggregate load shedding of 300 MW or more within 15 minutes."

Response: Thank you for your comments.

1) Requirement R2 has been changed to clarify the issues presented.
2) Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset a Transmission Facility operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. There is no distance requirement in the criterion.
3) Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."

Voter	Entity	Segment	Vote	Comment
Allen Klassen	Westar Energy	1	Affirmative	Westar shares and would echo many of the concerns already expressed by other entities, but is casting an affirmative vote to move this process forward.
Response: Thank you for your comments.				
Peter T Yost	Consolidated Edison Co. of New York	3	Affirmative	1. New Requirement R1: We request an explicit definition of "annual." In addition, it is not clear whether the "update as necessary" applies to updates to the list during the annual review. The language should be clarified to more definitely express the "update as necessary" to be applicable to the list during the annual review. 2. New Requirement R2: In addition, there is no reason for the parenthetical with the specific inclusion of nuclear generation. It should be removed. 3. Attachment 1/Requirement R2: We suggest the removal of "control system" and "backup control system" in Attachment 1, Part 1.14. These systems should be identified as part of new Requirement R2, Critical Cyber Asset Identification. 4. Attachment 1: Part 1.3 is extremely broad and is under defined. Either delete it or provide additional specificity delineating the limited range of circumstances when a PC or TP may designate a facility as critical. 5. Attachment 1: Part 1.10 uses the phrase "the loss of the assets" without describing the relevant time period. Are these assets losses for a few cycles, for a few minutes, for a few hours or for a few days? We recommend that the conclusion of Part 1.10 state "...would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3 for a period of xx hours (e.g., 24 hours) or more." 6. Implementation Plan: Agreed, so long as an Entity can have access to an exception process with an implementation plan to request additional time due to a large increase in identified assets, without a self-reported violation, within an implementation schedule.
Response: Thank you for your comments. 1) The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects to correct this phraseology in the next version. 2) The parenthetical statement about nuclear generation comes from Attachment 1 criterion 1.1. 3) Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which				

Voter	Entity	Segment	Vote	Comment
				states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." 4) Item 1.3 – This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." 5) The phrase "loss of assets" is not limited to any period of time. A trip and a 24 hour outage would both apply. 6) Thank you for your comments.
Henry Ernst-Jr	Duke Energy Carolina	3	Affirmative	Duke Energy appreciates the drafting team's work, and offers the following comments, which are also being submitted via the comment form: 1. We agree that the revised CIP-002-4 will lead to an improvement in reliability. However, CIP-003 through CIP-009 need modifications other than just changing the revision numbers, as evidenced by numerous interpretation requests and general confusion in the industry. While we understand that the plan is to complete those modifications in 2011, industry will be adding numerous Critical Assets and Critical Cyber Assets due to these revisions to CIP-002. Applying the current versions of CIP-003 through CIP-009 to numerous additional Critical Cyber Assets compounds the difficulty of maintaining compliance without more clear direction. 2. CIP-002-4 Attachment 1 criteria need further clarification. a. 1.1 - Consistent with Criteria 1.8 and 1.9, this criterion should be conditioned by adding the phrase "unless planning studies are available to demonstrate that the loss of generation does not cause violation of one or more Interconnection Reliability Operating Limits (IROLs)." Related to the generation loss impact on Interconnection frequency and resource adequacy, Duke Energy disagrees with the arbitrary selection of the generation loss MW amount for the following reasons: o System inertia and frequency response factor into potential impact a generation loss could have on Interconnection frequency, and are different for each Interconnection. A 1,500 MW loss in the Eastern Interconnection is much less significant in terms of the initial frequency deviation than a similar loss within any other Interconnection. o The limit fails to recognize the options available to the Balancing Authority to restore its balance within the existing criteria of the NERC reliability standards. For example, recovery from the loss of 1,500 MW within a 5,000 MW Balancing Authority may be quite different than recovery from a 1,500 MW loss within a 135,000 MW Balancing Authority in the Eastern Interconnection. PJM alone is about

Voter	Entity	Segment	Vote	Comment
				twice the size of ERCOT. b. 1.2 - We believe that 1000 MVAR may too large, and should be reduced to 500 MVAR. However criterion 1.2 could just be deleted, since any significant reactive resources would be picked up under criterion 1.8 c. 1.3 - "Generation designated as required for reliability purposes" doesn't seem to be a very "bright-line". We believe this criterion should be further clarified by including language from the "Rationale and Implementation Reference Document". d. 1.4 - Need to clarify that this criterion only includes the primary Blackstart Resources. Entities may include various alternative resources in their restoration plans which aren't Critical Assets, but which may not be clearly distinguished from the primary Blackstart Resources in the restoration plan. Add the phrase "that the entity intends to rely on for system restoration". e. 1.5 - The CIPDT is looking to the industry to define Critical Assets based on NERC definitions that are somewhat ambiguous and can be redefined by Standard Drafting Teams any time a group of standards is proposed. This could lead to Critical Assets being removed or added without proper analysis being performed on the impact to the system. Also, the definition of Cranking Path could be debated that it could be from a generating source that provides electricity to a larger resource during restoration. This source could be a small diesel that is sitting next to a large generator that provides the electricity to lift pumps, exciter field, or some other device that provides the means for a larger generator to become a Blackstart Resource. Or it could be argued that the cranking path is from a Blackstart Resource to fossil plants on the system that are used to facilitate the restoration of the system. Duke Energy requests that the Drafting team rewrite this requirement so that it does not use this term. Duke Energy also believes that the CIPDT should get input from those that are familiar with Restoration by requesting input from the Emergency Operations Drafting Team. We propose rewriting 1.5 as follows: The Facilities comprising the current carrying path from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan, up to the point where multiple path options exist. f. 1.8 & 1.9 - These two criteria need clarification. First, it should be made clear that this IROL evaluation is to be made in the planning timeframe, because the purpose is to identify Critical Cyber Assets that need to be protected, which is an activity that takes place in the planning timeframe. Also, including the word "destroyed" in the phrase "destroyed, degraded,

Voter	Entity	Segment	Vote	Comment
				misused or otherwise rendered unavailable" creates significant uncertainty regarding what the IROL analysis is intended to encompass. Add the phrase "via cyber attack" after the word "unavailable". This will clarify that the evaluation only encompasses destruction, degradation or misuse that can be achieved via cyber attack, and not a physical attack on the station. For example, physical attack could imply multiple transmission lines shorted to ground, which entails a much different analysis than transmission lines removed from service via cyber attack. NOTE: The physical security provided by the CIP standards is focused on protection of the Critical Cyber Assets, not the Critical Assets. g. 1.10 - As with our comment on 1.8 & 1.9 above, add the phrase "via cyber attack" after the word "unavailable". We also have a concern that if an entity fails to identify a facility under 1.1 or 1.3, they will also be in violation for failing to identify the corresponding Transmission Facilities under 1.10 (i.e. the double jeopardy issue). Need to replace the phrase "described in" with the phrase "identified by an entity pursuant to". Alternatively, 1.10 could be folded into 1.1 and 1.3 by adding the phrase "and Transmission Facilities providing the generation interconnection" to those criteria. h. 1.11 - Need to clarify that these Transmission Facilities are those that are specifically identified in the Nuclear Plant Interface Requirements (NPIRs) in the Agreement developed between the Nuclear Plant Generator Operator and applicable Transmission Entities pursuant to NUC-001-2. At the end of this criterion add the phrase "in the Agreement(s) required by NUC-001 R2." i. 1.12 - As with our comment on 1.8 & 1.9 above, this criterion should be revised to clarify that this IROL evaluation is to be made in the planning timeframe, because the purpose is to identify Critical Cyber Assets that need to be protected, which is an activity that takes place in the planning timeframe. Also, the phrase "destroyed, degraded, misused or otherwise rendered unavailable" needs to be clarified by adding the phrase "via cyber attack" after the word "unavailable". j. 1.13 - Load control programs shouldn't be defined as Critical Assets but rather Critical Cyber Assets, since they are a function of the control center, which is already a Critical Asset. Replace the word "Common" with the phrase "Each control center or backup control center used to". Also, clarify the meaning of "automatic" by inserting the parenthetical (without human intervention) after the word "automatic". k. 1.14 - This criterion is far too broad because we don't have an approved

Voter	Entity	Segment	Vote	Comment
				NERC definition of control room, control system, backup control room or backup control system. Many switchyards and substations have control systems that could be used to perform transmission functions, but that doesn't mean that they are "Critical Assets". Remove control system and backup control system from this criterion and limit it to identifying the control centers and backup control centers associated with the Critical Assets on the transmission system, just as criteria 1.15 links identification of the control center or backup co

Response: Thank you for your comments.

The SDT agrees that other changes ultimately need to be made to the body of CIP standards, and expects to post them next year.

Item 1.1 - Prior drafts had wording about reserve sharing for the threshold. The SDT received feedback that that wording was confusing, that the amount referred to in the reserve sharing was not a specific amount, and that the amounts changed daily. The drafting team conducted an informal survey of the regions, and identified what the megawatt value of the reserve sharing would be for various groups. The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions. Based on information provided on the DOE website, the SDT believes that an increased amount of generation capacity will be classified as Critical Assets in the US.

Item 1.2 – The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.4 – A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." EOP-005-2 R1.4 states that the restoration plan must include "Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit." The SDT feels that these Blackstart Resources must be classified as Critical Assets. It should be noted that not all blackstart generators must be designated as Blackstart Resources.

Item 1.5 – NERC standard EOP-005-2 R1.5, "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started," designates that Cranking Paths must be identified.

Items 1.8 & 1.9 – Cyber analysis is contained in Requirement R2, not in the identification of Critical Assets.

Item 1.10 – Cyber analysis is contained in Requirement R2, not in the identification of Critical Assets. There is no double jeopardy, since all

Voter	Entity	Segment	Vote	Comment
of these criteria are contained in the same Requirement. Item 1.11 – The SDT does not believe that adding the phrase "in the Agreement(s) required by NUC-001 R2" provides any clarification, since the defined NERC term Nuclear Plant Interface Requirements is "The requirements based on NPLRs and Bulk Electric System requirements that have been mutually agreed to by the Nuclear Plant Generator Operator and the applicable Transmission Entities." Item 1.12 – Cyber analysis is contained in Requirement R2, not in the identification of Critical Assets. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."				
Kevin Querry	FirstEnergy Solutions	3	Affirmative	FirstEnergy appreciates the CIP Standard Drafting Team's (SDT) careful consideration of our and other stakeholder feedback during prior comment periods and the SDT's decision to develop the CIP-002-4 bright-line standard. The development of CIP-002-4 and continued use of the CIP-003 through CIP-009 standards brings needed industry consistency in Critical Asset determinations while appropriately building upon prior industry efforts of implementing the CIP standards. FirstEnergy supports CIP-002-4 and is voting AFFIRMATIVE for the standard but believes changes are needed to better clarify Attachment 1. In our view, some of the criteria are vaguely written and subject to interpretation - specifically criteria 1.8 and 1.11 - and we offer suggestions for improving expectations and compliance certainty. Additionally, we suggest less substantive changes to criteria 1.5 and 1.14 for clarity and consistency. Lastly, we encourage the SDT to reconsider its Implementation Plan for the CIP version 4 standards. The Implementation Plan is a 15 page document which is overly complex and difficult to understand. Please refer to FE's comments submitted through the parallel comment period for suggestions for improvement and simplification. The following are FirstEnergy's proposed Attachment 1 changes: 1) Criterion 1.8 currently states "Transmission Facilities at a single station

Voter	Entity	Segment	Vote	Comment
				location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)." Clarity needed: A.) It is not evident who is responsible for identifying the applicable transmission facilities covered by 1.8. B.) Item 1.8 should rely on review/analysis that is regularly performed by industry in meeting other NERC reliability standards. Item 1.8 should be based on IROL determinations made from planning horizon studies and information communicated to responsible entities via FAC-010/FAC-014. C.) A possible misinterpretation of Attachment 1, Item 1.8 is that it is intended to review a complete loss of substation. However the words say "Transmission Facilities at a single station location ..." not all transmission facilities at a single substation location. Based on the above items, FirstEnergy proposes the following for item 1.8: "1.8. Transmission Facilities designated by the Planning Coordinator or Transmission Planner that, if destroyed, degraded, misused or otherwise rendered unavailable, demonstrates the need for an Interconnection Reliability Operating Limit (IROL)." The Planning Coordinator and Transmission Planner determine and communicate IROLs in the planning time horizon per NERC reliability standard FAC-014. The subject Transmission Facilities are the contingency Transmission Facilities communicated by the PC and TP per requirement R5 of FAC-014. The 1.8 criterion should not appear to require any new study or analysis by the TP or PC. 2) Criterion 1.11 currently states "Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements" Clarity needed: The term "essential" is vague and open to interpretation. FE suggests that the SDT focus on Transmission Facilities identified in Nuclear Plant Interface Requirements identified as providing offsite power supply for nuclear plant safety requirements. We propose the following change for 1.11: "1.11 Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements." 3) Criterion 1.5 currently states "The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist." FirstEnergy suggests replacing the word "multiple" with "two or more" for clarity. 4) Criterion 1.14 currently states "Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator." FirstEnergy suggests removing the

Voter	Entity	Segment	Vote	Comment
				text “control system” and “or backup control system” for consistency to criteria 1.15. If the intent is to ensure coverage of offsite data centers or telecommunication centers that support the “control center” then the SDT should provide a separate criterion in Attachment 1. To extend coverage of 1.14 and not 1.15 is inconsistent and the use of the phrase “control system” is vague.
Response: Thank you for your comments. Item 1.8 – This criterion has been changed to “Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.” Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 “Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.” It is not limited to offsite power requirements. Item 1.5 – This criterion has been reworded to “The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan.” Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to “Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator.” A new criterion, 1.16, has been added which states, “Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.” A new criterion, 1.17, has also been added which states, ”Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection.” The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.				
R Scott S. Barfield-McGinnis	Georgia System Operations Corporation	3	Affirmative	Additional clarity is needed to criteria 1.15 in Attachment 1 regarding what constitutes control. For example, merely sending set points to a generator which will reject those inputs if they are outside preset parameters should not constitute control of that generation.
Response: Thank you for your comments. Item 1.15 –This criterion has been changed to “Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection.”				

Voter	Entity	Segment	Vote	Comment
Charles Locke	Kansas City Power & Light Co.	3	Affirmative	The bright lines established by the proposed standard have not been established with a strong engineering basis and do not necessarily reflect a true measure of reliability impact to the bulk electric system. It is recommended to develop a process to determine a true reliability assessment and adjust the bright line proposed here to a deliberate and supportable definition.
Response: Thank you for your comments. Please refer to the response to comments document.				
David Burke	Orange and Rockland Utilities, Inc.	3	Affirmative	1. New Requirement R1: ORU requests an explicit definition of "annual." In addition, it is not clear whether the "update as necessary" applies to updates to the list during the annual review. The language should be clarified to more definitely express the "update as necessary" to be applicable to the list during the annual review. 2. New Requirement R2: In addition, there is no reason for the parenthetical with the specific inclusion of nuclear generation. It should be removed. 3. Attachment 1/Requirement R2: ORU suggests the removal of "control system" and "backup control system" in Attachment 1, Part 1.14. These systems should be identified as part of new Requirement R2, Critical Cyber Asset Identification. 4. Attachment 1: Part 1.3 is extremely broad and is under defined. Either delete it or provide additional specificity delineating the limited range of circumstances when a PC or TP may designate a facility as critical. 5. Attachment 1: Part 1.10 uses the phrase "the loss of the assets" without describing the relevant time period. Are these assets losses for a few cycles, for a few minutes, for a few hours or for a few days? We recommend that the conclusion of Part 1.10 state "...would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3 for a period of xx hours (e.g., 24 hours) or more." 6. Implementation Plan: Agreed, so long as an Entity can have access to an exception process with an implementation plan to request additional time due to a large increase in identified assets, without a self-reported violation, within an implementation schedule.
Response: Thank you for your comments. 1) The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects to correct this phraseology in the next version.				

Voter	Entity	Segment	Vote	Comment
2) The parenthetical statement about nuclear generation comes from Attachment 1 criterion 1.1. 3) Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." 4) Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." 5) The phrase "loss of assets" is not limited to any period of time. A trip and a 24-hour outage would both apply. 6) Thank you for your comments.				
Dana Wheelock	Seattle City Light	3	Affirmative	Specifically, Seattle City Light commends the change to a "bright line" approach to identifying Critical Assets as proposed in draft CIP-002-4. The use of nationwide criteria reasonably captures as Critical Assets the large generating units and high voltage transmission facilities essential to the reliable operation of the North American Bulk Power System. The flexibility afforded individual Planning Coordinators and Transmission Planners to specify additional facilities as Critical Assets important to local reliability furthers the objective of Bulk Power System reliability by allowing some smaller generating units and transmission facilities to be called out as Critical Assets without drawing in all assets of a certain size that are not critical elsewhere. These changes are consistent with Seattle City Light's philosophy towards Critical Assets, which always has been about stepping up and acknowledging the importance of identifying and protecting all Critical Assets essential to the reliability of the bulk power system. Ultimately CIP-002-4 as proposed promises to benefit the electricity industry, consumers, and North America by improving reliability through a certain and consistent application of the Critical Asset identification process. That said, Seattle City Light expresses concern that imperfections in the language of draft CIP-002-4 may frustrate its promise of bringing Critical Asset certainty and consistency. Imprecise language has been a recurring problem all throughout the short life of the NERC Mandatory Reliability Standards. Unnecessary compliance difficulties, tortured interpretations, and wasteful efforts have resulted. Lack of care with language threatens the existing regulatory regime by fostering distrust

Voter	Entity	Segment	Vote	Comment
				among industry, regulators, government, and the public at large. As such the comments below are offered as potential corrections to the details of draft and not as reflecting on the "bright-line" approach of proposed CIP-002-4. 1. Requirement 2 of draft CIP-002-4 states, "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." Seattle City Light follows Tacoma Power in finding the term 'shared Cyber Assets' unclear and suggests clarification as follows: "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those Cyber Assets networked to a system that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." 2. Critical Asset criterion 1.7 of CIP-002-4, Appendix A, identifies as Critical Assets "Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV of higher with three or more other transmission stations." Seattle City Light agrees with Lower Colorado River Authority that additional detail is needed about the nature of the specified interconnections. In particular, questions exist as to type (what about a radial line connected to a generator-does it count?) and distance (does a high-voltage bus count if connected to another substation a dozen feet away?). 3. Critical Asset criterion 1.13 indicates that "Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes" are Critical Assets. Seattle City Light concurs with the assessment of APPA and others that this wording may inadvertently include any SCADA system that controls 300 MW or more of load (and thus has 'capability' to shed it), and recommends wording similar to item 1.11 of draft CIP-010-1, "BES elements that perform automatic aggregate load shedding of 300 MW or more within 15 minutes." 4. Critical Asset criterion 1.15 states "Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection." Seattle City Light concurs with APPA in understanding that this criterion is intended to apply to control centers controlling multiple

Voter	Entity	Segment	Vote	Comment
				units, and recommends the following wording: "Each control center or backup control center used to control multiple generation units identified as Critical Assets, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection."
Response: Thank you for your comments. 1) Requirement R2 has been changed to clarify the issues presented. 2) Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Assets Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. There is no distance requirement in the criterion. 3) Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." 4) Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."				
Travis Metcalfe	Tacoma Public Utilities	3	Affirmative	Tacoma Power has submitted comments during the comment period for Version 4 of the CIP standards. If there is a subsequent future ballot for Project 2008-06, consideration of all submitted comments need to be reflected in such ballot.
Response: Thank you for your comments. Please refer to the response to comments document.				
Guy Andrews	Georgia System Operations Corporation	4	Affirmative	Additional clarity is needed to criteria 1.15 in Attachment 1 regarding what constitutes control. For example, merely sending set points to a generator which will reject those inputs if they are outside preset parameters should not constitute control of that generation.
Response: Thank you for your comments. Item 1.15 –This criterion has been changed to "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control				

Voter	Entity	Segment	Vote	Comment
center used to control aggregate generation equal to or exceeding 1500 MWs in a single Interconnection."				
Douglas Hohlbaugh	Ohio Edison Company	4	Affirmative	FirstEnergy appreciates the CIP Standard Drafting Team's (SDT) careful consideration of our and other stakeholder feedback during prior comment periods and the SDT's decision to develop the CIP-002-4 bright-line standard. The development of CIP-002-4 and continued use of the CIP-003 through CIP-009 standards brings needed industry consistency in Critical Asset determinations while appropriately building upon prior industry efforts of implementing the CIP standards. FirstEnergy supports CIP-002-4 and is voting AFFIRMATIVE for the standard but believes changes are needed to better clarify Attachment 1. In our view, some of the criteria are vaguely written and subject to interpretation - specifically criteria 1.8 and 1.11 - and we offer suggestions for improving expectations and compliance certainty. Additionally, we suggest less substantive changes to criteria 1.5 and 1.14 for clarity and consistency. Lastly, we encourage the SDT to reconsider its Implementation Plan for the CIP version 4 standards. The Implementation Plan is a 15 page document which is overly complex and difficult to understand. Please refer to FE's comments submitted through the parallel comment period for suggestions for improvement and simplification. The following are FirstEnergy's proposed Attachment 1 changes: 1) Criterion 1.8 currently states "Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)." Clarity needed: A.) It is not evident who is responsible for identifying the applicable transmission facilities covered by 1.8. B.) Item 1.8 should rely on review/analysis that is regularly performed by industry in meeting other NERC reliability standards. Item 1.8 should be based on IROL determinations made from planning horizon studies and information communicated to responsible entities via FAC-010/FAC-014. C.) A possible misinterpretation of Attachment 1, Item 1.8 is that it is intended to review a complete loss of substation. However the words say "Transmission Facilities at a single station location ..." not all transmission facilities at a single substation location. Based on the above items, FirstEnergy proposes the following for item 1.8: "1.8. Transmission Facilities designated by the Planning Coordinator or Transmission Planner that, if destroyed, degraded, misused or otherwise rendered unavailable, demonstrates the need for an Interconnection Reliability Operating Limit (IROL)." The Planning

Voter	Entity	Segment	Vote	Comment
				Coordinator and Transmission Planner determine and communicate IROLs in the planning time horizon per NERC reliability standard FAC-014. The subject Transmission Facilities are the contingency Transmission Facilities communicated by the PC and TP per requirement R5 of FAC-014. The 1.8 criterion should not appear to require any new study or analysis by the TP or PC. 2) Criterion 1.11 currently states “Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements” Clarity needed: The term “essential” is vague and open to interpretation. FE suggests that the SDT focus on Transmission Facilities identified in Nuclear Plant Interface Requirements identified as providing offsite power supply for nuclear plant safety requirements. We propose the following change for 1.11: “1.11 Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements.” 3) Criterion 1.5 currently states “The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist.” FirstEnergy suggests replacing the word “multiple” with “two or more” for clarity. 4) Criterion 1.14 currently states “Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator.” FirstEnergy suggests removing the text “control system” and “or backup control system” for consistency to criteria 1.15. If the intent is to ensure coverage of offsite data centers or telecommunication centers that support the “control center” then the SDT should provide a separate criterion in Attachment 1. To extend coverage of 1.14 and not 1.15 is inconsistent and the use of the phrase “control system” is vague.
Response: Thank you for your comments. Item 1.8 – This criterion has been changed to “Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.” Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2, “Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.” It is not limited to offsite power requirements.				

Voter	Entity	Segment	Vote	Comment
Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.				
Hao Li	Seattle City Light	4	Affirmative	Specifically, Seattle City Light commends the change to a "bright-line" approach to identifying Critical Assets as proposed in draft CIP-002-4. The use of nationwide criteria reasonably captures as Critical Assets the large generating units and high voltage transmission facilities essential to the reliable operation of the North American Bulk Power System. The flexibility afforded individual Planning Coordinators and Transmission Planners to specify additional facilities as Critical Assets important to local reliability furthers the objective of Bulk Power System reliability by allowing some smaller generating units and transmission facilities to be called out as Critical Assets without drawing in all assets of a certain size that are not critical elsewhere. These changes are consistent with Seattle City Light's philosophy towards Critical Assets, which always has been about stepping up and acknowledging the importance of identifying and protecting all Critical Assets essential to the reliability of the bulk power system. 				the comments below are offered as potential corrections to the details of draft and not as reflecting on the "bright-line" approach of proposed CIP-002-4. 1. Requirement 2 of draft CIP-002-4 states, "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." Seattle City Light follows Tacoma Power in finding the term 'shared Cyber Assets' unclear and suggests clarification as follows: "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those Cyber Assets networked to a system that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." 2. Critical Asset criterion 1.7 of CIP-002-4, Appendix A, identifies as Critical Assets "Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV of higher with three or more other transmission stations." Seattle City Light agrees with Lower Colorado River Authority that additional detail is needed about the nature of the specified interconnections. In particular, questions exist as to type (what about a radial line connected to a generator-does it count?) and distance (does a high-voltage bus count if connected to another substation a dozen feet away?). 3. Critical Asset criterion 1.13 indicates that "Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes" are Critical Assets. Seattle City Light concurs with the assessment of APPA and others that this wording may inadvertently include any SCADA system that controls 300 MW or more of load (and thus has 'capability' to shed it), and recommends wording similar to item 1.11 of draft CIP-010-1, "BES elements that perform automatic aggregate load shedding of 300 MW or more within 15 minutes." 4. Critical Asset criterion 1.15 states "Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection." Seattle City Light concurs with APPA in understanding that this criterion is intended to apply to control centers controlling multiple units, and recommends the following wording: "Each control center or

Voter	Entity	Segment	Vote	Comment
				backup control center used to control multiple generation units identified as Critical Assets, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection."
Response: Thank you for your comments. 1) Requirement R2 has been changed to clarify the issues presented. 2) Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset a Transmission Facility operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. There is no distance requirement in the criterion. 3) Item 1.13 – This criterion has been changed to "System(s) or facilities that perform automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." 4) Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."				
Keith Morisette	Tacoma Public Utilities	4	Affirmative	Tacoma Power has submitted comments during the comment period for Version 4 of the CIP standards. If there is a subsequent future ballot for Project 2008-06, consideration of all submitted comments need to be reflected in such ballot.
Response: Thank you for your comments. Please refer to the response to comments document.				
Max Emrick	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	5	Affirmative	Tacoma Power has submitted comments during the comment period for Version 4 of the CIP standards. If there is a subsequent future ballot for Project 2008-06, consideration of all submitted comments need to be reflected in such ballot.

Response: Thank you for your comments. Please refer to the response to comments document.				
Amir Y Hammad	Constellation Power Source Generation, Inc.	5	Affirmative	This affirmative ballot is contingent on successfully addressing specific comments submitted on the Formal Comment Form for Project 2008-06 Cyber Security 706.
Response: Thank you for your comments. Please refer to the response to comments document.				
Kenneth Dresner	FirstEnergy Solutions	5	Affirmative	FirstEnergy appreciates the CIP Standard Drafting Team's (SDT) careful consideration of our and other stakeholder feedback during prior comment periods and the SDT's decision to develop the CIP-002-4 bright-line standard. The development of CIP-002-4 and continued use of the CIP-003 through CIP-009 standards brings needed industry consistency in Critical Asset determinations while appropriately building upon prior industry efforts of implementing the CIP standards. FirstEnergy supports CIP-002-4 and is voting AFFIRMATIVE for the standard but believes changes are needed to better clarify Attachment 1. In our view, some of the criteria are vaguely written and subject to interpretation - specifically criteria 1.8 and 1.11 - and we offer suggestions for improving expectations and compliance certainty. Additionally, we suggest less substantive changes to criteria 1.5 and 1.14 for clarity and consistency. Lastly, we encourage the SDT to reconsider its Implementation Plan for the CIP version 4 standards. The Implementation Plan is a 15 page document which is overly complex and difficult to understand. Please refer to FE's comments submitted through the parallel comment period for suggestions for improvement and simplification. The following are FirstEnergy's proposed Attachment 1 changes: 1) Criterion 1.8 currently states "Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)." Clarity needed: A.) It is not evident who is responsible for identifying the applicable transmission facilities covered by 1.8. B.) Item 1.8 should rely on review/analysis that is regularly performed by industry in meeting other NERC reliability standards. Item 1.8 should be based on IROL determinations made from planning horizon studies and information communicated to responsible entities via FAC-010/FAC-014. C.) A possible

Voter	Entity	Segment	Vote	Comment
				misinterpretation of Attachment 1, Item 1.8 is that it is intended to review a complete loss of substation. However the words say “Transmission Facilities at a single station location …” not all transmission facilities at a single substation location. Based on the above items, FirstEnergy proposes the following for item 1.8: “1.8. Transmission Facilities designated by the Planning Coordinator or Transmission Planner that, if destroyed, degraded, misused or otherwise rendered unavailable, demonstrates the need for an Interconnection Reliability Operating Limit (IROL).” The Planning Coordinator and Transmission Planner determine and communicate IROLs in the planning time horizon per NERC reliability standard FAC-014. The subject Transmission Facilities are the contingency Transmission Facilities communicated by the PC and TP per requirement R5 of FAC-014. The 1.8 criterion should not appear to require any new study or analysis by the TP or PC. 2) Criterion 1.11 currently states “Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements” Clarity needed: The term “essential” is vague and open to interpretation. FE suggests that the SDT focus on Transmission Facilities identified in Nuclear Plant Interface Requirements identified as providing offsite power supply for nuclear plant safety requirements. We propose the following change for 1.11: “1.11 Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements.” 3) Criterion 1.5 currently states “The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist.” FirstEnergy suggests replacing the word “multiple” with “two or more” for clarity. 4) Criterion 1.14 currently states “Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator.” FirstEnergy suggests removing the text “control system” and “or backup control system” for consistency to criteria 1.15. If the intent is to ensure coverage of offsite data centers or telecommunication centers that support the “control center” then the SDT should provide a separate criterion in Attachment 1. To extend coverage of 1.14 and not 1.15 is inconsistent and the use of the phrase “control system” is vague.

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comments. Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements. Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval.				
Michelle DAntuono	Occidental Chemical	5	Affirmative	Although Occidental Chemical has voted to approve CIP-002-4, we are concerned about the ambiguous wording under Criterion 1.3 "Each generation Facility that the Planning Coordinator or Transmission Planner designates as required for reliability purposes." Although clarified in the CIP-002-4 Rationale and Implementation Reference Document as those generation facilities designated as "Reliability Must Run", the language in the standard is the ultimate arbiter. We understand that not all regions use the term "Reliability Must Run", but Criterion 1.3 as written is too open-ended - which violates the intent of NERC's goal to develop requirements that are clear and measurable.
Response: Thank you for your comments. Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."				

Voter	Entity	Segment	Vote	Comment
Annette M Bannon	PPL Generation LLC	5	Affirmative	Regarding Attachment 1, section 1.1, a generation plant that is tripped as part of a Remedial Action Scheme (Special Protection System) to protect the Bulk Electric System should be exempted from Critical Asset designation. The inclusion of a generation plant in a RAS scheme infers that the plant is not critical to the operation of the BES. NERC included this same criteria in their guidance document "Security Guideline for the Electricity Sector: Identifying Critical Assets," page 10, table C-2.
Response: Thank you for your comments. The Remedial Action Scheme would be covered under criterion 1.12. The plant would not be exempted if it met any of the criteria in Attachment 1.				
Michael J. Haynes	Seattle City Light	5	Affirmative	Specifically, Seattle City Light commends the change to a "bright-line" approach to identifying Critical Assets as proposed in draft CIP-002-4. The use of nationwide criteria reasonably captures as Critical Assets the large generating units and high voltage transmission facilities essential to the reliable operation of the North American Bulk Power System. The flexibility afforded individual Planning Coordinators and Transmission Planners to specify additional facilities as Critical Assets important to local reliability furthers the objective of Bulk Power System reliability by allowing some smaller generating units and transmission facilities to be called out as Critical Assets without drawing in all assets of a certain size that are not critical elsewhere. These changes are consistent with Seattle City Light's philosophy towards Critical Assets, which always has been about stepping up and acknowledging the importance of identifying and protecting all Critical Assets essential to the reliability of the bulk power system. Ultimately CIP-002-4 as proposed promises to benefit the electricity industry, consumers, and North America by improving reliability through a certain and consistent application of the Critical Asset identification process. That said, Seattle City Light SME expresses concern that imperfections in the language of draft CIP-002-4 may frustrate its promise of bringing Critical Asset certainty and consistency. Imprecise language has been a recurring problem all throughout the short life of the NERC Mandatory Reliability Standards. Unnecessary compliance difficulties, tortured interpretations, and wasteful efforts have resulted. Lack of care with language threatens the existing regulatory regime by fostering distrust among industry, regulators, government, and the public at large. As such the comments below are offered as potential corrections to the details of draft and not as reflecting on the "bright-line" approach of proposed CIP-002-4.

Voter	Entity	Segment	Vote	Comment
				1. Requirement 2 of draft CIP-002-4 states, "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." Seattle City Light follows Tacoma Power in finding the term 'shared Cyber Assets' unclear and suggests clarification as follows: "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those Cyber Assets networked to a system that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." 2. Critical Asset criterion 1.7 of CIP-002-4, Appendix A, identifies as Critical Assets "Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV of higher with three or more other transmission stations." Seattle City Light agrees with Lower Colorado River Authority that additional detail is needed about the nature of the specified interconnections. In particular, questions exist as to type (what about a radial line connected to a generator-does it count?) and distance (does a high-voltage bus count if connected to another substation a dozen feet away?). 3. Critical Asset criterion 1.13 indicates that "Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes" are Critical Assets. Seattle City Light concurs with the assessment of APPA and others that this wording may inadvertently include any SCADA system that controls 300 MW or more of load (and thus has 'capability' to shed it), and recommends wording similar to item 1.11 of draft CIP-010-1, "BES elements that perform automatic aggregate load shedding of 300 MW or more within 15 minutes." 4. Critical Asset criterion 1.15 states "Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection." Seattle City Light concurs with APPA in understanding that this criterion is intended to apply to control centers controlling multiple units, and recommends the following wording: "Each control center or backup control center used to control multiple generation units identified as Critical Assets, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection."

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comments. 1) Requirement R2 has been changed to clarify the issues presented. 2) Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset a Transmission Facility operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. There is no distance requirement in the criterion. 3) Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." 4) Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."				
Scott M. Helyer	Tenaska, Inc.	5	Affirmative	Regarding the Critical Asset Criteria, it seems that the 300 MW referred to in 1.13 should be 1500 MW to make it consistent with generation.
Response: Thank you for your comment. Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."				
Martin Bauer P.E.	U.S. Bureau of Reclamation	5	Affirmative	The vote reflects that project can generally move forward we offer the following comments to improve the criterion in CIP-002-4 Attachment 1. Criterion 1.1 uses the phrase "aggregate highest rated net Real Power capability. The Rationale and Implementation Reference Document states the term "net Real Power capability" is drawn from MOD-024. However, use of that standard is questionable on at least two counts, the first being that it has yet to be approved by FERC, and that it is a "fill-in-the-black" standard that FERC has stated it finds unacceptable. As MOD-024 would rely on the Reliability Assurer's procedures, it could not assure a uniform application across the Interconnections. We suggest instead "Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest Facility Rating, pursuant to FAC-008/009, equal

Voter	Entity	Segment	Vote	Comment
				to or exceeding 1500 MW." Criterion 1.8 refers to conditions which would "violate one or more Interconnection Reliability Operating Limits (IROLs)" for transmission Facilities at a single station. However, Transmission Owners are not on the list of Responsible Entities with whom coordination of identified SOL's or IROL's is required in the Reliability Standards. This would make it difficult for a Transmission Owner to assess the facility based on the criterion. Criterion 1.12 has similar requirements as Criterion 1.8, but applies to Special Protection Systems, Remedial Action Schemes or automated switching systems. Where a Responsible Entity either provides information to one of these systems/schemes or responds to such a scheme, without being the "owner/operator" of the scheme may not be privy to knowing if an IROL is or could be violated. This would make it difficult for the Responsible Entity to assess the facility based on the criterion. We suggest that a requirement that Responsible Entities, who have the Reliability Standards obligations to identify System Operating Limits (SOL's) and IROL's, must respond if requested by a Responsible Entity whom they are not currently required notify. This would permit the Responsible Entity to assess his facility or systems/schemes.
Response: Thank you for your comments. Item 1.1 – The SDT chose to use "net Real Power capability" instead of Facility Rating due to the fact that it is a more accurate reflection on generation output to the system. Items 1.8 and 1.12 – FAC-014-2 R5 states "The Reliability Coordinator, Planning Authority and Transmission Planner shall each provide its SOLs and IROLs to those entities that have a reliability-related need for those limits and provide a written request that includes a schedule for delivery of those limits as follows:"				
Nickesha P Carrol	Consolidated Edison Co. of New York	6	Affirmative	1. New Requirement R1: We request an explicit definition of "annual." In addition, it is not clear whether the "update as necessary" applies to updates to the list during the annual review. The language should be clarified to more definitely express the "update as necessary" to be applicable to the list during the annual review. 2. New Requirement R2: In addition, there is no reason for the parenthetical with the specific inclusion of nuclear generation. It should be removed. 3. Attachment 1/Requirement R2: We suggest the removal of "control system" and "backup control system" in Attachment 1, Part 1.14. These systems should be identified as part of new Requirement R2, Critical Cyber Asset Identification.

Voter	Entity	Segment	Vote	Comment
				4. Attachment 1: Part 1.3 is extremely broad and is under defined. Either delete it or provide additional specificity delineating the limited range of circumstances when a PC or TP may designate a facility as critical. 5. Attachment 1: Part 1.10 uses the phrase "the loss of the assets" without describing the relevant time period. Are these assets losses for a few cycles, for a few minutes, for a few hours or for a few days? We recommend that the conclusion of Part 1.10 state "…would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3 for a period of xx hours (e.g., 24 hours) or more." 6. Implementation Plan: Agreed, so long as an Entity can have access to an exception process with an implementation plan to request additional time due to a large increase in identified assets, without a self-reported violation, within an implementation schedule.
Response: Thank you for your comments. 1) The phraseology you are concerned about exists in the existing CIP-002-3 standard. The SDT expects to correct this phraseology in the next version. 2) The parenthetical statement about nuclear generation comes from Attachment 1 criterion 1.1. 3) Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." 4) Item 1.3 – This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." 5) The phrase "loss of assets" is not limited to any period of time. A trip and a 24-hour outage would both apply. 6) Thank you for your comments.				
Mark S Travaglianti	FirstEnergy Solutions	6	Affirmative	FirstEnergy appreciates the CIP Standard Drafting Team's (SDT) careful consideration of our and other stakeholder feedback during prior comment periods and the SDT's decision to develop the CIP-002-4 bright-line standard. The development of CIP-002-4 and continued use of the CIP-003 through CIP-009 standards brings needed industry consistency in Critical Asset determinations while appropriately building upon prior industry efforts of implementing the CIP standards. FirstEnergy supports CIP-002-4

Voter	Entity	Segment	Vote	Comment
				and is voting AFFIRMATIVE for the standard but believes changes are needed to better clarify Attachment 1. In our view, some of the criteria are vaguely written and subject to interpretation - specifically criteria 1.8 and 1.11 - and we offer suggestions for improving expectations and compliance certainty. Additionally, we suggest less substantive changes to criteria 1.5 and 1.14 for clarity and consistency. Lastly, we encourage the SDT to reconsider its Implementation Plan for the CIP version 4 standards. The Implementation Plan is a 15 page document which is overly complex and difficult to understand. Please refer to FE's comments submitted through the parallel comment period for suggestions for improvement and simplification. The following are FirstEnergy's proposed Attachment 1 changes: 1) Criterion 1.8 currently states "Transmission Facilities at a single station location that, if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs)." Clarity needed: A.) It is not evident who is responsible for identifying the applicable transmission facilities covered by 1.8. B.) Item 1.8 should rely on review/analysis that is regularly performed by industry in meeting other NERC reliability standards. Item 1.8 should be based on IROL determinations made from planning horizon studies and information communicated to responsible entities via FAC-010/FAC-014. C.) A possible misinterpretation of Attachment 1, Item 1.8 is that it is intended to review a complete loss of substation. However the words say "Transmission Facilities at a single station location …" not all transmission facilities at a single substation location. Based on the above items, FirstEnergy proposes the following for item 1.8: "1.8. Transmission Facilities designated by the Planning Coordinator or Transmission Planner that, if destroyed, degraded, misused or otherwise rendered unavailable, demonstrates the need for an Interconnection Reliability Operating Limit (IROL)." The Planning Coordinator and Transmission Planner determine and communicate IROLs in the planning time horizon per NERC reliability standard FAC-014. The subject Transmission Facilities are the contingency Transmission Facilities communicated by the PC and TP per requirement R5 of FAC-014. The 1.8 criterion should not appear to require any new study or analysis by the TP or PC. 2) Criterion 1.11 currently states "Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements" Clarity needed: The term "essential" is vague and open to interpretation. FE suggests that the SDT focus on Transmission Facilities identified in Nuclear Plant Interface Requirements identified as providing offsite power supply for nuclear plant safety requirements. We propose the

Voter	Entity	Segment	Vote	Comment
				following change for 1.11: "1.11 Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements." 3) Criterion 1.5 currently states "The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where multiple path options exist." FirstEnergy suggests replacing the word "multiple" with "two or more" for clarity. 4) Criterion 1.14 currently states "Each control center, control system, backup control center, or backup control system used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator." FirstEnergy suggests removing the text "control system" and "or backup control system" for consistency to criteria 1.15. If the intent is to ensure coverage of offsite data centers or telecommunication centers that support the "control center" then the SDT should provide a separate criterion in Attachment 1. To extend coverage of 1.14 and not 1.15 is inconsistent and the use of the phrase "control system" is vague.

Response: Thank you for your comments.

Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements.

Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan."

Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."

The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters

Voter	Entity	Segment	Vote	Comment
after regulatory approval.				
Silvia P Mitchell	Florida Power & Light Co.	6	Affirmative	The standard CIP-002-4 includes a more consistent method for the evaluation of Critical Assets and removes the variability that is introduced when letting Entity's perform their own risk-based methodology. It is requested to include an exception process in the implementation plan for a company that has a large number of new CA(s). For consistency, make all of the cases fall under the 24 month timeline to remove the possible misinterpretation of the Categories as stated in proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities. The only exception to the 24-month requirement shall be those newly identified CCAs and Responsible Entities that require compliance before commissioning. Depending on the number of CCAs a utility needs to protect, the resources needed to accomplish the lockdowns may not be available. We recommend a 24-month implementation time frame for all categories. This would make the criteria for compliance more consistent. Industry will be competing for cyber security resources for implementation. We are also very concerned that the expectation is to replace CCA's with TFEs with assets not requiring an exception. In general, this is the correct direction to go in, but in practice this is not necessarily easy. For example, If tomorrow an asset with a TFE fails in service and needs to be replaced with a similar asset, it instead must be replaced with a "technically compliant" asset. This may be impractical early on as stocking levels may be inadequate and qualified replacements may not have been fully vetted for the application.
Response: Thank you for your comments. Thank you for your comments. The SDT has simplified the Implementation Plan to reference the Effective Date of CIP-002-4 through CIP-009-4 which is 8 calendar quarters after regulatory approval				
Jessica L Klinghoffer	Kansas City Power & Light Co.	6	Affirmative	The bright-lines established by the proposed standard have not been established with a strong engineering basis and do not necessarily reflect a true measure of reliability impact to the bulk electric system. It is recommended to develop a process to determine a true reliability assessment and adjust the bright-line proposed here to a deliberate and supportable definition.

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comment. The SDT believes that the implementation of Attachment 1 criteria will increase the consistency of Critical Asset identification over the existing entity defined risk-based methodology.				
Dennis Sismaet	Seattle City Light	6	Affirmative	Seattle City Light Subject Matter Expert (SME) supports the changes proposed for CIP-002-4 and recommends a "yes" vote despite imperfections with the language of draft Appendix A. SME recommends comments in the hope that the language yet will be clarified. Specifically, Seattle City Light commends the change to a "bright-line" approach to identifying Critical Assets as proposed in draft CIP-002-4. The use of nationwide criteria reasonably captures as Critical Assets the large generating units and high voltage transmission facilities essential to the reliable operation of the North American Bulk Power System. The flexibility afforded individual Planning Coordinators and Transmission Planners to specify additional facilities as Critical Assets important to local reliability furthers the objective of Bulk Power System reliability by allowing some smaller generating units and transmission facilities to be called out as Critical Assets without drawing in all assets of a certain size that are not critical elsewhere. These changes are consistent with Seattle City Light's philosophy towards Critical Assets, which always has been about stepping up and acknowledging the importance of identifying and protecting all Critical Assets essential to the reliability of the bulk power system. Ultimately CIP-002-4 as proposed promises to benefit the electricity industry, consumers, and North America by improving reliability through a certain and consistent application of the Critical Asset identification process. That said, Seattle City Light SME expresses concern that imperfections in the language of draft CIP-002-4 may frustrate its promise of bringing Critical Asset certainty and consistency. Imprecise language has been a recurring problem all throughout the short life of the NERC Mandatory Reliability Standards. Unnecessary compliance difficulties, tortured interpretations, and wasteful efforts have resulted. Lack of care with language threatens the existing regulatory regime by fostering distrust among industry, regulators, government, and the public at large. As such the comments below are offered as potential corrections to the details of draft and not as reflecting on the "bright-line" approach of proposed CIP-002-4. 1. Requirement 2 of draft CIP-002-4 states, "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable

Voter	Entity	Segment	Vote	Comment
				operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." Seattle City Light follows Tacoma Power in finding the term 'shared Cyber Assets' unclear and suggests clarification as follows: "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those Cyber Assets networked to a system that could adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1 within 15 minutes." 2. Critical Asset criterion 1.7 of CIP-002-4, Appendix A, identifies as Critical Assets "Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV of higher with three or more other transmission stations." Seattle City Light agrees with Lower Colorado River Authority that additional detail is needed about the nature of the specified interconnections. In particular, questions exist as to type (what about a radial line connected to a generator-does it count?) and distance (does a high-voltage bus count if connected to another substation a dozen feet away?). 3. Critical Asset criterion 1.13 indicates that "Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes" are Critical Assets. Seattle City Light concurs with the assessment of APPA and others that this wording may inadvertently include any SCADA system that controls 300 MW or more of load (and thus has 'capability' to shed it), and recommends wording similar to item 1.11 of draft CIP-010-1, "BES elements that perform automatic aggregate load shedding of 300 MW or more within 15 minutes." 4. Critical Asset criterion 1.15 states "Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection." Seattle City Light concurs with APPA in understanding that this criterion is intended to apply to control centers controlling multiple units, and recommends the following wording: "Each control center or backup control center used to control multiple generation units identified as Critical Assets, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection."
Response: Thank you for your comments. 1) Requirement R2 has been changed to clarify the issues presented. 2) Item 1.7 – The intent of Criterion 1.7 is to classify as a Critical Asset a Transmission Facility operated at 300 kV or higher at stations				

Voter	Entity	Segment	Vote	Comment
interconnected at 300 kV or higher with three or more other transmission stations. That includes upstream, downstream, networked, and radial. It should be noted that connections to generators or generation only substations are not counted in this Criterion. The source to the radial substation may be considered a Critical Asset, but the radial substation would not be considered a Critical Asset since by definition it cannot be connected to three or more transmission substations. There is no distance requirement in the criterion. 3) Item 1.13 – This criterion has been changed to "Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." 4) Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection."				
Michael C Hill	Tacoma Public Utilities	6	Affirmative	Tacoma Power has submitted comments during the comment period for Version 4 of the CIP standards. If there is a subsequent future ballot for Project 2008-06, consideration of all submitted comments need to be reflected in such ballot.
Response: Thank you for your comments. Please refer to the response to comments document.				
Brian Evans-Mongeon	Utility Services, Inc.	8	Affirmative	Utility Services endorses the comments as submitted by the NPCC Regional Standards Committee, as well as the American Public Power Association (APPA). We thank the SDT for their continued efforts to address this difficult matter and urge them to consider the comments from both of these organizations as a means to strengthen the standard and its requirements.
Response: Thank you for your comments. Please refer to the response to comments document.				
Guy V. Zito	Northeast Power Coordinating Council, Inc.	10	Affirmative	Removal of the Canadian Nuclear exclusion is problematic for many of NPCC's Canadian members. Although the drafting team believed that in all cases the Canadian Nuclear Safety Commission would have authority, the onice to demonstrate and prove that the standard wouldn't apply to Canadian nukes is a burden in the view of some.

Voter	Entity	Segment	Vote	Comment
Response: Thank you for your comments. The SDT is aware that the removal of the nuclear plant exclusion in response to a FERC order brought Canadian nuclear plants into the CIP standards. That was unintentional and will be corrected in the revised standards next posted for ballot.				
David Batz	Edison Electric Institute	1	Abstain	EEI believes that the adoption of a uniform and consistent methodology for the selection of Critical Assets will enhance the reliability of the bulk power system. EEI offers the following suggested revisions for Attachment 1: ..... 1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW. 1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater. 1.3. Each generation Facility that the Planning Coordinator or Transmission Planner has designated as required to avoid one or more reliability criteria violations. 1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan. 1.5. The Facilities comprising the Cranking Paths and initial switching requirements from the Blackstart Resource to the unit(s) to be started, as identified in the Transmission Operator's restoration plan up to the point on the Cranking Path where two or more path options exist. 1.6. Transmission Facilities operated at 500 kV or higher. 1.7. Transmission Facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations. 1.8. Transmission Facilities at a single station location that the Planning Coordinator or Transmission Planner has designated that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limit (IROL) violations. 1.9. Flexible AC Transmission Systems (FACTS) at a single station location, that, if destroyed, degraded, misused or otherwise rendered unavailable, would result in one or more Interconnection Reliability Operating Limit (IROLs) violations. 1.10. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets described in Attachment 1, criterion 1.1 or 1.3.

Voter	Entity	Segment	Vote	Comment
				1.11. Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements. 1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROLs) violations for failure to operate as designed. 1.13.Common control system(s) capable of performing automatic load shedding of 300 MW or more within 15 minutes. 1.14. Each control center, , or backup control center, used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. 1.15. Each control center or backup control center used to control generation identified as a Critical Asset, or used to control generation greater than an aggregate of 1500 MWs in a single Interconnection. 1.16. Any additional assets owned by the Responsible Entity that the Responsible Entity deems appropriate to include.

Response: Thank you for your comments.

Item 1.1 – The guidance document posted by the SDT provides direction on the location issue. "Single plant location" refers to a group of generating units occupying a defined physical footprint and designated as an individual "plant" using commonly accepted generating facility terminology. Adjacent plants would be defined using the same criteria. The units do not necessarily have to be connected to the BES at the same substation or interconnection point in order to be considered a single plant.

Item 1.3 –This criterion has been reworded to "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon."

Item 1.5 – This criterion has been reworded to "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist as identified in the Transmission Operator's restoration plan."

Item 1.8 – This criterion has been changed to "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Item 1.9 – This criterion has been changed to "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies."

Voter	Entity	Segment	Vote	Comment
Item 1.11 – Criterion 1.11 is based on NUC-001-2 R9.2.2, "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." It is not limited to offsite power requirements. Item 1.12 – This criterion has been changed to "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limit (IROL) violations for failure to operate as designed." Item 1.14 – Based on industry comments received, criterion 1.14 has been reworded to "Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator." A new criterion, 1.16, has been added which states, "Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." A new criterion, 1.17, has also been added which states, "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MWs in a single Interconnection." Item 1.16 – In order to eliminate any confusion, the SDT has chosen to eliminate this criterion in the next ballot.				
Gary Ofner	North Carolina Electric Membership Corp.	1	Abstain	Although NCEMC supports replacing a subjective "Risk Based Methodology" with a "Bright-line Criteria" to identify critical assets, we believe many of the proposed criteria have not been technically justified on the basis that the proposed criteria properly identify those assets which could have a material impact on the reliability of the BES. If the proposed criteria are not modified to better reflect the impact of the assets on the reliability of the BES, then there should be a provision in the standard that provides a process for an entity to technically demonstrate that even though the criteria identifies some of their assets as Critical Assets, their assets (or a portion thereof) do not meet the definition of a Critical Asset and should be excluded from applicability of CIP-003 through CIP-009.
Response: Thank you for your comments. Please refer to the response to comments document. In addition, the SDT believes that having an exception process to the criteria presents the same challenges associated with a risk-based assessment in external review and oversight.				
Gregory Van Pelt	California ISO	2	Abstain	The standard as written is flawed in that Applicability for this standard should be clearly stated to only include owners of the facilities or assets involved (i.e., "Critical Assets"). For example, broad sweeping designation of Transmission Operators or Balancing Authorities, as "Responsible Entities" is inappropriate in cases where they do not own the "Critical Assets". This creates undue and duplicative burden without benefit. Requirements should be revised to note a Responsible Entity is only a Responsible Entity for assets that it owns. The standard is an improvement

Voter	Entity	Segment	Vote	Comment
				in that clear criteria for designation of "Critical Asssets" is beneficial to consistent application and enforcement.
Response: Thank you for your comments. The Applicability section of the standard specifies to which NERC Registered Entities the standard applies. All Requirements apply to all Entities listed in the Applicability section. Each requirement uses the phrase “its … Assets” to designate ownership.				
Barry Lawson	National Rural Electric Cooperative Association	4	Abstain	Please see NRECA submitted comments for reasons for abstaining during this ballot. If hte standard is modified as requested in our comments, we can vote in the affirmative.
Response: Thank you for your comments. Please refer to the response to comments document.				
Joanna Luong-Tran	TransAlta Centralia Generation, LLC	5	Abstain	TransAlta sumbitted comments to explain our abstain.
Response: Thank you for your comments. Please refer to the response to comments document.

Unofficial Comment Form for Project 2008-06 — Cyber Security Order 706 Draft CIP-002-4

Please **DO NOT** use this form to submit comments. Please use the electronic form located at the link below to submit comments on the proposed CIP Version 4 Standards and Implementation Plans. Comments must be submitted by **December 10, 2010.** If you have questions please contact Howard Gugel at howard.gugel@nerc.net or by telephone at (609) 651-2269.

http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html

Background:
In 2008, FERC Order 706 paragraph 236 directed the ERO to develop modifications to Standard CIP-002-1 Cyber Security – Critical Cyber Asset Identification to address their concerns regarding: (1) the need for ERO guidance regarding the risk-based assessment methodology; (2) the scope of critical assets and critical cyber assets; (3) internal, management approval of the risk-based assessment; (4) external review of critical assets identification; and (5) inter-dependency analysis.

A Standards Drafting Team (SDT) was appointed by the NERC Standards Committee on August 7, 2008 to develop these modifications as part of Project 2008-06 – Cyber Security Order 706. The SDT has been charged to review each of the CIP reliability standards and address the modifications identified in the FERC Order 706. The SDT began meeting in October 2008.

Prior to this posting, the SDT developed CIP-002-2 through CIP-009-2 to comply with the near-term specific directives of FERC Order 706. This version of the Standards was approved by FERC in September of 2009 with additional directives to be addressed within 90 days of the order. In response, the SDT developed CIP-002-3 through CIP-009-3, which FERC approved in March 2010.

Throughout this period, the SDT has continued efforts to develop an approach to address the remaining FERC Order 706 directives. CIP-010 and CIP-011were posted for informal comment in May of 2010. After reviewing and analyzing responses from the industry, the SDT determined it was infeasible to address all of the concerns and achieve industry consensus on CIP-010 and CIP-011 by the planned target date of December 2010. Consequently, the SDT limited the scope of modifications to requirements in CIP-002 through CIP-009 as an interim step to address the more immediate concerns raised in FERC Order 706, paragraph 236. The approach to address the remaining FERC Order 706 directives continues to be developed.

The SDT believes the NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System. These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

The draft standard *CIP 002-4 – Cyber Security – Critical Cyber Asset Identification* identifies BES Cyber Systems according to "bright-line" criteria associated with the impact on reliable operation of the BES. The "bright-line" criteria is contained in *Attachment 1 – Critical Asset Criteria* of CIP-002-4.The *CIP-002-4 Cyber Security - Critical Asset Identification - Rationale and Implementation Reference Document* provides clarifying notes and rationale of the SDT. The draft CIP-003-4 through CIP-009-4 standards include conforming changes to match the versioning of CIP-002-4.

On September 20, 2010, the SDT posted CIP-002-4 for a formal 45-day comment period. During the comment period, the team received 101 sets of comments, including comments from more than 200 different people from approximately 125 companies representing 9 of the 10 Industry Segments. Concurrent with the comment period, a ballot pool was assembled and the first formal ballot was conducted. For the ballot a quorum was achieved, and the weighted sector vote was 43.33% affirmative.

Based on the comments received, a few changes were made to CIP-002-4.

- The Applicability section was modified to include an exemption for nuclear facilities regulated by the Canadian Nuclear Safety Commission, and Cyber Assets associated with Cyber Security Plans submitted to and verified by the U. S. Nuclear Regulatory Commission pursuant to 10 C.F.R. Section 73.54.
- In addition, the effective date was changes to eight quarters after regulatory approval, so that entities are not required to maintain two sets of approved Critical Asset lists and Critical Cyber Asset lists during the implementation plan.
- Requirements R1 and R2 were modified slightly to clarify that each list must be updated on an ongoing basis, but the review and approval need only occur annually. Conforming changes were made to the compliance section.
- Finally, significant changes were made to Attachment 1 to ten of the criteria. One criterion was deleted, which allowed entities to place items on the Critical Asset list at their discretion.
    - The criterion for control centers was split into three criteria to allow for differentiation in size for Balancing Authorities and Transmission Operators.

All of these changes were in response to comments received.

A separate ballot is being conducted for CIP-005-4, and if the proposed standard is approved it will be filed with CIP-003-4 to CIP-009-4. If the proposed CIP-005-4 is rejected, then the present CIP-005-3 will be modified with conforming changes and filed with CIP-003-4 to CIP-009-4. The team is continuing to work on subsequent cyber security standards that will establish impact levels and define associated cyber security controls at levels appropriate to their BES impact.

The Team is seeking industry feedback on this draft of CIP 002-4. The industry feedback will be considered by the SDT in determining if there is a need to make any additional changes to CIP 002-4 requirements and related documents.

The SDT has provided a form for industry participants to offer their comments on this draft of CIP-002-4.

Question

Your response to the following question will assist the SDT for Project 2008-06 Cyber Security Order 706 in finalizing the work for CIP-002-4 through CIP-009-4 relative to the proposed modifications summarized above.

1. When reviewing the changes to the proposed CIP-002-4 standard, do you believe that the proposed standard was responsive to feedback received and provides acceptable bright-line criteria for the determination of Critical Cyber Assets?

    ☐ Yes

    ☐ No

    Comments:

CIP-002-4 – Cyber Security – Critical Cyber Asset Identification

Rationale and Implementation Reference Document

NERC Cyber Security Standards Drafting Team for Order 706
September 2010

This document provides guidance for Responsible Entities in the application of the criteria in CIP-002-4, Attachment 1. It provides clarifying notes on the intent and rationale of the Standards Drafting Team. It is not meant to augment, modify, or nullify any compliance requirements in the standard.

TABLE OF CONTENTS

CIP-002-4 – CYBER SECURITY - CRITICAL CYBER ASSET IDENTIFICATION

RATIONALE AND IMPLEMENTATION REFERENCE DOCUMENT

This document serves as a reference and provides guidance for Responsible Entities in the application of the criteria in CIP-002-4, Attachment 1. It provides clarifying notes on the intent and rationale of the Standards Drafting Team. It is not meant to augment, modify, or nullify any compliance requirements in the standard.

EXECUTIVE SUMMARY

The North American Electric Reliability Corporation (NERC) Reliability Standards are a set of standards that preserve and enhance the reliability of the Bulk Electric System (BES). The objective of the CIP standards is to protect the critical infrastructure elements necessary for the reliable operation of this system. CIP-002-4 – Cyber Security – Critical Cyber Asset Identification requires "the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System."

In drafting CIP-002-4, the drafting team used an approach that leveraged work that that it had already performed towards categorization of BES cyber systems. The drafting team also worked within a narrowly defined scope that includes addressing the following:

- Non-uniform application of methodologies for identifying Critical Assets resulting in wide variation in the types and number of critical assets across regions. The approach taken to mitigate this issue was to replace the Entity-defined Risk-Based Methodology requirement with a bright-line based criteria requirement for identifying Critical Assets.
- FERC Order 706 comments and directives regarding oversight of the lists of identified Critical Assets in CIP-002. (Para. 329). By using bright-line criteria, the requirement for oversight is significantly mitigated.
- External perceptions of insufficiency of the Entity-defined methodologies in identification of Critical Assets.

To accomplish these objectives, the drafting team adapted the approach originally used in the on-going development of cyber security standards and the categorization of BES Cyber Systems based on their impact on the BES functions performed by BES assets. For CIP-002-4, the drafting team primarily used those criteria defined for the High Impact category to identify Critical

Assets as a step towards identifying Critical Cyber Assets. These criteria were developed for the three major classes of assets used in the reliable operation of the BES: generation, transmission, and control centers. Because substantial work has already been completed for the planning and operation of these assets by existing and evolving NERC reliability standards, these standards were a natural source which the drafting team used to define the areas from which bright-line criteria would be derived and developed. Additionally, the drafting team drew on other published documents in this area.

