NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

September 30, 2009

VIA ELECTRONIC FILING

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, D.C. 20426

Re: *North American Electric Reliability Corporation*
Docket Nos. RM09-___-000

Dear Ms. Bose:

The North American Electric Reliability Corporation ("NERC") hereby submits this filing in accordance with Section 215(d)(1) of the Federal Power Act ("FPA") and Part 39.5 of the Federal Energy Regulatory Commission's ("FERC") regulations, seeking approval of two proposed Reliability Standards:

- PER-005-1 — System Personnel Training
- PER-004-2 — Reliability Coordination – Staffing

The full text of these proposed standards is contained in **Exhibit A** to this petition. NERC requests an effective date for these standards to be established in accordance with the implementation plan set forth in the respective standards. NERC requests that FERC retire existing Reliability Standards PER-002-0 — Operating Personnel Training and PER-004-1 — Reliability Coordination – Staffing as of the effective date of the proposed standards herein.

Proposed Violation Risk Factors ("VRFs") or Violation Severity Levels ("VSLs") are provided for each main requirement in PER-005-1. Because the changes to PER-004-1 removed existing requirements in total without alteration to requirements that remain in PER-004-2, VRFs and VSLs approved for PER-004-1 are brought forward intact and NERC requests that they be approved for the requirements that remain in PER-004-2. The VSLs applicable to PER-005-1 and PER-004-2 are being reviewed pursuant to the four FERC Guidelines detailed in FERC's June 19, 2008 Order[1] and November 20, 2008 Order,[2] and the review of those assignments will be filed upon approval by the NERC Board of Trustees. Accordingly, pending FERC review and approval of that filing, NERC requests these proposed standards be made effective under FERC's procedures in accordance with the implementation plan set forth in the proposed Reliability Standards.

These proposed Reliability Standards were adopted by the NERC Board of Trustees on February 10, 2009.

NERC's petition consists of the following:

- This transmittal letter;
- A table of contents for the entire petition;
- A description explaining how the proposed Reliability Standards meet FERC's requirements;
- Reliability Standards PER-004-2 and PER-005-1 submitted for approval (**Exhibit A**);
- The complete development record of the proposed Reliability Standards (**Exhibit B**); and
- Standard Drafting Team Roster (**Exhibit C**).

PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF PROPOSED RELIABILITY STANDARDS REGARDING SYSTEM PERSONNEL TRAINING

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC")[3] hereby requests the Federal Energy Regulatory Commission ("FERC") to approve, in accordance with Section 215(d)(1) of the Federal Power Act ("FPA")[4] and Section 39.5 of FERC's regulations, 18 C.F.R. § 39.5, two Reliability Standards, PER-004-2 — Reliability Coordination – Staffing and PER-005-1 — System Personnel Training. On February 10, 2009, the NERC Board of Trustees approved the PER-004-2 and PER-005-1 Reliability Standards that are proposed in this filing. NERC requests that FERC approve the proposed Reliability Standards and make them effective in accordance with the implementation plan set forth in the Reliability Standards. NERC requests that FERC retire existing approved Reliability Standards PER-002-0 — Operating Personnel Training and PER-004-1 — Reliability Coordination – Staffing upon the effective date of PER-004-2 and PER-005-1 proposed herein. **Exhibit A** to this filing sets forth the

[3] NERC has been certified by FERC as the electric reliability organization ("ERO") authorized by Section 215 of the Federal Power Act. FERC certified NERC as the ERO in its order issued July 20, 2006 in Docket No. RR06-1-000. *North American Electric Reliability Corporation*, 116 FERC ¶ 61,062 (2006) ("ERO Certification Order).

III. BACKGROUND

a. Regulatory Framework

By enacting the Energy Policy Act of 2005,[5] Congress entrusted FERC with the duties of approving and enforcing rules to ensure the reliability of the Nation's bulk power system, and with the duties of certifying an electric reliability organization ("ERO") that would be charged with developing and enforcing mandatory Reliability Standards, subject to FERC approval. Section 215 states that all users, owners and

[5] 16 U.S.C. § 824o (2000).

operators of the bulk power system in the United States will be subject to FERC-approved Reliability Standards.

b. Basis for Approval of Proposed Reliability Standards

Section 39.5(a) of FERC's regulations requires the ERO to file with FERC for its approval each Reliability Standard that the ERO proposes to become mandatory and enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes to be made effective. FERC has the regulatory responsibility to approve standards that protect the reliability of the bulk power system. In discharging its responsibility to review, approve, and enforce mandatory Reliability Standards, FERC is authorized to approve those proposed Reliability Standards that meet the criteria detailed by Congress:

> [FERC] may approve, by rule or order, a proposed reliability standard or modification to a reliability standard if it determines that the standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest.[6]

When evaluating proposed Reliability Standards, FERC is expected to give "due weight" to the technical expertise of the ERO. Order No. 672 provides guidance on the factors FERC will consider when determining whether proposed Reliability Standards meet the statutory criteria.[7]

c. Reliability Standards Development Procedure

NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development) of its Rules of Procedure and the NERC *Reliability Standards*

[6] 16 U.S.C. § 824o (d)(2) (2000).
[7] *See Rules Concerning Certification of the Electric Reliability Organization; Procedures for the Establishment, Approval and Enforcement of Electric Reliability Standards, FERC Stats. & Regs.*, ¶ 31,204 at PP 320-338 ("Order No. 672"), *order on reh'g*, FERC Stats. & Regs. ¶ 31,212 (2006) ("Order No. 672-A").

Development Procedure, which is incorporated into the Rules of Procedure as Appendix 3A. In its ERO Certification Order, FERC found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards and thus satisfies certain of the criteria for approving Reliability Standards.[8]

The development process is open to any person or entity with a legitimate interest in the reliability of the bulk power system. NERC considers the comments of all stakeholders, and a vote of stakeholders and the NERC Board of Trustees is required to approve a Reliability Standard for submission to FERC.

The proposed Reliability Standards set out in **Exhibit A** have been developed and approved by industry stakeholders using NERC's *Reliability Standards Development Procedure*, and were approved by the NERC Board of Trustees on February 10, 2009.

The Reliability Standards proposed for approval serve a key reliability goal identified during the 2003 blackout to strengthen the quality of operator training programs.[9] Reliability standard PER-005-1 — System Personnel Training is a new standard that wholly supersedes approved Reliability Standard PER-002-0 and certain requirements in PER-004-1, resulting in a revised PER-004-2 standard that is also proposed for approval. NERC requests that upon the effective date of the proposed

[8] Order No. 672 at PP 268, 270.

[9] *August 14, 2003 Blackout: NERC Actions to Prevent and Mitigate the Impacts of Future Cascading Blackouts February 10, 2004,* Recommendation 6. Improve Operator and Reliability Coordinator Training, p. 11:

> NERC found during its investigation that some reliability coordinators and control area operators had not received adequate training in recognizing and responding to system emergencies. Most notable was the lack of realistic simulations and drills for training and verifying the capabilities of operating personnel. This training deficiency contributed to the lack of situational awareness and failure to declare an emergency when operator intervention was still possible prior to the high speed portion of the sequence of events.

standards, FERC concurrently retire existing Reliability Standards PER-002-0 and PER-004-1.

These proposed standards are a significant improvement from the currently existing Reliability Standards. For that reason, NERC recommends that FERC approve the standards proposed in this filing as a significant step in strengthening the quality of operator training programs as necessary for the reliability of the bulk power system.

IV. JUSTIFICATION FOR APPROVAL OF PROPOSED RELIABILITY STANDARDS

This section summarizes the development of the proposed Reliability Standards and provides evidence that the proposed Reliability Standards meet the criteria for approval set by FERC – that is, the proposed Reliability Standards are just, reasonable, not unduly discriminatory or preferential and in the public interest. This section also describes the reliability objectives to be achieved by approving the Reliability Standards, explains how the Reliability Standards meet the criteria FERC has established, and states how the Reliability Standards address key FERC directives from Order No. 693. The final discussion in this section provides the stakeholder ballot results and explains how other key issues were considered and addressed by the Standard Drafting Team.

The complete development record for these proposed Reliability Standards is available in **Exhibit B**. This record includes the successive drafts of the Reliability Standards, the implementation plan, the ballot pool and the final ballot results by registered ballot body members, stakeholder comments received during the development of the Reliability Standards, and how those comments were considered in developing the Reliability Standards. The Standard Drafting Team roster is provided in **Exhibit C**.

a. Basis and Purpose of PER-005-1 — System Personnel Training

Proposed Reliability Standard PER-005-1 requires the use of a systematic approach to training in developing System Operator training programs, requires verification that System Operators can perform their assigned tasks, and requires responsible entities to provide at least 32 hours of emergency operations training to each of their System Operators every 12 months. For Reliability Coordinators, Balancing Authorities, and Transmission Operators that have operational authority or control over facilities with established Interconnection Reliability Operating Limits ("IROLs") or that have established operating guides or protection systems to mitigate IROL violations, Requirement 3.1 of PER-005-1 requires that simulation technology, such as simulator, virtual technology, or other technology that replicates the operational behavior of the bulk electric system[10] be used during normal and emergency conditions as a part of their emergency operations training requirements. The proposed Reliability Standards serve to implement a key recommendation from the 2003 Northeast blackout by addressing an identified gap where operations personnel were not adequately trained to maintain

[10] Section 215 of the FPA and Section 39.1 of FERC's regulations codified the term "bulk power system" to refer to those facilities and control systems necessary for operating an interconnected electric energy transmission network and electric energy from generating facilities needed to maintain transmission system reliability. Prior to enactment of Section 215 of the FPA, NERC used the term "bulk electric system" to refer to the facilities subject to its planning and operating rules. In Order No. 693, FERC provided for an initial period in which FERC will rely on the NERC definition of bulk electric system and NERC's registration process to provide as much certainty as possible regarding the applicability to and the responsibility of specific entities to comply with the Reliability Standards in the start-up phase of a mandatory Reliability Standard regime. *See* Mandatory Reliability Standards for the Bulk-Power System, FERC Stats. & Regs. ¶ 31,242 (2007) (Order No. 693) at P 75, *reh'g denied*, 120 FERC ¶ 61,053 (2007) (Order No. 693-A). Because the drafting team for the Reliability Standards proposed in this filing began work on the development of these standards before the term "bulk power system" was codified, the proposed Reliability Standard continues to use the NERC-defined term "bulk electric system." In this filing, NERC uses the term "bulk power system" unless citing directly to the proposed Reliability Standard, in which case the term "bulk electric system" is used.

reliable operation under emergency conditions.[11] Operators must be trained to recognize and take effective action in response to these emergencies. These concepts were further embodied in FERC's Order No. 693 where the expectation to incorporate a systematic approach to training was established, as well as the need to provide operator simulation as part of the emergency training requirement.

NERC's filing for approval of these Reliability Standards marks a significant milestone toward achieving FERC priorities as articulated in Order No. 693. These

[11] *See* Blackout Report at pp. at 110, 194 and 202, respectively. The US-Canada Blackout Report contained further detail on the deficiencies regarding operator training that contributed to the event:

"Operating procedures were necessary but not sufficient to deal with severe power system disturbances in several of the events. Enhanced procedures and training for operating personnel were recommended. Dispatcher training facility scenarios with disturbance simulation were suggested as well. Operators tended to reduce schedules for transactions but were reluctant to call for increased generation—or especially to shed load—in the face of a disturbance that threatened to bring the whole system down. Previous recommendations concerning training include:

- Thorough programs and schedules for operator training and retraining should be vigorously administered.
- A full-scale simulator should be made available to provide operating personnel with "hands-on" experience in dealing with possible emergency or other system conditions.
- Procedures and training programs for System Operators should include anticipation, recognition, and definition of emergency situations.
- Written procedures and training materials should include criteria that System Operators can use to recognize signs of system stress and mitigating measures to be taken before conditions degrade into emergencies.
- Line loading relief procedures should not be relied upon when the system is in an insecure state, as these procedures cannot be implemented effectively within the required time frames in many cases. Other readjustments must be used, and the System Operator must take responsibility to restore the system immediately.
- Operators' authority and responsibility to take immediate action if they sense the system is starting to degrade should be emphasized and protected.
- The current processes for assessing the potential for voltage instability and the need to enhance the existing operator training programs, operational tools, and annual technical assessments should be reviewed to improve the ability to predict future voltage stability problems prior to their occurrence, and to mitigate the potential for adverse effects on a regional scale."

"Problems identified in studies of prior large-scale blackouts were repeated, including deficiencies in vegetation management, operator training, and tools to help operators better visualize system conditions."

"NERC found during its investigation that some reliability coordinators and control area operators had not received adequate training in recognizing and responding to system emergencies. Most notable was the lack of realistic simulations and drills for training and verifying the capabilities of operating personnel. This training deficiency contributed to the lack of situational awareness and failure to declare an emergency when operator intervention was still possible prior to the high speed portion of the sequence of events."

proposed standards result from a collaborative effort by the NERC Standard Drafting Team and the electric industry over several years to address these challenging training issues. The resulting standards proposed in this filing add a significant amount of structure to the training programs for the principal operators of the bulk power system, namely Reliability Coordinators, Balancing Authorities and Transmission Operators. NERC recognizes that additional training obligations remain to be established for generator operators and various operations support personnel in response to Order No. 693; these will be addressed in a subsequent development effort as described in the *Reliability Standards Development Plan: 2009-2011*.

The proposed Reliability Standard requires training for the purpose of ensuring that System Operators performing real-time, reliability-related tasks on the North American bulk power system are competent to perform those reliability-related tasks. The proposed standard PER-005-1 addresses the functional entities required to complete the training, the design of training programs, and the implementation of those training programs. PER-005-1[12] represents the first NERC Reliability Standard that expressly addresses the design of System Operator training programs. The implementation of this Reliability Standard will ensure that the expectations for operating the bulk power system are understood through the training contemplated by the standard, are formally documented, and are adhered to in practice.

PER-005-1 contains three requirements summarized as follows:

- Requirement R1 mandates the use of a systematic approach to training for both new and existing training programs. The requirement further requires applicable entities to create a company-specific, reliability-related task list

[12] The basic elements of three requirements (R2- 4) of FERC approved PER-004-1 were incorporated into proposed PER-005-1. The remaining requirements (R1 and R5) from PER-004-1 were not modified and are carried forward intact in PER-004-2.

relevant to bulk power system operation and to design and develop learning objectives and training materials based on the task list performed by its System Operators each calendar year. Finally, the requirement mandates the training be delivered and the training program be evaluated on at least an annual basis to assess its effectiveness.

- Requirement R2 requires the verification of a System Operator's ability to perform the tasks identified in Requirement R1. The requirement also mandates re-verification of a System Operator's ability to perform the tasks within a specified time period when program content is modified.
- Requirement R3 identifies the number of hours of emergency operations training (at least 32 hours) that a System Operator is required to obtain every twelve months. The requirement further identifies those entities required to use simulation technology such as a simulator, virtual technology, or other technology in their emergency operations training programs.

Demonstration that the proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential and in the public interest

In Order No. 672, FERC identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest.[13] The discussion below identifies these factors and explains how the proposed Reliability Standards have met or exceeded the criteria:

1. **Proposed Reliability Standards must be designed to achieve a specified reliability goal**

   Order No. 672 at P 321. The proposed Reliability Standard must address a reliability concern that falls within the requirements of section 215 of the FPA. That is, it must provide for the reliable operation of Bulk-Power System facilities. It may not extend beyond reliable operation of such facilities or apply to other facilities. Such facilities include all those necessary for operating an interconnected electric energy transmission network, or any portion of that network, including control systems. The proposed Reliability Standard may apply to any design of planned additions or modifications of such facilities that is necessary to provide for reliable operation. It may also apply to Cybersecurity protection.

[13] *See* Order No. 672 at PP 262, 321-37. *See also* Order No. 693 at P 5.

Proposed Reliability Standard PER-005-1 — System Personnel Training is designed to ensure that System Operators performing real-time reliability-related tasks on the bulk power system are competent to perform those reliability-related tasks.

2. Proposed Reliability Standards must contain a technically sound method to achieve the goal

> Order No. 672 at P 324. The proposed Reliability Standard must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve this goal. Although any person may propose a topic for a Reliability Standard to the ERO, in the ERO's process, the specific proposed Reliability Standard should be developed initially by persons within the electric power industry and community with a high level of technical expertise and be based on sound technical and engineering criteria. It should be based on actual data and lessons learned from past operating incidents, where appropriate. The process for ERO approval of a proposed Reliability Standard should be fair and open to all interested persons.

The proposed Reliability Standards contain a technically sound method that strengthens the quality of operator training programs that are necessary for the reliability of the bulk power system. For example, proposed PER-005-1 utilizes a systematic approach to training, a training structure used to ensure that operators receive the training necessary to perform their assigned tasks. Responsible entities identify the tasks necessary for competent job performance through a systematic analysis of job requirements. A comprehensive training program is then developed based on the results of that analysis.

A systematic approach to training provides: focus on what the trainee needs to know and will be able to do after training is conducted; program development that is experience-based and is a process that is "reusable" as new tasks are identified; and a methodology used in every systematic approach to training that carefully links each component of a training program. A systematic approach to training also provides reasonable assurance that the program effectively addresses the required tasks through

application of analysis, design, development, implementation, and evaluation. Finally, the systematic approach to training requires a systematic evaluation of training effectiveness and its relation to on-the-job performance to ensure that the training program conveys all required skills and knowledge. On this basis, the systematic approach to training provides a technically sound foundation for development of operator training programs.

Additionally, the proposed Reliability Standard PER-005-1 requires that System Operators be trained with simulators/simulation technology, which facilitates training on how to respond to events that occur infrequently. This type of training is widely accepted in many industries as an effective and efficient tool for providing training and practice. Simulators/simulation technology has been used by personnel in industries where the consequences of an error can have extensive ramifications for safety. These industries include airline pilots, shipping pilots and operators of control systems in the chemical, oil and gas industries. Therefore, requiring the use of simulators/simulation technology in training programs is a key component to achieving the objective of the Reliability Standard.

In its development of the proposed Reliability Standard, the team identified Reliability Coordinators, Transmission Operators and Balancing Authorities that have operational authority or control over facilities with established Interconnection Reliability Operating Limits ("IROLs") or that have established operating guides or protection systems to mitigate IROL violations as having operational control over a significant portion of load and generation. The Standard Drafting Team based this decision on the fact that IROLs, if exceeded, could expose a widespread area of the bulk power system to

instability, uncontrolled separation(s) or cascading outages. On this basis, the Standard Drafting Team concluded it is technically sound to use IROLs as a delineating factor to determine which entities need to employ simulator/simulation technology in their training programs.

3. Proposed Reliability Standards must be applicable to users, owners and operators of the bulk power system, and not others

> Order No. 672 at P 322. The proposed Reliability Standard may impose a requirement on any user, owner, or operator of such facilities, but not on others.

This standard is applicable only to Reliability Coordinators, Balancing Authorities and Transmission Operators. These entities are users, owners and operators of the bulk power system.

4. Proposed Reliability Standards must be clear and unambiguous as to what is required and who is required to comply

> Order No. 672 at P 325. The proposed Reliability Standard should be clear and unambiguous regarding what is required and who is required to comply. Users, owners, and operators of the Bulk-Power System must know what they are required to do to maintain reliability.

The proposed Reliability Standard applies to specific functional entities: Reliability Coordinators, Balancing Authorities and Transmission Operators. NERC uses its Section 500 compliance registry process to identify the specific entities that are required to comply with the proposed standards. The proposed Reliability Standards are specific with regard to what is required to comply with the requirements. PER-005-1 Requirement R1 requires subject entities to use a systematic approach to establish a training program for the bulk power system company-specific, reliability-related tasks performed by its System Operators. Requirement R1 further details four components to: (1) create a list of bulk power system company-specific reliability-related tasks; (2) design and develop learning objectives and training materials based on the task list; (3)

deliver the training; and (4) conduct an annual evaluation of the training program to identify and implement any needed changes.

Requirement R2 requires each subject entity to verify each of its System Operator's capabilities to perform each assigned identified task at least one time. Requirement R3 requires each subject entity to provide at least thirty-two hours of applicable emergency operations training to its System Operators within each twelve-month period. The proposed standard also includes measures that are used to determine an entity's compliance with the requirements, and a compliance process to verify conformance with the standard.

5. Proposed Reliability Standards must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation

Order No. 672 at P 326. The possible consequences, including range of possible penalties, for violating a proposed Reliability Standard should be clear and understandable by those who must comply.

The proposed PER-005-1 Reliability Standard includes a VRF for each main requirement in the Reliability Standard. In addition, the Reliability Standard contains a table containing VSLs ranging from Moderate to Severe that support the Reliability Standard's requirements.

Reliability Standard PER-005-1, Requirement R1 has a Medium VRF. This requirement is primarily administrative in nature because it prescribes a certain process to be used when developing a training program. It is unlikely that, under emergency, abnormal or restoration conditions, a violation of this requirement would lead to bulk power system instability, separation or cascading failures or hinder restoration to a normal condition.

An entity that fails to provide evidence that it updated its company-specific reliability-related task list to identify new or modified tasks each calendar year, or the entity that fails to provide evidence of having evaluated its training program to identify needed changes to its training programs, has failed to comply with Requirement R1 at a Moderate Level VSL. An entity that fails to design and develop learning objectives and training materials based on the bulk power system company-specific reliability-related tasks has failed to comply with Requirement R1 at a High Level VSL. An entity that fails to prepare a company-specific reliability-related task list or to deliver training based on the bulk power system company-specific reliability-related tasks has failed to comply with Requirement R1 at a Severe Level VSL.

Reliability Standard PER-005-1, Requirement R2 has a High VRF. This requirement provides for verification of an operator's ability to perform tasks associated with certain functions. If this requirement were violated, it could either directly cause or contribute to bulk power system instability, separation or a cascading sequence of failures, or it could place the bulk power system at an unacceptable risk of instability, separation or cascading failures.

An entity that verifies at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of bulk power system company-specific reliability-related tasks has failed to comply with Requirement R2 at a Moderate Level VSL. An entity that verifies at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of bulk power system company-specific reliability-related tasks or that fails to verify its System Operators' capabilities to perform each new or modified task within six months of making a

modification to its bulk power system company-specific reliability-related task list has failed to comply with Requirement R2 at a High Level VSL. An entity that verifies less than 70% of its System Operators' capabilities to perform each assigned task from its list of bulk power system company-specific reliability-related tasks has failed to comply with Requirement R2 at a Severe Level VSL.

Reliability Standard PER-005-1, Requirement R3 has a Medium VRF. Although this requirement provides for certain types of training to be performed at least every 12 months, it is unlikely that under emergency, abnormal or restoration conditions, a failure to complete this training would lead to bulk power system instability, separation or cascading failures or hinder restoration to a normal condition.

An entity that provides at least 32 hours of emergency operations training to at least 90% but less than 100% of their System Operators has failed to comply with Requirement R3 at a Moderate Level VSL. An entity that provides at least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators has failed to comply with Requirement 3 at a High Level VSL. An entity that provides 32 hours of emergency operations training to less than 70% of its System Operators or did not include simulation technology replicating the operational behavior of the bulk power system in its emergency operations training has failed to comply with Requirement R3 at a Severe Level VSL.

Once the standard is approved by FERC, the ranges of penalties for violations will be based on the applicable VRFs and VSLs and will be administered based on the sanctions table and supporting penalty determination process described in FERC-

approved NERC Sanction Guidelines, included in Appendix 4B to the NERC's Rules of Procedure.

6. Proposed Reliability Standards must identify clear and objective criterion or measures for compliance, so that it can be enforced in a consistent and non-preferential manner

> Order No. 672 at P 327. There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.

Each requirement in the proposed Reliability Standard is supported by a measure that clearly identifies what is required and how the requirement will be enforced. These measures, which include all sub-requirements, will ensure the requirements are clearly administered for enforcement in a consistent manner and without prejudice to any party. The measures are included in Section C of the proposed Reliability Standard. Furthermore, to aid in the compliance monitoring processes, NERC will develop a Reliability Standard audit worksheet ("RSAW") for this proposed Reliability Standard, once approved, in the list of actively monitored Reliability Standards for a particular program year. These RSAWs are auditor guides that also assist the applicable entity in understanding what they are expected to provide in support of the particular measures to demonstrate compliance.

7. Proposed Reliability Standards should achieve a reliability goal effectively and efficiently - but does not necessarily have to reflect "best practices" without regard to implementation cost

> Order No. 672 at P 328. The proposed Reliability Standard does not necessarily have to reflect the optimal method, or "best practice," for achieving its reliability goal without regard to implementation cost or historical regional infrastructure design. It should however achieve its reliability goal effectively and efficiently.

The proposed Reliability Standard helps the industry achieve the stated reliability goal effectively and efficiently by requiring the implementation of a systematic approach to training for reliability related tasks performed by System Operators (Requirement R1). This includes the development of a list of company specific bulk power system reliability related tasks, learning objectives and training material based on the list and an annual review of the training program. (Requirements R1.1 – R1.4). The proposed standard requires that the operator's ability to perform each of the tasks on the task list to be verified (Requirement R2). The proposed standard also requires that a portion of the training be devoted to emergency operations and restoration topics that includes the expectation for certain entities to provide simulation (Requirement R3). NERC recognizes that the implementation cost of a full-fledged system-specific simulator can be significant. Therefore, the use of a simulator is only required for entities managing facilities having a significant impact on the bulk power system (Requirement R3.1), that is, those who are responsible for identifying, managing, or mitigating IROLs. Additionally, these entities have thirty-six (36) months to implement the simulator requirement (Applicability Section 5.3). This approach takes into consideration the implementation cost of simulators, as well as the time to integrate simulation technologies into the training program.

8. Proposed Reliability Standards cannot be "lowest common denominator," i.e., cannot reflect a compromise that does not adequately protect bulk power system reliability

> Order No. 672 at P 329. The proposed Reliability Standard must not simply reflect a compromise in the ERO's Reliability Standard development process based on the least effective North American practice — the so-called "lowest common denominator" — if such practice does not adequately protect Bulk-Power System reliability. Although [FERC] will give due weight to the technical expertise of the ERO, [FERC] will not hesitate to remand a proposed

> Reliability Standard if [FERC is] convinced it is not adequate to protect reliability.

The proposed Reliability Standards do not reflect a "lowest common denominator" approach because the proposed standards add significant structure and specificity beyond that required in the current operator training standards. The proposed standards are a significant improvement from the currently existing Reliability Standards. For that reason, NERC recommends that FERC approve the standards proposed in this filing as a significant step in strengthening the quality of operator training programs as necessary for the reliability of the bulk power system.

The proposed standards require users, owners or operators of the bulk power system to utilize a systematic approach to training in order to establish, coordinate and implement training programs which do not exist in the FERC-approved PER-002-0 or PER-004-1 Reliability Standards. Further, the expectation to include a minimum of thirty-two hours of emergency operations training for every twelve-month period exists in the current standards but the requirement to add simulation training for certain entities is new. Therefore, the proposed standards add greater expectations with respect to operator training than exists currently. As a result, these standards are not the lowest common denominator with regard to its development, and are a significant step in improving operating training standards for bulk power system reliability.

9. Proposed Reliability Standards may consider the costs to implement a proposed Reliability Standard on smaller entities but not at consequence of less than excellence in operating system reliability

> Order No. 672 at P 330. A proposed Reliability Standard may take into account the size of the entity that must comply with the Reliability Standard and the cost to those entities of implementing the proposed Reliability Standard. However, the ERO should not propose a "lowest common denominator" Reliability Standard that would achieve less than excellence in operating system reliability solely to protect against reasonable expenses for

> supporting this vital national infrastructure. For example, a small owner or operator of the Bulk-Power System must bear the cost of complying with each Reliability Standard that applies to it.

With the exception of the requirement for simulation training discussed previously, all entities, small and large, are expected to comply with the proposed standards in the same manner. The standards allow an entity to tailor a training program to its company-specific related tasks and thus recognizes that a training program is not a "one size fits all." Smaller entities may have a lesser number of reliability-related tasks than larger entities, thus the size of their training program will be smaller as a result.

The requirement in this standard for the use of simulation technology has been limited to only those entities with established IROLs or that have established operating guides or protection systems to mitigate IROL violations. In addition, simulation technology has been identified in the proposed PER-005-1, Requirement R3.1 standard as a "simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency operations." Therefore, the standard adequately takes into account the costs of achieving compliance with the requirements of the standard because several options for implementing simulation technology are available in order to achieve compliance. Because all of options presented in Requirement R3.1 of the proposed Reliability Standard will achieve the desired result for operating training, the proposed standard's purpose in ensuring bulk power system reliability is not compromised for the sake of achieving greater cost savings.

10. Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one area or approach

> Order No. 672 at P 331. A proposed Reliability Standard should be designed to apply throughout the interconnected North American Bulk-Power System, to the maximum extent this is achievable with a single Reliability Standard. The proposed Reliability Standard should not be based on a single geographic or regional model but should take into account geographic variations in grid characteristics, terrain, weather, and other such factors; it should also take into account regional variations in the organizational and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.

The proposed Reliability Standard is a single standard that will be universally applicable in the U.S. and in applicable governmental areas in Canada where NERC standards or their equivalents are made effective. This proposed Reliability Standard recognizes business and operational variations in the responsibilities of large and small entities. For example, only entities with established IROLs or that have protection schemes in place to mitigate an IROL are obligated to integrate simulation capability, respectful of the impact these entities have on the reliability of the bulk power system.

11. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid

> Order No. 672 at P 332. As directed by section 215 of the FPA, [FERC] itself will give special attention to the effect of a proposed Reliability Standard on competition. The ERO should attempt to develop a proposed Reliability Standard that has no undue negative effect on competition. Among other possible considerations, a proposed Reliability Standard should not unreasonably restrict available transmission capability on the Bulk-Power System beyond any restriction necessary for reliability and should not limit use of the Bulk-Power System in an unduly preferential manner. It should not create an undue advantage for one competitor over another.

The proposed training standard enhances the operation and reliability of the grid and does not constrain competition or restrict transmission capability. Because the proposed standard does not have a business practice impact, this factor is not applicable.

12. The implementation time for the proposed Reliability Standards must be reasonable.

> Order No. 672 at P 333. In considering whether a proposed Reliability Standard is just and reasonable, [FERC] will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.

Operator training is a high priority activity. Recommendation 6 of the 2003 Blackout report titled "Improve Operator and Reliability Coordinator Training" served notice to the industry that operator training needed improvement. FERC Order No. 693 also reinforced FERC's expectations regarding operator training. The priority for implementing this Reliability Standard was described in FERC's Notice of Proposed Rulemaking[14] (NOPR) preceding FERC Order No. 693. In the NOPR, FERC described the basis for identifying Operating Personnel Training as a "High Priority Standard."

Paragraph 774 of the NOPR stated:

> A review of operator demographics reveals that a large percentage of electrical operators will retire over the next five years. As these older and more experienced operators retire, the need for structured, comprehensive and effective training programs tailored to the needs of the functions and individuals become even more crucial, and will need to be developed and implemented for incoming operators who will not have benefited from years of on-the-job training, mentoring and knowledge transfer from experienced operators…

The implementation schedule for the proposed standards is reasonable and recognizes that training is not a "one-size-fits-all" program. The 24-month implementation timeframe for Requirement R1 and R2 allows flexibility in creating and implementing the training programs that use a systematic approach to training, and is structured and tailored to the functions that each entity performs in operating the bulk

[14] *Notice of Proposed Rulemaking*, 117 FERC 61,084 (October 20, 2006).

power system. Additionally, Requirement R3, which addresses emergency operations training, is presently in effect through PER-002-0 Requirement R4 and PER-004-1 Requirement R2. Therefore, immediate implementation of this Requirement will not impose any further burden on entities.

The proposed Requirement R3.1, which requires entities that have operational authority or control over Facilities with established IROLs or that have established operating guides or protection systems to mitigate IROL violations to use simulation technology within the emergency operations training construct, allows for a 36-month implementation period. Many of the entities already provide for the use of simulation technology within their training programs to some extent. However, the proposed standard will require these entities to ensure that simulation technology is integrated as a core component of those programs going forward. For entities currently without such capabilities, the implementation timeframe allows the needed flexibility to secure and integrate simulation technology into one compliance program. Finally, the proposed Reliability Standard generally exempts smaller entities that do not have a significant effect on the bulk power system from this requirement, except for those with IROL responsibility. Accordingly, NERC believes this proposed implementation plan presents a reasonable time frame to comply with the proposed Reliability Standard.

13. The Reliability Standard development process must be open and fair

> Order No. 672 at P 334. Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its [FERC]-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development

process if it is conducted in good faith in accordance with the procedures approved by [FERC].

NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development Process) of its Rules of Procedure and the NERC *Reliability Standards Development Procedure*, which is incorporated into the Rules of Procedure as Appendix 3A. In its ERO Certification Order, FERC found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards.[15] The development process is open to any person or entity with a legitimate interest in the reliability of the bulk power system. The process considers the comments of all stakeholders, and a vote of both the stakeholders and the NERC Board of Trustees is required to approve a Reliability Standard for submission to FERC.

The proposed Reliability Standards set out in **Exhibit A** have been developed and approved by industry stakeholders using NERC's *Reliability Standards Development Procedure*, and were adopted by the NERC Board of Trustees on February 10, 2009 for filing with FERC. Therefore, NERC has utilized its standard development process in good faith and in a manner that is open and fair.

14. Proposed Reliability Standards must balance with other vital public interests

> Order No. 672 at P 335. Finally, we understand that at times development of a proposed Reliability Standard may require that a particular reliability goal must be balanced against other vital public interests, such as environmental, social and other goals. We expect the ERO to explain any such balancing in its application for approval of a proposed Reliability Standard.

The Reliability Standard PER-005-1, System Personnel Training, does not require balancing against any vital public interests nor does it do any harm to any vital public

[15] Order No. 672 at PP 268, 270.

interest. The System Personnel Training Standard supports vital public interests by ensuring that operating personnel of the bulk power system are adequately trained to operate the bulk power system at the highest levels of bulk power system reliability.

15. Proposed Reliability Standards must consider any other relevant factors

> Order No. 672 at P 323. In considering whether a proposed Reliability Standard is just and reasonable, we will consider the following general factors, as well as other factors that are appropriate for the particular Reliability Standard proposed.
>
> ***
>
> Order No. 672 at P 337. In applying the legal standard to review of a proposed Reliability Standard, [FERC] will consider the general factors above. The ERO should explain in its application for approval of a proposed Reliability Standard how well the proposal meets these factors and explain how the Reliability Standard balances conflicting factors, if any. [FERC] may consider any other factors it deems appropriate for determining if the proposed Reliability Standard is just and reasonable, not unduly discriminatory or preferential, and in the public interest. The ERO applicant may, if it chooses, propose other such general factors in its ERO application and may propose additional specific factors for consideration with a particular proposed Reliability Standard.

NERC does not propose any additional factors for consideration at this time.

b. Basis and Purpose of PER-004-2 Reliability Coordination – Staffing

Reliability Standard PER-004-1 — Reliability Coordination – Staffing addresses subject matter critical to bulk power system reliability, namely that Reliability Coordinators have sufficient competent staff to effectively perform the Reliability Coordinator functions. Proposed Reliability Standard PER-004-2 — Reliability Coordination – Staffing includes modifications to the PER-004-1 standard, that were made to avoid redundancy and potential conflict, and to conform to the requirements now associated with proposed new Reliability Standard PER-005-1.

More specifically, PER-004-2 modifies Reliability Standard PER-004-1, by deleting Requirements R2, R3, and R4 because more detailed, complete, and less ambiguous requirements addressing the same issues are now included as Requirements R3, R2, and R1, respectively, of new proposed Reliability Standard PER-005-1. A more detailed description of these changes appears below. Note that the remaining requirements in PER-004-1 are carried forward to PER-004-2 intact, including all associated VRF and VSL assignments, and are included herein for FERC approval.

Replacement of PER-004-1 Requirement R2 with PER-005-1 Requirement R3

PER-004-1 Requirement R2 provides:

> ***R2****.All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.*

In contrast, proposed Requirement R3 of PER-005-1 provides:

> ***R3.*** *At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
>
> > ***R3.1.*** *Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.*

Because the proposed PER-005-1 Requirement R3 addresses the training requirement pertaining to duration and drills, simulations, and exercises formerly described in PER-004-1 Requirement R2, and because the provisions of PER-004-1 Requirement R2 would now be redundant and potentially conflict with the more precise

requirements of PER-005-1 Requirement R3, proposed PER-004-2 has been modified to remove Requirement R2, with the associated renumbering of the remaining requirements. These changes are consistent with NERC Reliability Standard objectives to eliminate redundancy and ambiguity in existing Reliability Standards.

Replacement of PER-004-1 Requirements R3 and R4 with PER-005-1 Requirements R1 and R2

Currently, PER-004-1 Requirements R3 and R4 provide:

> ***R3.*** *Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.*
>
> ***R4.*** *Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.*

Proposed Reliability Standard PER-004-2 modifies the previously approved standard to remove these requirements, because they are more fully addressed by Requirements R1 and R2 of PER-005-1. Requirements R1 and R2 of proposed Reliability Standard PER-005-1 are as follows:

> ***R1.*** *Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
>
> > ***R1.1.*** *Each Reliability Coordinator, Balancing Authority and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.*
> >
> > > ***R1.1.1.*** *Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related tasks performed by its System Operators each calendar year to identify new or modified tasks for inclusion in training.*

R1.2. *Each Reliability Coordinator, Balancing Authority and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.*

R1.3. *Each Reliability Coordinator, Balancing Authority and Transmission Operator shall deliver the training established in R1.2.*

R1.4. *Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified.*

R2. *Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. [Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. *Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.*

c. Basis for Retirement of PER-002-0 — Operating Personnel Training – Staffing

The Requirements of FERC-approved Reliability Standard PER-002-0 have been completely replaced and supplanted by the specific provisions of proposed new Reliability Standard PER-005-1. Retirement of PER-002-0, upon the effective date of PER-005-1 is necessary to avoid redundancy, conflict, and confusion regarding the mandatory training standards.

V. PROPOSED RELIABILITY STANDARDS' COMPLIANCE WIH THE DIRECTIVES IN FERC ORDER NO. 693

When FERC approved Reliability Standard PER-002-2 in Order No. 693, it directed that modifications be made through the Reliability Standards development process. Those modifications were addressed in the development of the Reliability Standards proposed for approval in this filing. FERC's directives, summarized in Paragraphs 1393 and 1394 of Order No. 693, are addressed below. In cases where the

approach in the Reliability Standards proposed in this filing deviate from the FERC directives, justification is offered to support an approach that is an equal and effective alternative to achieve the same reliability objective.

1. Identify the Expectations of Training for Each Job Function and Develop Training Programs Tailored to Each Job Function.

In Order No. 693, FERC directed NERC to identify the expectations of the training for each job function, and develop training programs tailored to each job function with consideration of the individual training needs of the personnel.[16] FERC noted that, in its inclusion of a formal training program for local control center personnel, this program should be tailored to the functions local control center operators, generator operations, and operations planning staff performing functions that impact the reliable operation of the bulk power system for both normal and emergency operations.[17]

Requirement R1 of the proposed PER-005-1 Reliability Standard requires each responsible entity to create a list of bulk power system company-specific reliability-related tasks performed by its System Operators. The responsible entity then uses the task list to design and develop learning objectives and training materials, thereby identifying the expectations of the training for each job function (or collection of tasks). By doing so, the proposed standard provides the opportunity for entities to develop training programs that are tailored to each job function with specific consideration to individual training needs. Similarly, Requirement R1.2 further adds that entities are required to design and develop learning objectives and training materials based on the task list, thereby identifying the expectations of the training for each job function (or collection of tasks).

[16] Order No. 693 at P 1393.
[17] *Id.* at P 1348.

As stated in the purpose of this proposed standard, the intent of these requirements is to ensure that properly trained individuals are operating the bulk power system. The proposed standard helps to achieve that purpose by providing the structure necessary to accomplish this intent while also ensuring that a means of evaluating the capability of the individual to perform each assigned task can be adequately determined. Accordingly, because the proposed standard requires that the training requirements be identified by task, the proposed Reliability Standard appropriately identifies the expectations of the training for each job function that is tailored to the functions of local control center personnel performing tasks related to the reliable operation of the bulk power system for both normal and emergency operations.

2. Expand the Applicability Section of the Proposed Reliability Standard to include Reliability Coordinators, Local Transmission Control Center Operating Personnel, Generator Operators Centrally-located at a Generator Control Center with Direct Impact on the Reliable Operation of the Bulk Power System, and Operations Planning and Operations Support Staff that carry out Outage Planning and Assessments and those who Develop SOLs, IROLs, or Operating Nomograms.

In Order No. 693, FERC required that the Applicability section of the PER-002-0 Reliability Standard be expanded to include Reliability Coordinators, local transmission control center operating personnel, Generator Owners centrally located at a generator control center with direct impact on the reliable operation of the bulk power system, and operations planning and operations support staff who carry out outage planning and assessments, and those who develop System Operating Limits ("SOLs"), IROLs, or operating nomograms for real-time operations.[18] The proposed PER-005-1 Reliability Standard has been expanded to include Reliability Coordinators as an applicable entity, and also includes Balancing Authorities and Transmission Operators.

[18] *Id.* at P 1393.

Generator Owners, operations planning, and operations support staff were not included in the scope of the development of the Reliability Standards proposed in this filing, and instead are included in the scope of Project 2010-1 – Support Personnel Training, which is part of NERC's *Reliability Standards Development Plan: 2009-2011*. The inclusion of these entities in the standards proposed here would have necessitated expansion of the Standard Drafting Team roster to ensure these disciplines were fairly represented. NERC elected to complete the core activities as identified in the project scope and obtain FERC approval on the proposed standards now rather than further delay the completion of this important set of standards. However, NERC plans to address the expansion of the training standard to other entities through a separate project team.

In determining how to apply FERC's guidance in expanding the Applicability section to local transmission control center operating personnel, the team referred to guidance provided in the NERC Drafting Team Guidelines to address this issue. As provided in this guideline document, the Applicability section must identify the functional entities (from the NERC Reliability Functional Model[19]) that are required to comply with the requirements in a proposed Reliability Standard. In its analysis, the team agreed that the NERC Reliability Functional Model accurately captures the list of functions that a Transmission Operator performs, and therefore includes those performed by local control center personnel. Accordingly, the team determined that if all entities register based on the guidance provided in NERC's *Statement of Compliance Registry Criteria,* FERC's directive in Order No. 693 will be appropriately addressed because the Transmission Operator has the ultimate responsibility to ensure that its functional responsibilities are met, even if through other entities.

[19] The NERC Reliability Functional Model is available at http://www.nerc.com/page.php?cid=2|247|108.

3. Use the Systematic Approach to Training Methodology in the Development of New Training Programs.

In Order No. 693, FERC states that a Systematic Approach to Training is a proven approach to: identify the tasks and associated skills and knowledge necessary to accomplish those tasks; determine the competency levels of each operator to carry out those tasks; determine the competency gaps; and design, implement, and evaluate a training plan to address each operator's competency.[20] Accordingly, FERC directed that NERC develop a modification to the PER-002-2 Reliability Standard, or a new Reliability Standard, that uses the Systematic Approach to Training methodology.[21]

Proposed Reliability Standard PER-005-1, Requirement R1 requires that each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a systematic approach to training to establish a training program for the bulk power system company-specific reliability-related tasks performed by its System Operators. Accordingly, FERC's directive that a Systematic Approach to Training be used is met in the proposed Reliability Standard.

4. Include the Use of Simulators by Reliability Coordinators, Transmission Operators, and Balancing Authorities that have Operational Control over a Significant Portion of Load and Generation.

In Order No. 693, FERC stated that hands-on training using simulators can add significant value to training for emergencies and can add significant reliability benefits if Reliability Coordinators, Transmission Operators, and Balancing Authorities that have operational control of a significant portion of load and generation are required to obtain

[20] *Id.* at P 1380.
[21] *Id.* at P. 1382.

simulator training.[22] FERC noted that, because the cost is likely to outweigh the reliability benefits for small entities, small entities can continue to use training aids such as generic operator training simulators and realistic table-top exercises.[23] However, FERC directed that NERC develop a requirement for the use of simulators dependant on the entity's role and size.[24]

Proposed Reliability Standard PER-005-1 Requirement R3.1 states "Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions." This allows entities the flexibility to utilize the most current technology available that replicates the operational behavior of the bulk power system.

The team determined that the proposed language in Requirement R3.1 is an equal and effective approach in meeting FERC's directives in Order No. 693 because the proposed standard requires simulator training for entities that have operational control of a significant portion of load and generation, while balancing the costs of simulator training on small entities. In developing the proposed standard, the team identified Reliability Coordinators, Transmission Operators and Balancing Authorities that have operational authority or control over facilities with established IROLs or that have established operating guides or protection systems to mitigate IROL violations as entities

[22] *Id.* at P 1390.
[23] *Id.* at P 1391.
[24] *Id.*

with operational control over a significant portion of load and generation. IROLs, if exceeded, could expose a widespread area of the bulk power system to instability, uncontrolled separation(s) or cascading outages. For this reason, the standard drafting team believed that focusing on IROLs was an equal and effective method for determining those entities that are required to use simulator/simulation technology in their training programs to that directed by FERC in Order No. 693.

5. Determine the Feasibility of Developing Meaningful Performance Metrics Associated with the Effectiveness of the Training Programs.

In Order No. 693, FERC directed NERC to determine whether it is feasible to develop meaningful performance metrics associated with the effectiveness of a training program, and if so, to develop such performance metrics.[25] In its analysis of FERC's directive, the team considered the effectiveness of the systematic approach to training and whether this provides meaningful performance metrics associated with the effectiveness of a training program.

The team determined that the systematic approach to training requires evaluation against stated objectives, as required in proposed Reliability Standard PER-005-1, Requirement R1.4. That is, Requirement R1.4 requires each Reliability Coordinator, Balancing Authority, and Transmission Operator to conduct an annual evaluation of the training program established in Requirement R1 to identify any needed changes to the training program and implement the changes identified. Therefore, the systematic approach to training and the requirement for entities to assess whether their System Operators are receiving effective training provides a meaningful assessment of the

[25] *Id.* at P 1394.

training program. An evaluation of how System Operators perform during infrequent, actual events on the system would not provide useful metrics on an ongoing basis.

Additionally, the team clarified that proposed Reliability Standard PER-005-1 is a training standard that identifies what a trainee should do and evaluates the training program against that standard, as described in PER-005-1, Measure M1.4. This standard is not intended to address individual System Operator performance apart from the requirements associated with the company-specific reliability-related tasks identified in Requirement R1.

6. Consider whether Personnel that Support EMS Applications should be included in the Mandatory Training Requirements.

FERC directed NERC to consider through the Reliability Standards Development Process the question of whether personnel that support EMS applications should be included in mandatory training.[26] This issue is being addressed in Project 2010-01 Support Personnel Training.

7. Consider FirstEnergy's Comments regarding the Nuclear Plant Operators' Training Program as part of the Standards Development Process.

In Order No. 693, FERC directed NERC to consider FirstEnergy's comment that nuclear power plant operators already subject to NRC training requirements should therefore satisfy the requirements of a NERC Reliability Standard regarding training programs. This is being addressed in Project 2010-01 Support Personnel Training.

8. Include Requirements Pertaining to Personnel Credentials for Reliability Coordinators similar to PER-003.

In Order No. 693, FERC directed NERC to include in the proposed standard requirements pertaining to personnel credentials for Reliability Coordinators similar to

[26] *Id.*

those in PER-003-0.[27] This issue is being addressed in Project 2007-04 Certifying System Operators.

9. Consider the Suggestions of FirstEnergy and Xcel as part of the Standards Development Process.

In Order No. 693, FERC directed NERC to consider the suggestions of FirstEnergy and Xcel in the Reliability Standards development process.[28] FirstEnergy sought revisions to the terms "shall have a comprehensive understanding of" and "shall have extensive knowledge" because it will be difficult for entities to demonstrate compliance with these terms.[29] After its review of these terms, the team determined that this language should not be included in the proposed PER-005-1 Reliability Standard. Rather, the Standard Drafting Team believed that the credentials inherent in the terms "shall have comprehensive understanding of" and "shall have extensive knowledge" would be evident once an entity developed its Reliability Coordinators' company-specific reliability-related tasks, as required in Requirement R1 of proposed PER-005-1.

Xcel suggested that the emergency training requirements be expressed in hour increments rather than days to allow for flexibility in scheduling training and coordinating with rotating shift schedules.[30] As a result, the language in proposed PER-005-1 Requirement R3 now requires that System Operators obtain at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, rather than the five days that is included in the current version of the Reliability Standard.

[27] *Id.* at P 1415.
[28] *Id.* at P 1417.
[29] *Id.* at P 1413.
[30] *Id.* at P 1414.

For the reasons stated above, NERC believes the proposed Reliability Standards PER-004-2 and PER-005-0 provide significant improvement to bulk power system System Operator training programs and address a key recommendation from the 2003 U.S./Canada Blackout Report and other prior large-scale blackouts.

VI. SUMMARY OF THE RELIABILITY STANDARD DEVELOPMENT PROCEEDINGS

a. Development History

The Standards Authorization Request ("SAR") for a new training standard, sponsored by the NERC Personnel Subcommittee, was posted for two 30-day comment periods, from December 7, 2004 through January 7, 2005, and from February 17, 2006 through March 20, 2006. The refinements to the SAR narrowed the list of applicable entities to the Reliability Coordinator, Transmission Operator and Balancing Authority and narrowed the focus to using the systematic approach to training System Operators to ensure that System Operators are competent to perform real-time reliability-related tasks.

The Standard Drafting Team posted the draft standard for four public comment periods. The initial draft of the standard was posted for a 30-day comment period, from September 27, 2006 through October 26, 2006. A generic task list, organized by task, was posted with the standard. There were 58 sets of comments, including comments from 174 people representing 91 different entities from all NERC Regions and six of the nine Industry Segments. The initial draft of the standard was very detailed and included a requirement for each of the specified steps to employing a "structured approach to training." Many stakeholders indicated that these individual requirements should be consolidated into a single requirement, and the team agreed. The team removed separate requirements targeted for entry-level training, a requirement that exceeded the scope of

the SAR. The team also addressed qualifications of persons developing or delivering training, and removed requirements for extensive documentation of each training activity and maintenance of training materials.

The second draft of the standard was posted for a 45-day public comment period, from August 15, 2007 through September 28, 2007. There were 43 sets of comments, including comments from 130 different people from more than 70 companies representing 9 of the now 10 Industry Segments. Based on stakeholder comments, the drafting team modified the standard extending the effective date for emergency operations training from "effective immediately" to effective 36 months after regulatory approval." The drafting team further modified the requirements to specify that the company-specific reliability-related task lists must be updated at least annually and that an additional assessment must be performed as the task list is modified. In addition, the drafting team modified the standard to include the use of simulators for emergency operations training.

The third draft of the standard was posted for a 45-day public comment period from February 25, 2007 through April 9, 2007. There were 51 sets of comments, including comments from more than 100 different people from approximately 100 companies representing 9 of the 10 Industry Segments. Based on stakeholder comments, the drafting team modified the standard reducing the effective dates for two of the requirements from 36 months after regulatory approval to 24 months after regulatory approval. The drafting team also modified the standard mandating system restoration training and clarified the methods of training that could be used as part of its emergency operations training. The team further modified the emergency operations training using

simulators to emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the behavior of the bulk power system during normal and emergency operations.

The fourth draft of the standard was posted for a 30-day comment period from June 18, 2008 through July 17, 2008. There were 41 sets of comments, including comments from more than 140 different people from approximately 70 companies representing 8 of the 10 Industry Segments. The drafting team made only minor changes to improve clarity following the fourth posting.

The team finalized the proposed Reliability Standards, and presented them for Standards Committee approval for balloting. In accordance with the *Reliability Standard Development Procedure*, NERC posted the proposed Reliability Standard for a 30-day pre-ballot review from September 26, 2008 through October 25, 2008. The first ballot took place October 27, 2008 through November 5, 2008. During the first ballot, 90.13% of those registered for the ballot pool voted, which exceeded the minimum 75% quorum required to be considered a valid vote. The proposed Reliability Standard received a weighted segment approval of 82.47%. However, there were negative ballots submitted with a comment, triggering the need for a recirculation ballot. The majority of the negative voters expressed concerns surrounding the two (2) year implementation time frame, the treatment of existing training programs and mandating of the use of simulators.

The drafting team explained that the need for improvements to System Operator training was identified in the 2003 Blackout Report and that an entity would conceivably have more than two (2) years to implement the program based on the process utilized to

gain regulatory approval of a standard. Concerning the treatment of existing training programs, the team explained that existing training programs would have to be verified against the Standard to ensure compliance with the use of a systematic approach to training. The drafting team also explained that the use of a simulator was a directive from FERC Order No. 693 and that the team had expanded the concept of using a simulator to include simulation technology, virtual technology or other technology that replicates the operational behavior of the bulk power system to increase flexibility for an organization to meet the requirement of the standard using the most cost effective solution. The drafting team further explained that it proposed the following language as delineating factors for determining those entities that must use simulation technology in their training programs; "…that has operational authority or control over facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations…" This language was proposed as an alternative that is an equally efficient and effective method of achieving the intent of the FERC Order No. 693 directive to include "the use of simulators by Reliability Coordinators, Transmission Operators and Balancing Authorities that have operational control over a significant portion of load or generation."

After the standard drafting team responded to the comments, the proposed Reliability Standard proceeded to a recirculation ballot that was conducted from December 12, 2008 through December 22, 2008. The proposed Reliability Standard passed with a final quorum of 91.48% and a weighted segment approval of 80.63%. A two-thirds weighted segment approval is required for passage. On February 10, 2009, the NERC Board of Trustees adopted the proposed Reliability Standard.

b. Key Issues

During the development of the proposed Reliability Standard, the standard drafting team considered three major issues raised by stakeholders that are discussed in this section: (i) the need for a new training standard, (ii) the use of a systematic approach to training methodology, and (iii) the use of simulators in training programs.

Need for a New Training Standard

There are several stakeholders who do not believe that the proposed standards are needed. They list cost and lack of resources as primary reasons for not supporting the standard. Some indicate that existing training programs are sufficient. The drafting team reminded these stakeholders that a lack of training was one of the contributing causes of the 2003 blackout and that FERC Order No. 693 Appendix D established that Operating Personnel Training is a "High Priority Standard."

Use of a Systematic Approach to Training

Several stakeholders indicated that the standard should not specify the use of the systematic approach to training process. Many of the stakeholders that objected to the use of the systematic approach to training process either did not understand the process or did not want to revise their existing programs to fit the systematic approach to training process. The drafting team explained that this was a training process that has been widely recognized in many different occupational fields as an effective and efficient method of linking training to specific performance on designated tasks. The SAR for this project specified that the requirements in the standard must mandate use of the systematic approach to training process and that one of the directives in FERC Order No. 693 was to

modify the existing training standard to require the use of the systematic approach to training methodology in the development training programs.

In addition, several stakeholders felt the drafting team was trying to prescribe a certain systematic approach to training process while others requested that the drafting team add more specificity to the standard regarding the term systematic approach to training. The drafting team explained that there are several different terms used to describe this approach to developing training programs. The drafting team felt that adding a definition would restrict the use of certain valid approaches and force some entities into modifying their existing practices, without any additional benefit to reliability. There are many variations to the systematic approach to training process, but all include the steps identified in sub-requirements R1.1 through R1.4. The team assembled a list of references covering the systematic approach to training process and posted these for stakeholders.

Use of a Simulator

Some stakeholders did not support the requirement to use a simulator or simulation technology for training and argued that the use of simulators should not be mandatory because of the cost associated with staffing, development and maintenance of simulator/simulation technology. Order No. 693 included a directive to modify the existing training standard to include the use of simulators by Reliability Coordinators, Transmission Operators and Balancing Authorities that have operational control over a significant portion of load and generation. The use of simulators/simulation technology as effective training tools, particularly for learning how to react to events that occur infrequently, is widely accepted in other industries as an effective and efficient method of

providing training and practice. Simulators/simulator technology is used by personnel in many industries where the ramifications of an error have far-reaching consequences to safety – including airline pilots, shipping pilots, and operators of control systems in chemical, oil and gas industries.

VII. CONCLUSION

NERC requests that FERC approve PER-005-1 — System Personnel Training and PER-004-2 — Reliability Coordination – Staffing, as set out in **Exhibit A**, in accordance with Section 215(d)(1) of the FPA and Part 39.5 of FERC's regulations. NERC requests that, upon the effective date of the proposed standards identified in the respective implementation plans, FERC concurrently retire existing Reliability Standards PER-002-0 — Operating Personnel Training, and PER-004-1 — Reliability Coordination – Staffing. In addition, NERC requests FERC approval for proposed VRFs and VSLs for PER-005-1 and to carry forward the VRFs and VSLs currently assigned to the existing FERC-approved PER-004-1 for use in the proposed version 2 of that Reliability Standard included in this filing, subject to the outcome of NERC's review of all VSLs pursuant to FERC's four VSL guidelines, which will be filed by NERC in FERC Docket Nos. RR08-4-000, RR08-4-001, and RR08-4-002. NERC requests these proposed standards be made effective under FERC's procedures in accordance with the implementation plan provided with the Reliability Standard.

Respectfully submitted,

CERTIFICATE OF SERVICE

I hereby certify that I have served a copy of the foregoing document upon all parties listed on the official service list compiled by the Secretary in this proceeding.

Dated at Washington, D.C. this 30th day of September, 2009.

/s/ Holly A. Hawkins
Holly A. Hawkins

Attorney for North American Electric Reliability Corporation

Exhibit A

Reliability Standards Proposed for Approval

A. Introduction

1. Title: **System Personnel Training**

2. Number: PER-005-1

3. Purpose: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. Applicability:

4.1. Functional Entities:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Transmission Operator.

5. Proposed Effective Date for Regulatory Approvals:

5.1. In those jurisdictions where regulatory approval is required, Requirement R1 and Requirement R2 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirement R1 and Requirement R2 shall become effective on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

5.2. In those jurisdictions where regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after Board of Trustees adoption.

5.3. In those jurisdictions where regulatory approval is required Sub-requirement R3.1 shall become effective on the first day of the first calendar quarter, 36 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the Sub-requirement R3.1 shall become effective on the first day of the first calendar quarter, 36 months after Board of Trustees adoption.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.

R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related tasks performed by its System Operators each calendar year to identify new or modified tasks for inclusion in training.