INTRODUCTION

The North American Electric Reliability Corporation (NERC) Reliability Standards are a set of standards developed to preserve and enhance the reliability of the Bulk Electric System (BES). The objective of the CIP series of these standards is to protect the critical infrastructure elements necessary for the **reliability and operability** of this system. The overarching mission is preserving and enhancing the reliability of the BES, which consists of assets engineered to perform functions to achieve this objective. The CIP Cyber Security Standards define cyber security requirements to protect cyber systems used in support of these functions and the reliability or operability of these assets.

CIP-002-4 – Cyber Security – Critical Cyber Asset Identification requires "the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System."

In drafting CIP-002-4, the drafting team used an approach that leveraged work that it had already performed towards categorization of BES cyber systems. The drafting team also worked within a narrowly defined scope that included addressing the following:

- Non-uniform application of methodologies for identifying Critical Assets resulting in wide variation in the types and number of critical assets across regions. The approach taken to mitigate this issue was to replace the Entity-defined Risk-Based Methodology requirement with a bright-line based criteria requirement for identifying Critical Assets.
- FERC Order 706 comments and directives regarding oversight of the lists of identified Critical Assets in CIP-002. (Para. 329). By using bright-line criteria, the requirement for oversight is significantly mitigated.
- External perceptions of insufficiency of the Entity-defined methodologies in identification of Critical Assets.

To accomplish these objectives, the drafting team adapted the approach originally used in the on-going development of cyber security standards that addressed the categorization of BES Cyber Systems based on their impact on the BES functions performed by BES assets. For CIP-002-4, the drafting team primarily used those criteria defined for the High Impact category to identify Critical Assets as a step towards identifying Critical Cyber Assets. The original categorization criteria were developed over the course of approximately one year with assistance from many participants in the operating and planning areas. These criteria had

already been posted through informal industry comment. In the context of CIP-002-4, the criteria in Attachment 1 form the backbone of the changes introduced in this version.

These criteria were developed for the three major classes of assets used in the reliable operation of the BES: generation, transmission, and control centers. Because substantial work has already been completed for the planning and operation of these assets by existing and evolving NERC reliability standards, these standards were a natural source which the drafting team used to define the areas from which bright-line criteria would be derived and developed. Additionally, the drafting team drew on several published documents referenced later in this document.

This document provides guidance and clarification on intent and context of the criteria in Attachment 1 to assist Entities in their application.

The scope of the CIP Cyber Security standards excludes the elements associated with the market functions UNLESS they also affect the reliable operation of the BES. In addition, these standards explicitly exclude facilities, equipment, and systems regulated by US and Canadian nuclear regulatory bodies since they are regulated outside of NERC jurisdiction. There may be facilities, equipment, or systems which may be in a nuclear facility associated with the BES which are outside of the regulatory realm of these nuclear organizations. These would therefore be regulated under these NERC CIP standards, as directed by FERC Order 706B, in the United States. Also, the CIP Cyber Security Standards do not include those assets associated with BES planning activities UNLESS they also have a direct effect on the reliable operation of the BES. There will, however, be cases where these types of BES planning and market function systems may be required to be protected under the CIP standards (e.g., they are in the same Electronic Security Perimeter) and must meet the protection requirements of the Cyber Security Standards.

OVERALL APPLICATION OF ATTACHMENT 1

Attachment 1 is a list of criteria that determines which BES assets are to be identified as Critical Assets under CIP-002-4, requirement R1. The following provides guidance and clarification that pertains to Attachment 1 as a whole.

- When the drafting team uses the term "Facilities", it leaves some latitude to Responsible Entities to determine included Facilities. The term Facility is defined in the NERC Glossary of Terms as "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)." In most cases the criteria refer to a group of Facilities in a given location that support the reliable operation of the BES. For example, for Transmission assets, the substation may be designated as the group of Facilities. However, in a substation that includes equipment that supports BES operations along with equipment that only supports Distribution operations, the Responsible Entity may be better served to designate only the group of Facilities that supports BES operation. In that case, the Responsible Entity may designate the group of Facilities by location, with qualifications on the group of Facilities that support reliable operation of the BES, as the Critical Asset. Generation Facilities are separately discussed in the Generation section below.

- In certain cases, a single Facility or group of Facilities may qualify as a Critical Asset by meeting multiple criteria. In such cases, the Responsible Entity may choose to document all criteria that qualify this asset as a Critical Asset. This will avoid inadvertent dropping of a particular Critical Asset when it no longer meets one of the criteria, but still meets another.

- The bright-line criteria in Parts 1.5 and 1.12 are included in both the generation and Transmission sections below because there may be generation or Transmission Facilities that meet these criteria. Although this document separately discusses the bright-line criteria in sections focused on generation, Transmission, and control centers, the criteria in Parts 1.5 and 1.12 were replicated to provide clarity to the reader. All Entities should understand that regardless of registration, they must review and apply all criteria against their list of assets in order to properly identify those assets which should be declared Critical Assets.

- A Critical Asset should be listed by only one Responsible Entity. Where there is joint ownership, it is advisable that the owning Responsible Entities should formally agree on the designated Responsible Entity responsible for compliance with the standards.

GENERATION

The criteria in Attachment 1 that generally apply to Generation Owner and Operator (GO/GOP) Registered Entities are parts 1.1, 1.3, 1.4, 1.5, 1.12 and 1.15.

- Part 1.1 designates as Critical Assets any group of generation units in a single plant location, whose net Real Power capability exceeds 1500 MW. This criterion is sourced partly from the Contingency Reserve requirements in NERC standard BAL-002 whose purpose is "to ensure the Balancing Authority is able to utilize its Contingency Reserve to balance resources and demand and return Interconnection frequency within defined limits following a Reportable Disturbance". In particular, it requires that "as a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency." The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions.

  In the use of net Real Power capability, the drafting team sought to use a value that could be verified through existing requirements: NERC standard MOD-024 was sourced for that.

- By using 1500 MW as a bright-line, the intent of the drafting team was to ensure that generation Facilities with common mode vulnerabilities that could result in the loss of generation capability higher than 1500 MW are adequately protected. Requirement R2 in CIP-002-4 further stipulates that, for Generation Facilities, only those Cyber Assets that are shared by any combination in a group of units that would exceed this value are candidates for further qualification as Critical Cyber Assets (i.e. the Critical Asset is the group of units). In considering common mode vulnerabilities, the Responsible Entity should include all Facilities and systems up to the point where the Generation is attached to the Transmission system.

  In specifying a 15 minute qualification, the drafting team sought to include those Cyber Assets which would have a real-time impact on the reliable operation of the BES. In a generation facility context, there may be Facilities which, while essential to the reliability and operability of the generation facility, may not have real-time operational impact within the specified real-time operations impact window of 15 minutes. This may be illustrated in the case of cyber assets controlling the supply of coal fuel in a coal burning facility: in this case, the compromise of the cyber asset may result in an inability

of the supply system to bring the fuel for generation. However, because of the way these systems are used, there may be a significant time before this affects real-time operation, time during which detection and remediation may be able to be effected.

The drafting team also used additional time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used.

- In part 1.3, the drafting team sought to ensure that those generation Facilities that have been designated by the Planning Coordinator as necessary to avoid BES Adverse Reliability Impacts in the long term planning horizon are designated as Critical Assets. These Facilities may be designated as "Reliability Must Run" and this designation is distinct from those generation Facilities designated as "must run" for market stabilization purposes. Because the use of the term "must run" creates some confusion in many areas, the drafting team chose to avoid using this term and instead drafted the requirement in more generic reliability language. In particular, the focus on preventing an Adverse Reliability Impact dictates that these units are designated as must run for reliability purposes beyond the local area. Those units designated as must run for voltage support in the local area would not generally be given this designation. In cases where there is no designated Planning Coordinator, the Transmission Planner is included as the Registered Entity that performs this designation.

  In the specification of the "long-term planning horizon" in this criterion, the drafting team sought to ensure that such Critical Assets would be designated in the time horizon described in the NERC document "Time Horizons", which defines long-term planning horizon as "a planning horizon of one year or longer".

- In part 1.4, generation resources that have been designated as Blackstart Resources in the Transmission Operator's restoration plan are designated as Critical Assets. NERC standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan as well as requirements to test these Resources. This criterion designates only those generation Blackstart Resources that

have been designated as such in the Transmission Operator's restoration plan. The glossary term Blackstart Capability Plan has been retired. While the definition of Blackstart Resource includes the fact that it is in a Transmission Operator's Restoration Plan, the drafting team included the term in the criterion for clarity.

Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in NERC standard EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 1.5 designates Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator's restoration plan, up to the point on the Cranking Path where two or more path options exist as Critical Assets. This criterion is sourced from requirements in NERC standard EOP-005-2, which requires the Transmission Operator to include in its Restoration Plan the Cranking Paths and initial switching requirements from the Blackstart Resource and the unit(s) to be started. The drafting team further qualified the Facilities to be designated as Critical Assets as only those in the Cranking Path up to the point where two or more paths exist to the units to be started.

- Part 1.12 designates Special Protection Systems and Remedial Action Schemes as Critical Assets. Special Protection Systems and Remedial Action Schemes may be implemented to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time they are required or if they operate outside of the parameters they were designed for. Generation Owners and Operators which have implemented such systems and schemes must designate them as Critical Assets.

- Part 1.15 designates generation control centers that control generation Facilities designated as Critical Assets, or used to control generation greater than an aggregate of 1500 MW in a single Interconnection, as Critical Assets. In the development of this criterion, the drafting team used 1500 MW as a bright line for aggregate generation controlled based on the bright-line used in Part 1.1. The drafting team specified a single Interconnection because it is more likely that the span of control of the generation

control center may cross multiple BA or RSG areas or even regions and Interconnections, and that BES impact will more likely be restricted within an Interconnection.

This criterion uses the phrase "control generation." Entities should consider the discussion of "control" for generation as discussed in the Frequently Asked Questions (FAQ) document for CIP 002-1, Question 9:

> **"Question:** *Are Cyber Assets for a control center or generation control center with monitoring only and no direct remote control required to be protected and secured under the Cyber Security Standards?*
> **Answer:** A control center or generation control center that provides critical operating functions and tasks as identified in CIP–002 must be protected per the requirements of the Cyber Security Standard. The monitoring and operating control function includes controls performed automatically, remotely, manually, or by voice instruction.
> An example of monitoring without direct control that is subject to the Cyber Security Standards is a Reliability Authority that receives data from Critical Cyber Assets to a state estimator. "

It must be noted that this part does not apply to those systems that would be included in the evaluation of Cyber Assets that are only associated with Facilities in a single plant location as specified in part 1.1. These would include Cyber Assets in control rooms in these generation plants. An excellent discussion of control centers and control rooms can be found in the NERC document "Security Guideline for the Electric Sector: Identifying Critical Assets".

TRANSMISSION

Parts 1.2, 1.5-1.13 in Attachment 1 are the criteria that are applicable to Transmission Owners and Operators. The general approach to the criteria is that these should cover those transmission Facilities generally designated as Extra High Voltage (EHV)[1,2] which form the

[1] REA BULLETIN 1724E-202. An Overview of Transmission System Studies, Page 12:6.1.3 System Voltage : Transmission system voltages below the extra-high-voltage (EHV) level are between 34.5 and 230 kilovolts(kV). The nominal EHV

backbone of the BES. At the lower end of the EHV range, additional qualifications have been defined to ensure appropriate impact for Critical Assets. In many of the criteria, the impact threshold is defined as the capability of the failure or compromise of a Critical Asset to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs).

- Part 1.2 includes those Facilities in Transmission systems that provide reactive resources to enhance and preserve the reliability of the BES. The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.

- In Part 1.5, the intent is to ensure that the Cranking Paths and other BES Transmission Facilities required to support the Transmission Operator's restoration plan required by EOP-005-2 receive consideration for protection from cyber threats. Transmission Owners and Operators own and operate a large number of these Facilities. EOP-005-2 specifies Facilities that comprise the "Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started". Part 1.5 specifies that the Facilities meeting these requirements or comprising the Cranking Paths be identified as Critical Assets.

  Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 1.6 includes any Transmission Facility at a substation operated at 500 kV or higher. While the drafting team felt that Facilities operated at 500 kV or higher did not require any further qualification for their role as components of the backbone on the Interconnected BES, Facilities in the lower EHV range should have additional qualifying criteria for inclusion as a Critical Asset.

---

levels in the United States are 345, 500 and 765 kV. (http://www.usda.gov/rus/electric/pubs/a/1724e202.pdf)

[2] Webster on-line Dictionary: Voltage levels higher than those normally used on transmission lines. Generally EHV is considered to be 345,000 volts or higher. (EHV).

It must be noted that if the collector bus for a non-Critical Asset generation plant (i.e. the plant is smaller in aggregate than the threshold set for generation plants in Part 1.1) is operated at 500kV, the collector bus should be considered a Generation Interconnection Facility and not a Transmission Facility, according to the "Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface". This collector bus would not be a Critical Asset because it doesn't significantly affect the 500kV Transmission grid; it only affects a plant which is below the Critical Asset threshold.

- Part 1.7 includes the lower end of the EHV range between 300kV and 500 kV, (primarily Facilities operated at 345kV) with qualifications for inclusion as Critical Assets if they are deemed highly likely to have significant impact on the BES. While the criterion has been specified as part of the rationale for requiring protection for EHV Transmission Facilities, the drafting team included, in this criterion, additional qualifications that would ensure the required level of impact to the BES: at this lower end of the EHV spectrum, the drafting team:
    - Excluded radial facilities that would only provide support for single generation facilities.
    - Specified interconnection to at least 3 transmission stations or substations to ensure that the level of impact would be appropriate.

- Parts 1.8 and 1.9 include those Transmission Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, **Establish and Communicate System Operating Limits,** R5.1.1 and R5.1.3.

- Part 1.10 designates those Transmission Facilities as Critical Assets that provide the generation interconnection for Generation Facilities identified as Critical Assets to the Transmission system. The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets.

- Part 1.11 is sourced from the NUC-001 NERC standard for the support of Nuclear Facilities. NUC-001 ensures that reliability of NPIR's are ensured through adequate coordination between the Nuclear Generator Owner/Operator and its Transmission provider "for the purpose of ensuring nuclear plant safe operation and shutdown". In

particular, there are specific requirements to coordinate physical and cyber security protection of these interfaces.

- Part 1.12 designates as Critical Assets those Special Protection Systems (SPS), Remedial Action Schemes (RAS), or automated switching systems installed to ensure BES operation within IROLs. The degradation, compromise or unavailability of these Critical Assets would result in exceeding IROLs if they fail to operate as designed. By the definition of IROL, the loss or compromise of any of these have Wide Area impacts.

- Part 1.13 designates as Critical Assets those systems or Facilities that are capable of performing automatic load shedding, without human operator initiation, of 300 MW or more. In the drafting of this criterion, the drafting team sought to include only those systems that did not require human operator initiation, and targeted in particular those Under Frequency Load Shedding (UFLS) facilities and systems and Under Voltage Load Shedding (UVLS) facilities and systems that would be implemented as part of a regional load shedding requirement to prevent Adverse Reliability Impact. These include automated Under Frequency Load Shedding systems or Under Voltage Load Shedding Systems that are capable of load shedding 300 MW or more. It should be noted that those qualifying systems which require a human operator to arm the system, but once armed, trigger automatically, are still to be considered as not requiring human operator initiation and should be designated as Critical Assets.

  300 MW is the reporting threshold for DOE EIA-417.

CONTROL CENTERS

Parts 1.14 through 1.17 apply to BES control centers. Control centers generally perform control center functions for multiple BES assets. These Facilities are evaluated as a control center. Facilities that perform control center functions for only a single BES asset should be evaluated as part of the BES asset (e.g., control room for a single generation plant or transmission substation). While it is clear that the primary and all backup control centers operated by RCs, BAs, or TOPs **that meet the criteria** must be designated as Critical Assets, control centers at other applicable Responsible Entities that are used, by delegation, to perform the functional obligations of the RCs, BAs, or TOPs must also be designated as Critical Assets. These include

Transmission Owners' control centers and backup control centers, for example, which have been formally delegated to perform some of these functions. It should be noted that Cyber Assets essential to the operation of a control center may be located at a data center that is not co-located with the control center itself.

- Part 1.14 designates all control centers used to perform the functional obligations of the Reliability Coordinator (RC) as Critical Assets. Each Reliability Coordinator control center and backup control center was included as a Critical Asset due to their key role in maintaining reliability for the Interconnection as a whole in concert with other Reliability Coordinators.

- For part 1.15, please refer to the discussion of generation control centers in the Generation section of this document.

- Part 1.16 specifies that all control centers or backup control centers that perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12. Due to the direct impact on the operation of identified Critical Assets, these Transmission control centers must be designated as Critical Assets. It must be noted that in many cases, some Transmission Operator functions are delegated to Transmission Owner control centers: in such cases, these must also be designated as Critical Assets. As with the discussion of part 1.15, the drafting team intended for the word control to have the same meaning as that found in *Frequently Asked Questions Cyber Security Standards CIP-002-1 through CIP-009-1* which indicates that controls may be "performed automatically, remotely, manually, or by voice instruction."

- Part 1.17 specifies that all control centers that perform the functional obligations of a Balancing Authority (BA) that include at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13 must be declared as Critical Assets. In addition, this criterion designates as a Critical Asset any BA control center that, in aggregate, performs the functional obligations of a BA for 1500 MWs or more in a single Interconnection. The threshold, 'controls generation of 1500 MW' was chosen to maintain consistency with the threshold in part 1.1.

GUIDANCE ON THE IMPLEMENTATION PLAN

There are two implementation plans associated with CIP-002-4 through CIP-009-4: the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4* and the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.* These plans are intended to work together as a set. In order to determine when an Entity must be compliant with CIP-002-4 through CIP-009-4, they should refer first to the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4*. This implementation plan describes the schedule by which an Entity must become compliant with the Version 4 CIP Standards. Once this initial compliance milestone is reached, this implementation plan is effectively retired. For an Entity that registers after the Version 4 CIP Standards are effective or for those Critical Cyber Assets that are newly identify after the Version 4 CIP Standards are effective, Responsible Entities should refer to the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.* The *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* remains in use throughout the entire time that the Version 4 CIP Standards remain in effect.

Responsible Entities shall be compliant with the requirements of CIP-002-4 through CIP-009-4 on the later of (i) the Effective Date[3] specified in the Standard or (ii) the compliance milestones in the version 3 Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities. This allows essentially a two year implementation period following FERC approval to become compliant with the Version 4 CIP Standards. Special consideration was given to maintain the compliance milestone date for those Critical Cyber Assets and Newly Registered Entities that are in the middle of their implementation period for the Version 3 Standards on the Effective Date of the Version 4 Standards.

The drafting team considered that Responsible Entities may not have been able to anticipate the addition of Critical Assets to the Critical Asset list since the criteria included in Attachment 1 of CIP-002-4 may significantly differ from an Entity's existing risk-based assessment methodology. As such, the drafting team determined that a one-time implementation window

[3] "The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)."

was needed to bring the Critical Cyber Assets at the newly identified Critical Assets into compliance with CIP-002-4 through CIP-009-4.

Both the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4* and the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* contain certain exceptions for U.S. Nuclear Power Plant Facilities in recognition of the special circumstances of this operating environment. The modifications used for the U.S. Nuclear Power Plant Facilities are consistent with those included in the Revised Implementation Plan for Version 3 of Cyber Security Standards CIP-002-3 through CIP-009-3.

CONCLUSION

In formulating this document, the drafting team hopes to have clarified the thinking and intent behind the criteria in Attachment 1. The drafting team hopes that this document will also provide Responsible Entities with additional guidance in the implementation of CIP-002-4. The drafting team reiterates that this document is not intended to augment, modify, or nullify any of the requirements and criteria in the standard. The language of requirements in the standard remains the only authority for the purpose of evaluating compliance.

CIP-002-4 – Cyber Security – Critical Cyber Asset Identification

Rationale and Implementation Reference Document

NERC Cyber Security Standards Drafting Team for Order 706
September 2010

This document ~~is intended to provide~~provides guidance for Responsible Entities in the application of the criteria in CIP-002-4, Attachment 1. It provides clarifying notes on the intent and rationale of the Standards Drafting Team. It is not meant to augment, modify, or nullify any compliance requirements in the standard.

TABLE OF CONTENTS

CIP-002-4 – CYBER SECURITY - CRITICAL CYBER ASSET IDENTIFICATION

RATIONALE AND IMPLEMENTATION REFERENCE DOCUMENT

This document serves as a reference and provides guidance for Responsible Entities in the application of the criteria in CIP-002-4, Attachment 1. It provides clarifying notes on the intent and rationale of the Standards Drafting Team. It is not meant to augment, modify, or nullify any compliance requirements in the standard.

EXECUTIVE SUMMARY

The North American Electric Reliability Corporation (NERC) Reliability Standards are a set of standards that preserve and enhance the reliability of the Bulk Electric System (BES). The objective of the CIP standards is to protect the critical infrastructure elements necessary for the reliable operation of this system. CIP-002-4 – Cyber Security – Critical Cyber Asset Identification requires "the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System."

In drafting CIP-002-4, the drafting team used an approach that leveraged work that that it had already performed towards categorization of BES cyber systems. The drafting team also worked within a narrowly defined scope that includes addressing the following:

- Non-uniform application of methodologies for identifying Critical Assets resulting in wide variation in the types and number of critical assets across regions. The approach taken to mitigate this issue was to replace the Entity-defined Risk-Based Methodology requirement with a bright-line based criteria requirement for identifying Critical Assets.
- FERC Order 706 comments and directives regarding oversight of the lists of identified Critical Assets in CIP-002. (Para. 329). By using bright-line criteria, the requirement for oversight is significantly mitigated.
- External perceptions of insufficiency of the Entity-defined methodologies in identification of Critical Assets.

To accomplish these objectives, the drafting team adapted the approach originally used in the on-going development of cyber security standards and the categorization of BES Cyber Systems based on their impact on the BES functions performed by BES assets. For CIP-002-4, the drafting team primarily used those criteria defined for the High Impact category to identify Critical

Assets as a step towards identifying Critical Cyber Assets. These criteria were developed for the three major classes of assets used in the reliable operation of the BES: generation, transmission, and control centers. Because substantial work has already been completed for the planning and operation of these assets by existing and evolving NERC reliability standards, these standards were a natural source which the drafting team used to define the areas from which bright-line criteria would be derived and developed. Additionally, the drafting team drew on other published documents in this area.

INTRODUCTION

The North American Electric Reliability Corporation (NERC) Reliability Standards are a set of standards developed to preserve and enhance the reliability of the Bulk Electric System (BES). The objective of the CIP series of these standards is to protect the critical infrastructure elements necessary for the **reliability and operability** of this system. The overarching mission is preserving and enhancing the reliability of the BES, which consists of assets engineered to perform functions to achieve this objective. The CIP Cyber Security Standards define cyber security requirements to protect cyber systems used in support of these functions and the reliability or operability of these assets.

CIP-002-4 – Cyber Security – Critical Cyber Asset Identification requires "the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System."

In drafting CIP-002-4, the drafting team used an approach that leveraged work that it had already performed towards categorization of BES cyber systems. The drafting team also worked within a narrowly defined scope that included addressing the following:

- Non-uniform application of methodologies for identifying Critical Assets resulting in wide variation in the types and number of critical assets across regions. The approach taken to mitigate this issue was to replace the Entity-defined Risk-Based Methodology requirement with a bright-line based criteria requirement for identifying Critical Assets.
- FERC Order 706 comments and directives regarding oversight of the lists of identified Critical Assets in CIP-002. (Para. 329). By using bright-line criteria, the requirement for oversight is significantly mitigated.
- External perceptions of insufficiency of the Entity-defined methodologies in identification of Critical Assets.

To accomplish these objectives, the drafting team adapted the approach originally used in the on-going development of cyber security standards that addressed the categorization of BES Cyber Systems based on their impact on the BES functions performed by BES assets. For CIP-002-4, the drafting team primarily used those criteria defined for the High Impact category to identify Critical Assets as a step towards identifying Critical Cyber Assets. The original categorization criteria were developed over the course of approximately one year with assistance from many participants in the operating and planning areas. These criteria had

already been posted through informal industry comment. In the context of CIP-002-4, the criteria in Attachment 1 form the backbone of the changes introduced in this version.

These criteria were developed for the three major classes of assets used in the reliable operation of the BES: generation, transmission, and control centers. Because substantial work has already been completed for the planning and operation of these assets by existing and evolving NERC reliability standards, these standards were a natural source which the drafting team used to define the areas from which bright-line criteria would be derived and developed. Additionally, the drafting team drew on several published documents referenced later in this document.

This document provides guidance and clarification on intent and context of the criteria in Attachment 1 to assist Entities in their application.

The scope of the CIP Cyber Security standards excludes the elements associated with the market functions UNLESS they also affect the reliable operation of the BES. In addition, these standards explicitly exclude facilities, equipment, and systems regulated by US and Canadian nuclear regulatory bodies since they are regulated outside of NERC jurisdiction. There may be facilities, equipment, or systems which may be in a nuclear facility associated with the BES which are outside of the regulatory realm of these nuclear organizations. These would therefore be regulated under these NERC CIP standards, as directed by FERC Order 706B~~.~~, in the United States. Also, the CIP Cyber Security Standards do not include those assets associated with BES planning activities UNLESS they also have a direct effect on the reliable operation of the BES. There will, however, be cases where these types of BES planning and market function systems may be required to be protected under the CIP standards (e.g., they are in the same Electronic Security Perimeter) and must meet the protection requirements of the Cyber Security Standards.

OVERALL APPLICATION OF ATTACHMENT 1

Attachment 1 is a list of criteria that determines which BES assets are to be identified as Critical Assets under CIP-002-4, requirement R1. The following provides guidance and clarification that pertains to Attachment 1 as a whole.

- When the drafting team uses the term "Facilities", it ~~is to leave~~leaves some latitude to Responsible Entities to determine included Facilities. The term Facility is defined in the NERC Glossary of Terms as "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)." In most cases the criteria refer to a group of Facilities in a given location that support the reliable operation of the BES. For example, for Transmission assets, the substation may be designated as the group of Facilities. However, in a substation that includes equipment that supports BES operations along with equipment that only supports Distribution operations, the Responsible Entity may be better served to designate only the group of Facilities that supports BES operation. In that case, the Responsible Entity may designate the group of Facilities by location, with qualifications on the group of Facilities that support reliable operation of the BES, as the Critical Asset. Generation Facilities are separately discussed in the Generation section below.

- In certain cases, a single Facility or group of Facilities may qualify as a Critical Asset by meeting multiple criteria. In such cases, the Responsible Entity ~~should~~may choose to document all criteria that qualify this asset as a Critical Asset. This will avoid inadvertent dropping of a particular Critical Asset when it no longer meets one of the criteria, but still meets another.

- The bright-line criteria in Parts 1.5 and 1.12 are included in both the generation and Transmission sections below because there may be generation or Transmission Facilities that meet these criteria. Although this document separately discusses the bright-line criteria in sections focused on generation, Transmission, and control centers, the criteria in Parts 1.5 and 1.12 were replicated to provide clarity to the reader. All Entities should understand that regardless of registration, they must review and apply all criteria against their list of assets in order to properly identify those assets which should be declared Critical Assets.

- A Critical Asset should be listed by only one Responsible Entity. Where there is joint ownership, it is advisable that the owning Responsible Entities should formally agree on the designated Responsible Entity responsible for compliance with the standards.

GENERATION

The criteria in Attachment 1 that generally apply to Generation Owner and Operator (GO/GOP) Registered Entities are parts 1.1, 1.3, 1.4, 1.5, 1.12 and 1.15.

- Part 1.1 designates as Critical Assets any group of generation units in a single plant location, whose net Real Power capability exceeds 1500 MW. This criterion is sourced partly from the Contingency Reserve requirements in NERC standard BAL-002 whose purpose is "to ensure the Balancing Authority is able to utilize its Contingency Reserve to balance resources and demand and return Interconnection frequency within defined limits following a Reportable Disturbance". In particular, it requires that "as a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency." The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions.

  In the use of net Real Power capability, the drafting team sought to use a value that could be verified through existing requirements: NERC standard MOD-024 was sourced for that.

- By using 1500 MW as a bright-line, the intent of the drafting team was to ensure that generation Facilities with common mode vulnerabilities that could result in the loss of generation capability higher than 1500 MW are adequately protected. Requirement R2 in CIP-002-4 further stipulates that, for Generation Facilities, only those Cyber Assets that are shared by any combination in a group of units that would exceed this value are candidates for further qualification as Critical Cyber Assets (i.e. the Critical Asset is the group of units). In considering common mode vulnerabilities, the Responsible Entity should include all Facilities and systems up to the point where the Generation is attached to the Transmission system.

- In specifying a 15 minute qualification, the drafting team sought to include those Cyber Assets which would have a real-time impact on the reliable operation of the BES. In a generation facility context, there may be Facilities which, while essential to the reliability and operability of the generation facility, may not have real-time operational impact within the specified real-time operations impact window of 15 minutes. This may be illustrated in the case of cyber assets controlling the supply of coal fuel in a coal burning facility: in this case, the compromise of the cyber asset may result in an inability

of the supply system to bring the fuel for generation. However, because of the way these systems are used, there may be a significant time before this affects real-time operation, time during which detection and remediation may be able to be effected.

The drafting team also used additional time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used.

- In part 1.3, the drafting team sought to ensure that those generation Facilities that have been designated by the Planning Coordinator as ~~required~~necessary to ~~run to ensure reliable operation of~~avoid BES Adverse Reliability Impacts in the ~~BES~~ long term planning horizon are designated as Critical Assets. These Facilities ~~are often~~may be designated as "Reliability Must Run" and this designation is distinct from those generation Facilities designated as "must run" for market stabilization purposes. Because the use of the term "must run" creates some confusion in many areas, the drafting team chose to avoid using this term and instead drafted the requirement in more generic reliability language. In particular, the focus on preventing an Adverse Reliability Impact dictates that these units are ~~typically~~ designated as must run for reliability purposes beyond the local area. Those units designated as must run for voltage support in the local area would not generally be given this designation. In cases where there is no designated Planning Coordinator, the Transmission Planner is included as the Registered Entity that performs this designation.

  In the specification of the "long-term planning horizon" in this criterion, the drafting team sought to ensure that such Critical Assets would be designated in the time horizon described in the NERC document "Time Horizons", which defines long-term planning horizon as "a planning horizon of one year or longer".

- In part 1.4, generation resources that have been designated as Blackstart Resources in the Transmission Operator's restoration plan are designated as Critical Assets. NERC standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan as well as requirements to test these

Resources. This criterion designates only those generation Blackstart Resources that have been designated as such in the Transmission Operator's restoration plan. The glossary term Blackstart Capability Plan has been retired. While the definition of Blackstart Resource includes the fact that it is in a Transmission Operator's Restoration Plan, the drafting team included the term in the criterion for clarity.

Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in NERC standard EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 1.5 designates Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator's restoration plan, up to the point on the Cranking Path where ~~multiple~~two or more path options exist as Critical Assets. This criterion is sourced from requirements in NERC standard EOP-005-2, which requires the Transmission Operator to include in its Restoration Plan the Cranking Paths and initial switching requirements from the Blackstart Resource and the unit(s) to be started. The drafting team further qualified the Facilities to be designated as Critical Assets as only those in the Cranking Path up to the point where ~~multiple~~two or more paths exist to the units to be started.

- Part 1.12 designates Special Protection Systems and Remedial Action Schemes as Critical Assets. ~~Since the purpose of~~ Special Protection Systems and Remedial Action Schemes ~~is~~may be implemented to prevent disturbances that would result in ~~excursions beyond~~exceeding IROLs~~, often in lieu of building additional Transmission Facilities,~~ if they do not provide the function required at the time ~~it is~~they are ~~expected that all such systems and schemes will be designated as Critical Assets.~~required or if ~~it~~they operate~~s~~ outside of the parameters ~~it was~~they were designed for. Generation Owners and Operators which have implemented such systems and schemes must designate them as Critical Assets.

- Part 1.15 designates generation control centers that control generation Facilities designated as Critical Assets, or used to control generation greater than an aggregate of

1500 MW in a single Interconnection, as Critical Assets. In the development of this criterion, the drafting team used 1500 MW as a bright line for aggregate generation controlled based on the bright-line used in Part 1.1. The drafting team specified a single Interconnection because it is more likely that the span of control of the generation control center may cross multiple BA or RSG areas or even regions and Interconnections~~.~~ , and that BES impact will more likely be restricted within an Interconnection.

This criterion uses the phrase "control generation." Entities should consider the discussion of "control" for generation as discussed in the Frequently Asked Questions (FAQ) document for CIP 002-1, Question 9:

> **"Question:** *Are Cyber Assets for a control center or generation control center with monitoring only and no direct remote control required to be protected and secured under the Cyber ~~Cyber~~ Security Standards?*
> **Answer:** A control center or generation control center that provides critical operating functions and tasks as identified in CIP–002 must be protected per the requirements of the Cyber Security Standard. The monitoring and operating control function includes controls performed automatically, remotely, manually, or by voice instruction.
> An example of monitoring without direct control that is subject to the Cyber Security Standards is a Reliability Authority that receives data from Critical Cyber Assets to a state estimator. "

It must be noted that this part does not ~~include the term "control systems" to avoid including~~apply to those systems that would be included in the evaluation of Cyber Assets that are only associated with Facilities in a single plant location as specified in part 1.1. These would include Cyber Assets in control rooms in these generation plants. An excellent discussion of control centers and control rooms can be found in the NERC document "Security Guideline for the Electric Sector: Identifying Critical Assets".

TRANSMISSION

Parts 1.2, 1.5-1.13 in Attachment 1 are the criteria that are applicable to Transmission Owners and Operators. The general approach to the criteria is that these should cover those

transmission Facilities generally designated as Extra High Voltage (EHV)[1,2] which form the backbone of the BES. At the lower end of the EHV range, additional qualifications have been defined to ensure appropriate impact for Critical Assets. In many of the criteria, the impact threshold is defined as the capability of the failure or compromise of a Critical Asset to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs).

- Part 1.2 includes those Facilities in Transmission systems that provide reactive resources to enhance and preserve the reliability of the BES. The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.

- In Part 1.5, the intent is to ensure that the Cranking Paths and other BES Transmission Facilities required to support the Transmission Operator's restoration plan required by EOP-005-2 receive consideration for protection from cyber threats. Transmission Owners and Operators own and operate a large number of these Facilities. EOP-005-2 specifies Facilities that comprise the "Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started~~.~~". Part 1.5 specifies that the Facilities meeting these requirements or comprising the Cranking Paths be identified as Critical Assets.

  Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 1.6 includes any Transmission Facility at a substation operated at 500 kV or higher. While the drafting team felt that Facilities operated at 500 kV or higher did not require

[1] REA BULLETIN 1724E-202. An Overview of Transmission System Studies, Page 12:6.1.3 System Voltage : Transmission system voltages below the extra-high-voltage (EHV) level are between 34.5 and 230 kilovolts(kV). The nominal EHV levels in the United States are 345, 500 and 765 kV. (http://www.usda.gov/rus/electric/pubs/a/1724e202.pdf)

[2] Webster on-line Dictionary: Voltage levels higher than those normally used on transmission lines. Generally EHV is considered to be 345,000 volts or higher. (EHV).

any further qualification for their role as components of the backbone on the Interconnected BES, Facilities in the lower EHV range should have additional qualifying criteria for inclusion as a Critical Asset.

It must be noted that if the collector bus for a non-Critical Asset generation plant (i.e. the plant is smaller in aggregate than the threshold set for generation plants in Part 1.1) is operated at 500kV, the collector bus should be considered a Generation Interconnection Facility and not a Transmission Facility, according to the "Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface". This collector bus would not be a Critical Asset because it doesn't significantly affect the 500kV Transmission grid; it only affects a plant which is below the Critical Asset threshold.

- Part 1.7 includes the lower end of the EHV range between 300kV and 500 kV, (primarily Facilities operated at 345kV) with qualifications for inclusion as Critical Assets if they are deemed highly likely to have significant impact on the BES. While the criterion has been specified as part of the rationale for requiring protection for EHV Transmission Facilities, the drafting team included, in this criterion, additional qualifications that would ensure the required level of impact to the BES: at this lower end of the EHV spectrum, the drafting team:
  - Excluded radial facilities that would only provide support for single generation facilities.
  - Specified interconnection to at least 3 transmission stations or substations to ensure that the level of impact would be appropriate.

- Parts 1.8 and 1.9 include those Transmission Facilities that ~~would violate~~have been identified as critical to the derivation of IROLs ~~if they were rendered unavailable or degraded. By definition, IROLs are those operating limits that, if exceeded, would have a Wide Area reliability impact.~~and their associated contingencies, as specified by FAC-014-2, **Establish and Communicate System Operating Limits,** R5.1.1 and R5.1.3.

- Part 1.10 designates those Transmission Facilities as Critical Assets that ~~directly connect~~provide the generation interconnection for Generation Facilities identified as Critical Assets to the Transmission system. The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets.

- Part 1.11 is sourced from the NUC-001 NERC standard for the support of Nuclear Facilities. NUC-001 ensures that reliability of NPIR's are ensured through adequate coordination between the Nuclear Generator Owner/Operator and its Transmission provider "for the purpose of ensuring nuclear plant safe operation and shutdown". In particular, there are specific requirements to coordinate physical and cyber security protection of these interfaces.

- Part 1.12 designates as Critical Assets those Special Protection Systems (SPS), Remedial Action Schemes (RAS), or automated switching systems installed to ensure BES operation within IROLs. ~~By IROL definition~~The degradation, compromise or unavailability of these Critical Assets would result in exceeding IROLs if they fail to operate as designed. By the ~~-~~definition of IROL, the loss or compromise of any of these have Wide Area impacts.

- Part 1.13 designates ~~those control systems~~ as Critical Assets those systems or Facilities that are capable of performing automatic load shedding, without human operator initiation, of 300 MW or more. ~~These may~~In the drafting of this criterion, the drafting team sought to include only those systems that did not require human operator initiation, and targeted in particular those Under Frequency Load Shedding (UFLS) facilities and systems and Under Voltage Load Shedding (UVLS) facilities and systems that would be implemented as part of a regional load shedding requirement to prevent Adverse Reliability Impact. These include automated Under Frequency Load Shedding systems or Under Voltage Load Shedding Systems that are capable of load shedding 300 MW or more. ~~Control Systems that provide a "one-button push" capability of shedding 300 MW or more would also qualify~~ It should be noted that those qualifying systems which require a human operator to arm the system, but once armed, trigger automatically, are still to be considered as not requiring human operator initiation and should be designated as Critical Assets.

  300 MW is the reporting threshold for DOE EIA-417.

CONTROL CENTERS

Parts 1.14 ~~and~~ through 1.~~15~~17 apply to BES control centers. Control centers generally perform control center functions for multiple BES assets. These Facilities are evaluated as a control center. Facilities that perform control center functions for only a single BES asset should be evaluated as part of the BES asset (e.g., control room for a single generation plant or transmission substation). ~~Part 1.15 has already been discussed in the Generation section.~~

~~Part 1.14 designates all control centers and control systems used to perform the functional obligations of the Reliability Coordinator (RC), Balancing Authority (BA) or Transmission Operator (TOP). EOP-008 requires that RCs, BAs and TOPs "ensure continued reliable operations of the Bulk Electric System (BES) in the event that a control center becomes inoperable."~~ While it is clear that the primary and all backup control centers operated by RCs, BAs, ~~and~~or TOPs **that meet the criteria** must be designated as Critical Assets, control ~~systems~~centers at other applicable Responsible Entities that are used, by delegation, to perform the functional obligations of the RCs, BAs, or TOPs must also be designated as Critical Assets. These include ~~control systems at~~ Transmission Owners' control centers and backup control centers, for example, which have been formally delegated to perform some of these functions. ~~Control systems were specifically called out separately from control centers to ensure that Entities fully evaluate those systems used to perform the functional obligations of the Reliability Coordinator, Balancing Authority, or Transmission Operator. These control systems~~ It should be noted that Cyber Assets essential to the operation of a control center may be located at a data center that is not co-located with the control center itself.

~~.~~

- Part 1.14 designates all control centers used to perform the functional obligations of the Reliability Coordinator (RC) as Critical Assets. Each Reliability Coordinator control center and backup control center was included as a Critical Asset due to their key role in maintaining reliability for the Interconnection as a whole in concert with other Reliability Coordinators.

- For part 1.15, please refer to the discussion of generation control centers in the Generation section of this document.

- Part 1.16 specifies that all control centers or backup control centers that perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12. Due to the direct impact

on the operation of identified Critical Assets, these Transmission control centers ~~-~~must be designated as Critical Assets. It must be noted that in many cases, some Transmission Operator functions are delegated to Transmission Owner control centers: in such cases, these must also be designated as Critical Assets. As with the discussion of part 1.15, the drafting team intended for the word control to have the same meaning as that found in *Frequently Asked Questions Cyber Security Standards CIP-002-1 through CIP-009-1* which indicates that controls may be "performed automatically, remotely, manually, or by voice instruction."

- Part 1.17 specifies that all control centers that perform the functional obligations of ~~the~~ a Balancing Authority (BA) that include at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13 must be declared as Critical Assets. In addition, this criterion designates as a Critical Asset any BA control center that, in aggregate, performs the functional obligations of a BA for 1500 MWs or more in a single Interconnection. The threshold, 'controls generation of 1500 MW' was chosen to maintain consistency with the threshold in part 1.1.

GUIDANCE ON THE IMPLEMENTATION PLAN

~~In general, Responsible Entities must:~~

~~(1) Comply with CIP-002-4 on the Effective Date[3]~~

~~(2) Comply with CIP-003-4 through CIP-009-4 on the Effective Date for previously identified CCAs and~~

~~(3) Comply with CIP-003-4 through CIP-009-4 18 months after the Effective Date for any new Critical Cyber Assets identified as a result of Attachment 1 Criteria~~

~~[3] "The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)." For example, if FERC approves CIP-002-4 on March 31, 2011, then US entities must be able to demonstrate compliance by October 1, 2011.~~

There are two implementation plans associated with CIP-002-4 through CIP-009-4: the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4*~~,~~ and the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.* These plans are intended to work together as a set. In order to determine when an Entity must be compliant with CIP-002-4 through CIP-009-4, they should refer first to the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4*. ~~Responsible Entities should then~~This implementation plan describes the schedule by which an Entity must become compliant with the Version 4 CIP Standards. Once this initial compliance milestone is reached, this implementation plan is effectively retired. For an Entity ~~who~~that registers after the Version 4 CIP Standards are effective or for those Critical Cyber Assets that are newly identify after the Version 4 CIP Standards are effective, Responsible Entities should refer to the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* ~~if directed to in the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4.* Responsible Entities shall be compliant with the requirements of CIP-002-4 on the Effective Date specified in the Standard. Compliance milestones for CIP-003-4 through CIP-009-4 is determined based on specific cases outlined in the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4.* These cases include the following: ~~ . The *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* remains in use throughout the entire time that the Version 4 CIP Standards remain in effect.

- ~~Critical Cyber Assets Already in Compliance with CIP-003-3 through CIP-009-3~~

  ~~Since only conforming changes to CIP-003-3 through CIP-009-3 were made and no changes were made to the existing requirement language itself, those Critical Cyber Assets already in compliance with CIP-003-3 through CIP-009-3 should be compliant with CIP-003-4 through CIP-009-4 on the Effective Date of the Version 4 Standard.~~

- ~~Critical Cyber Assets at Critical Assets Newly Identified by CIP-002-4~~

Responsible Entities shall be compliant with the requirements of CIP-002-4 through CIP-009-4 on the later of (i) the Effective Date[4] specified in the Standard or (ii) the compliance milestones

[4] "The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)."

in the version 3 Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities. This allows essentially a two year implementation period following FERC approval to become compliant with the Version 4 CIP Standards. Special consideration was given to maintain the compliance milestone date for those Critical Cyber Assets and Newly Registered Entities that are in the middle of their implementation period for the Version 3 Standards on the Effective Date of the Version 4 Standards.

The drafting team considered that Responsible Entities may not have been able to anticipate the addition of Critical Assets to the Critical Asset list since the criteria included in Attachment 1 of CIP-002-4 may significantly differ from an Entity's existing risk-based assessment methodology. As such, the drafting team determined that a one-time implementation window was needed to bring the Critical Cyber Assets at the newly identified Critical Assets into compliance with CIP-~~003-4 through CIP-009-4. Since updates to the Critical Asset list must be made as necessary and since these updates may occur before the next scheduled annual review of the Critical Asset list as defined in CIP-002-4 R1, this implementation window is defined as a rolling window for the first 12 month period following the effective date of CIP-002-4.~~ 002-4 through CIP-009-4.

> ~~This rolling implementation window is only applicable to those Entities that have already defined Critical~~ Both the *Implementation Plan for Version 4 of* *Cyber* ~~Assets according to previous versions of~~ *Security Standards* *CIP-002*~~. Since these Entities already have fully developed~~ *4 through* *CIP*~~ programs, the implementation window for these newly identified Critical Cyber Assets is 18 months. This implementation window is shorter than the 24 month implementation period given to Entities that do not currently have existing Critical Cyber Assets as per~~ *009-4* and the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities*~~.~~

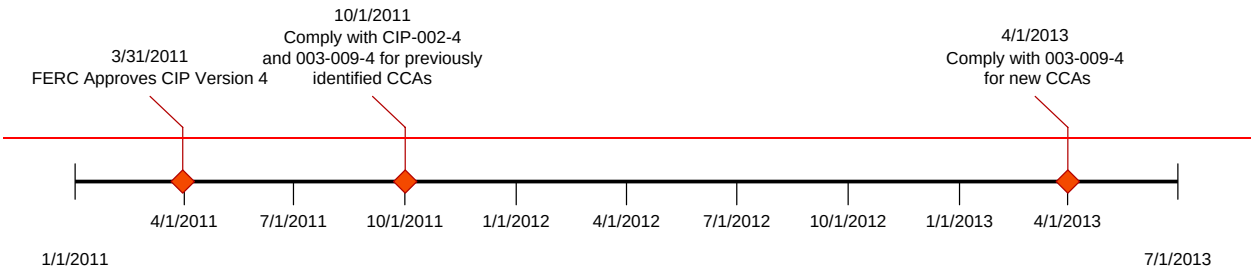
~~This special implementation window is slightly modified~~ contain certain exceptions for U.S. Nuclear Power Plant Facilities in recognition of the special circumstances of this operating environment. The modifications used for the U.S. Nuclear Power Plant Facilities are consistent with those included in the Revised Implementation Plan for Version 3 of Cyber Security Standards CIP-002-3 through CIP-009-3.

- ~~All Other Critical Cyber Assets~~

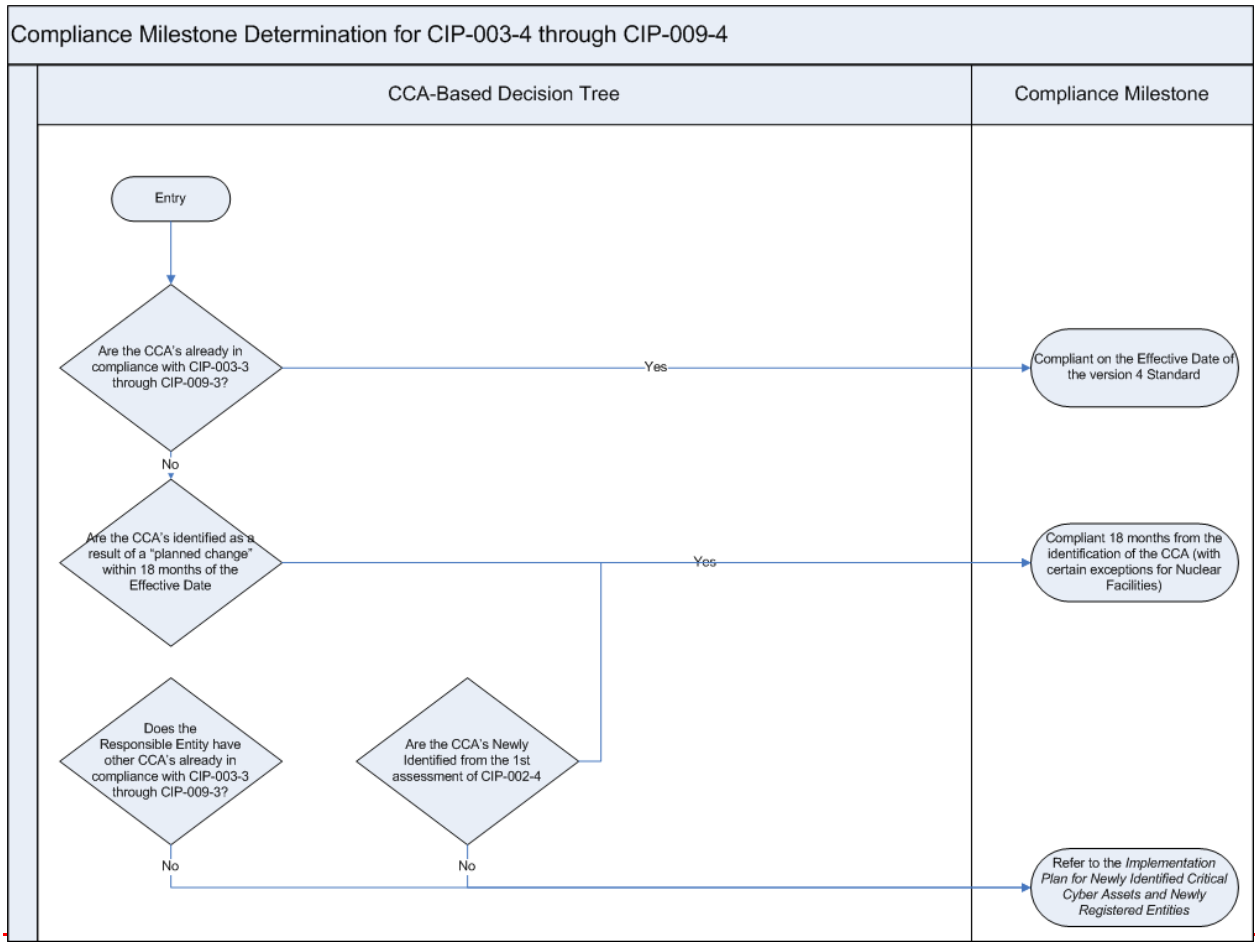
  ~~The compliance milestones for all other circumstances should be derived from the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered*~~

~~*Entities.* The modifications made to the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* over the previous version of this plan were only those needed to conform to the Version 4 Standards.~~

~~The process for determining the compliance milestones for CIP-003-4 through CIP-009-4 is illustrated in the timeline and flowchart below.~~



~~**Figure 1: Sample Implementation Plan Timeline (General Case)**~~



CONCLUSION

In formulating this document, the drafting team hopes to have clarified the thinking and intent behind the criteria in Attachment 1. The drafting team hopes that this document will also provide Responsible Entities with additional guidance in the implementation of CIP-002-4. The drafting team reiterates that this document is not intended to augment, modify, or nullify any of the requirements and criteria in the standard. The language of requirements in the standard remains the only authority for the purpose of evaluating compliance.

Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

This Implementation Plan applies to Cyber Security Standards CIP-002-4 through CIP-009-4.

The term "Compliant" in this Implementation Plan is used in the same way that it is used in the (Revised) Implementation Plan for Cyber Security Standards CIP-002-1 through CIP-009-1: "Compliant means the entity meets the full intent of the requirements and is beginning to maintain required 'data,' 'documents,' 'documentation,' 'logs,' and 'records.'"

The Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities (hereafter referred to as 'this Implementation Plan') defines the schedule for compliance with the requirements of Version 4 of the NERC Reliability Standards CIP-003 through CIP-009[1] on Cyber Security for (a) newly Registered Entities and (b) newly identified Critical Cyber Assets by an existing Registered Entity after the Registered Entity's applicable *Compliant* milestone date has already passed based upon the scenarios identified in the Version 4 CIP-002-4 through CIP-009-4 Implementation Plan.

There are no *Compliant* milestones specified in Table 2 of this Implementation Plan for compliance with NERC Standard CIP-002, since all Responsible Entities are required to be compliant with NERC Standard CIP-002 based on a previous or existing version-specific Implementation Plan[2].

Implementation Plan for Newly Identified Critical Cyber Assets

This Implementation Plan defines the *Compliant* milestone dates in terms of the number of calendar months after designation of the newly identified Cyber Asset as a Critical Cyber Asset, following the process stated in NERC Standard CIP-002. These *Compliant* Milestone dates are included in Table 2 of this Implementation Plan.

The term 'newly identified Critical Cyber Asset' is used when a Registered Entity has been required to be compliant with NERC Reliability Standard CIP-002 for at least one application of the "Critical Asset Criteria" for the identification of Critical Assets. Upon a subsequent annual application of the Critical Asset identification in compliance with requirements of NERC Reliability Standard CIP-002, either a previously non-critical asset has now been determined to be a Critical Asset, and its associated essential Cyber Assets have now been determined to be Critical Cyber Assets, or Cyber Assets associated with an existing Critical Asset have now been identified as Critical Cyber Assets. These newly determined Critical Cyber Assets are referred to in this Implementation Plan as 'newly identified Critical Cyber Assets'.

[1] The reference in this Implementation Plan to 'NERC Standards CIP-002 through CIP-009' is to all versions (i.e., Version 1, Version 2, Version 3, and Version 4) of those standards. If reference to only a specific version of a standard or set of standards is required, a version number (i.e., '-1', '-2','-3', or '-4') will be applied to that particular reference.

[2] Each version of NERC Standards CIP-002 through CIP-009 has its own implementation plan and/or designated effective date when approved by the NERC Board of Trustees or appropriate government authorities.

Table 2 defines the *Compliant* milestone dates for all of the requirements defined in the NERC Reliability Standards CIP-003 through CIP-009 in terms of the number of months following the designation of a newly identified Critical Cyber Asset a Responsible Entity has to become compliant with that requirement. Table 2 further defines the *Compliant* milestone dates for the NERC Reliability Standards CIP-003 through CIP-009 based on the 'Milestone Category', which characterizes the scenario by which the Critical Cyber Asset was identified.

For those NERC Reliability Standard requirements that have an entry in Table 2 annotated as *existing*, the designation of a newly identified Critical Cyber Asset has no bearing on its *Compliant* milestone date, since Responsible Entities are required to be compliant with those requirements as part of an existing CIP compliance implementation program[3], independent of the determination of a newly identified Critical Cyber Asset.

Implementation Plan for Newly Registered Entities

A newly Registered Entity is one that has registered with NERC as of the Effective Date of the CIP-002-4 Standard or thereafter and has not previously undergone the NERC CIP-002 Critical Asset Identification Process. As such, it is presumed that no Critical Cyber Assets have been previously identified and no previously established CIP compliance implementation program exists. The *Compliant* milestone schedule defined in Table 3 of this Implementation Plan document defines the applicable compliance schedule for the newly Registered Entity to the NERC Reliability Standards CIP-002 through CIP-009.

Implementation Milestone Categories

The Implementation Plan milestones and schedule to achieve compliance with the NERC Reliability Standards CIP-002 through CIP-009 for newly identified Critical Cyber Assets and newly Registered Entities are provided in Tables 2 and 3 of this Implementation Plan document.

The Implementation Plan milestones defined in Table 2 are divided into categories based on the scenario by which the Critical Cyber Asset was newly identified. The scenarios that represent the milestone categories are briefly defined as follows:

1. A Cyber Asset is designated as the first Critical Cyber Asset by a Responsible Entity according to the process defined in NERC Reliability Standard CIP-002. No existing CIP compliance implementation program for Standards CIP-003 through CIP-009 is assumed to exist at the Responsible Entity. This category would also apply in the case of a newly Registered Entity (not resulting from a merger or acquisition), if any Critical Cyber Asset was identified according to the process defined in NERC Reliability Standard CIP-002.

2. An existing Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009, *not due to a planned change in the electric system or Cyber Assets by*

[3] The term 'CIP compliance implementation program' is used to mean that a Responsible Entity has programs and procedures in place to comply with the requirements of NERC Reliability Standards CIP-003 through CIP-009 for Critical Cyber Assets. All entities are required to be Compliant with NERC Reliability Standard CIP-002 according to a version specific Implementation Plan.

the Responsible Entity (unplanned changes due to emergency response are handled separately). A CIP compliance implementation program already exists at the Responsible Entity.

3. A new or existing Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009, *due to a planned change in the electric system or Cyber Assets by the Responsible Entity*. A CIP compliance implementation program already exists at the Responsible Entity.

Note that the phrase 'Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009' as used above applies to all Critical Cyber Assets, as well as other (non-critical) Cyber Assets within an Electronic Security Perimeter that must comply with the applicable requirements of NERC Reliability Standards CIP-003 through CIP-009.

Note also that the phrase 'planned change in the electric system or Cyber Assets by the Responsible Entity' refers to any changes of the electric system or Cyber Assets which were planned and implemented by the Responsible Entity.

For example, if a particular transmission substation has been designated a Critical Asset, but there are no Cyber Assets at that transmission substation, then there are no Critical Cyber Assets associated with the Critical Asset at the transmission substation. If an automation modernization activity is performed at that same transmission substation, whereby Cyber Assets are installed that meet the requirements as Critical Cyber Assets, then those newly identified Critical Cyber Assets have been implemented as a result of a planned change of the Critical Asset, and must therefore be in Compliance with NERC Reliability Standards CIP-003 through CIP-009 upon the commissioning of the modernized transmission substation.(Compliant Upon Commissioning below.)

If, however, a particular transmission substation with Cyber Assets does not meet the criteria as a Critical Asset, its associated Cyber Assets are *not* Critical Cyber Assets, as described in the requirements of NERC Reliability Standard CIP-002. Further, if an action is performed outside of that particular transmission substation, such as a transmission line is constructed or retired, a generation plant is modified changing its rated output, or load patterns shift resulting in corresponding transmission flow changes through that transmission substation, that unchanged transmission substation may become a Critical Asset based on the established criteria in the CIP-002-4 *Attachment 1 Critical Asset Criteria* through the application of the Critical Asset identification (required by CIP-002 R1). (Note that the actions that cause the change in power flows may have been performed by a neighboring entity without the full knowledge of the affected Responsible Entity.) Application of those Critical Asset criteria is required annually (by CIP-002 R1), and, as such, it may not be immediately apparent that that particular transmission substation has become a Critical Asset until after the required annual application of the identification methodology. Category 1 Scenario below applies if there was no pre-existing Critical Cyber Assets subject to the standard, and therefore, there was no existing full CIP program. Category 2 Scenario below applies if a CIP program for existing Critical Cyber Assets has been implemented for that Registered Entity.

Figure 1 shows an overall process flow for determining which milestone category a Critical Cyber Asset identification scenario must follow. Following the figure is a more detailed description of each category.

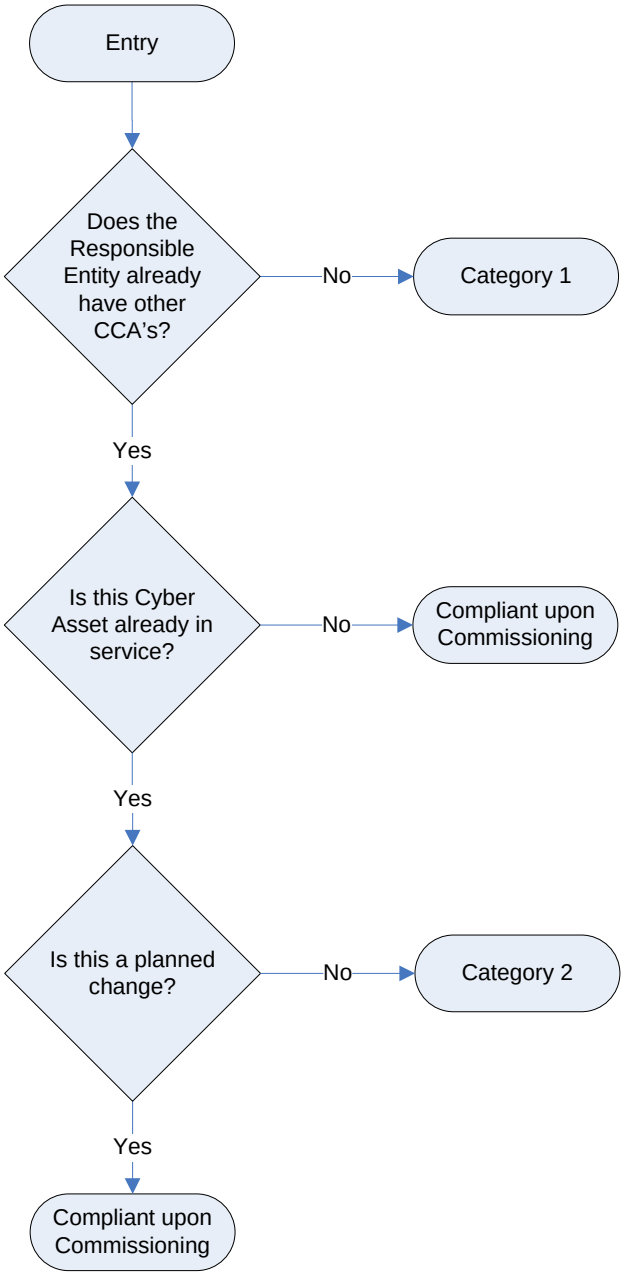


Figure 1: Category Selection Process Flow

Implementation Milestone Categories and Schedules

Based on the Critical Cyber Asset identification scenarios identified above, the implementation milestone categories and schedules for those scenarios are defined and distinguished below for entities with existing registrations in the NERC Compliance Registry. Scenarios resulting from the formation of newly Registered Entities are discussed in a subsequent section of this Implementation Plan.