R1.2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall deliver the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish and implement a training program, as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific reliability-related task list, with the date of the last review and/or revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1.4 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence (such as instructor observations, trainee feedback, supervisor feedback, course evaluations, learning assessments, or internal audit results) that it performed an annual training program evaluation, as specified in R1.4

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is

capable of performing each assigned task identified in R1.1, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

M3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring Period and Reset

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator, Balancing Authority and Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	None	The responsible entity failed to provide evidence that it updated its company-specific reliability-related task list to identify new or modified tasks each calendar year (R1.1.1) OR The responsible entity failed to provide evidence of evaluating its training program to identify needed changes to its training program(s). (R1.4)	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related tasks. (R1.2)	The responsible entity failed to prepare a company-specific reliability-related task list (R1.1) OR The responsible entity failed to deliver training based on the BES company specific reliability related tasks. (R1.3)
R2	None	The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)	The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks (R2) OR The responsible entity failed to verify its system operator's capabilities to perform each new or modified task within six months of making a modification to its BES company-specific reliability-related task list. (R2.1)	The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)
R3	None	The responsible entity provided at least 32 hours of emergency operations training to at least 90% but less than 100% of their System Operators. (R3)	The responsible entity provided at least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators. (R3)	The responsible entity provided 32 hours of emergency operations training to less than 70% of its System Operators (R3) OR The responsible entity did not include simulation technology replicating the operational behavior of the BES in its emergency operations training. (R3.1)

E. Regional Variances

None.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standards Committee approves SAR for posting on December 1, 2004.
2. SAR Drafting Team posted SAR for comments on December 7, 2004.
3. SAR Drafting Team responds to comments, revises SAR, and posts revised SAR for comments on February 17, 2006.
4. SAR Drafting Team responds to comments and revises SAR on May 15, 2006.
5. Standards Committee approves development of Standard on May 15, 2006.
6. The Standards Authorization Committee appointed the Standard Drafting Team on June 21, 2006.
7. Standards Drafting Team posted draft standard for comment on September 27, 2006.
8. Standards Drafting Team responded to comments and posted the revised standard on August 15, 2007.
9. Standard Drafting Team responded to comments and posted the revised standard for comment on February 15, 2008.
10. Standards Drafting Team responded to comments and posted the revised standard for comment on June 18, 2008.
11. Standards Drafting Team responded to comments from the fourth posting and will request the Standards Committee to move the standard forward to balloting on September 15, 2008.

Proposed Action Plan and Description of Current Draft:
This is the fifth version of the proposed standard and its associated implementation plan that has been posted for industry comments. The drafting team will be requesting the Standards Committee to move the standard forward to balloting.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on the fourth draft of the proposed standard.	September 15, 2008
2. Obtain the Standards Committee's approval to move the standard forward to balloting.	September 15, 2008
3. Post the standard and implementation plan for a 30-day pre-ballot review.	September 17, 2008
4. Conduct an initial ballot for ten days.	October 17, 2008
5. Respond to comments submitted with the initial ballot.	November 1, 2008
6. Conduct a recirculation ballot for ten days.	November 11, 2008
7. Post for a 30-day preview for board.	November 21, 2008
8. BOT adoption.	December 22, 2008

A. Introduction

1. Title: **System Personnel Training**

2. Number: PER-005-1

3. Purpose: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. Applicability:

4.1. Functional Entities:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Transmission Operator.

5. Proposed Effective Date for Regulatory Approvals:

5.1. In those jurisdictions where regulatory approval is required, Requirement R1 and Requirement R2 shall become~~s~~ effective on the first day of the first calendar quarter, 24 months after ~~the first day of the first calendar quarter following~~ applicable regulatory approval. ~~, or i~~In those jurisdictions where no regulatory approval is required, Requirement R1 and Requirement R2 shall ~~the Reliability Standard~~ become~~s~~ effective on the first day of the first calendar quarter, 24 months after ~~the first day of the first calendar quarter after~~ Board of Trustee~~s~~ adoption.

5.2. In those jurisdictions where regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after Board of Trustees adoption.~~Requirement R3 is presently in effect and will remain in effect upon approval of this Standard.~~

5.3. In those jurisdictions where regulatory approval is required ~~S~~sub~~-R~~requirement R3.1 shall become~~s~~ effective on the first day of the first calendar quarter, 36 months after ~~the first day of the first calendar quarter following~~ applicable regulatory approval. ~~I, or i~~n those jurisdictions where no regulatory approval is required, ~~the S~~s~~s~~ub~~-~~requirement R3.1 shall become~~s~~ effective on the first day of the first calendar quarter, 36 months after ~~the first day of the first calendar quarter after~~ Board of Trustee~~s~~ adoption.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.

R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related

tasks performed by its System Operators each calendar year~~at least annually~~ to identify new or modified tasks for inclusion in training.

R1.2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall deliver the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel~~,~~. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish and implement a training program, as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific reliability-related task list, with the date of the last review and/or revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1.4 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence (such as instructor observations, trainee

feedback, supervisor feedback, course evaluations, learning assessments, or internal audit results) that it performed an annual training program evaluation, as specified in R1.4

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is capable of performing each assigned task identified in R1.1, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

M3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring Period and Reset

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.~~—~~.

If a Reliability Coordinator, Balancing Authority and Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

~~2.~~Violation Severity Levels

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. Title: Reliability Coordination — Staffing

2. Number: PER-004-2

3. Purpose:

Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. Applicability

4.1. Reliability Coordinators.

5. Effective Date:

- Retire Requirement 2 when PER-005-1 Requirement 3 becomes effective.
- Retire Requirements 3 and 4 when PER-005-1 Requirements 1 and 2 become effective.

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

R2. Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an

extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for a Reliability Coordinator (Replaced with VSLs)

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Retire R2 and M1 when PER-005-1 Requirement 3 becomes effective. Retire R3, R4 and M2 when PER-005 R1 and R2 become effective.	Revised

A. Introduction

1. **Title:** **Reliability Coordination — Staffing**

2. **Number:** PER-004-~~1~~2

3. **Purpose:**

   Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. **Applicability**

   4.1. Reliability Coordinators.

5. **Effective Date:** ~~January 1, 2007~~

   - Retire Requirement~~s~~ 2 ~~and 5 retired~~ when PER-005-1 Requirement 3 becomes effective.
   - ~~1.~~ Retire Requirements 3 and 4 ~~retired~~ when PER-005-1 Requirements 1 and 2 become effective.

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

~~R2. All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.~~

~~R3. Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.~~

~~R4. Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.~~

R2. Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None

~~**M1.** The Reliability Coordinator shall have and provide upon request training records that confirm that each of its operating personnel has completed a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel, as specified in Requirement 2.~~

Formatted: List Number, Indent: Left: 18 pt

Formatted: Font: 11 pt

Formatted: Bullets and Numbering

M2. Each Reliability Coordinator shall have and provide upon request evidence that could include but is not limited to, a documented training program and individual training records for each of its operating personnel or other equivalent evidence that will be used to confirm that it meets Requirements 3 and 4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for a Reliability Coordinator (Replaced with VSLs)

2.1. **Level 1:** Not applicable.

Formatted: Bullets and Numbering

2.2. **Level 2:** Not applicable.

2.3. **Level 3:** Not applicable.

2.4.2.1. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

2.4.1 One or more of its shift operating personnel did not complete a minimum of five days per year of training and drills using realistic simulations of system emergencies in the past year. (R2)

2.4.2 No evidence operating personnel have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas. (R3)

2.4.3 No evidence operating personnel have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area. (R4)

E. Regional Differences

1. None identified.

Formatted: Indent: Left: 18 pt, No bullets or numbering

The SPT SDT recommends that this entire standard be retired when PER-005 becomes effective.

A. Introduction

1. **Title:** **Operating Personnel Training**

2. **Number:** PER-002-0

3. **Purpose:** Each Transmission Operator and Balancing Authority must provide their personnel with a coordinated training program that will ensure reliable system operation.

4. **Applicability**

   4.1. Balancing Authority.

   4.2. Transmission Operator.

5. **Effective Date:** April 1, 2005

B. Requirements

R1. Each Transmission Operator and Balancing Authority shall be staffed with adequately trained operating personnel.

R2. Each Transmission Operator and Balancing Authority shall have a training program for all operating personnel that are in:

R2.1. Positions that have the primary responsibility, either directly or through communications with others, for the real-time operation of the interconnected Bulk Electric System.

R2.2. Positions directly responsible for complying with NERC standards.

R3. For personnel identified in Requirement R2, the Transmission Operator and Balancing Authority shall provide a training program meeting the following criteria:

R3.1. A set of training program objectives must be defined, based on NERC and Regional Reliability Organization standards, entity operating procedures, and applicable regulatory requirements. These objectives shall reference the knowledge and competencies needed to apply those standards, procedures, and requirements to normal, emergency, and restoration conditions for the Transmission Operator and Balancing Authority operating positions.

R3.2. The training program must include a plan for the initial and continuing training of Transmission Operator and Balancing Authority operating personnel. That plan shall address knowledge and competencies required for reliable system operations.

R3.3. The training program must include training time for all Transmission Operator and Balancing Authority operating personnel to ensure their operating proficiency.

R3.4. Training staff must be identified, and the staff must be competent in both knowledge of system operations and instructional capabilities.

R4. For personnel identified in Requirement R2, each Transmission Operator and Balancing Authority shall provide its operating personnel at least five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.

C. Measures

M1. The Transmission Operator and Balancing Authority operating personnel training program shall be reviewed to ensure that it is designed to promote reliable system operations.

D. Compliance

1. Compliance Monitoring Process

Periodic Review: The Regional Reliability Organization will conduct an on-site review of the Transmission Operator and Balancing Authority operating personnel training program every three years. The operating personnel training records will be reviewed and assessed compared to the program curriculum.

1.1. Compliance Monitoring Responsibility

Self-certification: The Transmission Operator and Balancing Authority will annually provide a self-certification based on Requirements R1 through R4.

1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year.

1.3. Data Retention

Three years.

1.4. Additional Compliance Information

Not specified.

2. Levels of Non-Compliance

2.1. Level 1: N/A.

2.2. Level 2: The Transmission Operator or Balancing Authority operating personnel training program does not address all elements of Requirement R3.

2.3. Level 3: The Transmission Operator or Balancing Authority operating personnel training program does not address Requirement R4.

2.4. Level 4: A Transmission Operator or Balancing Authority has not provided a training program for its operating personnel.

E. Regional Differences

None identified.

Exhibit B

Record of Development of Proposed Reliability Standards

System Personnel Training (Project 2006-01)

Registered Ballot Body | Related Files | Drafting Team Rosters

Status

The ballot has passed and will be submitted to the NERC Board of Trustees for approval.

Purpose/Industry Need

A training standard is required to set the minimum acceptable requirements for the development, implementation and maintenance of initial and continuing System Personnel Training programs.

This standard is needed to help insure that system personnel throughout the industry are provided with an adequate amount of training in order to promote the reliability and adequacy of the North American Interconnections and their bulk electrical systems.

Standard Authorization Request Form

Title of Proposed Standard	System Personnel Training
Request Date	07/01/2004 Revised 12/01/04

SAR Requestor Information		**SAR Type** (Put an 'x' in front of one of these selections)	
Name	NERC Personnel Subcommittee	☒	New Standard
Primary Contact	Earl Cass, Chair NERC PS	☐	Revision to existing Standard
Telephone	605-882-7550	☐	Withdrawal of existing Standard
Fax	605-882-7453		
E-mail	cass@wapa.gov	☐	Urgent Action

Purpose/Industry Need (Provide one or two sentences)

A training standard is required to set the minimum acceptable requirements for the development, implementation and maintenance of initial and continuing System Personnel Training programs.

This standard is needed to help insure that system personnel throughout the industry are provided with an adequate amount of training in order to promote the reliability and adequacy of the North American Interconnections and their bulk electrical systems.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies by double clicking the grey boxes.)*		
☒	Reliability Authority	Ensures the reliability of the bulk transmission system within its Reliability Authority area. This is the highest reliability authority.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time
☒	Interchange Authority	Authorizes valid and balanced Interchange Schedules
☒	Planning Authority	Plans the bulk electric system
☐	Resource Planner	Develops a long-term (>1year) plan for the resource adequacy of specific loads within a Planning Authority area.
☐	Transmission Planner	Develops a long-term (>1 year) plan for the reliability of transmission systems within its portion of the Planning Authority area.
☒	Transmission Service Provider	Provides transmission services to qualified market participants under applicable transmission service agreements
☐	Transmission Owner	Owns transmission facilities
☒	Transmission Operator	Operates and maintains the transmission facilities, and executes switching orders
☐	Distribution Provider	Provides and operates the “wires” between the transmission system and the customer
☐	Generator Owner	Owns and maintains generation unit(s)
☒	Generator Operator	Operates generation unit(s) and performs the functions of supplying energy and Interconnected Operations Services
☒	Purchasing-Selling Entity	The function of purchasing or selling energy, capacity and all necessary Interconnected Operations Services as required
☒	Market Operator	Integrates energy, capacity, balancing, and transmission resources to achieve an economic, reliability-constrained dispatch.
☒	Load-Serving Entity	Secures energy and transmission (and related generation services) to serve the end user

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check boxes for all that apply by double clicking the grey boxes.)*	
☒	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box by double clicking the grey area.)*
1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes
3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes
5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft, modify, or withdraw a Standard based on this description.)

Requirements shall be established for the development, implementation, and maintenance of system personnel training programs. The goal would be to promote the reliability of the Interconnections through the setting of appropriate minimum training requirements for system personnel. The standard would be designed to promote quality-training programs for the initial and continuing education of system personnel. The Standard shall include essential elements of a training program, required minimum number of hours, topics of study, and training program requirements. This standard should, as a minimum, include the following:

1. Elements of a training program
    a. Objectives
        i. Competency-based
    b. Needs assessments
        i. Job task analysis
    c. Training plan
    d. Schedule
    e. Delivery methods
    f. Program design
    g. Progress (learning) assessment
    h. Program evaluation
    i. Administration
        i. Learning management system
        ii. Documentation
        iii. Record retention
2. Initial training requirements (topics and hours)
    a. Entry level positions
    b. Assessment guides
    c. Certification preparation
    d. On-the-job training
3. Continuous training requirements (topics and hours)
    a. Annual training requirements
        i. Number of hours that system personnel must commit to annual training
        ii. Topics
        iii. Methods
    b. Progression training
    c. Cross training
    d. Job related (OJT)
    e. Refresher training
    f. Emergency training
    g. Advanced system operations training
    h. Situational awareness training
    i. Team training
    j. System awareness
        i. Local area
        ii. Adjacent system
        iii. Wide-area
4. Simulation training
    a. Initial and continuous requirements

b. Operator Training Simulators (DTS, OTS)
c. Drills and table top exercises

5. Identify target audiences
    a. System personnel that impact system reliability
        i. Includes all functional authorities identified in the NERC Functional Model, management and supervision and other support staff
6. Staffing level adequacy needed to improve the quality and quantity of training
    a. Operating personnel (System personnel that impact system reliability)
    b. Training personnel
7. Training resources and staff
    a. Facilities
    b. Tools
    c. Materials
    d. Instructor qualifications
        i. Instructors must be individuals competent in both knowledge of the subject and instructional capabilities
    e. Instructor training requirements
    f. Funding
8. Program accreditation standards (Initial and continuous)
    a. Adheres to the NERC Continuing Education program criteria
    b. Approval and revocation processes
9. Compliance to training standards
    a. Templates

Related Standards

Standard No.	Explanation
PER-002-0 (031)	If Version 0 standards are adopted, proposed standard PER-002-0 (031) on Operating Personnel Training would be entirely replaced.

Related SARs

SAR ID	Explanation
BA_CERTIFICATION_01_03	Certification of the Balancing Authority function includes requirements for staffing with NERC-certified system operators. The proposed standard should set a required minimum training program for these certified system operators.
IA_CERTIFICATION_01_02	Certification of the Interchange Authority function includes requirements for staffing with NERC-certified system operators. The proposed standard should set a required minimum training program for these certified system operators.
RA_CERTIFICATION_01_02	Certification of the Reliability Authority function includes requirements for staffing with NERC-certified system operators. The proposed standard should set a required minimum training program for these certified system operators.
TOP_CERTIFICATION_01_02	Certification of the transmission Operator Authority function includes requirements for staffing with NERC-certified system

	operators. The proposed standard should set a required minimum training program for these certified system operators.

Related NERC Operating Policies or Planning Standards

ID	Explanation
Policy 8B - Training	Policy 8B – Training – requires that all operating authority shall provide its system operators with a coordinated training program that is designed to promote reliable operation. The purpose of the proposed standard is to define what would constitute a coordinated training program, and what types of training would be required. The proposed standards should include a requirement for the amount of training required on an annual basis, the core curriculum of the training that should be provided, and the standards for the design, development and delivery of the training (criteria from the NERC Continuing Education Program). System operators should include Reliability coordinators, control area operators and transmission operators. In addition, the proposed standard should include training for operator support staff, as outlined in Recommendation 19 of the Joint US-Canada Power System Outage Task Force report on the August 14, 2003 Blackout. Operating Policy 8B would be retired by the adoption of this proposed Standard on System Personnel Training, if it has not already been retired with the adoption of Version 0 standards.
Appendix 8B1	Appendix 8B1 – Suggested Items for System Operator Training Courses – is an outline of suggested items that should be included in a training program for system operators. While this listing is extensive, the proposed standard should address

	a core curriculum of training that would be required for 1) entry level system operators, 2) system operators who work under the authority of control area operators and reliability coordinators and 3) senior system operators. Appendix 8B1 would be retired by the adoption of this proposed Standard on System Personnel Training, if it has not already been retired with the adoption of Version 0 standards.
P8T3	Compliance template on Operating Personnel Training would be entirely replaced, unless it has already been retired by adoption of Version 0 standards.

System Personnel Training Standard Drafting Team

Project Plan

- *Standards Process manager needs to send a survey to every entity in the Registered Ballot Body to develop a ballot pool*

April 15, 2005 – Alexandra, VA - Complete

PS/Standards Drafting Team meeting

- Chair will open a discuss on the development process and action plan to complete work on drafting an industry standard for training
- Chair appoint drafting team members, including a team lead, to work in three teams that will be responsible for drafting various portions of the training standards as follows:
  - Team 1 – **John Taylor, Ray Gross, Geoff Elmer and Rick King**
    - Draft the process portion of the training standard that outlines the process that organizations will use to determine their individual training program needs
    - Supplement the draft with supporting references
  - Team 2 – **Donnie Harrell, Sanjay Dutta, Brent Hebert, James Bradley and (David Folk)**
    - Draft the prescriptive portion of the training standard that outlines the minimum training requirements for various organizations based on the NERC Functional Model
    - The prescriptive portion of the training standard will also include methods of evaluation of training that are consistent with other training models and NERC standards
    - Supplement the draft with supporting references
  - Team 3 – **Earl Cass, Kent Grammer, Mike Wells, Larry Alderink, and (Don Boyer)**
    - Draft a description of the compliance monitoring process and levels of compliance including sanctions
    - Supplement the draft with supporting references, and compliance templates

This item has been completed. Drafting team has divided into three subgroups to work on the development of the training standard.

April – May 2005

The three teams will continue to refine their deliverables using email and/or Webex meetings. John Theotonio will coordinate with these teams to set up the necessary conference calls and Webex meetings.

May 22, 2005

FERC to finalize its system operator training study Phase 1 interim report

System Personnel Training Standard Drafting Team

Project Plan

June 6, 2005

The three teams will work to finalize their drafts. As the drafts are completed, the team leads will forward the documents to John Theotonio who will combine the drafts into a composite documents. John will forward the composite draft to all the drafting team members for their review prior to the regular June 14-16, 2005 meeting.

The drafting team will review (if made available to NERC) FERC's Phase 1 interim report to include any findings into the training standard.

June 14-16, 2005

PS/Standards Drafting Team meeting

- The drafting team will review the composite draft standard to address issues that arise. As needed, the three teams will meet separately during this meeting to modify their portion of the draft standard. Once each team reconciles its issues, the complete drafting team will review the standard to finalize any required changes.

July 8, 2005

John Theotonio will incorporate all changes into the composite standard and ready the document for review. John will email this document to the drafting team who will review the document by July 20, 2005

July 28, 2005 – via conference call and Webex meeting

The drafting team will review data from the NERC System Operator Training Program study and the FERC Training Program survey to determine additional areas that must be incorporated into the training standard. This should be done as soon as data from these two studies is available. Drafting team may need to schedule a meeting, conference call or Webex meeting to incorporate material from these studies into the training standard.

August 15, 2005

The drafting team will review the draft of the training standard. The drafting team will work on preparing the standard for public posting for industry comments.

August 14, 2005

FERC to finalize its system operator training study Phase 2 interim report

August 23-25, 2005

PS/Standards Drafting Team meeting

The drafting team will finalize the training standard for submittal to the NERC Reliability Standards director for its initial public posting for comments.

- Public posting will be either 30 or 45 days, as determined by NERC Reliability Standards director, and the Standards Authorization Committee (SAC)
- NERC will compile public comments for the drafting team to review and respond
- First public posting may occur no later than September 2005

- Team 3 should liaison with the CCC to determine if compliance measures are adequate and if any field testing is required

The drafting team will review (if made available to NERC) FERC's Phase 2 interim report to include any findings into the training standard.

September 4, 2005
FERC to finalize its system operator training study Phase 3 interim report

October 16, 2005
FERC to prepare and submit its system operator training study final report

October 18-20, 2005
PS/Standards Drafting Team meeting

- Drafting team to meet to respond to public comments and modify the training standard as needed (changes should be done in red-line version to show changes
- Drafting team will prepare the training standard for a second public posting
- Post the standard for a second round of comments

The drafting team will review (if made available to NERC) FERC's final report and recommendations to include any findings into the training standard.

November 21, 2005 – via conference call and Webex meeting

- Drafting team will review comments received on the second posting of the training standard, and incorporate any changes that are required
- Drafting team will prepare a final draft of the training standard and determine of the standard is ready for balloting

December 13-15, 2005
PS and Drafting Team meeting
The drafting team will meet to finalize the standard for balloting

- Drafting team will submit the draft training standard to NERC and request SAC to post the standard for balloting
- Balloting should occur no later than December 2005
- Drafting team may be required to address comments received during balloting, and prepare the training standard for a second balloting
- Completed standard, if approved during balloting, will be sent to the NERC Board of Trustees for adoption by (need day here)

January 2006 (need to finalize deadline)
Based on the results of balloting, the drafting team may need to meet again to review any comments received during balloting and prepare the standard for a final balloting.

COMMENT FORM
Proposed System Personnel Training Standard

This form is to be used to submit comments on the proposed System Personnel Training Standard Authorization Request. Comments must be submitted by **January 07, 2005**. You may submit the completed form by emailing it to: sarcomm@nerc.com with the words "System Personnel Training SAR Comments" in the subject line. If you have questions please contact Mark Ladrow at mark.ladrow@nerc.net on 609-452-8060.

ALL DATA ON THIS FORM WILL BE TRANSFERRED AUTOMATICALLY TO A DATABASE.

DO: **Do** enter text only, with no formatting or styles added.
Do use punctuation and capitalization as needed (except quotations).
Do use more than one form if responses do not fit in the spaces provided.
Do submit any formatted text or markups in a separate WORD file.

DO NOT: **Do not** insert tabs or paragraph returns in any data field.
Do not use numbering or bullets in any data field.
Do not use quotation marks in any data field.
Do not submit a response in an unprotected copy of this form.

* If more than one Region or Segment applies, indicate the best fit for the purpose of these comments. Regional acronyms and segment numbers are shown on prior page.

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

If we do not develop a focused training standard we are destined to repeat August 14.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☒ Yes ☐ No
Resource Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Owner	☒ Yes ☐ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☒ Yes ☐ No
Generator Owner	☒ Yes ☐ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☒ Yes ☐ No
Market Operator	☒ Yes ☐ No
Load-Serving Entity	☒ Yes ☐ No

Comments

I have checked all of the above because all will need to have some level of knowledge around the operation of the grid. The key phrase is "some level of knowledge'. A one size fits all approach would be over kill and doomed to failure. The training requirements should fit the knowledge requirement of the position.

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☐ Yes

☒ No

If yes, please explain.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

I believe that regional differences should be handled in the content and design of the enitities training program.

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

My guess is that it will increase our staffing requirement in order to send dispatchers to training. It will certainly mean additional record keeping.

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Can this reporting be handled similar to the CEU tracking for NERC certification? It will have to be tracked annually since most of the requirements will be annual requirements.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments
None

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

I don't think you are going far enough with the requirement for training. I am constantly amazed at how generation operators do not understand where they fit into the big picture as far as system reliability issues are concerned. Even the little task of voltage support is poorly understood by our operators.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☒ Yes ☐ No
Resource Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Owner	☐ Yes ☐ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☒ Yes ☐ No
Generator Owner	☐ Yes ☐ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☐ Yes ☐ No
Market Operator	☒ Yes ☐ No
Load-Serving Entity	☒ Yes ☐ No

Comments

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☒ Yes

☐ No

If yes, please explain.

I feel that various levels of certification should be developed, similar to engineer in training to registered professional engineer.

Are there existing elements that should be excluded in this proposal?

☐ Yes

☐ No

If yes, please explain.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

In order for national certification to mean anything, there should be no region specific differences for earning certification.

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

It takes manpower off of the workbench in order to go through a certification training process. I would suspect that there will be some staff that require more remedial training than others. With the present shortage of staff at most facilities, it will be dificult to accomplish all of the required training in a timely manner without increasing staffing.

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

The training programs should be accredited in the same manner and frequency as utilized in higher education. Nationally recognized auditting and once every 4 or 5 year recertification.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

Associated Electric Cooperative Inc. agrees with the general concept of a training standard for the purpose of promoting reliability. The SAR does not contain sufficient detail to determine whether or not Associated would agree with a standard based on this SAR.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☐ Yes ☒ No
Resource Planner	☐ Yes ☒ No
Transmission Service Provider	☐ Yes ☒ No
Transmission Planner	☐ Yes ☒ No
Transmission Service Provider	☐ Yes ☒ No
Transmission Owner	☐ Yes ☒ No
Transmission Operator	☐ Yes ☒ No
Distribution Provider	☐ Yes ☒ No
Generator Owner	☐ Yes ☒ No
Generator Operator	☐ Yes ☒ No
Purchasing-Selling Entity	☐ Yes ☒ No
Market Operator	☐ Yes ☒ No
Load-Serving Entity	☐ Yes ☒ No

Comments

Associated Electric Cooperative Inc. suggests it is inappropriate and unnecessary for a training standard resulting from this SAR to apply to electric utility industry individuals other than those directly responsible for the operation of the interconnected system, i.e. control center personnel.

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

Associated Electric Cooperative Inc. suggests a training standard should address the desired outcomes and should not specify the methods to achieve those outcomes. The SAR does not contain sufficient detail to determine the SAR drafting team's intent, but it appears the resulting standard would be quite prescriptive in many areas. Any elements currently included in the SAR that prescribe facilities, tools, materials, funding, staffing levels, methods, etc. should be deleted. These details are best determined by and should be left to the descretion of the individual company.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

Given the limited detail in the SAR, Associated Electric Cooperative Inc. does not see a need for regional differences.

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

Associated Electric Cooperative Inc. responds to this question with a qualified no. As stated above, the SAR does not contain sufficient detail to positively determine required staffing.

Comments

If the standard developed from this SAR is applicable to all the entities indicated on Page SAR-2, a 15 - 20% staff increase in affected areas could conceivably be necesssary for Associated Electric Cooperative Inc. to comply. It is unlikely Associated's customers would appreciate or understand rate increases to fund such a training program that would do nothing to decrease the number of blackouts they have experienced (0).

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Associated Electric Cooperative Inc. suggests an annual self-certification to the appropriate Regional Reliability Council.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments
Associated Electric Cooperative Inc. reiterates its comments above that a training standard should address the desired outcomes and should not detail the methods to achieve those outcomes. Prescriptive requirements for facilities, tools, materials, funding, staffing levels, methods, etc. should not be included. These details are best determined by and should be left to the descretion of the individual company.
Associated Electric Cooperative Inc. respectfully requests the Standards Drafting Team fully and carefully consider the industry's comments submitted in response to publication of the System Operator Certification Program Administrative Guidelines. Special attention should be given to the comments regarding the number of training hours (CEH) required.

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

I believe there is a reliability need for a training standard, though not necessarily the one being proposed.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☐ Yes ☒ No
Balancing Authority	☐ Yes ☒ No
Interchange Authority	☐ Yes ☒ No
Planning Authority	☐ Yes ☒ No
Resource Planner	☐ Yes ☒ No
Transmission Service Provider	☐ Yes ☒ No
Transmission Planner	☐ Yes ☒ No
Transmission Service Provider	☐ Yes ☒ No
Transmission Owner	☐ Yes ☒ No
Transmission Operator	☐ Yes ☒ No
Distribution Provider	☐ Yes ☒ No
Generator Owner	☐ Yes ☒ No
Generator Operator	☐ Yes ☒ No
Purchasing-Selling Entity	☐ Yes ☒ No
Market Operator	☐ Yes ☒ No
Load-Serving Entity	☐ Yes ☒ No

Comments

The proposed Standard is overly broad and ambiguous, and should not uniformly apply to anyone.

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

The content is inadequate not because of a lack of elements but because of the ambiguity of what it is intended to do. A Training Standard cannot be a "one size fits all" approach for functions as disparate as Relaibility Authorities and Purchasing and Selling entities.

Are there existing elements that should be excluded in this proposal?

☐ Yes

☐ No

If yes, please explain.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☒ Yes

☐ No

If yes, please list the region-specific differences.

ERCOT's system, for example, does not easily fit into the NERC proposed functional model and the training standard should recognize the unique regional differences found in the ERCOT Region.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☒ Yes

☐ No

If no, please explain what staffing changes might be needed.

It might be doable if as many control areas as possible were consolidated, which would mean fewer people to train. If existing control areas continue to exist in their current number, then no, a training standard could not be implemented at current staffing levels.

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Comments

The training program should be reviewed often enough to insure it remains aligned with current markets /regional design and adjust, if needed, to capture future market and reliabilty training needs.

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments
The statement, Any person with access to a control room should be trained, from the blackout report, should be clarified. What kind of control room? Is this a control area? An RTO control room? A power plant control room?
Also, there are essential pieces missing from the proposal, such as what are the goals of the training program? It is quite exhaustive in the elements of a training program but fails to explain what objectives are to be met. Beyond the broad goal of promoting the reliability of the Interconnections, what subject matter is envisioned to fall into the recommended elements that would be applicable to all the Reliability Functions to which it is intended to apply? A good example is simulator training. Simulator training on what?
The current proposal is so overly broad as to be unworkable. More explantion of the goals of the training program and the applicability to the Reliability Functions must be presented.
This is too important a subject to apply the broad brush of a one-size-fits-all Training Standard.

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

There needs to be flexibility to tailor the training to the individual involved.

Requirements should be limited to Certification Standards. NERC is being overly descriptive of "how to" conduct training rather than achieving specific results. NERC Standards should be "object oriented", that is, specify what the final requirements are. Prescribing how each entity goes about to achieve these objectives is beyond NERC's mandate.

Limit this to only Control Room Operating staff that actually "operate" the system.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☐ Yes ☒ No
Resource Planner	☐ Yes ☒ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☐ Yes ☒ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Owner	☐ Yes ☒ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☒ No
Generator Owner	☐ Yes ☒ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☐ Yes ☒ No
Market Operator	☐ Yes ☒ No
Load-Serving Entity	☐ Yes ☒ No

Comments

NPCC believes that anyone engaged in direct operating/control activity for the Bulk Power System should be properly qualified/certified.

An alternative approach to the above also discussed might also involve only requiring NERC Certifiable Functions..i.e. Reliability Authority(RC), Balancing Authority, Interchange Authority, Transmission Operator to adhere to the resultant standard.

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

Certification is a control room operator issue.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

Administrative duties related to audit. Additional Operating Room personnel due to out of control room activities.

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

NPCC believes the training programs should be reviewed internally and self certified for compliance as required or at least yearly, with audits being conducted at least once every three years.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments

COMMENT FORM
Proposed System Personnel Training Standard

This form is to be used to submit comments on the proposed System Personnel Training Standard Authorization Request. Comments must be submitted by **January 07, 2005**. You may submit the completed form by emailing it to: sarcomm@nerc.com with the words "System Personnel Training SAR Comments" in the subject line. If you have questions please contact Mark Ladrow at mark.ladrow@nerc.net on 609-452-8060.

Load-Serving Entity	☐ Yes ☒ No

Comments

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☐ Yes

☒ No

If yes, please explain.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

I believe it will require more personnel dedicated for the training function alone, which may be difficult for the smaller organizations.

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments
Somewhere the standard should encourage/recommend that the Regions should form Training Groups to promote uniform training throughout the regions. This will help promote a better understanding of operations, by all the parties.

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

However, the training standard must be reasonable and explicit, it must be specific as to which personnel in each entity require training, it must be specific as to the different training protocols not only for the personnel within each entity, but also for the different entities, it must be achievable in a reasonable time frame for a reasonable cost, and not subject to compliance for a reasonable period of time, say three years to allow for formation and implementation.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☒ Yes ☐ No
Resource Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Owner	☒ Yes ☐ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☐ No
Generator Owner	☒ Yes ☐ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☒ Yes ☐ No
Market Operator	☒ Yes ☐ No
Load-Serving Entity	☒ Yes ☐ No

Comments

Do the proposed training standards apply to non-registered entities to whom actions or operations are delegated by a registered entity? If yes, why. If not, then do any training standards apply?

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☒ Yes

☐ No

If yes, please explain.

Qualification testing; Real-time assessments to verify training carried over to the job; Missing the link to competency of existing system operators; Needs to identify the qualifications for the system operator to first sit in the chair; Needs to address resources needed to accomplish the training;Need a training shift for system operators (adequate time dedicated to training)

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

Companies should have plans in place to take a system operator from an intial competency level up to an expert level, however this is not NERC’s responsibility.

Comments

What is written is ‘process-oriented’ and is not sufficient in detail for all system personnel positions – the scope is too broad (covering too many positions) and the level is too high level (doesn't identify what positions are included in the category called 'system personnel')– a SAR targeted for the individual types of positions (such as a SAR just for the operating authority positions) would be more helpful.

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

A reasonable standard is needed, however, additional training personnel, training infrastructure, training documentation, training funding, etc would be required to train all "system personnel" as indicated in the SAR.

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Bi-annual basis.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments
Match the definitions on the SAR with the definitions in the Glossary posted with Version 0. The standard needs to be written so the rules are objective, clear and well-understood by all end-users as well as auditors; Need to define what is meant by 'system personnel'; Need to define terms used such as 'job task analysis' and 'competency-based'.

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

A training standard is needed to ensure we have competent personnel who can safely and reliably operate, maintain, and improve the performance of the electric power system.

Training for the system operators is critical to the industry as a whole. We are at the beginning stages of where we must go in the future to reassure ourselves and the public at large that the events of August 14th 2003 will not be repeated. For the NERC organization this should be at a minimum, in it's top three priorities..

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☒ Yes ☐ No
Resource Planner	☐ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☐ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Owner	☐ Yes ☐ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☐ No
Generator Owner	☐ Yes ☐ No
Generator Operator	☐ Yes ☐ No
Purchasing-Selling Entity	☐ Yes ☐ No
Market Operator	☐ Yes ☐ No
Load-Serving Entity	☐ Yes ☐ No

Comments

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☒ Yes

☐ No

If yes, please explain.

One basic tenet or requirement that should be stated is the use of a systematic approach (SAT), based on job performance requirements, to guide the training of system personnel.

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

You should not specify job and task analysis under 1.b. A needs assessment can be satisfied in several ways from a simple needs or job analysis up to a full blown job and task analysis.

There should only be a requirement for documentation and record keeping under 1.i. Administration. A learning management system is one means to document and track training.

If hours are specified under initial training requirements they should reflect only the minimum acceptable number of hours for training. If a company does a needs analysis to determine job requirements the time to conduct the initial training program will vary based on the components of the job and the necessary elements to be trained on.

Progression training and cross training are not consistent with the intent of a continuing training program. A continuing training program is intended to refresh and improve the application of knowledge and job-related skills for the job the trainee works or is qualified to work.

Simulation training is a platform or method to provide initial and continuing training. I don't feel that it should be addressed separately.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☒ Yes

☐ No

If yes, please list the region-specific differences.

From an overall framework the standard should be the same however we must recognize the special needs and the special circumstance of individual regions. One size does not always fit all.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

When you consider the additional training requirements that will probably come out of the standard I foresee a need for additional staffing in both the system personnel side of the business and on the training side of the business.

We need an industry standard for staffing levels that applies across the board for the functional responsibility.

Comments

It would be prudent to develop a training standard that stipulates the minimum requirements to satisfy training for system personnel, versus taking the approach to identify the best approach. This will minimize the impact on the staffing levels for both training and staff personnel.

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Every 4 years

Comments
A mandatory compliance type review should be conducted every 4 years. This approach is consistent with similar utility training requirements. Each utiltity/entity should conduct self-assessments on a more frequent time frame. This approach will minimize the impact on NERC and the industry when trying to audit training for compliance.

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☐ Yes ☒ No
Resource Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Owner	☐ Yes ☒ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☒ Yes ☐ No
Generator Owner	☐ Yes ☒ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☐ Yes ☒ No
Market Operator	☐ Yes ☒ No
Load-Serving Entity	☒ Yes ☐ No

Comments

For the Generator Operator category, Manitoba Hydro believes that this Standard should apply for a generator operator at the generation company operations or dispatch center but not to an operator at the thermal or hydraulic plant.

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☐ Yes

☒ No

If yes, please explain.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

Manitoba Hydro foresees requiring at least 2 additional staff; one administrative representative to help maintain the documentation and for record keeping and at least one instructional designer to create/revise the training courses. This is an estimate only and is based on a control centre perspective only. The total impact on Manitoba Hydro may be more extensive depending on the finalized training requirements and what options exist to develop and target the requisite training

Comments

Program planning and training development is both time and staff intensive. Manitoba Hydro currently has difficulty maintaining its trainee program and ongoing staff training with the existing staff. Additional staff will be required to implement any new requirements to the existing training program.

Question 6: How and how often should training programs be reviewed for compliance with the standard?

every three years.

Comments
Each entity training program should be reviewed as part of the entity operational audit which is presently part of the NERC Compliance program. In the MAPP /MRO region this presently occurs every three years. Any program which was judged satisfactory at the last operational audit should not deteriorate to such a degree that the system is a threat to reliability in any three year window.

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☐ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☒ Yes ☐ No
Resource Planner	☐ Yes ☒ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☐ Yes ☒ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Owner	☐ Yes ☒ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☒ No
Generator Owner	☐ Yes ☒ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☒ Yes ☐ No
Market Operator	☒ Yes ☐ No
Load-Serving Entity	☒ Yes ☐ No

Comments

Those entities operating in real time should have training requirements.

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☒ Yes

☐ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

Under Item 1, i. Administration, a Learning Management System is a "how" rather than a "what" and should be eliminated. Item 3, Continuous training requiremnts, is poorly defined. It mixes topics, categories and methods of training, and many are subsets of others. The list is not propely defined or organized. Item 4, Simulation training: Should identify types, but not prescribe any specific method of simulation or simulator. Item 7, Training resources and staff, f. Funding: funding should not be part of the standard.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

At a minimum, we would need additional training personnel. It is also possible that training requirements would be so great as to require additional operating personnel.

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Self report via comprehensive questionnaire annually or every two years. Training audit team visit every 5 years.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments

COMMENT FORM
Proposed System Personnel Training Standard

This form is to be used to submit comments on the proposed System Personnel Training Standard Authorization Request. Comments must be submitted by **January 07, 2005**. You may submit the completed form by emailing it to: sarcomm@nerc.com with the words "System Personnel Training SAR Comments" in the subject line. If you have questions please contact Mark Ladrow at mark.ladrow@nerc.net on 609-452-8060.

ALL DATA ON THIS FORM WILL BE TRANSFERRED AUTOMATICALLY TO A DATABASE.

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

There is a need for a training standard and we applaud the intent. Such a standard should be the place for all training requirements (presently, training requirements are found in several locations), for the appropriate functions. However, the proposed standard appears to apply a "one size fits all" approach to every authority and function. If this is the case, then this approach is likely to be unrealistic. It should be clear as to which functions should be certified versus having taken accredited courses. Also, clarity is needed that there will be different types of certification, rather than just NERC Operator Certification.

NERC needs to better define the Scope of this standard. Is the intent of the standard to measure compliance of the the training of (reliability entity) personnel regarding NERC Reliability Standards, or is the standard meant to measure compliance of all Training Programs? If the intent is the former, then the question would be ,is there enough material to really test ?, since some of the NERC standards applying to owners for example only require communications of data. If the intent is the latter, then the question would be ,is NERC the right organization to evaluate in-house training programs?, given the diversity of operating approaches used in North America. In this case, some programs are probably better evaluated by those closer to the needs and responsibilities of the individual organization.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☐ Yes ☒ No
Resource Planner	☐ Yes ☒ No
Transmission Service Provider	☐ Yes ☒ No
Transmission Planner	☐ Yes ☒ No
Transmission Service Provider	☐ Yes ☒ No
Transmission Owner	☐ Yes ☒ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☒ No
Generator Owner	☐ Yes ☒ No
Generator Operator	☐ Yes ☒ No
Purchasing-Selling Entity	☐ Yes ☒ No
Market Operator	☐ Yes ☒ No
Load-Serving Entity	☐ Yes ☒ No

Comments

Where we indicated "No" above , does not imply that there should not be training. Support staff and other staff (PA, RP, TSP, GOp, etc) or operators not required to be certified should be able to meet their obligations by participating in NERC continuing education. Others (DPs, PSE, LSE, etc) may be trained on a localized basis.

TSP is listed twice. Was there supposed to be some other entity or is it a duplication?

The industry needs a little more definition and clarity on who is the functional entity (IA, RA, PA, etc.)

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☒ Yes

☒ No

If yes, please explain.

There are two conflicting questions. The training program requirements are more than adequate (and may not be necessary for some training programs).

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

Again, if the approach is "one size fits all", this will cause problems. What type of emergency (or situational awareness, or simulator) training should PSE, IA or PA participate in?
On the other hand, if the intention is to have different courses/certification streamlined for each involved function, then we can understand the approach. However, not all of the functions listed in Q2 should be part of this standard. See comments on Q2.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

.

Comments

There will be site-to-site differences. There would be some regional differences in content and topics, but there should be no regional differences in general training requirements. Some of the NERC functional definitions need more details (who is the TO, IA, RA, etc.).

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

Each organization would have different requirements. In general, there would likely be additional staff required in many of the organizations to meet this standard (to maintain the program, to coordinate training, and to provide relief for staff to participate in training, etc.) In addition, each organization, subject to this standard, would incur start-up costs associated with developing the process. A simulator requirement would add workload (setup, maintenance and running scenarios),etc. The extent of increased resourcing can not be determined until the details of the standard are available.

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

The training programs should be reviewed internally and self certified for compliance as required or at least yearly, with audits being conducted at least once every three years.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments
Again, the "one-size-fits-all" approach does not appear to be justified. If an operator or authority does not need to be certified, their training requirements should be reduced. A continuing education with some focus on recommended topics (that could be tailored locally) would be more appropriate and would relieve much of the administrative burden for non-certified entities.

It might be better if this standard applies (for now) only to those entities that must be certified.

Transmission Owner	☐ Yes ☐ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☐ No
Generator Owner	☐ Yes ☐ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☒ Yes ☐ No
Market Operator	☒ Yes ☐ No
Load-Serving Entity	☒ Yes ☐ No

Comments

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

In item 3 - Continuous trianng requirements (topics and hours), parts b. Progression training and c. Cross training goes beyond training requirements. These two parts could infringe on Corporate Policy. Part i. Team training should be a desire or suggestion rather than a requirement. In item 1, part c should be excluded since it is just the physical representation of parts a and b.

Comments

Parts f, g, h, and j should be included in 3.a. as part of the Annual training requirements.

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☐ No

If no, please explain what staffing changes might be needed.

Comments

Staffing levels can not be predicted until the requirements are specified. If this proposed standard mandates the hours required, this question can't be answered until we know the required hours.

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Comments
Training Programs should be reviewed annually by the responsible staff. Entities should be required to Self-Certify annually. Every two to three years, the entity should undergo an on-site audit.

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☐ Yes ☐ No
Resource Planner	☐ Yes ☐ No
Transmission Service Provider	☐ Yes ☐ No
Transmission Planner	☐ Yes ☐ No
Transmission Service Provider	☐ Yes ☐ No
Transmission Owner	☐ Yes ☐ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☐ No
Generator Owner	☐ Yes ☐ No
Generator Operator	☐ Yes ☐ No
Purchasing-Selling Entity	☐ Yes ☐ No
Market Operator	☐ Yes ☐ No
Load-Serving Entity	☐ Yes ☐ No

Comments

The standard should be initally developed to support only those personel who are required to be NERC certified. Once the standards have been established and fully implemented at that level, expansion of the target audience should be examined.

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

Several items need clarification:
The distinction between job related OJT, Cross training, and progression training.
The distincition between situational awarness and system awarenesss.
The distinction between "learning management system" and Training Plan/Training Schedule/Progress Assessment/Documentation/Record Retention.
Item 7f should be deleted as redundant. It is included in 6 and 7 a-c.
Item 8b should be deleted as redundant. It is part or 8a.
It would make more sense to more explicitly link item 1f "program design" with item 8a "Adheres to the NERC Contining Education program criteria".

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

In the case of most organizations there will be a substantial operating staff increase required to provide operators with sufficent training time (6 crew shift rotations in place of 4 and 5 crew shift rotations). There will be an amost universal need to create or increase the size of training staffs to to conduct continual Job Task Analysis, develop training modules for all tasks, continually validate and verify of individual training modules, and maintain of the "learning management system" (training plans/training schedules/progress assessment/documentation/records retention - all on an individual basis).

Comments

This standard is is being created to rectify the absence of existing staff levels sufficient to meet the in the training needs of system operators. If there were sufficient staffing, there would not be need for this standard.

Operating or training staffing levels should be be dictated as part of the standard. The individual entity should have the flexibility to deterime the most effective mechanism to meet their particular training needs. Face-to-face training options require different staffing levels than a full e-learning approach.

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Full training audit compliance should be included in the normal sequence of NERC functional organization audits.

Complaince should be phased in due to the magnitude of the staffing and progam development needs.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

There is a need for a training standard and we applaud the intent. Such a standard should be the single location for all training requirements (presently training requirements are found in several locations) for the appropriate functions. However, the proposed standard appears to apply a "one size fits all" approach to every authority and function. If this is the case, then this approach is likely to be unrealistic. It should be clear as to which functions should be certuified versus having taken accredited courses. Also, clarity is needed that there will be different typres of certification rather than just NERC Operator Certification.

NERC needs to better define the Scope of this standard. Is the intent of the standard to measure compliance of the the training of (reliability entity) personnel regarding NERC Reliability Standards, or is the standard meant to measure compliance of all Training Programs? If the intent is the former, then the question is , is there enough material to really test ?, since some of the NERC standards applying to owners for example only require communications of data. If the intent is the latter, then the question is, is NERC the right organization to evaluate in-house training programs? given the diversity of operating approaches used in North America. In this case, the some programs are probably better evaluated by those closer to the needs and responsibilities of the individual organization.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☐ Yes ☐ No
Planning Authority	☐ Yes ☒ No
Resource Planner	☐ Yes ☒ No
Transmission Service Provider	☐ Yes ☒ No
Transmission Planner	☐ Yes ☒ No
Transmission Service Provider	☐ Yes ☒ No
Transmission Owner	☐ Yes ☒ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☒ No
Generator Owner	☐ Yes ☒ No
Generator Operator	☐ Yes ☒ No
Purchasing-Selling Entity	☐ Yes ☒ No
Market Operator	☐ Yes ☒ No
Load-Serving Entity	☐ Yes ☒ No

Comments

Support staff and other operators not required to be certified should be able to meet their obligations by participating in NERC continuing eduction.

TSP is listed twice. Was there supposed to be some other entity?

The industry needs a little more definition and clarity on who is the functional entity (IA, RA, PA, etc.)

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☒ Yes

☒ No

If yes, please explain.

There are two conflicting questions. The training program requirements are more than adequate (and may not be necessary for some training programs).

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

Again, the one size fits all causes problems. What type of emergency (or situational awareness or simulator) training should PSE, IA or Planning Authority participate? As another example, why do all these entities need to perform independent JTAs when it's likely something will need to be created at the NERC level to review the JTAs (unless the intent is to check compliance by seeing if there is a document called "JTA" as opposed to a thoughtful analysis).

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

.

Comments

There will be site-to-site differences. There would be some regional differences in content and topics, but there should be no regional differences in general training requirements. Some of the NERC functional definitions need more detail (who is the transmission operator, interchange authority, reliability authority, etc.).

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

Each location would have different requirements. In general, there would likely be an additional person needed for every 5-10 people subject to this standard (to maintain the program, coordination training and provide relief for workers to participate in training, etc.). In addition, each organization subject to this standard would need a person for each occupation (for perhaps a year) to develop the program and get it started. A simulator requirement would add workload (setup, maintenance and running scenarios).

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Comments
Every 3-5 years as part of normal compliance review. The organization's ability to meet the other NERC standards is a measure of the success of their training program.

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments
Again, the one-size-fits-all approach does not appear to be justified. If an operator or authority does not need to be certified, their training requirements should be less. Continuing eduction with some focus on recommended topics that could be tailored locally would be valuable and would relieve much of the administrative burden.

It might be better if this standard applied (for now) only to those entities that must be certified. Training of everyone is important and necessary, but consider the administration if NERC required that each RRC check every generator operator and purchasing selling entity training records versus this standard. If the industry agrees that Generator Operators and others need to be certified then apply the standard. Again, training programs are probably better evaluated locally.

A continuing eduction requirement with some in a set of approved topics may be more appropriate for non-certified entities.

COMMENT FORM
Proposed System Personnel Training Standard

This form is to be used to submit comments on the proposed System Personnel Training Standard Authorization Request. Comments must be submitted by **January 07, 2005**. You may submit the completed form by emailing it to: sarcomm@nerc.com with the words "System Personnel Training SAR Comments" in the subject line. If you have questions please contact Mark Ladrow at mark.ladrow@nerc.net on 609-452-8060.

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☒ Yes ☐ No
Resource Planner	☐ Yes ☐ No
Transmission Service Provider	☐ Yes ☐ No
Transmission Planner	☐ Yes ☐ No
Transmission Service Provider	☐ Yes ☐ No
Transmission Owner	☐ Yes ☐ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☐ No
Generator Owner	☐ Yes ☐ No
Generator Operator	☐ Yes ☐ No
Purchasing-Selling Entity	☐ Yes ☐ No
Market Operator	☐ Yes ☐ No
Load-Serving Entity	☐ Yes ☐ No

Comments

There should be a baseline competency for each Functional model entity listed above. However, recognizing that the baseline competency varies by entity class, therefore it can't be a "one size fits all" concept. The Standard should consider this factor and be flexible to the varying needs of the intended entity class

The training needs and requirements for a RA/RC and TOP differ from that of a BA or IA. The standard should be clear on that point and have different requiements for each of the enitities. An IA should not have to have staff with the same knowledge and expertise as a RA/RC.

The Standard should only include the entites checked above. Additionally, the Standard should not cover management.

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☒ Yes

☐ No

If yes, please explain.

The Standard needs to define the baseline competencies of the training program individually for each Functional model entity listed above, as they have different needs and requirements. Also, the Standard needs to define the essential elements of a training program idividually for the RA/RC, BA, IA, and TOP, as they each have different needs and requirements.

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

5.a.i: The Standard should target just the RA/RC, BA, IA, and TOP and their support staff. The standard should not apply to all functional entities in the Fucntional Model nor to management.

6.a and 6.b: Delete all of 6.a and 6.b. The Standard should not dictate staffing levels. This is a business decision. The standard may influence staffing levels via the requirement for the amount of annual training, which is OK, but it should not dictate staffing levels by saying you need x staff for a system operator shift, etc. An entity may need no training staff if they decide to outsource 100% of their training needs.

7.a: Facilities. We question the wisdom of a NERC Standard dictating facility requirements for training, other then to state that adequate facilities need to be provided. Depending upon how an entity decides to provide the required training, they may not need much in the way of physical training facilities, i.e. if they decide to outsource all their training and send their staff to a vendor's training facilities. We would agree that it is appropriate for inclusion in a Standard to specify some boundaries/requirements inregard to how training should be facilitated or proctored, but we are not sure if that is what is meant by this bullet point on "Facilities."

7.f: Delete Funding. It is inappropriate for a NERC Reliability Standard to dictate a certain level of funding. Funding is not a proper measure of a Standard, performance is.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

However, some of the Regions and RTOs have separate training requirements for their members, which may or may not go beyond those proposed by this Standard. It is our belief that Regions and/or RTOs should be allowed to have more stringent requirements if they so choose, but should not be allowed or granted exceptions from this proposed NERC Standard if they desire weaker requirements. Further, we encourage the Regions and RTOs that have additional training requirements, to structure their requirements such that credit hours counted towards meeting their requirements could also count toward meeting the proposed NERC Standard requirements. However, we would be oppossed to diluting the proposed NERC Standard in order to meet a Region's or RTO's lesser requirements. To clarify by example, if the proposed NERC Standard required 32 hours of emergency training and a Region or RTO required their members to have 50 hours of emergency training, we would want the Region and RTO to structure their requirements such that once completeing the Region/RTO's 50 hours of emergency training, that 32 hours of that training also met the requirements of the proposed NERC Standard regarding emergency training. That is, the method of determing what is required in order to officially count an hour as a credit towards meeting the Region/RTO requirement needs to be at least as strict as the NERC requirement for what counts as an hour of training.

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☐ No

If no, please explain what staffing changes might be needed.

Comments

For AEP, yes, I believe we can implement the proposed standard with our existing staffing levels. However, that is because we have already increased our staffing since the August 2003 Blackout, specifically to allow for more training. It would be inappropriate for us to speculate for the rest of the industry.

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Comments
It should be similar to policies today. Specifically, annual self-certification and then as part of on-site audits every three years.

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

The training should be broken into three segments. The first should be certification training or that training needed to maintain certification. This would be applicable to the RA, BA, IA, Transmission Operator and possibly the Market Operator In other words control room oerator training. The second segment should be for those not directly involved in the operation of the power system. This would apply to the Planning Authority, Resource Planner and Transmission Planner. The third segment should be for generator operators and would cover items susch as interconnections, VAR flow, relaying, etc sothat these operators can develop an understanding of the working of the power system and their impact on it.

The standard should define the training subjects, total hours and, for continued education, the frequency.Flexibility is key so defining specific hours to each subject is not appropriate.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☒ Yes ☐ No
Resource Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☒ Yes ☐ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Owner	☐ Yes ☒ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☒ No
Generator Owner	☐ Yes ☒ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☐ Yes ☒ No
Market Operator	☒ Yes ☐ No
Load-Serving Entity	☐ Yes ☒ No

Comments

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

Much of the training is inappropriate for people not directly involved in operations or planning such as certain levels of management or support staff.

Comments

The training program should not be so rigid that a training group is required. Senior staff should be capable of providing the training.

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☐ No

If no, please explain what staffing changes might be needed.

Comments

The response depends on the final product. If it is a very formal and rigid plan, similar to the nuclear industry, additional staff will be required.

Question 6: How and how often should training programs be reviewed for compliance with the standard?

The program should be self certified for compliance with audits on a biannual basis.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

Although the industry has survived without one for several years, the investigation of the August 14th blackout has pretty much dictated that this be yes.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☒ Yes ☐ No
Resource Planner	☐ Yes ☒ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☐ Yes ☒ No
Transmission Service Provider	☒ Yes ☐ No

Transmission Operator	☒ Yes ☐ No
Distribution Provider	☐ Yes ☒ No
Generator Owner	☐ Yes ☒ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☒ Yes ☐ No
Market Operator	☒ Yes ☐ No
Load-Serving Entity	☒ Yes ☐ No

Comments

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☒ Yes

☐ No

If yes, please explain.

Certification preparation
Progression Training
Learning management system (LMS)
Number of hours
Advanced system operations training

Comments

Certification Preparation - Each candidate must prepare for the exam and the measure is passing the test. A formal program to say what needs to be trained on before you can take the test is unnecessary. Would this preclude an individual from taking the test on his own, being hired, and then be non-compliant because he did not complete the "certification preparation" training but yet is certified?

Progression Training - The training requirements for a company to advance an employee should be dictated by that company. The reliability of the grid should address the position, not the advancement to that position. If the "higher" position has additional training requirements, address those requirements, not what is needed to move up to that position.

LMS - What is this intended to be? I do not recall seeing this in a list of definitions. Is this a "buzz word" that a particular vendor uses in describing their system? What would be in it that would not fall under Documentation or Record Retention?

Number of hours - This contradicts the "Competency-based" objectives. Is the goal competent operators or having enough hours. You can have one with or without the other. Since this SAR does not address CEH's or Certification maintenance a specific number of hours would be easier to budget for, but may not yield the intended reliable operations.

Advanced system operations training - How advanced is this intended to be? How much greater than basic? How much more "reliable" than "reliable"? The Detailed Description states "The goal would be to promote the reliability of the Interconnection through the setting of appropriate MINIMUM training requirements for system personnel." Having advanced training sounds like more than the minimum requirements.

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☐ Yes

☒ No

If yes, please list the region-specific differences.

Minimum standards should be minimum standards. If a region needs something beyond that , it should become a regional requirement.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

- We anticipate that at least 2 additional "trainers" will be needed. In addition to the additional work load to support the training, and the research, and the administration required to become a NERC Certified CEH provider, the qualifications of these personnel is not yet known. There is no clarification as to what "competent in both knowledge of the subject and instructional capabilities" really means.
These words seem to lead to the conclusion that we will have to hire outside agencies of ex-utility workers that have become trainers.

- Additional System Operators will be needed to adequately support the targeted hours and still be able to cover minimum vacation and sick time.

- Additional trainers and Operators will be needed each year to satisfy Item 6 "Staffing level adequacy needed to improve the quality and quantity of training." This statement also seems to go beyond the goal of setting minimum standards. It also goes beyond the Purpose/Industry need of "adequate". We will need more and more every year?

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Reviews should be consistant with other standards.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments
5a. "support staff" needs to be clarified. If the position does not need to be certified, why do they need to fall under this requirement. Are we saying that the training requirements of their respective professional certification (i.e. PE) is inadequate? The same can be said of "management".

8a. Why does a companies training plan have to adhere to the CE program? There is no discussion here of how to maintain certification. In fact it is patently obvious that it was intentionally avoided. Is the goal of this to have quality training or further the CE programs viability? Why can't all the training requirements be in one place?

8b. Approval and revocation processes for what? Being a CEH provider or certifying my training program? Compliance monitoring should be sufficient. Why is a separate process neeeded? The CEH process already contains a system for approval and revocation, it's duplication here will increase administrative work load unnecessarily.

Background Information:

Posted for comments is the first posting of the System Personnel Training Standard Authorization Request. The US-Canada Power System Outage Task Force identified training as one of several initiatives that should be undertaken to enhance the reliability of the bulk interconnected grid. In their report on the August 14, 2003, outage the task force stated "Any person with access to a control room should be trained so that he or she understands the basic functions of the control room … under any conditions." This Standard Authorization Request was initiated, in part, to address this recommendation.

The requestor would like to gauge the level of consensus regarding the scope of this SAR and to obtain the input of the industry prior to determining the final scope and requirements of the SAR. Accordingly, your comments included on this form, emailed with the subject "System Personnel Training SAR Comments" by January 07, 2005, would be appreciated.

Question 1: Do you agree there is a reliability need for the proposed training standard?

☒ Yes

☐ No

Comments

All real-time market participants must have some level of training dependent upon the potential effects they may have on system reliability.

Question 2: Regarding the applicability of the SAR:

Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator	☒ Yes ☐ No
Balancing Authority	☒ Yes ☐ No
Interchange Authority	☒ Yes ☐ No
Planning Authority	☐ Yes ☒ No
Resource Planner	☐ Yes ☒ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Planner	☐ Yes ☒ No
Transmission Service Provider	☒ Yes ☐ No
Transmission Owner	☒ Yes ☐ No
Transmission Operator	☒ Yes ☐ No
Distribution Provider	☒ Yes ☐ No
Generator Owner	☒ Yes ☐ No
Generator Operator	☒ Yes ☐ No
Purchasing-Selling Entity	☒ Yes ☐ No
Market Operator	☒ Yes ☐ No
Load-Serving Entity	☒ Yes ☐ No

Comments

It should apply to all entities that can affect real-time operations. However, the training requirements for each entity should be different dependent on the way they can affect the system.