1. **Category 1 Scenario**: A Responsible Entity that previously has undergone the NERC Reliability Standard CIP-002 Critical Asset identification process for at least one annual review and approval period without ever having previously identified any Critical Cyber Assets associated with Critical Assets, but has now identified one or more Critical Cyber Assets. As such, it is presumed that the Responsible Entity does not have a previously established CIP compliance implementation program.

   The *Compliant* milestones defined for this Category are defined in Table 2 (Milestone Category 1) of this Implementation Plan document.

2. **Category 2 Scenario**: A Responsible Entity has an established NERC Reliability Standards CIP compliance implementation program in place, and has newly identified additional existing Cyber Assets that need to be added to its Critical Cyber Asset list and therefore subject to compliance to the NERC Reliability CIP Standards due to unplanned changes in the electric system or the Cyber Assets. Since the Responsible Entity already has a CIP compliance implementation program, it needs only to implement the NERC Reliability CIP standards for the newly identified Critical Cyber Asset(s). The existing Critical Cyber Assets may remain in service while the relevant requirements of the NERC Reliability CIP Standards are implemented for the newly identified Critical Cyber Asset(s).

   This category applies only when additional in-service Critical Cyber Assets or applicable other Cyber Assets are *identified* as Critical Cyber Assets according to the process defined in the NERC Reliability Standard CIP-002. This category does not apply if the newly identified Critical Cyber Assets are not already in-service, or if the additional Critical Cyber Assets resulted from planned changes to the electric system or the Cyber Assets. In the case where the Critical Cyber Asset is not in service, the Responsible Entity must be compliant with the NERC Reliability Standards CIP-003 through CIP-009 upon commissioning of the new cyber or electric system assets (see "Compliant upon Commissioning" below).

   Unplanned changes due to emergency response, disaster recovery or system restoration activities are handled separately (see "Disaster Recovery and Restoration Activities" below).

3. **Compliant upon Commissioning**: When a Responsible Entity has an established NERC Reliability Standards CIP compliance implementation program and implements a new or replacement Critical Cyber Asset associated with a previously identified or newly

constructed Critical Asset, the Critical Cyber Asset shall be compliant when it is commissioned or activated. This scenario shall apply for the following scenarios:

a) 'Greenfield' construction of an asset that will be declared a Critical Asset (based on the Critical Asset criteria in CIP-002-4 Attachment 1) upon its commissioning or activation
b) Replacement or upgrade of an existing Critical Cyber Asset (or other Cyber Asset within an Electronic Security Perimeter) associated with a previously identified Critical Asset
c) Upgrade or replacement of an existing non-cyber asset with a Cyber Asset (e.g., replacement of an electro-mechanical relay with a microprocessor-based relay) associated with a previously identified Critical Asset and meets other criteria for identification as a Critical Cyber Asset
d) Planned addition of:
    i. a Critical Cyber Asset, or,
    ii. another (i.e., non-critical) Cyber Asset within an established Electronic Security Perimeter

In summary, this scenario applies in any case where a Critical Cyber Asset or applicable other Cyber Asset is being added or modified associated with an existing or new Critical Asset and where that Entity has an established NERC Reliability Standard CIP compliance implementation program.

A special case of a 'greenfield' construction exists where the asset under construction was planned and construction started under the assumption that the asset would not be a Critical Asset. During construction, conditions changed, and the asset will now be a Critical Asset upon its commissioning. In this case, the Responsible Entity must follow the Category 2 milestones from the date of the determination that the asset is a Critical Asset.

Since the assets must be compliant with the NERC Reliability Standards CIP-003 through CIP-009 upon commissioning, no implementation milestones or schedules are provided herein.

Disaster Recovery and Restoration Activities

A special case of restoration as part of a disaster recovery situation (such as storm restoration) shall follow the emergency provisions of the Responsible Entity's policy required by CIP-003 R1.1.

The rationale for this is that the primary task following a disaster is the restoration of the power system, and the ability to serve customer load. Cyber security provisions are implemented to support reliability and operations. If restoration were to be slowed to ensure full implementation of the CIP compliance implementation program, restoration could be hampered, and reliability could be harmed.

However, following the completion of the restoration activities, the entity is obligated to implement the CIP compliance implementation program at the restored facilities, and be able to demonstrate full compliance in a spot-check or audit; or, file a self-report of non-compliance with a mitigation plan describing how and when full compliance will be achieved.

Newly Registered Entity Scenarios

Based on the Critical Cyber Asset identification scenarios identified above, the implementation milestone categories and schedules for those scenarios as they apply to newly Registered Entities are defined and distinguished below.

The following examples of business merger and asset acquisition scenarios may be helpful in explaining the expectations in each of the scenarios. Note that in each case, the predecessor Registered Entities are assumed to already be in compliance with NERC Reliability Standard CIP-002-4.

1. **Newly Registered Entity Scenario 1 (Application of Category 1 Milestones):**

   A Merger of Two or More Registered Entities where None of the Predecessor Registered Entities has Identified any Critical Cyber Asset
   In the case of a business merger or asset acquisition, because there are no identified Critical Cyber Assets in any of the predecessor Registered Entities, a CIP compliance implementation program is not assumed to exist. The only program component required is a Critical Asset and Critical Cyber Asset identification process per NERC Reliability Standard CIP-002-4.

   If either predecessor Registered Entities has identified Critical Assets (but without associated Critical Cyber Assets), the merged Registered Entity must continue to perform annual application of the Critical Asset identification as required in CIP-002 R1, as well as to annually verify whether associated Cyber Assets meet the requirements as newly identified Critical Cyber Assets as required by CIP-002 R2. If newly identified Critical Cyber Assets are found at any point in this process (i.e., during the one calendar year allowance period, or after that one calendar year allowance period), then the implementation milestones, categories and schedules of this Implementation Plan apply regardless of when this newly identified Critical Cyber Assets are determined, and independent of any merger and acquisition discussions contained in this Implementation Plan.

2. **Newly Registered Entity Scenario 2:**

   A Merger of Two or More Registered Entities where Only One of the Predecessor Registered Entities has Identified at Least One Critical Cyber Asset
   Since only one of the predecessor Registered Entities has previously identified Critical Cyber Assets, it is assumed that none of the other predecessor Registered Entities have CIP compliance implementation programs (since they are not required to have them). In

this case, the CIP compliance implementation program from the predecessor Registered Entity with the previously identified Critical Cyber Asset would be expected to be implemented as the CIP compliance implementation program for the merged Registered Entity, and would be expected to apply to any Critical Cyber Assets identified after the effective date of the merger. Since the other predecessor Registered Entities did not have any Critical Cyber Assets, this should present no conflict in any CIP compliance implementation programs.

Note that the discussion of the disposition of any NERC Reliability Standard CIP-002 Critical Asset identification process from Scenario 1 above would apply in this case as well.

3. **Newly Registered Entity Scenario 3:**

A Merger of Two or More Registered Entities where Two or More of the Predecessor Registered Entities has Identified at Least One Critical Cyber Asset
This scenario is the most complicated of the three, since it applies to a merged Registered Entity that has more than one CIP compliance implementation program, which are most likely not in complete agreement with each other. These differences could be due to any number of issues, ranging from something as 'simple' as selection of different anti-virus tools, to something as 'complicated' as the access authorization process.

The merged Responsible Entity has one calendar year from the effective date of the business merger to continue to operate the separate CIP compliance implementation programs while determining how to either combine the CIP compliance implementation programs, or at a minimum, operate the CIP compliance implementation programs under a common Senior Manager and governance structure.

Following the one year analysis period, if the decision is made to continue the operation of separate CIP compliance implementation programs under a common Senior Manager and governance structure, the merged Responsible Entity must update any required Senior Manager and governance issues, and clearly identify which CIP compliance implementation program components apply to each individual Critical Cyber Asset. This is essential to the implementation of the CIP compliance implementation program at the merged Responsible Entity, so that the correct and proper program components are implemented on the appropriate Critical Cyber Assets, as well as to allow the ERO compliance program (in a spot-check or audit) to determine if the CIP compliance implementation program has been properly implemented for each Critical Cyber Asset. Absent this clear identification, it would be possible for the wrong CIP compliance implementation program to be applied to a Critical Cyber Asset, or the wrong CIP compliance implementation program be evaluated in a spot-check or audit, leading to a possible technical non-compliance without real cause.

However, if after the one year analysis period, the decision is made to combine the operation of the separate CIP compliance implementation programs into a single CIP

compliance implementation program, the merged Responsible Entity must develop a plan for merging of the separate CIP compliance implementation programs into a single CIP compliance implementation program, with a schedule and milestones for completion. The programs should be combined as expeditiously as possible, but without causing harm to reliability or operability of the Bulk power System. This 'merged plan' must be made available to the ERO compliance program upon request, and as documentation for any spot-check or audit conducted while the merged plan is being performed. Progress towards meeting milestones and completing the merged plan will be verified during any spot-checks or audits conducted while the plan is being executed.

Example Scenarios

Note that there are no implementation milestones or schedules specified for a Responsible Entity that has a newly identified Critical Asset, but no newly identified Critical Cyber Assets. This situation exists because no action is required by the Responsible Entity upon identification of a Critical Asset without associated Critical Cyber Assets. Only upon identification of Critical Cyber Assets does a Responsible Entity need to become compliant with the NERC Reliability Standards CIP-003 through CIP-009.

As an example, Table 1 provides some sample scenarios, and provides the milestone category for each of the described situations.

Table 1: Example Scenarios

Scenarios	CIP Compliance Implementation Program:	
	No Program (note 1)	Existing Program
Existing asset becomes Critical Asset; associated Cyber Assets become Critical Cyber Assets	Category 1	Category 2
New asset comes online as a Critical Asset; associated Cyber Assets become Critical Cyber Asset	Category 1	Compliant upon Commissioning
Existing Cyber Asset moves into the Electronic Security Perimeter due to network reconfiguration	N/A	Compliant upon Commissioning
New Cyber Asset – never before in service and not a replacement for an existing Cyber Asset – added into a new or existing Electronic Security Perimeter	Category 1	Compliant upon Commissioning
New Cyber Asset replacing an existing Cyber Asset within the Electronic Security Perimeter	N/A	Compliant upon Commissioning
Planned modification or upgrade to existing Cyber Asset that causes it to be reclassified as a Critical Cyber Asset	Category 1	Compliant upon Commissioning
Asset under construction as another (non-critical) asset becomes declared as a Critical Asset during construction	Category 1	Category 2

Scenarios	CIP Compliance Implementation Program:	
	No Program (note 1)	Existing Program
Unplanned modification such as emergency restoration invoked under a disaster recovery situation or storm restoration	N/A	Per emergency provisions as required by CIP-003 R1.1

Note: 1) assumes the entity is already compliant with CIP-002

Table 2 provides the compliance milestones for each of the two identified milestone categories.

Table 2: Implementation milestones for Newly Identified Critical Cyber Assets[4]

CIP Standard Requirement	Milestone Category 1	Milestone Category 2
Standard CIP-002-4 — Critical Cyber Asset Identification		
R1	*N/A*	*N/A*
R2	*N/A*	*N/A*
R3	*N/A*	*N/A*

R5	24 months	6 months

Table 3[5][6] Compliance Schedule for Standards CIP-002-4 through CIP-009-4 For Entities Registering in April 2008 and Thereafter		
Requirements	**Registration + 12 months**	**Registration + 24 months**
Standard CIP-002-4 — Critical Cyber Assets		
All Requirements		Compliant
Standard CIP-003-4 — Security Management Controls		
All Requirements Except R2		Compliant
R2	Compliant	
Standard CIP-004-4 — Personnel & Training		
All Requirements		Compliant
Standard CIP-005-4 — Electronic Security		
All Requirements		Compliant
Standard CIP-006-4 — Physical Security		
All Requirements		Compliant
Standard CIP-007-4 — Systems Security Management		
All Requirements		Compliant
Standard CIP-008-4 — Incident Reporting and Response Planning		
All Requirements		Compliant
Standard CIP-009-4 — Recovery Plans		
All Requirements		Compliant

[5] Note: This table only specifies a 'Compliant' date, consistent with the convention used elsewhere in this Implementation Plan. The Compliant dates are consistent with those specified in Table 4 of the Version 1 Implementation Plan. Other compliance states referenced in the Version 1 Implementation Plan are no longer used.
[6] For Owners and Operators of U.S. Nuclear Power Plants, Critical Cyber Assets associated with U.S. Nuclear Power Plants identified as Critical Assets shall be compliant with CIP-002-4 through CIP-009-4 by the later of (i) the milestone date listed in Table 3, or (ii) 6 months following the completion date of the first refueling outage beyond the milestone date in Table 3 for those requirements requiring a refueling outage.

Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

This Implementation Plan applies to Cyber Security Standards CIP-002-4 through CIP-009-4.

The term "Compliant" in this Implementation Plan is used in the same way that it is used in the (Revised) Implementation Plan for Cyber Security Standards CIP-002-1 through CIP-009-1: "Compliant means the entity meets the full intent of the requirements and is beginning to maintain required 'data,' 'documents,' 'documentation,' 'logs,' and 'records.'"

The Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities (hereafter referred to as 'this Implementation Plan') defines the schedule for compliance with the requirements of Version 4 of the NERC Reliability Standards CIP-003 through CIP-009[1] on Cyber Security for (a) newly Registered Entities and (b) newly identified Critical Cyber Assets by an existing Registered Entity after the Registered Entity's applicable *Compliant* milestone date has already passed based upon the scenarios identified in the Version 4 CIP-002-4 through CIP-009-4 Implementation Plan.

There are no *Compliant* milestones specified in Table 2 of this Implementation Plan for compliance with NERC Standard CIP-002, since all Responsible Entities are required to be compliant with NERC Standard CIP-002 based on a previous or existing version-specific Implementation Plan[2].

Implementation Plan for Newly Identified Critical Cyber Assets

This Implementation Plan defines the *Compliant* milestone dates in terms of the number of calendar months after designation of the newly identified Cyber Asset as a Critical Cyber Asset, following the process stated in NERC Standard CIP-002. These *Compliant* Milestone dates are included in Table 2 of this Implementation Plan.

The term 'newly identified Critical Cyber Asset' is used when a Registered Entity has been required to be compliant with NERC Reliability Standard CIP-002 for at least one application of the "Critical Asset Criteria" for the identification of Critical Assets. Upon a subsequent annual application of the Critical Asset identification in compliance with requirements of NERC Reliability Standard CIP-002, either a previously non-critical asset has now been determined to be a Critical Asset, and its associated essential Cyber Assets have now been determined to be Critical Cyber Assets, or Cyber Assets associated with an existing Critical Asset have now been

[1] The reference in this Implementation Plan to 'NERC Standards CIP-002 through CIP-009' is to all versions (i.e., Version 1, Version 2, Version 3, and Version 4) of those standards. If reference to only a specific version of a standard or set of standards is required, a version number (i.e., '-1', '-2','-3', or '-4') will be applied to that particular reference.

[2] Each version of NERC Standards CIP-002 through CIP-009 has its own implementation plan and/or designated effective date when approved by the NERC Board of Trustees or appropriate government authorities.

identified as Critical Cyber Assets. These newly determined Critical Cyber Assets are referred to in this Implementation Plan as 'newly identified Critical Cyber Assets'.

Table 2 defines the *Compliant* milestone dates for all of the requirements defined in the NERC Reliability Standards CIP-003 through CIP-009 in terms of the number of months following the designation of a newly identified Critical Cyber Asset a Responsible Entity has to become compliant with that requirement. Table 2 further defines the *Compliant* milestone dates for the NERC Reliability Standards CIP-003 through CIP-009 based on the 'Milestone Category', which characterizes the scenario by which the Critical Cyber Asset was identified.

For those NERC Reliability Standard requirements that have an entry in Table 2 annotated as *existing*, the designation of a newly identified Critical Cyber Asset has no bearing on its *Compliant* milestone date, since Responsible Entities are required to be compliant with those requirements as part of an existing CIP compliance implementation program[3], independent of the determination of a newly identified Critical Cyber Asset.

~~In all cases where a *Compliant* milestone is specified in Table 2 (i.e., not annotated as *existing*), the Responsible Entity is expected to have all audit records required to demonstrate compliance (i.e., to be 'Auditably Compliant'[4]) one year following the *Compliant* milestone listed in this Implementation Plan.~~

Implementation Plan for Newly Registered Entities

A newly Registered Entity is one that has registered with NERC as of the Effective Date of the CIP-002-4 Standard or thereafter and has not previously undergone the NERC CIP-002 Critical Asset Identification Process. As such, it is presumed that no Critical Cyber Assets have been previously identified and no previously established CIP compliance implementation program exists. The *Compliant* milestone schedule defined in Table 3 of this Implementation Plan document defines the applicable compliance schedule for the newly Registered Entity to the NERC Reliability Standards CIP-002 through CIP-009.

Implementation Milestone Categories

[3] The term 'CIP compliance implementation program' is used to mean that a Responsible Entity has programs and procedures in place to comply with the requirements of NERC Reliability Standards CIP-003 through CIP-009 for Critical Cyber Assets. All entities are required to be Compliant with NERC Reliability Standard CIP-002 according to a version specific Implementation Plan.

[4] ~~The term 'Auditably Compliant' (AC) used in this Implementation Plan for newly identified Critical Cyber Assets and newly Registered Entities means "the entity meets the full intent of the requirement and can demonstrate compliance to an auditor, including 12 calendar months of auditable 'data,' 'documents,' 'documentation,' 'logs,' and 'records.'" [see (Revised) Implementation Plan for Cyber Security Standards CIP-002-1 through CIP-009-1]. Since in all cases, the 'Auditably Compliant' dates are one calendar year following the 'Compliant' (C) date, the Auditably Compliant dates are not specified in this plan. The terms 'Begin Work' (BW) and 'Substantially Compliant' (SC) used in the Version 1 Implementation Plan are no longer used, and therefore are not referenced in this Implementation Plan.~~

The Implementation Plan milestones and schedule to achieve compliance with the NERC Reliability Standards CIP-002 through CIP-009 for newly identified Critical Cyber Assets and newly Registered Entities are provided in Tables 2 and 3 of this Implementation Plan document.

The Implementation Plan milestones defined in Table 2 are divided into categories based on the scenario by which the Critical Cyber Asset was newly identified. The scenarios that represent the milestone categories are briefly defined as follows:

1. A Cyber Asset is designated as the first Critical Cyber Asset by a Responsible Entity according to the process defined in NERC Reliability Standard CIP-002. No existing CIP compliance implementation program for Standards CIP-003 through CIP-009 is assumed to exist at the Responsible Entity. This category would also apply in the case of a newly Registered Entity (not resulting from a merger or acquisition), if any Critical Cyber Asset was identified according to the process defined in NERC Reliability Standard CIP-002.

2. An existing Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009, *not due to a planned change in the electric system or Cyber Assets by the ~~Responsibility~~Responsible Entity* (unplanned changes due to emergency response are handled separately). A CIP compliance implementation program already exists at the Responsible Entity.

3. A new or existing Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009, *due to a planned change in the electric system or Cyber Assets by the ~~Responsibility~~Responsible Entity*. A CIP compliance implementation program already exists at the Responsible Entity.

Note that the phrase 'Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009' as used above applies to all Critical Cyber Assets, as well as other (non-critical) Cyber Assets within an Electronic Security Perimeter that must comply with the applicable requirements of NERC Reliability Standards CIP-003 through CIP-009.

Note also that the phrase 'planned change in the electric system or Cyber Assets by the Responsible Entity' refers to any changes of the electric system or Cyber Assets which were planned and implemented by the Responsible Entity.

For example, if a particular transmission substation has been designated a Critical Asset, but there are no Cyber Assets at that transmission substation, then there are no Critical Cyber Assets associated with the Critical Asset at the transmission substation. If an automation modernization activity is performed at that same transmission substation, whereby Cyber Assets are installed that meet the requirements as Critical Cyber Assets, then those newly identified Critical Cyber Assets have been implemented as a result of a planned change of the Critical Asset, and must therefore be in Compliance with NERC Reliability Standards CIP-003 through CIP-009 upon the commissioning of the modernized transmission substation.(Compliant Upon Commissioning below.)

If, however, a particular transmission substation with Cyber Assets does not meet the criteria as a Critical Asset, its associated Cyber Assets are *not* Critical Cyber Assets, as described in the requirements of NERC Reliability Standard CIP-002. Further, if an action is performed outside of that particular transmission substation, such as a transmission line is constructed or retired, a generation plant is modified changing its rated output, or load patterns shift resulting in corresponding transmission flow changes through that transmission substation, that unchanged transmission substation may become a Critical Asset based on the established criteria in the CIP-002-4 *Attachment 1 Critical Asset Criteria* through the application of the Critical Asset identification (required by CIP-002 R1). (Note that the actions that cause the change in power flows may have been performed by a neighboring entity without the full knowledge of the affected Responsible Entity.) Application of those Critical Asset criteria is required annually (by CIP-002 R1), and, as such, it may not be immediately apparent that that particular transmission substation has become a Critical Asset until after the required annual application of the identification methodology. Category 1 Scenario below applies if there was no pre-existing Critical Cyber Assets subject to the standard, and therefore, there was no existing full CIP program. Category 2 Scenario below applies if a CIP program for existing Critical Cyber Assets has been implemented for that Registered Entity.

Figure 1 shows an overall process flow for determining which milestone category a Critical Cyber Asset identification scenario must follow. Following the figure is a more detailed description of each category.

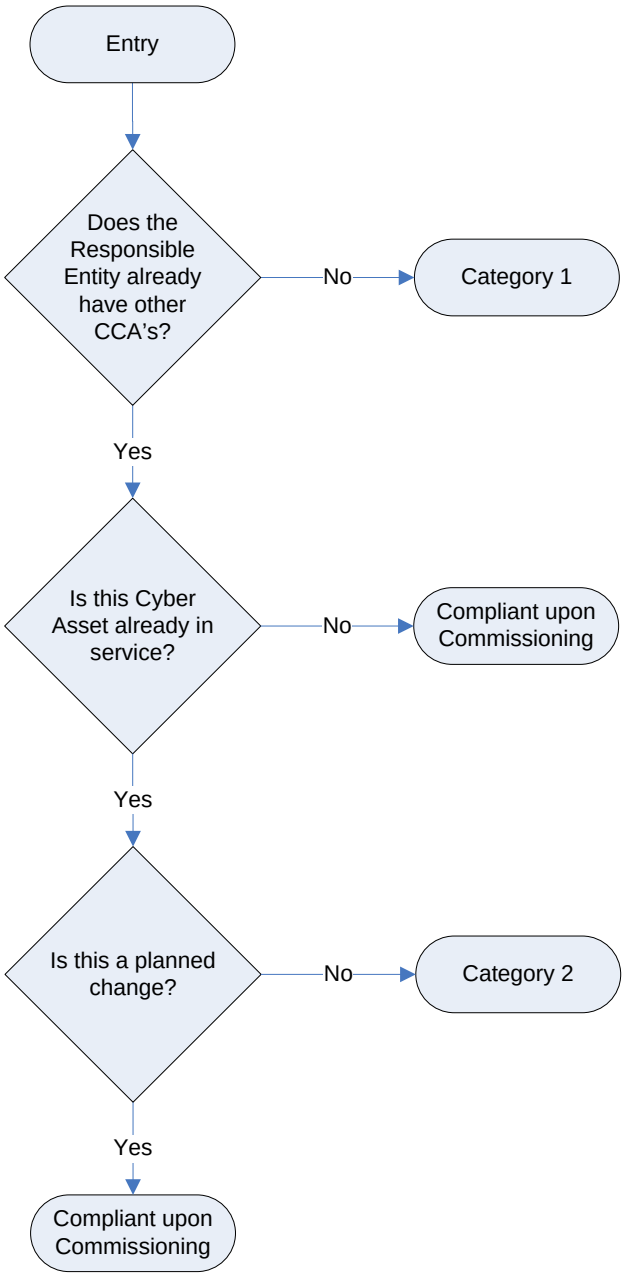

Figure 1: Category Selection Process Flow

Implementation Milestone Categories and Schedules

Based on the Critical Cyber Asset identification scenarios identified above, the implementation milestone categories and schedules for those scenarios are defined and distinguished below for entities with existing registrations in the NERC Compliance Registry. Scenarios resulting from the formation of newly Registered Entities are discussed in a subsequent section of this Implementation Plan.

1. **Category 1 Scenario**: A Responsible Entity that previously has undergone the NERC Reliability Standard CIP-002 Critical Asset identification process for at least one annual review and approval period without ever having previously identified any Critical Cyber Assets associated with Critical Assets, but has now identified one or more Critical Cyber Assets. As such, it is presumed that the Responsible Entity does not have a previously established CIP compliance implementation program.

   The *Compliant* milestones defined for this Category are defined in Table 2 (Milestone Category 1) of this Implementation Plan document.

2. **Category 2 Scenario**: A Responsible Entity has an established NERC Reliability Standards CIP compliance implementation program in place, and has newly identified additional existing Cyber Assets that need to be added to its Critical Cyber Asset list and therefore subject to compliance to the NERC Reliability CIP Standards due to unplanned changes in the electric system or the Cyber Assets. Since the Responsible Entity already has a CIP compliance implementation program, it needs only to implement the NERC Reliability CIP standards for the newly identified Critical Cyber Asset(s). The existing Critical Cyber Assets may remain in service while the relevant requirements of the NERC Reliability CIP Standards are implemented for the newly identified Critical Cyber Asset(s).

   This category applies only when additional in-service Critical Cyber Assets or applicable other Cyber Assets are *identified* as Critical Cyber Assets according to the process defined in the NERC Reliability Standard CIP-002. This category does not apply if the newly identified Critical Cyber Assets are not already in-service, or if the additional Critical Cyber Assets resulted from planned changes to the electric system or the Cyber Assets. In the case where the Critical Cyber Asset is not in service, the Responsible Entity must be compliant with the NERC Reliability Standards CIP-003 through CIP-009 upon commissioning of the new cyber or electric system assets (see "Compliant upon Commissioning" below).

   Unplanned changes due to emergency response, disaster recovery or system restoration activities are handled separately (see "Disaster Recovery and Restoration Activities" below).

3. **Compliant upon Commissioning**: When a Responsible Entity has an established NERC Reliability Standards CIP compliance implementation program and implements a new or replacement Critical Cyber Asset associated with a previously identified or newly

constructed Critical Asset, the Critical Cyber Asset shall be compliant when it is commissioned or activated. This scenario shall apply for the following scenarios:

a) 'Greenfield' construction of an asset that will be declared a Critical Asset (based on the Critical Asset criteria in CIP-002-4 Attachment 1) upon its commissioning or activation
b) Replacement or upgrade of an existing Critical Cyber Asset (or other Cyber Asset within an Electronic Security Perimeter) associated with a previously identified Critical Asset
c) Upgrade or replacement of an existing non-cyber asset with a Cyber Asset (e.g., replacement of an electro-mechanical relay with a microprocessor-based relay) associated with a previously identified Critical Asset and meets other criteria for identification as a Critical Cyber Asset
d) Planned addition of:
    i. a Critical Cyber Asset, or,
    ii. another (i.e., non-critical) Cyber Asset within an established Electronic Security Perimeter

In summary, this scenario applies in any case where a Critical Cyber Asset or applicable other Cyber Asset is being added or modified associated with an existing or new Critical Asset and where that Entity has an established NERC Reliability Standard CIP compliance implementation program.

A special case of a 'greenfield' construction exists where the asset under construction was planned and construction started under the assumption that the asset would not be a Critical Asset. During construction, conditions changed, and the asset will now be a Critical Asset upon its commissioning. In this case, the Responsible Entity must follow the Category 2 milestones from the date of the determination that the asset is a Critical Asset.

Since the assets must be compliant with the NERC Reliability Standards CIP-003 through CIP-009 upon commissioning, no implementation milestones or schedules are provided herein.

Disaster Recovery and Restoration Activities

A special case of restoration as part of a disaster recovery situation (such as storm restoration) shall follow the emergency provisions of the Responsible Entity's policy required by CIP-003 R1.1.

The rationale for this is that the primary task following a disaster is the restoration of the power system, and the ability to serve customer load. Cyber security provisions are implemented to support reliability and operations. If restoration were to be slowed to ensure full implementation of the CIP compliance implementation program, restoration could be hampered, and reliability could be harmed.

However, following the completion of the restoration activities, the entity is obligated to implement the CIP compliance implementation program at the restored facilities, and be able to demonstrate full compliance in a spot-check or audit; or, file a self-report of non-compliance with a mitigation plan describing how and when full compliance will be achieved.

Newly Registered Entity Scenarios

Based on the Critical Cyber Asset identification scenarios identified above, the implementation milestone categories and schedules for those scenarios as they apply to newly Registered Entities are defined and distinguished below.

The following examples of business merger and asset acquisition scenarios may be helpful in explaining the expectations in each of the scenarios. Note that in each case, the predecessor Registered Entities are assumed to already be in compliance with NERC Reliability Standard CIP-002-4.

1. **Newly Registered Entity Scenario 1 (Application of Category 1 Milestones):**

   A Merger of Two or More Registered Entities where None of the Predecessor Registered Entities has Identified any Critical Cyber Asset
   In the case of a business merger or asset acquisition, because there are no identified Critical Cyber Assets in any of the predecessor Registered Entities, a CIP compliance implementation program is not assumed to exist. The only program component required is a Critical Asset and Critical Cyber Asset identification process per NERC Reliability Standard CIP-002-4.

   ~~The merged Registered Entity has one calendar year from the effective date of the business merger asset acquisition to continue to operate the separate Critical Asset identification processes while determining how to either combine the Critical Asset identification processes, or at a minimum, operate separate Critical Asset identifications under a common Senior Manager and governance structure. It would be preferred that a single program be the result, however, Registered Entity-specific circumstances may dictate or allow multiple programs to continue separately. These decisions may be subject to review as part of compliance with NERC Reliability Standard CIP-002.~~

   ~~The merged Registered Entity must ensure that it maintains the required 'annual application' of the Critical Asset identification as required in CIP-002 R1, even if that annual application timeframe is within the one calendar year allowed to determine if the merged Responsible Entity will combine the separate processes, or continue to operate them separately. Following the one calendar year allowance, the merged Responsible Entity must remain compliant with the program as it is determined to be implemented as a result of the one calendar year analysis of the disposition of the programs from the predecessor Responsible Entities.~~

   If either predecessor Registered Entities has identified Critical Assets (but without associated Critical Cyber Assets), the merged Registered Entity must continue to perform

annual application of the Critical Asset identification as required in CIP-002 R1, as well as to annually verify whether associated Cyber Assets meet the requirements as newly identified Critical Cyber Assets as required by CIP-002 R2. If newly identified Critical Cyber Assets are found at any point in this process (i.e., during the one calendar year allowance period, or after that one calendar year allowance period), then the implementation milestones, categories and schedules of this Implementation Plan apply regardless of when this newly identified Critical Cyber Assets are determined, and independent of any merger and acquisition discussions contained in this Implementation Plan.

2. **Newly Registered Entity Scenario 2:**

A Merger of Two or More Registered Entities where Only One of the Predecessor Registered Entities has Identified at Least One Critical Cyber Asset
Since only one of the predecessor Registered Entities has previously identified Critical Cyber Assets, it is assumed that none of the other predecessor Registered Entities have CIP compliance implementation programs (since they are not required to have them). In this case, the CIP compliance implementation program from the predecessor Registered Entity with the previously identified Critical Cyber Asset would be expected to be implemented as the CIP compliance implementation program for the merged Registered Entity, and would be expected to apply to any Critical Cyber Assets identified after the effective date of the merger. Since the other predecessor Registered Entities did not have any Critical Cyber Assets, this should present no conflict in any CIP compliance implementation programs.

Note that the discussion of the disposition of any NERC Reliability Standard CIP-002 Critical Asset identification process from Scenario 1 above would apply in this case as well.

3. **Newly Registered Entity Scenario 3:**

A Merger of Two or More Registered Entities where Two or More of the Predecessor Registered Entities has Identified at Least One Critical Cyber Asset
This scenario is the most complicated of the three, since it applies to a merged Registered Entity that has more than one ~~existing Critical Asset identification process and more than one~~ CIP compliance implementation program, which are most likely not in complete agreement with each other. These differences could be due to any number of issues, ranging from something as ~~-~~'simple' as selection of different anti-virus tools, to something as ~~-~~'complicated' as the ~~Critical Asset identification. This scenario will be discussed in two sections, the first dealing with the combination of the Critical Asset identification methodologies; the second dealing with combining the CIP compliance implementation programs.~~access authorization process.

~~**(a) Combining the Critical Asset identification processes:** The merged Responsible Entity has one calendar year from the effective date of the business merger or asset acquisition to continue to operate the separate Critical Asset identification processes while~~

~~determining how to either combine the Critical Asset identification processes, or at a minimum, operate the separate Critical Asset identification processes under a common Senior Manager and governance structure. It would be preferred that a single program be the result, however, Registered Entity specific circumstances may dictate or allow the two programs to continue separately. These decisions may be subject to review as part of compliance with NERC Reliability Standard CIP-002.~~

~~Registered Entities are encouraged when combining separate Critical Asset identification processes to ensure that, absent extraordinary circumstances, the resulting process produces a resultant list of Critical Assets that contains at least the same Critical Assets as were identified by all the predecessor Registered Entities' Critical Asset identification processes, as well as at least the same list of Critical Cyber Assets associated with the Critical Assets. The combined Critical Asset identification and resultant Critical Asset list and Critical Cyber Asset list will be subject to review as part of compliance with NERC Reliability Standard CIP-002 R1 and R2. If additional Critical Assets are identified as a result of the application of the merged Critical Asset identification, they should be treated as newly identified Critical Cyber Assets, as discussed elsewhere in this Implementation Plan, and subject to the CIP compliance implementation program merger determination as discussed next.~~

~~Combining the CIP compliance implementation programs:~~

~~(b)~~ The merged Responsible Entity has one calendar year from the effective date of the business merger to continue to operate the separate CIP compliance implementation programs while determining how to either combine the CIP compliance implementation programs, or at a minimum, operate the CIP compliance implementation programs under a common Senior Manager and governance structure.

Following the one year analysis period, if the decision is made to continue the operation of separate CIP compliance implementation programs under a common Senior Manager and governance structure, the merged Responsible Entity must update any required Senior Manager and governance issues, and clearly identify which CIP compliance implementation program components apply to each individual Critical Cyber Asset. This is essential to the implementation of the CIP compliance implementation program at the merged Responsible Entity, so that the correct and proper program components are implemented on the appropriate Critical Cyber Assets, as well as to allow the ERO compliance program (in a spot-check or audit) to determine if the CIP compliance implementation program has been properly implemented for each Critical Cyber Asset. Absent this clear identification, it would be possible for the wrong CIP compliance implementation program to be applied to a Critical Cyber Asset, or the wrong CIP compliance implementation program be evaluated in a spot-check or audit, leading to a possible technical non-compliance without real cause.

However, if after the one year analysis period, the decision is made to combine the operation of the separate CIP compliance implementation programs into a single CIP compliance implementation program, the merged Responsible Entity must develop a plan for merging of the separate CIP compliance implementation programs into a single CIP

compliance implementation program, with a schedule and milestones for completion. The programs should be combined as expeditiously as possible, but without causing harm to reliability or operability of the Bulk power System. This '~~merge~~merged plan' must be made available to the ERO compliance program upon request, and as documentation for any spot-check or audit conducted while the ~~merge~~merged plan is being performed. Progress towards meeting milestones and completing the ~~merge~~merged plan will be verified during any spot-checks or audits conducted while the plan is being executed.

Example Scenarios

Note that there are no implementation milestones or schedules specified for a Responsible Entity that has a newly ~~designated~~identified Critical Asset, but no newly ~~designated~~identified Critical Cyber Assets. This situation exists because no action is required by the Responsible Entity upon ~~designation~~identification of a Critical Asset without associated Critical Cyber Assets. Only upon ~~designation~~identification of Critical Cyber Assets does a Responsible Entity need to become compliant with the NERC Reliability Standards CIP-003 through CIP-009.

As an example, Table 1 provides some sample scenarios, and provides the milestone category for each of the described situations.

Table 1: Example Scenarios

Scenarios	CIP Compliance Implementation Program:	
	No Program (note 1)	Existing Program
~~Existing Cyber Asset reclassified as Critical Cyber Asset due to change in assessment methodology~~	~~Category 1~~	~~Category 2~~
Existing asset becomes Critical Asset; associated Cyber Assets become Critical Cyber Assets	Category 1	Category 2
New asset comes online as a Critical Asset; associated Cyber Assets become Critical Cyber Asset	Category 1	Compliant upon Commissioning
Existing Cyber Asset moves into the Electronic Security Perimeter due to network reconfiguration	N/A	Compliant upon Commissioning
New Cyber Asset – never before in service and not a replacement for an existing Cyber Asset – added into a new or existing Electronic Security Perimeter	Category 1	Compliant upon Commissioning
New Cyber Asset replacing an existing Cyber Asset within the Electronic Security Perimeter	N/A	Compliant upon Commissioning
Planned modification or upgrade to existing Cyber Asset that causes it to be reclassified as a Critical Cyber Asset	Category 1	Compliant upon Commissioning
Asset under construction as an other (non-critical) asset becomes declared as a Critical Asset during construction	Category 1	Category 2

Scenarios	CIP Compliance Implementation Program:	
	No Program (note 1)	Existing Program
Unplanned modification such as emergency restoration invoked under a disaster recovery situation or storm restoration	N/A	Per emergency provisions as required by CIP-003 R1.1

Note: 1) assumes the entity is already compliant with CIP-002

Table 2 provides the compliance milestones for each of the two identified milestone categories.

Table 2: Implementation milestones for Newly Identified Critical Cyber Assets[5]

CIP Standard Requirement	Milestone Category 1	Milestone Category 2
Standard CIP-002-4 — Critical Cyber Asset Identification		
R1	*N/A*	*N/A*
R2	*N/A*	*N/A*
R3	*N/A*	*N/A*
~~R4~~	~~*N/A*~~	~~*N/A*~~

R3	24 months	12 months
R4	24 months	6 months
R5	24 months	6 months

Table 3[6][7] Compliance Schedule for Standards CIP-002-4 through CIP-009-4 For Entities Registering in April 2008 and Thereafter		
Requirements	Registration + 12 months	Registration + 24 months
	~~All Facilities~~	~~All Facilities~~
Standard CIP-002-4 — Critical Cyber Assets		
All Requirements		Compliant
Standard CIP-003-4 — Security Management Controls		
All Requirements Except R2		Compliant
R2	Compliant	
Standard CIP-004-4 — Personnel & Training		
All Requirements		Compliant
Standard CIP-005-4 — Electronic Security		
All Requirements		Compliant
Standard CIP-006-4 — Physical Security		
All Requirements		Compliant
Standard CIP-007-4 — Systems Security Management		
All Requirements		Compliant
Standard CIP-008-4 — Incident Reporting and Response Planning		
All Requirements		Compliant
Standard CIP-009-4 — Recovery Plans		
All Requirements		Compliant

[6] Note: This table only specifies a 'Compliant' date, consistent with the convention used elsewhere in this Implementation Plan. The Compliant dates are consistent with those specified in Table 4 of the Version 1 Implementation Plan. Other compliance states referenced in the Version 1 Implementation Plan are no longer used.

[7] For Owners and Operators of U.S. Nuclear Power Plants, Critical Cyber Assets associated with U.S. Nuclear Power Plants identified as Critical Assets shall be compliant with CIP-002-4 through CIP-009-4 by the later of (i) the milestone date listed in Table 3, or (ii) 6 months following the completion date of the first refueling outage beyond the milestone date in Table 3 for those requirements requiring a refueling outage,

Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before these standards can be implemented.

The term Blackstart Resource, used in CIP-002-4 Attachment 1, was submitted for regulatory approval with Project 2006-03 – System Restoration and Blackstart. The definition must be approved before Criteria 1.4 and 1.5 are used to determine Critical Assets for Responsible Entities.

Applicable Standards

The following standards are covered by this Implementation Plan:

CIP–002–4 —Cyber Security — Critical Cyber Asset Identification
CIP–003–4 — Cyber Security — Security Management Controls
CIP–004–4 — Cyber Security — Personnel and Training
CIP–005–4 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–4 — Cyber Security — Physical Security
CIP–007–4 —Cyber Security — Systems Security Management
CIP–008–4 — Cyber Security — Incident Reporting and Response Planning
CIP–009–4 — Cyber Security — Recovery Plans for Critical Cyber Assets

When these standards become effective, all prior versions of these standards are retired.

Compliance with Standards

Once these standards become effective, the Responsible Entities identified in the Applicability section of the standard must comply with the requirements. These Responsible Entities include:

- Reliability Coordinator
- Balancing Authority
- Interchange Authority
- Transmission Service Provider
- Transmission Owner
- Transmission Operator
- Generator Owner
- Generator Operator
- Load Serving Entity
- NERC
- Regional Entity

Proposed Effective Date for CIP-002-4 through CIP-009-4

All Facilities Other Than U.S. Nuclear Power Plant Facilities

Responsible Entities shall be compliant with the requirements of CIP-002-4 through CIP-009-4 on the later of (i) the Effective Date specified in the Standard, or (ii) the compliance milestones specified in version 3 of the *Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities.*

U.S. Nuclear Power Plant Facilities
For Owners and Operators of U.S. Nuclear Power Plants, Critical Cyber Assets associated with U.S. Nuclear Power Plants identified as Critical Assets shall be compliant with CIP-002-4 through CIP-009-4 by the later of (i) the Effective Date in CIP-002-4 through CIP-009-4; (ii) 6 months following the completion of the first refueling outage beyond the Effective Date of CIP-002-4 for those requirements requiring a refueling outage; or (iii) the compliance milestones specified in version 3 of the *Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities*.

Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

Concurrently submitted with version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4 is a separate Implementation Plan document that would be used by the Responsible Entities to bring any Critical Cyber Assets identified after the effective date of CIP-002-4 into compliance with the Cyber Security Standards, as those assets are identified. The Implementation Plan for newly identified Critical Cyber Assets provides a reasonable schedule for the Responsible Entity to achieve the 'Compliant' state for those newly identified Critical Cyber Assets.

The Implementation Plan for newly identified Critical Cyber Assets also addresses how to achieve the 'Compliant' state for: 1) Responsible Entities that merge with or are acquired by other Responsible Entities; and 2) Responsible Entities that register in the NERC Compliance Registry during or following the completion of the Implementation Plan for Version 4 of the NERC Cyber Security Standards CIP-002-4 to CIP-009-4.

Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before ~~this~~ these standards can be implemented.

The term Blackstart Resource, used in CIP-002-4 Attachment 1, was submitted for regulatory approval with Project 2006-03 – System Restoration and Blackstart. The definition must be approved before Criteria 1.4 and 1.5 are used to determine Critical Assets for Responsible Entities.

Applicable Standards

The following standards are covered by this Implementation Plan:

CIP–002–4 —Cyber Security — Critical Cyber Asset Identification
CIP–003–4 — Cyber Security — Security Management Controls
CIP–004–4 — Cyber Security — Personnel and Training
CIP–005–4 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–4 — Cyber Security — Physical Security
CIP–007–4 — Cyber Security — Systems Security Management
CIP–008–4 — Cyber Security — Incident Reporting and Response Planning
CIP–009–4 — Cyber Security — Recovery Plans for Critical Cyber Assets

~~These standards are posted for ballot by NERC together with this Implementation Plan.~~ When these standards become effective, all prior versions of these standards are retired.

Compliance with Standards

Once these standards become effective, the Responsible Entities identified in the Applicability section of the standard must comply with the requirements. These Responsible Entities include:

- Reliability Coordinator
- Balancing Authority
- Interchange Authority
- Transmission Service Provider
- Transmission Owner
- Transmission Operator
- Generator Owner
- Generator Operator
- Load Serving Entity
- NERC
- Regional Entity

Proposed Effective Date for CIP-002-4 through CIP-009-4

All Facilities Other Than U.S. Nuclear Power Plant Facilities
Responsible Entities shall be compliant with the requirements of CIP-002-4 through CIP-009-4 on the later of (i) the Effective Date specified in the Standard, .

Proposed Effective Date for CIP-003-4 – CIP-009-4
Critical Cyber Assets Already in Compliance with CIP-003-3 – CIP-009-3

Critical Cyber Assets identified by CIP-002-4 R2 that are already compliant with CIP-003-3 through CIP-009-3 shall be compliant with the requirements of CIP-003-4 through CIP-009-4 on or (ii) the Effective Datecompliance milestones specified in each version 4 Standard.

Critical Cyber Assets Associated with Critical Assets 3 of the *Implementation Plan for Newly Identified* **by CIP-002-4** *Critical Cyber Asset and Newly Registered Entities.*

U.S. Nuclear Power Plant Facilities
For Owners and Operators of U.S. Nuclear Power Plants, Critical Cyber Assets associated with U.S. Nuclear Power Plants identified as Critical Assets which are newly identified by CIP-002-4 R1 within the first 18 months following the Effective Date of CIP-002-4 shall be compliant with CIP-003002-4 through CIP-009-4 by the latterlater of (i) 18 months after the Effective Date ofin CIP-002-4 orthrough CIP-009-4;; (ii) 6 months following the completion of the first refueling outage beyond 18 months from the Effective Date of CIP-002-4 for those requirements requiring a refueling outage;; or (iii) the compliance milestones specified in version 3 of the *Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities*.

All Facilities Other Than U.S. Nuclear Power Plant Facilities
For Responsible Entities who previously identified Critical Cyber Assets under CIP-002-1 R3, CIP-002-2 R3, or CIP-002-3 R3; Critical Cyber Assets associated with Critical Assets which are newly identified by CIP-002-4 R1 within the first 18 months following the Effective Date of CIP-002-4 shall be compliant with CIP-003-4 through CIP-009-4 18 months after the Effective Date of CIP-002-4.

All Other Critical Cyber Assets

For all cases not identified above, Critical Cyber Assets shall be compliant with the requirements of **CIP-003-4 through CIP-009-4** by the latter of (i) the Effective Date specified in each Version 4 Standard or (ii) the compliance milestones in the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* based on the earliest date of identification of the Critical Cyber Asset from CIP-002-1 R3, CIP-002-2 R3, CIP-002-3 R3, or CIP-002-4 R2.

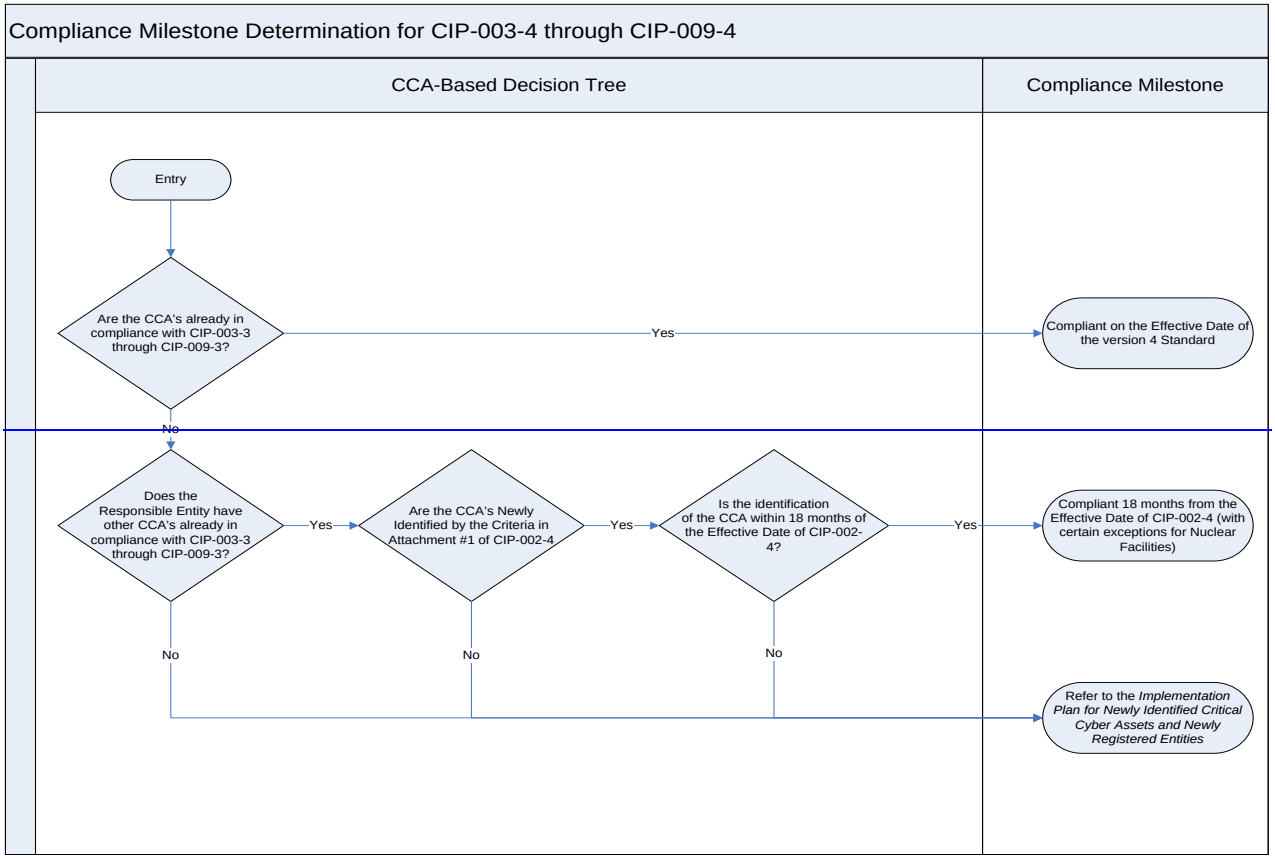
Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

Concurrently submitted with version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4 is a separate Implementation Plan document that would be used by the Responsible Entities to bring any newly identified Critical Cyber Assets into compliance with the Cyber Security Standards, as those assets are identified. This Implementation Plan would apply based on the situations identified in the above section, *Proposed Effective Date*. This Implementation Plan closes the compliance gap created in the Version 1 Implementation Plan whereby Responsible Entities were required to

~~annually determine their list of Critical Cyber Assets, yet the implication from the Version 1 Implementation Plan was that any newly identified Critical Cyber Assets were to be immediately 'Auditably Compliant', thereby not allowing Responsible Entities the necessary time to achieve the Auditably Compliant state.~~
Critical Cyber Assets identified after the effective date of CIP-002-4 into compliance with the Cyber Security Standards, as those assets are identified. The Implementation Plan for newly identified Critical Cyber Assets provides a reasonable schedule for the Responsible Entity to achieve the 'Compliant' state for those newly identified Critical Cyber Assets.

The Implementation Plan for newly identified Critical Cyber Assets also addresses how to achieve the 'Compliant' state for: 1) Responsible Entities that merge with or are acquired by other Responsible Entities; and 2) Responsible Entities that register in the NERC Compliance Registry during or following the completion of the Implementation Plan for Version 4 of the NERC Cyber Security Standards CIP-002-4 to CIP-009-4.

~~Prior Version Standard Retirement~~
~~Standards CIP-002-3 – CIP-009-3 shall be retired upon the Effective Date of the corresponding Version 4 Standard.~~



Compliance Milestone Determination for CIP-003-4 through CIP-009-4
CCA-Based Decision Tree
Compliance Milestone
Entry
Are the CCA's already in compliance with CIP-003-3 through CIP-009-3?
Yes
Compliant on the Effective Date of the version 4 Standard
No
Does the Responsible Entity have other CCA's already in compliance with CIP-003-3 through CIP-009-3?
Yes
Are the CCA's Newly Identified by the Criteria in Attachment #1 of CIP-002-4
Yes
Is the identification of the CCA within 18 months of the Effective Date of CIP-002-4?
Yes
Compliant 18 months from the Effective Date of CIP-002-4 (with certain exceptions for Nuclear Facilities)
No
No
No
Refer to the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-4

3. Purpose: NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-4 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of the criteria in Attachment 1.

4. Applicability:

4.1. Within the text of Standard CIP-002-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Cyber Assets associated with Cyber Security Plans submitted to and verified by the U. S. Nuclear Regulatory Commission pursuant to 10 C.F.R. Section 73.54.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

B. Requirements

R1. Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update this list as necessary, and review it at least annually.

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually.

For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1.

For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

- The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
- The Cyber Asset uses a routable protocol within a control center; or,
- The Cyber Asset is dial-up accessible.

R3. Annual Approval — The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

M1. The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R1.

M2. The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R2.

M3. The Responsible Entity shall make available its records of approvals as specified in Requirement R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-002-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	January 16, 2006	R3.2 — Change “Control Center” to “control center”	03/24/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update

CIP-002-4 - Attachment 1

Critical Asset Criteria

The following are considered Critical Assets:

1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW.

1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVAR or greater.

1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.

1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan.

1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan.

1.6. Transmission Facilities operated at 500 kV or higher.

1.7. Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.

1.8. Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.9. Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.10. Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3.

1.11. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed.

1.13. Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.

1.14. Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator.

1.15. Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection.

1.16. Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.

1.17. Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-~~3~~4

3. Purpose: NERC Standards CIP-002-~~3~~4 through CIP-009-~~3~~4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-~~3~~4 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of ~~a risk-based assessment~~the criteria in Attachment 1.

4. Applicability:

4.1. Within the text of Standard CIP-002-~~3~~4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-~~3~~4:

4.2.1 Facilities regulated by ~~the U.S. Nuclear Regulatory Commission or~~ the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Cyber Assets associated with Cyber Security Plans submitted to and verified by the U. S. Nuclear Regulatory Commission pursuant to 10 C.F.R. Section 73.54.

5. Effective Date: The first day of the ~~third~~eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ~~third~~ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

B. Requirements

R1. Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.

R1.1. The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.

R1.2. The risk-based assessment shall consider the following assets:

R1.2.1. Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.

R1.2.2. Transmission substations that support the reliable operation of the Bulk Electric System.

R1.2.3. Generation resources that support the reliable operation of the Bulk Electric System.

R1.2.4. Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.

R1.2.5. Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

R1.2.6. Special Protection Systems that support the reliable operation of the Bulk Electric System.

R1.2.7. Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.

R2.R1. Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology requiredcriteria contained in R1.*CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall reviewupdate this list as necessary, and review it at least annually, and update it as necessary.

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R2R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall reviewupdate this list as necessary, and review it at least annually, and update it as necessary. .

For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1.

R3. For the purpose of Standard CIP-002-34, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

R3.1. • The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,

R3.2. • The Cyber Asset uses a routable protocol within a control center; or,

R3.3. • The Cyber Asset is dial-up accessible.

~~R4.~~R3. Annual Approval — The senior manager or delegate(s) shall approve annually the ~~risk-based assessment methodology, the~~ list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1~~, R2,~~ and ~~R3~~R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the ~~risk-based assessment methodology, the~~ list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

~~**M1. The Responsible Entity shall make available its current risk-based assessment methodology documentation as specified in Requirement R1.**~~

~~M2.~~M1. The Responsible Entity shall make available its list of Critical Assets as specified in Requirement ~~R2~~R1.

~~M3.~~M2. The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement ~~R3~~R2.

~~M4.~~M3. The Responsible Entity shall make available its ~~approval~~ records of ~~annual~~ approvals as specified in Requirement ~~R4~~R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity ~~for Responsible Entities that do not perform delegated tasks~~, the Regional Entity shall serve as the Compliance Enforcement Authority.

~~1.1.1~~1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

~~**1.1.2 ERO for Regional Entity.**~~

1.2.3 ~~Third~~For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

~~**1.1.3**~~ For the ERO, a third-party monitor without vested interest in the outcome for ~~NERC.~~

~~**1.2.**~~ the ERO shall serve as the Compliance ~~**Monitoring Period and Reset Time Frame**~~

1.2.4 ~~Not applicable~~Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-002-~~3~~4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

CIP-002-4 - Attachment 1

Critical Asset Criteria

~~R5.~~

The following are considered Critical Assets:

1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW.

1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVAR or greater.

1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.

1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan.

1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan.

1.6. Transmission Facilities operated at 500 kV or higher.

1.7. Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.

1.8. Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.9. Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.10. Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3.

1.11. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed.

1.13. Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.

1.14. Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator.

1.15. Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection.

1.16. Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.

1.17. Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-4

3. Purpose: NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-4 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of the criteria in Attachment 1.

4. Applicability:

4.1. Within the text of Standard CIP-002-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

~~4.2.1~~**4.2.3** Cyber Assets associated with Cyber Security Plans submitted to and verified by the U. S. Nuclear Regulatory Commission pursuant to 10 C.F.R. Section 73.54.

5. Effective Date: The first day of the ~~third~~ eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ~~third~~ ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

B. Requirements

R1. Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update ~~review~~ this list as necessary~~at least annually~~, and ~~update~~ review it ~~at least annually~~~~as necessary~~.

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. ~~The~~ The Responsible Entity shall update ~~review~~ this list as necessary~~at least annually~~, and ~~update~~ review it ~~at least annually~~~~as necessary~~.

For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that ~~could~~, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1 ~~within 15 minutes~~. ~~The Responsible Entity shall review this list at least annually, and update it as necessary.~~

For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

~~**R1.1.**~~ • The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,

~~**R1.2.**~~ • The Cyber Asset uses a routable protocol within a control center; or,

~~**R1.3.**~~ • The Cyber Asset is dial-up accessible.

~~R2.~~R3. Annual Approval — The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of ~~the risk-based assessment methodology,~~ the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

M1. The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R1.

M2. The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R2.

M3. The Responsible Entity shall make available its ~~approval~~ records of ~~annual~~ approvals as specified in Requirement R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~1.1.~~1.2. **The RE shall serve as the CEA with the following exceptions:**

~~1.1.1~~1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.~~Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.~~

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.~~ERO for Regional Entity.~~

~~1.1.2~~1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

~~1.1.3~~1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority~~Third-party monitor without vested interest in the outcome for NERC~~.

~~**1.2. Compliance Monitoring Period and Reset Time Frame**~~

~~Not applicable.~~

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-002-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

CIP-002-4 - Attachment 1

Critical Asset Criteria

The following are considered Critical Assets:

1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW.

1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVARs or greater.

1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon required for reliability purposes.

1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan.

1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator's restoration plan or up to the point on the Cranking Path where two or more multiple path options exist, as identified in the Transmission Operator's restoration plan.

1.6. Transmission Facilities operated at 500 kV or higher.

1.7. Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.

1.8. Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of , if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.9. Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of , if destroyed, degraded, misused or otherwise rendered unavailable, violate one or more Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.10. Transmission Facilities providing the generation interconnection required to directly connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of described in Attachment 1, criterion 1.1 or 1.3.

1.11. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause violate one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed.

1.13. Each system or Facility that performs Common control system(s) capable of performing automatic load shedding, without human operator initiation, of 300 MW or more

implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program~~within 15 minutes~~.

1.14. Each control center~~, control system,~~ or backup control center~~, or backup control system~~ used to perform the functional obligations of the Reliability Coordinator~~, Balancing Authority, or Transmission Operator~~.

1.15. Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4.~~identified as a Critical Asset,~~ Each control center or backup control center ~~or~~ used to control generation equal to or exceeding ~~greater than an aggregate of~~ 1500 MW~~s~~ in a single I~~i~~nterconnection.

1.16. Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.~~Any additional assets that the Responsible Entity deems appropriate to include.~~

~~1.16.~~1.17. Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

Standards Announcement

Successive Ballot Window Opens
Abbreviated Comment Period Opens
December 1-10, 2010

Now available at: https://standards.nerc.net/CurrentBallots.aspx

Ballot Window December 1-10, 2010

A successive ballot will be conducted from 8:00 a.m. on Wednesday, December 1, 2010 through 8:00 p.m. on Friday, December 10, 2010. During the successive ballot window, members of the ballot pool associated with this project may log in and submit their votes from the following page:
https://standards.nerc.net/CurrentBallots.aspx

With a successive ballot, votes are **not** carried forward from the previous ballot. The Standards Committee encourages all members of the ballot pool to review the consideration of comments for the previous ballot and comment period and the modifications that team made to the standards and associated implementation plans.

Abbreviated Formal Comment Period Comment December 1-10, 2010

An abbreviated formal comment period will be open from December 1-10, 2010. The Standards Committee authorized the abbreviated comment period to support providing stakeholders with the opportunity to provide comment while also supporting the goal of completing this set of revisions before the end of December, 2010. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page:
http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html

Project 2008-06 — Cyber Security 706

The drafting team working on "Version 4 CIP Standards" has posted its consideration of the comments submitted during the formal comment period and initial ballot that ended on November 3, 2010. Based on those comments, the drafting team modified CIP-002-4, the implementation plans, and the associated guidance document. Most revisions focused on 'fine tuning' the bright line criteria proposed for use in identifying critical assets. The proposed CIP-002-4 provides a significant improvement to CIP-002-3 by including a specific list of criteria for entities to use in identifying their critical assets.

Recognizing that protecting the cyber assets critical to the electric utility's infrastructure is also critical to national and international security, the revisions to CIP-002 are being advanced ahead of other improvements to the remaining set of CIP standards. The remaining CIP standards all rely on a complete and accurate identification of those assets that are critical to reliability. Because entities are so tightly interconnected, a vulnerability that seems insignificant to a single entity can place the entire grid in a state of vulnerability.