Question 3: Do you believe the content as outlined in the Standard Authorization Request is adequate?

Are additional elements that should be included in this proposed standard?

☐ Yes

☒ No

If yes, please explain.

Are there existing elements that should be excluded in this proposal?

☐ Yes

☒ No

If yes, please explain.

Comments

Question 4: Do you believe there are any regional differences that should exist in the proposed standard?

☒ Yes

☐ No

If yes, please list the region-specific differences.

My perspective is one of a Generator Operator which operates in four different Reliability Councils (centralized dispatch generation control center with control of multiple generation assets in multiple regions). Each Council has unique differences that must be accomodated.

Comments

Question 5: Do you believe it is practical to implement the proposed standard with the existing staffing levels?

☐ Yes

☒ No

If no, please explain what staffing changes might be needed.

I have no training staff so it would be impossible to design/implement formal training just for my group without additional staffing/expenditures. However, we do participate in all "pool wide" system operator training that is offered in MAAC and MAIN (via PJM) and applicable to Generation Operators. This is the type of training I would depend on to meet the requirements.

Comments

Question 6: How and how often should training programs be reviewed for compliance with the standard?

Every five years.

Comments

Question 7: Please enter any additional comments you have regarding the proposed SAR below.

Comments
Some random thoughts: Although we do operate in several Reliability Councils and I admit there are clearly regional differences, the minimum standard should be global so I don't have to meet different minimum standards. The training should be web/computer based so it is available during back shifts. The training needs to be geared towards the responsibilities. For example, the minimum level for Generator Operators need not be at the same level as that of Reliability Coordinators. The costs should be spread across all market participants because the entire market benefits from reliability..

Background

The System Personnel Training SAR Drafting Team thanks all those who submitted comments with the posting of the first draft of the SAR for personnel training. After careful review and consideration of all comments received, the drafting team has prepared a revised SAR for additional comments.

The drafting team posted the first draft of its SAR for comment from 12/07/04–01/07/05. The drafting team received 19 sets of comments. The comments can be viewed in their original format at:

ftp://www.nerc.com/pub/sys/all_updl/standards/sar/System_Personnel_Training_Comments.pdf

If you feel that the drafting team overlooked your comments, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Cauley at 609-452-8060 or at gerry.cauley@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.

Introduction

The public comments on the latest standards authorization request for the NERC Training Standard revealed that the SAR did not explain adequately the intent of the proposed training standard nor the concepts upon which that standard would be based. This response provides more detail, and, along with the revisions we have made to the SAR, should provide greater comfort to those who identified key issues with our previous draft.

The SAR drafting team noted three common concerns among these public comments, specifically that the standard seemed to:

1. Unduly prescribe the details for training programs,
2. Cover too broad a range of operating personnel, and
3. Require a "one size fits all" approach to training

The comments also indicated some confusion surrounding the separation and interdependencies of training, personnel certification, organization certification and continuing education, which we will clear up as well.

This response to the public comments is divided into five sections:

1. General explanation of the concepts of the standard,
2. What the standard *does not* cover,
3. Responses to the three common concerns listed above
4. Responses to all other comments, and
5. Drafting team roster with email addresses and phone numbers. The team will be glad to answer your questions.

Applicability of the Standard

The scope of the initial training standard will be limited to the initial training of new staff and the continuing education of existing staff performing operating tasks in real-time that directly impact the reliability of the Bulk Electric System (BES).

The Goal of the Training Standard: Competency

The goal of operator training is to develop *competency*, which is "the ability to do something well or to a required standard."[1] Competent system operators understand the tasks they are expected to perform and how to do those tasks. They also understand the reliability standards to which they and their organizations are held accountable. The organization, in turn, must design and implement its training program to ensure this competency. The proposed NERC training standard includes the requirements for these training programs.

[1] Source: Encarta Dictionary

Approach to Developing A Training Standard

The approach of the revised SAR for a training standard is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. To provide for flexibility is not a compromise on the quality of training and is in fact quite the opposite. Quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. Using this process, an organization can identify training needs and deliver quality training that eliminates competency gaps. Not using this fundamental process for training, or leaving out any step in the process, will not produce training that can validate competency required for job performance.

The primary purpose of training is to produce competency where a gap exists between ability (or performance required for the job) and the existing competency of a person performing that job. A systematic approach to training starts by determining performance requirements. You must know what performance is required before you can say the capability to perform exists or not. Determining performance requirements simply means knowing what a person is supposed to be able to do, and is only the first step in determining and delivering training that produces needed competency. Once you know what is supposed to be done and how well (performance requirements), you must then determine the existing level of competency of personnel performing those tasks. The process for determining the difference between required competency and existing competency, which is a competency gap, is termed training needs assessment.

Valid training is the result of a systematic approach to identify performance deficiencies and correcting the lack of ability to perform with valid training. Training, without attention to other performance factors such as tools, etc. required to do a job cannot make performance happen. Training, when done using a systematic approach, can guarantee competency, or the ability to perform. However, training, without attention to other performance factors such as tools, procedures, etc. required to do a job, cannot make performance happen.

The approach to a training standard could be to select a list of topics that must be covered and a specific number of hours per year of training. That approach would guarantee nothing in terms of competency. Learning might occur, but whether or not the right learning occurred would be unknown without a method for validating learning. That is the principle of the systematic approach to training – training is a process that, without each of it s critical elements, cannot guarantee competency. Without competency performance will not occur as desired.

The approach being proposed in the revised SAR, will be based on the fact that developing and maintaining an effective training program involves a number of steps:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.

3. **Developing the training program** to include effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel** to ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process.

When all of these steps are correctly applied, training will be able to validate competency. The omission of any step means that the training cannot guarantee the desired competency. The training standard includes all five of these steps, and measures compliance by requiring documentation that these steps were performed. If the process is followed, credible training will result. If the process is not followed, the needed learning may not occur.

Requirements the Training Standard Does Not Include

Does not specify the number of hours of training the organization must deliver, with one exception: that every system operator must receive at least 32 hours of training in emergency operations. This training was specifically required in NERC's original recommendations following its initial investigations into the August 2003 blackout and the drafting team agrees it must be in the training standard until data substantiates another number.

Does not specify who must be trained. That's the purpose of the job and task analysis. The Personnel Subcommittee (PS) is conducting a job and task analysis to provide the industry with a solid base of tasks that impact reliability. (See text box at right on Determining Tasks.)

Does not list the training subjects that must be taught. The subjects must be germane to the tasks that the system operators perform, and these are revealed through the job and task analysis. Even though the PS is supplying the majority of operator tasks that directly impact reliability, the list is neither complete, nor does it specify specific training requirements for an organization. A needs assessment must still be conducted by each organization to determine the training needs of their personnel.

Determining tasks

The proposed training standard will require every organization to determine the tasks that its operating personnel perform. This is accomplished through a task analysis or a job and task analysis (JTA). Organizations with long-established training programs conduct JTAs whenever needed to ensure their training programs include the proper content. But most organizations, especially those who do not have their own training programs, probably don't perform JTAs.

The proposed standard does not require the organization to perform a formal JTA. It does require the organization to explain how it identified the tasks for which its training program was designed.

To help the industry identify these critical operating tasks, the NERC Personnel Subcommittee is conducting three studies. The first study determined the competencies of excellent operators. The second will identify the tasks done by operating personnel that directly impact reliability. The third will identify tasks performed by support personnel that directly impact reliability. The results of the first two studies will be factored into the initial training standard. In late 2006, the study of support personnel tasks will be included in a revision to the training standard. Organizations may use this "generic" JTA to identify those operating personnel who must be included in their training program, but they must conduct a training needs assessment to determine the specific training needs of their personnel.

Does not require operator certification or specify who must be certified. NERC certification of personnel is not covered by this standard.

Does not specify how many hours of NERC continuing education a system operator must have for renewal of a NERC certificate.

Does not require a specific number of training staff. The number of qualified training staff is a function of training needed to maintain qualified operating personnel, which must be determined by each organization. Staffing with qualified personnel to operate is a responsibility of each organization impacting the reliability of the BES.

Does not require an operator training simulator, though it does require simulation training as part of the training in emergency operations, the standard must certainly encompass training using simulators

Does not accredit training programs. If the systematic approach to training is followed, training programs will be credible and produce the desired competency.

Responses to General Comments

In this section of the drafting team's response, we will focus on the three most common comments.

Comment 1. The Training Standard Is Too Prescriptive

Comments from Guy Zito, Kathleen Goodman, Ralph Rufrano, Greg Campoli, Pete Lebro, Roger Champagne, Khaqan Khan, Al Adamsom, David Kiguel, Robert Pelligrini, David Little, Brian Hogue, and Jerry Mosier stated that:

> "There needs to be the flexibility to tailor the training to the individual involved. Requirements should be limited to Certification Standards. NERC is being overly descriptive of "how to" conduct training rather than achieving specific results. NERC Standards should be "object oriented," that is, specify what the final requirements are. Prescribing how each entity goes about to achieve these objectives is beyond NERC's mandate."

Response

The training needs of each organization and each individual are different because each organization has a somewhat different set of tasks assigned to an individual, and each individual has different levels of competency for the set of tasks that is their job. The approach of the revised SAR is to provide maximum flexibility to the industry by requiring a fundamentally sound process to be followed in determining training needs for operating personnel in a specific organization. It would be overly prescriptive to list a set of topics that must be taught to all system operators for some arbitrary number of hours per year. The drafting team cannot know the training needs of each organization in the industry. That is why the approach was taken in the revised SAR to require that a valid process for determining training needs be followed by each organization employing operating personnel that can impact system reliability.

As we listed in the section "Requirements the Training Standard Does Not Include," the proposed training standard does not overly or unduly prescribe *how* training must be administered or *how* many courses must be taught. It does, however, require all

organizations to determine *what* their system operators do and then develop training programs to ensure that the system operators perform those tasks and responsibilities competently. This is not being unduly prescriptive—in fact it's quite the opposite. For a training program to be effective, especially when associated with a certification program, it must be flexible enough to train to the *tasks* that the organization's personnel perform. This is the way effective training programs are developed in all industries which are striving to achieve excellence through competent performance of their personnel.

As to the results of the training program, those are measured through the organization's assessments and examinations of its students that the organization must conduct.

Comment 2. The Training Standard Is A "One Size Fits All"

Comments from Karl Tammar, Dale McMaster, Ed Riley, Sam Jones, Peter Henderson, Peter Brandien, Bill Phillips, Bruce Balmat, Charles Yeung stated that:

> "However, the proposed standard appears to apply a "one size fits all" approach to every authority and function. If this is the case, then this approach is likely to be unrealistic. It should be clear as to which functions should be certified versus having taken accredited courses. Also, clarity is needed that there will be different types of certification rather than just NERC Operator Certification. NERC needs to better define the scope of this standard. Is the intent of the standard to measure compliance of the training of (reliability entity) personnel regarding NERC Reliability Standards, or is the standard meant to measure compliance of all Training Programs? If the intent is the former, then the question is 'Is there enough material to really test since some of the NERC standards applying to owners, for example, only require communications of data?' If the intent is the latter, then the question is, 'Is NERC the right organization to evaluate in-house training programs given the diversity of operating approaches used in North America?' In this case, some programs are probably better evaluated by those closer to the needs and responsibilities of the individual organization."

Response

We received similar comments from others, or the reverse comment that the training standard must be flexible enough to provide the appropriate training for the tasks that are performed. We agree and have limited the scope of the revised SAR to system operators performing tasks that will directly impact real-time system reliability as identified by the Personnel Subcommittee's proctored Job and Task Analysis. The studies are targeted for completion in the 2nd quarter of 2006. The task list derived from the PS's JTA will not and cannot be all inclusive. Organizations must still conduct a needs assessment to determine training needs for the operating tasks their operators perform .

The proposed training standard does not take a "one size fits all" approach. In fact, to be truly effective, it can't because effective training must be tailored to the *tasks* that system operators perform, not whether they work for an organization who registers as a particular responsible entity as defined in the functional model, such as a Transmission Operator or Reliability Coordinator.

For example, all Regional Transmission Organizations have registered as transmission operators, and most—but not all—of their members have as well. However, not all RTO operating personnel perform physical transmission switching *tasks* and their training program would not need extensive instruction in those switching operations. On the other hand, the RTOs' members who operate SCADA centers do need training in transmission tagging and switching *tasks*, but may not need training in wide-area contingency analysis. That is a *task* the RTO staff handles because the RTO, not the SCADA operator, has the wide area view.

The RTO's job and task analysis will reveal that its system operators do not perform transmission switching tasks, and the RTO member's JTA will reveal that its personnel do. Of course, we expect these organizations already know this, but this example shows that the training programs for the RTO as the Transmission Operator and its member as a Transmission Operator may not be the same, and, in fact, the training standard will require that each organization's training program be tailored to the tasks that its operating personnel perform.

The proposed training standard does not require that training programs be accredited or approved, and, as we explained earlier, is not intended to specify personnel certification requirements. Those requirements are in other NERC standards and will be reviewed by the Personnel Subcommittee upon completion of the Training Standard. Training is a much broader issue than certification.

Comment 3. The Scope of the Training Standard Is Too "Wide" Or Too "Deep"

James Stanton commented that:

> "The proposed Standard is overly broad and ambiguous, and should not uniformly apply to anyone."

NPCC noted that:

> "... anyone engaged in direct operating/control activity for the Bulk Power System should be properly qualified/certified. An alternative approach to the above also discussed might also involve only requiring NERC Certifiable Functions i.e. Reliability Authority (RC), Balancing Authority, Interchange Authority, Transmission Operator to adhere to the resultant standard."

Karl Tammar, Dale McMaster, Ed Riley, Sam Jones, Peter Henderson, Peter Brandien, Bill Phillips, Bruce Balmat, and Charles Yeung stated that:

> "Support staff and other operators not required to be certified should be able to meet their obligations by participating in NERC continuing education."

> "The industry needs a little more definition and clarity on who is the functional entity (IA, RA, PA, etc.)"

Response

The drafting team will focus the scope of this first version of the training standard to those operating personnel who *directly perform* the tasks critical to the reliable operation of the bulk electric system. NERC will identify those tasks in a JTA that it is conducting this spring with system operators, and we will list those tasks in the standard. These tasks will be those most likely performed by Reliability Coordinators, Balancing Authorities, and Transmission Operators. However, we do not want to assume that no other organizations perform any of these tasks. Therefore, the drafting team will continue to check all responsible entities on the standards authorization request, making it clear that only those organizations whose personnel perform one or more of the listed tasks must comply with the standard.

NERC will conduct future JTAs to identify the tasks that support and supervisory personnel perform with the idea of revising the training standard in the future to include these new tasks.

In regard to the relationship between training and certification, training is a broader issue than certification. Certification may require a minimal competency in knowledge across the broad spectrum of all system operators that perform for example, reliability tasks. Certification says nothing about performing specific tasks for a specific organization. Training, on the other hand, must at some point address organization-specific requirements to perform the tasks of a system reliability coordinator for that specific organization. The training standard does not address which operating personnel must be certified. Other standards contain those requirements. The question of which personnel should be certified will be re-examined by the Personnel Subcommittee upon completion of the Training Standard.

To address these comments, we need to look at the breadth and depth of the proposed standard.

Breadth. By *breadth*, we mean two things. First, the variety of responsible entities—Transmission Operators, Reliability Coordinators, Balancing Authorities and so on—to which the training standard applies. Second, we mean the population of operating personnel for which the training programs must be developed. For example, an RTO member who does not register as a Transmission Operator may instead see itself as only a Distribution Provider (DP) or Load-Serving Entity (LSE). If NERC does not include the DP and LSE in the training standard, there is no compelling reason for these organizations to utilize a systematic approach to training, even though their operating personnel may perform *tasks* that can affect the operations of the high-voltage transmission system. So unlike other NERC standards, the training standard cannot be limited to just those responsible entities that some may consider the more obvious candidates for operator training programs.

This also means that organizations that are transmission dependent and normally thought of as too small to require operator training may need training for their personnel who perform transmission operating tasks that can affect the bulk electric system. While the training requirements may be minimal, they are nonetheless important and NERC cannot overlook these organizations.

To this point, the training standard does not require an organization to have training staff, but rather utilize a systematic approach to training. This training program can be provided through vendors or even arrangements with other utilities who do have training staffs and programs of their own. It would be quite reasonable for operators at a smaller municipal or

cooperative utility that operates, say, a 230 kV switchyard to receive training from that utility's Transmission Operator neighbor that operates the rest of the system to which that switchyard is connected. As long as the smaller utility can demonstrate that it determined the tasks that its operators perform and that those operators were trained to those tasks, the utility can comply with the training standard.

Depth. As to the *depth* within an organization's management structure to which the training standard applies, this, too, will be revealed by the JTA. For example, the JTA will make quite clear the wide array of critical operating tasks that the operating personnel "on the desks" perform. And it is these tasks that must be covered in the organization's training if that training is to be relevant to the operators' competency.

On the other hand, the vice-president of operations, while certainly responsible for the reliable operations of the system, does not perform these operating tasks and would need little training in the details of breaker switching or reactive control.

Responses to Individual Comments

In this section we list our responses to each comment. For efficiency's sake, if the comment is one of the three General Comments discussed above, we noted that instead of simply repeating the same response.

1. Do you agree there is a reliability need for the proposed training standard?

Commenter	Yes	No	Comment	Response
Total	**19**	**0**		
Anthony Giasi	**X**		However, the training standard must be reasonable and explicit, it must be specific as to which personnel in each entity require training, it must be specific as to the different training protocols not only for the personnel within each entity, but also for the different entities, it must be achievable in a reasonable time frame for a reasonable cost, and not subject to compliance for a reasonable period of time, say three years to allow for formation and implementation.	Please refer to our Responses to General Comments above. We are not sure how to judge "reasonable cost." Training costs should be a matter of the cost to operate competently. The revised SAR focuses all training requirements on the competency to operate. Reasonable cost to operate competently depends on the organization, its functions, the market , and many other factors. Training costs should be directly tied to what is required to operate competently, and the revised SAR stresses this in terms of performance requirements as the basis for training. The Standards Authorization Committee will determine if a field testing period is needed for implementation of the standard.
Guy Zito Kathleen Goodman Ralph Rufrano Greg Campoli Pete Lebro Roger Champagne Khaqan Khan Al Adamsom David Kiguel Robert Pelligrini David Little Brian Hogue Jerry Mosier	**X**		There needs to be the flexibility to tailor the training to the individual involved. Requirements should be limited to Certification Standards. NERC is being overly descriptive of "how to" conduct training rather than achieving specific results. NERC Standards should be "object oriented," that is, specify what the final requirements are. Prescribing how each entity goes about to achieve these objectives is beyond NERC's mandate. Limit this to only Control Room Operating staff that actually "operate" the system.	Please refer to our Response to General Comment 1 above.

Commenter	Yes	No	Comment	Response
James Stanton	X		I believe there is a reliability need for a training standard, though not necessarily the one being proposed.	The drafting team welcomes specific recommendations.
John Neagle	X		AECI agrees with the general concept of a training standard for the purpose of promoting reliability. The SAR does not contain sufficient detail to determine whether or not Associated would agree with a standard based on this SAR.	Please refer to our Response to General Comment 3 above. The new SAR has considerably more detail than the intial SAR. We request that the commenter review the revised SAR and determine if it contains sufficient detail to resolve their concerns and comment accordingly.
Karl Bryan	X		I don't think you are going far enough with the requirement for training. I am constantly amazed at how generation operators do not understand where they fit into the big picture as far as system reliability issues are concerned. Even the little task of voltage support is poorly understood by our operators.	Please refer to our Response to General Comment 3 above. We agree. The Personnel Subcommittee will be conducting another round of job and tasks analysis for personnel that support the reliability of the Bulk Electric System. Generator operators, though they do not operate the transmission component of the bulk electric system, can most definitely impact real-time reliability. This should be verified by the second round of job and task analysis to be completed in early summer, 2006. The training standard will be revised to include any additional tasks identified by the second round of studies to directly impact the reliability of the Bulk Electric System other than what has been traditionally considered system operators

Commenter	Yes	No	Comment	Response
Karl Tammar Dale McMaster Ed Riley Sam Jones Peter Henderson Peter Brandien Bill Phillips Bruce Balmat Charles Yeung Peter Henderson	X		There is a need for a training standard and we applaud the intent. Such a standard should be the single location for all training requirements (presently training requirements are found in several locations) for the appropriate functions. However, the proposed standard appears to apply a "one size fits all" approach to every authority and function. If this is the case, then this approach is likely to be unrealistic. It should be clear as to which functions should be certified versus having taken accredited courses. Also, clarity is needed that there will be different types of certification rather than just NERC Operator Certification. NERC needs to better define the Scope of this standard. Is the intent of the standard to measure compliance of the training of (reliability entity) personnel regarding NERC Reliability Standards, or is the standard meant to measure compliance of all Training Programs? If the intent is the former, then the question is, is there enough material to really test?, since some of the NERC standards applying to owners for example only require communications of data. If the intent is the latter, then the question is, is NERC the right organization to evaluate in-house training programs? Given the diversity of operating approaches used in North America. In this case, some programs are probably better evaluated by those closer to the needs and responsibilities of the individual organization.	Please refer to our Response to General Comment 2 above. Also, the training standard is not a certification standard. Certification requirements are specified in other standards. That said, the certification requirements must consider the training provided to the system operators. That is, NERC cannot require operator certification for tasks that the operator does not perform. That's why the JTA plays a key role in both the training and certification programs. The Personnel Subcommittee has been tasked with examining which personnel must be certified. This will be addressed in 2006, after the training standard is completed. Refer to the General Comment 3 for the relationship of training to certification.
Kathleen Davis Jeff Newsome Rick King	X		A training standard is needed to ensure we have competent personnel who can safely and reliably operate, maintain, and improve the performance of the electric power system. Training for the system operators is critical to the industry as a whole. We are at the beginning stages of where we must go in the future to reassure ourselves and the public at large that the events of August 14th 2003 will not be repeated. For the NERC organization this should be at a minimum, in it's top three priorities.	We agree.

Commenter	Yes	No	Comment	Response
Theodore G. Pappas	X		The training should be broken into three segments. The first should be certification training or that training needed to maintain certification. This would be applicable to the RA, BA, IA, Transmission Operator, and possibly the Market Operator In other words control room operator training. The second segment should be for those not directly involved in the operation of the power system. This would apply to the Planning Authority, Resource Planner, and Transmission Planner. The third segment should be for generator operators and would cover items such as interconnections, VAR flow, relaying, etc so that these operators can develop an understanding of the working of the power system and their impact on it. The standard should define the training subjects, total hours and, for continued education, the frequency. Flexibility is key so defining specific hours to each subject is not appropriate.	Please refer to our Responses to General Comments above. We are having difficulty with the last two sentences in the comment. It says in effect, that the standard should specify training subjects, total hours, and frequency of training, yet be flexible by not specifying hours required for each subject. These appear to be conflicting statements so we do not know how to respond.
Thomas Bradish	X		If we do not develop a focused training standard, we are destined to repeat August 14.	That's why the training standard is so important.Please refer to our Responses to General Comments above.
Alan Gale	X		Although the industry has survived without one for several years, the investigation of the August 14th blackout has pretty much dictated that this be yes.	
Mark Heimbach	X		All real-time market participants must have some level of training dependent upon the potential effects they may have on system reliability.	Please refer to our Responses to General Comments above.
Howard Rulf	X		No comment	
Ken Goldsmith	X		No comment	
Gerald Rheault	X		No comment	
Richard Kafka Michael Maher William Mitchell David Thorne Vic Davis Val Hildebrand	X		No comment	
William Smith	X		No comment	
Michael Calimano	X		No comment	
Raj Rana	X		No comment	

2. Regarding the applicability of the SAR: Indicate which of the following you believe the proposed standard should apply:

Reliability Authority/Coordinator

- Balancing Authority
- Interchange Authority
- Planning Authority
- Resource Planner
- Transmission Service Provider
- Transmission Planner
- Transmission Owner
- Transmission Operator
- Distribution Provider
- Generator Owner
- Generator Operator
- Purchasing-Selling Entity
- Market Operator
- Load-Serving Entity

Comment	Comment	Response
Anthony Giasi	All boxes checked except DP Do the proposed training standards apply to non-registered entities to whom actions or operations are delegated by a registered entity? If yes, why. If not, then do any training standards apply?	**General response**: The comments to this question do not show consensus. As we explain in our responses to the General Comments sections, this standard requires that all organizations determine for themselves if their operating personnel need training. Also, • Please refer to our Responses to General Comments above. • Under the ERO, *all* bulk power system owners, operators, and users will need to register under one of the definitions of the functional model. The revised SAR does limit its scope to those system operators performing real-time tasks that directly impact the reliability of the Bulk Electric System. Support tasks and personnel will be addressed after some additional studies are completed. • Personnel directly responsible for operating the electric power system may reside in organizations other than just the RC, BA, and IA. That's why the scope of the proposed standard includes all responsible entities. However, we will contain the initial job and tasks analysis to those system operators who perform critical operating tasks. The proposed training standard does not include personnel certification requirements. This standard does not address NERC operator certification requirements. • Refer to the General Comment 3 for the relationship of training to certification. Generator operators, though they do not operate the transmission component of the bulk electric system, can most definitely impact real-time reliability. This should be verified by the second
Guy Zito Kathleen Goodman Ralph Rufrano Greg Campoli Pete Lebro Roger Champagne Khaqan Khan Al Adamsom David Kiguel Robert Pelligrini David Little Brian Hogue Jerry Mosier	RC, BA, IA, TSP, TOP, GOP NPCC - believes that anyone engaged in direct operating/control activity for the Bulk Power System should be properly qualified/certified. An alternative approach to the above also discussed might also involve only requiring NERC Certifiable Functions i.e. Reliability Authority (RC), Balancing Authority, Interchange Authority, Transmission Operator to adhere to the resultant standard.	
James Stanton	No boxes checked The proposed Standard is overly broad and ambiguous, and should not uniformly apply to anyone	

Comment	Comment	Response
John Neagle	RC, BA, IA, AECI suggests it is inappropriate and unnecessary for a training standard resulting from this SAR to apply to electric utility industry individuals other than those directly responsible for the operation of the interconnected system, i.e. control center personnel.	round of job and task analysis to be completed in early summer, 2006. The training standard will be revised to include any additional tasks identified by the second round of studies to directly impact the reliability of the Bulk Electric System other than what has been traditionally considered system operators
Karl Bryan	RC, BA, IA, PA, RP, TSP, TP, TOP, DP, GOP, MO, LSE No other comments	
Karl Tammar Dale McMaster Ed Riley Sam Jones Peter Henderson Peter Brandien Bill Phillips Bruce Balmat Charles Yeung	RC, BA, TOP Support staff and other operators not required to be certified should be able to meet their obligations by participating in NERC continuing education. TSP is listed twice. Was there supposed to be some other entity? The industry needs a little more definition and clarity on who is the functional entity (IA, RA, PA, etc.)	
Kathleen Davis Jeff Newsome Rick King	RC, BA, IA, PA, TSP, TOP No other comments	
Peter Henderson	RC, BA, IA, TOP Where we indicated "No" above, does not imply that there should not be training. Support staff and other staff (PA, RP, TSP, GOP, etc) or operators not required to be certified should be able to meet their obligations by participating in NERC continuing education TSP is listed twice. Was there supposed to be some other entity or is it a duplication? The industry needs a little more definition and clarity on who is the functional entity (IA, RA, PA, etc.)	
Theodore G. Pappas	RC, BA, IA, PA, RP, TSP, TP, TOP, GOP, MO No other comments	
Thomas Bradish	All boxes checked, I have checked all of the above because all will need to have some level of knowledge around the operation of the grid. The key phrase is "some level of knowledge'. A one size fits all approach would be over kill and doomed to failure. The training requirements should fit the knowledge requirement of the position.	

Comment	Comment	Response
Alan Gale	RC, BA, IA, PA, TSP, TOP, GOP, PSE, MO, LSE No other comments	
Mark Heimbach	RC, BA, IA, TSP, TO, TOP, DP, GOP, GO, PSE, MO, LSE It should apply to all entities that can affect real-time operations. However, the training requirements for each entity should be different dependent on the way they can affect the system.	
Howard Rulf	RC, BA, IA, PA, TSP, TOP, GOP, PSE, MO, LSE No other comments	
Ken Goldsmith	RC, BA, IA, TSP, TOP, No other comments	
Gerald Rheault	RC, BA, IA, RP, TSP, TP, TOP, DP, GOP, LSE For the Generator Operator category, Manitoba Hydro believes that this Standard should apply for a generator operator at the generation company operations or dispatch center but not to an operator at the thermal or hydraulic plant	
Richard Kafka Michael Maher William Mitchell David Thorne Vic Davis Val Hildebrand	BA, IA, PA, TSP, TOP, GOP, PSE, MO, LSE Those entities operating in real time should have training requirements.	
William Smith	RC, BA, IA, PA, TSP, TOP, GOP, PSE, MO, LSE No other comments	
Michael Calimano	RC, BA, IA, TOP The standard should be initially developed to support only those personnel who are required to be NERC certified. Once the standards have been established and fully implemented at that level, expansion of the target audience should be examined.	

Comment	Comment	Response
Raj Rana	RC, BA, IA, PA, TOP There should be a baseline competency for each Functional model entity listed above. However, recognizing that the baseline competency varies by entity class, therefore it can't be a "one size fits all" concept. The Standard should consider this factor and be flexible to the varying needs of the intended entity class. The training needs and requirements for a RA/RC and TOP differ from that of a BA or IA. The standard should be clear on that point and have different requirements for each of the entities. An IA should not have to have staff with the same knowledge and expertise as a RA/RC. The Standard should only include the entities checked above. Additionally, the Standard should not cover management.	

3. Do you believe the content as outlined in the Standard Authorization Request is adequate?

Q1. Are there additional elements that should be included in this proposed standard?

Q2. Are there existing elements that should be excluded in this proposal?

Drafting Team General Response to Question 3:

The Drafting Team understands that the types of continuous training listed in the SAR were only examples of training that an organization could provide. However, other types of training, such as cross training, could come under the title of other training. Again, the intent is to use a systematic approach in developing all types of training that would be provided.

The overall goal of the training standard will be to provide guidance in how each entity will determine what training is needed for its staff based on performance requirements, some valid method for determining if a competency gap exists, and delivering training that corrects the competency gap. Those competency gaps should be identified on several levels, for example from new employee up through a master operator level. Various types of training appropriate for the situation, but meeting the standard for effective training can then address the gaps. That standard for effective training is the objective of the drafting team.

To help the industry identify critical operating tasks, the NERC Personnel Subcommittee is conducting several studies to determine the competencies of excellent operators, the tasks done by operating personnel that directly impact reliability, and tasks performed by support personnel that directly impact reliability. The first two studies will be completed and the results factored into the initial training standard. The study of support personnel tasks will be included in a revision to the training standard at a later date. Organizations may use these NERC conducted JTAs to identify those operating personnel who must be included in their training program, but they must conduct a training needs assessment to determine the specific training needs of their personnel.

To clarify our intent, it was not to quantify the elements of a training program, but to develop a process that considers key elements of a good training program. (Item 1)

Commenter	Yes	No	Comment	Response

Commenter	Yes	No	Comment	Response
Anthony Giasi	**XX**		Yes to Q1 and Q2. Qualification testing; Real-time assessments to verify training carried over to the job; Missing the link to competency of existing system operators; Needs to identify the qualifications for the system operator to first sit in the chair; Needs to address resources needed to accomplish the training; Need a training shift for system operators (adequate time dedicated to training) Companies should have plans in place to take a system operator from an initial competency level up to an expert level, however this is not NERC's responsibility. What is written is 'process-oriented' and is not sufficient in detail for all system personnel positions – the scope is too broad (covering too many positions) and the level is too high level (doesn't identify what positions are included in the category called 'system personnel')– a SAR targeted for the individual types of positions (such as a SAR just for the operating authority positions) would be more helpful.	Please refer to our Responses to General Comments above. Qualification training and testing will need to adhere to the same process as any other type of training which is based on an analysis of needs conducted by the employer. The resources will be determined by this same needs analysis. Several changes / additions to the SAR have been made to base training on performance requirements. Performance capability (competency) does not have to, in most cases, be verified on live systems to validate competency. The SAR has been changed to extensively address On-the-Job-Training The approach of focusing on the training process will achieve the most detail you can get, if done correctly. Following a valid process for training is how you get down to the specific requirements for a specific task. The emphasis is on tasks, not job positions because those will vary in the tasks they do from organization to organization. The Job and Task Analysis being conducted by the Personnel Subcommittee will identify many of the jobs performing operating tasks that directly impact reliability, but it will not identify al of them. The performance of tasks impact reliability, not a person's job title. Initial training and testing will need to adhere to the same process as any other type of training which is based on an analysis of needs conducted by the employer. The final standard will address the recommendations of the blackout investigation with respect to who should be trained. The scope of this standard must address all that can impact the reliability of the bulk electrical system.

Guy Zito Kathleen Goodman Ralph Rufrano Greg Campoli Pete Lebro Roger Champagne Khaqan Khan Al Adamsom David Kiguel Robert Pelligrini David Little Brian Hogue Jerry Mosier	X	X	Yes to Q1 and No to Q2. Certification is a control room operator issue.	This standard is not intended to prescribe which personnel should be certified. This standard does not address NERC operator certification requirements.
James Stanton		X	No to Q1 and no check for Q2. The content is inadequate not because of a lack of elements but because of the ambiguity of what it is intended to do. A Training Standard cannot be a "one size fits all" approach for functions as disparate as Reliability Authorities and Purchasing and Selling entities.	Please refer to our Responses to General Comments above as well as the revised SAR and the draft training standard that accompanies the SAR.
John Neagle	X	X	No to Q1 and Yes to Q2. Associated Electric Cooperative Inc. suggests a training standard should address the desired outcomes and should not specify the methods to achieve those outcomes. The SAR does not contain sufficient detail to determine the SAR drafting team's intent, but it appears the resulting standard would be quite prescriptive in many areas. Any elements currently included in the SAR that prescribe facilities, tools, materials, funding, staffing levels, methods, etc. should be deleted. These details are best determined by and should be left to the discretion of the individual company.	Please refer to our Responses to General Comments above.
Karl Bryan	X		Yes to Q2, no check for Q2. I feel that various levels of certification should be developed, similar to engineer in training to registered professional engineer.	• The proposed training standard does not include personnel certification requirements. This standard does not address NERC operator certification requirements.

Commenter	Yes	No	Comment	Response
Karl Tammar Dale McMaster Ed Riley Sam Jones Peter Henderson Peter Brandien Bill Phillips Bruce Balmat Charles Yeung	XX	X	Yes and No to Q1, Yes to Q2. There are two conflicting questions. The training program requirements are more than adequate (and may not be necessary for some training programs). Again, the one size fits all causes problems. What type of emergency (or situational awareness or simulator) training should PSE, IA or Planning Authority participate? As another example, why do all these entities need to perform independent JTAs when it's likely something will need to be created at the NERC level to review the JTAs (unless the intent is to check compliance by seeing if there is a document called "JTA" as opposed to a thoughtful analysis).	Please refer to our Responses to General Comments above and the text box "Determining Tasks."
Kathleen Davis Jeff Newsome Rick King	XX		Yes to Q1 and Q2. One basic tenet or requirement that should be stated is the use of a systematic approach (SAT), based on job performance requirements, to guide the training of system personnel.	We agree and have included language to that effect.
			You should not specify job and task analysis under 1.b. A needs assessment can be satisfied in several ways from a simple needs or job analysis up to a full blown job and task analysis.	We agree regarding the JTA, and have changed the language to needs analysis or assessment.
			There should only be a requirement for documentation and record keeping under 1.i. Administration. A learning management system is one means to document and track training.	We agree with the documentation comment and have changed the language to reflect simply documentation and record keeping
			If hours are specified under initial training requirements they should reflect only the minimum acceptable number of hours for training. If a company does a needs analysis to determine job requirements the time to conduct the initial training program will vary based on the components of the job and the necessary elements to be trained on.	We agree and have modified the SAR to reflect this.
			Progression training and cross training are not consistent with the intent of a continuing training program. A continuing training program is intended to refresh and improve the application of knowledge and job-related skills for the job the trainee works or is qualified to work.	We agree and have modified the SAR to reflect this.

Commenter	Yes	No	Comment	Response
			Simulation training is a platform or method to provide initial and continuing training. I don't feel that it should be addressed separately.	We agree and have modified the SAR to reflect the intent that any method of training delivery needs to be part of the training development process.
Peter Henderson	**XX**	**X**	Yes and no to Q1 and yes to Q2. There are two conflicting questions. The training program requirements are more than adequate (and may not be necessary for some training programs). Again, if the approach is "one size fits all," this will cause problems. What type of emergency (or situational awareness, or simulator) training should PSE, IA or PA participate in? On the other hand, if the intention is to have different courses/certification streamlined for each involved function, then we can understand the approach. However, not all of the functions listed in Q2 should be part of this standard. See comments on Q2.	Please refer to our Responses to General Comments above. There may, however, be some specific requirements for system operators based on information gained through the NERC System Operator Study currently being conducted.
Theodore G. Pappas	**X**	**X**	No to Q1 and Yes to Q2. Much of the training is inappropriate for people not directly involved in operations or planning such as certain levels of management or support staff. The training program should not be so rigid that a training group is required. Senior staff should be capable of providing the training.	Please refer to our Responses to General Comment 3 above. NERC will consider training for management and support staff at a later time. It is not the Drafting Team's intent to define the resources, such as instructors, facilities, and funding. It is the drafting team's intent, however, that certain practices, such as having an operator come to training after working a full shift, is not even a minimally acceptable training process.
Thomas Bradish		**XX**	No to both Q1 and Q2 with no comments	

Commenter	Yes	No	Comment	Response
Alan Gale	**X**	**X**	No to Q1 and Yes to Q2. Certification Preparation - Each candidate must prepare for the exam and the measure is passing the test. A formal program to say what needs to be trained on before you can take the test is unnecessary. Would this preclude an individual from taking the test on his own, being hired, and then be non-compliant because he did not complete the "certification preparation" training but yet is certified? Progression Training - The training requirements for a company to advance an employee should be dictated by that company. The reliability of the grid should address the position, not the advancement to that position. If the "higher" position has additional training requirements, address those requirements, not what is needed to move up to that position. LMS - What is this intended to be? I do not recall seeing this in a list of definitions. Is this a "buzz word" that a particular vendor uses in describing their system? What would be in it that would not fall under Documentation or Record Retention? Number of hours - This contradicts the "Competency-based" objectives. Is the goal competent operators or having enough hours. You can have one with or without the other. Since this SAR does not address CEH's or Certification maintenance a specific number of hours would be easier to budget for, but may not yield the intended reliable operations. Advanced system operations training - How advanced is this intended to be? How much greater than basic? How much more "reliable" than "reliable"? The Detailed Description states "The goal would be to promote the reliability of the Interconnection through the setting of appropriate MINIMUM training requirements for system personnel." Having advanced training sounds like more than the minimum requirements.	First, please refer to our Responses to General Comments above. We have rewritten the SAR and standard to address these comments. Also, the proposed training standard does not include personnel certification requirements. Regarding progression training, it has been taken out of the standard The training process does apply to it just like any other training, but specific reference to it has been removed. LMS is a Learning Management System. Reference to LMS has been removed. We agree about the number of hours. The only reference made in the revised SAR is to a specific number of hours for emergency operations training. We have left that requirement as is because at present, we do not have another number of hours that we can validate, but will include that as an item in future Personnel Subcommittee study. Advance training was meant to refer to continuing education. We have changed the wording accordingly.
Mark Heimbach		**XX**	No for both Q1 and Q2 with no comments.	
Howard Rulf		**XX**	No for both Q1 and Q2 with no comments.	
Ken Goldsmith		**XX**	No for both Q1 and Q2 with no comments.	

Commenter	Yes	No	Comment	Response
Gerald Rheault		**XX**	No for both Q1 and Q2 with no comments.	
Richard Kafka Michael Maher William Mitchell David Thorne Vic Davis Val Hildebrand	**XX**		Yes for both Q1 and Q2 Under Item 1, i. Administration, a Learning Management System is a "how" rather than a "what" and should be eliminated. Item 3, Continuous training requirements, is poorly defined. It mixes topics, categories and methods of training, and many are subsets of others. The list is not properly defined or organized. Item 4, Simulation training: Should identify types, but not prescribe any specific method of simulation or simulator. Item 7, Training resources and staff, f. Funding: funding should not be part of the standard.	The SAR drafting team agrees and the SAR has been rewritten to address these concerns
William Smith	**X**	**X**	No to Q1 and yes to Q2. In item 3 - Continuous training requirements (topics and hours), parts b. Progression training and c. Cross training goes beyond training requirements. These two parts could infringe on Corporate Policy. Part i. Team training should be a desire or suggestion rather than a requirement. In item 1, part c should be excluded since it is just the physical representation of parts a and b. Parts f, g, h, and j should be included in 3.a. as part of the Annual training requirements.	The SAR drafting team agrees and the SAR has been rewritten to address these concerns.

Commenter	Yes	No	Comment	Response
Michael Calimano	X	X	No to Q1 and Yes to Q2. Several items need clarification: The distinction between job related OJT, Cross training, and progression training. The distinctions between situational awareness and system awareness. The distinction between "learning management system" and Training Plan/Training Schedule/Progress Assessment/Documentation/Record Retention. Item 7f should be deleted as redundant. It is included in 6 and 7 a-c. Item 8b should be deleted as redundant. It is part or 8a. It would make more sense to more explicitly link item 1f "program design" with item 8a "Adheres to the NERC Continuing Education program criteria."	The SAR drafting team agrees and the SAR has been rewritten to address these concerns.

Commenter	Yes	No	Comment	Response
Raj Rana	**XX**		Yes to both Q1 and Q2. The Standard needs to define the baseline competencies of the training program individually for each Functional model entity listed above, as they have different needs and requirements. Also, the Standard needs to define the essential elements of a training program individually for the RA/RC, BA, IA, and TOP, as they each have different needs and requirements. 5.a.i: The Standard should target just the RA/RC, BA, IA, and TOP and their support staff. The standard should not apply to all functional entities in the Functional Model nor to management. 6.a and 6.b: Delete all of 6.a and 6.b. The Standard should not dictate staffing levels. This is a business decision. The standard may influence staffing levels via the requirement for the amount of annual training, which is OK, but it should not dictate staffing levels by saying you need x staff for a system operator shift, etc. An entity may need no training staff if they decide to outsource 100% of their training needs. 7.a: Facilities. We question the wisdom of a NERC Standard dictating facility requirements for training, other then to state that adequate facilities need to be provided. Depending upon how an entity decides to provide the required training, they may not need much in the way of physical training facilities, i.e. if they decide to outsource all their training and send their staff to a vendor's training facilities. We would agree that it is appropriate for inclusion in a Standard to specify some boundaries/requirements in regard to how training should be facilitated or proctored, but we are not sure if that is what is meant by this bullet point on "Facilities." 7.f: Delete Funding. It is inappropriate for a NERC Reliability Standard to dictate a certain level of funding. Funding is not a proper measure of a Standard, performance is.	Please refer to our Responses to General Comments above. In regard to the applicability of the standard, the revised SAR does limit its scope to those system operators performing real-time tasks that directly impact the reliability of the Bulk Electric System. Support tasks and personnel will be addressed after some additional studies are completed. We have left several functional entities checked in the SAR because we do not have the results of the JTA that will identify who is performing those real-time operating tasks that directly impact reliability. Also, the revised SAR and standard do not specify staffing levels, facilities, or funding requirements. We agree that the organization must determine these as it sees fit to develop its training program and ensure that it provides adequate time for training.

4. Do you believe there are any regional differences that should exist in the proposed standard?

Drafting Team General Response to Question 4:

Regional differences can be addressed by a standard that requires those differences to be a part of the local training program. Again, the Standard will establish the requirements for what is considered an acceptable training program in our industry. The type and format of training is then part of the process of designing training for a particular target audience on a particular level of competency on a particular level of organizational specificity.

Commenter	Yes	No	Comment	Response
Total	**3**	**16**		The drafting team generally agrees with these comments. As we explain in our responses to the three General Comments, every organization will need to determine its own training needs based on the tasks its personnel perform. The NERC standard does not preclude additional training required by the Regional Council, RTO or ISO, or the individual organization. Finally, this standard does not include certification requirements.
Anthony Giasi		**X**	No comments	
Guy Zito Kathleen Goodman Ralph Rufrano Greg Campoli Pete Lebro Roger Champagne Khaqan Khan Al Adamsom David Kiguel Robert Pelligrini David Little Brian Hogue Jerry Mosier		**X**	No comments	
James Stanton	**X**		ERCOT's system, for example, does not easily fit into the NERC proposed functional model and the training standard should recognize the unique regional differences found in the ERCOT Region.	
John Neagle		**X**	Given the limited detail in the SAR, Associated Electric Cooperative Inc. does not see a need for regional differences.	
Karl Bryan		**X**	In order for national certification to mean anything, there should be no region specific differences for earning certification.	This standard does not address NERC operator certification requirements.

Commenter	Yes	No	Comment	Response
Karl Tammar Dale McMaster Ed Riley Sam Jones Peter Henderson Peter Brandien Bill Phillips Bruce Balmat Charles Yeung		**X**	There will be site-to-site differences. There would be some regional differences in content and topics, but there should be no regional differences in general training requirements. Some of the NERC functional definitions need more details (who is the TO, IA, RA, etc.).	The drafting team generally agrees with these comments. As we explain in our responses to the three General Comments, every organization will need to determine its own training needs based on the tasks its personnel perform.
Kathleen Davis Jeff Newsome Rick King	**X**		From an overall framework, the standard should be the same however we must recognize the special needs and the special circumstance of individual regions. One size does not always fit all.	We agree. That is why the approach to the standard will be to require a systematic approach to training. The standard will be focused on following a valid process, but every organization will need to determine its own training needs based on the tasks its personnel perform.
Peter Henderson		**X**	There will be site-to-site differences. There would be some regional differences in content and topics, but there should be no regional differences in general training requirements. Some of the NERC functional definitions need more detail (who is the transmission operator, interchange authority, reliability authority, etc.).	We agree.
Theodore G. Pappas		**X**	No Comments	
Thomas Bradish		**X**	I believe that regional differences should be handled in the content and design of the entities training program.	We agree.
Alan Gale		**X**	Minimum standards should be minimum standards. If a region needs something beyond that, it should become a regional requirement.	We agree.
Mark Heimbach	**X**		My perspective is one of a Generator Operator, which operates in four different Reliability Councils (centralized dispatch generation control center with control of multiple generation assets in multiple regions). Each Council has unique differences that must be accommodated.	We agree. That is why the approach to the standard will be to require a systematic approach to training. The standard will be focused on following a valid process, but every organization will need to determine its own training needs based on the tasks its personnel perform.
Howard Rulf		**X**	No Comments	
Ken Goldsmith		**X**	No Comments	
Gerald Rheault		**X**	No Comments	

Commenter	Yes	No	Comment	Response
Richard Kafka Michael Maher William Mitchell David Thorne Vic Davis Val Hildebrand		**X**	No Comments	
William Smith		**X**	No Comments	
Michael Calimano		**X**	No Comments	
Raj Rana		**X**	However, some of the Regions and RTOs have separate training requirements for their members, which may or may not go beyond those proposed by this Standard. It is our belief that Regions and/or RTOs should be allowed to have more stringent requirements if they so choose, but should not be allowed or granted exceptions from this proposed NERC Standard if they desire weaker requirements. Further, we encourage the Regions and RTOs that have additional training requirements, to structure their requirements such that credit hours counted towards meeting their requirements could also count toward meeting the proposed NERC Standard requirements. However, we would be opposed to diluting the proposed NERC Standard in order to meet a Region's or RTO's lesser requirements. To clarify by example, if the proposed NERC Standard required 32 hours of emergency training and a Region or RTO required their members to have 50 hours of emergency training, we would want the Region and RTO to structure their requirements such that once completing the Region/RTO's 50 hours of emergency training, that 32 hours of that training also met the requirements of the proposed NERC Standard regarding emergency training. That is, the method of determining what is required in order to officially count an hour as a credit towards meeting the Region/RTO requirement needs to be at least as strict as the NERC requirement for what counts as an hour of training.	We agree. All types of training will need to follow the proposed standard process and meet the same requirements. Regional specific or company specific training requirements should be developed as per the standard and would thus meet both requirements simultaneously

5. Do you believe it is practical to implement the proposed standard with the existing staffing levels?

Drafting Team General Response to Question 5

This question was designed to garner the opinions of the respondents based on 1.) their current staffing levels, 2.) their understanding of the SAR, and 3.) their estimate of how many personnel they would need to add.

The drafting team does not intend to take issue with any of these opinions. Indeed, the actual requirements for both operating and training staff will depend on many factors, most notably the number and types of tasks that the operating personnel perform. Organizations will need to conduct some type of job and task analysis to identify those tasks (or use the one completed by the Personnel Subcommittee and included in the Training Standard, followed by a training needs assessment), and only then will they know what kind of staff, and how many are needed.

The training standard will not define staffing levels. Rather, it will define a training process that you would use to determine what staffing levels are required to support good training practices. If a well-defined process of developing training is used, as intended by this standard, each organization would use a systematic process to determine what training is needed, how it should be delivered, and what staff levels may be required to support training adequately.

With regard to justifying any additional resources your organization might need to conduct effective training, if your organization currently provides valid training that is needed to perform the jobs that may impact the reliability of the bulk electrical system, and can demonstrate that, then you would probably meet the proposed standard. If, however, you are not providing training for your system operators then the fact that you have not experienced a blackout to date is not a reliable indicator that your personnel are adequately trained.

The drafting team intends this general response to apply to all of the comments that follow. In most cases we have nothing more to add, and so we've left the response blank rather than just copy the same text repeatedly. We did respond to some comments for which this general response does not apply.

Commenter	Yes	No	Comment	Response
Anthony Giasi			A reasonable standard is needed, however, additional training personnel, training infrastructure, training documentation, training funding, etc would be required to train all "system personnel" as indicated in the SAR.	The revised SAR and standard do not specify staffing levels, facilities, or funding requirements. We agree that the organization must determine these as it sees fit to develop its training program and ensure that it provides adequate time for training. Also, the revised SAR does limit its scope to those system operators performing real-time tasks that directly impact the reliability of the Bulk Electric System. Support tasks and personnel will be addressed after some additional studies are completed.
Guy Zito Kathleen Goodman Ralph Rufrano Greg Campoli Pete Lebro Roger Champagne Khaqan Khan Al Adamsom David Kiguel Robert Pelligrini David Little Brian Hogue Jerry Mosier			Administrative duties related to audit. Additional Operating Room personnel due to out of control room activities.	The revised SAR and standard do not specify staffing levels, facilities, or funding requirements.
James Stanton			It might be doable if as many control areas as possible were consolidated, which would mean fewer people to train. If existing control areas continue to exist in their current number, then no, a training standard could not be implemented at current staffing levels.	
John Neagle			Associated Electric Cooperative Inc. responds to this question with a qualified no. As stated above, the SAR does not contain sufficient detail to positively determine required staffing. If the standard developed from this SAR is applicable to all the entities indicated on Page SAR-2, a 15 - 20% staff increase in affected areas could conceivably be necessary for Associated Electric Cooperative Inc. to comply. It is unlikely Associated's customers would appreciate or understand rate increases to fund such a training program that would do nothing to decrease the number of blackouts they have experienced (0).	The revised SAR and standard do not specify staffing levels, facilities, or funding requirements. We agree that the organization must determine these as it sees fit to develop its training program and ensure that it provides adequate time for training. Also, the revised SAR does limit its applicability to those system operators performing real-time tasks that directly impact the reliability of the Bulk Electric System. Support tasks and personnel will be addressed after some additional studies are completed.

Commenter	Yes	No	Comment	Response
Karl Bryan			It takes manpower off of the workbench in order to go through a certification training process. I would suspect that there will be some staff that require more remedial training than others. With the present shortage of staff at most facilities, it will be difficult to accomplish all of the required training in a timely manner without increasing staffing.	
Karl Tammar Dale McMaster Ed Riley Sam Jones Peter Henderson Peter Brandien Bill Phillips Bruce Balmat Charles Yeung			Each location would have different requirements. In general, there would likely be an additional person needed for every 5-10 people subject to this standard (to maintain the program, coordination training and provide relief for workers to participate in training, etc.). In addition, each organization subject to this standard would need a person for each occupation (for perhaps a year) to develop the program and get it started. A simulator requirement would add workload (setup, maintenance and running scenarios).	
Kathleen Davis Jeff Newsome Rick King			When you consider the additional training requirements that will probably come out of the standard I foresee a need for additional staffing in both the system personnel side of the business and on the training side of the business. We need an industry standard for staffing levels that applies across the board for the functional responsibility. It would be prudent to develop a training standard that stipulates the minimum requirements to satisfy training for system personnel, versus taking the approach to identify the best approach. This will minimize the impact on the staffing levels for both training and staff personnel.	
Peter Henderson			Each organization would have different requirements. In general, there would likely be additional staff required in many of the organizations to meet this standard (to maintain the program, to coordinate training, and to provide relief for staff to participate in training, etc.) In addition, each organization, subject to this standard, would incur start-up costs associated with developing the process. A simulator requirement would add workload (setup, maintenance and running scenarios), etc. The extent of increased resources cannot be determined until the details of the standard are available.	

Commenter	Yes	No	Comment	Response
Theodore G. Pappas			The response depends on the final product. If it is a very formal and rigid plan, similar to the nuclear industry, additional staff will be required.	
Thomas Bradish			My guess is that it will increase our staffing requirement in order to send dispatchers to training. It will certainly mean additional record keeping.	
Alan Gale			We anticipate that at least 2 additional "trainers" will be needed. In addition to the additional work load to support the training, and the research, and the administration required to become a NERC Certified CEH provider, the qualifications of these personnel is not yet known. There is no clarification as to what "competent in both knowledge of the subject and instructional capabilities" really means. These words seem to lead to the conclusion that we will have to hire outside agencies of ex-utility workers that have become trainers. Additional System Operators will be needed to adequately support the targeted hours and still be able to cover minimum vacation and sick time. Additional trainers and Operators will be needed each year to satisfy Item 6 "Staffing level adequacy needed to improve the quality and quantity of training." This statement also seems to go beyond the goal of setting minimum standards. It also goes beyond the Purpose/Industry need of "adequate". We will need more and more every year.	
Mark Heimbach			I have no training staff so it would be impossible to design/implement formal training just for my group without additional staffing/expenditures. However, we do participate in all "pool wide" system operator training that is offered in MAAC and MAIN (via PJM) and applicable to Generation Operators. This is the type of training I would depend on to meet the requirements.	
Howard Rulf			No comments	
Ken Goldsmith			I believe it will require more personnel dedicated for the training function alone, which may be difficult for the smaller organizations.	

Commenter	Yes	No	Comment	Response
Gerald Rheault			Manitoba Hydro foresees requiring at least 2 additional staff; one administrative representative to help maintain the documentation and for record keeping and at least one instructional designer to create/revise the training courses. This is an estimate only and is based on a control centre perspective only. The total impact on Manitoba Hydro may be more extensive depending on the finalized training requirements and what options exist to develop and target the requisite training. Program planning and training development is both time and staff intensive. Manitoba Hydro currently has difficulty maintaining its trainee program and ongoing staff training with the existing staff. Additional staff will be required to implement any new requirements to the existing training program.	
Richard Kafka Michael Maher William Mitchell David Thorne Vic Davis Val Hildebrand			At a minimum, we would need additional training personnel. It is also possible that training requirements would be so great as to require additional operating personnel	
William Smith			Staffing levels cannot be predicted until the requirements are specified. If this proposed standard mandates the hours required, this question can't be answered until we know the required hours.	

Commenter	Yes	No	Comment	Response
Michael Calimano			In the case of most organizations there will be a substantial operating staff increase required to provide operators with sufficient training time (6 crew shift rotations in place of 4 and 5 crew shift rotations). There will be an almost universal need to create or increase the size of training staffs to conduct continual Job Task Analysis, develop training modules for all tasks, continually validate and verify of individual training modules, and maintain of the "learning management system" (training plans/training schedules/progress assessment/documentation/records retention - all on an individual basis). This standard is being created to rectify the absence of existing staff levels sufficient to meet the in the training needs of system operators. If there were sufficient staffing, there would not be need for this standard. Operating or training staffing levels should be dictated as part of the standard. The individual entity should have the flexibility to determine the most effective mechanism to meet their particular training needs. Face-to-face training options require different staffing levels than a full e-learning approach.	

6. How and how often should training programs be reviewed for compliance with the standard?

Drafting Team Response to Question 6:

The industry recognized the need for auditing. Although the response is not unanimous, it does indicate a majority opinion with which the Drafting Team agrees. We have an existing compliance program that should be used to audit compliance with this standard just as we do with other NERC standards.

Commenter	Yes	No	Comment	Response
Total				
Anthony Giasi			Bi-annual basis.	
Guy Zito Kathleen Goodman Ralph Rufrano Greg Campoli Pete Lebro Roger Champagne Khaqan Khan Al Adamsom David Kiguel Robert Pelligrini David Little Brian Hogue Jerry Mosier			NPCC believes the training programs should be reviewed internally and self certified for compliance as required or at least yearly, with audits being conducted at least once every three years.	
James Stanton			The training program should be reviewed often enough to insure it remains aligned with current markets /regional design and adjust, if needed, to capture future market and reliability training needs.	
John Neagle			Associated Electric Cooperative Inc. suggests an annual self-certification to the appropriate Regional Reliability Council.	
Karl Bryan			The training programs should be accredited in the same manner and frequency as utilized in higher education. Nationally recognized auditing and once every 4 or 5 year recertification.	
Karl Tammar Dale McMaster Ed Riley			Every 3-5 years as part of normal compliance review. The organization's ability to meet the other NERC standards is a measure of the success of their	

Commenter	Yes	No	Comment	Response
Sam Jones Peter Henderson Peter Brandien Bill Phillips Bruce Balmat Charles Yeung			training program.	
Kathleen Davis Jeff Newsome Rick King			A mandatory compliance type review should be conducted every 4 years. This approach is consistent with similar utility training requirements. Each utility/entity should conduct self assessments on a more frequent time frame. This approach will minimize the impact on NERC and the industry when trying to audit training for compliance.	
Peter Henderson			The training programs should be reviewed internally and self certified for compliance as required or at least yearly, with audits being conducted at least once every three years.	
Theodore G. Pappas			The program should be self certified for compliance with audits on a biannual basis.	
Thomas Bradish			Can this reporting be handled similar to the CEU tracking for NERC certification? It will have to be tracked annually since most of the requirements will be annual requirements.	
Alan Gale			Reviews should be consistent with other standards.	
Mark Heimbach			Every five years.	
Howard Rulf			Every three years.	
Ken Goldsmith			No Comment	
Gerald Rheault			Each entity training program should be reviewed as part of the entity operational audit which is presently part of the NERC Compliance program. In the MAPP /MRO region this presently occurs every three years. Any program which was judged satisfactory at the last operational audit should not deteriorate to such a degree that the system is a threat to reliability in any three year window.	