Each of the CIP standards (CIP-003-3 through CIP-009-3) contains at least one reference to CIP-002-3. To maintain clarity, CIP-003-3 through CIP-009-3 have had conforming changes made, so that all cross references within the set of standards are to "CIP Version 4" standards. *(CIP-005-4 - Cyber Security — Electronic Security Perimeter is posted separately, with a set of proposed revisions for expedited processing under Project 2010-15. If CIP-005-4 is not approved under Project 2010-15, it will be returned to this set of CIP standards.)*

Next Steps

Voting results will be posted and announced after the ballot window closes.

Project Background

FERC Order 706 directed NERC to develop modifications to the CIP Reliability Standards. Due to the variety of changes directed in Order 706 and the complexity of the project, the drafting team adopted a multi-phase revision strategy. The initial phase involved modifying standards CIP-002-1 through CIP-009-1 to comply with the near-term directives included in Order 706. The resulting version 2 CIP standards were approved by the NERC Board of Trustees, and as part of its approval Order, FERC directed NERC to make changes to two standards and the associated implementation plan within 90 days. Those changes, along with necessary conforming cross-reference changes for the remaining six CIP standards, resulted in the version 3 CIP standards. The current phase (Phase II) involves the more complex FERC directives.

Further details are available on the project page:

Standards Announcement
Successive Ballot Results

Now available at: https://standards.nerc.net/Ballots.aspx

Project 2008-06 - Cyber Security Order 706
A successive ballot on revisions to CIP-002 concluded on December 10, 2010.

Ballot Results for Revisions to CIP-002-4
Voting statistics are listed below, and the Ballot Results Web page provides a link to the detailed results:

Quorum: 87.07 %
Approval: 77.06 %
Since there were negative ballots that included a comment, these results are not final.

Next Steps
The drafting team will post its consideration of all comments (those submitted with a comment form, and those submitted with a ballot) and the standard will proceed to a recirculation ballot.

Background:
FERC Order 706 directed NERC to develop modifications to the CIP Reliability Standards. Due to the variety of changes directed in Order 706 and the complexity of the project, the drafting team adopted a multi-phase revision strategy. The initial phase involved modifying standards CIP-002-1 through CIP-009-1 to comply with the near-term directives included in Order 706. The resulting version 2 CIP standards were approved by the NERC Board of Trustees, and as part of its approval Order, FERC directed NERC to make changes to two standards and the associated implementation plan within 90 days. Those changes, along with necessary conforming cross-reference changes for the remaining six CIP standards, resulted in the version 3 CIP standards. The current phase (Phase II) involves the more complex FERC directives.

The team has been working to revise CIP-002 – Identification of Critical Assets, with the goal of establishing bright line criteria for the identification of critical assets. In November, the SC Executive Committee authorized the team to conduct an abbreviated comment period in parallel with a successive ballot, to support providing stakeholders with the opportunity to provide comment while also supporting the goal of completing this set of revisions to CIP-002 before the end of December, 2010.

Further details are available on the project page:
http://www.nerc.com/filez/standards/Project_2008-06_Cyber_Security_PhaseII_Standards.html

Standards Process
The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 609.452.8060.

Consideration of Comments on Project 2008-06

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. When reviewing the changes to the proposed CIP-002-4 standard, do you believe that the proposed standard was responsive to feedback received and provides acceptable bright-line criteria for the determination of Critical Cyber Assets?

Summary Consideration: In general, most commenters stated that they believed the proposed standard was responsive to feedback received and provides acceptable bright-line criteria for the determination of Critical Cyber Assets. The following summary of comments and responses is grouped by areas of CIP-002-4.

General Comments:

Concern was expressed that any clarification included in the Guidance Document should be made part of the Standard. The SDT responded that, while the Guidance Documents are not the standard, they do provide additional context. Other entities expressed concern that the bright line prescribed in Attachment 1 will still include smaller Registered Entities that do not have significant impact on the reliable operation of the BES. The SDT responded that in FERC Order 706, the Commission addressed the importance of Critical Assets, no matter how small. Another entity stated that there needs to be a clear and consistent method for Planning to identify IROLs, or it becomes subjective and open to interpretation. The SDT responded that the purpose of FAC-014-2 Requirements R3 and R4 is to establish a clear and consistent method for identifying IROLs. The method for Planning to identify IROLs is beyond the scope of the CIP standards. Several entities expressed an interest that the SDT should take steps to reduce ambiguous language. (e.g. black start resources). The SDT responded that they have made efforts to reduce any ambiguous language, to the point of using the NERC glossary term “Blackstart Resources” in order to eliminate any confusion over the term.

Several entities stated that the SDT should clarify that substations are the facilities to be identified as Transmission Critical Assets, not lines, transformers, reactive equipment, etc. The SDT responded that substations are not the only Facilities identified as Critical Assets. Lines, transformers, reactive equipment, and other Facilities can be classified as a Critical Asset if they meet any of the criteria in Attachment 1. The SDT referred commenters to the posted guidance document for additional clarification. One entity expressed concern that many items give one entity the power to designate facilities owned by another entity as critical. The SDT responded that the issue of communication between entities is recognized as an issue that needs to be addressed and will be considered in a future version. Some entities felt that the SDT was prescriptive in determining Critical Assets, which they felt was contrary to FERC Order 706. The SDT responded that the Attachment 1 criteria were developed in response to an external oversight directive in the FERC Order 706. In consideration of this directive, the SDT decided there did not exist across all regions an appropriate third party to provide this type of oversight. Also, external review and oversight carries with it the compliance overhead and arbitration processes analogous to the TFE process. This “bright-line” criteria approach removes the variability of entity defined methodologies that would prompt the need for external review. Additionally, some entities expressed concern that the SDT should begin a similar effort in identifying a bright line criteria for Critical Cyber Assets. The SDT responded that the scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method, not the Critical Cyber Asset Identification method.

Nuclear Applicability:

Several entities expressed concern about the nuclear generation exemption language for nuclear generation plants located in the United States (U.S.) along with the parenthetical text of Attachment 1 criterion stating "including nuclear generation." They expressed that this leaves the standard ambiguous and in need of clarification based on recent Nuclear Regulatory Commission (NRC) findings. The NRC and NERC have worked closely to address FERC's Order 706B concerns related to any nuclear balance of plant (BOP) systems, structures and components (SSCs) within a U.S. nuclear power plant that is not regulated by the NRC and subject to NERC CIP standards. However, the NRC letter to NERC dated November 26, 2010 clarifies its findings that "Based on the Commission's [NRC] determination, the NRC staff does not believe that there will be any SSCs in the BOP that will fall under NERC's Critical Infrastructure Protection (CIP) standards." The SDT responded that the phrase "including nuclear generation" in criterion 1.1 is there to define a plant site. Unit output from all units at a single plant site should be included to determine if a plant meets the 1500MW threshold. The evaluation for Critical Cyber Assets is similar. Although it is highly unlikely that nuclear and non-nuclear units share common Cyber Assets, the evaluation should still occur. In addition, the Applicability language has been modified in light of the NRC letter.

Requirement R2:

An entity expressed concern that the requirement as written continues and does not solve the ambiguity with the current Critical Cyber Asset identification requirement. Specifically: "essential to the operation of the Critical Asset" needs to be defined; "adversely impact the reliable operation" needs to be defined; and, it is not clear what "within 15 minutes" means in this context. The SDT responded that the scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology. The subjectivity involved in the Critical Cyber Asset identification requirement will be addressed in future releases of these Standards. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact.

Requirement R3:

An entity expressed concern that the SDT should confirm that under the proposed language for Requirement R3 the approval of the senior manager of the CCA list is only required on an annual basis, and that intermediate updates made "as necessary" under this Requirement do not require senior manager approval. Additionally, the SDT should confirm that under the proposed language for Requirement R3 that the timing of updates "as necessary" to the CCA list is left to the discretion of the entity, and that there is no expectation that such updates are completed within a certain period of time. The SDT responded that the intent of Requirement R3 is that the approval of lists by the senior manager is only required on an annual basis. The intermediate updates do not require senior management approval. The timing of the updates for the Critical Asset list and the Critical Cyber Asset list is not specified and is left to the discretion of the Responsible Entity.

Attachment 1:

Criterion 1.1

One entity expressed concern that criterion 1.1 needs to have "in a single interconnection" added to the end. They provided an example of a single plant site that resided in two Interconnections. The SDT incorporated the suggested wording as clarification of criterion 1.1. Another commenter was concerned about communication that is necessary between various Responsible Entities to identify Critical Assets. The SDT agreed that communication between various Responsible Entities will be required to ensure that all critical Assets are identified. Another commenter stated that the threshold for criteria 1.1, needs to be supported by engineering principles and transmission operations knowledge. The SDT responded that it performed an informal survey of the regions and identified what the megawatt value of the reserve sharing would be for various groups. The SDT used 1500 MW as a number derived from the most significant Contingency Reserves operated in various Balancing Authorities in all regions.

Criterion 1.2

One commenter expressed that 1000 MVAR was too large, and that there are not any reactive resources that large in their region. They asked if the drafting team is aware of where any 1000 MVAR resources are located. The SDT responded that the survey that NERC conducted earlier this year showed that there were facilities that would qualify at this threshold.

Criterion 1.3

One commenter expressed that criterion 1.3 was not consistent with the goal of providing bright line requirements. This criterion requires entity to conduct a study and submit to the Reliability Coordinator, Planning Coordinator or Transmission Planner, who will then determine if a facility qualifies as critical. The SDT responded that there is no burden or obligation placed on the Planning Coordinator or Transmission Planner to designate any unit as needed to avoid Adverse Reliability Impacts in the long-term planning horizon. However, if the PC or TP has identified Adverse Reliability Impacts (the impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection), then any units identified that avoid this scenario must be classified as a Critical Asset. Another entity stated that the term "long-term planning horizon" is referenced but is not clear within the Standard what it means or that it is defined elsewhere. The SDT responded that the resource document “Time Horizons” (found at http://www.nerc.com/files/Time_Horizons.pdf) was used to determine the long-term planning horizon. In this document, long-term planning is defined as “a planning horizon of one year or longer”

One commenter stated that the Reliability Coordinator should be the entity to determine the criticality of a generation Facility, based on information it receives from the Planning Coordinator. The SDT responded that based on the functional model the Planning Coordinator or the Transmission Planner are the correct entities to perform the evaluation. If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, such as due to a category C3 contingency as defined in TPL-003 or a category D contingency as defined in TPL-004, then that unit must be classified as a Critical Asset.

Criterion 1.4

One commenter expressed concern that the Blackstart Resources term used in Criteria 1.4 and 1.5 is in the NERC Glossary and is used in EOP-005-2. However this standard and the related definition are not approved by FERC yet. So what happens if the definition of Blackstart Resource is significantly changed after approval of this standard? The SDT responded that this concern was noted prior to the second posting and the implementation plan was revised to clarify the issue.

Another commenter suggested that NERC consider a "Black Start Tier Methodology" in which only "Primary Black Start Units" would fall under stringent compliance scrutiny and obligations, while other "Secondary Tier Units" would still be made available with required annual testing and operating specifications but be taken off the scope of NERC compliance. The SDT responded that a tiered approach to Blackstart Resources is a good idea, and the SDT suggested that a SAR be submitted by the entity outlining this approach to EOP-005-2.

The APPA CIP Task Force identified what they believed to be an unintended consequence - a Catch-22 - from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. It was felt that these resources are critically important in their function to restore the BES under blackstart conditions. As such, these assets deserve protection as a Critical Asset. Due to their connectivity and configuration, control centers that operate these Blackstart Resources also have the ability to jeopardize their availability and function in a time of need if maliciously misused. As such, these control centers should also be deemed Critical Assets. The SDT appreciates the "catch-22" concern that was brought forth by APPA. However, the SDT does not believe that the criteria as written present a catch-22 scenario. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." The APPA comments indicate that the assets of concern to them are being utilized "once voltage and frequency are stabilized." As such, these assets are not required to be included in the TOP's restoration plan as Blackstart Resources. Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.

Criterion 1.5

A few commenters suggested alternate wording for this criterion. The SDT discussed the merits of each, but ultimately decided to keep the posted wording unchanged.

Criteria 1.6 and 1.7

One commenter stated that this criterion should have another factor based on the size of the facility such that loss of the Facility would have an adverse impact on the BES. The SDT will take this suggestion under consideration for future revisions.

Another commenter believed the list of relevant transmission facilities developed by the Responsible Entity should be subject to an impact-based assessment by the Reliability Coordinator who has the wide-area view of the system. If necessary, an additional requirement that requires the RC to have a risk-based assessment methodology and to conduct the assessment should be included. Such an arrangement would be akin to the exemption provisions advocated by FERC in its Final Rule on Revisions to the ERO definition of Bulk Electric System. The SDT considered placing various analysis requirements on the Reliability Coordinator. The Functional Model describes the Reliability Coordinator as "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." However, the nature of the Critical Asset list is long-term, since implementation of CIP-003 to CIP-009 is up to two years. Based on this, it was determined that the Reliability Coordinator was not an appropriate entity for this analysis.

Criterion 1.8 and 1.9

Several entities asked where the phrase "critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies" came from. The SDT responded that this phrase came from FAC-014-2 Requirement R5. One commenter stated that there should be some obligation that the parties that identify the Transmission Facility as critical also notify the Transmission Owner and Operator of that identification so the Transmission Owner and Operator are aware and can protect. The SDT responded that FAC-014-2 R5 contains information concerning communication of Facilities that are critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

Another commenter expressed that the Reliability Coordinator be removed from the criterion that identifies Critical Asset facilities based on Interconnection Reliability Operating Limits (IROLs). The SDT responded that according to FAC-014-2 Requirement R1 "The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology." Since they have a responsibility to ensure that the IROLs are established and consistent with their SOL methodology, it is valid to list them in this Criterion.

Another commenter stated that only the Reliability Coordinator develops IROLs, and as such should be the only entity to determine criticality, that the NERC Functional Model Version 5 identifies a Planning Coordinator, not a Planning Authority, and that since the Planning Coordinator is referred to in the standard, it must be included in the Applicability section. The SDT responded that FAC-014-2 Requirement R3 states "The Planning Authority shall establish SOLs, including IROLs, for its Planning Authority Area that are consistent with its SOL Methodology." FAC-014-2 Requirement R4 states "The Transmission Planner shall establish SOLs, including IROLs, for its Transmission Planning Area that are consistent with its Planning Authority's SOL Methodology." FAC-014-2 Requirement R1 states "The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology." According to FAC-014-2, the Reliability Coordinator does not develop IROLs. They ensure that the IROLs are established, and that they are consistent with their SOL methodology. Planning Authority is referenced because of FAC-014-2 Requirement R3. Also, since the Planning Coordinator would not own any Critical Assets, they are not subject to CIP-002-4 and would not be listed as a Responsible Entity.

Criterion 1.10

Several commenters stated that the phrase "directly" should be included in Criterion 1.10 which existed in the previous draft. The SDT responded that several commenters in the first posting were concerned about the use of the term "directly." After consideration by the SDT, it was determined that the term could be removed without affecting the intent of the criterion. One commenter expressed concern that, in so much as Criterion 1.1 could result in the identification of generation plant locations with no Critical Cyber Assets, the resulting requirements in Criterion 1.10 could result in expending efforts protecting transmission assets that might not otherwise need to be protected, diverting resources that might be more effectively expended elsewhere. The SDT responded that the intent of Criterion 1.10 is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any Transmission Facility that the loss of which would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset.

Criterion 1.11

Several commenters stated that this criterion should either be removed or revised to "Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements." The SDT responded that Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." While the purpose of NUC-001-2 states "This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown," it is a NERC reliability standard and as such helps to ensure the reliability of the Bulk Electric System.

Criterion 1.13

Several commenters asked that the Guidance Document be modified to provide the reasoning behind the 300 MW criteria listed in criterion 1.13. The SDT responded that the posted Guidance document has been modified to add reasoning for the threshold level. Other commenters suggested alternate wording for the criterion. The SDT discussed the merits of each, but ultimately decided to keep the posted wording unchanged.

Some commenters stated that criterion 1.13 should be reworded to indicate that distributed UFLS or UVLS schemes (i.e., individual UF or UV relays operating independently in multiple substations) are not considered to be a critical asset. Collectively the UFLS or UVLS scheme may shed more than 300MW; however, due to the distributed nature of the scheme, the UFLS or UVLS schemes are not considered to be a critical asset. The SDT spent considerable time discussing the wording of criterion 1.13, and chose the term "Each" to represent that the criterion applied to a discrete system or Facility. The SDT responded that a discrete component that sheds more than 300MW of load due to the implementation of Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program is a Critical Asset. This criterion is intended to include as Critical Assets regional Under Frequency Load Shedding and Under Voltage Load Shedding schemes.

Criterion 1.15

One commenter asked for clarification on what the term "control" means. The SDT responded that from the posted Guidance document: "A control center or generation control center that provides critical operating functions and tasks as identified in CIP–002 must be protected per the requirements of the Cyber Security Standard. The monitoring and operating control function includes controls performed automatically, remotely, manually, or by voice instruction." Another entity expressed concern that if a small utility, as a joint owner, has control over only a small portion of a large plant that falls under the brightline of criterion 1.1, they are concerned that as currently written, the first sentence of criterion 1.15 would designate this small utility's control center as critical. The SDT responded that the concern is that the joint owner's control center could provide a path to compromise the functionality of the generation designated a Critical Asset.

Criteria 1.16 and 1.17

One commenter stated that they believe that in Criterion 1.16 the functional obligation should be clearly defined to include those pertaining to the real-time operations and NOT all. The SDT responded that due to the direct impact on the operation of identified Critical Assets, these Transmission control centers must be designated as Critical Assets. Attachment 1 criteria are used to identify control centers as Critical Assets. The consideration of specific reliability functions would be a part of the entity identifying Critical Cyber Assets which support the control center.

Implementation Plan

One entity stated that the proposed implementation is too aggressive. Physical Security Perimeters are expensive and it may not be possible to fund these modifications in the short timeframe for compliance. A 3-year implementation period would be more appropriate. The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC Approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.

Organization	Yes or No	Question 1 Comment
Arizona Public Service Company	Yes	
Dynegy Inc.	Yes	
NIPSCO	Yes	

Organization	Yes or No	Question 1 Comment
Northeast Utilities	Yes	
Portland General Electric Company	Yes	(1) The Standard Drafting Team (SDT) should confirm that under the proposed language for Requirement 1 the approval of the senior manager of the CCA list is only required on an annual basis, and that intermediate updates made "as necessary" under this Requirement do not require senior manager approval.(2) The SDT should confirm that under the proposed language for Requirement 1 that the timing of updates "as necessary" to the CCA list is left to the discretion of the entity, and that there is no expectation that such updates are completed within a certain period of time.
Response: Thank you for your comments. The intent of Requirement R3 is that the approval of lists by the senior manager is only required on an annual basis. The intermediate updates do not require senior management approval. The timing of the updates for the Critical Asset list and the Critical Cyber Asset list is not specified and is left to the discretion of the Responsible Entity.		
Ameren	No	. We suggest Criteria 1.6, 1.7 and 1.10 should be changed to include substations and switchyard (station) only and not “Facilities”. Based on the definition of “Facilities” and application of Criteria 1.6, 1.7 and 1.10, the Critical Asset list now would include transmission lines. Our concern is that there will be significant issue to comply with CIP-003 through CIP-009 (for example, physical security requirements) for the transmission line assets, if some components installed on the lines fall into cyber asset category, such as temperature or flow monitoring devices or fiber optics used for communication. 2. The Blackstart Resources term used in Criteria 1.4 and 1.5 is in the NERC Glossary and is used in EOP-005-2. However this standard and the related definition are not approved by FERC yet. So what happens if the definition of Blackstart Resource is significantly changed after approval of this standard? We suggest that the definition of Blackstart Resources should be included in this standard. 3. The phrase “directly” should be included in Criterion 1.10 which existed in the previous draft. We believe that after removing this term, the revised wordings now are more confusing. 4. We believe that in Criterion 1.16 the functional obligation should be clearly defined to include those pertaining to the real-time operations and NOT all. We suggest that Criterion 1.16 should be modified to read “Each control center or backup control center used to perform the functional

Organization	Yes or No	Question 1 Comment
		obligations, pertaining to real time operation of the BES, of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." 5. We believe that in Criterion 1.17 the functional obligation should be clearly defined to include those pertaining to the real-time operations and NOT all. Further this criterion should make clear that the 1500 MW is calculated on the same basis as defined in Critetion 1.1. We suggest that Criterion 1.17 should be modified to read, "Each control center or backup control center used to perform the functional obligations, pertaining to real time operation of the BES, of a Balancing Authority if its Balancing Authority Area(s) includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations pertaining to real time operation of the BES, of a Balancing Authority if its Balancing Authority Area(s) includes an aggregate of 1500 MW in a single Interconnection, calculated using the highest rated net Real Power capability of each unit during the preceding 12 months. 6. During the Webinar, references were made to the Guidance Document. However, the Guidance Document is NOT the standard and can not be used in the compliance audit. So, any clarification included in the Guidance Document should be made part of the Standard.

Response: Thank you for your comments.

1. The SDT does not feel this change is necessary. Please refer to the first bullet in the Overall Application of Attachment 1 in the posted Guidance document for a discussion of the SDT's reason for the use of the term "Facility."
2. Your concern was noted prior to the second posting and the implementation plan was revised with the following: "The term Blackstart Resource, used in CIP-002-4 Attachment 1, was submitted for regulatory approval with Project 2006-03 – System Restoration and Blackstart. The definition must be approved before Criteria 1.4 and 1.5 are used to determine Critical Assets for Responsible Entities." The language has been revised in this posting to "The term Blackstart Resource, used in CIP-002-4 Attachment 1, was submitted to FERC for regulatory approval in the US with Project 2006-03 – System Restoration and Blackstart. The Effective Date of EOP-005-2 is the date that Criteria 1.4 and 1.5 will be used to determine Critical Assets for any Responsible Entity."
3. Several commenters in the first posting were concerned about the use of the term "directly." After consideration by the Standard Drafting Team, it was determined that the term could be removed without affecting the intent of the criterion.
4. Due to the direct impact on the operation of identified Critical Assets, these Transmission control centers must be designated as Critical

Organization	Yes or No	Question 1 Comment
Assets. Attachment 1 criteria are used to identify control centers as Critical Assets. The consideration of specific reliability functions would be a part of the entity identifying Critical Cyber Assets which support the control center. 5. Due to the direct impact on the operation of identified Critical Assets, these Balancing Authority control centers must be designated as Critical Assets. The impact to the identified Critical Assets would be in real time, as the Balancing Authority functions in the Functional Model involve real time operations. If a Balancing Authority can control 1500MW or more of generation, it is considered a Critical Asset. The language in criterion 1.1 was taken from MOD-024, which is only applicable to Generation Owners. 6. While the Guidance Documents are not the standard, they do provide additional context. The SDT believes the wording in the posted standard provide sufficient clarity.		
Kansas City Power & Light	No	o The bright line prescribed here will still include smaller Registered Entities that do not have significant impact on the reliable operation of the BES. The bright line components that need to be considered for modification are those regarding control centers and the blackstart facility considerations. It may be easiest to consider the role system load could play in the entirety of this bright line. For example, leave the bright line language as is, but those entities with 500 MW of system load or less are exempt. o Section 1.8 is not clear as to the intent. If the intent is to include those facilities that are identified as IROL flowgates then it is recommended the Drafting Team consider the following language, "Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as a LODF flowgate with an IROL limit established and the associated contingent facility(ies)." If this is not the case what does, "critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies" mean? o Section 1.9 is not clear as to the intent for the same reasons stated for section 1.8. If the intent is to include those facilities that are identified as IROL flowgates then it is recommended the Drafting Team consider the following language, "Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as a LODF flowgate with an IROL limit established and their associated contingent facility(ies). If this is not the case what does, "critical to the derivation of Interconnection

Organization	Yes or No	Question 1 Comment
		Reliability Operating Limits (IROLs) and their associated contingencies" mean?
Response: Thank you for your comments. • In FERC Order 706, the Commission addressed the importance of Critical Assets, no matter how small. An entity with 500MW or less of system load may still have a Critical Asset which needs to be evaluated for possible Critical Cyber Assets. • The wording for criterion 1.8 came from FAC-014-2 Requirement R5. • The wording for criterion 1.9 came from FAC-014-2 Requirement R5.		
Great River Energy	Yes	After reviewing the SDT summary of comments and their associated edits to Attachment 1, GRE feels the changes were responsive to the feedback received by industry in the previous comment/ballot period.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment.		
Alliant Energy	No	Alliant Energy agrees with most of the changes to the standard, however, Attachment 1, Criterion 1.4 concerning Blackstart Resources is unacceptable as currently written. Alliant Energy fears that there will be a degradation of the Black Start program as it exists today. The industry has already seen companies removing their black start resources from Power System Restoration Plans due to compliance requirements which entail additional costs associated with not only bringing these units up to the required standards but the extensive fines which may occur if rigid compliance specifications are not met. We would respectfully suggest that NERC consider a "Black Start Tier Methodology" in which only "Primary Black Start Units" would fall under stringent compliance scrutiny and obligations, while other "Secondary Tier Units" would still be made available with required annual testing and operating specifications but be taken off the scope of NERC compliance. This methodology would promote back up facilities to the primary black start units and would encourage smaller black start units to remain in the black start program which could be used to expedite the restoration process. A "Black Start Area Plan" could be created to specify the "Primary Black Start Units" and "Secondary Black Start Units" requirements for a given footprint or specified loading area. A minimum of one "Primary Black Start Unit" would be required for any specific footprint with special additional considerations for those units which may supply stabilization power to nuclear facilities. The Black Start Tariff could be utilized to maintain the "Primary Black Start Units" availability and be used to reward the availability of the "Secondary Black Start Units". The tariff could also be used by those entities which do not physically have such facilities but could contract to support this kind of services. A third possible tier of black start units could be defined and incorporated which would be comprised of larger coal/gas units with only black start stabilization capability. Incorporating these third tier units would enable coal/ gas units to self supply their own stabilization power and would be immediately made available to contribute to the loading and stabilization of the black start area plan once the skeletal grid was reconstructed. These types of units could also be rewarded through the black start tariff to ensure unit availability, and promote the reduction of unit damage which can occur to generating stations during a black out situation.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. A tiered approach to Blackstart Resources is a good idea, and the drafting team suggests that a SAR be submitted by the entity outlining this approach to EOP-005-2. It is beyond the scope of this SDT.		
American Transmission Company	No	ATC believes that Attachment 1, the so-called bright line criteria, language needs to be clarified. There needs to be a clear and consistent method for Planning to identify IROLs, or it becomes subjective and open to interpretation. The following are ATC's recommended changes to the Criteria listed: Criterion 1.3: o Not consistent with the goal of providing bright line requirements. This criterion requires entity to conduct a study and submit to the RC, PC or TP, who will then determine if a facility qualifies as critical. These criteria will likely result in inconsistent and unrepeatable studies being performed by RC, PC or TP. Comment also applies to 1.8, 1.9. o Suggestion: Delete this criterion at the next CIP-002 revision. Criterion 1.8: o The 'critical to the derivation of . . . and their associated contingencies' wording is more cryptic and less clear than the previous wording. o Suggestion: Suggest wording more similar to the previous draft, 'Facilities that if destroyed, degraded, misused, or otherwise rendered unavailable, could cause the violation of one or more IROLs.' Criterion 1.10: o We suggest expanding the wording of "loss of the assets" to "loss of more than 1500 MW of assets" to clarify that the inclusion of Transmission Facilities that would result in the loss of more than 1500 MW but less than all of the assets at a single plant location and the exclusion of Transmission Facilities that may result in the loss of less than 1500 MW of the assets at a single plant location. o Added the wording of 'identified by any Generator Owner as a result of its application of'. Generator Owner would apply Criterion 1.1 and 1.3 to its generating facility, rather than obligate the TO to apply the criteria which and possibly lead to disagreements. Criterion 1.11: o This criterion is not clear and distinct because in an ultimate analysis the entire interconnection minus certain selected elements is essential to meeting the NPIRs at any given nuclear facility. o Suggestion: Revise the criterion to, "Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements", which is consistent with the

Organization	Yes or No	Question 1 Comment
		former EEI comments.

Response: Thank you for your comments.

The purpose of FAC-014-2 Requirements R3 and R4 is to establish a clear and consistent method for identifying IROLs. The method for Planning to identify IROLs is beyond the scope of the CIP standards.

Criterion 1.3: There is no burden or obligation placed on the Planning Coordinator or Transmission Planner to designate any unit as needed to avoid Adverse Reliability Impacts in the long-term planning horizon. However, if the PC or TP has identified Adverse Reliability Impacts (the impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that

Organization	Yes or No	Question 1 Comment
affects a widespread area of the Interconnection), then any units identified that avoid this scenario must be classified as a Critical Asset. Criterion 1.8: The wording for criterion 1.8 came from FAC-014-2 Requirement R5. Criterion 1.10: The SDT believes the phrase “loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3” contained in the balloted version of CIP-002-4 conveys the same intent as your proposed language. Criterion 1.11: Criterion 1.11 is based on NUC-001-2 R9.2.2 “Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.”		
Basin Electric Power Cooperative		Attachment #1, Criterion 1.1 needs to have "in a single interconnection" added to the end. The Laramie River Station in Wheatland, Wyoming is a three generator station with two 550 MW generators in the Western Interconnection and one 550 MW generator in the Eastern Interconnection. (there doesn't appear to be any specific place to submit substantative comments on the standard)
Response: Thank you for your comments. The SDT has incorporated your suggested wording in Attachment 1 Criterion 1.1.		
Pepco Holdings Inc and Affiliates	Yes	Attachment 1 Critical Asset CriteriaItem 1.1-- Please clarify the process that the Transmission Owner would find out about Generator Owners or Generator Operator facilities identified under Item 1.3. Suggest have some statement similar to 1.3 regarding informs. Should the Planning Coordinator or Transmission Planner not only designate and inform the Generator Owner or Generator Operator but the Transmission Owner?General-- Please take steps to reduce ambiguous language. (e.g. black start resources).
Response: Thank you for your comments. Criterion 1.3: The process would be that the Planning Coordinator or Transmission Planner would notify the Generation Owner and Generation Operator about any facilities that meet Criterion 1.3. The GO and/or GOP would need to notify the Transmission Owner of any facilities that need to be considered for Criterion 1.10. The SDT has made efforts to reduce any ambiguous language. In your example the SDT chose the NERC glossary term “Blackstart Resources” in		

Organization	Yes or No	Question 1 Comment
order to eliminate any confusion over the term.		
BGE	Yes	BGE thanks the SDT for their positive response to the previously submitted comments. BGE asks that the SDT consider adding to the Guidance Document the reasoning behind the 300 MW criteria listed in the automatic load shedding criteria 1.13 in Appendix 1.
Response: Thank you for your comments. The posted Guidance document has been modified to add reasoning for the threshold level.		
Bonneville Power Administration	No	BPA believes that the bright line criteria approach in CIP-002-4 is an improvement over prior versions. However, it still does not address the concern by the industry in regards to providing sufficient clarity to many portions of CIP-002-4 to make it acceptable to the majority of utilities that must understand and develop strategies to meet the standards and requirements and implement them in a reasonably timely fashion. BPA still supports the formal comments that we submitted in October 2010. See additional comments below: CIP-002-4 R2.1. “The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter” does not go far enough in its definition of what qualifies as a critical cyber asset and needs further clarification, particularly concerning serial devices. For example: What exactly is meant by "uses a routable protocol to communicate outside the Electronic Security Perimeter"? 1. Can a device that is not capable of native routable protocol (does not have, or use an ethernet card) qualify as using routable protocol? 2. Does a device that is not capable of native routable protocol, that is connected to a device which is ethernet connection outside the ESP (Serial to Ethernet Converter) qualify? 3. Does a device that is not capable of native routable protocol, but is connected to a Terminal Server, which is ethernet connected outside the ESP qualify?4. Does it make a difference if there is only view access to the internal ESP device with no possible ability to control it?5. What if the device

Organization	Yes or No	Question 1 Comment
		is connected to another device which is ethernet connected, but it simply dumps to a data-store on that device, and there is no access through to the data-store device (the internal ESP device)?6. What if the device itself never initiates communications outbound, and can only be connected to if access is initiated to it from elsewhere?7. What if the device has no ability to connect to and influence any other device?8. What if you can't connect to that device and through it connect to any other device?9. What if the Serial to Ethernet device between the Cyber Asset and the network strips all routable protocol information off and forwards only non-routable data to the Cyber Asset. Comments from October 2010: Mapping Document - The individual utility's development and implementation of their risk-based methodology instills ownership in their process and is a positive result of the current CIP versions. For BPA, application of the bright-line assessment criteria for Critical Asset identification in the recent NERC data request resulted in fewer assets being classified in the high impact categorization. However, we see that if a utility's implementation of the criteria resulted in more Critical Assets being identified with the corresponding implementation of security controls at those assets, then an improvement in reliability would occur. Attachment 1 - Make it clear that substations are the facilities to be identified as Transmission Critical Assets, not lines, transformers, reactive equipment, etc. Another alternative would be to identify all facilities that operate at a specified certain kV level would be determined to be Critical Assets. The different categories identified in Attachment 1still allow utilities to justify most of what they have already declared as Critical Assets. R1 - We agree with the "at least annually" aspect of the requirement. Annual review seems appropriate if a utility has not had any major changes or expansion to their grid since their last Critical Asset determination. R2 - The requirement as written continues and does not solve the ambiguity with the current Critical Cyber Asset identification requirement. Specifically: "essential to the operation of the Critical Asset" needs to be defined; "adversely impact the reliable operation" needs to be defined; and, it is not clear what "within 15 minutes" means in this context. The intent of the Standards Drafting Team needs to be

Organization	Yes or No	Question 1 Comment
		made clear. Implementation Plan - If this version requires more substations to be identified as Critical Assets, then we believe that the proposed implementation is too aggressive. Physical Security Perimeters are expensive and it may not be possible to fund these modifications in the short timeframe for compliance. A 3-year implementation period would be more appropriate. BPA agrees with the proposed revisions to the implementation plan for newly identified CCAs and Responsible Entities.

Response: Thank you for your comments

Requirement R2: This language has existed in versions 1 through 3 of CIP-002. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. Also, please refer to the "Identifying Critical Cyber Assets" document for additional clarification.

Mapping Document - While some entities may have a few assets fall off of its Critical Asset list, it is expected that overall more BES assets in North America will be classified as Critical Assets.

Attachment 1 - Substations are not the only Facilities identified as Critical Assets. Lines, transformers, reactive equipment, and other Facilities can be classified as a Critical Asset if they meet any of the criteria in Attachment 1. Please refer to the posted guidance document for additional clarification.

R2 - The scope of changes to this Standard only addresses the near-term issues associated with external oversight and review of the risk-based assessment methodology. The subjectivity involved in the Critical Cyber Asset identification requirement will be addressed in future releases of these Standards. The 15 minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do

Organization	Yes or No	Question 1 Comment
not necessarily involve real-time reliability impact. Implementation Plan - The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC Approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.		
Brazos Electric Power Cooperative, Inc.	No	Brazos Electric appreciates the work of the SDT and is supportive of the efforts and the general concepts of this draft. This is a negative vote due to disagreement over some elements in Attachment 1 criterion as provided below. 1.3 The term "long-term planning horizon" is referenced but is not clear within the Standard what it means or that it is defined elsewhere. 1.5 This criterion should be clarified by changing the words "first interconnection point of the generation unit(s)to be started" to be "interconection point to the first generation unit(s)to be started". 1.6 This criterion should have another factor based on the size of the facility such that loss of the Facility would have an adverse impact on the BES. 1.7 This criterion should have another factor based on the size of the facility such that loss of the Facility would have an adverse impact on the BES. 1.13 Consider re-wording of this criterion as follows to better intent. “Each system or Facility that performs automatic load shedding as required by regional load shedding programs that implement Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) of 300 MW or more without human operator initiation.” 1.15 This criterion should be clarified to define what the term "control" means. It is not clear within the

Organization	Yes or No	Question 1 Comment
		Standard what it means or that it is defined elsewhere.

Response: Thank you for your comments.

Criterion 1.3 - The resource document "Time Horizons" (found at http://www.nerc.com/files/Time_Horizons.pdf) was used to determine the long-term planning horizon. In this document, long-term planning is defined as "a planning horizon of one year or longer"

Criterion 1.5 - The SDT appreciates the suggestion, but believes the posted wording is adequate.

Criterion 1.6 - The SDT will take this suggestion under consideration for future revisions.

Criterion 1.7 - The SDT will take this suggestion under consideration for future revisions.

Criterion 1.13 - The SDT appreciates the suggestion, but believes the posted wording is adequate.

Criterion 1.15 - From the posted Guidance document: "A control center or generation control center that provides critical operating functions and tasks as identified in CIP–002 must be protected per the requirements of the Cyber Security Standard. The monitoring and operating control function includes controls performed automatically, remotely, manually, or by voice instruction."

Organization	Yes or No	Question 1 Comment
Central Lincoln	No	Central Lincoln supports the following APPA CIP Task Force comments. If this issue is addressed as suggested, we will vote affirmative on the next ballot. The APPA CIP Task Force has identified what we believe to be an unintended consequence - a Catch-22 - from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. This interaction will cause many if not all registered TOPs, BAs and Generation Owners that control Blackstart Resources used in a TOP restoration plan to become subject to CIP-002 through CIP-009, regardless of entity size.EOP-005 requires all TOPs to have a restoration plan. APPA's reading of EOP-005 indicates that each TOP must identify one or more Blackstart Resources. CIP-002-4 Criterion 1.4 requires a TOP to identify each such Blackstart Resource identified in its restoration plan as a critical asset. Criterion 1.5 requires the identification of certain Cranking Paths as critical assets.Criterion 1.15 requires that each generation control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for generation control center size (1500 MW).Criterion 1.16 requires each transmission control center or backup control center used to control a Cranking Path identified under Criterion 1.5 be identified as a critical asset, without any exception for TOP control center size.Criterion 1.17 requires each Balancing Authority control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for Balancing Authority control center size (1500 MW).In effect, Criterion 1.4 swallows all exceptions created under 1.15 through 1.17, with the possible exception of a generation-only BA that does not have any Blackstart Resource obligations to its TOP. All vertically integrated utilities would be responsible for CIP-002 through CIP-009, including small BAs and TOPs that do not own any other Critical Assets.To address this problem, we propose the following edits to 1.4 and 1.5 shown in CAPS:1.4. Each Blackstart Resource identified in the RESTORATION PLAN FOR A Transmission Operator SERVING LOAD OR GENERATION EQUAL TO OR GREATER THAN AN AGGREGATE OF 1500 MW IN A SINGLE INTERCONNECTION. 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart

Organization	Yes or No	Question 1 Comment
		Resource(S) IDENTIFIED IN 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan. This surgical approach ensures that generation, TOP and BA control centers with responsibility for other critical generation and transmission assets are still responsible for full CIP-002-4 through CIP-009 compliance. However, small BA/TOP systems with no initial obligations to the RC and larger TOPs for regional restoration would not be deemed “critical.” The experience of these smaller systems is that their restoration obligations have not been relied upon to restore the BES, but rather to start generation to serve local load after a system separation - and then to wait for direction from the RC on resynchronization with the rest of the BES, once voltage and frequency are stabilized. While we recognize that cyber events may have an impact on the availability of resources, the fundamental fact is the vast majority of Blackstart Resources and control centers will be protected under CIP-002 through -009, because they will be classified as Critical/High Impact under the proposed criteria, as revised above. Thus the revised criteria support rather than undermine the distinction between categorization of big iron/big aluminum resources and their associated control centers as Critical or High Impact in the development of CIP-002-4. The categorization and development of security controls for smaller resources as either medium or low impact for the BES, should be addressed through development of additional bright line criteria and associated security controls in the next phase of this project (CIP-002-5 or CIP-010/011.)

Response: Thank you for your comment.

The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. It was felt that these resources are critically important in their function to restore the BES under blackstart conditions. As such, these assets deserve protection as a Critical Asset. Due to their connectivity and configuration, control centers that operate these Blackstart Resources also have the ability to jeopardize their availability and function in a time of need if maliciously misused. As such, these control centers should also be deemed Critical Assets. The SDT appreciates the "catch-22" concern that was brought forth by APPA. However, the SDT does not believe that the criteria as written present a catch-22 scenario. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." The APPA comments indicate that the assets of concern to them are being utilized "once voltage and frequency are stabilized." As such, these assets are not required to be included in the TOP's restoration plan as Blackstart Resources. Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator’s System." As such, smaller TOPs have the opportunity to coordinate with

Organization	Yes or No	Question 1 Comment
neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.		
City Utilities of Springfield, Missouri	No	City Utilities of Springfield, Missouri believes that the proposed bright-line criteria will improperly identify lower impact Blackstart Resources as Critical Assets. City Utilities agrees with the comments submitted by the APPA Task Force.
Response: Thank you for your comments. Please refer to the response to APPA's Task Force contained in Central Lincoln's comments.		
San Diego Gas and Electric	Yes	Comment on 1.8, 1.9, 1.10: There should be some obligation that the parties that identify the Transmission Facility as critical (e.g. RC, PA, TP, GO) that they also notify the Transmission Owner and Operator of that identification so the TOP and TO are aware and can protect.Comment on 1.8, 1.9: What does the statement "critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies" mean?
Response: Thank you for your comments. Criterion 1.8 and 1.9 - FAC-014-2 R5 contains all of the information concerning communication of Facilities that are critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies. Criterion 1.10 – It is agreed that communication between Generator Operators and Transmission Owners and Transmission Operators will be required to ensure that all Critical Assets are identified. The wording for 1.8 and 1.9 came from FAC-014-2 Requirement R5.		

Organization	Yes or No	Question 1 Comment
Electric Market Policy	Yes	Dominion supports the latest revision of CIP-002-4 through CIP-009-4 (excluding CIP-005-4)
Response: Thank you for your comments.		
FirstEnergy	Yes	FirstEnergy agrees that the standard drafting team's changes to the proposed CIP-002-4 reliability standard have been responsive to industry feedback and believe the team's work will drive further consensus. While FE has voted in support of the standard, we offer the following comments as clarifying revisions permitted by the NERC Process Manual prior to a Recirculation (Final) Ballot.A) Applicability to nuclear generation. The proposed revisions regarding exemption language for nuclear generation plants located in the United States (U.S.) along with the parenthetical text of Attachment 1 criterion stating "including nuclear generation" leaves the standard ambiguous and in need of clarification based on recent Nuclear Regulatory Commission (NRC) findings. The NRC and NERC have worked closely to address FERC's Order 706B concerns related to any nuclear balance of plant (BOP) systems, structures and components (SSCs) within a U.S. nuclear power plant that is not regulated by the NRC and subject to NERC CIP standards. However, the NRC letter to NERC dated November 26, 2010 clarifies its findings that "Based on the Commission's [NRC] determination, the NRC staff does not believe that there will be any SSCs in the BOP that will fall under NERC's Critical Infrastructure Protection (CIP) standards." While the letter acknowledges that there may be some SSCs in a nuclear plant that are not subject to the NRC's cyber security regulations or NERC's CIP standards, the NRC indicates "these SSCs do not have a nexus to radiological health and safety and do not affect grid reliability." Based on the NRC's November 26, 2010 FE believes that NERC should retain the original exemption language related to U.S. nuclear plants in section 4.2 of the standard and remove the parenthetical text "including nuclear generation" from the Attachment 1 criteria 1.1.B) Attachment 1, Criterion 1.6. Item 1.6 currently reads "Transmission Facilities operated at 500 kV or higher." For consistency with other Attachment 1 criteria we propose that this criterion be revised to read "Transmission Facilities at a single station or substation location operated at 500kV or higher". This change clarifies that the intent is to classify the 500kV substation as a Critical Asset and not individual transmission lines that terminate at the substation. C) Attachment 1, Criterion 1.8. FirstEnergy suggests that the Reliability Coordinator be removed

Organization	Yes or No	Question 1 Comment
		from the criterion that identifies Critical Asset facilities based on Interconnection Reliability Operating Limits (IROLs). For consistency with criterion 1.3 which identifies Critical Asset generation necessary to avoid BES Adverse Reliability Impacts in the "long-term planning horizon" we propose that the Critical Assets identified based on IROL also be limited to the study of the Planning Coordinator and the Transmission Planner in the long-term planning horizon. The Reliability Coordinators role in real-time conditions for IROL are generally aimed at fine tuning the appropriate operating limits that they monitor based on actual system conditions and would typically not identify any new "facilities" associated with an IROL. In the unlikely event that a Reliability Coordinator would identify a very unique IROL condition not identified by the rigorous study work of a Planning Coordinator or Transmission Planner it would be for extremely unique and temporary system conditions and would not warrant long-term Critical Asset determinations.
Response: Thank you for your comments. Nuclear generation applicability - The phrase "including nuclear generation" in Criterion 1.1 is there to define a plant site. Unit output from all units at a single plant site should be included to determine if a plant meets the 1500MW threshold. The evaluation for Critical Cyber Assets is similar. Although it is highly unlikely that nuclear and non-nuclear units share common Cyber Assets, the evaluation should still occur. Criterion 1.6 – The purpose of classifying Critical Assets is to identify all Critical Cyber Assets. While it is true that almost all Critical Cyber Assets associated with 500kV Facilities are located inside of a substation, the potential exists for it to not be located there. If a Critical Cyber Asset is not located within the bounds of a station or substation, it must still be protected from cyber attacks. Criterion 1.8 – According to FAC-014-2 Requirement R1 "The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology." Since they have a responsibility to ensure that the IROLs are established and consistent with their SOL methodology, it is valid to list them in this Criterion.		
Tacoma Power	Yes	For Criterion 1.13, the term "System" is defined in the NERC Glossary of Terms but is not capitalized. I suggest that a change be made to capitalize the word System.
Response: Thank you for your comments. The term "system" can refer to systems other than "a combination of generation, transmission, and		

Organization	Yes or No	Question 1 Comment
distribution components." The SDT believes it is correct to refer to "system" instead of "System."		
City of Grand Island	No	General Comment: So many items give one entity the power to designate facilities owned by another entity as critical. Yet there is no mention of justification and no process to mediate differences of opinion. Specific Comments: 1.3 This criteria should have a MW level. Suggest: "Each Blackstart Resource identified in the restoration plan for a Transmission Operator serving load or generation equal to or greater than 1500 MW." 1.4 Reference Blackstart Resourses identified in 1.4 (see above modified 1.4).
Response: Thank you for your comments. The issue of communication between entities is recognized as an issue that needs to be addressed and will be considered in a future version. Criterion 1.4 - Thank you for your comment. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. It was felt that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as a Critical Asset.		
Pinellas County Resource Recovery Facility	Yes	I think the bright-line criteria provide much needed consistency and give beneficial direction to registered entities in identifying their critical assets.
Response: Thank you for your comment.		

Organization	Yes or No	Question 1 Comment
Independent Consultant	Yes	In CIP-002-4 Attachment 1 Criteria items 1.15 & 1.17 contain two criteria each. The first criteria in each of these statements if based on 'functionality', and the second criteria is based on 'span of control' (> 1500MW). It would appear that a separate criteria for span of control should be listed and that aspect of the criteria removed from 1.15 & 1.17.Suggested separation provided below. Criteria numbering would need to be adjusted appropriately.1.14. Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator. 1.15. Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4.NEW: Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection. 1.16. Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12. 1.17. Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. NEW: Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.
Response: Thank you for your comment. The SDT decided to group the criteria for control centers based on functionality. Separating then does not appear to add any additional clarity to the criteria.		

Organization	Yes or No	Question 1 Comment
Luminant	Yes	Luminant thanks the SDT for their work on the standard and for the opportunity to provide comments for consideration by the SDT. Luminant believes the changes to CIP-002-4 are responsive to the concerns expressed by the industry and provide acceptable bright-line criteria for the determination of Critical Assets. Luminant does request the SDT to consider a wording change in the "Draft Guidance Document". On page 10 of the Clean version of the document, in reference to Special Protection Schemes, the following is listed:"Part 1.12 designates Special Protection Systems and Remedial Action Schemes as Critical Assets. Special Protection Systems and Remedial Action Schemes may be implemented to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time they are required or if they operate outside of the parameters they were designed for. Generation Owners and Operators which have implemented such systems and schemes must designate them as Critical Assets. " The term "implemented" is not consistent with other NERC standards and can lead to disagreements on who is responsible for the Critical Asset CIP requirements. Luminant asks the SDT to change the language to: "Generator Owners and Operators that own such systems and schemes...." The term "own" is consistent with other NERC standards that are applicable to Special Protection Systems and Remedial Action Schemes, and very clearly identifies the responsible entity. Thank you for your consideration of our comments.
Response: Thank you for your comments. Your suggested change to the Guidance document has been made.		
Minnesota Power	No	Minnesota Power believes that CIP-002-4 R1 needs to clearly state "The RE should identify a list of Critical Asset that it owns..." While the Standard Drafting Team did speak to this in its response to the California ISO's comments, the SDT did not go far enough to eliminate potential interpretation issues in the future. Specifically, there is ambiguity as to what this would mean from a Balancing Authority perspective. The "its assets" language as written could be interpreted to mean the assets it controls, rather than those assets it owns. As such, we would urge the Standard Drafting Team to reconsider, and include a stronger ownership statement in the proposed standard language.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment. The drafting team believes the phrase "a list of its identified Critical Assets" in R1 specifies ownership of the Critical Asset by the Responsible Entity.		
PPL Electric Utilities Corporation	Yes	PPL Electric Utilities Corporation ("PPL EU") appreciates the hard work and efforts of the Standards Drafting Team in reaching this point in the standards development process. However PPL EU has reviewed the CIP-002-4 standard version dated 11/30/2010 and the associated Rationale and Implementation Reference Document and Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities and still find the need to offer comments as follows: 1) CIP-002-4, Attachment 1, Criterion 1.1 should include a requirement that the Generator Owner or Generator Operator must inform the Transmission Operator, Transmission Operator, Planning Coordinator or Transmission Planner of each group of generating units that has been designated as a critical asset. 2) CIP-002-4, Attachment 1, Criterion 1.3 should be reworded to indicate "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator, "and the Transmission Owner and Transmission Operator" as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon. 3) CIP-002-4, Attachment 1, Criterion 1.5 should be reworded to indicate "The facilities comprising the Cranking Paths and Meeting the initial switching requirements from the Blackstart Resource "up to and including" the first interconnection point of the generation unit(s) to be started, or up to "and including" the point on the Cranking Path where two or more path options exist "including the first interconnection point of the generation unit(s) to be started" , as identified in the Transmission Operator's restoration plan. 4) CIP-002-4, Attachment 1, Criterion 1.13 should be revised to include load shed systems capable of shedding 300 MW or more. These load shed systems, which are typically part of the energy management systems, are initiated to ensure the reliability of the BES. 5) CIP-002-4, Attachment 1, Criterion 1.13 should be reworded to indicate that distributed UFLS or UVLS schemes (i.e., individual UF or UV relays operating independently in multiple substations) are

Organization	Yes or No	Question 1 Comment
		not considered to be a critical asset. Collectively the UFLS or UVLS scheme may shed more than 300MW; however, due to the distributed nature of the scheme, the UFLS or UVLS schemes are not considered to be a critical asset.

Response: Thank you for your comments.

Criterion 1.1 - It is agreed that communication between Generator Operators and Transmission Owners and Transmission Operators will be required to ensure that all Critical Assets are identified.

Criterion 1.3 - The process would be that the Planning Coordinator or Transmission Planner would notify the Generation Owner and Generation Operator about any facilities that meet Criterion 1.3. The GO and/or GOP would need to notify the Transmission Owner of any facilities that need to be considered for Criterion 1.10.

Criterion 1.5 - The SDT appreciates the suggestion, but believes the posted wording is adequate.

Criterion 1.13 – A discrete component that sheds more than 300MW of load due to the implementation of Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program is a Critical Asset. During the previous ballot and comment period, the SDT received many comments on this criterion, whose wording was similar to this suggestion. Some commenters stated that the wording of this criterion will inadvertently bring in all SCADA systems with the capability of shedding load even if such SCADA systems are in fact not planned or operated to perform load shedding. This was not the intent of the SDT. Other commenters stated that this item needs to be clarified to confirm that it applies to a single common control system only, and not multiple but separate “like” systems that in aggregate are capable of load shedding up to 300 MW. Also, the criterion needs to be clarified to confirm that it applies to systems “configured” for automatic load shedding, not simply just “capable” of load shedding. This criterion was intended to include as Critical Assets regional Under Frequency Load Shedding and Under Voltage Load Shedding schemes. The SDT appreciates the suggestion, but believes the posted wording is correct.

Organization	Yes or No	Question 1 Comment
Southern Company Transmission	Yes	Southern believes that the SDT's changes to the proposed standard were responsive to some of the feedback received; however, certain key industry comments still have not been adequately addressed. For example, in Attachment 1, Section 1.11 should be deleted. Section 1.11 relates to Transmission Facilities necessary to secure offsite power to permit safe reactor shutdown. Although such Transmission Facilities are within the scope of Nuclear Plant Interface Coordination standards (NUC reliability standards), they are not within the intended scope of the Cyber Security standards (CIP reliability standards). The Purpose section of the NUC reliability standards states "This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown." The Purpose section of the CIP reliability standards states "NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System." Therefore, Section 1.11 should be deleted because it is clearly out of scope. Moreover, the criticality of facilities for BES reliability purposes should not be based on fuel type alone. In addition, Southern believes the following proposed changes made by the SDT should be reconsidered: In Attachment 1, Section 1.10, the SDT deleted the word "directly" by changing "generation interconnection required to directly connect generator output" to "generation interconnection required to connect generator output." The word "directly" should not be deleted from Section 1.10 because it is necessary to appropriately define the scope of the requirement. Removing the word "directly" removes the bright line criteria, which is the goal of the new standard. As proposed by the SDT, the standard would require various risk-based analyses i.e. load flow and transient stability studies to determine the assets in scope. Therefore, the SDT should reconsider this proposed change. The proposed Section 1.13 would be clearer if it were changed to the following: "1.13. Each system or facility that implements Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) of 300 MW or more without human operator initiation as required by the regional load shedding program."

Organization	Yes or No	Question 1 Comment

Response: Thank you for your comments.

Criterion 1.11 – This criterion is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." Since these facilities were deemed so important that a NERC reliability standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets. While the purpose of NUC-001-2 states "This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown," it is a NERC reliability standard and as such helps to ensure the reliability of the Bulk Electric System.

Criterion 1.10 - Several commenters in the first posting were concerned about the use of the term "directly." After consideration by the Standard Drafting Team, it was determined that the term could be removed without affecting the intent of the criterion.

Criterion 1.13 - The SDT appreciates the suggestion, but believes the posted wording is adequate.

Organization	Yes or No	Question 1 Comment
MRO's NERC Standards Review Subcommittee	No	The MRO NSRS believes the SDT was responsive to much of the feedback received from the industry; however, we question whether these bright-line criteria as a whole are acceptable for determining Critical Cyber Assets. We believe the following criteria need to be adjusted as follows to properly address these areas: Attachment 1, Criterion 1.4We believe EOP-005-2, which defines the Transmission Operator restoration plan and related Blackstart Resource requirements, is ambiguous as to what actually constitutes a Blackstart Resource. For example, assume a plant has a 1 MW diesel engine that is used to start a 100 MW combustion turbine when the system is black. What is the Blackstart Resource, the 1 MW diesel engine or the 100 MW combustion turbine? To our knowledge, EOP-005-2 does not answer this question. Even at the regional restoration plan level, we believe many utilities are currently designating the 1 MW diesel engine as the Blackstart Resource under EOP-005-2, whereas others have designated the 100 MW combustion turbine. We realize this appears to be more of an issue with EOP-005-2, and not CIP-002-4. However, the effect of this EOP-005-2 ambiguity will be greatly magnified once CIP-002-4 begins using this same designation to identify critical assets, determining where an entity focuses their time and resources related to cyber security. For this reason, we believe the CIP-002-4 and EOP-005-2 SDT's must work together to clarify this designation, enabling us to apply the definition of a Blackstart Resource, and the related cyber security efforts, uniformly across the industry. Attachment 1, Criteria 1.4 & 1.5The APPA has identified an issue where criteria 1.4 and 1.5 end up requiring nearly all control centers to be identified as critical, even for small entities. The MRO NSRS recognizes this unintended consequence, and supports the following APPA comments: "The APPA CIP Task Force has identified what we believe to be an unintended consequence - a Catch-22 - from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. This interaction will cause many if not all registered TOPs, BAs and Generation Owners that control Blackstart Resources used in a TOP restoration plan to become subject to CIP-002 through CIP-009, regardless of entity size. EOP-005 requires all TOPs to have a restoration plan. APPA's reading of EOP-005 indicates that each TOP must identify one or more Blackstart Resources. CIP-002-4 Criterion 1.4 requires a TOP to identify each such Blackstart Resource identified in its restoration plan as a

Organization	Yes or No	Question 1 Comment
		critical asset. Criterion 1.5 requires the identification of certain Cranking Paths as critical assets. Criterion 1.15 requires that each generation control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for generation control center size (1500 MW). Criterion 1.16 requires each transmission control center or backup control center used to control a Cranking Path identified under Criterion 1.5 be identified as a critical asset, without any exception for TOP control center size. Criterion 1.17 requires each Balancing Authority control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for Balancing Authority control center size (1500 MW). In effect, Criterion 1.4 swallows all exceptions created under 1.15 through 1.17, with the possible exception of a generation-only BA that does not have any Blackstart Resource obligations to its TOP. All vertically integrated utilities would be responsible for CIP-002 through CIP-009, including small BAs and TOPs that do not own any other Critical Assets. To address this problem, we propose the following edits to 1.4 and 1.5 shown in quotation marks:"1.4. Each Blackstart Resource identified in the RESTORATION PLAN FOR A Transmission Operator SERVING LOAD OR GENERATION EQUAL TO OR GREATER THAN AN AGGREGATE OF 1500 MW IN A SINGLE INTERCONNECTION. 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(S) IDENTIFIED IN 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan." This surgical approach ensures that generation, TOP and BA control centers with responsibility for other critical generation and transmission assets are still responsible for full CIP-002-4 through CIP-009 compliance. However, small BA/TOP systems with no initial obligations to the RC and larger TOPs for regional restoration would not be deemed "critical." The experience of these smaller systems is that their restoration obligations have not been relied upon to restore the BES, but rather to start generation to serve local load after a system separation - and then to wait for direction from the RC on resynchronization with the rest of the BES, once voltage and frequency are stabilized. While we recognize that cyber events may have an impact on the availability of resources, the fundamental fact is the vast majority of Blackstart Resources and control centers will be protected under CIP-002 through -009, because they will be classified as Critical/High Impact under the proposed criteria, as revised above. Thus the revised criteria support rather than undermine the distinction between categorization of big iron/big aluminum resources and their associated control

Organization	Yes or No	Question 1 Comment
		centers as Critical or High Impact in the development of CIP-002-4. The categorization and development of security controls for smaller resources as either medium or low impact for the BES, should be addressed through development of additional bright line criteria and associated security controls in the next phase of this project. (CIP-002-5 or CIP-010/011)" Attachment 1, Criterion 1.10If a generating facility that falls under the brightline of criterion 1.1 has numerous Transmission Facilities providing interconnections to the system, all of them would be designated as critical under criterion 1.10, even if their loss does not result in the loss of at least 1500 MW of generation. To prevent this, we would propose rewording the criterion as follows:"Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in THE LOSS OF AT LEAST 1500 MW OF GENERATION ASSETS IDENTIFIED BY AN GENERATOR OWNER AS A RESULT OF ITS APPLICATION OF ATTACHMENT 1, CRITERION 1.1, OR the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.3." Attachment 1, Criterion 1.13We are concerned that as currently worded, this criterion could unintentionally designate multiple smaller, disparate systems with like settings as a "system" that performs automatic load shedding of 300 MW or more, assuming the total combined load shedding capability of the disparate systems exceeds 300 MW. To prevent this, we would propose rewording the criterion as follows to more closely match the old version:"Each COMMON system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." Attachment 1, Criterion 1.15Even if a small utility, as a joint owner, has control over only a small portion of a large plant that falls under the brightline of criterion 1.1, we are concerned that as currently written, the first sentence of criterion 1.15 would unintentionally designate this small utility's control center as critical. To prevent this, we would propose rewording the criterion as follows:"Each control cen

Organization	Yes or No	Question 1 Comment

Response: Thank you for your comments

Criterion 1.4 - A Blackstart Resource is defined as "A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan." It is difficult to imagine a scenario in which a 1 MW generator can fulfill all of the requirements in the Blackstart Resource definition. However, any generator designated a Blackstart Resource per EOP-005-2 must be classified a Critical Asset.

The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. It was felt that these resources are critically important in their function to restore the BES under blackstart conditions. As such, these assets deserve protection as a Critical Asset. Due to their connectivity and configuration, control centers that operate these Blackstart Resources also have the ability to jeopardize their availability and function in a time of need if maliciously misused. As such, these control centers should also be deemed Critical Assets. The SDT appreciates the "catch-22" concern that was brought forth by APPA. However, the SDT does not believe that the criteria as written present a catch-22 scenario. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." The APPA comments indicate that the assets of concern to them are being utilized "once voltage and frequency are stabilized." As such, these assets are not required to be included in the TOP's restoration plan as Blackstart Resources. Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.

Criterion 1.10 - The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any Transmission Facility that the loss of which would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset.

Criterion 1.13 - In the drafting of this criterion, the drafting team sought to include only those systems that did not require human operator initiation, and targeted in particular those Under Frequency Load Shedding (UFLS) facilities and systems and Under Voltage Load Shedding (UVLS) facilities and systems that would be implemented as part of a regional load shedding requirement to prevent Adverse Reliability Impact. It is unclear how adding the term "common" adds any additional clarity over the existing wording. A discrete component that sheds more than 300MW of load due to

Organization	Yes or No	Question 1 Comment
the implementation of Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program is a Critical Asset. Criterion 1.15 - The concern here is that the joint owner's control center could provide a path to compromise the functionality of the generation designated as a Critical Asset.		
Manitoba Hydro	No	The SDT addressed some but not all of the issues in the current proposed version of CIP-002-4. Please see Manitoba Hydro's voting recommendation and associated comments for further details.
Response: Thank you for your comments.		
USACE	No	The Standards Drafting Team still is been prescriptive in determining Critical Assets. The Responsible Entity is responsible for identifying Critical Assets, as pointed out in Order 706, and FERC directed NERC to provide additional guidance in helping the Responsible Entity determine Critical Assets and for NERC to maintain flexibility for the Responsible Entity in the determination of Critical Assets. The prescriptive nature of the approach being used in the Ver 4 CIP Standard appears to be taking the responsibility of determining Critical Assets away from the Responsible Entity and the lack of flexibility may eliminate or preclude a system or component from being identified as a Critical Asset. This process, with out the jpropper full ris assesment to understand what is critical in the BES system, willnot result on a more secure BES. More assets in the list does not translate to more secure overall system.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The Attachment 1 criteria were developed in response to an external oversight directive in the FERC Order 706. In consideration of this directive, the SDT decided there did not exist across all regions an appropriate third party to provide this type of oversight. Also, external review and oversight carries with it the compliance overhead and arbitration processes analogous to the TFE process. This "bright-line" criteria approach		

Organization	Yes or No	Question 1 Comment
removes the variability of entity defined methodologies that would prompt the need for external review.		
Constellation Energy Commodities Group	No	The team was very responsive to feedback and addressed each comment. However, we do not believe the bright-line criteria to be acceptable - specifically 1.15. Comments were included on the ballot. In addition, we offer the comment below. New Language - 1.13 - Each system(s) or facilities that perform automatic load shedding, without human operator initiation, of 300 MW or more implementing undervoltage load shedding (UVLS) or underfrequency load shedding (UFLS) as required by the regional load shedding program. Excluding high-set underfrequency load shedding ("UFR"), as incorporated in the ERCOT Load acting as a Resource ("LaaR") Demand Response Program, which requires such relay protection. As the trip threshold for UFR is set above that of the regional requirements for the UFLS, the UFR type load shedding should be exempt from this requirement. (This should be clarified in the Guidance Document to maintain a clear scope of intent in the requirement.)
Response: Thank you for your comment. Criterion 1.13 – If the trip threshold for UFR is set above that of the regional requirements for the UFLS, then the Standard Drafting team is unclear how it would be required as part of the regional UFLS program, and thus be classified as a Critical Asset. The "LaaR" is not part of the regional load shedding program, but an ancillary services market.		

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	The wording in the Applicability Section exempts "Facilities regulated by the Canadian Nuclear Safety Commission", and "Cyber Assets associated with Cyber Security Plans submitted to and verified by the U. S. Nuclear Regulatory Commission pursuant to 10 C.F.R. Section 73.54." It is stated in 1.1 "(including nuclear generation)...", contradicting the Applicability section. Criteria 1.3 as revised--"Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon." From the NERC Functional Model, the Reliability Coordinator should be the entity to determine the criticality of a generation Facility, based on information it receives from the Planning Coordinator. Criteria 1.8 as revised--"Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies." As per the NERC Functional Model, only the Reliability Coordinator develops IROLs, and as such should be the only entity to determine criticality. There is no need to say "substation location"--substation or station will suffice. Where more than one entity is listed (such as Reliability Coordinator, Planning Coordinator, et al., it must be made clear which of those entities is the primary entity. The NERC Functional Model Version 5 identifies a Planning Coordinator, not a Planning Authority. If Planning Coordinator is referred to in the standard, it must be included in the Applicability section.

Response: Thank you for your comment.

Criterion 1.1 - The phrase "including nuclear generation" in Criterion 1.1 is there to define a plant site. Unit output from all units at a single plant site should be included to determine if a plant meets the 1500MW threshold. The evaluation for Critical Cyber Assets is similar. Although it is highly unlikely that nuclear and non-nuclear units share common Cyber Assets, the evaluation should still occur.

Criterion 1.3 – One of the functions identified in the Functional Model is Planning Reliability, which has an identified task of "Evaluate, develop, document, and report on resource and transmission expansion plans for the Planning Coordinator area. Integrate the respective plans, evaluate the impact of those plans on and by adjoining Planning Coordinator's integrated plans and assess whether the integrated plan meets reliability needs, and, if not, then to report on potential transmission system and resource adequacy deficiencies and suggest or facilitate the process for developing

Organization	Yes or No	Question 1 Comment
		alternative plans to mitigate identified deficiencies." The Functional Entity responsible for that function is the Planning Coordinator, who is "(t)he functional entity that coordinates, facilitates, integrates and evaluates (generally one year and beyond) transmission facility and service plans, and resource plans within a Planning Coordinator area and coordinates those plans with adjoining Planning Coordinator areas." Another function in the Functional Model is Transmission Planning, which has an identified task of "Evaluate, develop, document, and report on expansion plans for the Transmission Planner area. Assess whether the integrated plan meets reliability needs, and, if not, report on potential network conditions or configurations that do not meet performance requirements and provide potential alternative solutions to meet performance requirements." The Functional Entity responsible for that function is the Transmission Planner, who is "(t)he functional entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within a Transmission Planner area." The Reliability Coordinator, on the other hand, is "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." The focus of Criterion 1.3 is the long-term planning horizon, not real-time. Criterion 1.8 - FAC-014-2 Requirement R3 states "The Planning Authority shall establish SOLs, including IROLs, for its Planning Authority Area that are consistent with its SOL Methodology." FAC-014-2 Requirement R4 states "The Transmission Planner shall establish SOLs, including IROLs, for its Transmission Planning Area that are consistent with its Planning Authority's SOL Methodology." FAC-014-2 Requirement R1 states "The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology." According to FAC-014-2, the Reliability Coordinator does not develop IROLs. They ensure that the IROLs are established, and that they are consistent with their SOL methodology. Planning Authority is referenced because of FAC-014-2 Requirement R3. Also, since the Planning Coordinator would not own any Critical Assets, they are not subject to CIP-002-4 and would not be listed as a Responsible Entity.

Organization	Yes or No	Question 1 Comment
OGE	Yes	This question was answered "Yes", however the following recommendations for improvement are offered. In attachment 1, the threshold for criteria 1.1, needs to be supported by engineering principles and transmission operations knowledge. The current threshold was seemingly driven by the need to increase the number of facilities. Attachment 1, criteria 1.4, needs to be focused on the distinct units that, per the Transmission Operator's restoration plan, are used to restore the system. Units meeting the Blackstart Resource definition that are alternate or backup sources should be included in the Transmission Operator's restoration plan, but excluded from the Critical Asset criteria. Attachment 1, criteria 1.7, the response to the prior comments included the statement, "It should be noted that connections to generators or generation-only substations are not counted in this Criterion." For an effective bright-line, this needs to be supported within the standard. Reference to a supplemental document, such as the "consideration of comments", will not suffice in a compliance effort.

Response: Thank you for your comments.

Criterion 1.1 - The Standard Drafting Team performed an informal survey of the regions and identified what the megawatt value of the reserve sharing would be for various groups. The SDT used 1500 MW as a number derived from the most significant Contingency Reserves operated in various Balancing Authorities in all regions.

Criterion 1.4 - The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. It was felt that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as a Critical Asset. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage."

Criterion 1.7 – The choice of the phrases “Transmission Facilities” and “transmission stations or substations” was intentional to exclude connections

Organization	Yes or No	Question 1 Comment
for generators and generation only substations.		
Tampa Electric	Yes	We agree with the proposed language, however if this version does not pass and changes need to be made, we would strongly recommend bright line criteria for Critical Cyber Assets and a CCA identification methodology. In the absence of such criteria and associated methodology we expect inconsistency across entities, and would recommend the language here be modified as follows: "the only Cyber Assets that must be considered are those shared Cyber Assets that could adversely impact the reliable operation of any combination of units via common mode failure that in aggregate exceeds Attachment 1, criterion 1.1 within 15 minutes."
Response: Thank you for your comment. The SDT will take your suggested wording under consideration for future revisions. In the absence of such criteria, please refer to the "Critical Cyber Asset Identification Guideline."		

Organization	Yes or No	Question 1 Comment
Wisconsin Electric Power Company d/b/a We Energies	Yes	We appreciate the diligence of the Standard Drafting Team in reviewing and responding to the comments and feedback provided during the previous ballot, and the changes made to the bright line criteria in Attachment 1 in response to comments and feedback. We strongly support the change to a single implementation timeline of 24 months which will simplify both implementation and audit requirements, and would like to point out the fact that there is a discrepancy in timelines specified in the draft standard and the timelines specified in the draft implementation plan. This discrepancy must be corrected in the final implementation. Also, the timeline proposed for CIP-005-4 should coincide with the timeline for the other CIP version 4 standards to further streamline compliance and audit processes. We would also like to express concern that, in so much as Criterion 1.1 could result in the identification of generation plant locations with no Critical Cyber Assets, the resulting requirements in Criterion 1.10 could result in expending efforts protecting transmission assets that might not otherwise need to be protected, diverting resources that might be more effectively expended elsewhere. Finally, we would like to express concern that the failure to specify a criticality criteria for Blackstart Resources in Criterion 1.4 will result in current blackstart-capable units not being identified as Blackstart Resources. Thank you for your consideration of these comments.

Response: Thank you for your comments.

The flowchart in the implementation plan has been removed.

Your comments on CIP-005-4 will be forwarded to that team.

Criterion 1.10 - The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any Transmission Facility that the loss of which would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset.

Criterion 1.4 - The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. It was felt that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As

Organization	Yes or No	Question 1 Comment
such, these assets deserve protection as a Critical Asset.		
Independent Electricity System Operator	No	We appreciate the Drafting Team's reinstatement of Section 4.2.1 pertaining to the exemption of facilities regulated by the CNSC. We however respectfully reiterate our objection to criteria 1.6 and 1.7. In our view, removal of some of the facilities identified as Critical Assets using these criteria will have no impact on the BES. Their inclusion on the Critical Assets list would therefore be unnecessary The Drafting Team's response to our comment was "The inclusion of a risk-based evaluation by any entity would not meet the objective of uniform application of Critical Asset identification across all entities."We must however point out that Criteria 1.3, 1.8 and 1.9 already allow entities (whether they be the RC, the PC etc.) the discretion to designate/identify as Critical Assets, facilities "necessary to avoid BES Adverse Reliability Impacts" or "critical to the derivation of IROLs". Presumably, these entities doing the "designating" will have a documented methodology and apply it. We therefore advocate a similar approach in the case of Criteria 1.6 and 1.7.We believe the list of relevant transmission facilities developed by the Responsible Entity, should be subject to an impact-based assessment by the Reliability Coordinator who has the wide-area view of the system. If necessary, an additional requirement that requires the RC to have a risk-based assessment methodology and to conduct the assessment should be included. Such an arrangement would be akin to the exemption provisions advocated by FERC in its Final Rule on Revisions to the ERO definition of Bulk Electric System.We therefore propose the following specific wording: 1.6 Transmission facilities operated at 500 kV or higher, unless the annual review performed by the Reliability Coordinator (new requirement) demonstrates that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages.1.7 Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations, unless the annual review performed by the Reliability Coordinator (new requirement) demonstrates that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment. The SDT considered placing various analysis requirements on the Reliability Coordinator. The Functional Model describes the Reliability Coordinator as "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." However, the nature of the Critical Asset list is long-term, since implementation of CIP-003 to CIP-009 is up to two years. Based on this, it was determined that the Reliability Coordinator was not an appropriate entity for this analysis.		
Great River Energy	No	We believe that criterion 1.4 and 1.5 of Attachment 1 need to be revised such that they are tied more closely to criterion 1.1 and 1.3, similar to the wording contained in criterion 1.10. We feel that this is necessary due to the fact that a Blackstart Resource's main function is the restoration of critical generation assets. This would create more clarity on the classification of Blackstart Resources and cranking paths as Critical Assets. A revised criterion 1.4 could read: "Each Blackstart Resource identified in the Transmission Operator's restoration plan as being essential to the restoration of a generating unit identified in Attachment 1 criterion 1.1 or 1.3."A revised criterion 1.5 could read: "The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource identified in criterion 1.4 to the first interconnection point of the generation unit(s)...."
Response: Thank you for your comment. The SDT is unsure of your comment "We feel that this is necessary due to the fact that a Blackstart Resource's main function is the restoration of critical generation assets." A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." The Blackstart Resource should not be limited to those that start other Critical Assets. A similar defense is made for criterion 1.5. Criterion 1.4 - The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. It was felt that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as a Critical Asset.		

Organization	Yes or No	Question 1 Comment
WECC	Yes	We believe that the proposed changes address the direction to develop a bright-line criteria to replace the individual responsible entity methodologies. This approach will lead to more uniformity and consistency across the continent in the identification of Critical Assets. While WECC continues to believe that the bright line Criteria identified in Attachment 1 of CIP-004-2 may lead to identification of fewer Critical Assets by some entities in the West than were identified using the individual methodologies required by the current version of CIP-002, we recognize the need and desire for consistency across the continent. WECC also continues to believe a similar effort in identifying a bright line criteria for Critical CYBER Assets is necessary, and encourages NERC to consider such actions in any future modification to the standard. The language "essential to the operation of the Critical Asset" is subjective and could lead to the same lack of uniformity and consistency in identifying Critical Cyber Assets that drove the changes in identification of Critical Assets. A lack of a uniform and consistent identification of Critical Cyber Assets may prevent the desired level of reliability and security.
Response: Thank you for your comment. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. In the absence of such criteria, please refer to the "Critical Cyber Asset Identification Guideline."		
Midwest ISO	No	We thank the drafting team for their efforts and the progress they have made in improving this standard since the last ballot. While we do believe the drafting team was responsive to the comments previously submitted, we believe a new issue has been identified and an existing issue persists. The standard shifts responsibility for critical asset identification to third parties. For example, criterion 1.3 essentially causes generation owners to rely on Planning Coordinators to identify their critical generators. This responsibility should not be trasnferred and Order 706 was clear that it cannot be in paragraph 328. Criterion 1.3 is ambiguous and likely will not result in any generators being identified unless the Planning Coordinator is violating the TPL standards. Adverse Reliability Impact involves impacts to the system that cause separation, cascading, instability, etc. The TPL standards require the Planning Coordinator to plan to prevent these kinds of events for multiple contingencies. Thus, this criterion should be removed.
Response: Thank you for your comment.		

Organization	Yes or No	Question 1 Comment
Criterion 1.3 - The burden for identifying Critical Assets is with the Responsible Entity that is the asset owner. If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, such as due to a category C3 contingency as defined in TPL-003 or a category D contingency as defined in TPL-004, then that unit must be classified as a Critical Asset.		
SPS Energy	No	While the changes in the Criteria 1.3 allow generators to be informed of whether they are designated a Critical Asset by the Planning Coordinator or Transmission Planner, that was not the point. The discretion to make such designations without proper due diligence or independent review remains. Planning studies have a wide latitude of assumptions and it would be quite easy designate one's competitor as critical and employ the assumptions in the planning models to make that happen. Lacking independence at the PC and TP level, independent review is the only way to insure competition is not blunted by this ability to designate one's competitor as critical.
Response: Thank you for your comment. Criterion 1.3 - In the Functional Model, one of the tasks of the Planning Coordinator is "Facilitates the integration of the respective plans of the Resource Planners and Transmission Planners within the Planning Coordinator area. a. Reviews the integrated plan with respect to established reliability needs considering the impact on and by adjoining systems. b. In coordination with the Resource Planners and Transmission Planners, facilitates the development of alternative solutions for plans that do not meet those reliability needs." One of the alternative solutions developed may require the availability of a particular generator to meet reliability needs and avoid an Adverse Reliability Impact Likewise, one of the tasks of the Transmission Planning function is "Evaluate, develop, document, and report on expansion plans for the Transmission Planner area. Assess whether the integrated plan meets reliability needs, and, if not, report on potential network conditions or configurations that do not meet performance requirements and provide potential alternative solutions to meet performance requirements."		

Organization	Yes or No	Question 1 Comment
Duke Energy	Yes	Yes, however we see much room for improvement and offer the following comments: o Criterion 1.2 - We previously commented that 1000 MVAR was too large, and reiterate that comment again. There are not any reactive resources that large in SERC. Is the drafting team aware of where any 1000 MVAR resources are located? o Criterion 1.3 - This criterion is less clear than before. Adding the phrase "necessary to avoid BES Adverse Reliability Impacts" potentially broadened this criterion to include every last generator on the system, because the defined term "Adverse Reliability Impact" includes tripping of generation. You need to limit this criterion to generation whose loss "could expose a widespread area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages." o Criterion 1.4 - Need to clarify that this criterion only includes the primary Blackstart Resources. Entities may include various alternative resources in their restoration plans which aren't Critical Assets, but which may not be clearly distinguished from the primary Blackstart Resources in the restoration plan. Add the phrase "that the entity intends to rely on for system restoration". o Criterion 1.7 - Wording change creates confusion as to whether generating stations are included. Insert the word "transmission" before the word "stations". o Criterion 1.8 - This criterion is less clear than before. Delete the RC, because the identification of facilities to be protected occurs in the planning timeframe. Also the unclear language "critical to the derivation of" and "their associated contingencies" should be struck. Suggested rewording: "Transmission Facilities at a single transmission station or substation location, that are identified by the Planning Authority or Transmission Planner, whose loss could expose a widespread area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages." o Criterion 1.9 - This criterion is less clear than before. Delete the RC, because the identification of facilities to be protected occurs in the planning timeframe. Also the unclear language "critical to the derivation of" and "their associated contingencies" should be struck. Suggested rewording: "Flexible AC Transmission Systems (FACTS) at a single transmission station or substation location, that are identified by the Planning Authority or Transmission Planner, whose loss could expose a widespread

Organization	Yes or No	Question 1 Comment
		area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages." o Criterion 1.10 - Removing the word "directly" creates significant uncertainty regarding what scope of facilities would be included. Reinsert the word "directly", preferably after the phrase "Transmission Facilities". Also, including the word "destroyed" in the phrase "destroyed, degraded, misused or otherwise rendered unavailable" creates significant uncertainty regarding what is intended. Add the phrase "via cyber attack" after the word "unavailable". This will clarify that the evaluation only encompasses destruction, degradation or misuse that can be achieved via cyber attack, and not a physical attack on the facilities. o Criterion 1.12 - The added language is unclear. Suggested rewording: "Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements whose loss could expose a widespread area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages for failure to operate as designed." o Criterion 1.13 - As clarified on the Webinar, the language needs to be revised to clarify that the phrase "Each system or Facility" only includes discrete systems or facilities that can individually shed 300 MW or more of load. UFLS and UVLS systems are typically composed of discrete components at many locations (not interconnected), usually on the distribution system. These discrete, localized facilities would not typically interrupt 300 MW individually. o While the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities provides milestones for implementing the CIP standards, we believe that a modification is needed related to the CIP 002 milestones within this plan. The implementation plan presumes that compilation of all of CIP 002 evidence (R1. Application of Methodology; R2. Identification of the new Critical Asset; R3. Identification of the new Critical Cyber Assets; and R4. Annual Approval of the above items) occurs simultaneously for Category 1 and Category 2. This approach does not allow sufficient time for the identification of new Critical Cyber Assets (R3) and approval of the documented CCA list (R4) once new Critical Assets are identified. We believe the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities should be amended to provide a period of 6 months following identification of a new Critical Asset for the

Organization	Yes or No	Question 1 Comment
		identification of new Critical Cyber Assts associated with the new Critical Asset (R3) and the Annual Approval of the revised Critical Cyber Asset List (R4).

Response: Thank you for your comments.

Criterion 1.2 - The value of 1000 MVAR used in this criterion is a value deemed reasonable for the purpose of determining criticality. The survey that NERC conducted earlier this year showed that there were facilities that would qualify at this threshold.

Criterion 1.3 – Adverse Reliability Impact is defined as "The impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection." The Guidance document has been modified to provide additional clarification on this issue.

Criterion 1.4 - The SDT considered using the word "primary", but ultimately rejected it as it is not a defined NERC Glossary term in this instance, nor is it used in EOP-005-2. The phrase "that the entity intends to rely on for system restoration" was discussed by the SDT, but it was determined that it added no additional clarity.

Criterion 1.7 - The choice of the phrases "Transmission Facilities" and "transmission stations or substations" was intentional to exclude connections to generators and generation only substations.

Criterion 1.8 - According to FAC-014-2 Requirement R1 "The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology." Since they have a responsibility to ensure that the IROLs are established and consistent with their SOL methodology, it is valid to list them in this Criterion. The wording for criterion 1.8 came from FAC-014-2 Requirement R5.

Criterion 1.9 - According to FAC-014-2 Requirement R1 "The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology." Since they have a responsibility to ensure that the IROLs are established and consistent with their SOL methodology, it is valid to list them in this Criterion. The wording for criterion 1.8 came from FAC-014-2 Requirement R5.

Criterion 1.10 - Several commenters in the first posting were concerned about the use of the term "directly." After consideration by the Standard Drafting Team, it was determined that the term could be removed without affecting the intent of the criterion. The SDT discussed your suggested

Organization	Yes or No	Question 1 Comment
		changes, and determined the existing language is adequate. The term “destroyed” is listed in the definition of Critical Asset. Criterion 1.12 - The SDT appreciates the suggestion, but believes the posted wording is adequate. Criterion 1.13 - The SDT spent considerable time discussing the wording of criterion 1.13, and chose the term “Each” to represent that the criterion applied to a discrete system or Facility. Implementation Plan – Thank you for raising this concern. The SDT will review the implementation plan in the next version and revise as necessary.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments on Successive Ballot for Cyber Security 706 – CIP Version 4 Standards

Summary Consideration: A successive ballot of the Cyber Security 706 CIP Version 4 standards was conducted from December 1-10, 2010 and achieved a quorum of 86.83% and a weighted segment approval of 77.04%. The following summary of comments and responses is grouped by areas of CIP-002-4.

General Comments:

Concern was expressed that any clarification included in the Guidance Document should be made part of the Standard. The SDT responded that, while the Guidance Documents are not the standard, they do provide additional context. Other entities expressed concern that the bright line prescribed in Attachment 1 will still include smaller Registered Entities that do not have significant impact on the reliable operation of the BES. The SDT responded that in FERC Order 706, the Commission addressed the importance of Critical Assets, no matter how small. Another entity stated that there needs to be a clear and consistent method for Planning to identify IROLs, or it becomes subjective and open to interpretation. The SDT responded that the purpose of FAC-014-2 Requirements R3 and R4 is to establish a clear and consistent method for identifying IROLs. The method for Planning to identify IROLs is beyond the scope of the CIP standards. Several entities expressed an interest that the SDT should take steps to reduce ambiguous language. (e.g. black start resources). The SDT responded that they have made efforts to reduce any ambiguous language, to the point of using the NERC glossary term “Blackstart Resources” in order to eliminate any confusion over the term. Another entity expressed that criteria for critical assets should be based on critical functions of assets like system restoration, voltage control, maintaining load/generation balance, maintaining flows within IROL/SOL, critical SPS and that the list the list should not rely on substation voltages or amount of MW. The SDT responded that voltage levels and MW thresholds were used in criteria that had no corresponding bright lines in existing standards.

Several entities stated that the SDT should clarify that substations are the facilities to be identified as Transmission Critical Assets, not lines, transformers, reactive equipment, etc. The SDT responded that substations are not the only Facilities identified as Critical Assets. Lines, transformers, reactive equipment, and other Facilities can be classified as a Critical Asset if they meet any of the criteria in Attachment 1. The SDT referred commenters to the posted guidance document for additional clarification. One entity expressed concern that many items give one entity the power to designate facilities owned by another entity as critical. The SDT responded that the issue of communication

between entities is recognized as an issue that needs to be addressed and will be considered in a future version. Some entities felt that the SDT was prescriptive in determining Critical Assets, which they felt was contrary to FERC Order 706. The SDT responded that the Attachment 1 criteria were developed in response to an external oversight directive in the FERC Order 706. In consideration of this directive, the SDT decided there did not exist across all regions an appropriate third party to provide this type of oversight. Also, external review and oversight carries with it the compliance overhead and arbitration processes analogous to the TFE process. This "bright-line" criteria approach removes the variability of entity defined methodologies that would prompt the need for external review. Additionally, some entities expressed concern that the SDT should begin a similar effort in identifying a bright line criteria for Critical Cyber Assets. The SDT responded that the scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method, not the Critical Cyber Asset Identification method.

One entity stated that they disagree with the removal of R1.2.7 from CIP-002-3. The entities should continue to have the option to add assets which they feel are appropriate. The SDT responded that originally criterion 1.16 was placed in Attachment 1 to provide Responsible Entities the flexibility to include addition items on their existing Critical Asset list that did not meet any other criterion in Attachment 1. The SDT was concerned that having additional Critical Assets without criteria opens the possibility of having the burden of proof on the Registered Entity that they have no additional Critical Assets.

Commenters pointed out a numbering format issue and an abbreviation issue in the Compliance section, and the SDT corrected the issues. Several entities recommended using different wording than "annual." The SDT responded that the term "annual" exists in the current CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version. Another commenter stated that FERC & NERC must attempt to provide the security needed, but in a way that balances adequate security with an entities ability to absorb the costs. The SDT and volunteer industry participants have developed appropriate Critical Asset Identification criteria which have been presented to industry through various iterations for review and feedback. In addition, the SDT has attempted to factor in this issue by limiting the scope of Critical Cyber Assets to those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1.

Many Canadian members of NPCC are of the opinion that in Attachment 1 of the draft CIP-002-4 standard an RC led exclusion provision should be available to allow some facilities to be exempted from the CIP standards. The SDT

believes that having an exception process to the criteria presents the same challenges associated with a risk-based assessment in external review and oversight.

Nuclear Applicability:

Several entities expressed concern about the nuclear generation exemption language for nuclear generation plants located in the United States (U.S.) along with the parenthetical text of Attachment 1 criterion stating "including nuclear generation." They expressed that this leaves the standard ambiguous and in need of clarification based on recent Nuclear Regulatory Commission (NRC) findings. The NRC and NERC have worked closely to address FERC's Order 706B concerns related to any nuclear balance of plant (BOP) systems, structures and components (SSCs) within a U.S. nuclear power plant that is not regulated by the NRC and subject to NERC CIP standards. However, the NRC letter to NERC dated November 26, 2010 clarifies its findings that "Based on the Commission's [NRC] determination, the NRC staff does not believe that there will be any SSCs in the BOP that will fall under NERC's Critical Infrastructure Protection (CIP) standards." The SDT responded that the phrase "including nuclear generation" in criterion 1.1 is there to define a plant site. Unit output from all units at a single plant site should be included to determine if a plant meets the 1500MW threshold. The evaluation for Critical Cyber Assets is similar. Although it is highly unlikely that nuclear and non-nuclear units share common Cyber Assets, the evaluation should still occur. In addition, the Applicability language has been modified in light of the NRC letter.

Requirement R1:

One commenter stated that Requirement R1 should be clarified to require the first list of identified Critical Assets to be developed prior to the effective date of the Standard. The SDT responded that in order to be compliant with CIP-002-4 on the effective date of the standard, the list must be developed by the effective date. This is clarified in the implementation plan. Another commenter believes that CIP-002-4 R1 needs to clearly state "The RE should identify a list of Critical Asset that it owns..." The SDT believes the phrase "a list of its identified Critical Assets" in R1 specifies ownership of the Critical Asset by the Responsible Entity.

Requirement R2:

One commenter stated that Requirement R2 should be clarified to require the first list of identified Critical Cyber Assets to be developed prior to the effective date of the Standard. The SDT responded that in order to be compliant

with CIP-002-4 on the effective date of the standard, the list must be developed by the effective date. This is clarified in the implementation plan.

Requirement R3:

One commenter stated that Requirement R3 should be modified to require any update of the Critical Asset or Critical Cyber Asset list to be approved. The SDT debated this issue and determined that an annual approval of each list was sufficient.

Attachment 1:

Criterion 1.1

One entity asked for clarity on the terms "a defined physical footprint" and "commonly accepted generating facility terminology." Additional clarity has been added to the Guidance document. The following sentence was added to the language explaining criterion 1.1: “Single plant location refers to a group of generating units occupying a defined physical footprint, often but not always, these units are surrounded by a common fence, have a common entry point, share common facilities such as warehouses, water plants and cooling sources, follow a similar naming convention (plant name - unit number) and fall under a common management organization.” Another commenter was concerned about communication that is necessary between various Responsible Entities to identify Critical Assets. The SDT agreed that communication between various Responsible Entities will be required to ensure that all critical Assets are identified.

Criterion 1.2

One commenter expressed that 1000 MVAR was too large, and that there are not any reactive resources that large in their region. They asked if the drafting team is aware of where any 1000 MVAR resources are located. The SDT responded that the survey that NERC conducted earlier this year showed that there were facilities that would qualify at this threshold.

Criterion 1.3

One commenter expressed that criterion 1.3 was not consistent with the goal of providing bright line requirements. This criterion requires entity to conduct a study and submit to the Reliability Coordinator, Planning Coordinator or Transmission Planner, who will then determine if a facility qualifies as critical. The SDT responded that there is no burden or obligation placed on the Planning Coordinator or Transmission Planner to designate any unit as needed to avoid Adverse Reliability Impacts in the long-term planning horizon. However, if the PC or TP has identified Adverse Reliability Impacts (the impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection), then any units identified that avoid this scenario must be classified as a Critical Asset. Another entity requested clarification whether this criterion is for "reliability must run" units? The SDT responded that the units identified using criterion 1.3 are not necessarily designated as "reliability must run."

One commenter stated that the Reliability Coordinator should be the entity to determine the criticality of a generation Facility, based on information it receives from the Planning Coordinator. The SDT responded that based on the functional model the Planning Coordinator or the Transmission Planner are the correct entities to perform the evaluation. If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, such as due to a category C3 contingency as defined in TPL-003 or a category D contingency as defined in TPL-004, then that unit must be classified as a Critical Asset.

Criterion 1.4

The APPA CIP Task Force identified what they believed to be an unintended consequence - a Catch-22 - from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions. As such, these assets deserve protection as Critical Assets. Due to their connectivity and configuration, control centers that operate these Blackstart Resources also have the ability to jeopardize their availability and function in a time of need if maliciously misused. As such, these control centers should also be deemed Critical Assets. The SDT appreciates the "catch-22" concern that was brought forth by APPA. However, the SDT does not believe that the criteria as written present a catch-22 scenario. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." The APPA comments indicate that the assets of concern to them

are being utilized "once voltage and frequency are stabilized." As such, these assets are not required to be included in the TOP's restoration plan as Blackstart Resources. Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.

One commenter expressed concern that the Blackstart Resources term used in Criteria 1.4 and 1.5 is in the NERC Glossary and is used in EOP-005-2. However this standard and the related definition are not approved by FERC yet. So what happens if the definition of Blackstart Resource is significantly changed after approval of this standard? The SDT responded that this concern was noted prior to the second posting and the implementation plan was revised to clarify the issue.

Another commenter suggested that NERC consider a "Black Start Tier Methodology" in which only "Primary Black Start Units" would fall under stringent compliance scrutiny and obligations, while other "Secondary Tier Units" would still be made available with required annual testing and operating specifications but be taken off the scope of NERC compliance. The SDT responded that a tiered approach to Blackstart Resources is a good idea, and the SDT suggested that a SAR be submitted by the entity outlining this approach to EOP-005-2. Other commenters suggested that a 1500MW limit be included in this criterion. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as a Critical Asset

Criterion 1.5

A few commenters suggested alternate wording for this criterion. The SDT discussed the merits of each, but ultimately decided to keep the posted wording unchanged.

Criteria 1.6 and 1.7

One commenter stated that this criterion should have another factor based on the size of the facility such that loss of the Facility would have an adverse impact on the BES. The SDT will take this suggestion under consideration for future revisions. Another commenter stated that the Generator Interconnection Facilities as defined in the NERC project http://www.nerc.com/filez/standards/Project2010-07_GOTO_Project.html, should be excluded from the Transmission Facilities. The SDT believes that the Guidance document is the appropriate place for this discussion until the Generation Interconnection Facilities are incorporated into the standards.

Another commenter believed the list of relevant transmission facilities developed by the Responsible Entity should be subject to an impact-based assessment by the Reliability Coordinator who has the wide-area view of the system. If necessary, an additional requirement that requires the RC to have a risk-based assessment methodology and to conduct the assessment should be included. Such an arrangement would be akin to the exemption provisions advocated by FERC in its Final Rule on Revisions to the ERO definition of Bulk Electric System. The SDT considered placing various analysis requirements on the Reliability Coordinator. The Functional Model describes the Reliability Coordinator as "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." However, the nature of the Critical Asset list is long-term, since implementation of CIP-003 to CIP-009 is up to two years. Based on this, it was determined that the Reliability Coordinator was not an appropriate entity for this analysis.

Criterion 1.8 and 1.9

One commenter stated that there should be some obligation that the parties that identify the Transmission Facility as critical also notify the Transmission Owner and Operator of that identification so the Transmission Owner and Operator are aware and can protect. The SDT responded that FAC-014-2 R5 contains information concerning communication of Facilities that are critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

Another commenter expressed that the Reliability Coordinator be removed from the criterion that identifies Critical Asset facilities based on Interconnection Reliability Operating Limits (IROLs). The SDT responded that according to FAC-014-2 Requirement R1 "The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology." Since they have a

responsibility to ensure that the IROLs are established and consistent with their SOL methodology, it is valid to list them in this Criterion.

Criterion 1.10

Several commenters stated that the phrase “directly” should be included in Criterion 1.10 which existed in the previous draft. The SDT responded that several commenters in the first posting were concerned about the use of the term “directly.” After consideration by the SDT, it was determined that the term could be removed without affecting the intent of the criterion. One commenter expressed concern that, in so much as Criterion 1.1 could result in the identification of generation plant locations with no Critical Cyber Assets, the resulting requirements in Criterion 1.10 could result in expending efforts protecting transmission assets that might not otherwise need to be protected, diverting resources that might be more effectively expended elsewhere. The SDT responded that the intent of Criterion 1.10 is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any Transmission Facility that the loss of which would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset.

Criterion 1.11

Several commenters stated that this criterion should either be removed or revised to “Transmission Facilities providing offsite power requirements as identified in the Nuclear Plant Interface Requirements.” The SDT responded that Criterion 1.11 is based on NUC-001-2 R9.2.2 “Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.” While the purpose of NUC-001-2 states “This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown,” it is a NERC reliability standard and as such helps to ensure the reliability of the Bulk Electric System.

Criterion 1.12

One commenter stated that the phrase "for failure to operate as designed" is inappropriate. Most SPS's are installed for automatic response to multi-contingency events. For an IROL to be exceeded, the multi-contingency event would need to occur at system conditions that would cause an IROL to be exceeded at the same time that the SPS failed to operate. The probability of the multi-contingency event occurring at such system conditions is very small (e.g., 1 in

50 year order of magnitude frequency), and the SPS would need to fail at that same time. The SDT responded that "Failure to operate as designed" was added to this criterion to account for human error, misconfigurations, improper change management (whether unintentional or malicious)

Criterion 1.13

Several commenters asked that the Guidance Document be modified to provide the reasoning behind the 300 MW criteria listed in criterion 1.13. The SDT responded that the posted Guidance document has been modified to add reasoning for the threshold level. Other commenters suggested alternate wording for the criterion. The SDT discussed the merits of each, but ultimately decided to keep the posted wording unchanged.

Some commenters stated that criterion 1.13 should be reworded to indicate that distributed UFLS or UVLS schemes (i.e., individual UF or UV relays operating independently in multiple substations) are not considered to be a critical asset. Collectively the UFLS or UVLS scheme may shed more than 300MW; however, due to the distributed nature of the scheme, the UFLS or UVLS schemes are not considered to be a critical asset. The SDT spent considerable time discussing the wording of criterion 1.13, and chose the term "Each" to represent that the criterion applied to a discrete system or Facility. The SDT responded that a discrete component that sheds more than 300MW of load due to the implementation of Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program is a Critical Asset. This criterion is intended to include as Critical Assets regional Under Frequency Load Shedding and Under Voltage Load Shedding schemes.

One commenter expressed concern that the owner of a UFLS system, Distribution Provider, is not listed in the applicability section of this Standard. The SDT does not feel it necessary at this time to include Distribution Providers in the Applicability section but may consider this in future revisions of the Standards. Distribution Providers may own certain very limited BES Cyber Assets, generally limited to UFLS and UVLS relays. However, additional functional entities (i.e. Transmission Operators) generally provide aggregate control of these relays.

Criterion 1.15

One commenter asked for clarification on the term "control generation." The SDT responded that Attachment 1 criteria refer to control centers which control generation. The guidance document provides additional clarity that "control centers generally perform control center functions for multiple BES assets. These Facilities are evaluated as

a control center. Facilities that perform control center functions for only a single BES asset should be evaluated as part of the BES asset (e.g., control room for a single generation plant or transmission substation)." Another commenter was concerned about confusion in both applying and auditing what are apparently two independent criteria presented together as a single criterion, and recommended separation of this criterion into two criteria. The SDT decided to group the criteria for control centers based on functionality. Separating them does not appear to add any additional clarity to the criteria.

Another entity expressed concern that if a small utility, as a joint owner, has control over only a small portion of a large plant that falls under the brightline of criterion 1.1, they are concerned that as currently written, the first sentence of criterion 1.15 would designate this small utility's control center as critical. The SDT responded that the concern is that the joint owner's control center could provide a path to compromise the functionality of the generation designated a Critical Asset.

Criteria 1.16 and 1.17

One commenter stated that they believe that in Criterion 1.16 the functional obligation should be clearly defined to include those pertaining to the real-time operations and NOT all. The SDT responded that due to the direct impact on the operation of identified Critical Assets, these Transmission control centers must be designated as Critical Assets. Attachment 1 criteria are used to identify control centers as Critical Assets. The consideration of specific reliability functions would be a part of the entity identifying Critical Cyber Assets which support the control center.

Implementation Plan

One entity stated that the proposed implementation is too aggressive. Physical Security Perimeters are expensive and it may not be possible to fund these modifications in the short timeframe for compliance. A 3-year implementation period would be more appropriate. The SDT believes there is precedent showing this implementation period is reasonable. Upon FERC Approval, the Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.

Balloter	Company	Seg-ment	Vote	Comment
Kirit S. Shah	Ameren Services	1	Affirmative	1. We suggest Criteria 1.6, 1.7 and 1.10 should be changed to include substations and switchyard (station) only and not "Facilities". Based on the definition of "Facilities" and application of Criteria 1.6, 1.7 and 1.10, the Critical Asset list now would include transmission lines. Our concern is that there will be significant issue to comply with CIP-003 through CIP-009 (for example, physical security requirements) for the transmission line assets, if some components installed on the lines fall into cyber asset category, such as temperature or flow monitoring devices or fiber optics used for communication. 2. The Blackstart Resources term used in Criteria 1.4 and 1.5 is in the NERC Glossary and is used in EOP-005-2. However this standard and the related definition are not approved by FERC yet. So what happens if the definition of Blackstart Resource is significantly changed after approval of this standard? We suggest that the definition of Blackstart Resources should be included in this standard. 3. The phrase "directly" should be included in Criterion 1.10 which existed in the previous draft. We believe that after removing this term, the revised wordings now are more confusing. 4. We believe that in Criterion 1.16 the functional obligation should be clearly defined to include those pertaining to the real-time operations and NOT all. We suggest that Criterion 1.16 should be modified to read "Each control center or backup control center used to perform the functional obligations, pertaining to real time operation of the BES, of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12." 5. We believe that in Criterion 1.17 the functional obligation should be clearly defined to include those pertaining to the real-time operations and NOT all. Further this criterion should make clear that the 1500 MW is calculated on the same basis as defined in Critetion 1.1. We suggest that Criterion 1.17 should be modified to read, "Each control center or backup control center used to perform the functional obligations, pertaining to real time operation of
Jennifer Richardson	Ameren Energy Marketing Co.	6

				the BES, of a Balancing Authority if its Balancing Authority Area(s) includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations pertaining to real time operation of the BES, of a Balancing Authority if its Balancing Authority Area(s) includes an aggregate of 1500 MW in a single Interconnection, calculated using the highest rated net Real Power capability of each unit during the preceding 12 months. 6. During the Webinar, references were made to the Guidance Document. However, the Guidance Document is NOT the standard and can not be used in the compliance audit. So, any clarification included in the Guidance Document should be made part of the Standard.

Response: Thank you for your comments.

1. The SDT does not feel this change is necessary. Please refer to the first bullet in the Overall Application of Attachment 1 in the posted Guidance document for a discussion of the SDT's reason for the use of the term "Facility."
2. Your concern was noted prior to the second posting and the implementation plan was revised with the following: "The term Blackstart Resource, used in CIP-002-4 Attachment 1, was submitted for regulatory approval with Project 2006-03 – System Restoration and Blackstart. The definition must be approved before Criteria 1.4 and 1.5 are used to determine Critical Assets for Responsible Entities." The language has been revised in this posting to "The term Blackstart Resource, used in CIP-002-4 Attachment 1, was submitted to FERC for regulatory approval in the US with Project 2006-03 – System Restoration and Blackstart. The Effective Date of EOP-005-2 is the date that Criteria 1.4 and 1.5 will be used to determine Critical Assets for any Responsible Entity."
3. Several commenters in the first posting were concerned about the use of the term "directly." After consideration by the Standard Drafting Team, it was determined that the term could be removed without affecting the intent of the criterion.
4. Due to the direct impact on the operation of identified Critical Assets, these Transmission control centers must be designated as Critical Assets. Attachment 1 criteria are used to identify control centers as Critical Assets. The consideration of specific reliability functions would be a part of the entity identifying Critical Cyber Assets which support the control center.
5. Due to the direct impact on the operation of identified Critical Assets, these Balancing Authority control centers must be designated as Critical Assets. The impact to the identified Critical Assets would be in real time, as the Balancing Authority functions in the Functional Model involve real time operations. If a Balancing Authority can control 1500MW or more of generation, it is considered a Critical Asset. The language in criterion 1.1 was taken from MOD-024, which is only applicable to Generation Owners.
6. While the Guidance Documents are not the standard, they do provide additional context. The SDT believes the wording in the posted standard provide sufficient clarity.

Balloter	Company	Seg-ment	Vote	Comment
Paul B. Johnson	American Electric Power	1	Affirmative	While not all of the concerns AEP raised in the last comment period were addressed, AEP can support this draft moving forward.
Edward P. Cox	AEP Marketing	6		
Brock Ondayko	AEP Service Corp.	5		
Response: Thank you for your comments.				
Jason Shaver	American Transmission Company, LLC	1	Affirmative	ATC supports Version 4 of the CIP Standard,however, believes that Attachment 1, the so-called bright line criteria, language needs to be clarified. There needs to be a clear and consistent method for Planning to identify IROLs, or it becomes subjective and open to interpretation. Please refer to ATC's recommended changes to the Criteria in their submitted comments for the NERC project.
Response: Thank you for your comments. The purpose of FAC-014-2 Requirements R3 and R4 is to establish a clear and consistent method for identifying IROLs. The method for Planning to identify IROLs is beyond the scope of the CIP standards.				
Gregory S Miller	Baltimore Gas & Electric Company	1	Affirmative	BGE thanks the SDT for their positive response to the previously submitted comments. BGE asks that the SDT consider adding to the Guidance Document the reasoning behind the 300 MW criteria listed in the automatic load shedding criteria 1.13 in Appendix 1.
Response: Thank you for your comments. The posted Guidance document has been modified to add reasoning for the threshold level.				
Gordon Rawlings	BC Transmission Corporation	1	Negative	BC Hydro agrees with the controls suggested around remote access but some clarification is required R6 - This is pretty wide open. Suggest that specific requirements be put forth so entities know exactly what they need to comply with. Instead of providing “examples” or “includes”, explicitly define those items that constitute support and maintenance. R6.4.2 – Recommends the use of SIEM technology to “alert” on access attempts by unauthorized parties. This automates the monitoring but would need clarification that this satisfies this requirement. R6.5 - Such a user agreement does make these users aware of their respective responsibilities in

Balloter	Company	Seg-ment	Vote	Comment
				ensuring the security of the CCA in question. However, this is a weak control as an entity cannot influence direct control over how these entities implement security (i.e. Areva desktops) on their computer devices used to support entities CCAs. Does having such a signed agreement in place satisfy compliance? Can these agreements be entered into with organizations (i.e. Areva) as security policies are typically enforced uniformly throughout organizations?
Response: Thank you for your comments. Your comments will be passed on to the Project 2010-15 drafting team.				
Donald S. Watkins	Bonneville Power Administration	1	Negative	BPA believes that the bright line criteria approach in CIP-002-4 is an improvement over prior versions. However, it still does not address the concern by the industry in regards to providing sufficient clarity to many portions of CIP-002-4 to make it acceptable to the majority of utilities that must understand and develop strategies to meet the standards and requirements and implement them in a reasonably timely fashion. BPA still supports the formal comments that we submitted in October 2010. Additional comments: CIP-002-4 R2.1. “The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter” does not go far enough in its definition of what qualifies as a critical cyber asset and needs further clarification, particularly concerning serial devices. For example: What exactly is meant by "uses a routable protocol to communicate outside the Electronic Security Perimeter"? 1. Can a device that is not capable of native routable protocol (does not have, or use an ethernet card) qualify as using routable protocol? 2. Does a device that is not capable of native routable protocol, that is connected to a device which is ethernet connection outside the ESP (Serial to Ethernet Converter) qualify? 3. Does a device that is not capable of native routable protocol, but is connected to a Terminal Server, which is ethernet connected outside the ESP qualify? 4. Does it make a difference if there is only view access to the internal ESP device with no

Tony Kroskey	Brazos Electric Power Cooperative, Inc.	1	Negative	Brazos Electric appreciates the work of the SDT and is supportive of the efforts and the general concepts of this draft. This is a negative vote due to disagreement over some elements in Attachment 1 criterion. See comments separately submitted.
Response: Thank you for your comments. Please refer to the response to comment document.				
Paul Rocha	CenterPoint Energy	1	Negative	CenterPoint Energy was extremely disappointed in this latest effort from the SDT and cannot support the proposed Standard in its current form. While the SDT did revise some criteria in Attachment 1 in response to industry comments, CenterPoint Energy believes the latest proposed Standard is less palatable than the previous version. Specific CenterPoint Energy concerns are as follows. The SDT's response to comments on Criterion 1.4 would seem to indicate a belief that the industry does not understand the term "Blackstart Resource". To the contrary, CenterPoint Energy believes the SDT fails to understand the contents of restoration plans and the far reaching implications of this criterion as pointed out by multiple comments.

Balloter	Company	Seg-ment	Vote	Comment
				CenterPoint Energy believes the revisions made to Criterion 1.5 do not adequately address commenter's concerns and, in fact, adds ambiguity to the Standard. The SDT did not address concerns regarding the phrase "initial switching requirements". In addition, the moving of the phrase, "…as identified in the Transmission Operator's restoration plan" to the end of the criterion potentially adds a requirement to the restoration plan where none currently exists. In Criterion 1.10, comments were made asking for clarity for the term "directly connected". Instead of providing the requested clarity the SDT chose to delete the word "directly" resulting in an even more ambiguous criterion. CenterPoint Energy is particularly concerned that the SDT chose to dismiss comments regarding Criterion 1.11. The SDT appears to have based its decision on a false understanding of the purpose of NUC-001-2. In its response, the SDT stated; "Since these facilities were deemed so important that a NERC reliability standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets." Using the SDT's logic, any BES facility or practice addressed by a NERC Standard would be deemed "critical" to BES reliability. Moreover, the Purpose section of NUC-001-2 clearly states that the Standard was developed to require "…coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown." In addition, as previously pointed out by CenterPoint Energy, as per NUC-001-2 R2, NPIR's are developed by a negotiated methodology between the NPGO and the Transmission Entity. As a result the facilities essential to meeting the NPIR's are also a result of a negotiated methodology, therefore each situation could have an entirely different set of NPIR's and associated facilities. CenterPoint Energy fails to see this as a "bright line" criterion. CenterPoint Energy strongly disagrees with the SDT's revisions to Criterion 1.13. In its response to comments, the SDT gives no indication any comments indicated a need to include UFLS and UVLS in this criterion. In fact, the SDT stated that several commenters indicated a need to clarify that this criterion applied to a single common control system only. Instead of addressing this concern, the SDT chose to go in a different direction as it completely changed the criterion from pertaining to a common control system to one that could possibly be applicable to distributed

Balloter	Company	Seg-ment	Vote	Comment
				load shedding devices on an entity's distribution system. The SDT's statement "This criterion was intended to include as Critical Assets regional Under Frequency Load Shedding and Under Voltage Load Shedding schemes" demonstrates a clear lack of understanding of UFLS and UVLS load shedding schemes as they are applied throughout the industry. In summary, CenterPoint Energy believes that the SDT has demonstrated a lack of understanding of industry practices and is unwilling or unable to adequately address industry concerns. Members of the SDT should represent industry stakeholders and produce Standards the industry can support. However, SDT's are not voted into position by industry stakeholders and therefore are not accountable to the industry, as evidenced by the unresponsive nature of this SDT. If the revised Standard is again rejected by the industry, CenterPoint Energy recommends the current SDT be disbanded and a new SDT be seated in order to complete this project in a reasonable fashion that addresses industry concerns and meets Commission directives. CenterPoint Energy believes there is value to retaining SDT members who dissented from the majority opinion of the SDT, and supports a process to allow such existing SDT members who dissented from the majority opinion to apply for the new SDT if CenterPoint Energy's proposal is accepted.

Response: Thank you for your comments.

Criterion 1.4 - The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets.

Criterion 1.5 – EOP-005-2 Requirement R1.5 states "Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started." This is already an element of the Transmission Operator's restoration plan.

Criterion 1.10 - Several commenters in the first posting were concerned about the use of the term "directly." After consideration by the Standard Drafting Team, it was determined that the term could be removed without affecting the intent of the criterion.

Criterion 1.11 - Criterion 1.11 is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." While the purpose of NUC-001-2 states "This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown," it is a NERC reliability standard and as such helps to ensure

Balloter	Company	Seg-ment	Vote	Comment
the reliability of the Bulk Electric System. Criterion 1.13 - During the previous ballot and comment period, the SDT received many comments on this criterion. Some commenters stated that the previous wording of this criterion would inadvertently bring in all SCADA systems with the capability of shedding load even if such SCADA systems are in fact not planned or operated to perform load shedding. This was not the intent of the SDT. Other commenters stated that this item needs to be clarified to confirm that it applies to a single common control system only, and not multiple but separate "like" systems that in aggregate are capable of load shedding up to 300 MW. Also, the criterion needs to be clarified to confirm that it applies to systems "configured" for automatic load shedding, not simply just "capable" of load shedding. This criterion was intended by the SDT to include as Critical Assets regional Under Frequency Load Shedding and Under Voltage Load Shedding schemes. The SDT is appointed by the Standards Committee, the process of which is outside the scope of Project 2008-06.				
David Batz	Edison Electric Institute	1	Abstain	EEI supports approval of this draft of CIP-002-4. We are concerned about ambiguous language that could lead to confusion or be open to interpretation. We recommend that the Standards drafting team consider suggestions to add clarity, particularly regarding the scope of black start facilities that will be subject to designation as Critical Assets.
Response: Thank you for your comment. The SDT has made every effort to reduce any ambiguous language. In your example the SDT chose the NERC glossary term "Blackstart Resources" in order to eliminate any confusion over the term.				
Ajay Garg	Hydro One Networks, Inc.	1	Negative	Hydro One restates its position and maintains its negative vote for the following reasons: 1. We do not believe the standard will result in an improvement in reliability since the revisions merely replace the risk-based assessment methodology in the current version with a list of criteria that will ultimately result in inclusion of facilities on the Critical Assets list that are non-impactive on the reliability of the BES. 2. We do not agree with criteria 1.6 and 1.7 in Attachment 1 as written. Application of these criteria would result in the inclusion of facilities that will have no impact on the BES reliability. We believe that the list of applicable facilities should be determined following an impact-based assessment to be performed by the Reliability Coordinator or the Planning Coordinator. If necessary, an additional requirement that requires the RC or PC to have a risk-based assessment

Balloter	Company	Seg-ment	Vote	Comment
David L Kiguel	Hydro One Networks, Inc.	3		methodology and to conduct/review the assessment should be included. We therefore propose the following wording to replace 1.6 and 1.7 in Attachment 1: 1.6 Transmission facilities operated at 500 kV or higher, unless the annual review performed by the RC (or the PC) determines that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. 1.7 Transmission Facilities operated at 300 kV, at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations, unless the annual review performed by the RC (or the PC) determines that destruction, degradation or unavailability of those assets will not have impact outside the local area and will not cause BES instability, separation, or cascading outages. 3. We do not believe the SDT addressed our comments submitted with the previous ballot.
Response: Thank you for your comments. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The SDT considered placing various analysis requirements on the Reliability Coordinator. The Functional Model describes the Reliability Coordinator as "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." However, the nature of the Critical Asset list is long-term, since implementation of CIP-003 to CIP-009 is up to two years. Based on this, it was determined that the Reliability Coordinator was not an appropriate entity for this analysis. In addition, the SDT believes that having an exception process to the criteria presents the same challenges associated with a risk-based assessment in external review and oversight.				
Bernard Pelletier	Hydro-Quebec TransEnergie	1	Negative	1.3 Each generation Facility that the Planning Coordinator or Transmission Planner or the RC designates and informs the Generator Owner as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon. 1.6 Transmission facilities operated at 500 kV or higher, unless the annual review performed by the RC determines that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages. 1.7 Transmission Facilities operated at 300 kV or higher interconnected at 300 kV or higher with three or more other transmission stations, unless the annual review performed by the RC determines that destruction, degradation or unavailability of those assets will not have impact outside the local area and will not cause BES instability, separation, or cascading outages. Also, we believe that to be an effort to "cast a wider net" and capture more assets without qualifying their actual criticality.

Balloter	Company	Seg-ment	Vote	Comment
				Attachment 1 inclusion criteria for critical assets should be based on critical functions of assets like: system restoration, voltage control, maintaining load/generation balance, maintaining flows within IROL/SOL, critical SPS. This list should not rely on substation voltages or amount of MW.
Response: Thank you for your comments. The SDT considered placing various analysis requirements on the Reliability Coordinator. The Functional Model describes the Reliability Coordinator as "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." However, the nature of the Critical Asset list is long-term, since implementation of CIP-003 to CIP-009 is up to two years. Based on this, it was determined that the Reliability Coordinator was not an appropriate entity for this analysis. In addition, the SDT believes that having an exception process to the criteria presents the same challenges associated with a risk-based assessment in external review and oversight. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. Voltage levels and MW thresholds were used in criteria that had no corresponding bright lines in existing standards.				
Michael Gammon	Kansas City Power & Light Co.	1	Affirmative	The proposed bright line is not clear for some of the bright line items. Items that are not clear introduces uncertainty and promotes interpretation issues and debates. The current proposal does not go far enough to exclude the facilities of smaller entities that do not have a significant impact on the reliability of the bulk electric system.
Charles Locke	Kansas City Power & Light Co.	3		
Jessica L Klinghoffer	Kansas City Power & Light Co.	6		

Balloter	Company	Seg-ment	Vote	Comment
Response: Thank you for your comment. The SDT has made effort to reduce any ambiguous language. Bright line criteria by its very nature may overreach in some areas and under-reach in others, with the end result being a more protected system on average.				
John W Delucca	Lee County Electric Cooperative	1	Negative	Compliance Monitoring Process Section D paragraph 1.1.2 of the CIP2v4 standard seeks to identify exceptions to the RE acting as the CEA but then lists as an exception an example where the RE DOES serve as the CEA. The intent of 1.1.2.1 is unclear. 1.1.2 The RE Shall serve as the CEA with the following exceptions: 1.1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority. Attachment 1 & Criteria Suggestions Attachment 1: • Paragraph 1.13 was modified from the previous CIP2v4 draft with the objective of clarifying the intent of the SDT to address Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program. This modification in addition to the deletion of the "common control system" terminology resulted in confusion surrounding the applicability of the 1.13 criteria to discrete relays whose sum may exceed 300MW. During the NERC Webinar on December 6, 2010, Howard Gugel clarified that the intent of the 1.13 criteria was NOT to include these discrete relays. To prevent any confusion when auditing to this standard, the intent should be clear within the standard itself and reinforced by supporting guideline documents. Suggested change to Attachment 1 paragraph 1.13: Each common control system or Facility that performs automatic load shedding, without human operator initiation, of 300MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program. Alternate Suggested change to Attachment 1 paragraph 1.13: Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program. This criterion is not intended to include systems where the 300 MW

Balloter	Company	Seg-ment	Vote	Comment
				or more threshold is met by an aggregate of discrete UF relayed distribution circuits.
Response: Thank you for your comments. The Compliance Monitoring Process language has been developed by NERC legal staff for use in all standards being developed. Criterion 1.13 - A discrete component that sheds more than 300MW of load due to the implementation of Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program is a Critical Asset. During the previous ballot and comment period, the SDT received many comments on this criterion. Some commenters stated that the previous wording of this criterion would inadvertently bring in all SCADA systems with the capability of shedding load even if such SCADA systems are in fact not planned or operated to perform load shedding. This was not the intent of the SDT. Other commenters stated that this item needs to be clarified to confirm that it applies to a single common control system only, and not multiple but separate "like" systems that in aggregate are capable of load shedding up to 300 MW. Also, the criterion needs to be clarified to confirm that it applies to systems "configured" for automatic load shedding, not simply just "capable" of load shedding. This criterion was intended by the SDT to include as Critical Assets regional Under Frequency Load Shedding and Under Voltage Load Shedding schemes. The SDT appreciates the suggested wording, but believes the posted wording is adequate.				
Martyn Turner	Lower Colorado River Authority	1	Affirmative	For CIP-002-4 Attachment 1, item 1.13 it should modified to read as follows to better clarify the system referred to in the item: 1.13. Each Protection System or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.
Response: Thank you for your comments. The SDT appreciates the suggested wording, but believes the posted wording is adequate.				

Balloter	Company	Seg-ment	Vote	Comment
Joe D Petaski	Manitoba Hydro	1	Negative	-We disagree with the removal of R1.2.7 from CIP-002-3. The entities should continue to have the option to add assets which they feel are appropriate. There is no obligation within the language of the standard which requires an entity to identify additional assets. An entity should not be found non-compliant for identifying Critical Assets outside of the Attachment 1 criteria, and should not be found non-compliant for not identifying any additional assets. -It is unclear if the 300MW is shed simultaneously or in blocks over time. The loss of generation or the loss of load are analogous in their reliability impact on the BES, thus criterion 1.13 using a 300 MW threshold seems inconsistent with criterion 1.1 using a 1500 MW threshold. -The thresholds appear arbitrary. No rationale has been provided for their selection. -The 15-minute “real-time” criterion should be applied to all Critical Cyber Assets, not just generation cyber assets. Implementation Plan Comments: Implementation Plan for Version 4 of Cyber Security Standards -Under the Prerequisite Approval section, the statement “The term Blackstart Resource, used in CIP-002-4 Attachment 1, was submitted for regulatory approval with Project 2006-03 – System Restoration and Blackstart. The definition must be approved before Criteria 1.4 and 1.5 are used to determine Critical Assets for Responsible Entities” only applies to entities under FERC jurisdiction. The terms are approved by the NERC BOT, and are therefore in effect for entities not under FERC jurisdiction, such as Canadian entities. Implementation Plan for Newly identified Critical Cyber Assets and Newly Registered Entities – The proposed 18 month timeframe is too short for the industry to meet compliance for a group of new CCAs. Although the existing approved Implementation Plan for Newly
Greg C. Parent	Manitoba Hydro	3		
S N Fernando	Manitoba Hydro	5		

Balloter	Company	Seg-ment	Vote	Comment
Daniel Prowse	Manitoba Hydro	6		Identified Critical Cyber Assets and Newly Registered Entities provides up to 18 months to reach compliance for some requirements under an existing program, the identification of new CCAs would distributed over time, both throughout the entity and throughout the industry. This new CIP-002-4 compliance date could cause a sudden increase in the number of new CCAs throughout the industry, which may not have the resources to meet this sudden compliance burden. Some consideration should be given to the types of environments and their unique challenges when establishing compliance dates.

Response: Thank you for your comments

Originally criterion 1.16 was placed in Attachment 1 to provide Responsible Entities the flexibility to include addition items on their existing Critical Asset list that did not meet any other criterion in Attachment 1. Many commenters stated that this was contrary to providing a bright line for Critical Asset identification, with which the SDT agrees. In addition, it has the potential of causing issues in compliance audits. The SDT was concerned that having additional Critical Assets without criteria opens the possibility of having the burden of proof on the Registered Entity that they have no additional Critical Assets. The NERC compliance and auditing process does not prohibit an entity from applying the requirements of CIP-003 to CIP-009 to any Cyber Assets.