Commenter	Yes	No	Comment	Response
Richard Kafka Michael Maher William Mitchell David Thorne Vic Davis Val Hildebrand			Self report via comprehensive questionnaire annually or every two years. Training audit team visit every 5 years.	
William Smith			Training Programs should be reviewed annually by the responsible staff. Entities should be required to Self-Certify annually. Every two to three years, the entity should undergo an on-site audit.	
Michael Calimano			Full training audit compliance should be included in the normal sequence of NERC functional organization audits. Compliance should be phased in due to the magnitude of the staffing and program development needs.	
Raj Rana			It should be similar to policies today. Specifically, annual self-certification and then as part of onsite audits every three years.	

7. Please enter any additional comments you have regarding the proposed SAR.

Drafting team response to Question 7:

The current NERC Continuing Education (CE) program is just one model that can be used to qualify good training activities. It is not the intent of this standard that all training must be NERC CE-approved training.

The intent of this standard is not to develop a "one-size fits all" program.

However, the standard should address a generic process that fits various functional entities. We, as an industry, have nothing in place to say that it is critical to train personnel that operate the bulk electrical system by defining what valid training is. This standard must establish a baseline for training validity. We have seen repeatedly that when we, as an industry do not train; we do have operating failures that impact our constituency. Entities that are doing valid training will likely not be impacted significantly by the standard. However, we as an industry have repeatedly taken the stand that we can and should regulate ourselves. If we do not have standards for valid training, we have not regulated ourselves.

The results of the system operator training study being conducted by NERC may well determine more specific requirements for system operating personnel.

James Stanton			The statement, Any person with access to a control room should be trained, from the blackout report, should be clarified. What kind of control room? Is this a control area? An RTO control room? A power plant control room? Also, there are essential pieces missing from the proposal, such as what are the goals of the training program? It is quite exhaustive in the elements of a training program but fails to explain what objectives are to be met. Beyond the broad goal of promoting the reliability of the Interconnections, what subject matter is envisioned to fall into the recommended elements that would be applicable to all the Reliability Functions to which it is intended to apply? A good example is simulator training. Simulator training on what? The current proposal is so overly broad as to be unworkable. More explanation of the goals of the training program and the applicability to the Reliability Functions must be presented. This is too important a subject to apply the broad brush of a one-size-fits-all Training Standard.	Please refer to our Responses to General Comments above. In regard to "any person with access to a control room", the revised SAR does limit its applicability to those system operators performing real-time tasks that directly impact the reliability of the Bulk Electric System. Support tasks and personnel will be addressed after an additional study is completed.
John Neagle			Associated Electric Cooperative Inc. reiterates its comments above that a training standard should address the desired outcomes and should not detail the methods to achieve those outcomes. Prescriptive requirements for facilities, tools, materials, funding, staffing levels, methods, etc. should not be included. These details are best determined by and should be left to the discretion of the individual company. Associated Electric Cooperative Inc. respectfully requests the Standards Drafting Team fully and carefully consider the industry's comments submitted in response to publication of the System Operator Certification Program Administrative Guidelines. Special attention should be given to the comments regarding the number of training hours (CEH) required.	It appears that the Drafting Team did not provide sufficient explanation with the initial SAR about the approach it was taking to writing the standard. The revised SAR includes considerably more explanation. Also, the revised SAR includes many changes in response to comments. We ask the respondent to review the revised SAR and comment, hoping that the revisions and additional explanation about our approach will satisfy some of the respondents concerns.

Alan Gale			5a. "support staff" needs to be clarified. If the position does not need to be certified, why do they need to fall under this requirement. Are we saying that the training requirements of their respective professional certification (i.e. PE) is inadequate? The same can be said of "management". 8a. Why does a companies training plan have to adhere to the CE program? There is no discussion here of how to maintain certification. In fact it is patently obvious that it was intentionally avoided. Is the goal of this to have quality training or further the CE programs viability? Why can't all the training requirements be in	The revised SAR does limit its applicability to those system operators performing real-time tasks that directly impact the reliability of the Bulk Electric System. Support tasks and personnel will be addressed after some additional studies are completed. The scope of training is much broader than the NERC continuing education. The Continuing Education (CE) Program was set up to provide a method for certified system operators to maintain their NERC certification by receiving training that applies to their job more than the current method for recertifying, which is to re-take the same exam they took 5 years ago. The NERC Board of Trustees wanted the CE Program to be an established

			one place? 8b. Approval and revocation processes for what? Being a CEH provider or certifying my training program? Compliance monitoring should be sufficient. Why is a separate process needed? The CEH process already contains a system for approval and revocation, it's duplication here will increase administrative work load unnecessarily.	and proven program before tying it to recertification. The Personnel Certification and Governance Committee (responsible for the integrity of the system operator certificate) is in the process of initiating recertification through continuing education. That is outside the proposed training standard, although the training standard must be sufficiently comprehensive to provide for it. Training must go beyond certification in providing a protocol that ensures that system operators receive the training they need for their specific job.
Mark Heimbach			Some random thoughts: Although we do operate in several Reliability Councils and I admit there are clearly regional differences, the minimum standard should be global so I don't have to meet different minimum standards. The training should be web/computer based so it is available during back shifts. The training needs to be geared towards the responsibilities. For example, the minimum level for Generator Operators need not be at the same level as that of Reliability Coordinators. The costs should be spread across all market participants because the entire market benefits from reliability..	We agree. That is why the approach to the standard will be to require a systematic approach to training. The standard will be focused on following a valid process, but every organization will need to determine its own training needs based on the tasks its personnel perform.
Howard Rulf			All training should not be required to be in the NERC CEH program.	It will not be in the training standard.
Ken Goldsmith			Somewhere the standard should encourage/recommend that the Regions should form Training Groups to promote uniform training throughout the regions. This will help promote a better understanding of operations, by all the parties.	The Drafting team agrees with the business sense of this suggestion, but resource utilization is outside the scope of the training standard.

Standard Authorization Request Form

Title of Proposed Standard	System Personnel Training Requirements
Request Date	2/8/2006

SAR Requestor Information		**SAR Type** (Put an 'x' in front of one of these selections)	
Name	NERC Personnel Subcommittee	☒	New Standard
Primary Contact	Earl Cass, Chair NERC PS	☐	Revision to existing Standard
Telephone	605-882-7550	☐	Withdrawal of existing Standard
Fax	605-882-7453		
E-mail	cass@wapa.gov	☐	Urgent Action

Purpose/Industry Need (Provide one or two sentences)

A training standard is required to set the minimum acceptable requirements for the development, implementation and maintenance of initial and continuing System Personnel Training programs.

This standard is needed to help insure that System Personnel performing operating tasks in real time are provided with an adequate amount of training in order to promote the Reliability and Adequacy of the North American Interconnections and their bulk electrical systems.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies by double clicking the grey boxes.)*		
☒	Reliability Authority	Ensures the reliability of the bulk transmission system within its Reliability Authority area. This is the highest reliability authority.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time
☒	Interchange Authority	Authorizes valid and balanced Interchange Schedules
☒	Planning Authority	Plans the bulk electric system
☐	Resource Planner	Develops a long-term (>1year) plan for the resource adequacy of specific loads within a Planning Authority area.
☐	Transmission Planner	Develops a long-term (>1 year) plan for the reliability of transmission systems within its portion of the Planning Authority area.
☒	Transmission Service Provider	Provides transmission services to qualified market participants under applicable transmission service agreements
☐	Transmission Owner	Owns transmission facilities
☒	Transmission Operator	Operates and maintains the transmission facilities, and executes switching orders
☐	Distribution Provider	Provides and operates the “wires” between the transmission system and the customer
☐	Generator Owner	Owns and maintains generation unit(s)
☒	Generator Operator	Operates generation unit(s) and performs the functions of supplying energy and Interconnected Operations Services
☒	Purchasing-Selling Entity	The function of purchasing or selling energy, capacity and all necessary Interconnected Operations Services as required
☒	Market Operator	Integrates energy, capacity, balancing, and transmission resources to achieve an economic, reliability-constrained dispatch.
☒	Load-Serving Entity	Secures energy and transmission (and related generation services) to serve the end user

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check boxes for all that apply by double clicking the grey boxes.)*	
☒	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box by double clicking the grey area.)*
1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes
3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes
5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft, modify, or withdraw a Standard based on this description.)

Introduction

The public comments to the latest standards authorization request for the NERC Training Standard revealed that the SAR did not explain adequately the intent of the proposed training standard nor the concepts upon which that standard would be based. This response provides more detail, and includes a SAR revision that should provide greater comfort to those who identified key issues with the first draft.

The SAR drafting team noted three common concerns among these comments, specifically that the standard would:

1. Unduly prescribe the details for training programs,
2. Cover too broad a range of operating personnel, and
3. Require a "one size fits all" approach to training

The comments also indicated some confusion surrounding the separation and interdependencies of training, personnel certification, organization certification and continuing education, which we will clear up as well.

This latest response to the public comments is divided into four sections:

1. General explanation of the concepts of the standard,
2. What the standard ***does not*** cover,
3. Responses to the three common concerns listed above, and
4. Responses to all other comments.

In response to comments received on the first SAR for a training standard, the SAR drafting team has determined that:

1. More explanation is needed to the industry regarding the approach planned to write a training standard.

2. The scope of the initial training standard should be limited to the initial training of new staff and the continuing education of existing staff performing operating tasks in real-time that directly impact the reliability of the Bulk Electric System (BES). The Personnel Subcommittee (PS) is in the process of conducting an Operating Tasks Analysis. Operating tasks that impact reliability are already known, but the Operating Task Analysis will identify who performs those tasks, and thereby clarify the target audience for the initial Training Standard.

3. The initial training standard will not cover operations support

personnel because we will not have adequate data to include those tasks performed by support personnel that can directly impact reliability. After completion of the Real-Time Operations Task Analysis the Personnel Subcommittee will conduct an Operations Support Task Analysis to determine who and which tasks performed can directly impact reliability. The initial training standard need not be delayed for the second round of tasks analysis to identify support tasks, and is targeted for completion by mid-May, 2006.

4. In the section on page SAR-2 above titled Reliability Functions, the drafting team has checked several functional entities that may or may not end up being covered by the standard. The Personnel Subcommittee is conducting a Task Analysis to determine those tasks performed by operating personnel in real time that directly impact reliability. The results of that study will shed further light on the functional model entities that might be covered by this standard. However, that study will not, and cannot be all inclusive, so there will still be some responsibility on organizations to recognize real time operating tasks their personnel perform that directly impact reliability that may not be on the list from the study. The Functional Model entities is not a perfect system for identifying tasks that impact reliability, and the drafting team has therefore decided to use a task-based approach to identifying who directly impacts real-time reliability. The drafting team does not and cannot know the Functional Model entities to which this standard will apply because the Functional Model is the wrong thing to use to identify tasks that directly impact real time reliability.

5. The target for completion of this second round of tasks analysis will be mid summer, 2006, with amendment of the Training Standard to be done in fall-winter 2006 to include persons performing support tasks that directly impact reliability

This approach accomplishes several objectives that have been expressed as concerns by the industry.

1. It puts a training standard in place for the highest priority personnel – those that directly operate the BES - in 2006.
2. It bases the training standard on tasks known to directly impact the reliability of the BES using Task Analysis data that has been gathered by a proven and widely accepted approach.
3. It supplies the industry with tasks analysis data that will serve as a foundation for performance requirements required to determine competency gaps. This is of particular benefit for the smaller entities that may not be able to afford a full Job Task Analysis. The PS and Standard Drafting Team are conducting one for them. Some additional amount of assessment will be required by specific entities to determine the training their employees in particular need, but the brunt of the more costly needs assessment process of a Job Task Analysis will have been done for

the industry for the tasks of highest priority to reliability, with a commitment to immediately follow-up with other studies to address support tasks in a legitimate way.

4. It establishes a systematic approach to training as the norm for the industry. This is critical to achieve measurable results from training, and at the same time provides the most flexibility for the industry to determine training needs for their specific jobs. Training results must be measured as required competency. Required competency cannot be measured without taking a systematic approach to developing training, which includes determining the competency required by tasks and the existing competency of employees. It is the elimination of the gap between competency required and existing competency that is the goal of training, and is what can and must be measured to validate that competency has been achieved through training. Specifying a number of training hours does not guarantee that competency will be achieved. Competency-based training is the most critical requirement of any legitimate training program, and this approach to a training standard ensures that the process required to deliver competency will be followed.

The Concepts of the Training Standard

The goal of operator training is to develop *competency*, which is "the ability to do something well or to a required standard."[1] Competent system operators understand the tasks they are expected to perform and how to do those tasks. They also understand the reliability standards to which they and their organizations are held accountable. The organization, in turn, must design and implement its training program to ensure this competency. The proposed NERC training standard includes the requirements for these training programs.

While training on its own won't ensure competency, it is a necessary ingredient for developing system operators who are competent—at what they do. System operators gain expertise through on-the-job training structured and executed according to this standard. However, on the job training not structured and executed in accordance with a systematic approach to training is seldom complete enough to ensure that system operators understand *why* their actions produce certain outcomes. Furthermore, unstructured training does not ensure that system operators will be able to deal with novel situations or simultaneous events they have never experienced. The failure to recognize that "the perfect storm" was brewing was one of the root causes of the August 2003 blackout and the subsequent requirement that all system operators receive at least five days of training annually in emergency operations.

Approach to Developing A Training Standard

[1] Source: Encarta Dictionary

The approach of the revised SAR for a training standard is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. To provide for flexibility is not a compromise on quality of training. Quite the opposite. Quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. Using this process, an organization can identify training needs and deliver quality training that eliminates competency gaps. Not using this fundamental process for training, or leaving out any step in the process, will not produce training that can validate competency required for job performance.

The primary purpose of training is to produce competency where a gap exists between ability (or performance required for the job) and the existing competency of a person performing that job. A systematic approach to training starts by determining performance requirements. You must know what performance is required before you can say the capability to perform exists or not. Determining performance requirements simply means knowing what a person is supposed to be able to do, and is only the first step in determining and delivering training that produces needed competency. Once you know what is supposed to be done and how well (performance requirements), you must then determine the existing level of competency of personnel performing those tasks. The process for determining the difference between required competency and existing competency, which is a competency gap, is termed training needs assessment.

Valid training is the result of a systematic approach to identify performance deficiencies and correcting the lack of ability to perform with valid training. Training, when done using a systematic approach, cannot guarantee competency, or the ability to perform. However, training, without attention to other performance factors such as tools, procedures, etc. required to do a job cannot make performance happen.

The approach to a training standard could be to select a list of topics that must be covered and a specific number of hours per year of training. That approach would not guarantee competency. Learning might occur, but whether or not the right learning occurred (leaning required to perform tasks) would be unknown without a method for validating learning. That is the principle of the systematic approach to training – training is a process that, without each of its critical elements, cannot guarantee competency. Without competency performance will not occur as desired.

To expand on the approach being proposed by the revised SAR, the approach will be based on the fact that developing and maintaining an effective training program involves a number of steps:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it

directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.

3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

When all of these steps are correctly applied, training will be able to validate competency. The omission of any step means that the training cannot guarantee the desired competency. The training standard includes all five of these steps, and measures compliance by requiring documentation that these steps were performed. If the process is followed credible training will result. If the process is not followed, the needed learning may not occur.

Requirements the Training Standard Does Not Include

Does not specify the number of hours of training the organization must deliver, with one exception: that every system operator must receive at least 32 hours of training in emergency operations. This training was specifically required in NERC's original recommendations following its initial investigations into the August 2003 blackout and the drafting team agrees it must be in the training standard until data substantiates another number.

Does not specify who must be trained. That's the purpose of the job and task analysis. The Personnel Subcommittee (PS) is conducting a job and task analysis to provide the industry with a solid base of tasks that impact reliability. (See text box at bottom on Determining Tasks.)

Does not list the training subjects that must be taught. The subjects must be germane to the tasks that the system operators perform, and these are revealed through the job and task analysis. Even though the PS is supplying the majority of operator tasks that directly impact reliability, the list is neither complete nor does it list specific training subjects for an organization. A needs assessment must still be conducted by each organization to determine the training needs of their personnel.

Does not require operator certification or specify who must be certified. NERC certification of personnel is not covered by this standard.

Does not specify how many hours of NERC continuing education a system operator must have for renewal of a NERC certificate.

Does not require a specific number of training staff. The number of

qualified training staff is a function of training needed to maintain qualified operating personnel, which must be determined by each organization. Staffing with qualified personnel to operate is a responsibility of each organization impacting the reliability of the BES.

Does not require an operator training simulator, though it does require simulation training as part of the training in emergency operations, the standard must certainly encompass training using simulators

Does not accredit training programs. If the systematic approach to training is followed, training programs will be credible and produce the desired competency.

Determining tasks

The proposed training standard will require every organization to determine the tasks that its operating personnel perform. This is accomplished through a task analysis or a job and task analysis (JTA). Organizations with long-established training programs conduct JTAs whenever needed to ensure their training programs include the proper content. But most organizations, especially those who do not have their own training programs, probably don't perform JTAs.

The proposed standard does not require the organization to perform a formal JTA. It does require the organization to explain how it identified the tasks for which its training program was designed.

To help the industry identify these critical operating tasks, the NERC Personnel Subcommittee is conducting three studies. The first study determined the competencies of excellent operators. The second will identify the tasks done by operating personnel that directly impact reliability. The third will identify tasks performed by support personnel that directly impact reliability. The results of the first two studies will be factored into the initial training standard. In late 2006, the study of support personnel tasks will be included in a revision to the training standard. Organizations may use this "generic" JTA to identify those operating personnel who must be included in their training program, but they must conduct a training needs assessment to determine the specific training needs of their personnel.

Proposed Training Standard Development Timeline

Feb 9 – Send updated SAR, timeline, and response to comments to SAC and NERC staff for posting and to SAC along with brochure

Feb 14 – Conference call with SAC to discuss the updated SAR, response to comments, and standard and ask for approval for the SAR drafting team to move forward as a standard drafting team
– Ask SAC to post updated SAR and response to comments

Feb 14 – March 16
- PS Members disperse brochures to their industry contacts
- Promote and educate managers or those in voting/commenting positions
- Use speakers notes/presentation

By end of February – Piloting test JTA instrument

March 15& 16 – John Taylor/Geoff Elmer present proposed standard to the OC to promote management support and ask for support for proctored workshops

April 11 –
- Group responds to industry comments on SAR after 30 day posting
- Send SAR response to comments to SAC and post
- Request SAC permission to post standard without completed task list
- Send draft standard to SAC for public posting and first round of comments 45 day comment period

April 17–28 – Proctored JTA Workshop East

May – Comments on draft standard gathered and responses compiled

May 30–June 9 – Proctored JTA Workshop Central

June 5–9 – Proctored JTA Workshop West

June 13 – Start designing survey instrument to gather info on operations support staff in the industry
– Data gathered from initial JTA workshops and analyzed

August PS – Respond to comments on training standard draft posting and adjustments made to draft standard and JTA attachment included
–build timetable for proctored workshops in the 4th quarter of 2006
– Submit second draft for second posting and comments

October PS – Respond to comments on second draft posting and submit to SAC with recommendation for balloting
- Complete voting by end of December 2006
- Continue work on SAR for support staff and JTA plans

November – Proctored JTA workshops for support staff

December – Respond to negative votes with comments if the standard does not pass first time. Post for second ballot

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☒ No

Comments

where is this information?

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☐ Yes

☒ No

Comments

the information should be provided in order to make an assessment.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☐ Yes

☒ No

Comments

Not in the form of the rejected SAR Draft.1.0 323825

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments
The Draft SAR 1.0 323825 is missing sections R9,10,11,12,13 and 14.
I think that this initial SAR should limit itself to those performing operating tasks in a real time or day ahead time frame.
As is the SAR is too encompassing and requires resources that are not available and may be unrealistic to support if drafted by many entities throughout the country.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

This should work if the requirement for a training plan that addresses "knowledge and competencies required for reliable system operations" remains in place (PER-002-0, R3.3).

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☒ Yes

☐ No

Comments

The SES believes that a Task Analaysis is the correct approach.

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☒ Yes

☐ No

Comments

The SES believes that this is the correct general approach but notes two concerns: 1) The drafting team is directly differing from the Functional Model. While there are many problems with the Functional Model, and NERC has already determined that differences between a requirement in a standard and the definition of the Functional Model will be resolved in favor of the standard, the SES prefers a more coordinated approach. 2) The detail of the tasks may result in some organizations with a very small set of tasks for which they must meet the personnel training standard.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

The SES notes that this is an excellent approach, but cautions that neither training programs nor personnel certifications nor qualifications are a guarantee of reliability.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

The SES believes that it is appropriate to begin the development of training standards with those most affecting the real-time relaiablity. The SES also believes that it will be very difficult to develop training standards for personnel involved in longer range planning. It is an inherently different process, involving group efforts and cycles of review, that tends to identify strong and poor performers. There are general requirements for educational level and subjects, training in the tools of trade and the general processes used in loger range planning, but it difficult to conceive of a training program that could provide asssurance of "good planning."

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

We agree with this approach. We value the certification of operators, and the certification of personnel who perform support tasks such as engineering, management, and technical services.

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☒ No

Comments

The wording here is a little ambiguous. Is it being proposed that the SAR Drafting Team identify and analyze the critical tasks associated with grid operations, and then each participating organization will determine within their unique structure who performs these critical tasks?...Then these identified personnel would fall under the auspices of the new standard?

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☐ Yes

☒ No

Comments

Once the tasks that "directly impact reliability of the BES" are identified and analyzed, each participating organization would be in the best position to decide which individuals would need to comply with the standard.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

We agree with the SAT philosophy for determining training requirements. However, the description provided in Step 1 above prescribes strict adherence to the following model: Job Analysis, Task Analysis, Needs Assessment. At the risk of getting into semantics, the understanding of these terms is pivotal to successful training: (1) Job Analysis, i.e. identifying tasks associated with a job, and determining these task's (DIF) Difficulty/Importance/Frequency (2) Task Analysis, i.e. analysis of each of these tasks to identify the knowledge/skills/abilities involved, (3) "Needs Assessment" (aka Needs Analysis) regarding each task to identify/solve gaps between performance desired and existing performance.

We would challenge the Drafting Team to consider the possibility that thorough analysis can be performed correctly in a number of ways. For instance, many reserve the right to go no farther in the analysis process than the DIF determination, which

may reveal that the task is so simple (or so prescriptively proceduralized), or that is so unimportant (from a stability or reliability standpoint), or is done so frequently that the likelihood of excellent performance is very strong, that no further analysis is indicated.

In addition, flexibility is often provided to analysts to allow the use of Needs Assessment first, which may preclude the need for JTA at all. For example, if a performance deficiency is detected, Needs Assessment may determine that this problem occurred because of a procedure deficiency, human factor shortfall, or other non-training related challenge. The correct intervention could be a job aid, procedure revision, or better lighting. IF there is a knowledge or skill deficit, THEN a JTA may be performed, learning objectives designed, and coursework developed.

In summary, we believe that the Systematic Approach to Training is an excellent process, but that this standard should not prescribe the absolute sequence or order of its application.

Finally, the term "assessment" in item 5 above has a broad range of meaning. Do you mean that the trainee must be assessed (i.e. evaluations or examinations)? Or do you mean that the evaluation process needs to be assessed for effectiveness (or audited) periodically? Or do you mean that the improvement in personnel performance (because of training) needs to be measured or assessed via some pre-determined metrics?

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

NPCC participating members believe the scope of the SAR should be limited to the tasks directly impacting the reliability of the Bulk Electric System. It is not entirely clear to whom this standard will apply.

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☒ No

Comments

NPCC Participating members, although believe it is a laudable approach to allow the Operating Tasks Analysis to determine what and who the training program should address, the Standard should be initially directed at those who have direct control or those that have supervisory control to implement actions that may impact reliablity of the system.

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☐ Yes

☒ No

Comments

Many participating members of NPCC, although recognizing that this effort stems from a blackout recommendation have noted that the SAR seems vague, seems unmeasurable in a meaningful way and questions the overall need for a standard. Perhaps a guideline may be more appropriate.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

If in fact a standard must develop then the NPCC participating members believe that the systematic approachful would be useful however it must be stressed that the individual organizations that must perform the training and show their affected employees must demonstrate a level of competancy than they must be afforded the latitude to tailor their training programs to accomplish this. How does one apply a metric to competency?

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

The NYISO agrees with the SAR drafting Team's approach to limit the scope of the standard to the area of "real time operating tasks" and to require a systematic approach to training. However, the SAR as written is too vague with regard to whom the standard applies. If the standard is meant to merely apply program method, a standard is not required - a definintion of what is intended by the existing requirement for "coordinated training" will do.

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☒ No

Comments

A national "Operating Tasks Analysis" can provide a useful baseline reference on the topics training programs should address in assuring a base competency of operating personnel in North America. However, prior to the completion, review and evaluation of the task analysis project, it is premature to formalize a training standard based on that foundation. At the present time, if a training standard is needed, it should clearly be applied to those functional entities that are under compliance and certification requirements - RC, BA and TOP.

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☒ Yes

☒ No

Comments

The NYISO does agree that the proposed systematic approach to training will be helpful in developing effective training programs. The need for a North American "Operations Support Task Analysis" to define training which personnel or which organizational entities are required to comply with the training standard not clear. In the mandatory standard environment, each entity responsible to comply with NERC standards, will train operations staff to comply. Extending the standard to cover "support" tasks should be a secondary consideration, if it is necessary at all.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☒ No

Comments

The NYISO agrees that a requirement of a "systematic" approach to training will be a benefit to the industry. However as mentioened before, simply putting this as a standardf requirement without (a) some mention of topics to be included in the training program, and (b) a sense of how the requirement can be measured will render the standard too vague, which bring into question the need for such a standard.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☒ No

Comments

The NYISO agrees that each entity should determine their own specific training needs and the methods to address those needs. If there is to be a benefit of a NERC training standard, such a standard should define a consissitant set of topics which need to be addressed across the industry, regardless of size, location or organizational structure.

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

The NYISO agrees that the systemaic approach to to training based on local needs and tasks is move that will benefit the reliable operation of the BES. However, the standard needs to be developed with a manageable scope, clearly defined measures of compliance, and it should contain an outline of topics that would insure consistancy in both the method and the content of operations training across the industry.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

Yes, the NERC Certification Program already includes a list of required continuing education topics. Additional NERC training documents developed to influence and support the known training tasks from the NERC task analysis, would be good to support the standard, but not to measure the standard. These documents would be created separate from the standards and would be added to the existing NERC training documents.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

The standard should provide a time specification and allowance for implementation of the standard. Putting future continuing education training materials and programs into format will fall into place more readily than the existing initial training program materials already in place by most entities. Re-development of these programs, especially if requiring additional staffing to handle development and delivery methods, would require more time to implement for existing progression programs.

Comments

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☒ Yes

☐ No

Comments

However, NERC needs to seriously address the accuracy and usability of the Functional Model.

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☒ Yes

☐ No

Comments

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

The concern we have with a "systematic" approach is training that is required in areas where Operator exposure in real time is sporadic (e.g. disturbances, restoration, frequency arrest, voltage collapse) may be sacrificed. A "systematic" approach in our view will tend to concentrate more on supporting daily operating functions, and ignore keeping Operators familiar with abnormal operations which is critical to maintaining the BES. Unfortunately a "systematic" approach has challenges in the compliance world whereas a specific number of hours is measurable and can easily fit in the compliance world.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

It appears that this SAR is not a new standard as checked under SAR type on SAR-1 but is actually a revision to existing standard PER-002-0. The PER-002-0 standard would appear to be redundant and not needed after this standard has been developed. We are very pleased about the NERC Personnel Subcommittee's interest and efforts to clarify and develop standards concerning training of support personnel. We also applaude the responsiveness of the System Personnel Training SAR Drafting Team to the initial concerns with the first draft of the SAR.

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☒ No

Comments

We don't disagree with the concept but asking for endorsement of the "Operating Tasks Analysis" that has not been published or included for review with this SAR seems inappropriate and premature in the development of the standard itself especially if it will be used to "determine which types of organizations will be required to comply with the standard".

Need clarification on "type of organization" as this seems to be getting away from the registered entity concept.

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☐ Yes

☒ No

Comments

Need clarification on "type of organization" as this seems to be getting away from the registered entity concept.

The FRCC believes that efforts and resources should focus on "real-time" personnel standard at this time and should be closely coordinated and complementary to the developments of the PCGC and the new CEH Certification policy. Real-time personnel have the "primary" impact to the reliability of the BES and as such should be the focus of the standard. The development of any standards should at the very least, complement the Operator Certification process especially in terminology and overlapping of compliance "measures".

The PS scope with regard to "support personnel" needs to be limited at this time and not included witthin this SAR Further, we would propose to eliminate "support personnel" training scope completely from this SAR and initiate a "stand-alone" SAR addressing "support personnel" training.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☐ Yes

☒ No

Comments

The FRCC appreciates the tremendous efforts that have been undertaken in researching, addressing and developing training program improvement strategies for the industry with respect to BES system operator training. We also agree in principle that the "systematic" approach to developing training programs is the "best" approach for the industry as we go forward.

Having said that, we do have significant concerns with the proposed implementation track via the "training standard". Our concern lies in translation of these subjective training concepts, principles and approaches into "clear" and "measurable" compliance elements, if the standard were to proceed through the development process.

The SAR states that "the training standard includes all five of these steps (of the systematic approach), and measures compliance by requiring documentation that these steps were performed". The FRCC contends that the necessary documentation to demonstrate compliance of a valid "systematic approach" leaves too much ambiguity to become effective Reliability Standards, Measures.

As we further reviewed this issue, we have come to the conclusion that the Reliability Standard may be the wrong document to use to convey the requirements of a "systematic training program" to the industry.

We suggest that the "Training Standard" should proceed but with a slightly diferent approach. The evaluation /verification and accreditation / certification (for lack of a specific terminology) of an entity's "systematic training program" should occur outside the Reliability Standards and Compliance arena. The evaluation should also be performed by appropriate personnel who are qualified and knowledgeable in the training concepts to ensure accurate determination of adequacy of such programs. The "Training Standard" would then prescribe training requirements, by job function (ie. hours in relevant study areas as determined by competency evaluations), and based on JTA impacts on BES reliability.