A single discrete component that sheds more than 300MW of load due to the implementation of Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program is a Critical Asset. It is a sum of all of the blocks of load that can be shed by a single discrete component.

The posted Guidance document has been modified to add reasoning for the threshold level. The SDT and volunteer industry participants have expended considerable effort to develop consistent Critical Asset Identification approaches. The team endeavored to include work already required by other standards, and provide some constraints for an entity's assessment. These approaches, in their various iterations, have been presented to industry for review and comment. The industry provided significant feedback for the need to simplify the Critical Asset identification approach. The Attachment 1 criteria were under development for CIP-010 when the team was asked to use the criteria for the basis of a new CIP Version 4 set of standards. The results of the recent NERC data request were used to assist the team in developing the criteria in Attachment 1.

The 15-minute threshold is intended to include only those assets at generating units affecting real-time operations. This qualifier is particularly important to a generating plant because several systems (i.e. a fuel-handling system) may be essential after a longer period of time but do not necessarily involve real-time reliability impact.

The Implementation Plan for Version 4 has been modified to clarify that the Effective Date of EOP-005-2 is the date that criteria 1.4 and 1.5 will be used to determine Critical Assets for any Responsible Entity.

The Effective Date was updated prior to the ballot posting for CIP-002-4 through CIP-009-4 to "The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)." The SDT believes there is precedent showing this implementation period is reasonable. The Responsible Entity has a minimum of 2 years to become compliant with new Critical Cyber Assets. This period is consistent with

Balloter	Company	Seg-ment	Vote	Comment
the implementation plan for version 1 of the CIP Cyber Security Standards and the implementation plan for Registered Entities identifying their first Critical Cyber Asset.				
Randi Woodward	Minnesota Power, Inc.	1	Negative	Minnesota Power believes that CIP-002-4 R1 needs to clearly state "The RE should identify a list of Critical Asset that it owns…" While the Standard Drafting Team did speak to this in its response to the California ISO's comments, the SDT did not go far enough to eliminate potential interpretation issues in the future. Specifically, there is ambiguity as to what this would mean from a Balancing Authority perspective. The "its assets" language as written could be interpreted to mean the assets it controls, rather than those assets it owns. As such, we would urge the Standard Drafting Team to reconsider, and include a stronger ownership statement in the proposed Standard language.
Response: Thank you for your comment. The drafting team believes the phrase "a list of its identified Critical Assets" in R1 specifies ownership of the Critical Asset by the Responsible Entity.				
Richard Burt	Minnkota Power Coop. Inc.	1	Negative	See comments submitted by NSRS
Response: Thank you for your comments.				
James McMorran	Nevada Power Co.	1	Negative	This draft requires more work before it is affirmed. Specifically it does not define the term, "Control Generation". The standard needs to be clear whether this means the control rooms that house the distributed control systems, turbine controls, boiler controls, etc., or the facilities that provide loading instructions (which in some cases could be a Merchant function), or the traditional grid control center that may have AGC functions and issue reactive power instructions to the generating plant. Editing is required to exclude black start units in systems that are inconsequential to the Interconnection. We assume entities should not be required to declare that generator, cranking path AND its control center all to be Critical Assets if they are inconsequential to the Interconnection. We disagree with the idea that all black start units are Critical Infrastructure no matter what the impact on the Interconnection is. Some are not Critical Infrastructure.
Response: Thank you for your comments. Attachment 1 criteria refer to control centers which control generation. The guidance document provides additional clarity that "control centers generally perform control center functions for multiple BES assets. These Facilities are evaluated as a control center. Facilities that perform control center functions for only a single BES asset should be evaluated as part of the BES asset (e.g., control room for a single generation plant or transmission substation)."				

Balloter	Company	Seg-ment	Vote	Comment
The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets.				
Rich Salgo	Sierra Pacific Power Co.	1	Negative	While the drafting team has done a commendable job on the latest draft, there remain several provisions that cause this "negative" vote: The language in the Attachment 1 concerning control centers now links the inclusion of a control center if it in any way controls a black start generator. We believe that this over-reaches and may include control centers or control rooms that would otherwise have no consequence to the reliability of the BES. There is lack of specificity about what it means to "control generation". It is still unclear whether this means the control rooms that house the distributed control sytems, turbine controls, boiler controls, etc., or the facilities that provide loading instructions (which in some cases could be a Merchant function), or the traditional grid control center that has AGC functions and issues reactive power instructions to the generating plant. We still maintain that not all black start units that are mentioned in a TOP's restoration plan rise to the level of "Critical". Perhaps only the primary black start resource should be included. This is a disincentive for entities to establish multiple (and hence, more reliable) means to black start their systems.
Response: Thank you for your comments. Attachment 1 criteria refer to control centers which control generation. The guidance document provides additional clarity that "control centers generally perform control center functions for multiple BES assets. These Facilities are evaluated as a control center. Facilities that perform control center functions for only a single BES asset should be evaluated as part of the BES asset (e.g., control room for a single generation plant or transmission substation)." The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets. The SDT considered using the word “primary”, but ultimately rejected it as it is not a defined NERC Glossary term in this instance, nor is it used in EOP-005-2.

Response: Thank you for your comment.				
Pawel Krupa	Seattle City Light	1	Affirmative	Seattle City Light supports the Standard Drafting Team's proposed changes for the successive ballot of CIP-002-4 because it provides greater precision to the identification of those Critical Assets essential to the reliability to the bulk power system. Seattle City Light commends the changes made in the successive ballot text of Appendix A to address City Light's previous comments about Critical Asset Criteria 1.13 and 1.15. Nevertheless, the revised proposed Standard continues to contain imperfections with the language that may frustrate its promise of bringing greater certainty and consistency. Imprecise language has been a recurring problem all throughout the short life of the NERC Mandatory Reliability Standards. Unnecessary compliance difficulties, tortured interpretations, and wasteful efforts have resulted. Lack of care with language threatens the existing regulatory regime by fostering distrust among industry, regulators, government, and the public at large. As such, Seattle City Light provides the following comments in the hope that the language yet will be clarified: 1. Requirement 2 of proposed CIP-002-4 states, "For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1." As previously commented, Seattle City Light finds the term 'shared Cyber Assets' unclear and suggests clarification as follows:
Dana Wheelock	Seattle City Light	3		

Balloter	Company	Seg-ment	Vote	Comment
Hao Li	Seattle City Light	4		"For each group of generating units (including Nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets networked to a system that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate exceed Attachment 1, criterion 1.1." 2. Section D, Item 1, is numbered "1.1 Compliance Enforcement Authority, 1.2 The RE shall…, 1.3 Compliance Monitoring and Enforcement Process, 1.4 Data Retention, and 1.5 Additional Compliance Information." Seattle City Light believes existing point 1.2 is intended to be subordinate to point 1.1, and thus should be renumbered 1.1.1, and the remainder of points renumbered as appropriate. This change will result in further renumbering to the subpoints now listed under 1.2 as 1.2.1, 1.2.2, etc, but Seattle City Light is not certain if these subpoints should be subordinate to new 1.1.1 or if they should be equal to new 1.1.1. 3. Critical Asset criterion 1.7 of CIP-002-4, Appendix A, identifies as Critical Assets "Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations." As previously commented, Seattle City Light believes additional detail is needed about the nature of the specified interconnections. In particular, questions exist as to type (what about a radial line connected to a generator—does it count?) and distance (does a high-voltage bus count if connected to another substation a dozen feet away?). 4. Critical Asset criterion 1.13, as revised for the successive ballot, now identities as Critical Assets "Each system or Facility that performs automatic load shedding, without human operator intervention, of 300 MW or more implementing Under Voltage Load Shedding ((UVLS) or Under Frequency Load Shedding (UFLS)) as required by the regional load shedding program." Seattle City Light appreciates the clarification to exclude non-material SCADA systems from this criterion but it is not certain what precisely the Standard Drafting Team means by the revised text beginning with "…implementing Under Voltage…" and recommends clarification.
Michael J. Haynes	Seattle City Light	5		

Balloter	Company	Seg-ment	Vote	Comment
				5. Critical Asset criterion 1.15 states "Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each Control Center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection." Seattle City Light is concerned about confusion in both applying and auditing what properly are two independent criteria presented together as a single criterion. Seattle City Light recommends separation of this criterion into two criteria, as follows: "1.15. Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4." and "1.18. Each Control Center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection." 6. Critical Asset criterion 1.1.7 states "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than the aggregate of 1500 MW in a single Interconnection." Seattle City Light is concerned about confusion in both applying and auditing what properly are two independent criteria presented together as a single criterion. Seattle City Light recommends separation of this criterion into two criteria, as follows: "1.17. "Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13." and "1.19. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than the aggregate of 1500 MW in a single Interconnection."
Response: Thank you for your comments. 1. The SDT appreciates the suggestion, but believes the posted wording is sufficient. 2. The SDT agrees and has incorporated the change. 3. The SDT believes there is sufficient detail about this in the posted Guidance document. 4. In the drafting of this criterion, the drafting team sought to include only those systems that did not require human operator initiation, and				

Balloter	Company	Seg-ment	Vote	Comment
targeted in particular those Under Frequency Load Shedding (UFLS) facilities and systems and Under Voltage Load Shedding (UVLS) facilities and systems that would be implemented as part of a regional load shedding requirement to prevent Adverse Reliability Impact. 5. The SDT decided to group the criteria for control centers based on functionality. Separating them does not appear to add any additional clarity to the criteria. 6. The SDT decided to group the criteria for control centers based on functionality. Separating them does not appear to add any additional clarity to the criteria.				
Horace Stephen Williamson	Southern Company Services, Inc.	1	Affirmative	Southern believes that the SDT's changes to the proposed standard were responsive to some of the feedback received; however, certain key industry comments still have not been adequately addressed. For example, in Attachment 1, Section 1.11 should be deleted. Section 1.11 relates to Transmission Facilities necessary to secure offsite power to permit safe reactor shutdown. Although such Transmission Facilities are within the scope of Nuclear Plant Interface Coordination standards (NUC reliability standards), they are not within the intended scope of the Cyber Security standards (CIP reliability standards). The Purpose section of the NUC reliability standards states "This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown." The Purpose section of the CIP reliability standards states "NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System." Therefore, Section 1.11 should be deleted because it is clearly out of scope. Moreover, the criticality of facilities for BES reliability purposes should not be based on fuel type alone. In addition, Southern believes the following proposed changes made by the SDT should be reconsidered: In Attachment 1, Section 1.10, the SDT deleted the word "directly" by changing "generation interconnection required to directly connect generator output" to "generation interconnection required to connect generator output." The word "directly" should not be deleted from Section 1.10 because it is necessary to appropriately define the scope of the requirement. Removing the word "directly"
Richard J. Mandes	Alabama Power Company	3		
Anthony L Wilson	Georgia Power Company	3		
Don Horsley	Mississippi Power	3		

Balloter	Company	Seg-ment	Vote	Comment
				removes the bright line criteria, which is the goal of the new standard. As proposed by the SDT, the standard would require various risk-based analyses i.e. load flow and transient stability studies to determine the assets in scope. Therefore, the SDT should reconsider this proposed change. The proposed Section 1.13 would be clearer if it were changed to the following: "1.13. Each system or facility that implements Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) of 300 MW or more without human operator initiation as required by the regional load shedding program."
Response: Thank you for your comments. Criterion 1.11 – This criterion is based on NUC-001-2 R9.2.2 "Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs." Since these facilities were deemed so important that a NERC reliability standard was written and adopted to clarify the issue, the SDT determined that this was adequate justification to include them as Critical Assets. While the purpose of NUC-001-2 states "This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown," it is a NERC reliability standard and as such helps to ensure the reliability of the Bulk Electric System. Criterion 1.10 - Several commenters in the first posting were concerned about the use of the term "directly." After consideration by the Standard Drafting Team, it was determined that the term could be removed without affecting the intent of the criterion. Criterion 1.13 - The SDT appreciates the suggestion, but believes the posted wording is adequate.				
James L. Jones	Southwest Transmission Cooperative, Inc.	1	Affirmative	The current draft of CIP 2-4 as a definite improvement over the existing CIP 2-3. It comes down to whether the failure to approve CIP-004-2 will ultimately result in more onerous CIP requirements in the future.
Response: Thank you for your comment.				
John Tolo	Tucson Electric Power Co.	1	Negative	We feel that the CIP-002-4 is overly prescriptive and does not provide a technical justification for moving away from the Reliability Based Risk Assessment Methodology(RBAM). Our opinion is the the current RBAM is a logical, reasonable, and reliable way to determine critical assets rather than a more arbitrary, "bright line" threshold contained in the proposed Requirements.

Balloter	Company	Seg-ment	Vote	Comment
				We have no issues with the changes to the other Version 4 CIP Standards regarding Nuclear facilities.
Response: Thank you for your comment. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method.				
Brandy A Dunn	Western Area Power Administration	1	Negative	With regard to identifying Critical Assets, Attachment 1 of the proposed CIP-002-4 standard is a step forward because it removes much of the ambiguity which existed under the three previous versions of the CIP standards. However, with regard to identifying Critical Cyber Assets, the proposed CIP-002-4 standard is a step backward because it increases ambiguity. It will lead to more rather than less confusion as to what is, and what is not, a Critical Cyber Asset. The "WECC Position Paper for the ballot of Project 2008-6" states, "...the failure to provide similar bright line criteria for identifying Critical Cyber Assets makes the current version unacceptable." The situation is actually worse than what the WECC states. Not only does the proposed standard fail to provide bright line criteria for identifying Critical Cyber Assets, it removes the following lanuage which existed in previous versions of the CIP standards: "Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange." The language which was removed, is the language which UGP relied on when developing its Critical Cyber Asset identification methodology. Removal of this language, removes the foundation for our Critical Cyber Asset identification methodology. The proposed standard for identifying Critical Cyber Assets is less prescriptive than the existing standard. It is moving in the wrong direction.
Response: Thank you for your comment. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. Similar language to that referred to can be found in the guidance document. Example language is ambiguous and therefore was removed from the standard.				
Chuck B Manning	Electric Reliability Council of Texas, Inc.	2	Negative	ERCOT ISO has joined in the submission of the IRC SRC comments. Please see IRC SRC submission for details.

Balloter	Company	Seg-ment	Vote	Comment
Response: Thank you for your comment.				
Charles H Yeung	Southwest Power Pool	2	Negative	We believe the bright line criteria proposed goes beyond what is required for protecting the bulk power system from cyber attack. We reiterate our support for the ISO RTO Council SRC comments submitted in the comment period.
Response: Thank you for your comment.				
Kim Warren	Independent Electricity System Operator	2	Negative	We appreciate the Drafting Team's reinstatement of Section 4.2.1 pertaining to the exemption of facilities regulated by the CNSC. We however respectfully reiterate our objection to criteria 1.6 and 1.7. In our view, removal of some of the facilities identified as Critical Assets using these criteria will have no impact on the BES. Their inclusion on the Critical Assets list would therefore be unnecessary The Drafting Team's response to our comment was "The inclusion of a risk-based evaluation by any entity would not meet the objective of uniform application of Critical Asset identification across all entities." We must however point out that Criteria 1.3, 1.8 and 1.9 already allow entities (whether they be the RC, the PC etc.) the discretion to designate/identify as Critical Assets, facilities "necessary to avoid BES Adverse Reliability Impacts" or "critical to the derivation of IROLs". Presumably, these entities doing the "designating" will have a documented methodology and apply it. We therefore advocate a similar approach in the case of Criteria 1.6 and 1.7. We believe the list of relevant transmission facilities developed by the Responsible Entity, should be subject to an impact-based assessment by the Reliability Coordinator who has the wide-area view of the system. If necessary, an additional requirement that requires the RC to have a risk-based assessment methodology and to conduct the assessment should be included. Such an arrangement would be akin to the exemption provisions advocated by FERC in its Final Rule on Revisions to the ERO definition of Bulk Electric System. We therefore propose the following specific wording: 1.6 Transmission facilities operated at 500 kV or higher, unless the annual review performed by the Reliability Coordinator (new requirement) demonstrates that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages.

Balloter	Company	Seg-ment	Vote	Comment
				1.7 Transmission facilities operated at 300 kV or higher at stations interconnected at 300 kV or higher with three or more other transmission stations, unless the annual review performed by the Reliability Coordinator (new requirement) demonstrates that destruction, degradation or unavailability of those assets will have no impact outside the local area and will not cause BES instability, separation, or cascading outages.
Response: Thank you for your comment. The SDT considered placing various analysis requirements on the Reliability Coordinator. The Functional Model describes the Reliability Coordinator as "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." However, the nature of the Critical Asset list is long-term, since implementation of CIP-003 to CIP-009 is up to two years. Based on this, it was determined that the Reliability Coordinator was not an appropriate entity for this analysis.				
Kathleen Goodman	ISO New England, Inc.	2	Negative	With regard to Criteria 1.3, ISO-NE agrees with and appreciates the Standard Drafting Team's (SDT) clarification that: "the burden for identifying Critical Assets is with the Responsibility Entity that is the Asset Owner. There is no burden or obligation placed on the Planning Coordinator or Transmission Planner to designate any unit as needed for reliability." (emphases added). To the extent that the Standard Drafting Team continues to leave this type of language in as Criteria 1.3, ISO-NE believes that such explanation should accompany any explanation of the Standard to NERC management/Board and/or FERC to ensure that there is no confusion on this point. ISO-NE continues to believe, however, that Criterion 1.3 should be removed. Because Attachment 1 establishes "bright-line" criteria for what assets should be included as "critical" assets under the Standard, for the reasons previously submitted to the Standard Drafting Team, including a Criterion in the Standard that places the task of making a "criticality" determination on an entity that does not own the assets violates FERC's Order 706 (and its Orders on Rehearing). As previously explained in submitted comments on this Standard, oversight from third parties (such as NERC, or its designee, if NERC so chooses) can be handled through the Rules of Procedure, where liability protections can be properly defined. In this case, of course,

Balloter	Company	Seg-ment	Vote	Comment
				NERC's designee would be entitled to the same liability protections as NERC. With this new iteration of Criteria 1.3, ISO-NE requests its removal, because: (a) it establishes a subjective method not included in other TPL Standards for Planning Coordinator/Transmission Planner (PC/TP) making a determination about generation assets; (b) as FERC has previously stated, PC/TP have no special expertise in identifying which assets are needed to protect as Critical Infrastructure from a cyber-security perspective; and (c) the inclusion of this Criteria may disincentivize generation owners/operators from conducting their own independent analysis – in that they will implicitly rely on whether the PC/TP has informed them of such a designation. Alternatively, such asset owners may simply unilaterally request that their PC/TP make such a designation. In short, the SDT and FERC have recognized the sole responsibility for identifying critical assets rests with the asset owner. As FERC clearly laid out in Order 706 (and its Orders on rehearing), NERC should provide some type of oversight to check that analysis (or designate another type of entity if it is not capable of doing so). Because Criteria 1.3 does not establish "bright-line" criteria for inclusion of bulk power system assets, it should be removed.
Response: Thank you for your comment. If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, such as due to a category C3 contingency as defined in TPL-003 or a category D contingency as defined in TPL-004, then that unit must be classified as a Critical Asset.				
Jason L Marshall	Midwest ISO, Inc.	2	Negative	We thank the drafting team for their efforts and the progress they have made in improving this standard since the last ballot. However, we still believe there are significant issues with the standard. The standard shifts responsibility for critical asset identification to third parties. For example, criterion 1.3 essentially causes generation owners to rely on Planning Coordinators to identify their critical generators. This responsibility should not be trasnferred and Order 706 was clear that it cannot be in paragraph 328. Criterion 1.3 is ambiguous and likely will not result in any generators being identified unless the Planning Coordinator is violating the TPL standards. Adverse Reliability Impact involves impacts to the system that cause separation, cascading, instability, etc. The TPL standards require the Planning Coordinator to plan to prevent these kinds of events for multiple contingencies. Thus, this criterion should be removed.
Response: Thank you for your comment. Criterion 1.3 - The burden for identifying Critical Assets is with the Responsible Entity that is the asset owner. If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, such as due to a category C3 contingency as defined in TPL-003 or a category D				

Balloter	Company	Seg-ment	Vote	Comment
contingency as defined in TPL-004, then that unit must be classified as a Critical Asset.				
Bruce Krawczyk	ComEd	3	Affirmative	1. When reviewing the changes to the proposed CIP-002-4 standard, do you believe that the proposed standard was responsive to feedback received and provides acceptable bright-line criteria for the determination of Critical Cyber Assets? No Comments: Exelon concurs that the changes made to the CIP-002-4 draft are responsive to the feedback received; however, the current draft version of CIP-002-4 does not address a technical issue previously not identified, and Exelon proposes a modification to the CIP-002-4 language. The current proposed exemption criteria in the "Applicability" Section 4.2.3 states that, "Cyber Assets associated with Cyber Security Plans submitted to and verified by the U.S. Nuclear Regulatory Commission pursuant to 10 C.F.R. Section 73.54." The wording of the exemption, and the parenthetical information in critical asset criteria 1.1 in Att. 1 (i.e., "including nuclear generation") appear to leave in place the requirement for nuclear generators to comply with Requirement 1, the annual determination of critical assets. Exelon understands that this exemption wording was put in place prior to the NRC letters to both FERC and NERC dated November 26, 2010, that by a matter of policy reserved to NRC the cyber security oversight of the BOP structures, systems, and components (SSCs) with impact on radiological health and safety. Because of the close coupling between electrical power and nuclear power, this regulatory oversight by the NRC would result in no BOP SSCs within the NERC CIP Standards. Thus, restricting the wording of the exemption to cyber assets is unnecessary. Exelon suggests that this technical issue can be resolved by revising the wording of exemption 4.2.3 to mirror that of 4.2.1 for Canadian nuclear generators (i.e., revise to state “4.2.3 Facilities regulated by the U.S. Nuclear Regulatory Commission”). The parenthetical “including nuclear generation” may also be removed from critical asset criteria 1.1 in Att. 1 of the draft standard. It is Exelon’s understanding that the current May 2010 version of the NERC Standard Process Manual, pp. 17-18, allows the draft CIP-002-4 wording to be changed to correct such technical issues without need for re-balloting.
Response: Thank you for your comments. The phrase “including nuclear generation” in Criterion 1.1 is there to define a plant site. Unit output from all units at a single plant site should be included to determine if a plant meets the 1500MW threshold. The evaluation for Critical Cyber Assets is similar. Although it is highly unlikely that nuclear and				

Balloter	Company	Seg-ment	Vote	Comment
non-nuclear units share common Cyber Assets, the evaluation should still occur. The Applicability language serves to ensure that all reliability systems not covered by the NRC will be covered by the CIP standards. The Applicability section has been revised to clarify the nuclear plan exemption.				
David A. Lapinski	Consumers Energy	3	Negative	The revised wording in CIP-002-4, Attachment 1 has not changed adequately to address the ambiguity that we had objected to in our previous comments and negative vote. It would seem that the changes have not done enough to limit inclusion of many more generating units that are part of alternate cranking paths. As this creates ambiguity, the Standard is not acceptable as proposed. In addition, Item 1.5 has not changed in a definitive fashion such as to limit inclusion of only the 'Primary Path", which was the same concern we raised previously.
David Frank Ronk	Consumers Energy	4		
James B Lewis	Consumers Energy	5		
Response: Thank you for your comments. The SDT considered using the word "primary", but ultimately rejected it as it is not a defined NERC Glossary term in this instance, nor is it used in EOP-005-2.				
Henry Ernst-Jr	Duke Energy Carolina	3	Affirmative	Yes, however we see much room for improvement and offer the following comments: • Criterion 1.2 – We previously commented that 1000 MVAR was too large, and reiterate that comment again. There are not any reactive resources that large in SERC. Is the drafting team aware of where any 1000 MVAR resources are located? • Criterion 1.3 – This criterion is less clear than before. Adding the phrase "necessary to avoid BES Adverse Reliability Impacts" potentially broadened this criterion to include every last generator on the system, because the defined term "Adverse Reliability Impact" includes tripping of generation. You need to limit this criterion to generation whose loss "could expose a widespread area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages." • Criterion 1.4 - Need to clarify that this criterion only includes the primary Blackstart Resources. Entities may include various alternative resources in their restoration plans which aren't Critical Assets, but which may not be clearly distinguished from the primary Blackstart Resources in the restoration plan. Add the phrase "that the entity intends to rely on for system restoration".

Balloter	Company	Seg-ment	Vote	Comment
				• Criterion 1.7 – Wording change creates confusion as to whether generating stations are included. Insert the word “transmission” before the word “stations”. • Criterion 1.8 – This criterion is less clear than before. Delete the RC, because the identification of facilities to be protected occurs in the planning timeframe. Also the unclear language “critical to the derivation of” and “their associated contingencies” should be struck. Suggested rewording: “Transmission Facilities at a single transmission station or substation location, that are identified by the Planning Authority or Transmission Planner, whose loss could expose a widespread area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages.” • Criterion 1.9 - This criterion is less clear than before. Delete the RC, because the identification of facilities to be protected occurs in the planning timeframe. Also the unclear language “critical to the derivation of” and “their associated contingencies” should be struck. Suggested rewording: “Flexible AC Transmission Systems (FACTS) at a single transmission station or substation location, that are identified by the Planning Authority or Transmission Planner, whose loss could expose a widespread area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages.” • Criterion 1.10 – Removing the word “directly” creates significant uncertainty regarding what scope of facilities would be included. Reinsert the word “directly”, preferably after the phrase “Transmission Facilities”. Also, including the word “destroyed” in the phrase “destroyed, degraded, misused or otherwise rendered unavailable” creates significant uncertainty regarding what is intended. Add the phrase “via cyber attack” after the word “unavailable”. This will clarify that the evaluation only encompasses destruction, degradation or misuse that can be achieved via cyber attack, and not a physical attack on the facilities. • Criterion 1.12 – The added language is unclear. Suggested rewording: “Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements whose loss could expose a widespread area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages for failure to operate as designed.”

Balloter	Company	Seg-ment	Vote	Comment
				• Criterion 1.13 – As clarified on the Webinar, the language needs to be revised to clarify that the phrase "Each system or Facility" only includes discrete systems or facilities that can individually shed 300 MW or more of load. UFLS and UVLS systems are typically composed of discrete components at many locations (not interconnected), usually on the distribution system. These discrete, localized facilities would not typically interrupt 300 MW individually. • While the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities provides milestones for implementing the CIP standards, we believe that a modification is needed related to the CIP 002 milestones within this plan. The implementation plan presumes that compilation of all of CIP 002 evidence (R1. Application of Methodology; R2. Identification of the new Critical Asset; R3. Identification of the new Critical Cyber Assets; and R4. Annual Approval of the above items) occurs simultaneously for Category 1 and Category 2. This approach does not allow sufficient time for the identification of new Critical Cyber Assets (R3) and approval of the documented CCA list (R4) once new Critical Assets are identified. We believe the Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities should be amended to provide a period of 6 months following identification of a new Critical Asset for the identification of new Critical Cyber Assts associated with the new Critical Asset (R3) and the Annual Approval of the revised Critical Cyber Asset List (R4).
Response: Thank you for your comments. Criterion 1.2 - The value of 1000 MVAR used in this criterion is a value deemed reasonable for the purpose of determining criticality. The survey that NERC conducted earlier this year showed that there were facilities that would qualify at this threshold. Criterion 1.3 – Adverse Reliability Impact is defined as "The impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection." The Guidance document has been modified to provide additional clarification on this issue. Criterion 1.4 - The SDT considered using the word "primary", but ultimately rejected it as it is not a defined NERC Glossary term in this instance, nor is it used in EOP-005-2. The phrase "that the entity intends to rely on for system restoration" was discussed by the SDT, but it was determined that it added no additional clarity. Criterion 1.7 - The choice of the phrases "Transmission Facilities" and "transmission stations or substations" was intentional to exclude connections and generation only substations. Criterion 1.8 - According to FAC-014-2 Requirement R1 "The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent				

Balloter	Company	Seg-ment	Vote	Comment
with its SOL Methodology." Since they have a responsibility to ensure that the IROLs are established and consistent with their SOL methodology, it is valid to list them in this Criterion. The wording for criterion 1.8 came from FAC-014-2 Requirement R5. Criterion 1.9 - According to FAC-014-2 Requirement R1 "The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology." Since they have a responsibility to ensure that the IROLs are established and consistent with their SOL methodology, it is valid to list them in this Criterion. The wording for criterion 1.8 came from FAC-014-2 Requirement R5. Criterion 1.10 - Several commenters in the first posting were concerned about the use of the term "directly." After consideration by the Standard Drafting Team, it was determined that the term could be removed without affecting the intent of the criterion. The SDT discussed your suggested changes, and determined the existing language is adequate. The term "destroyed" is listed in the definition of Critical Asset. Criterion 1.12 - The SDT appreciates the suggestion, but believes the posted wording is adequate. Criterion 1.13 - The SDT spent considerable time discussing the wording of criterion 1.13, and chose the term "Each" to represent that the criterion applied to a discrete system or Facility. Implementation Plan – Thank you for raising this concern. The SDT will review this implementation plan in the next version and revise as necessary.				
Robert D Adam	Kansas City Board of Public Utilities	3	Affirmative	Consider the changes being proposed in the following language. 1.4. Each Blackstart Resource identified in the RESTORATION PLAN FOR A Transmission Operator SERVING LOAD OR GENERATION EQUAL TO OR GREATER THAN AN AGGREGATE OF 1500 MW IN A SINGLE INTERCONNECTION. 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(S) IDENTIFIED IN 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan. This surgical approach ensures that generation, TOP and BA control centers with responsibility for other critical generation and transmission assets are still responsible for full CIP-002-4 through CIP-009 compliance. However, small BA/TOP systems with no initial obligations to the RC and larger TOPs for regional restoration would not be deemed "critical." The experience of these smaller systems is that their restoration obligations have not been relied upon to restore the BES, but rather to start generation to serve local load after a system separation – and then to wait for direction from the RC on resynchronization with the rest of the BES, once voltage and frequency are stabilized. While we recognize that cyber events may have an impact on the availability of resources, the fundamental fact is the vast majority of Blackstart Resources and control centers will be protected under CIP-002 through -009, because they will be classified as Critical/High Impact under the proposed criteria, as revised above. Thus the revised criteria support rather than undermine the distinction between categorization of big

Balloter	Company	Seg-ment	Vote	Comment
				iron/big aluminum resources and their associated control centers as Critical or High Impact in the development of CIP-002-4. The categorization and development of security controls for smaller resources as either medium or low impact for the BES, should be addressed through development of additional bright line criteria and associated security controls in the next phase of this project (CIP-002-5 or CIP-010/011.)
Response: Thank you for your comments. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system.				
Bruce Merrill	Lincoln Electric System	3	Negative	LES believes the SDT was responsive to much of the feedback received from the industry; however, we question whether these bright-line criteria as a whole are acceptable for determining Critical Cyber Assets. We believe a few criteria need to be adjusted to provide a proper foundation moving forward, and support the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS) to properly address these issues.
Dennis Florom	Lincoln Electric System	5		
Eric Ruskamp	Lincoln Electric System	6		
Response: Thank you for your comments.				

Balloter	Company	Seg-ment	Vote	Comment
Charles A. Freibert	Louisville Gas and Electric Co.	3	Affirmative	PPL affiliates appreciate the hard work and efforts of the Standards Drafting Team in reaching this point in the standards development process. However PPL affiliates have reviewed the CIP-002-4 standard version dated 11/30/2010 and the associated Rationale and Implementation Reference Document and Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities and still find the need to offer comments as follows: 1) CIP-002-4, Attachment 1, Criterion 1.1 should include a requirement that the Generator Owner or Generator Operator must inform the Transmission Operator, Transmission Operator, Planning Coordinator or Transmission Planner of each group of generating units that has been designated as a critical asset. 2) CIP-002-4, Attachment 1, Criterion 1.3 should be reworded to indicate "Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator, "and the Transmission Owner and Transmission Operator" as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon. 3) CIP-002-4, Attachment 1, Criterion 1.5 should be reworded to indicate "The facilities comprising the Cranking Paths and Meeting the initial switching requirements from the Blackstart Resource “up to and including” the first interconnection point of the generation unit(s) to be started, or up to “and including” the point on the Cranking Path where two or more path options exist "including the first interconnection point of the generation unit(s) to be started" , as identified in the Transmission Operator's restoration plan. 4) CIP-002-4, Attachment 1, Criterion 1.13 should be revised to include load shed systems capable of shedding 300 MW or more. These load shed systems, which are typically part of the energy management systems, are initiated to ensure the reliability of the BES. 5) CIP-002-4, Attachment 1, Criterion 1.13 should be reworded to indicate that distributed UFLS or UVLS schemes (i.e., individual UF or UV relays operating independently in multiple substations) are not considered to be a critical asset. Collectively the UFLS or UVLS scheme may shed more than 300MW; however, due to the distributed nature of the scheme, the UFLS or UVLS schemes are not considered to be a critical asset.
Response: Thank you for your comments. Criterion 1.1 - It is agreed that communication between Generator Operators and Transmission Owners and Transmission Operators will be required to ensure that all Critical Assets are identified.				

Balloter	Company	Seg-ment	Vote	Comment
Criterion 1.3 - The process would be that the Planning Coordinator or Transmission Planner would notify the Generation Owner and Generation Operator about any facilities that meet Criterion 1.3. The GO and/or GOP would need to notify the Transmission Owner of any facilities that need to be considered for Criterion 1.10. Criterion 1.5 - The SDT appreciates the suggestion, but believes the posted wording is adequate. Criterion 1.13 – A discrete component that sheds more than 300MW of load due to the implementation of Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program is a Critical Asset. During the previous ballot and comment period, the SDT received many comments on this criterion, whose wording was similar to this suggestion. Some commenters stated that the wording of this criterion will inadvertently bring in all SCADA systems with the capability of shedding load even if such SCADA systems are in fact not planned or operated to perform load shedding. This was not the intent of the SDT. Other commenters stated that this item needs to be clarified to confirm that it applies to a single common control system only, and not multiple but separate "like" systems that in aggregate are capable of load shedding up to 300 MW. Also, the criterion needs to be clarified to confirm that it applies to systems "configured" for automatic load shedding, not simply just "capable" of load shedding. This criterion was intended to include as Critical Assets regional Under Frequency Load Shedding and Under Voltage Load Shedding schemes. The SDT appreciates the suggestion, but believes the posted wording is correct.				
Darl Shimko	Madison Gas and Electric Co.	3	Abstain	We appreciate the Standard Drafting Teams time and effort in developing this revised Standard and believe substantial progress has been made. However, there are several items that we feel warrant further modifications. 1.4 Each Blackstart Resource identified in the Transmission Operator's restoration plan. Minor modifications are required for 1.4. As currently drafted, any Blackstart Resource identified in the Transmission Operator's restoration plan would be a Critical Asset without regard to the circumstances of the Blackstart Resource. A modified approach would be to allow the Transmission Operator to have both essential and non-essential resources (resources that meet the CIP bright-line criteria and those that do not meet the CIP bright-line criteria) within their restoration plan. We recommend that Criterion 1.4 be rewritten to state: Each Blackstart Resource identified as being necessary to restore the system in the Transmission Operator's restoration plan. Rationale: By modifying the criterion, the Transmission Owner is able to develop a fully encompassing plan that will allow resources with blackstart capability to be included in the plan, even if that particular resource is not deemed to be essential to the restoration of the system. This would add diversity to the restoration plans, allowing the
Joseph G. DePoorter	Madison Gas and Electric Co.	4		

Balloter	Company	Seg-ment	Vote	Comment
Steven Schultz	Madison Gas and Electric Co.	5		Transmission Operator to use all the available resources to ensure the reliability of the system during these circumstances. When a Blackstart Resource is included in the plan, it will receive the full attention of the Transmission Operator and will be the focus of training and emergency simulation. Without this modification, it is likely that Blackstart Resources that are not essential, but may be helpful to the restoration plan, will not be included in the plan and therefore will not be a considered during the training and simulation drills. The Transmission Operator will likely be in a better position to respond to the circumstances, which may be unforeseen, if it has included all available resources, not just those deemed critical. 1.13. Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program. Clarity is required for 1.13. The owner of a UFLS system is not listed in the applicability section of this Standard which is a Distribution Provider. PRC-008-0 has the Distribution Provider in its applicability section for the maintenance and testing of UFLS relays. Please review and update. This criterion could be interpreted as each relay that is enabled to perform UFLS operations would be considered a CA. These relays are located at distribution substations and may change annually due to the customer make up per distribution feeder. Since a UFLS system is enabled at individual feeder relays, this criterion would require each individual relay to be classified as a CA. When the NERC defined term of "Facility" is in the criterion it will bring in all components of the UFLS system as being a CA. We recommend that Criterion 1.13 be rewritten to state: Each automatic load shedding relay that interrupts, without human operator initiation, 100 MW or more of load as a result of Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program. Rationale: The 300 MW limit is a DOE requirement and is subject to public law outside the authority of NERC. The 100 MW is per FERC approved NERC Standard EOP-004-1. UFLS relays that fall below this threshold will still need to be maintained per PRC-008-0 since there is no bright line associated with that Standard. This recommended revised criterion adds to the adequate level of reliability and does not adversely affect those small entities. 1.15 Each control center or backup control center used to control generation at multiple plant
Jeffrey M Keebler	Madison Gas and Electric Co.	6		

Balloter	Company	Seg-ment	Vote	Comment
				locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection Even if a small utility, as a joint owner, has control over only a small portion of a large plant that falls under the brightline of 1.1, we are concerned that as currently written, the first sentence of this criteria would unintentionally designate this small utility's control center as critical. We would propose rewording the criteria as follows: Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.3 or 1.4, or used to control at least 1500 MW of generation at any Facility identified in criteria 1.1. Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection. Rationale: The important part of this criteria is the amount of generation controllable by the system, the MW level of the entire generation. As written, it could be interpreted that the total generation size at a single plant location is the defining criteria, not what is controllable by the individual system. If a system is only able to control 100 MW of a 2000 MW plant, the Criteria for 1.15 should be looking at the 100 MWs of control capability, not the 2000 MW plant.
Response: Thank you for your comments. Criterion 1.4 - The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets. Criterion 1.13 – The SDT does not feel it necessary at this time to include Distribution Providers in the Applicability section but may consider this in future revisions of the Standards. Distribution Providers may own certain very limited BES Cyber Assets, generally limited to UFLS and UVLS relays. However, additional functional entities (i.e. Transmission Operators) generally provide aggregate control of these relays. Criterion 1.15 - The concern here is that the smaller utility's control center could provide a path to compromise the functionality of the generation designated a Critical Asset.				
Rick Keetch	NRG Energy Power Marketing, Inc.	3	Negative	The revision to CIP002 V4 Section 1.15 in Attachment 1 still requires additional clarification. The requirement states that if a facility has the ability to control generation at multiple locations, it is designated as a control center and therefore is deemed critical under this requirement. However, a single entity that has generation may have a control room that controls remote sites from a single location (ex. Gas turbines). If the intent is to pull in these assets under the classification of control center, it should clearly state that control rooms having this configuration are in scope or redefine the control center definition based upon application of this methodology.
Richard Comeaux	LaGen	4		

Balloter	Company	Seg-ment	Vote	Comment
Patricia A. Lynch	NRG Energy, Inc.	5		
Response: Thank you for your comments. Criterion 1.15 - From the posted Guidance document: "A control center or generation control center that provides critical operating functions and tasks as identified in CIP–002 must be protected per the requirements of the Cyber Security Standard. The monitoring and operating control function includes controls performed automatically, remotely, manually, or by voice instruction." If the control center meets the specifications of criterion 1.15, it is a Critical Asset.				
Scott Peterson	San Diego Gas & Electric	3	Negative	SDG&E is concerned that the "bright line" needs additional improvement to make sure it is clear to all entities. Comment on 1.8, 1.9, 1.10: There should be some obligation that the parties that identify the Transmission Facility (e.g. RC, PA, TP, GO) as critical also notify the Transmission Owner and Operator of that identification so the TOP and TO are aware and can protect. Comment on 1.8, 1.9: What does the statement "critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies" mean? This isn't clear.
Response: Thank you for your comments. Criterion 1.8 and 1.9 - FAC-014-2 R5 contains all of the information concerning communication of Facilities that are critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies. Criterion 1.10 – It is agreed that communication between Generator Operators and Transmission Owners and Transmission Operators will be required to ensure that all critical Assets are identified. The wording for 1.8 and 1.9 came from FAC-014-2 Requirement R5.				
James R. Keller	Wisconsin Electric Power Marketing	3	Affirmative	We appreciate the diligence of the Standard Drafting Team in reviewing and responding to the comments and feedback provided during the previous ballot, and the changes made to the bright line criteria in Attachment 1 in response to comments and feedback. We strongly support the change to a single implementation timeline of 24 months which will simplify both implementation and audit requirements, and would like to point out the fact that there is a discrepancy in timelines specified in the draft standard and the timelines specified in the draft implementation plan. This discrepancy must be corrected in the final implementation.
Linda Horn	Wisconsin Electric Power Co.	5		

Balloter	Company	Seg-ment	Vote	Comment
Anthony Jankowski	Wisconsin Energy Corp.	4		Also, the timeline proposed for CIP-005-4 should coincide with the timeline for the other CIP version 4 standards to further streamline compliance and audit processes. We would also like to express concern that, in so much as Criterion 1.1 could result in the identification of generation plant locations with no Critical Cyber Assets, the resulting requirements in Criterion 1.10 could result in expending efforts protecting transmission assets that might not otherwise need to be protected, diverting resources that might be more effectively expended elsewhere. Finally, we would like to express concern that the failure to specify a criticality criteria for Blackstart Resources in Criterion 1.4 will result in current blackstart-capable units not being identified as Blackstart Resources. Thank you for your consideration of these comments.
Response: Thank you for your comments. The flowchart in the implementation plan has been removed. Your comments on CIP-005-4 will be forwarded to that team. Criterion 1.10 - The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets. Any Transmission Facility that the loss of which would result in the loss of a Critical Asset identified in criterion 1.1 or 1.3 would need to be classified as a Critical Asset. Criterion 1.4 - The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets.				
Kenneth Goldsmith	Alliant Energy Corp. Services, Inc.	4	Negative	Alliant Energy agrees with most of the revisions, except criterion 1.4 concerning Blackstart units. We are very concerned that with the wording as in the standard, many Registered Entities will not make their emergency generation available as blackstart resources, and the end result will be a reduction in the reliability of the BES. A possible solution is to consider a Blackstart Tier Methodology, where "Primary" Blackstart units would be subject to the full CIP criteria, and then "secondary" Blackstart units that would not be required to meet the full requirements due to their size and negligible impact on the BES.
Response: Thank you for your comments. A tiered approach to Blackstart Resources is a good idea, and the drafting team suggests that a SAR be submitted by the entity outlining this approach to EOP-005-2. It is beyond the scope of this SDT.				

Balloter	Company	Seg-ment	Vote	Comment
Timothy Beyrle	City of New Smyrna Beach Utilities Commission	4	Affirmative	Any and all blackstart and cranking paths that are part of a TOP's restoration plan are included, not matter the importance to the region. This is not reasonable and only a few for the region ought to be identified (e.g., as identified in the regional plan). Unfortunately, not all regions have restoration plans, which is really the issue (which seems a violation to EOP-006-1 R3 to me).
Response: Thank you for your comments. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets.				
Thomas W. Richards	Fort Pierce Utilities Authority	4	Affirmative	Although we are voting affirmative, FPUA strongly agrees with APPA's comments, which state: In effect, Criterion 1.4 swallows all exceptions created under 1.15 through 1.17, with the possible exception of a generation-only BA that does not have any Blackstart Resource obligations to its TOP. All vertically integrated utilities would be responsible for CIP-002 through CIP-009, including small BAs and TOPs that do not own any other Critical Assets. To address this problem, we propose the following rewording: 1.4. Each Blackstart Resource identified in the restoration plan for a Transmission Operator serving load or generation equal to or greater than an aggregate of 1500 MW in a single Interconnection. 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(s) identified in 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan.
Response: Thank you for your comment. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions. As such, these assets deserve protection as Critical Assets. Due to their connectivity and configuration, control centers that operate these Blackstart Resources also have the ability to jeopardize their availability and function in a time of need if maliciously misused. As such, these control centers should also be deemed Critical Assets. The SDT appreciates the "catch-22" concern that was brought forth by APPA. However, the SDT does not believe that the criteria as written present a catch-22 scenario. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." The APPA comments indicate that the assets of concern to them are being utilized "once voltage and frequency are stabilized." As such, these assets are not required to be included in the TOP's				

Balloter	Company	Seg-ment	Vote	Comment
restoration plan as Blackstart Resources. Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.				
Jack Alvey	Indiana Municipal Power Agency	4	Affirmative	IMPA is voting affermative on the ballot, however, there is an issue that needs to be addressed and corrected. In Attachment 1, criteria 1.4 (Blackstart Resources), it is including all Blackstart Resources used in a TOP restoration plan to become subject to CIP-002 through CIP-009, regardless of entity size. Basically, criteria 1.4 eliminates all exceptions under criteria 1.15 through 1.17, with the possible exception of a generation-only BA that does not have any Blackstart Resource obligations to its TOP. To address this issue, IMPA proposes to make the following edits to 1.4 and 1.5: 1.4 Each Blackstart Resource identified in the restoration plan for a Transmission Operator serving load or generation equal to or greater than aggregate of 1500MW in a single interconnection. 1.5 The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(s) identified in 1.4 to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan. This surgical approach ensures that generation, TOP and BA control centers with responsibility for other critical generation and transmission assets are still responsible for full CIP-002-4 through CIP-009 compliance. However, small BA/TOP systems with no initial obligations to the RC and larger TOPs for regional restoration would not be deemed "critical." The experience of these smaller systems is that their restoration obligations have not been relied upon to restore the BES, but rather to start generation to serve local load after a system separation - and thento wait for direction from the RC on resynchronization with the rest of the BES, once voltage and frequency are stabilized. IMPA also recomments using different wording than just annual. We would prefer to see wording

Balloter	Company	Seg-ment	Vote	Comment
				that might say "each calendar year but no longer than 16 months" to avoid the ambiguityh of the term "annual."

Response: Thank you for your comment.
The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions. As such, these assets deserve protection as Critical Assets. Due to their connectivity and configuration, control centers that operate these Blackstart Resources also have the ability to jeopardize their availability and function in a time of need if maliciously misused. As such, these control centers should also be deemed Critical Assets. The SDT appreciates the "catch-22" concern that was brought forth. However, the SDT does not believe that the criteria as written present a catch-22 scenario. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." These comments indicate that the assets of concern to them are being utilized "once voltage and frequency are stabilized." As such, these assets are not required to be included in the TOP's restoration plan as Blackstart Resources. Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.

The phraseology you are concerned about (annual) exists in the current CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version.

Balloter	Company	Seg-ment	Vote	Comment
Christopher Plante	Integrys Energy Group, Inc.	4	Affirmative	Wisconsin Public Service Corporation and Upper Peninsula Power Company support the MRO's NSRS comments. However, we are concerned with Attachment 1, Criterion 1.13. As currently worded, this criterion could unintentionally designate multiple smaller, disparate systems with like settings as a "system" that performs automatic load shedding of 300 MW or more, assuming the total combined load shedding capability of the disparate systems exceeds 300 MW. To prevent this, we would propose rewording the criterion as follows to more closely match the old version: Each COMMON system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.
Response: Thank you for your comments. A discrete component that sheds more than 300MW of load due to the implementation of Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program is a Critical Asset. In the drafting of this criterion, the drafting team sought to include only those systems that did not require human operator initiation, and targeted in particular those Under Frequency Load Shedding (UFLS) facilities and systems and Under Voltage Load Shedding (UVLS) facilities and systems that would be implemented as part of a regional load shedding requirement to prevent Adverse Reliability Impact. It is unclear how adding the term "common" adds any additional clarity over the existing wording.				
Jeff Mead	City of Grand Island	5	Negative	Comments put in official form.
Response: Thank you for your comments.				
Amir Y Hammad	Constellation Power Source Generation, Inc.	5	Affirmative	Constellation appreciates the hard work and dedication of the CSO 706 Standard Drafting Team. Constellation Power Generation believes that the Standard Drafting Team needs to further explain the technical justification for the 1500 MW bright-line threshold in Attachment 1 – 1.1 as well as the 300 MW bright-line threshold in Attachment 1 – 1.13. The technical justifications should be included in the guidance documentation. Constellation Energy Nuclear Group appreciates the inclusion of the language in 4.2.3: "Cyber Assets associated with Cyber Security Plans submitted to and verified by the U. S. Nuclear Regulatory Commission pursuant to 10 C.F.R. Section 73.54." This exemption language should

Balloter	Company	Seg-ment	Vote	Comment
				also be added to CIP-003 thru -009.
Response: Thank you for your comments. The SDT believes that the justification for each threshold is presented in the guidance document. The posted Guidance document has been modified to add reasoning for the 300MW threshold level. The exemption language referenced is in the posted versions of CIP-003-4 to CIP-009-4.				
Kenneth Dresner	FirstEnergy Solutions	5	Affirmative	No Comments
Response:				
Brent Hebert	Horizon Wind Energy	5	Negative	The way 1.15 is written, it would include control centers that control 1500 MW of total generation in an Interconnection comprised of small generators dispersed throughout multiple Balancing Authorities and Reserve Sharing Groups within that Interconnection. We believe this criteria is too broad, does not meet the intent of enhancing reliability, and places a significant burden on small entities that control dispersed generation. We believe using a criteria based on the amount of generation controlled within a single BA or RSG would better enhance reliability, while not unduly burdening entities that cannot appreciably contribute to resolving BES emergencies. We recommend changing the criteria from "Each control center or backup control center used to control generation equal to or exceeding 1500 MWs in a single Interconnection." to "Each control center or backup control center used to control total generation in a single BA or RSG equal to or exceeding the lesser of: •1500 MWs, or •The Most Severe Single Contingency for that BA RSG.
Response: Thank you for your comment. The SDT appreciates the suggestion, but believes the posted wording is adequate.				

Balloter	Company	Seg-ment	Vote	Comment
Mike Laney	Luminant Generation Company LLC	5	Affirmative	Luminant thanks the STD for their work on the standard and for the opportunity to provide comments for consideration by the SDT. Luminant believes the changes to CIP-002-4 are responsive to the concerns expressed by the industry and provide acceptable bright-line criteria for the determination of Critical Assets. Luminant does request the SDT to consider a wording change in the "Draft Guidance Document". On page 10 of the Clean version of the document, in reference to Special Protection Schemes, the following is listed: "Part 1.12 designates Special Protection Systems and Remedial Action Schemes as Critical Assets. Special Protection Systems and Remedial Action Schemes may be implemented to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time they are required or if they operate outside of the parameters they were designed for. Generation Owners and Operators which have implemented such systems and schemes must designate them as Critical Assets. " (emphasis added) The term "implemented" is not consistent with other NERC standards and can lead to disagreements on who is responsible for the Critical Asset CIP requirements. Luminant asks the SDT to change the language to: "Generator Owners and Operators that own such systems and schemes…." The term "own" is consistent with other NERC standards that are applicable to Special Protection Systems and Remedial Action Schemes, and very clearly identifies the responsible entity. Thank you for your consideration of our comments.
Brad Jones	Luminant Energy	6		
Response: Thank you for your comments. Your suggested change to the Guidance document has been made.				
Don Schmit	Nebraska Public Power District	5	Affirmative	Suggest changing Attachment 1, sub-paragraphs 1.4 and 1.5 to read as follows: 1.4. Each Blackstart Resource identified in the RESTORATION PLAN FOR A Transmission Operator SERVING LOAD OR GENERATION EQUAL TO OR GREATER THAN AN AGGREGATE OF 1500 MW IN A SINGLE INTERCONNECTION. 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(S) IDENTIFIED IN 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path

Balloter	Company	Seg-ment	Vote	Comment
				options exist, as identified in the Transmission Operator's restoration plan.
Response: Thank you for your comments. Criterion 1.4 – The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets. The SDT appreciates the suggested wording, but believes the posted wording is adequate.				
Michelle DAntuono	Occidental Chemical	5	Affirmative	Request clarification where Attachment 1, 1.3 allows PCs or TPs to designate units that are necessary to avoid "BES Adverse Reliability Impacts". Is this meant to be RMR units?
Response: Thank you for your comments. The units are not necessarily designated as reliability must run. If the PC or TP has identified Adverse Reliability Impacts (the impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection), then any units identified that avoid this scenario must be classified as a Critical Asset.				
Joanna Luong-Tran	TransAlta Centralia Generation, LLC	5	Abstain	For the criterion 1.1, the SDT response said "the guidance document posted by the SDT provides directions on the location issue". We have reviewed the guidance document and we think the terms of "a defined physical footprint" and "commonly accepted generating facility terminology" in the SDT response are still vague. Can the SDT elaborate this by providing some examples? For the criteria 1.6 and 1.7, we have read the SDT response and think the Generator Interconnection Facilities as defined in the NERC project http://www.nerc.com/filez/standards/Project2010-07_GOTO_Project.html, should be excluded from the Transmission Facilities, the term used in the criteria 1.6 and 1.7. The guidance document discusses this. We think it is appropriate to clarify this in the standard, instead of addressing this in the guidance document.
Response: Thank you for your comments. Additional clarity has been added to the Guidance document. The following sentence was added to the language explaining criterion 1.1: “Single plant location refers to a group of generating units occupying a defined physical footprint, often but not always, these units are surrounded by a common				

Balloter	Company	Seg-ment	Vote	Comment
fence, have a common entry point, share common facilities such as warehouses, water plants and cooling sources, follow a similar naming convention (plant name - unit number) and fall under a common management organization." The SDT believes that the Guidance document is the appropriate place for this discussion until the Generation Interconnection Facilities are incorporated into the standards.				
Brenda Powell	Constellation Energy Commodities Group	6	Negative	Constellation appreciates the hard work and dedication of the CSO 706 Standard Drafting Team. Constellation Energy Commodities Group continues to be concerned that Attachment 1, criteria 1.15 inappropriately covers control centers in one-size fits all approach. While there are EMS systems that can directly control generation, there are also Generation Management Systems (GMS) that function on a much lower level. For instance, many GMS systems: • Do not open and close breakers of any critical asset • Simply send a signal to units operating in the AGC mode and do not directly move the units output • Can only request MW movement between those ranges. Each generating unit controls the set points (low and high AGC limits and ramp rates). • May be turned off and/or switched locally to manual dispatch mode without disruption to the BES. If, through malicious means, attempts are made to use the GMS to adversely impact the reliable operation of a generating unit, the generating unit would be taken off of AGC. No single aspect of system operations should be viewed in a vacuum. By design, multiple points of system information are processed and reacted to in context of each other. Mechanical and human checks and balances react to data to maintain a responsive, reliable system. Should the data become compromised for some reason operators will react to the disparities by switching to manual or other operational measures. Requirement 2 distinguishes critical cyber assets as "shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1. The control centers covered under criterion 1.15 should also include the same distinction. In addition, defining the control center area would be more appropriately determined by

Balloter	Company	Seg-ment	Vote	Comment
				planning studies, none of which are as broad as a single Interconnection. Since this may create complications for standard applicability, we propose that the area be set by NERC Regional area. 1.15. Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection. For the above reasons, we propose the following revision: 1.15 Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed 1500 MW of generation in a single NERC Regional area.
Response: Thank you for your comments. The SDT considered your proposed wording. In order for the plant to determine that if, "through malicious means, attempts are made to use the GMS to adversely impact the reliable operation of a generating unit, the generating unit could be taken off of AGC," it is felt that the protections provided in CIP-003 to CIP-009 are necessary. In addition, the SDT believes that the generation summary must be performed at the NERC Interconnection, because control actions are not taken at the NERC Regional level.				
Larry W. Rodriguez	Entegra Power Services	6	Negative	FERC & NERC must attempt to provide the security needed, BUT in a way that balances adequate security with an entities ability to absorb the enormous costs! We are a small shop IPP which can not pass on these costs to ratepayers as the IOUs. The up front "Brightline" costs and ongoing costs MAY PUT US OUT OF BUSINESS and reduce jobs in a terrible economic time for the entire country. Please consider some efforts to balance adequate security needs with the size and financial capability of companies.
Response: Thank you for your comments.				

Balloter	Company	Seg-ment	Vote	Comment
The SDT and volunteer industry participants have developed appropriate Critical Asset Identification criteria which have been presented to industry through various iterations for review and feedback. In addition, the SDT has attempted to factor in this issue by limiting the scope of Critical Cyber Assets to those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1.				
Joseph O'Brien	Northern Indiana Public Service Co.	6	Affirmative	Concerns included in previous ballot have been addressed
Response: Thank you for your comments.				
Jim R Stanton	SPS Consulting Group Inc.	8	Negative	While the changes in the Criteria 1.3 allow generators to be informed of whether they are designated a Critical Asset by the Planning Coordinator or Transmission Planner, that was not the point. The discretion to make such designations without proper due diligence or independent review remains. Planning studies have a wide latitude of assumptions and it would be quite easy designate one's competitor as critical and employ the assumptions in the planning models to make that happen. Lacking independence at the PC and TP level, independent review is the only way to insure competition is not blunted by this ability to designate one's competitor as critical.
Response: Thank you for your comments. In the Functional Model, one of the tasks of the Planning Coordinator is “Facilitates the integration of the respective plans of the Resource Planners and Transmission Planners within the Planning Coordinator area. a. Reviews the integrated plan with respect to established reliability needs considering the impact on and by adjoining systems. b. In coordination with the Resource Planners and Transmission Planners, facilitates the development of alternative solutions for plans that do not meet those reliability needs.” One of the alternative solutions developed may require the availability of a particular generator to meet reliability needs and avoid an Adverse Reliability Impact. Likewise, one of the tasks of the Transmission Planning function is “Evaluate, develop, document, and report on expansion plans for the Transmission Planner area. Assess whether the integrated plan meets reliability needs, and, if not, report on potential network conditions or configurations that do not meet performance requirements.” If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, such as due to a category C3 contingency as defined in TPL-003 or a category D contingency as defined in TPL-004, then that unit must be classified as a Critical Asset.				

Balloter	Company	Seg-ment	Vote	Comment
Guy V. Zito	Northeast Power Coordinating Council, Inc.	10	Affirmative	Many Canadian members of NPCC are of the opinion that in Attachment 1 of the draft CIP-002-4 standard an RC led exclusion provision should be available to allow some facilities to be exempted from the CIP standards. Also the designation of a PC in Attachment 1 in the criteria "1.3" should be removed as there is a liability issue for the PC that fails to correctly identify a GO GOP as being impactive. The TP is the appropriate entity, and correctly identified, to do this and is more likely to have the necessary information in interconnection agreements and design specifications coordinated at the local level.
Response: Thank you for your comments. The SDT believes that having an exception process to the criteria presents the same challenges associated with a risk-based assessment in external review and oversight. One of the functions identified in the Functional Model is Planning Reliability, which has an identified task of "Evaluate, develop, document, and report on resource and transmission expansion plans for the Planning Coordinator area. Integrate the respective plans, evaluate the impact of those plans on and by adjoining Planning Coordinator's integrated plans and assess whether the integrated plan meets reliability needs, and, if not, then to report on potential transmission system and resource adequacy deficiencies and suggest or facilitate the process for developing alternative plans to mitigate identified deficiencies." The Functional Entity responsible for that function is the Planning Coordinator, who is "(t)he functional entity that coordinates, facilitates, integrates and evaluates (generally one year and beyond) transmission facility and service plans, and resource plans within a Planning Coordinator area and coordinates those plans with adjoining Planning Coordinator areas." Another function in the Functional Model is Transmission Planning, which has an identified task of "Evaluate, develop, document, and report on expansion plans for the Transmission Planner area. Assess whether the integrated plan meets reliability needs, and, if not, report on potential network conditions or configurations that do not meet performance requirements and provide potential alternative solutions to meet performance requirements." The Functional Entity responsible for that function is the Transmission Planner, who is "(t)he functional entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within a Transmission Planner area." The Reliability Coordinator, on the other hand, is "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." The focus of Criterion 1.3 is the long-term planning horizon, not real-time.				
Stacy Dochoda	Southwest Power Pool Regional Entity	10	Affirmative	1) Criteria 1.5 can be read to limit the cranking path to only the path between the entity's own defined blackstart resource and the generation resource to be started. This fails to consider the situation where cranking power is obtained through a tie interconnection to an adjacent utility or generation owner/operator. In this instance, the cranking path needs to be defined as starting at the interconnect point substation, in effect making the adjacent utility the blackstart

Balloter	Company	Seg-ment	Vote	Comment
				resource. If not clarified, a number of entities could identify no cranking paths to generation that must be started as part of initial system restoration simply because they have no blackstart generation resources that they, themselves, own and/or operate. 2) It is still not clear as to how far blackstart must go before initial system restoration is complete. Black start should be defined as starting the entity's generation resources to the point that load can be served (not to be confused with bringing on load to balance generation during the black start sequencing). This is often more than starting the first "black start" combustion turbine unit to start a thermal unit. Unless that black start unit has sufficient capacity to start individually every other generation resource in the entity's footprint that is not self-starting, additional generation is required even if not specifically identified as a black start resource in the entity's restoration plan. 3) There is sufficient opportunity for confusion and interpretation of the term Control Center that if the term is not to be added to the NERC Glossary, it should be defined locally to the standard. 4) Criteria 1.10 should be modified to refer to Critical Assets. In other words, "…would result in the loss of the Critical Assets..." 5) Criteria 1.14, 1.15. and 1.16 should refer to control center "and" backup control center rather than "or." 6) Measure M1 should be modified to state "The Responsible Entity shall make available its approved list of Critical Assets as specified in Requirement R1." (addition of the word "approved") 7) Measure M2 should be modified to state "The Responsible Entity shall make available its approved list of Critical Cyber Assets as specified in Requirement R2." (addition of the word "approved")

Balloter	Company	Seg-ment	Vote	Comment
				8) The Responsible Entity data retention requirement (Section D.1.4.1) should be modified to require records to be kept since the effective date of the standard or the most recent scheduled audit of this version of the standard, whichever is a shorter period of time, unless a shorter retention period (such as the 90-day routine log retention found in several of the CIP standards) is specified in a requirement. This is in keeping with NERC Compliance Process Bulletin #2009-005 'Current In-Force Document Data Retention Requirements for Registered Entities'. A similar modification should be made to CIP-003-4 through CIP-009-4. (Entities are already expected to retain all evidence in support of the annual, or in the case of the CIP standards to date, semi-annual self certification, so this is not an undue burden. Retention of records with the exception of specific information with a prescribed shorter retention, such as logs, will allow the CEA to verify sustained compliance with the standards over the full audit period. And, in the case of the logs, the entity will need to maintain some sort of evidence that logs were retained for at least 90 days, although retention of the actual logs is not required.) 9) Requirement R1 should be clarified to require the first list of identified Critical Assets to be developed prior to the effective date of the Standard. A number of entities have adopted the position that an annual requirement allows the first instance of the requirement to be performed any time within the first year after the effective date. 10) Requirement R2 should be clarified to require the first list of identified Critical Cyber Assets to be developed prior to the effective date of the Standard. A number of entities have adopted the position that an annual requirement allows the first instance of the requirement to be performed any time within the first year after the effective date. 11) The first bulleted qualifying criterion found in Requirement R2 states “The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter.” Although well intentioned, this does not adequately address risk exposure. While a given Critical Cyber Asset might not communicate itself with Cyber Assets outside of the Electronic Security Perimeter, the network it is connected to may well have connectivity to external networks. That external connectivity offers a vector for compromise through an intermediary system that both the external network and the Critical Cyber Asset are connected to. This exclusion should only apply

Balloter	Company	Seg-ment	Vote	Comment
				in the instance where the network employing a routable protocol is completely isolated from any network not enclosed within the same Electronic Security Perimeter. 12) A number of entities are getting around the routable protocol criteria for Critical Cyber Assets in Requirement R2 by utilizing data diodes for communication. This issue desperately needs to be addressed in this revision of the requirement. 13) Requirement R3 should be modified to require any update of the Critical Asset or Critical Cyber Asset list to be approved. This activity should be separated from the required annual review and approval, where the approval is required even if no changes were identified. 14) The proposed effective date of eight calendar quarters after regulatory approval (or the first day of the ninth calendar quarter after NERC BoT approval where regulatory approval is not required) is excessive and should be reverted back to the original two calendar quarter specification. The expectation is that the first Critical Asset and Critical Cyber Asset list must be developed by the effective date and allowing two years given straightforward bright-line criteria is not reasonable. While the concern may be that the entities would be expected to be fully compliant with all requirements of all eight standards by the effective date, such is not the case. Entities are expected to maintain compliance for any currently identified Critical Cyber Assets that appear on the Critical Cyber Asset list under the bright-line criteria. The entity then has up to two years to bring into compliance any newly identified Critical Cyber Assets stemming from the Version 4-compliant Critical Cyber Asset list. With an eight-calendar quarter effective date, entities can logically assume that they would have up to four years to come into compliance. 15) Figure 1: Sample Implementation Plan Timeline (General Case) in the accompanying guidance document should be restored to clarify the compliance timeline issue discussed in the previous comment.

Response: Thank you for your comments.

1. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." Additionally, it should be noted that

Balloter	Company	Seg-ment	Vote	Comment
				EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." 2. Again, A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." 3. Since the term "control center" is used in other NERC standards without confusion, it can be reasonably expected that a commonly accepted industry definition exists. The SDT believes that defining this term under this proposed version of the Standard would have far-reaching impacts beyond the scope of CIP-002-4 to CIP-009-4. 4. The SDT has considered your proposal and believes the posted wording is adequate. 5. The SDT has considered your proposal and believes the posted wording is adequate. 6. Since the list may be updated between annual approvals, the most updated list should be provided for Measure M1. 7. Since the list may be updated between annual approvals, the most updated list should be provided for Measure M2. 8. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. The suggested changes to the data retention requirement will be considered in a subsequent version of the CIP standards. 9. In order to be compliant with CIP-002-4 on the effective date of the standard, the list must be developed by the effective date. This is clarified in the implementation plan. 10. In order to be compliant with CIP-002-4 on the effective date of the standard, the list must be developed by the effective date. This is clarified in the implementation plan. 11. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. This issue will be considered in a subsequent version of the CIP standards. 12. The scope of CIP-002-4 was to address the consistency issues with the Critical Asset identification method. The team deliberately limited the scope of changes in this interim standard to minimize the impact on the industry while addressing the identified consistency issues. This issue will be considered in a subsequent version of the CIP standards. 13. The SDT debated this issue and determined that an annual approval of each list was sufficient. 14. Currently identified CCAs which would remain on the list after applying "bright-line" criteria should comply with Version 3 of the CIP Cyber Security Standards until the Effective Date of Version 4. CCAs identified through the first application of Attachment 1 of CIP-002-4 shall comply with Version 4 of the CIP Cyber Security Standards on the Effective Date as well. In essence, an entity should have their list of CCAs fully compliant with Version 4 of the CIP Cyber Security Standards on the Effective Date, which occurs approximately 2 years after FERC approval in the US. 15. Currently identified CCAs which would remain on the list after applying "bright-line" criteria should comply with Version 3 of the CIP Cyber Security Standards until the Effective Date of Version 4. CCAs identified through the first application of Attachment 1 of CIP-002-4 shall comply with Version 4 of the CIP Cyber Security Standards on the Effective Date as well. In essence, an entity should have their list of CCAs fully compliant with Version 4 of the CIP Cyber Security Standards on the Effective Date, which occurs approximately 2 years after FERC approval in the US.

Balloter	Company	Seg-ment	Vote	Comment
Larry D. Grimm	Texas Reliability Entity	10	Affirmative	In Part D, Compliance, Section 1.2, the acronyms RE and CEA should be spelled out (Regional Entity and Compliance Enforcement Authority).
Response: Thank you for your comment. Your suggested changes have been made.				
Louise McCarren	Western Electricity Coordinating Council	10	Affirmative	We recognize that the drafting team was charged with developing a bright line methodology for determining Critical Assets to address the need for consistency and that the bright line methodology accomplishes that. We continue to have concerns that for some entities in the West, the bright line methodology may result in fewer facilities being identified as Critical Assets than under the entities individual methodologies required by the current version of CIP-002. We also continue to have concerns that the proposed standard is not as clear as it could be regarding the identification of Critical CYBER Assets and urge NERC to consider a bright line methodology for Critical CYBER Assets in future revisions of the standard.
Response: Thank you for your comments. While some entities may have a few assets fall off of its Critical Asset list, it is expected that overall more BES assets in North America will be classified as Critical Assets. This issue will be considered in a subsequent version of the CIP standards.				
Frank Gaffney	Florida Municipal Power Agency	4	Affirmative	FMPA appreciates the hard work of the SDT. We have five issues that were not a big enough reasons to vote Negative, but, we would like to see addressed: 1. On Attachment 1, bullet 1.12, the phrase "for failure to operate as designed" was added since the last posting. We believe that this is inappropriate. Most SPS's are installed for automatic response to multi-contingency events. For an IROL to be exceeded, the multi-contingency event would need to occur at system conditions that would cause an IROL to be exceeded at the same time that the SPS failed to operate. The probability of the multi-contingency event occurring at such system conditions is very small (e.g., 1 in 50 year order of magnitude frequency), and the SPS would need to fail at that same time. We believe that the appropriate risk to protect against is manipulation of SPS at conditions experienced more frequently and we believe the original wording is correct.. 2. Attachment 1, bullets 1.4 and 1.5. Any and all blackstart and cranking paths that are part of a TOP's restoration plan are included, no matter the importance to the region. This is not reasonable and only a few of the region's black-start unit and cranking paths ought to be
David Schumann	Florida Municipal Power Agency	5		
Richard L. Montgomery	Florida Municipal Power Agency	6		

Balloter	Company	Seg-ment	Vote	Comment
				identified as critical (e.g., as identified in the regional plan). FMPA suggests something like: "Blackstart units and cranking paths determined as critical by the Reliability Coordinator", which is similar in concept to Attachment 1, bullet 1.3. 3. Use of the word "annual". We would probably be better off avoiding the word and saying something like "each calendar year but no longer than 16 months" to avoid controversy of the ambiguity of the term "annual". 4. 1500 MW used in Attachment 1, item 1.1, and the 1000 MVAR used in 1.2, are rather arbitrary and ought to vary by region. 1.1 could use the combined Contingency Reserves of entities within the Reliability Coordinator or something like that 5. Attachment 1, bullet 1.13 Automatic load shedding of 300 MW. The 300 MW is rather arbitrary and it ought to be any cyber-system controlled ability to shed load, not just automatic, of the same target of 1.1 (currently 1500 MW). Loss of 300 MW of load has less impact to BES reliability than loss of 300 MW of generation, so, there is inconsistency between the 1500 MW target for generation of bullet 1.1 and the 300 MW loss of load target of 1.13.
Response: Thank you for your comments. 1. "Failure to operate as designed" was added to this criterion to account for human error, misconfigurations, improper change management (whether unintentional or malicious). 2. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets. 3. The phraseology you are concerned about (annual) exists in the current CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version. 4. The issue with using different MW values in each region is that it does not meet the objective of uniform application of Critical Asset identification across all entities. 5. The issue with using different MW values in each region is that it does not meet the objective of uniform application of Critical Asset identification across all entities. The posted Guidance document has been modified to add reasoning for the 300 MW threshold level.				
Larry E Watt	Lakeland Electric	1	Negative	We appreciate the hard work of the SDT. We have four issues that we would like to see addressed: 1. Use of the word "annual". We would probably better off avoiding the word and saying something like "each calendar year but no longer than 16 months" to avoid controversy of the ambiguity of the term.

Balloter	Company	Seg-ment	Vote	Comment
				2. 1500 MW used in Attachment 1, item 1.1, and the 1000 MVAR used in 1.2, are rather arbitrary and ought to vary by region. 1.1 could use the combined Contingency Reserves of entities within the Reliability Coordinator or something like that 3. Automatic load shedding of 300 MW. The 300 MW is arbitrary and it ought to be any cyber-system controlled load shedding, not just automatic, of the same target of 1.1 (currently 1500 MW) 4. Any and all blackstart and cranking paths that are part of a TOP's restoration plan are included, no matter the importance to the region. This is not reasonable and only a few of the regions black-start unit and cranking paths ought to be identified as critical (e.g., as identified in the regional plan). Randall McCamish	City of Vero Beach	1	Affirmative	The City of Vero Beach appreciates the hard work of the SDT. We have four issues that were not a big enough reason to vote Negative, but, we would like to see addressed: 1. Use of the word "annual". We would probably better off avoiding the word and saying something like "each calendar year but no longer than 16 months" to avoid controversy of the ambiguity of the term. 2. 1500 MW used in Attachment 1, item 1.1, and the 1000 MVAR used in 1.2, are rather arbitrary and ought to vary by region. 1.1 could use the combined Contingency Reserves of entities within the Reliability Coordinator or something like that. 3. Automatic load shedding of 300 MW. The 300 MW is arbitrary and it ought to be any cyber-system controlled load shedding, not just automatic, of the same target of 1.1 (currently 1500 MW) 4. Any and all blackstart and cranking paths that are part of a TOP's restoration plan are included, no matter the importance to the region. This is not reasonable and only a few of the regions black-start unit and cranking paths ought to be identified as critical (e.g., as identified in the regional plan). The City of Vero Beach suggests something like: "Blackstart units and cranking paths determined as critical by the Reliability Coordinator", which is similar in concept to Attachment 1, bullet 1.3.
Response: Thank you for your comments. 1. The phraseology you are concerned about (annual) exists in the current CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version. 2. The issue with using different MW values in each region is that it does not meet the objective of uniform application of Critical Asset identification across all entities. 3. The posted Guidance document has been modified to add reasoning for the threshold level. 4. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets.				

Balloter	Company	Seg-ment	Vote	Comment
Ralph Frederick Meyer	Empire District Electric Co.	1	Negative	EDE appreciates the work that the drafting team has performed to get this standard to this point in the balloting process; however EDE casts a negative vote for the following reasons: 1) The term "annual" is used in R1 twice and R3 twice. While NERC has not defined the term annual I would suggest the drafting team take the approach to change the wording from "annual" to either "Twelve Full Calendar Months" or "Once per Calendar year". This would clarify two of these requirements in the proposed standard. By providing clarity hear avoids future conflicts between auditor's interpretations of this standard and the companies wishing to comply. 2) In attachment A, 1.4. EDE would suggest that the Drafting team change 1.4 to read: "Each Blackstart Unit identified in the Transmission Operator's Restoration Plan restoring the initial load to a group of generator units at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500MW." 3) And EDE would suggest the change to 1.5 to read: "The facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Unit identified in 1.4 to the first interconnection point of the generation unit(s) to be started, up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan." These thee changes would further signify the importance of the bright line on Highly Impact facilities to the Bulk Electric System that the drafting team is seeking to accomplish. We understand the effort the drafting team has put forth to this point and feel that they are close to a standard that the industry can comply with if some minor considerations were taken.

Response: Thank you for your comments.

1. The phraseology you are concerned about (annual) exists in the current CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version.
2. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to

Balloter	Company	Seg-ment	Vote	Comment
control frequency or voltage." Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. 3. Please refer to response to comment 2.				
Kenneth Simmons	Gainesville Regional Utilities	3	Affirmative	GRG has two comments we would liek to see addressed: 1- Attachment 1, bullets 1.4 and 1.5. Any and all blackstart and cranking paths that are part of a TOP's restoration plan are included, no matter the importance to the region. This is not reasonable and only a few of the region's black-start unit and cranking paths ought to be identified as critical (e.g., as identified in the regional plan). GRU suggests something like: "Blackstart units and cranking paths determined as critical by the Reliability Coordinator", which is similar in concept to Attachment 1, bullet 1.3. 2- 2- Use of the word "annual". We would be better off avoiding the word and saying something like "each calendar year but no longer than 16 months" to avoid controversy of the ambiguity of the term "annual"

Stan T. Rzad	Keys Energy Services	1	Affirmative	Use of the word "annual", probably better off avoiding the word and saying something like "each calendar year but no longer than 16 months" to avoid controversy 1500 MW used in Attachment 1, item 1.1, and the 1000 MVAR used in 1.2, are rather arbitrary and ought to vary by region. 1.1 could use the contingency reserves of the Reliability Coordinator or something like that Automatic load shedding of 300 MW. The 300 MW is arbitrary and it ought to be any load shedding of the same target of 1.1 (currently 1500 MW) Any and all blackstart and cranking paths that are part of a TOP's restoration plan are included, not matter the importance to the region. This is not reasonable and only a few for the region ought to be identified (e.g., as identified in the regional plan). Unfortunately, not all regions have restoration plans, which is

Balloter	Company	Seg-ment	Vote	Comment
				really the issue (which seems a violation to EOP-006-1 R3 to me). FMPA appreciates the hard work of the SDT. We have five issues that were not a big enough reasons to vote Negative, but, we would like to see addressed: On Attachment 1, bullet 1.12, the phrase "for failure to operate as designed" was added since the last posting. We believe that this is inappropriate. Most SPS's are installed for automatic response to multi-contingency events. For an IROL to be exceeded, the multi-contingency event would need to occur at system conditions that would cause an IROL to be exceeded at the same time that the SPS failed to operate. The probability of the multi-contingency event occurring at such system conditions is very small (e.g., 1 in 50 year order of magnitude frequency), and the SPS would need to fail at that same time. We believe that the appropriate risk to protect against is manipulation of SPS at conditions experienced more frequently and we believe the original wording is correct.. Attachment 1, bullets 1.4 and 1.5. Any and all blackstart and cranking paths that are part of a TOP's restoration plan are included, no matter the importance to the region. This is not reasonable and only a few of the region's black-start unit and cranking paths ought to be identified as critical (e.g., as identified in the regional plan). FMPA suggests something like: "Blackstart units and cranking paths determined as critical by the Reliability Coordinator", which is similar in concept to Attachment 1, bullet 1.3. Use of the word "annual". We would probably be better off avoiding the word and saying something like "each calendar year but no longer than 16 months" to avoid controversy of the ambiguity of the term "annual". 1500 MW used in Attachment 1, item 1.1, and the 1000 MVAR used in 1.2, are rather arbitrary and ought to vary by region. 1.1 could use the combined Contingency Reserves of entities within the Reliability Coordinator or something like that Attachment 1, bullet 1.13 Automatic load shedding of 300 MW. The 300 MW is rather arbitrary and it ought to be any cyber-system controlled ability to shed load, not just automatic, of the same target of 1.1 (currently 1500 MW). Loss of 300 MW of load has less impact to BES reliability than loss of 300 MW of generation, so, there is inconsistency between the 1500 MW target for generation of bullet 1.1

Balloter	Company	Seg-ment	Vote	Comment
				and the 300 MW loss of load target of 1.13.
Response: Thank you for your comments. "Failure to operate as designed" was added to this criterion to account for human error, misconfigurations, improper change management (whether unintentional or malicious) The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions, regardless of MW capability. As such, these assets deserve protection as Critical Assets. The phraseology you are concerned about (annual) exists in the current CIP-002-3 standard. The SDT expects this phraseology to be resolved in the next version. The issue with using different MW values in each region is that it does not meet the objective of uniform application of Critical Asset identification across all entities. The posted Guidance document has been modified to add reasoning for the 300 MW threshold level.				
Allen Mosher	American Public Power Association	4	Abstain	The APPA CIP Task Force has identified what we believe to be an unintended consequence – a Catch-22 – from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. This interaction will cause many if not all registered TOPs, BAs and Generation Owners that control Blackstart Resources used in a TOP restoration plan to become subject to CIP-002 through CIP-009, regardless of entity size. EOP-005 requires all TOPs to have a restoration plan. APPA's reading of EOP-005 indicates that each TOP must identify one or more Blackstart Resources. CIP-002-4 Criterion 1.4 requires a TOP to identify each such Blackstart Resource identified in its restoration plan as a critical asset. Criterion 1.5 requires the identification of certain Cranking Paths as critical assets. Criterion 1.15 requires that each generation control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for generation control center size (1500 MW). Criterion 1.16 requires each transmission control

Balloter	Company	Seg-ment	Vote	Comment
				center or backup control center used to control a Cranking Path identified under Criterion 1.5 be identified as a critical asset, without any exception for TOP control center size. Criterion 1.17 requires each Balancing Authority control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for Balancing Authority control center size (1500 MW). In effect, Criterion 1.4 swallows all exceptions created under 1.15 through 1.17, with the possible exception of a generation-only BA that does not have any Blackstart Resource obligations to its TOP. All vertically integrated utilities would be responsible for CIP-002 through CIP-009, including small BAs and TOPs that do not own any other Critical Assets. To address this problem, we propose the following edits to 1.4 and 1.5 shown in redline CAPS/strikeout: 1.4. Each Blackstart Resource identified in the RESTORATION PLAN FOR A Transmission Operator[delete: 's restoration plan] SERVING LOAD OR GENERATION EQUAL TO OR GREATER THAN AN AGGREGATE OF 1500 MW IN A SINGLE INTERCONNECTION. 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(S) IDENTIFIED IN 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan. This surgical approach ensures that generation, TOP and BA control centers with responsibility for other critical generation and transmission assets are still responsible for full CIP-002-4 through CIP-009 compliance. However, small BA/TOP systems with no initial obligations to the RC and larger TOPs for regional restoration would not be deemed "critical." The experience of these smaller systems is that their restoration obligations have not been relied upon to restore the BES, but rather to start generation to serve local load after a system separation – and then to wait for direction from the RC on resynchronization with the rest of the BES, once voltage and frequency are stabilized. While we recognize that cyber events may have an impact on the availability of resources, the fundamental fact is the vast majority of Blackstart Resources and control centers will be protected under CIP-002 through -009, because they will be classified as Critical/High Impact under the proposed criteria, as revised above. Thus the revised criteria support rather than undermine the distinction between categorization of big iron/big aluminum resources and their associated control centers as Critical or High Impact in the development of CIP-002-4. The categorization and development of security controls for smaller resources as either medium or

Balloter	Company	Seg-ment	Vote	Comment
				low impact for the BES, should be addressed through development of additional bright line criteria and associated security controls in the next phase of this project (CIP-002-5 or CIP-010/011.)
Response: Thank you for your comment. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions. As such, these assets deserve protection as Critical Assets. Due to their connectivity and configuration, control centers that operate these Blackstart Resources also have the ability to jeopardize their availability and function in a time of need if maliciously misused. As such, these control centers should also be deemed Critical Assets. The SDT appreciates the "catch-22" concern that was brought forth by APPA. However, the SDT does not believe that the criteria as written present a catch-22 scenario. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." The APPA comments indicate that the assets of concern to them are being utilized "once voltage and frequency are stabilized." As such, these assets are not required to be included in the TOP's restoration plan as Blackstart Resources. Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.

Balloter	Company	Seg-ment	Vote	Comment
John S Bos	Muscatine Power & Water	3	Negative	MP&W agrees with all APPA comments. APPA points out, there is an obvious consequence from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. This noticeable interaction will cause many if not all registered TOP's, BA's, and GO's that control Blackstart Resources used in a TOP restoration plan to become subject to CIP-002 through CIP-009, regardless of the size of the entity. As the APPA points out, EOP-005 requires all TOPs to have a restoration plan. EOP-005 specifies that each TOP must identify one or more Blackstart Resources. CIP-002-4 Criterion 1.4 requires a TOP to identify each such Blackstart Resource identified in its restoration plan as a Critical Asset. Criterion 1.5 requires the identification of the Cranking Paths as Critical Assets. Criterion 1.15 requires that each generation control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a Critical Asset, without any exception for generation control center size (1500 MW). Criterion 1.16 requires each transmission control center or backup control center used to control a Cranking Path identified under Criterion 1.5 be identified as a Critical Asset, without any exception for TOP control center size. Criterion 1.17 requires each Balancing Authority control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for Balancing Authority control center size (1500 MW). In effect, Criterion 1.4 swallows all exceptions created under 1.15 through 1.17, with the possible exception of a generation-only BA that does not have any Blackstart Resource obligations to its TOP. All vertically integrated utilities would be responsible for CIP-002 through CIP-009, including small BAs and TOPs that do not own any other Critical Assets. To address this problem, MP&W agrees with the APPA position in the following edits: Criterion 1.4. Each Blackstart Resource identified in the Restoration Plan for a Transmission Operator serving load or generation equal to or greater than an aggregate of 1500 MW in a single Interconnection. Criterion 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(s) identified in 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan. MP&W agrees with surgical approach proposed by APPA, that ensures that generation, TOP and BA control centers with responsibility for other critical generation and transmission assets are still responsible for full

Balloter	Company	Seg-ment	Vote	Comment
				CIP-002-4 through CIP-009 compliance. However, small BA/TOP systems with no initial obligations to the RC and larger TOPs for regional restoration would not be deemed “critical.” MP&W concurs with the APPA assessment that the experience of these smaller systems is that their restoration obligations have not been relied upon to restore the BES. Rather, their importance is to start generation to serve their small, local loads after a system separation. At this point, these smaller systems are to wait for direction from the Reliability Coordinator on resynchronization with the rest of the BES, once voltage and frequency are stabilized. MP&W again consents with the APPA comments. We recognize that cyber events may have an impact on the availability of resources, the fundamental fact is the vast majority of Blackstart Resources and control centers will be protected under CIP-002 through -009, because they will be classified as Critical/High Impact under the proposed criteria, as revised above. Therefore, the revised criteria would support rather than undermine the distinction between categorization of big iron/big aluminum resources and their associated control centers as Critical or High Impact in the development of CIP-002-4. The categorization and development of security controls for smaller resources as either medium or low impact for the BES, should be addressed through development of additional bright line criteria and associated security controls in the next phase of this project (CIP-002-5 or CIP-010/011.)
Response: Thank you for your comment. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions. As such, these assets deserve protection as Critical Assets. Due to their connectivity and configuration, control centers that operate these Blackstart Resources also have the ability to jeopardize their availability and function in a time of need if maliciously misused. As such, these control centers should also be deemed Critical Assets. The SDT appreciates the "catch-22" concern that was brought forth by APPA. However, the SDT does not believe that the criteria as written present a catch-22 scenario. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." The APPA comments indicate that the assets of concern to them are being utilized "once voltage and frequency are stabilized." As such, these assets are not required to be included in the TOP's restoration plan as Blackstart Resources. Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator’s System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.

John D. Martinsen	Public Utility District No. 1 of Snohomish County	4	Affirmative	The District believes to be an unintended consequence – a Catch-22 – from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. This interaction will cause many if not all registered TOPs, BAs and Generation Owners that control Blackstart Resources used in a TOP restoration plan to become subject to CIP-002 through CIP-009, regardless of entity size. EOP-005 requires all TOPs to have a restoration plan. The District's reading of EOP-005 indicates that each TOP must identify one or more Blackstart Resources. CIP-002-4 Criterion 1.4 requires a TOP to identify each such Blackstart Resource identified in its restoration plan as a critical asset. Criterion 1.5 requires the identification of certain Cranking Paths as critical assets. Criterion 1.15 requires that each generation control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for generation control center size (1500 MW). Criterion 1.16 requires each transmission control center or backup control center used to control a Cranking Path identified under Criterion 1.5 be identified as a critical asset, without any exception for TOP control center size. Criterion 1.17 requires each Balancing Authority control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for Balancing Authority control center size (1500 MW). In effect, Criterion 1.4 swallows all exceptions created under 1.15 through 1.17, with the possible exception of a generation-only BA that does not have any Blackstart Resource obligations to its TOP. All vertically integrated utilities would be responsible for CIP-002 through CIP-009, including small BAs and TOPs that do not own any other Critical Assets. To address this problem, we propose the following edits to 1.4 and 1.5 shown in redline CAPS/strikeout: 1.4. Each Blackstart Resource identified in the RESTORATION PLAN FOR A Transmission Operator's restoration plan SERVING LOAD OR GENERATION EQUAL TO OR GREATER THAN AN AGGREGATE OF 1500 MW IN A SINGLE INTERCONNECTION. 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(S) IDENTIFIED IN 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan. This surgical approach ensures that generation, TOP and BA control centers with responsibility for other critical generation and transmission assets are still responsible for full CIP-002-4 through CIP-009

Richard L. Koch	Nebraska Public Power District	1	Affirmative	The APPA CIP Task Force has identified what we believe to be an unintended consequence – a Catch-22 – from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. This interaction will cause many if not all registered TOPs, BAs and Generation Owners that control Blackstart Resources used in a TOP restoration plan to become subject to CIP-002 through CIP-009, regardless of entity size. EOP-005 requires all TOPs to have a restoration plan. APPA's reading of EOP-005 indicates that each TOP must identify one or more Blackstart Resources. CIP-002-4 Criterion 1.4 requires a TOP to identify each such Blackstart Resource identified in its restoration plan as a critical asset. Criterion 1.5 requires the identification of certain Cranking Paths as critical assets. Criterion 1.15 requires that each generation control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for generation control center size (1500 MW). Criterion 1.16 requires each transmission control

Balloter	Company	Seg-ment	Vote	Comment
				center or backup control center used to control a Cranking Path identified under Criterion 1.5 be identified as a critical asset, without any exception for TOP control center size. Criterion 1.17 requires each Balancing Authority control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for Balancing Authority control center size (1500 MW). In effect, Criterion 1.4 swallows all exceptions created under 1.15 through 1.17, with the possible exception of a generation-only BA that does not have any Blackstart Resource obligations to its TOP. All vertically integrated utilities would be responsible for CIP-002 through CIP-009, including small BAs and TOPs that do not own any other Critical Assets. To address this problem, we propose the following edits to 1.4 and 1.5: 1.4. Each Blackstart Resource identified in the RESTORATION PLAN FOR A Transmission Operator SERVING LOAD OR GENERATION EQUAL TO OR GREATER THAN AN AGGREGATE OF 1500 MW IN A SINGLE INTERCONNECTION. 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(S) IDENTIFIED IN 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan. This surgical approach ensures that generation, TOP and BA control centers with responsibility for other critical generation and transmission assets are still responsible for full CIP-002-4 through CIP-009 compliance. However, small BA/TOP systems with no initial obligations to the RC and larger TOPs for regional restoration would not be deemed “critical.” The experience of these smaller systems is that their restoration obligations have not been relied upon to restore the BES, but rather to start generation to serve local load after a system separation – and then to wait for direction from the RC on resynchronization with the rest of the BES, once voltage and frequency are stabilized. While we recognize that cyber events may have an impact on the availability of resources, the fundamental fact is the vast majority of Blackstart Resources and control centers will be protected under CIP-002 through -009, because they will be classified as Critical/High Impact under the proposed criteria, as revised above. Thus the revised criteria support rather than undermine the distinction between categorization of big iron/big aluminum resources and their associated control centers as Critical or High Impact in the development of CIP-002-4. The categorization and development of security controls for smaller resources as either medium or low impact for the BES, should be addressed through development of additional bright line

Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.				
Linda R. Jacobson	City of Farmington	3	Affirmative	FEUS shares the concerns expressed by APPA with the draft standard regarding a 'catch 22' without a threshold designated for Blackstart Resources and cranking paths set forth in Criteria 1.4 and 1.5. However, FEUS believes the bright line criteria represented in CIP-002-4 is an improvement of the current CIP-002-3. FEUS also recognizes the importance of getting the bright line criteria approved; therefore, FEUS voted affirmative with an expectation the concern will be addressed in a future revision.
Response: Thank you for your comment. The SDT carefully selected criteria around the NERC Glossary term Blackstart Resource and its derivation from EOP-005-2. The team feels that these resources are critically important in their function to restore the BES under blackstart conditions. As such, these assets deserve protection as Critical Assets. Due to their connectivity and configuration, control centers that operate these Blackstart Resources also have the ability to jeopardize their				

Balloter	Company	Seg-ment	Vote	Comment
availability and function in a time of need if maliciously misused. As such, these control centers should also be deemed Critical Assets. The SDT appreciates the "catch-22" concern that was brought forth by APPA. However, the SDT does not believe that the criteria as written present a catch-22 scenario. A careful reading of EOP-005-2 indicates that those assets identified as Blackstart Resources are those needed to bring the shutdown area "to a state whereby the choice of Load to be restored is not driven by the need to control frequency or voltage." The APPA comments indicate that the assets of concern to them are being utilized "once voltage and frequency are stabilized." As such, these assets are not required to be included in the TOP's restoration plan as Blackstart Resources. Additionally, it should be noted that EOP-005-2 does not presume that Blackstart Resources are only those "located within the Transmission Operator's System." As such, smaller TOPs have the opportunity to coordinate with neighboring TOPs and the RC in the development of their restoration plan which may not necessarily identify Blackstart Resources in their own system. In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.				
Ernest Hahn	Metropolitan Water District of Southern California	1	Affirmative	Although MWD is voting yes, it supports the concern raised by the APPA CIP Task Force. The APPA Task Force has identified what may be an unintended consequence from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. This interaction will cause many if not all registered TOPs, BAs and Generation Owners that control Blackstart Resources used in a TOP restoration plan to become subject to CIP-002 through CIP-009, regardless of entity size.

Paul Morland	Colorado Springs Utilities	1	Affirmative	CSU shares the concerns expressed by many other APPA members with the draft standard and CSU would support the following proposed revision developed by the APPA CIP Task Force as an improvement in clarity that will focus cyber-security controls on assets that are truly Critical to BES real-time operations: The APPA CIP Task Force has identified what we believe to be an unintended consequence – a Catch-22 – from the interaction of the revised CIP-002-4 Attachment 1's Criteria 1.4 (Blackstart Resources) and 1.5 (identified Cranking Paths) with the control center size and facility exceptions in 1.15, 1.16 and 1.17. This interaction will cause many if not all registered TOPs, BAs and Generation Owners that control Blackstart Resources used in a TOP restoration plan to become subject to CIP-002 through CIP-009, regardless of entity size. EOP-005 requires all TOPs to have a restoration plan. APPA's reading of EOP-005 indicates that each TOP must identify one or more Blackstart Resources. CIP-002-4 Criterion 1.4 requires a TOP to identify each such Blackstart Resource identified in its restoration plan as a critical asset. Criterion 1.5 requires the identification of certain Cranking Paths as critical assets. Criterion 1.15 requires that each generation control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for generation control center size (1500 MW). Criterion 1.16 requires

Balloter	Company	Seg-ment	Vote	Comment
				each transmission control center or backup control center used to control a Cranking Path identified under Criterion 1.5 be identified as a critical asset, without any exception for TOP control center size. Criterion 1.17 requires each Balancing Authority control center or backup control center used to control a Blackstart Resource identified under Criterion 1.4 be identified as a critical asset, without any exception for Balancing Authority control center size (1500 MW). In effect, Criterion 1.4 swallows all exceptions created under 1.15 through 1.17, with the possible exception of a generation-only BA that does not have any Blackstart Resource obligations to its TOP. All vertically integrated utilities would be responsible for CIP-002 through CIP-009, including small BAs and TOPs that do not own any other Critical Assets. To address this problem, we propose the following edits to 1.4 and 1.5 shown in redline CAPS/strikeout: 1.4. Each Blackstart Resource identified in the RESTORATION PLAN FOR A Transmission Operator's restoration plan serving load or generation equal to or greater than an aggregate of 1500 MW in a single Interconnection. 1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource(s) identified in 1.4. to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan. This surgical approach ensures that generation, TOP and BA control centers with responsibility for other critical generation and transmission assets are still responsible for full CIP-002-4 through CIP-009 compliance. However, small BA/TOP systems with no initial obligations to the RC and larger TOPs for regional restoration would not be deemed "critical." The experience of these smaller systems is that their restoration obligations have not been relied upon to restore the BES, but rather to start generation to serve local load after a system separation – and then to wait for direction from the RC on resynchronization with the rest of the BES, once voltage and frequency are stabilized. While we recognize that cyber events may have an impact on the availability of resources, the fundamental fact is the vast majority of Blackstart Resources and control centers will be protected under CIP-002 through -009, because they will be classified as Critical/High Impact under the proposed criteria, as revised above. Thus the revised criteria support rather than undermine the distinction between categorization of big iron/big aluminum resources and their associated control centers as Critical or High Impact in the development of CIP-002-4. The categorization and development of security controls for smaller resources as either medium or low impact for the BES, should be addressed through

Balloter	Company	Seg-ment	Vote	Comment
				development of additional bright line criteria and associated security controls in the next phase of this project (CIP-002-5 or CIP-010/011.)

In light of these clarifications, the SDT does not believe that a catch-22 exists that would unnecessarily bring in all TOP/BA control centers regardless of size, but rather only those that have the potential to impact Blackstart Resources that are essential to BES restoration as identified through EOP-005-2.				

CIP-002-4 – Cyber Security – Critical Cyber Asset Identification

Rationale and Implementation Reference Document

NERC Cyber Security Standards Drafting Team for Order 706
December 2010

This document provides guidance for Responsible Entities in the application of the criteria in CIP-002-4, Attachment 1. It provides clarifying notes on the intent and rationale of the Standards Drafting Team. It is not meant to augment, modify, or nullify any compliance requirements in the standard.

TABLE OF CONTENTS

CIP-002-4 – CYBER SECURITY - CRITICAL CYBER ASSET IDENTIFICATION

RATIONALE AND IMPLEMENTATION REFERENCE DOCUMENT

This document serves as a reference and provides guidance for Responsible Entities in the application of the criteria in CIP-002-4, Attachment 1. It provides clarifying notes on the intent and rationale of the Standards Drafting Team. It is not meant to augment, modify, or nullify any compliance requirements in the standard.

EXECUTIVE SUMMARY

The North American Electric Reliability Corporation (NERC) Reliability Standards are a set of standards that preserve and enhance the reliability of the Bulk Electric System (BES). The objective of the CIP standards is to protect the critical infrastructure elements necessary for the reliable operation of this system. CIP-002-4 – Cyber Security – Critical Cyber Asset Identification requires "the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System."

In drafting CIP-002-4, the drafting team used an approach that leveraged work that that it had already performed towards categorization of BES cyber systems. The drafting team also worked within a narrowly defined scope that includes addressing the following:

- Non-uniform application of methodologies for identifying Critical Assets resulting in wide variation in the types and number of critical assets across regions. The approach taken to mitigate this issue was to replace the Entity-defined Risk-Based Methodology requirement with a bright-line based criteria requirement for identifying Critical Assets.
- FERC Order 706 comments and directives regarding oversight of the lists of identified Critical Assets in CIP-002. (Para. 329). By using bright-line criteria, the requirement for oversight is significantly mitigated.
- External perceptions of insufficiency of the Entity-defined methodologies in identification of Critical Assets.

To accomplish these objectives, the drafting team adapted the approach originally used in the on-going development of cyber security standards and the categorization of BES Cyber Systems based on their impact on the BES functions performed by BES assets. For CIP-002-4, the drafting team primarily used those criteria defined for the High Impact category to identify Critical

Assets as a step towards identifying Critical Cyber Assets. These criteria were developed for the three major classes of assets used in the reliable operation of the BES: generation, transmission, and control centers. Because substantial work has already been completed for the planning and operation of these assets by existing and evolving NERC reliability standards, these standards were a natural source which the drafting team used to define the areas from which bright-line criteria would be derived and developed. Additionally, the drafting team drew on other published documents in this area.

INTRODUCTION

The North American Electric Reliability Corporation (NERC) Reliability Standards are a set of standards developed to preserve and enhance the reliability of the Bulk Electric System (BES). The objective of the CIP series of these standards is to protect the critical infrastructure elements necessary for the **reliability and operability** of this system. The overarching mission is preserving and enhancing the reliability of the BES, which consists of assets engineered to perform functions to achieve this objective. The CIP Cyber Security Standards define cyber security requirements to protect cyber systems used in support of these functions and the reliability or operability of these assets.

CIP-002-4 – Cyber Security – Critical Cyber Asset Identification requires "the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System."

In drafting CIP-002-4, the drafting team used an approach that leveraged work that it had already performed towards categorization of BES cyber systems. The drafting team also worked within a narrowly defined scope that included addressing the following:

- Non-uniform application of methodologies for identifying Critical Assets resulting in wide variation in the types and number of critical assets across regions. The approach taken to mitigate this issue was to replace the Entity-defined Risk-Based Methodology requirement with a bright-line based criteria requirement for identifying Critical Assets.
- FERC Order 706 comments and directives regarding oversight of the lists of identified Critical Assets in CIP-002. (Para. 329). By using bright-line criteria, the requirement for oversight is significantly mitigated.
- External perceptions of insufficiency of the Entity-defined methodologies in identification of Critical Assets.

To accomplish these objectives, the drafting team adapted the approach originally used in the on-going development of cyber security standards that addressed the categorization of BES Cyber Systems based on their impact on the BES functions performed by BES assets. For CIP-002-4, the drafting team primarily used those criteria defined for the High Impact category to identify Critical Assets as a step towards identifying Critical Cyber Assets. The original categorization criteria were developed over the course of approximately one year with assistance from many participants in the operating and planning areas. These criteria had

already been posted through informal industry comment. In the context of CIP-002-4, the criteria in Attachment 1 form the backbone of the changes introduced in this version.

These criteria were developed for the three major classes of assets used in the reliable operation of the BES: generation, transmission, and control centers. Because substantial work has already been completed for the planning and operation of these assets by existing and evolving NERC reliability standards, these standards were a natural source which the drafting team used to define the areas from which bright-line criteria would be derived and developed. Additionally, the drafting team drew on several published documents referenced later in this document.

This document provides guidance and clarification on intent and context of the criteria in Attachment 1 to assist Entities in their application.

The scope of the CIP Cyber Security standards excludes the elements associated with the market functions UNLESS they also affect the reliable operation of the BES. In addition, these standards explicitly exclude facilities, equipment, and systems regulated by US and Canadian nuclear regulatory bodies since they are regulated outside of NERC jurisdiction. There may be facilities, equipment, or systems which may be in a nuclear facility associated with the BES which are outside of the regulatory realm of these nuclear organizations. These would therefore be regulated under these NERC CIP standards, as directed by FERC Order 706B, in the United States. Also, the CIP Cyber Security Standards do not include those assets associated with BES planning activities UNLESS they also have a direct effect on the reliable operation of the BES. There will, however, be cases where these types of BES planning and market function systems may be required to be protected under the CIP standards (e.g., they are in the same Electronic Security Perimeter) and must meet the protection requirements of the Cyber Security Standards.

OVERALL APPLICATION OF ATTACHMENT 1

Attachment 1 is a list of criteria that determines which BES assets are to be identified as Critical Assets under CIP-002-4, requirement R1. The following provides guidance and clarification that pertains to Attachment 1 as a whole.

- When the drafting team uses the term “Facilities”, it leaves some latitude to Responsible Entities to determine included Facilities. The term Facility is defined in the NERC Glossary of Terms as “A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.).” In most cases the criteria refer to a group of Facilities in a given location that support the reliable operation of the BES. For example, for Transmission assets, the substation may be designated as the group of Facilities. However, in a substation that includes equipment that supports BES operations along with equipment that only supports Distribution operations, the Responsible Entity may be better served to designate only the group of Facilities that supports BES operation. In that case, the Responsible Entity may designate the group of Facilities by location, with qualifications on the group of Facilities that support reliable operation of the BES, as the Critical Asset. Generation Facilities are separately discussed in the Generation section below.

- In certain cases, a single Facility or group of Facilities may qualify as a Critical Asset by meeting multiple criteria. In such cases, the Responsible Entity may choose to document all criteria that qualify this asset as a Critical Asset. This will avoid inadvertent dropping of a particular Critical Asset when it no longer meets one of the criteria, but still meets another.

- The bright-line criteria in Parts 1.5 and 1.12 are included in both the generation and Transmission sections below because there may be generation or Transmission Facilities that meet these criteria. Although this document separately discusses the bright-line criteria in sections focused on generation, Transmission, and control centers, the criteria in Parts 1.5 and 1.12 were replicated to provide clarity to the reader. All Entities should understand that regardless of registration, they must review and apply all criteria against their list of assets in order to properly identify those assets which should be declared Critical Assets.

- A Critical Asset should be listed by only one Responsible Entity. Where there is joint ownership, it is advisable that the owning Responsible Entities should formally agree on the designated Responsible Entity responsible for compliance with the standards.

GENERATION

The criteria in Attachment 1 that generally apply to Generation Owner and Operator (GO/GOP) Registered Entities are parts 1.1, 1.3, 1.4, 1.5, 1.12 and 1.15.

- Part 1.1 designates as Critical Assets any group of generation units in a single plant location, whose net Real Power capability exceeds 1500 MW. Single plant location refers to a group of generating units occupying a defined physical footprint, often but not always, these units are surrounded by a common fence, have a common entry point, share common facilities such as warehouses, water plants and cooling sources, follow a similar naming convention (plant name - unit number) and fall under a common management organization. The 1500 MW criterion is sourced partly from the Contingency Reserve requirements in NERC standard BAL-002 whose purpose is "to ensure the Balancing Authority is able to utilize its Contingency Reserve to balance resources and demand and return Interconnection frequency within defined limits following a Reportable Disturbance". In particular, it requires that "as a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency." The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions.

  In the use of net Real Power capability, the drafting team sought to use a value that could be verified through existing requirements: NERC standard MOD-024 was sourced for that.

- By using 1500 MW as a bright-line, the intent of the drafting team was to ensure that generation Facilities with common mode vulnerabilities that could result in the loss of generation capability higher than 1500 MW are adequately protected. Requirement R2 in CIP-002-4 further stipulates that, for Generation Facilities, only those Cyber Assets that are shared by any combination in a group of units that would exceed this value are candidates for further qualification as Critical Cyber Assets (i.e. the Critical Asset is the group of units). In considering common mode vulnerabilities, the Responsible Entity should include all Facilities and systems up to the point where the Generation is attached to the Transmission system.

  In specifying a 15 minute qualification, the drafting team sought to include those Cyber Assets which would have a real-time impact on the reliable operation of the BES. In a

generation facility context, there may be Facilities which, while essential to the reliability and operability of the generation facility, may not have real-time operational impact within the specified real-time operations impact window of 15 minutes. This may be illustrated in the case of cyber assets controlling the supply of coal fuel in a coal burning facility: in this case, the compromise of the cyber asset may result in an inability of the supply system to bring the fuel for generation. However, because of the way these systems are used, there may be a significant time before this affects real-time operation, time during which detection and remediation may be able to be effected.

The drafting team also used additional time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used.

- In part 1.3, the drafting team sought to ensure that those generation Facilities that have been designated by the Planning Coordinator as necessary to avoid BES Adverse Reliability Impacts in the long term planning horizon are designated as Critical Assets. These Facilities may be designated as "Reliability Must Run" and this designation is distinct from those generation Facilities designated as "must run" for market stabilization purposes. Because the use of the term "must run" creates some confusion in many areas, the drafting team chose to avoid using this term and instead drafted the requirement in more generic reliability language. In particular, the focus on preventing an Adverse Reliability Impact dictates that these units are designated as must run for reliability purposes beyond the local area. Those units designated as must run for voltage support in the local area would not generally be given this designation. In cases where there is no designated Planning Coordinator, the Transmission Planner is included as the Registered Entity that performs this designation.

  In the specification of the "long-term planning horizon" in this criterion, the drafting team sought to ensure that such Critical Assets would be designated in the time horizon described in the NERC document "Time Horizons", which defines long-term planning horizon as "a planning horizon of one year or longer".

If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, such as due to a category C3 contingency as defined in TPL-003 or a category D contingency as defined in TPL-004, then that unit must be classified as a Critical Asset.

- In part 1.4, generation resources that have been designated as Blackstart Resources in the Transmission Operator's restoration plan are designated as Critical Assets. NERC standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan as well as requirements to test these Resources. This criterion designates only those generation Blackstart Resources that have been designated as such in the Transmission Operator's restoration plan. The glossary term Blackstart Capability Plan has been retired. While the definition of Blackstart Resource includes the fact that it is in a Transmission Operator's Restoration Plan, the drafting team included the term in the criterion for clarity.

  Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in NERC standard EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 1.5 designates Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator's restoration plan, up to the point on the Cranking Path where two or more path options exist as Critical Assets. This criterion is sourced from requirements in NERC standard EOP-005-2, which requires the Transmission Operator to include in its Restoration Plan the Cranking Paths and initial switching requirements from the Blackstart Resource and the unit(s) to be started. The drafting team further qualified the Facilities to be designated as Critical Assets as only those in the Cranking Path up to the point where two or more paths exist to the units to be started.

- Part 1.12 designates Special Protection Systems and Remedial Action Schemes as Critical Assets. Special Protection Systems and Remedial Action Schemes may be implemented

to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time it is required or if it operates outside of the parameters it was designed for. Generation Owners and Operators which own such systems and schemes must designate them as Critical Assets.

- Part 1.15 designates generation control centers that control generation Facilities designated as Critical Assets, or used to control generation greater than an aggregate of 1500 MW in a single Interconnection, as Critical Assets. In the development of this criterion, the drafting team used 1500 MW as a bright line for aggregate generation controlled based on the bright-line used in Part 1.1. The drafting team specified a single Interconnection because it is more likely that the span of control of the generation control center may cross multiple BA or RSG areas or even regions and Interconnections, and that BES impact will more likely be restricted within an Interconnection.

  This criterion uses the phrase "control generation." Entities should consider the discussion of "control" for generation as discussed in the Frequently Asked Questions (FAQ) document for CIP 002-1, Question 9:

  > **"Question:** *Are Cyber Assets for a control center or generation control center with monitoring only and no direct remote control required to be protected and secured under the Cyber Cyber Security Standards?*
  > **Answer:** A control center or generation control center that provides critical operating functions and tasks as identified in CIP–002 must be protected per the requirements of the Cyber Security Standard. The monitoring and operating control function includes controls performed automatically, remotely, manually, or by voice instruction.
  > An example of monitoring without direct control that is subject to the Cyber Security Standards is a Reliability Authority that receives data from Critical Cyber Assets to a state estimator. "

It must be noted that this part does not apply to those systems that would be included in the evaluation of Cyber Assets that are only associated with Facilities in a single plant location as specified in part 1.1. These would include Cyber Assets in control rooms in these generation plants. An excellent discussion of control centers and control rooms can be found in the NERC document "Security Guideline for the Electric Sector: Identifying Critical Assets".

TRANSMISSION

Parts 1.2, 1.5-1.13 in Attachment 1 are the criteria that are applicable to Transmission Owners and Operators. The general approach to the criteria is that these should cover those transmission Facilities generally designated as Extra High Voltage (EHV)[1,2] which form the backbone of the BES. At the lower end of the EHV range, additional qualifications have been defined to ensure appropriate impact for Critical Assets. In many of the criteria, the impact threshold is defined as the capability of the failure or compromise of a Critical Asset to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs).

- Part 1.2 includes those Facilities in Transmission systems that provide reactive resources to enhance and preserve the reliability of the BES. The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.

- In Part 1.5, the intent is to ensure that the Cranking Paths and other BES Transmission Facilities required to support the Transmission Operator's restoration plan required by EOP-005-2 receive consideration for protection from cyber threats. Transmission Owners and Operators own and operate a large number of these Facilities. EOP-005-2 specifies Facilities that comprise the "Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started". Part 1.5 specifies that the Facilities meeting these requirements or comprising the Cranking Paths be identified as Critical Assets.

[1] REA BULLETIN 1724E-202. An Overview of Transmission System Studies,Page 12:6.1.3 System Voltage : Transmission system voltages below the extra-high-voltage (EHV) level are between 34.5 and 230 kilovolts(kV). The nominal EHV levels in the United States are 345, 500 and 765 kV. (http://www.usda.gov/rus/electric/pubs/a/1724e202.pdf)

[2] Webster on-line Dictionary: Voltage levels higher than those normally used on transmission lines. Generally EHV is considered to be 345,000 volts or higher. (EHV).

Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 1.6 includes any Transmission Facility at a substation operated at 500 kV or higher. While the drafting team felt that Facilities operated at 500 kV or higher did not require any further qualification for their role as components of the backbone on the Interconnected BES, Facilities in the lower EHV range should have additional qualifying criteria for inclusion as a Critical Asset.

  It must be noted that if the collector bus for a non-Critical Asset generation plant (i.e. the plant is smaller in aggregate than the threshold set for generation plants in Part 1.1) is operated at 500kV, the collector bus should be considered a Generation Interconnection Facility and not a Transmission Facility, according to the "Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface". This collector bus would not be a Critical Asset because it doesn't significantly affect the 500kV Transmission grid; it only affects a plant which is below the Critical Asset threshold.

- Part 1.7 includes the lower end of the EHV range between 300kV and 500 kV, (primarily Facilities operated at 345kV) with qualifications for inclusion as Critical Assets if they are deemed highly likely to have significant impact on the BES. While the criterion has been specified as part of the rationale for requiring protection for EHV Transmission Facilities, the drafting team included, in this criterion, additional qualifications that would ensure the required level of impact to the BES: at this lower end of the EHV spectrum, the drafting team:
  - Excluded radial facilities that would only provide support for single generation facilities.
  - Specified interconnection to at least 3 transmission stations or substations to ensure that the level of impact would be appropriate.

- Parts 1.8 and 1.9 include those Transmission Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, **Establish and Communicate System Operating Limits,** R5.1.1 and R5.1.3.

- Part 1.10 designates those Transmission Facilities as Critical Assets that provide the generation interconnection for Generation Facilities identified as Critical Assets to the Transmission system. The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets.

- Part 1.11 is sourced from the NUC-001 NERC standard for the support of Nuclear Facilities. NUC-001 ensures that reliability of NPIR's are ensured through adequate coordination between the Nuclear Generator Owner/Operator and its Transmission provider "for the purpose of ensuring nuclear plant safe operation and shutdown". In particular, there are specific requirements to coordinate physical and cyber security protection of these interfaces.

- Part 1.12 designates as Critical Assets those Special Protection Systems (SPS), Remedial Action Schemes (RAS), or automated switching systems installed to ensure BES operation within IROLs. The degradation, compromise or unavailability of these Critical Assets would result in exceeding IROLs if they fail to operate as designed. By the definition of IROL, the loss or compromise of any of these have Wide Area impacts.

- Part 1.13 designates as Critical Assets those systems or Facilities that are capable of performing automatic load shedding, without human operator initiation, of 300 MW or more. The SDT spent considerable time discussing the wording of criterion 1.13, and chose the term "Each" to represent that the criterion applied to a discrete system or Facility. In the drafting of this criterion, the drafting team sought to include only those systems that did not require human operator initiation, and targeted in particular those Under Frequency Load Shedding (UFLS) facilities and systems and Under Voltage Load Shedding (UVLS) facilities and systems that would be implemented as part of a regional load shedding requirement to prevent Adverse Reliability Impact. These include automated Under Frequency Load Shedding systems or Under Voltage Load Shedding Systems that are capable of load shedding 300 MW or more. It should be noted that those qualifying systems which require a human operator to arm the system, but once armed, trigger automatically, are still to be considered as not requiring human operator initiation and should be designated as Critical Assets.

Within an operational environment the drafting team understands that the real-time impact to the Bulk Electric System of a loss of load, or the equivalent amount of generation, will be similar, with loss of load resulting in a frequency high condition and a loss of generation resulting in a frequency low condition. This particular threshold (300 MW) was provided in CIP version 1. The SDT believes that the threshold should be lower than the 1500MW generation requirement since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System and hence requires a lower threshold for inclusion as Critical Assets.

In ERCOT, the Load acting as a Resource ("LaaR") Demand Response Program is not part of the regional load shedding program, but an ancillary services market.

CONTROL CENTERS

Parts 1.14 through 1.17 apply to BES control centers. Control centers generally perform control center functions for multiple BES assets. These Facilities are evaluated as a control center. Facilities that perform control center functions for only a single BES asset should be evaluated as part of the BES asset (e.g., control room for a single generation plant or transmission substation). While it is clear that the primary and all backup control centers operated by RCs, BAs, or TOPs **that meet the criteria** must be designated as Critical Assets, control centers at other applicable Responsible Entities that are used, by delegation, to perform the functional obligations of the RCs, BAs, or TOPs must also be designated as Critical Assets. These include Transmission Owners' control centers and backup control centers, for example, which have been formally delegated to perform some of these functions. It should be noted that Cyber Assets essential to the operation of a control center may be located at a data center that is not co-located with the control center itself.

- Part 1.14 designates all control centers used to perform the functional obligations of the Reliability Coordinator (RC) as Critical Assets. Each Reliability Coordinator control center and backup control center was included as a Critical Asset due to their key role in maintaining reliability for the Interconnection as a whole in concert with other Reliability Coordinators.

- For part 1.15, please refer to the discussion of generation control centers in the Generation section of this document.

- Part 1.16 specifies that all control centers or backup control centers that perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12. Due to the direct impact on the operation of identified Critical Assets, these Transmission control centers must be designated as Critical Assets. It must be noted that in many cases, some Transmission Operator functions are delegated to Transmission Owner control centers: in such cases, these must also be designated as Critical Assets. As with the discussion of part 1.15, the drafting team intended for the word control to have the same meaning as that found in *Frequently Asked Questions Cyber Security Standards CIP-002-1 through CIP-009-1* which indicates that controls may be "performed automatically, remotely, manually, or by voice instruction."

- Part 1.17 specifies that all control centers that perform the functional obligations of the a Balancing Authority (BA) that include at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13 must be declared as Critical Assets. In addition, this criterion designates as a Critical Asset any BA control center that, in aggregate, performs the functional obligations of a BA for 1500 MWs or more in a single Interconnection. The threshold, controls generation of 1500 MW was chosen to maintain consistency with the threshold in part 1.1.

GUIDANCE ON THE IMPLEMENTATION PLAN

There are two implementation plans associated with CIP-002-4 through CIP-009-4: the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4* and the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.* These plans are intended to work together as a set. In order to determine when an Entity must be compliant with CIP-002-4 through CIP-009-4, they should refer first to the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4*. This implementation plan describes the schedule by which an Entity must become compliant with the Version 4 CIP Standards. Once this initial compliance milestone is reached, this implementation plan is effectively retired. For an Entity who registers after the Version 4 CIP

Standards are effective or for those Critical Cyber Assets that are newly identify after the Version 4 CIP Standards are effective, Responsible Entities should refer to the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.* The *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* remains in use throughout the entire time that the Version 4 CIP Standards remain in effect.

Responsible Entities shall be compliant with the requirements of CIP-002-4 through CIP-009-4 on the later of (i) the Effective Date[3] specified in the Standard or (ii) the compliance milestones in the version 3 Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities. This allows essentially a two year implementation period following FERC approval to become compliant with the Version 4 CIP Standards. Special consideration was given to maintain the compliance milestone date for those Critical Cyber Assets and Newly Registered Entities that are in the middle of their implementation period for the Version 3 Standards on the Effective Date of the Version 4 Standards.

The drafting team considered that Responsible Entities may not have been able to anticipate the addition of Critical Assets to the Critical Asset list since the criteria included in Attachment 1 of CIP-002-4 may significantly differ from an Entity's existing risk-based assessment methodology. As such, the drafting team determined that a one-time implementation window was needed to bring the Critical Cyber Assets at the newly identified Critical Assets into compliance with CIP-002-4 through CIP-009-4.

Both the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4* and the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* contain certain exceptions for U.S. Nuclear Power Plant Facilities in recognition of the special circumstances of this operating environment. The modifications used for the U.S. Nuclear Power Plant Facilities are consistent with those included in the Revised Implementation Plan for Version 3 of Cyber Security Standards CIP-002-3 through CIP-009-3.

[3] "The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)."

CONCLUSION

In formulating this document, the drafting team hopes to have clarified the thinking and intent behind the criteria in Attachment 1. The drafting team hopes that this document will also provide Responsible Entities with additional guidance in the implementation of CIP-002-4. The drafting team reiterates that this document is not intended to augment, modify, or nullify any of the requirements and criteria in the standard. The language of requirements in the standard remains the only authority for the purpose of evaluating compliance.

CIP-002-4 – Cyber Security – Critical Cyber Asset Identification

Rationale and Implementation Reference Document

NERC Cyber Security Standards Drafting Team for Order 706

~~September~~ December 2010

This document provides guidance for Responsible Entities in the application of the criteria in CIP-002-4, Attachment 1. It provides clarifying notes on the intent and rationale of the Standards Drafting Team. It is not meant to augment, modify, or nullify any compliance requirements in the standard.

TABLE OF CONTENTS

CIP-002-4 – CYBER SECURITY - CRITICAL CYBER ASSET IDENTIFICATION

RATIONALE AND IMPLEMENTATION REFERENCE DOCUMENT

This document serves as a reference and provides guidance for Responsible Entities in the application of the criteria in CIP-002-4, Attachment 1. It provides clarifying notes on the intent and rationale of the Standards Drafting Team. It is not meant to augment, modify, or nullify any compliance requirements in the standard.

EXECUTIVE SUMMARY

The North American Electric Reliability Corporation (NERC) Reliability Standards are a set of standards that preserve and enhance the reliability of the Bulk Electric System (BES). The objective of the CIP standards is to protect the critical infrastructure elements necessary for the reliable operation of this system. CIP-002-4 – Cyber Security – Critical Cyber Asset Identification requires "the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System."

In drafting CIP-002-4, the drafting team used an approach that leveraged work that that it had already performed towards categorization of BES cyber systems. The drafting team also worked within a narrowly defined scope that includes addressing the following:

- Non-uniform application of methodologies for identifying Critical Assets resulting in wide variation in the types and number of critical assets across regions. The approach taken to mitigate this issue was to replace the Entity-defined Risk-Based Methodology requirement with a bright-line based criteria requirement for identifying Critical Assets.
- FERC Order 706 comments and directives regarding oversight of the lists of identified Critical Assets in CIP-002. (Para. 329). By using bright-line criteria, the requirement for oversight is significantly mitigated.
- External perceptions of insufficiency of the Entity-defined methodologies in identification of Critical Assets.

To accomplish these objectives, the drafting team adapted the approach originally used in the on-going development of cyber security standards and the categorization of BES Cyber Systems based on their impact on the BES functions performed by BES assets. For CIP-002-4, the drafting team primarily used those criteria defined for the High Impact category to identify Critical

Assets as a step towards identifying Critical Cyber Assets. These criteria were developed for the three major classes of assets used in the reliable operation of the BES: generation, transmission, and control centers. Because substantial work has already been completed for the planning and operation of these assets by existing and evolving NERC reliability standards, these standards were a natural source which the drafting team used to define the areas from which bright-line criteria would be derived and developed. Additionally, the drafting team drew on other published documents in this area.

INTRODUCTION

The North American Electric Reliability Corporation (NERC) Reliability Standards are a set of standards developed to preserve and enhance the reliability of the Bulk Electric System (BES). The objective of the CIP series of these standards is to protect the critical infrastructure elements necessary for the **reliability and operability** of this system. The overarching mission is preserving and enhancing the reliability of the BES, which consists of assets engineered to perform functions to achieve this objective. The CIP Cyber Security Standards define cyber security requirements to protect cyber systems used in support of these functions and the reliability or operability of these assets.

CIP-002-4 – Cyber Security – Critical Cyber Asset Identification requires "the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System."

In drafting CIP-002-4, the drafting team used an approach that leveraged work that it had already performed towards categorization of BES cyber systems. The drafting team also worked within a narrowly defined scope that included addressing the following:

- Non-uniform application of methodologies for identifying Critical Assets resulting in wide variation in the types and number of critical assets across regions. The approach taken to mitigate this issue was to replace the Entity-defined Risk-Based Methodology requirement with a bright-line based criteria requirement for identifying Critical Assets.
- FERC Order 706 comments and directives regarding oversight of the lists of identified Critical Assets in CIP-002. (Para. 329). By using bright-line criteria, the requirement for oversight is significantly mitigated.
- External perceptions of insufficiency of the Entity-defined methodologies in identification of Critical Assets.

To accomplish these objectives, the drafting team adapted the approach originally used in the on-going development of cyber security standards that addressed the categorization of BES Cyber Systems based on their impact on the BES functions performed by BES assets. For CIP-002-4, the drafting team primarily used those criteria defined for the High Impact category to identify Critical Assets as a step towards identifying Critical Cyber Assets. The original categorization criteria were developed over the course of approximately one year with assistance from many participants in the operating and planning areas. These criteria had

already been posted through informal industry comment. In the context of CIP-002-4, the criteria in Attachment 1 form the backbone of the changes introduced in this version.

These criteria were developed for the three major classes of assets used in the reliable operation of the BES: generation, transmission, and control centers. Because substantial work has already been completed for the planning and operation of these assets by existing and evolving NERC reliability standards, these standards were a natural source which the drafting team used to define the areas from which bright-line criteria would be derived and developed. Additionally, the drafting team drew on several published documents referenced later in this document.

This document provides guidance and clarification on intent and context of the criteria in Attachment 1 to assist Entities in their application.

The scope of the CIP Cyber Security standards excludes the elements associated with the market functions UNLESS they also affect the reliable operation of the BES. In addition, these standards explicitly exclude facilities, equipment, and systems regulated by US and Canadian nuclear regulatory bodies since they are regulated outside of NERC jurisdiction. There may be facilities, equipment, or systems which may be in a nuclear facility associated with the BES which are outside of the regulatory realm of these nuclear organizations. These would therefore be regulated under these NERC CIP standards, as directed by FERC Order 706B, in the United States. Also, the CIP Cyber Security Standards do not include those assets associated with BES planning activities UNLESS they also have a direct effect on the reliable operation of the BES. There will, however, be cases where these types of BES planning and market function systems may be required to be protected under the CIP standards (e.g., they are in the same Electronic Security Perimeter) and must meet the protection requirements of the Cyber Security Standards.

OVERALL APPLICATION OF ATTACHMENT 1

Attachment 1 is a list of criteria that determines which BES assets are to be identified as Critical Assets under CIP-002-4, requirement R1. The following provides guidance and clarification that pertains to Attachment 1 as a whole.

- When the drafting team uses the term "Facilities", it leaves some latitude to Responsible Entities to determine included Facilities. The term Facility is defined in the NERC Glossary of Terms as "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)." In most cases the criteria refer to a group of Facilities in a given location that support the reliable operation of the BES. For example, for Transmission assets, the substation may be designated as the group of Facilities. However, in a substation that includes equipment that supports BES operations along with equipment that only supports Distribution operations, the Responsible Entity may be better served to designate only the group of Facilities that supports BES operation. In that case, the Responsible Entity may designate the group of Facilities by location, with qualifications on the group of Facilities that support reliable operation of the BES, as the Critical Asset. Generation Facilities are separately discussed in the Generation section below.

- In certain cases, a single Facility or group of Facilities may qualify as a Critical Asset by meeting multiple criteria. In such cases, the Responsible Entity may choose to document all criteria that qualify this asset as a Critical Asset. This will avoid inadvertent dropping of a particular Critical Asset when it no longer meets one of the criteria, but still meets another.

- The bright-line criteria in Parts 1.5 and 1.12 are included in both the generation and Transmission sections below because there may be generation or Transmission Facilities that meet these criteria. Although this document separately discusses the bright-line criteria in sections focused on generation, Transmission, and control centers, the criteria in Parts 1.5 and 1.12 were replicated to provide clarity to the reader. All Entities should understand that regardless of registration, they must review and apply all criteria against their list of assets in order to properly identify those assets which should be declared Critical Assets.

- A Critical Asset should be listed by only one Responsible Entity. Where there is joint ownership, it is advisable that the owning Responsible Entities should formally agree on the designated Responsible Entity responsible for compliance with the standards.

GENERATION

The criteria in Attachment 1 that generally apply to Generation Owner and Operator (GO/GOP) Registered Entities are parts 1.1, 1.3, 1.4, 1.5, 1.12 and 1.15.

- Part 1.1 designates as Critical Assets any group of generation units in a single plant location, whose net Real Power capability exceeds 1500 MW. Single plant location refers to a group of generating units occupying a defined physical footprint, often but not always, these units are surrounded by a common fence, have a common entry point, share common facilities such as warehouses, water plants and cooling sources, follow a similar naming convention (plant name - unit number) and fall under a common management organization. The 1500 MW~~This~~ criterion is sourced partly from the Contingency Reserve requirements in NERC standard BAL-002 whose purpose is "to ensure the Balancing Authority is able to utilize its Contingency Reserve to balance resources and demand and return Interconnection frequency within defined limits following a Reportable Disturbance". In particular, it requires that "as a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency." The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions.

  In the use of net Real Power capability, the drafting team sought to use a value that could be verified through existing requirements: NERC standard MOD-024 was sourced for that.

- By using 1500 MW as a bright-line, the intent of the drafting team was to ensure that generation Facilities with common mode vulnerabilities that could result in the loss of generation capability higher than 1500 MW are adequately protected. Requirement R2 in CIP-002-4 further stipulates that, for Generation Facilities, only those Cyber Assets that are shared by any combination in a group of units that would exceed this value are candidates for further qualification as Critical Cyber Assets (i.e. the Critical Asset is the group of units). In considering common mode vulnerabilities, the Responsible Entity should include all Facilities and systems up to the point where the Generation is attached to the Transmission system.

  In specifying a 15 minute qualification, the drafting team sought to include those Cyber Assets which would have a real-time impact on the reliable operation of the BES. In a

generation facility context, there may be Facilities which, while essential to the reliability and operability of the generation facility, may not have real-time operational impact within the specified real-time operations impact window of 15 minutes. This may be illustrated in the case of cyber assets controlling the supply of coal fuel in a coal burning facility: in this case, the compromise of the cyber asset may result in an inability of the supply system to bring the fuel for generation. However, because of the way these systems are used, there may be a significant time before this affects real-time operation, time during which detection and remediation may be able to be effected.

The drafting team also used additional time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used.

- In part 1.3, the drafting team sought to ensure that those generation Facilities that have been designated by the Planning Coordinator as necessary to avoid BES Adverse Reliability Impacts in the long term planning horizon are designated as Critical Assets. These Facilities may be designated as "Reliability Must Run" and this designation is distinct from those generation Facilities designated as "must run" for market stabilization purposes. Because the use of the term "must run" creates some confusion in many areas, the drafting team chose to avoid using this term and instead drafted the requirement in more generic reliability language. In particular, the focus on preventing an Adverse Reliability Impact dictates that these units are designated as must run for reliability purposes beyond the local area. Those units designated as must run for voltage support in the local area would not generally be given this designation. In cases where there is no designated Planning Coordinator, the Transmission Planner is included as the Registered Entity that performs this designation.

  In the specification of the "long-term planning horizon" in this criterion, the drafting team sought to ensure that such Critical Assets would be designated in the time horizon described in the NERC document "Time Horizons", which defines long-term planning horizon as "a planning horizon of one year or longer".

If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, such as due to a category C3 contingency as defined in TPL-003 or a category D contingency as defined in TPL-004, then that unit must be classified as a Critical Asset.

- In part 1.4, generation resources that have been designated as Blackstart Resources in the Transmission Operator's restoration plan are designated as Critical Assets. NERC standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan as well as requirements to test these Resources. This criterion designates only those generation Blackstart Resources that have been designated as such in the Transmission Operator's restoration plan. The glossary term Blackstart Capability Plan has been retired. While the definition of Blackstart Resource includes the fact that it is in a Transmission Operator's Restoration Plan, the drafting team included the term in the criterion for clarity.

  Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in NERC standard EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 1.5 designates Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator's restoration plan, up to the point on the Cranking Path where two or more path options exist as Critical Assets. This criterion is sourced from requirements in NERC standard EOP-005-2, which requires the Transmission Operator to include in its Restoration Plan the Cranking Paths and initial switching requirements from the Blackstart Resource and the unit(s) to be started. The drafting team further qualified the Facilities to be designated as Critical Assets as only those in the Cranking Path up to the point where two or more paths exist to the units to be started.

- Part 1.12 designates Special Protection Systems and Remedial Action Schemes as Critical Assets. Special Protection Systems and Remedial Action Schemes may be implemented

to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time it is required or if it operates outside of the parameters it was designed for. Generation Owners and Operators which ~~have implemented~~own such systems and schemes must designate them as Critical Assets.

- Part 1.15 designates generation control centers that control generation Facilities designated as Critical Assets, or used to control generation greater than an aggregate of 1500 MW in a single Interconnection, as Critical Assets. In the development of this criterion, the drafting team used 1500 MW as a bright line for aggregate generation controlled based on the bright-line used in Part 1.1. The drafting team specified a single Interconnection because it is more likely that the span of control of the generation control center may cross multiple BA or RSG areas or even regions and Interconnections, and that BES impact will more likely be restricted within an Interconnection.

  This criterion uses the phrase "control generation." Entities should consider the discussion of "control" for generation as discussed in the Frequently Asked Questions (FAQ) document for CIP 002-1, Question 9:

  > **"Question:** *Are Cyber Assets for a control center or generation control center with monitoring only and no direct remote control required to be protected and secured under the Cyber Cyber Security Standards?*
  > **Answer:** A control center or generation control center that provides critical operating functions and tasks as identified in CIP–002 must be protected per the requirements of the Cyber Security Standard. The monitoring and operating control function includes controls performed automatically, remotely, manually, or by voice instruction.
  > An example of monitoring without direct control that is subject to the Cyber Security Standards is a Reliability Authority that receives data from Critical Cyber Assets to a state estimator. "

It must be noted that this part does not apply to those systems that would be included in the evaluation of Cyber Assets that are only associated with Facilities in a single plant location as specified in part 1.1. These would include Cyber Assets in control rooms in these generation plants. An excellent discussion of control centers and control rooms can be found in the NERC document "Security Guideline for the Electric Sector: Identifying Critical Assets".

TRANSMISSION

Parts 1.2, 1.5-1.13 in Attachment 1 are the criteria that are applicable to Transmission Owners and Operators. The general approach to the criteria is that these should cover those transmission Facilities generally designated as Extra High Voltage (EHV)[1,2] which form the backbone of the BES. At the lower end of the EHV range, additional qualifications have been defined to ensure appropriate impact for Critical Assets. In many of the criteria, the impact threshold is defined as the capability of the failure or compromise of a Critical Asset to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs).

- Part 1.2 includes those Facilities in Transmission systems that provide reactive resources to enhance and preserve the reliability of the BES. The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.

- In Part 1.5, the intent is to ensure that the Cranking Paths and other BES Transmission Facilities required to support the Transmission Operator's restoration plan required by EOP-005-2 receive consideration for protection from cyber threats. Transmission Owners and Operators own and operate a large number of these Facilities. EOP-005-2 specifies Facilities that comprise the "Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started". Part 1.5 specifies that the Facilities meeting these requirements or comprising the Cranking Paths be identified as Critical Assets.

[1] REA BULLETIN 1724E-202. An Overview of Transmission System Studies,Page 12:6.1.3 System Voltage : Transmission system voltages below the extra-high-voltage (EHV) level are between 34.5 and 230 kilovolts(kV). The nominal EHV levels in the United States are 345, 500 and 765 kV. (http://www.usda.gov/rus/electric/pubs/a/1724e202.pdf)

[2] Webster on-line Dictionary: Voltage levels higher than those normally used on transmission lines. Generally EHV is considered to be 345,000 volts or higher. (EHV).

Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 1.6 includes any Transmission Facility at a substation operated at 500 kV or higher. While the drafting team felt that Facilities operated at 500 kV or higher did not require any further qualification for their role as components of the backbone on the Interconnected BES, Facilities in the lower EHV range should have additional qualifying criteria for inclusion as a Critical Asset.

  It must be noted that if the collector bus for a non-Critical Asset generation plant (i.e. the plant is smaller in aggregate than the threshold set for generation plants in Part 1.1) is operated at 500kV, the collector bus should be considered a Generation Interconnection Facility and not a Transmission Facility, according to the "Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface". This collector bus would not be a Critical Asset because it doesn't significantly affect the 500kV Transmission grid; it only affects a plant which is below the Critical Asset threshold.

- Part 1.7 includes the lower end of the EHV range between 300kV and 500 kV, (primarily Facilities operated at 345kV) with qualifications for inclusion as Critical Assets if they are deemed highly likely to have significant impact on the BES. While the criterion has been specified as part of the rationale for requiring protection for EHV Transmission Facilities, the drafting team included, in this criterion, additional qualifications that would ensure the required level of impact to the BES: at this lower end of the EHV spectrum, the drafting team:
  - Excluded radial facilities that would only provide support for single generation facilities.
  - Specified interconnection to at least 3 transmission stations or substations to ensure that the level of impact would be appropriate.

- Parts 1.8 and 1.9 include those Transmission Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, **Establish and Communicate System Operating Limits,** R5.1.1 and R5.1.3.

- Part 1.10 designates those Transmission Facilities as Critical Assets that provide the generation interconnection for Generation Facilities identified as Critical Assets to the Transmission system. The intent is to ensure the availability of Facilities necessary to support those generation Critical Assets.

- Part 1.11 is sourced from the NUC-001 NERC standard for the support of Nuclear Facilities. NUC-001 ensures that reliability of NPIR's are ensured through adequate coordination between the Nuclear Generator Owner/Operator and its Transmission provider "for the purpose of ensuring nuclear plant safe operation and shutdown". In particular, there are specific requirements to coordinate physical and cyber security protection of these interfaces.

- Part 1.12 designates as Critical Assets those Special Protection Systems (SPS), Remedial Action Schemes (RAS), or automated switching systems installed to ensure BES operation within IROLs. The degradation, compromise or unavailability of these Critical Assets would result in exceeding IROLs if they fail to operate as designed. By the definition of IROL, the loss or compromise of any of these have Wide Area impacts.

- Part 1.13 designates as Critical Assets those systems or Facilities that are capable of performing automatic load shedding, without human operator initiation, of 300 MW or more. The SDT spent considerable time discussing the wording of criterion 1.13, and chose the term "Each" to represent that the criterion applied to a discrete system or Facility. In the drafting of this criterion, the drafting team sought to include only those systems that did not require human operator initiation, and targeted in particular those Under Frequency Load Shedding (UFLS) facilities and systems and Under Voltage Load Shedding (UVLS) facilities and systems that would be implemented as part of a regional load shedding requirement to prevent Adverse Reliability Impact. These include automated Under Frequency Load Shedding systems or Under Voltage Load Shedding Systems that are capable of load shedding 300 MW or more. It should be noted that those qualifying systems which require a human operator to arm the system, but once armed, trigger automatically, are still to be considered as not requiring human operator initiation and should be designated as Critical Assets.

Within an operational environment the drafting team understands that the real-time impact to the Bulk Electric System of a loss of load, or the equivalent amount of generation, will be similar, with loss of load resulting in a frequency high condition and a loss of generation resulting in a frequency low condition. This particular threshold (300 MW) was provided in CIP version 1. The SDT believes that the threshold should be lower than the 1500MW generation requirement since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System and hence requires a lower threshold for inclusion as Critical Assets.~~300 MW is the reporting threshold for DOE EIA 417.~~

In ERCOT, the Load acting as a Resource ("LaaR") Demand Response Program is not part of the regional load shedding program, but an ancillary services market.

CONTROL CENTERS

Parts 1.14 through 1.17 apply to BES control centers. Control centers generally perform control center functions for multiple BES assets. These Facilities are evaluated as a control center. Facilities that perform control center functions for only a single BES asset should be evaluated as part of the BES asset (e.g., control room for a single generation plant or transmission substation). While it is clear that the primary and all backup control centers operated by RCs, BAs, or TOPs **that meet the criteria** must be designated as Critical Assets, control centers at other applicable Responsible Entities that are used, by delegation, to perform the functional obligations of the RCs, BAs, or TOPs must also be designated as Critical Assets. These include Transmission Owners' control centers and backup control centers, for example, which have been formally delegated to perform some of these functions. It should be noted that Cyber Assets essential to the operation of a control center may be located at a data center that is not co-located with the control center itself.

- Part 1.14 designates all control centers used to perform the functional obligations of the Reliability Coordinator (RC) as Critical Assets. Each Reliability Coordinator control center and backup control center was included as a Critical Asset due to their key role in maintaining reliability for the Interconnection as a whole in concert with other Reliability Coordinators.

- For part 1.15, please refer to the discussion of generation control centers in the Generation section of this document.

- Part 1.16 specifies that all control centers or backup control centers that perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12. Due to the direct impact on the operation of identified Critical Assets, these Transmission control centers must be designated as Critical Assets. It must be noted that in many cases, some Transmission Operator functions are delegated to Transmission Owner control centers: in such cases, these must also be designated as Critical Assets. As with the discussion of part 1.15, the drafting team intended for the word control to have the same meaning as that found in *Frequently Asked Questions Cyber Security Standards CIP-002-1 through CIP-009-1* which indicates that controls may be "performed automatically, remotely, manually, or by voice instruction."

- Part 1.17 specifies that all control centers that perform the functional obligations of the a Balancing Authority (BA) that include at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13 must be declared as Critical Assets. In addition, this criterion designates as a Critical Asset any BA control center that, in aggregate, performs the functional obligations of a BA for 1500 MWs or more in a single Interconnection. The threshold, controls generation of 1500 MW was chosen to maintain consistency with the threshold in part 1.1.

GUIDANCE ON THE IMPLEMENTATION PLAN

There are two implementation plans associated with CIP-002-4 through CIP-009-4: the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4* and the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.* These plans are intended to work together as a set. In order to determine when an Entity must be compliant with CIP-002-4 through CIP-009-4, they should refer first to the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4*. This implementation plan describes the schedule by which an Entity must become compliant with the Version 4 CIP Standards. Once this initial compliance milestone is reached, this implementation plan is effectively retired. For an Entity who registers after the Version 4 CIP

Standards are effective or for those Critical Cyber Assets that are newly identify after the Version 4 CIP Standards are effective, Responsible Entities should refer to the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities.* The *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* remains in use throughout the entire time that the Version 4 CIP Standards remain in effect.

Responsible Entities shall be compliant with the requirements of CIP-002-4 through CIP-009-4 on the later of (i) the Effective Date[3] specified in the Standard or (ii) the compliance milestones in the version 3 Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities. This allows essentially a two year implementation period following FERC approval to become compliant with the Version 4 CIP Standards. Special consideration was given to maintain the compliance milestone date for those Critical Cyber Assets and Newly Registered Entities that are in the middle of their implementation period for the Version 3 Standards on the Effective Date of the Version 4 Standards.

The drafting team considered that Responsible Entities may not have been able to anticipate the addition of Critical Assets to the Critical Asset list since the criteria included in Attachment 1 of CIP-002-4 may significantly differ from an Entity's existing risk-based assessment methodology. As such, the drafting team determined that a one-time implementation window was needed to bring the Critical Cyber Assets at the newly identified Critical Assets into compliance with CIP-002-4 through CIP-009-4.

Both the *Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4* and the *Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities* contain certain exceptions for U.S. Nuclear Power Plant Facilities in recognition of the special circumstances of this operating environment. The modifications used for the U.S. Nuclear Power Plant Facilities are consistent with those included in the Revised Implementation Plan for Version 3 of Cyber Security Standards CIP-002-3 through CIP-009-3.

[3] "The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)."

CONCLUSION

In formulating this document, the drafting team hopes to have clarified the thinking and intent behind the criteria in Attachment 1. The drafting team hopes that this document will also provide Responsible Entities with additional guidance in the implementation of CIP-002-4. The drafting team reiterates that this document is not intended to augment, modify, or nullify any of the requirements and criteria in the standard. The language of requirements in the standard remains the only authority for the purpose of evaluating compliance.

Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

This Implementation Plan applies to Cyber Security Standards CIP-002-4 through CIP-009-4.

The term "Compliant" in this Implementation Plan is used in the same way that it is used in the (Revised) Implementation Plan for Cyber Security Standards CIP-002-1 through CIP-009-1: "Compliant means the entity meets the full intent of the requirements and is beginning to maintain required 'data,' 'documents,' 'documentation,' 'logs,' and 'records.'"

The Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities (hereafter referred to as 'this Implementation Plan') defines the schedule for compliance with the requirements of Version 4 of the NERC Reliability Standards CIP-003 through CIP-009[1] on Cyber Security for (a) newly Registered Entities and (b) newly identified Critical Cyber Assets by an existing Registered Entity after the Registered Entity's applicable *Compliant* milestone date has already passed based upon the scenarios identified in the Version 4 CIP-002-4 through CIP-009-4 Implementation Plan.

There are no *Compliant* milestones specified in Table 2 of this Implementation Plan for compliance with NERC Standard CIP-002, since all Responsible Entities are required to be compliant with NERC Standard CIP-002 based on a previous or existing version-specific Implementation Plan[2].

Implementation Plan for Newly Identified Critical Cyber Assets

This Implementation Plan defines the *Compliant* milestone dates in terms of the number of calendar months after designation of the newly identified Cyber Asset as a Critical Cyber Asset, following the process stated in NERC Standard CIP-002. These *Compliant* Milestone dates are included in Table 2 of this Implementation Plan.

The term 'newly identified Critical Cyber Asset' is used when a Registered Entity has been required to be compliant with NERC Reliability Standard CIP-002 for at least one application of the "Critical Asset Criteria" for the identification of Critical Assets. Upon a subsequent annual application of the Critical Asset identification in compliance with requirements of NERC Reliability Standard CIP-002, either a previously non-critical asset has now been determined to be a Critical Asset, and its associated essential Cyber Assets have now been determined to be Critical Cyber Assets, or Cyber Assets associated with an existing Critical Asset have now been identified as Critical Cyber Assets. These newly determined Critical Cyber Assets are referred to in this Implementation Plan as 'newly identified Critical Cyber Assets'.

[1] The reference in this Implementation Plan to 'NERC Standards CIP-002 through CIP-009' is to all versions (i.e., Version 1, Version 2, Version 3, and Version 4) of those standards. If reference to only a specific version of a standard or set of standards is required, a version number (i.e., '-1', '-2','-3', or '-4') will be applied to that particular reference.

[2] Each version of NERC Standards CIP-002 through CIP-009 has its own implementation plan and/or designated effective date when approved by the NERC Board of Trustees or appropriate government authorities.

Table 2 defines the *Compliant* milestone dates for all of the requirements defined in the NERC Reliability Standards CIP-003 through CIP-009 in terms of the number of months following the designation of a newly identified Critical Cyber Asset a Responsible Entity has to become compliant with that requirement. Table 2 further defines the *Compliant* milestone dates for the NERC Reliability Standards CIP-003 through CIP-009 based on the 'Milestone Category', which characterizes the scenario by which the Critical Cyber Asset was identified.

For those NERC Reliability Standard requirements that have an entry in Table 2 annotated as *existing*, the designation of a newly identified Critical Cyber Asset has no bearing on its *Compliant* milestone date, since Responsible Entities are required to be compliant with those requirements as part of an existing CIP compliance implementation program[3], independent of the determination of a newly identified Critical Cyber Asset.

Implementation Plan for Newly Registered Entities

A newly Registered Entity is one that has registered with NERC as of the Effective Date of the CIP-002-4 Standard or thereafter and has not previously undergone the NERC CIP-002 Critical Asset Identification Process. As such, it is presumed that no Critical Cyber Assets have been previously identified and no previously established CIP compliance implementation program exists. The *Compliant* milestone schedule defined in Table 3 of this Implementation Plan document defines the applicable compliance schedule for the newly Registered Entity to the NERC Reliability Standards CIP-002 through CIP-009.

Implementation Milestone Categories

The Implementation Plan milestones and schedule to achieve compliance with the NERC Reliability Standards CIP-002 through CIP-009 for newly identified Critical Cyber Assets and newly Registered Entities are provided in Tables 2 and 3 of this Implementation Plan document.

The Implementation Plan milestones defined in Table 2 are divided into categories based on the scenario by which the Critical Cyber Asset was newly identified. The scenarios that represent the milestone categories are briefly defined as follows:

1. A Cyber Asset is designated as the first Critical Cyber Asset by a Responsible Entity according to the process defined in NERC Reliability Standard CIP-002. No existing CIP compliance implementation program for Standards CIP-003 through CIP-009 is assumed to exist at the Responsible Entity. This category would also apply in the case of a newly Registered Entity (not resulting from a merger or acquisition), if any Critical Cyber Asset was identified according to the process defined in NERC Reliability Standard CIP-002.

2. An existing Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009, *not due to a planned change in the electric system or Cyber Assets by*

[3] The term 'CIP compliance implementation program' is used to mean that a Responsible Entity has programs and procedures in place to comply with the requirements of NERC Reliability Standards CIP-003 through CIP-009 for Critical Cyber Assets. All entities are required to be Compliant with NERC Reliability Standard CIP-002 according to a version specific Implementation Plan.

the Responsible Entity (unplanned changes due to emergency response are handled separately). A CIP compliance implementation program already exists at the Responsible Entity.

3. A new or existing Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009, *due to a planned change in the electric system or Cyber Assets by the Responsible Entity*. A CIP compliance implementation program already exists at the Responsible Entity.

Note that the phrase 'Cyber Asset becomes subject to the NERC Reliability Standards CIP-003 through CIP-009' as used above applies to all Critical Cyber Assets, as well as other (non-critical) Cyber Assets within an Electronic Security Perimeter that must comply with the applicable requirements of NERC Reliability Standards CIP-003 through CIP-009.

Note also that the phrase 'planned change in the electric system or Cyber Assets by the Responsible Entity' refers to any changes of the electric system or Cyber Assets which were planned and implemented by the Responsible Entity.

For example, if a particular transmission substation has been designated a Critical Asset, but there are no Cyber Assets at that transmission substation, then there are no Critical Cyber Assets associated with the Critical Asset at the transmission substation. If an automation modernization activity is performed at that same transmission substation, whereby Cyber Assets are installed that meet the requirements as Critical Cyber Assets, then those newly identified Critical Cyber Assets have been implemented as a result of a planned change of the Critical Asset, and must therefore be in Compliance with NERC Reliability Standards CIP-003 through CIP-009 upon the commissioning of the modernized transmission substation.(Compliant Upon Commissioning below.)

If, however, a particular transmission substation with Cyber Assets does not meet the criteria as a Critical Asset, its associated Cyber Assets are *not* Critical Cyber Assets, as described in the requirements of NERC Reliability Standard CIP-002. Further, if an action is performed outside of that particular transmission substation, such as a transmission line is constructed or retired, a generation plant is modified changing its rated output, or load patterns shift resulting in corresponding transmission flow changes through that transmission substation, that unchanged transmission substation may become a Critical Asset based on the established criteria in the CIP-002-4 *Attachment 1 Critical Asset Criteria* through the application of the Critical Asset identification (required by CIP-002 R1). (Note that the actions that cause the change in power flows may have been performed by a neighboring entity without the full knowledge of the affected Responsible Entity.) Application of those Critical Asset criteria is required annually (by CIP-002 R1), and, as such, it may not be immediately apparent that that particular transmission substation has become a Critical Asset until after the required annual application of the identification methodology. Category 1 Scenario below applies if there was no pre-existing Critical Cyber Assets subject to the standard, and therefore, there was no existing full CIP program. Category 2 Scenario below applies if a CIP program for existing Critical Cyber Assets has been implemented for that Registered Entity.

Figure 1 shows an overall process flow for determining which milestone category a Critical Cyber Asset identification scenario must follow. Following the figure is a more detailed description of each category.

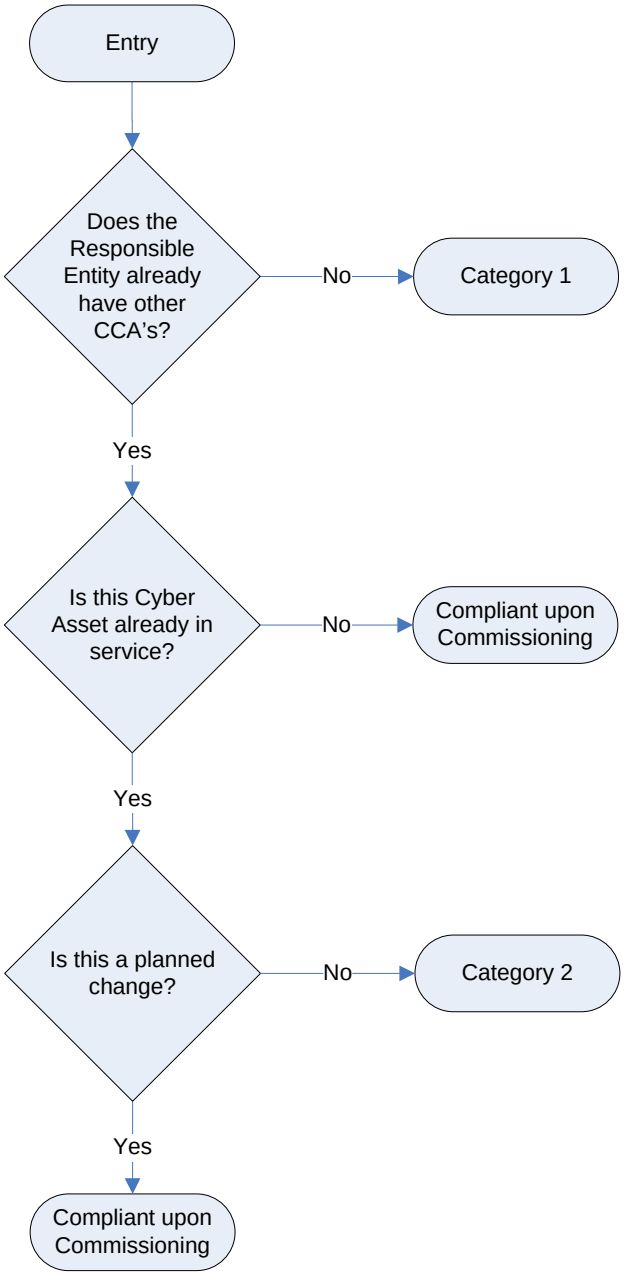

Figure 1: Category Selection Process Flow

Implementation Milestone Categories and Schedules

Based on the Critical Cyber Asset identification scenarios identified above, the implementation milestone categories and schedules for those scenarios are defined and distinguished below for entities with existing registrations in the NERC Compliance Registry. Scenarios resulting from the formation of newly Registered Entities are discussed in a subsequent section of this Implementation Plan.

1. **Category 1 Scenario**: A Responsible Entity that previously has undergone the NERC Reliability Standard CIP-002 Critical Asset identification process for at least one annual review and approval period without ever having previously identified any Critical Cyber Assets associated with Critical Assets, but has now identified one or more Critical Cyber Assets. As such, it is presumed that the Responsible Entity does not have a previously established CIP compliance implementation program.

   The *Compliant* milestones defined for this Category are defined in Table 2 (Milestone Category 1) of this Implementation Plan document.

2. **Category 2 Scenario**: A Responsible Entity has an established NERC Reliability Standards CIP compliance implementation program in place, and has newly identified additional existing Cyber Assets that need to be added to its Critical Cyber Asset list and therefore subject to compliance to the NERC Reliability CIP Standards due to unplanned changes in the electric system or the Cyber Assets. Since the Responsible Entity already has a CIP compliance implementation program, it needs only to implement the NERC Reliability CIP standards for the newly identified Critical Cyber Asset(s). The existing Critical Cyber Assets may remain in service while the relevant requirements of the NERC Reliability CIP Standards are implemented for the newly identified Critical Cyber Asset(s).

   This category applies only when additional in-service Critical Cyber Assets or applicable other Cyber Assets are *identified* as Critical Cyber Assets according to the process defined in the NERC Reliability Standard CIP-002. This category does not apply if the newly identified Critical Cyber Assets are not already in-service, or if the additional Critical Cyber Assets resulted from planned changes to the electric system or the Cyber Assets. In the case where the Critical Cyber Asset is not in service, the Responsible Entity must be compliant with the NERC Reliability Standards CIP-003 through CIP-009 upon commissioning of the new cyber or electric system assets (see "Compliant upon Commissioning" below).

   Unplanned changes due to emergency response, disaster recovery or system restoration activities are handled separately (see "Disaster Recovery and Restoration Activities" below).

3. **Compliant upon Commissioning**: When a Responsible Entity has an established NERC Reliability Standards CIP compliance implementation program and implements a new or replacement Critical Cyber Asset associated with a previously identified or newly

constructed Critical Asset, the Critical Cyber Asset shall be compliant when it is commissioned or activated. This scenario shall apply for the following scenarios:

a) 'Greenfield' construction of an asset that will be declared a Critical Asset (based on the Critical Asset criteria in CIP-002-4 Attachment 1) upon its commissioning or activation
b) Replacement or upgrade of an existing Critical Cyber Asset (or other Cyber Asset within an Electronic Security Perimeter) associated with a previously identified Critical Asset
c) Upgrade or replacement of an existing non-cyber asset with a Cyber Asset (e.g., replacement of an electro-mechanical relay with a microprocessor-based relay) associated with a previously identified Critical Asset and meets other criteria for identification as a Critical Cyber Asset
d) Planned addition of:
    i. a Critical Cyber Asset, or,
    ii. another (i.e., non-critical) Cyber Asset within an established Electronic Security Perimeter

In summary, this scenario applies in any case where a Critical Cyber Asset or applicable other Cyber Asset is being added or modified associated with an existing or new Critical Asset and where that Entity has an established NERC Reliability Standard CIP compliance implementation program.

A special case of a 'greenfield' construction exists where the asset under construction was planned and construction started under the assumption that the asset would not be a Critical Asset. During construction, conditions changed, and the asset will now be a Critical Asset upon its commissioning. In this case, the Responsible Entity must follow the Category 2 milestones from the date of the determination that the asset is a Critical Asset.

Since the assets must be compliant with the NERC Reliability Standards CIP-003 through CIP-009 upon commissioning, no implementation milestones or schedules are provided herein.

Disaster Recovery and Restoration Activities

A special case of restoration as part of a disaster recovery situation (such as storm restoration) shall follow the emergency provisions of the Responsible Entity's policy required by CIP-003 R1.1.

The rationale for this is that the primary task following a disaster is the restoration of the power system, and the ability to serve customer load. Cyber security provisions are implemented to support reliability and operations. If restoration were to be slowed to ensure full implementation of the CIP compliance implementation program, restoration could be hampered, and reliability could be harmed.

However, following the completion of the restoration activities, the entity is obligated to implement the CIP compliance implementation program at the restored facilities, and be able to demonstrate full compliance in a spot-check or audit; or, file a self-report of non-compliance with a mitigation plan describing how and when full compliance will be achieved.

Newly Registered Entity Scenarios

Based on the Critical Cyber Asset identification scenarios identified above, the implementation milestone categories and schedules for those scenarios as they apply to newly Registered Entities are defined and distinguished below.

The following examples of business merger and asset acquisition scenarios may be helpful in explaining the expectations in each of the scenarios. Note that in each case, the predecessor Registered Entities are assumed to already be in compliance with NERC Reliability Standard CIP-002-4.

1. **Newly Registered Entity Scenario 1 (Application of Category 1 Milestones):**

   A Merger of Two or More Registered Entities where None of the Predecessor Registered Entities has Identified any Critical Cyber Asset
   In the case of a business merger or asset acquisition, because there are no identified Critical Cyber Assets in any of the predecessor Registered Entities, a CIP compliance implementation program is not assumed to exist. The only program component required is a Critical Asset and Critical Cyber Asset identification process per NERC Reliability Standard CIP-002-4.

   If either predecessor Registered Entities has identified Critical Assets (but without associated Critical Cyber Assets), the merged Registered Entity must continue to perform annual application of the Critical Asset identification as required in CIP-002 R1, as well as to annually verify whether associated Cyber Assets meet the requirements as newly identified Critical Cyber Assets as required by CIP-002 R2. If newly identified Critical Cyber Assets are found at any point in this process (i.e., during the one calendar year allowance period, or after that one calendar year allowance period), then the implementation milestones, categories and schedules of this Implementation Plan apply regardless of when this newly identified Critical Cyber Assets are determined, and independent of any merger and acquisition discussions contained in this Implementation Plan.

2. **Newly Registered Entity Scenario 2:**

   A Merger of Two or More Registered Entities where Only One of the Predecessor Registered Entities has Identified at Least One Critical Cyber Asset
   Since only one of the predecessor Registered Entities has previously identified Critical Cyber Assets, it is assumed that none of the other predecessor Registered Entities have CIP compliance implementation programs (since they are not required to have them). In

this case, the CIP compliance implementation program from the predecessor Registered Entity with the previously identified Critical Cyber Asset would be expected to be implemented as the CIP compliance implementation program for the merged Registered Entity, and would be expected to apply to any Critical Cyber Assets identified after the effective date of the merger. Since the other predecessor Registered Entities did not have any Critical Cyber Assets, this should present no conflict in any CIP compliance implementation programs.

Note that the discussion of the disposition of any NERC Reliability Standard CIP-002 Critical Asset identification process from Scenario 1 above would apply in this case as well.

3. **Newly Registered Entity Scenario 3:**

A Merger of Two or More Registered Entities where Two or More of the Predecessor Registered Entities has Identified at Least One Critical Cyber Asset
This scenario is the most complicated of the three, since it applies to a merged Registered Entity that has more than one CIP compliance implementation program, which are most likely not in complete agreement with each other. These differences could be due to any number of issues, ranging from something as 'simple' as selection of different anti-virus tools, to something as 'complicated' as the access authorization process.

The merged Responsible Entity has one calendar year from the effective date of the business merger to continue to operate the separate CIP compliance implementation programs while determining how to either combine the CIP compliance implementation programs, or at a minimum, operate the CIP compliance implementation programs under a common Senior Manager and governance structure.

Following the one year analysis period, if the decision is made to continue the operation of separate CIP compliance implementation programs under a common Senior Manager and governance structure, the merged Responsible Entity must update any required Senior Manager and governance issues, and clearly identify which CIP compliance implementation program components apply to each individual Critical Cyber Asset. This is essential to the implementation of the CIP compliance implementation program at the merged Responsible Entity, so that the correct and proper program components are implemented on the appropriate Critical Cyber Assets, as well as to allow the ERO compliance program (in a spot-check or audit) to determine if the CIP compliance implementation program has been properly implemented for each Critical Cyber Asset. Absent this clear identification, it would be possible for the wrong CIP compliance implementation program to be applied to a Critical Cyber Asset, or the wrong CIP compliance implementation program be evaluated in a spot-check or audit, leading to a possible technical non-compliance without real cause.

However, if after the one year analysis period, the decision is made to combine the operation of the separate CIP compliance implementation programs into a single CIP

compliance implementation program, the merged Responsible Entity must develop a plan for merging of the separate CIP compliance implementation programs into a single CIP compliance implementation program, with a schedule and milestones for completion. The programs should be combined as expeditiously as possible, but without causing harm to reliability or operability of the Bulk power System. This 'merged plan' must be made available to the ERO compliance program upon request, and as documentation for any spot-check or audit conducted while the merged plan is being performed. Progress towards meeting milestones and completing the merged plan will be verified during any spot-checks or audits conducted while the plan is being executed.

Example Scenarios

Note that there are no implementation milestones or schedules specified for a Responsible Entity that has a newly identified Critical Asset, but no newly identified Critical Cyber Assets. This situation exists because no action is required by the Responsible Entity upon identification of a Critical Asset without associated Critical Cyber Assets. Only upon identification of Critical Cyber Assets does a Responsible Entity need to become compliant with the NERC Reliability Standards CIP-003 through CIP-009.

As an example, Table 1 provides some sample scenarios, and provides the milestone category for each of the described situations.

Table 1: Example Scenarios

Scenarios	CIP Compliance Implementation Program:	
	No Program (note 1)	Existing Program
Existing asset becomes Critical Asset; associated Cyber Assets become Critical Cyber Assets	Category 1	Category 2
New asset comes online as a Critical Asset; associated Cyber Assets become Critical Cyber Asset	Category 1	Compliant upon Commissioning
Existing Cyber Asset moves into the Electronic Security Perimeter due to network reconfiguration	N/A	Compliant upon Commissioning
New Cyber Asset – never before in service and not a replacement for an existing Cyber Asset – added into a new or existing Electronic Security Perimeter	Category 1	Compliant upon Commissioning
New Cyber Asset replacing an existing Cyber Asset within the Electronic Security Perimeter	N/A	Compliant upon Commissioning
Planned modification or upgrade to existing Cyber Asset that causes it to be reclassified as a Critical Cyber Asset	Category 1	Compliant upon Commissioning
Asset under construction as another (non-critical) asset becomes declared as a Critical Asset during construction	Category 1	Category 2

Scenarios	CIP Compliance Implementation Program:	
	No Program (note 1)	Existing Program
Unplanned modification such as emergency restoration invoked under a disaster recovery situation or storm restoration	N/A	Per emergency provisions as required by CIP-003 R1.1

Note: 1) assumes the entity is already compliant with CIP-002

Table 2 provides the compliance milestones for each of the two identified milestone categories.

Table 2: Implementation milestones for Newly Identified Critical Cyber Assets[4]

CIP Standard Requirement	Milestone Category 1	Milestone Category 2
Standard CIP-002-4 — Critical Cyber Asset Identification		
R1	*N/A*	*N/A*
R2	*N/A*	*N/A*
R3	*N/A*	*N/A*
Standard CIP-003-4 — Security Management Controls		
R1	24 months	*existing*
R2	*N/A*	*existing*

Standard CIP-009-4 — Recovery Plans for Critical Cyber Assets		
R1	24 months	6 months
R2	24 months	12 months
R3	24 months	12 months
R4	24 months	6 months
R5	24 months	6 months

Table 3[5][6] Compliance Schedule for Standards CIP-002-4 through CIP-009-4 For Entities Registering in April 2008 and Thereafter		
Requirements	**Registration + 12 months**	**Registration + 24 months**
Standard CIP-002-4 — Critical Cyber Assets		
All Requirements		Compliant
Standard CIP-003-4 — Security Management Controls		
All Requirements Except R2		Compliant
R2	Compliant	
Standard CIP-004-4 — Personnel & Training		
All Requirements		Compliant
Standard CIP-005-4 — Electronic Security		
All Requirements		Compliant
Standard CIP-006-4 — Physical Security		
All Requirements		Compliant
Standard CIP-007-4 — Systems Security Management		
All Requirements		Compliant
Standard CIP-008-4 — Incident Reporting and Response Planning		
All Requirements		Compliant
Standard CIP-009-4 — Recovery Plans		
All Requirements		Compliant

[5] Note: This table only specifies a 'Compliant' date, consistent with the convention used elsewhere in this Implementation Plan. The Compliant dates are consistent with those specified in Table 4 of the Version 1 Implementation Plan. Other compliance states referenced in the Version 1 Implementation Plan are no longer used.
[6] For Owners and Operators of U.S. Nuclear Power Plants, Critical Cyber Assets associated with U.S. Nuclear Power Plants identified as Critical Assets shall be compliant with CIP-002-4 through CIP-009-4 by the later of (i) the milestone date listed in Table 3, or (ii) 6 months following the completion date of the first refueling outage beyond the milestone date in Table 3 for those requirements requiring a refueling outage.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for Version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before

The term Blackstart Resource, used in CIP-002-4 Attachment 1, was submitted for regulatory approval with Project 2006-03 – System Restoration and Blackstart. The effective date of EOP-005-2 is the date that Criteria 1.4 and 1.5 will be used to determine Critical Assets for Responsible Entity.

Applicable Standards

The following standards are covered by this Implementation Plan:
CIP–002–4 —Cyber Security — Critical Cyber Asset Identification
CIP–003–4 — Cyber Security — Security Management Controls
CIP–004–4 — Cyber Security — Personnel and Training
CIP–005–4 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–4 — Cyber Security — Physical Security
CIP–007–4 —Cyber Security — Systems Security Management
CIP–008–4 — Cyber Security — Incident Reporting and Response Planning
CIP–009–4 — Cyber Security — Recovery Plans for Critical Cyber Assets

These standards are posted for ballot by NERC together with this Implementation Plan. When these standards become effective, all prior versions of these standards are retired.

Compliance with Standards

Once these standards become effective, the Responsible Entities identified in the Applicability section of the standard must comply with the requirements. These Responsible Entities include:
• Reliability Coordinator
• Balancing Authority
• Interchange Authority
• Transmission Service Provider
• Transmission Owner
• Transmission Operator
• Generator Owner
• Generator Operator
• Load Serving Entity
• NERC
• Regional Entity

609.452.8060 | www.nerc.com

Proposed Effective Date for CIP-002-4 through CIP-009-4

All Facilities Other Than U.S. Nuclear Power Plant Facilities
Responsible Entities shall be compliant with the requirements of CIP-002-4 through CIP-009-4 on the later of (i) the Effective Date specified in the Standard or (ii) the compliance milestones specified in version 3 of the *Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities.*

U.S. Nuclear Power Plant Facilities
For Owners and Operators of U.S. Nuclear Power Plants, Critical Cyber Assets associated with U.S. Nuclear Power Plants identified as Critical Assets shall be compliant with CIP-002-4 through CIP-009-4 by the later of (i) the Effective Date in CIP-002-4 through CIP-009-4, (ii) 6 months following the completion of the first refueling outage beyond the Effective Date of CIP-002-4 for those requirements requiring a refueling outage, or (iii) the compliance milestones specified in version 3 of the *Implementation Plan for Newly Identified Critical Cyber Asset and Newly Registered Entities.*

Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities

Concurrently submitted with version 4 of Cyber Security Standards CIP-002-4 through CIP-009-4 is a separate Implementation Plan document that would be used by the Responsible Entities to bring any Critical Cyber Assets identified after the effective date of CIP-002-4 into compliance with the Cyber Security Standards, as those assets are identified. The Implementation Plan for newly identified Critical Cyber Assets provides a reasonable schedule for the Responsible Entity to achieve the 'Compliant' state for those newly identified Critical Cyber Assets.
The Implementation Plan for newly identified Critical Cyber Assets also addresses how to achieve the 'Compliant' state for: 1) Responsible Entities that merge with or are acquired by other Responsible Entities; and 2) Responsible Entities that register in the NERC Compliance Registry during or following the completion of the Implementation Plan for Version 4 of the NERC Cyber Security Standards CIP-002-4 to CIP-009-4.

Standards Announcement

Recirculation Ballot Window Opens
December 20-30, 2010

Now available at: https://standards.nerc.net/CurrentBallots.aspx

Project 2008-06: Cyber Security Order 706

A recirculation ballot window for standard CIP-002-4 — Critical Cyber Asset Identification is open **until 8 p.m. Eastern on Thursday, December 30th, 2010**.

Instructions

Members of the ballot pools associated with this project may log in and submit their votes from the following page: https://standards.nerc.net/CurrentBallots.aspx

Ballot Process

The Standards Committee encourages all members of the ballot pool to review the consideration of comments submitted during the last ballot window. In the recirculation ballot, votes are counted by exception only — if a ballot pool member does not submit a revision to that member's original vote, the vote remains the same as in the first ballot. Members of the ballot pool may:

- Reconsider and change their votes from the first ballot
- Vote in the second ballot even if they did not vote on the first ballot
- Take no action if they do not want to change their original vote

Additional Information

The Standard Processes Manual allows drafting teams to make changes following an initial or successive ballot with a goal of improving the quality of a standard, provided those changes do not alter the applicability or scope of the proposed standard. Following the initial ballot, the Project 2008-06 drafting team made minor changes to CIP-002-4 and the associated guidance document and implementation plan. Redlines against the last posted documents as well as the last approved versions of CIP-002 through CIP-009, along with redlines of the guidance document and implementation plan against the last posted versions have been posted on the project page for stakeholder review.

Next Steps

Voting results will be posted and announced after the ballot window closes. If approved, the standard, Violation Risk Factors and Violation Severity Levels, guidance document, and associated implementation plan will be submitted to the Board of Trustees.

Background

FERC Order 706 directed NERC to develop modifications to the CIP Reliability Standards. Due to the variety of changes directed in Order 706 and the complexity of the project, the drafting team adopted a multi-phase revision strategy. The initial phase involved modifying standards CIP-002-1 through CIP-009-1 to comply with

the near-term directives included in Order 706. The resulting version 2 CIP standards were approved by the NERC Board of Trustees, and as part of its approval Order, FERC directed NERC to make changes to two standards and the associated implementation plan within 90 days. Those changes, along with necessary conforming cross-reference changes for the remaining six CIP standards, resulted in the version 3 CIP standards. The current phase (Phase II) involves the more complex FERC directives.

The team has been working to revise CIP-002 – Identification of Critical Assets, with the goal of establishing bright line criteria for the identification of critical assets. In November, the SC Executive Committee authorized the team to conduct an abbreviated comment period in parallel with a successive ballot, to support providing stakeholders with the opportunity to provide comment, while also supporting the goal of completing this set of revisions to CIP-002 before the end of December, 2010.

Recirculation Ballot Results

Now available at: https://standards.nerc.net/Ballots.aspx

Ballot Results for Project 2008-6: CIP-002-4 Critical Asset Identification

The recirculation ballot window to vote on proposed revisions to CIP-002 closed on December 30, 2010. The ballot pool has approved the following standards and associated implementation plans:

CIP–002–4—Cyber Security — Critical Cyber Asset Identification
CIP–003–4— Cyber Security — Security Management Controls
CIP–004–4— Cyber Security — Personnel and Training
CIP–005–4— Cyber Security — Electronic Security Perimeter(s)
CIP–006–4— Cyber Security — Physical Security
CIP–007–4—Cyber Security — Systems Security Management
CIP–008–4—Cyber Security — Incident Reporting and Response Planning
CIP–009–4— Cyber Security — Recovery Plans for Critical Cyber Assets

Voting statistics are listed below, and the Ballot Results Web page provides a link to the detailed results.

Quorum: 90.49%
Approval: 80.56%

Background

FERC Order 706 directed NERC to develop modifications to the CIP Reliability Standards. Due to the variety of changes directed in Order 706 and the complexity of the project, the drafting team adopted a multi-phase revision strategy. The initial phase involved modifying standards CIP-002-1 through CIP-009-1 to comply with the near-term directives included in Order 706. The resulting version 2 CIP standards were approved by the NERC Board of Trustees, and as part of its approval Order, FERC directed NERC to make changes to two standards and the associated implementation plan within 90 days. Those changes, along with necessary conforming cross-reference changes for the remaining six CIP standards, resulted in the version 3 CIP standards. The current phase (Phase II) involves the more complex FERC directives.

The team has been working to revise CIP-002 – Identification of Critical Assets, with the goal of establishing bright line criteria for the identification of critical assets. In November, the SC Executive Committee authorized the team to conduct an abbreviated comment period in parallel with a successive ballot, to support providing stakeholders with the opportunity to provide comment, while also supporting the goal of completing this set of revisions to CIP-002 before the end of December, 2010.

Next Steps
The standards will be submitted to the NERC Board of Trustees for approval.

Ballot Criteria
Approval requires both a (1) quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention, and (2) a two-thirds majority of the weighted segment votes cast must be affirmative; the number of votes cast is the sum of affirmative and negative votes, excluding abstentions and non-responses.

Standards Process
The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participated.

Exhibit F

Table of CIP Version 4 Violation Risk Factors and Violation Severity Levels Proposed for Approval

CIP Version 4 Violation Risk Factors and Violation Severity Levels Proposed for Approval

CIP-002-4

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	HIGH	N/A	N/A	The Responsible Entity has developed a list of Critical Assets but the list has not been reviewed and updated annually as required.	The Responsible Entity did not develop a list of its identified Critical Assets even if such list is null.
R2	HIGH	N/A	N/A	The Responsible Entity has developed a list of associated Critical Cyber Assets essential to the operation of the Critical Asset list as per requirement R2 but the list has not been reviewed and updated annually as required.	The Responsible Entity did not develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset list as per requirement R2 even if such list is null. OR A Cyber Asset essential to the operation of the Critical Asset was identified that met at least one of the bulleted characteristics in this requirement but was not included in the Critical Cyber Asset List.
R3	LOWER	N/A	N/A	The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of the list of Critical Assets. OR The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of the list of Critical Cyber Assets (even if such lists are null.)	The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual approval of both the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

CIP-003-4

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	MEDIUM	N/A	N/A	The Responsible Entity has documented but not implemented a cyber security policy.	The Responsible Entity has not documented nor implemented a cyber security policy.
R1.1.	LOWER	N/A	N/A	N/A	The Responsible Entity's cyber security policy does not address all the requirements in Standards CIP-002-4 through CIP-009-4, including provision for emergency situations.
R1.2.	LOWER	N/A	N/A	N/A	The Responsible Entity's cyber security policy is not readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

CIP Version 4 Violation Risk Factors and Violation Severity Levels Proposed for Approval

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.3	LOWER	N/A	N/A	The Responsible Entity's senior manager, assigned pursuant to R2, annually reviewed but did not annually approve its cyber security policy.	The Responsible Entity's senior manager, assigned pursuant to R2, did not annually review **nor** approve its cyber security policy.
R2.	LOWER	N/A	N/A	N/A	The Responsible Entity has not assigned a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-4 through CIP-009-4.
R2.1.	LOWER	N/A	N/A	N/A	The senior manager is not identified by name, title, and date of designation.
R2.2.	LOWER	Changes to the senior manager were documented in greater than 30 but less than 60 days of the effective date.	Changes to the senior manager were documented in 60 or more but less than 90 days of the effective date.	Changes to the senior manager were documented in 90 or more but less than 120 days of the effective date.	Changes to the senior manager were documented in 120 or more days of the effective date.
R2.3.	LOWER	N/A	N/A	The identification of a senior manager's delegate does not include at least one of the following; name, title, or date of the designation, OR The document is not approved by the senior manager, OR Changes to the delegated authority are not documented within thirty calendar days of the effective date.	A senior manager's delegate is not identified by name, title, and date of designation; the document delegating the authority does not identify the authority being delegated; the document delegating the authority is not approved by the senior manager; AND changes to the delegated authority are not documented within thirty calendar days of the effective date.
R2.4	LOWER	N/A	N/A	N/A	The senior manager or delegate(s) did not authorize and document any exceptions from the requirements of the cyber security policy as required.

The Responsible Entity did not maintain documentation that training is conducted at least annually, including the date the training was completed or attendance records.
R3.	MEDIUM	N/A	The Responsible Entity has a personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access, but the program is not documented.	The Responsible Entity has a personnel risk assessment program as stated in R3, but conducted the personnel risk assessment pursuant to that program after such personnel were granted such access except in specified circumstances such as an emergency.	The Responsible Entity does not have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access. OR The Responsible Entity did not conduct the personnel risk assessment pursuant to that program for personnel granted such access except in specified circumstances such as an emergency.
R3.1.	LOWER	N/A	N/A	The Responsible Entity did not ensure that an assessment conducted included an identity verification (e.g., Social Security Number verification in the U.S.) **or** a seven-year criminal check.	The Responsible Entity did not ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check.
R3.2.	LOWER	N/A	The Responsible Entity did not update each personnel risk assessment at least every seven years after the initial personnel risk assessment but did update it for cause when applicable.	The Responsible Entity did not update each personnel risk assessment for cause (when applicable) but did at least updated it every seven years after the initial personnel risk assessment.	The Responsible Entity did not update each personnel risk assessment at least every seven years after the initial personnel risk assessment nor was it updated for cause when applicable.
R3.3.	LOWER	The Responsible Entity did not document the results of personnel risk assessments for at least one individual but less than 5% of all personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, pursuant to Standard CIP-004-4.	The Responsible Entity did not document the results of personnel risk assessments for 5% or more but less than 10% of all personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, pursuant to Standard CIP-004-4.	The Responsible Entity did not document the results of personnel risk assessments for 10% or more but less than 15% of all personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, pursuant to Standard CIP-004-4.	The Responsible Entity did not document the results of personnel risk assessments for 15% or more of all personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, pursuant to Standard CIP-004-4.

CIP Version 4 Violation Risk Factors and Violation Severity Levels Proposed for Approval

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R4.	LOWER	The Responsible Entity did not maintain complete list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets, missing at least one individual but less than 5% of the authorized personnel.	The Responsible Entity did not maintain complete list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets, missing 5% or more but less than 10% of the authorized personnel.	The Responsible Entity did not maintain complete list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets, missing 10% or more but less than 15%of the authorized personnel.	The Responsible Entity did not maintain complete list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets, missing 15% or more of the authorized personnel.
R4.1.	LOWER	N/A	The Responsible Entity did not review the list(s) of its personnel who have access to Critical Cyber Assets quarterly.	The Responsible Entity did not update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, nor any change in the access rights of such personnel.	The Responsible Entity did not review the list(s) of all personnel who have access to Critical Cyber Assets quarterly, nor update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, nor any change in the access rights of such personnel.
R4.2.	MEDIUM	N/A	The Responsible Entity did not revoke access within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.	The Responsible Entity did not revoke access to Critical Cyber Assets within 24 hours for personnel terminated for cause.	The Responsible Entity did not revoke access to Critical Cyber Assets within 24 hours for personnel terminated for cause nor within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.

CIP-005-4

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	MEDIUM	The Responsible Entity did not document one or more access points to the Electronic Security Perimeter(s).	The Responsible Entity identified but did not document one or more Electronic Security Perimeter(s).	The Responsible Entity did not ensure that one or more of the Critical Cyber Assets resides within an Electronic Security Perimeter. OR The Responsible Entity did not identify nor document one or more Electronic Security Perimeter(s).	The Responsible Entity did not ensure that one or more Critical Cyber Assets resides within an Electronic Security Perimeter, and the Responsible Entity did not identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s) for all Critical Cyber Assets.
R1.1.	MEDIUM	N/A	N/A	N/A	Access points to the Electronic Security Perimeter(s) do not include all externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).

CIP Version 4 Violation Risk Factors and Violation Severity Levels Proposed for Approval

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.2.	MEDIUM	N/A	N/A	N/A	For one or more dial-up accessible Critical Cyber Assets that use a non-routable protocol, the Responsible Entity did not define an Electronic Security Perimeter for that single access point at the dial-up device.
R1.3.	MEDIUM	N/A	N/A	N/A	At least one end point of a communication link within the Electronic Security Perimeter(s) connecting discrete Electronic Security Perimeters was not considered an access point to the Electronic Security Perimeter.
R1.4.	MEDIUM	N/A	One or more non-critical Cyber Asset within a defined Electronic Security Perimeter is not identified but is protected pursuant to the requirements of Standard CIP-005.	One or more non-critical Cyber Asset within a defined Electronic Security Perimeter is identified but not protected pursuant to the requirements of Standard CIP-005.	One or more non-critical Cyber Asset within a defined Electronic Security Perimeter is not identified and is not protected pursuant to the requirements of Standard CIP-005.
R1.5.	MEDIUM	A Cyber Asset used in the access control and/or monitoring of the Electronic Security Perimeter(s) is provided with all but one (1) of the protective measures as specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4 Requirement R3; Standard CIP-007-4 Requirements R1 and R3 through R9; Standard CIP-008-4; and Standard CIP-009-4.	A Cyber Asset used in the access control and/or monitoring of the Electronic Security Perimeter(s) is provided with all but two (2) of the protective measures as specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4 Requirement R3; Standard CIP-007-4 Requirements R1 and R3 through R9; Standard CIP-008-4; and Standard CIP-009-4.	A Cyber Asset used in the access control and/or monitoring of the Electronic Security Perimeter(s) is provided with all but three (3) of the protective measures as specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4 Requirement R3; Standard CIP-007-4 Requirements R1 and R3 through R9; Standard CIP-008-4; and Standard CIP-009-4.	A Cyber Asset used in the access control and/or monitoring of the Electronic Security Perimeter(s) is provided without four (4) or more of the protective measures as specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4 Requirements R2 and R3; Standard CIP-006-4 Requirement R3; Standard CIP-007-4 Requirements R1 and R3 through R9; Standard CIP-008-4; and Standard CIP-009-4.
R1.6.	LOWER	N/A	N/A	The Responsible Entity did not maintain documentation of one of the following: Electronic Security Perimeter(s), interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), electronic access point to the Electronic Security Perimeter(s) or Cyber Asset	The Responsible Entity did not maintain documentation of two or more of the following: Electronic Security Perimeter(s), interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), electronic access points to the Electronic Security Perimeter(s) and Cyber Assets deployed for