On further reflection, we would also offer that such an approach will lend itself better to improving the overall quality of industry training programs than the proposed track of the standard. An evalation / accreditation process will re-focus the programs away from striving to meet the "minimum" documentation requirements of a "systematic training program" to a cooperative process geared to, not only evaluate the program, but perhaps serve as an opportunity to share industry-wide training "best practices".

Finally, in light of limited resources, this approach would provide the industry the greatest flexibility at achieving compliance to the "Training Standard" by allowing entities access to not only "in house" training programs but also access to external training resources (as long as they have been "accredited" as a "systematic approach program") to fulfill their training objectives.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

Some degree of self-determination is appropriate as long as it is based on an appropriate "Job Task Analysis".

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

We reiterate our concern with the development of a "support staff" training standard at this time. The NERC PS should focus its efforts on real-time operations of the BES at this time. Trying to get every entity to have a "Cadillac" training system is beyond the charge of establishing MINIMUM standards as stated in the SAR "purpose". Training programs for all the "support staff" in an organization would be a significant cost that may not significantly improve the reliability of the BES.

Introduction - Page SAR-5, item number 5. What process is an "ammendment of the Training Standard"? The word "amendment" is not used in the Reliability Standards Process Manual, Version 4 of 8/2/05. The SDT/PS should follow the approved process for modification and not attempt to create a new process by saying they are going to "amend" a standard when they can get around to it.

Finally, we want to reiterate our appreciation for the significant work of the PS and by no means are we suggesting it should be tempered or abandoned. We feel that the concepts, as described, do "need" to be delivered to the industry, we just don't concur that the "Training Standard" is an appropriate "systematic training program" evaluation and measurement vehicle.

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

For each of the proposed standards for real time operating tasks and support tasks, would the standard differentiate between the new hire who may need to be trained to perform all of the tasks identified to a specified minimum level of competency and the more experienced person who might need, on a periodic basis, to demonstrate that they can still perform at the minimum level of competency and perhaps also perform at a specified higher level of competency?

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☒ Yes

☐ No

Comments

Using the task analysis would be a good method for identifying who would be subject to the real time operating tasks standard. The approach suggests that if a person performs any of the tasks identified with "real time operating" that person's organization regardless of its functional model type would be subject to the standard. Would the standard apply to an organization if the person performed only one or two tasks or if an organization's understanding of what a particular task entails differs from the accepted task analysis prepared by the Personnel Subcommittee?

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☒ Yes

☐ No

Comments

While this could be an acceptable method for identifying support tasks that directly impact reliability the range of organizations that might be affected could be much broader and more difficult to assess. And the same question needs to be asked…what if an organization performs only one or two support tasks and what if those tasks are performed by different kinds of persons in a wide variety of organization types? Would any organization that had perhaps one person in one department and one person in another department who each performed only one or two tasks be subject to the standard?

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

The systematic approach is an excellent approach to developing training versus requiring a specific number of hours of training on specific topics.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

A standard that requires any given entity to determine its own specific training needs is preferable to one that prescribes or mandates training that might not be applicable to all organizations.

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

This is a much more labor intensive process. Arriving at an assessment that accurately measures a person's competency could be difficult to create or achieve, particularly in an organization with limited training resources.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☒ Yes

☐ No

Comments

Every effort should be made to examine and leverage exsiting work and efforts that are in place already and functioning well. In the PJM RTO, LCC and MOC operators have PJM training requirements that need to be met for initial operator and ongoing continuing operator training. These requirements were established by taking into account several factors. It is strongly desired that the NERC standard would align with and recognize the initiatives currently underway in PJM.

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☒ Yes

☐ No

Comments

The role of the support staff at the Transmission Operator should be the primary focus, with the role of the support staff at Local Control Centers being secondary since the local control center individuals support the Transmission Operator who is the ultimate responsible entity.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

Yes, this approach is critical to ensuring that the training is relevant and specific to benefit each organization.

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☒ Yes

☐ No

Comments

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☒ Yes

☐ No

Comments

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☐ Yes

☒ No

Comments

My concern is this approach will result in voids. I believe high level goals should be outlined by the SAR drafting team with the individual enitites providing the necessary traing to meet each goal.

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:
The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

We agree that the scope of the initial standard should cover training program pertaining to real-time operating tasks that directly impact reliability of the BES. However, the way this question is worded (…to persons performing…) and from the SAR as presented, it is not clear whether the proposed standard, even within the aforementioned scope, is intended to set requirements for:

(i) the entities that perform these operating functions to develop the needed training program for their operating personnel to acquire the competency to perform these tasks, or

(ii) the training program to cover a minimum set of topics that enables the operating personnel to acquire the competency to perform these tasks, or

(iii) both of the above or something else.

While we agree with the recommendation that a systematic approach be used to develop the required training program, and further recognize a training standard should not be overly prescriptive as different organizations (entities) may assign different/additional tasks to its operating personnel. We nevertheless believe that absent any specificities such as to whom the standards apply and a high level scope of the minimum tasks or task related topics to be covered by the training program, the need for having an industry-wide standard for personnel training becomes questionable.

In brief, the SAR as written fails to convey the essence of the requirements - to whom the standard apply and whether or not it is a process that is required, which we feel is too vague, or a minimum set of topics that need to be included in the training program, or both.

Regarding the applicability identified in the SAR:
For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☒ No

Comments

While we agree that the Operating Tasks Analysis can offer assistance in providing a focus on who and the topics that a training program should cover, the analysis itself is not a critical factor in determining which organizations or functional entities should comply with the training standard (assuming a standard on training program development is needed). Without prejudice to the yet to be made available Operating Tasks Analysis results, we feel that, as a first step, the standard should be directed to at least those recognized entities that must make decisions in implementing, approving or directing others to implement actions that have a direct bearing on system reliability.

At the onset, the functional entities that are required to have a training program should be the prime candidates to comply with such a standard. At present, the certification standards for RC, BA and TOP are being developed and expected to be posting for balloting. Each of these standards contains a requirement for the respective entity (organization) to have a training program and provide its operating personnel with training (e.g. Standard ORG-022-1). Given this requirement, it makes logical sense that a standard on training program development be also applied to these entities.

To require other entities for which an organization certification standard and the corresponding requirement for having a training program do not current exist or expect to be established in the near future would likely be challenged by these other entities. Moreover, the scope of the training standard would be too wide for effective development and compliance monitoring.

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☒ Yes

☒ No

Comments

We do not hold a position on whether or not the proposed analysis be performed since the priority at this time is to (a) determine the need for having a standard for the entities (or is it the personnel as the question implies?) that perform "direct" tasks, and (b) develop the standard. Extending the standard to cover entities (or personnel) that perform the "support" tasks should be a secondary consideration and, when pursued, can be built upon the structure and success of the initial set.

We agree that the systematic approach will help responsible organizations develop a structured and effective training program for operating personnel to attain the required competency to perform their tasks. We further recognize that the training standards should not be prescriptive as different organizations may assign different tasks to its operating personnel, and hence the standards should provide the flexibility for these organizations to develop the training program according to their specific needs, budget and resource considerations, etc. However, as mentioned earlier, simply putting this as a standard requirement without (a) some mention of the topics, even just at a high level, to be included in the training program and (b) a sense of how the requirement can be measured may render the standard too vague, which begs a question on the need for this standard.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☒ No

Comments

We agree that the systematic approach can help responsible organizations to develop a structured and effective training program to help operating personnel to acquire the needed competency to perform their tasks. However, as mentioned earlier, simply putting this as a standard requirement without (a) some mention of the topics, even just at a high level, to be included in the training program and (b) a sense of how the requirement can be measured may render the standard too vague, which begs a question on the need for this standard.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☒ No

Comments

We agree that each entity should determine their specific training needs. However, believe the standard needs to include at least a set of high level training topics to be covered by the training program. Commensurate with our proposal that the RC, BA and TOP are the entities to which this standard will apply at least in the onset, their operating functions are clearly defined in the functional model. There is no reason why some of the topics that reflect their operating functions should not be included, as minimum requirements, in the standard to ensure that there is consistent coverage in the training programs for the same function across the industry, regardless of size, location and organization structure.

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

We feel that development of a training standard is a step in the right direction in view of the recommendations of the 2003 blackout report and given the requirements to have certified personnel for some of the functional entities and these entities' responsibility to provide training. However, the standard needs to be developed with manageable scope, tangible requirements that can be measured, and with an aim to achieve consistency in training development not just in terms of the process but also in terms of the topics for the same function across the industry. In this vein, we offer the following suggestions for consideration:

a. The SAR to clearly convey to whom (entities) the proposed standard would apply. To limit the scope at the onset, we suggest the standard be developed for compliance by the RC, BA and TOP only.
b. The SAR to provide a high level description of the requirements, which should include (i) the use of a systematic approach to develop the training program and (ii) a high level scope of coverage of the training program. The tasks listed in the draft Organization Certification standards for RC, BA and TOP could serve to provide this coverage.

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☐ Yes

☒ No

Comments

This SAR continues to be overly broad, ambiguous and confusing. We are not sure but it appears the initial standard would require a process to be developed and not require training of anyone. Therefore this question is not appropriate at this time. We do agree that when the appropriate SAR is presented that the training standard should be limited to those persons performing real-time operating tasks that directly impact reliability of the BES.

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☒ No

Comments

We are not sure but it appears the initial standard resulting from this SAR would require a process to be developed and not require training of anyone. Therefore this question is premature, not appropriate at this time, and should be asked when the SAR for personnel training is presented to the industry.

However, at this time we will say we do not agree with the drafting team's approach. The standard that will apply to the personnel who perform real-time operating tasks should apply to those personnel performing the tasks, not to the organizations.

An organization that takes on responsibility for meeting the requirements of a standard may delegate the tasks to another organization to actually perform the tasks. The training standards should apply to the personnel actually performing the work for the second organization, not the second organization, nor the organization responsible for meeting the requirements of the standards.

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☐ Yes

☒ No

Comments

Our response to Question 2 above also applies here with respect to Operations Support Task Analysis, the personnel performing those tasks, and the applicable organizations.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

We agree that the standard developed from this SAR should expand on this SYSTEMATIC TRAINING PROCESS.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☐ Yes

☒ No

Comments

We are not sure but it appears the initial standard resulting from this SAR would require a process to be developed and not require training of anyone. Therefore this question is premature, not appropriate at this time, and should be asked when the SAR for personnel training is presented to the industry.

Also, we are not sure we understand the statement nor the question. An organization should be able to specify the tasks for which it is responsible. That specification of tasks is through being the functional entity responsible to meet the requirements of a standard, or through a delegation agreement.

An organization whose employees perform tasks to meet reliability-related real-time tasks should have a process to evaluate the competancy of its personnel and to train its personnel to perform those tasks. That process should evaluate the specific training needs of the employees performing those tasks.

Competancy standards should apply to the personnel performing the tasks, not to the organization.

A list of training topics may be included in the standard but they would apply to the personnel performing the tasks, not to the organization.

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

We commend the SAR authors for modifying the SAR based on comments submitted. However, we believe the authors have not modified the SAR enough. This SAR continues to be overly broad, ambiguous and confusing. The SAR contains a discussion of many issues but does not specify the requirements of a standard resulting from THIS SAR.

We are not sure but THIS SAR seems to be requesting the initial standard would require a process to be developed and not require training of anyone. We agree that the development of the process should be vetted through the industry standards developemnt process to obtain industry-wide comments. However, we think the development of a PROCESS rises to the level of being a STANDARD. We also think that the PROCESS of a training program is not really measurable, except in a very subjective sense, and will cause significant problems with audits and sanctions.

Also, after reading the SAR it is not cleasr which entity is being discussed: the corporation that needs to develop a training program, or the employee who may need training. If the SAR is discussing both the corporation and the employee then it is not clear which parts of the SAR apply to the corporation and which apply to the employee.

However, we do not think the industry participants should guess about the intent and/or content of a standard to be developed. Nor should we agree to march forward with a vague request for a standard and associated requirements.

The SAR contains a discussion of Job Task Analysis, Operating Task Analysis and Operations Support Task Analysis that will be performed. Then, based on those results something else will be done. We suggest another SAR be written and submitted when those analyses are complete. For instance, Item 3 states the task analysis will supply the industry with the task analysis data that will serve as the foundation for performance requirements required to determine competency gaps.

There is a section entitled Concepts of the Training Standard which includes the statement that the proposed NERC training standard includes the requirements for these training standards. We are unable to find the requirements of the training standards in the SAR. They do not seem to be there.

The SAR contains 5 steps which appear to be steps in a training program PROCESS. Those steps seem reasonable.

The SAR also contains a highlighted section with three paragraphs. The first paragraph contains a reasonable statement that every organization should determine the tasks that its operating personel perform. The second paragraph contains the seemingly contradictory statement that the organization is not required to perform a Job Task Analysis. The third paragraph contains a statement that the Personnel Subcommittee is conducting three studies.

What would be the requirements of a standard that resulted from this SAR? We do not know from the content of this SAR and therefore suggest the authors make the SAR more explicit.

Comment Form
Proposed System Personnel Training Standard

This form is to be used to submit comments on the proposed System Personnel Training Standard Authorization Request. Comments must be submitted by **March 20, 2006**. You may submit the completed form by e-mailing it to: sarcomm@nerc.com with the words "System Personnel Training SAR Comments" in the subject line. If you have questions please contact Mark Ladrow at mark.ladrow@nerc.net on 609-452-8060.

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

The ISO/RTO Council (IRC) agrees with the SAR Drafting Team's approach to limit the scope of the standard to real-time operating tasks that directly impact the reliability of the Bulk Power System.

The IRC also agrees with the concept that a mandatory NERC standard not be overly prescriptive. In the case of a Personnel Training Program each Reliability Entity must tailor its Training Programs to the specific tasks its operating personnel are required to perform.

The IRC also recognizes the conflict facing this Drafting Team:

- Reliability entities do not have a common set of jobs tasks for "…the persons performing real-time operating tasks…" and therefore the Team logically wants to allow the Reliability entity to define the tasks that require training and to define the level of competency needed to achieve a desired outcome. However,

- Reliability entities that face non-compliance penalties want to be certain about what is expected from them including who (organization / personnel) and what (process / job tasks) are being covered. Equally critical is the issue of how to measure competency in a way that ensures that all operating personnel have the competency to ensure that the reliability of the bulk power system is maintained. Leaving the definition of competency to each Reliability entity does not ensure a base competency level for North America.

The IRC, while agreeing with the approach, believes that the SAR, as written, fails to convey the essence of a NERC standard - to whom does the standard apply, what is the requirement (achieving a NERC specified level of competency, or is the requirement to have a NERC specified process in place?)

The IRC, while understanding of the Drafting Team's above noted conflict, requests that if the Industry consensus is to have a Training Standard, then the Drafting Team must address:

(1) WHO (Organizations to have a process, or Operating Persons that must be trained)

(2) WHAT (Have a process in place, or Performance measures that define competency)

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☒ No

Comments

While the IRC agrees that the Personnel Subcommittee's Operating Tasks Analysis can offer assistance in providing a focus on who and on what topics a training program should cover, the analysis itself is not a critical factor in determining which organizations or functional entities should comply with the training standard (assuming a standard on training program development is needed). Without prejudice to the yet to be made available Operating Tasks Analysis results, it is the IRC's opinion that, as a first step, the standard should be directed to at least those recognized entities that must make decisions in implementing, approving or directing others to implement actions that have a direct bearing on system reliability.

At the onset, the functional entities that are required to have a training program should be the prime candidates to comply with such a standard. At present, the certification standards for RC, BA and TOP are being developed and expected to be posting for balloting. Each of these standards contains a requirement for the respective entity (organization) to have a training program and provide its operating personnel with training (e.g. Standard ORG-022-1). Given this requirement, it makes logical sense that a standard on training program development be also applied to these entities.

To require other entities for which an organization certification standard and the corresponding requirement for having a training program do not currently exist or expect to be established in the near future would likely be challenged by these other entities. Moreover, the scope of the proposed training standard is too wide for effective development and compliance monitoring.

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☒ Yes

☒ No

Comments

In the mandatory standard environment each entity responsible to comply with a NERC standard, must do whatever is required to comply with that standard. To the extent that support persons need training to ensure that the entity complies, then training will be done (otherwise the entity would in the long or short run be unable to continually comply).

The IRC proposes that the priority of the Drafting Team be:

1 - Determine the need for having a standard

2 - Define WHO the standard applies to (is it reliability entities or is it directed at personnel as the question implies)

3. - Develop a standard

Extending the standard to include entities (or personnel) that perform "support" tasks is a secondary consideration; one that, if needed, should be pursued subsequent to the development of the primary standard.

The IRC does agree that the proposed Systematic approach would be useful to help organizations develop structured and effective training programs attain a required (by standard or by organization's needs) level of competency. The IRC agrees that training standards should not be prescriptive and that any Training standard must permit flexibility in HOW each responsible entity complies to the standard. However, as previously mentioned, crafting this SAR into a mandatory standard (a) without some definition of the topics to be included in the Training Programs, and (b) without some indication of how compliance will be measured - renders this SAR too vague, which in turn begs the question of the need for a standard at all.

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☒ No

Comments

The IRC does agree that the proposed Systematic approach would be useful to help organizations develop structured and effective training programs attain a required (by standard or by organization's needs) level of competency. The IRC agrees that training standards should not be prescriptive and that any Training standard must permit flexibility in HOW each responsible entity complies to the standard. However, as previously mentioned, crafting this SAR into a mandatory standard (a) without some definition of the topics to be included in the Training Programs, and (b) without some indication of how compliance will be measured - renders this SAR too vague, which in turn begs the question of the need for a standard at all.

The term 'competency' is subjective and not a measurable quantity. The proposed Systematic Approach is just that one approach out of many. Generally speaking , just as one training program is as good as another, one Training approach is as good as another. NERC may need to mandate training but it must provide more justification to show that it is mandatory to follow one approach.

The IRC proposes that if the PS believes that this standard is a goal that everyone should "strive" to achieve, then this proposal should be drafted as a Best Practice - but not as a standard.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☒ No

Comments

The IRC does agree that "the final determination of what tasks are performed …be addressed in (a) training program…determined by each entity."

The IRC also agrees that if this SAR is to be a standard, then the proposal must identify, at least a high-level, the topics that must be used to meet the compliance requirements for a training program.

The IRC suggests that if this SAR is to proceed then the RC, BA and TOP are the entities to which this standard will apply because their operating functions are clearly defined in the functional model.

The IRC believes that there is no reason why some of the topics that reflect the operating functions of the three above noted functional entities should not be included, as minimum requirements, in the standard. This would ensure that there is consistent coverage in the training programs for the same function across the industry, regardless of size, location and organization structure.

The IRC agrees that the Personnel Subcommittee has created an excellent training manual that organizations should consider as a "Best Practice" approach to training, but this material need not be turned into a NERC Standard .

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

In its comments to the first draft of this SAR, the Industry overwhelmingly supports the value of Training. The IRC also strongly endorses the concept of training to ensure reliability, and supports the Systematic Approach process being developed. The Personnel Subcommittee has taken a step in the right direction in view of the recommendations of the 2003 Blackout Report, however, the IRC must point out the fact that the SAR is required to complement:

1. Current Certification process
2. Functional Model regarding the entities that are responsible for compliance to NERC standards
3. NERC Standards Process
   - Manageable scope
   - Measurable requirements
   - Consistent application and results

The IRC suggests:

* Create a "Best Practice" Training Approach that all entities can use - but if the Team decides to proceed with a standard then:

1. The Drafting Team review current standards for Training Obligations and requirements to avoid duplication
2. The Drafting Team clearly define the entities responsible for complying in terms of NERC's currently defined functional entities
   - The Team consider starting with RC, BA and T-OPer
3. The Drafting Team clearly establish its objective(s)
   - Have a process
   - Train personnel that do x.y.& z
   - both
4. The Drafting Team clearly define its requirements
   - suggest starting with the tasks listed in the Certification standards for RC, BA, T-Oper

Background Information:

Posted for comments is the second draft of the System Personnel Training Standard Authorization Request (SAR). The approach proposed in this revised SAR is to be flexible to the industry in determining their unique training needs and not try to force a single set of training topics on a widely diversified audience. Rather than a "one-size fits all" list of requirements, this approach is based on the fact that quality training results from applying a systematic approach to training that includes training needs assessment, training development, delivery, and evaluation. The standard will provide the framework for a training program based on the tasks performed that impact reliability.

The requestor would like to gauge the level of consensus regarding the revised SAR and to obtain the input of the industry on the scope and applicability of the proposed standards. Accordingly, your comments included on this form, e-mailed with the subject "System Personnel Training SAR Comments" by March 20, 2006, would be appreciated.

Regarding the scope of the SAR:

The SAR Drafting Team is proposing that this SAR will result in two standards:

- One standard will require training all personnel who perform 'real-time operating tasks' that directly impact the reliability of the Bulk Electric System (BES)
- One standard will require training personnel who perform 'support tasks' that directly impact reliability of the BES.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☐ Yes

☐ No

Comments

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☐ No

Comments

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☐ Yes

☐ No

Comments

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

Northeast Utilities endorses the use of SAT process

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☐ Yes

☐ No

Comments

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

The SAR Drafting Team wants to develop the standard for the personnel who perform 'real-time operating tasks' first, then develop the standard for personnel who perform 'support tasks'.

1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

☒ Yes

☐ No

Comments

ATC supports the position of the SAR Drafting Team of breaking out the training standard into two separate standards. With the SAR Drafting Team creating this two tier approach, any standards from the initial phase should be balloted seperately from standards developed in the second phase.

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☐ Yes

☒ No

Comments

ATC reserves judgement on the SAR Drafting Team's approach until the results are revealed to the industry. In addition, the SAR does not discuss any alternate approaches considered by the SAR Drafting Team .

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

ATC is supportive of the 'systematic' approach to developing customized, personnel training as opposed to a centrally developed, topic specific, standardized approach to personnel training. The former approach allows for more flexibility between companies while providing a common framework for the industry. That being said, ATC recommedns the team give consideration to how NERC will validate and audit this standard as a customized approach will likely result in varying levels of documentation and results among companies.

Any standards that come out of this SAR should be complimentary ,or at a minimum parallel, to NERC's CEH accreditation process. This standard should not create a conflicting approach to what is currently being used for the NERC CEH accreditation process.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

The SAR Team should consider whether this SAR, if applicable to Planning Authority personnel, also has applicability to other Reliability Functions, as indicated in the "Reliability Functions" section, such as Resource Planner, Transmission Planner and Distribution Provider.

Any standards that come out of this SAR should be complimentary ,or at a minimum parallel, to NERC's CEH accreditation process.

ATC requests that meeting invites for the proctored JTA Workshops be sent out by email in addition to being posted on the NERC Standards Development web page. The industry should know about the workshops as soon as they are agreed to by NERC to allow for adequate scheduling time.

ATC looks forward to reviewing this standard in the future.

☒ Yes

☐ No

Comments

We agree but there are still some very basic training requirements which are needed regardless of the function or region the work is being done. These functions must be done the same way by all or there will be confusion in the industry.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

Regarding the applicability identified in the SAR:

For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

☒ Yes

☐ No

Comments

But also need to determine the type of personnel within those organizations that perform "real-time" operating tasks

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

☒ Yes

☐ No

Comments

But also need to determine the types of personnel that perform the support tasks

Regarding the Focus of the Proposed SAR

The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

☒ Yes

☐ No

Comments

But this "systematic" approach pre-supposes that personnel are NOT at the organization's desired level of competency. There really needs to be a "Step 0" that periodically measures whether an individual currently possesses the organization's desired level of competency for the job or tasks they are performing. If not, then they need training.

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

☒ Yes

☐ No

Comments

However, a list of "such as" training topics would be acceptable

6. Please provide any additional comments on the revised SAR that you haven't already provided above.

Comments

Background:

The System Personnel Training SAR drafting team thanks all commenters who submitted comments on the second draft of the SAR. The second draft of the Personnel Training SAR was posted for a 30-day public comment period from February 17 through March 20, 2006. The drafting team asked stakeholders to provide feedback through a special Comment Form. There were 20 sets of comments submitted, representing comments from 64 different people from 59 different entities, representing all NERC Regions and 6 of the 9 industry segments.

Based on the comments received, the drafting team eliminated much of the explanatory information from the SAR and clarified the scope and applicability by making the following conforming changes to the SAR.

- The revised SAR clearly states that the scope is limited to training system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators.

- The revised SAR clearly states that the standard will include requirements for the following:
  - Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators.
  - Measure the mis-match between actual and desired performance, and
  - Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training.

- The revised SAR clearly states that the following documents will be developed in parallel with the standard to provide stakeholders with support in implementing the standard's requirements:
  - A generic, reliability-related list of tasks assigned to real-time system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators
  - How to determine task performance requirements
  - How to apply a systematic approach to training

With the above conforming changes, the drafting team is recommending that the SAR move forward to standard drafting.

In this 'Consideration of Comments' document, stakeholder comments have been organized so that it is easier to see the summary of changes in response to each aspect of the drafting team's approach to adding the missing measures and compliance elements.. All comments received on the can be viewed in their original format at:

http://www.nerc.com/~filez/standards/Compliance_Cleanup_V0.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error

or omission, you can contact the Vice President and Director of Standards, Gerry Cauley at 609-452-8060 or at gerry.cauley@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Process Manual: http://www.nerc.com/standards/newstandardsprocess.html.

~~2.~~1. Do you agree with the approach to the training standard to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact reliability of the BES?

Summary Consideration: All commenter but one agreed with the drafting team's revised approach to limit the scope of the initial standard to persons performing real-time operating tasks that directly impact the reliability of the BES. Several commenters asked for additional clarification and the drafting team refined the original SAR to include the following:

> The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators.

Commenter	Yes	No	Comment
Entergy Services, Inc. (1) Ed Davis		✓	This SAR continues to be overly broad, ambiguous and confusing. We are not sure but it appears the initial standard would require a process to be developed and not require training of anyone. Therefore this question is not appropriate at this time. We do agree that when the appropriate SAR is presented that the training standard should be limited to those persons performing real-time operating tasks that directly impact reliability of the BES.

Response: The SAR has been reworded to clarify to whom the proposed standard will apply, and to clarify what will be required in the standard. The revised SAR does not require that a process be developed – it requires that a systematic process be followed. The wording now reads:

"The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators.

The proposed standard will require the use of a systematic approach to determining training needs: The proposed standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to:

- Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators.
- Measure the mis-match between actual and desired performance, and
- Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training.

The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training.

The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks."

Commenter	Yes	No	Comment
Northeast Power Coordinating Council CP9 Reliability Standards Working Group Guy Zito – NPCC (2) K. Goodman – ISO-NE(2) Ralph Rufrano – NYPA (1) David Little – NS Power (1) Peter Lebro – NGrid (1) David Kiguel – Hydro One (1) J. Barnhart – Nstar (1) W. Shemley – ISONE (2) Greg Campoli – NYISO (2) Ron Falsetti – IESO (2) A. Adamson – NYSRC (2) Sashi Parekh – MA Dept. of Tele. And Energy (9) R. Pelligrinni – United Illum. (1)	✓		NPCC participating members believe the scope of the SAR should be limited to the tasks directly impacting the reliability of the Bulk Electric System. It is not entirely clear to whom this standard will apply.
Response: The SAR has been reworded to clarify to whom the proposed standard will apply, and to clarify what will be required in the standard. The wording now reads**:** **"**The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators.			
ATC (1) Jason Shaver	✓		ATC supports the position of the SAR Drafting Team of breaking out the training standard into two separate standards. With the SAR Drafting Team creating this two tier approach, any standards from the initial phase should be balloted seperately from standards developed in the second phase.
Response: Agreed. Most commenters indicated that the SAR drafting team should focus, for now, solely on training for the real-time system operators who work for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators. As revised, the SAR will not address training for other personnel.			
NYISO (2) Michael Calimano	✓		The NYISO agrees with the SAR drafting Team's approach to limit the scope of the standard to the area of "real time operating tasks" and to require a systematic approach to training. However, the

Commenter	Yes	No	Comment
			SAR as written is too vague with regard to whom the standard applies. If the standard is meant to merely apply program method, a standard is not required - a definintion of what is intended by the existing requirement for "coordinated training" will do.
Response: The SAR has been reworded to clarify to whom the proposed standard will apply, and to clarify what will be required in the standard. The wording now reads: **"**The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators.			
Arizona Public Services (1) Michael Scott	✓		We agree with this approach. We value the certification of operators, and the certification of personnel who perform support tasks such as engineering, management, and technical services.
Response: Agreed. Most commenters indicated that the SAR drafting team should focus, for now, solely on training for the real-time system operators who work for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators. As revised, the SAR will not address training for other personnel.			
IESO (2) Ron Falsetti	✓		We agree that the scope of the initial standard should cover training program pertaining to real-time operating tasks that directly impact reliability of the BES. However, the way this question is worded (…to persons performing…) and from the SAR as presented, it is not clear whether the proposed standard, even within the aforementioned scope, is intended to set requirements for: (i) the entities that perform these operating functions to develop the needed training program for their operating personnel to acquire the competency to perform these tasks, or (ii) the training program to cover a minimum set of topics that enables the operating personnel to acquire the competency to perform these tasks, or (iii) both of the above or something else. While we agree with the recommendation that a systematic approach be used to develop the required training program, and further recognize a training standard should not be overly prescriptive as different organizations (entities) may assign different/additional tasks to its operating personnel. We nevertheless believe that absent any specificities such as to whom the standards apply and a high level scope of the minimum tasks or task related topics to be covered by the training program, the need for having an industry-wide standard for personnel training becomes questionable. In brief, the SAR as written fails to convey the essence of the requirements - to whom the standard apply and whether or not it is a process that is required, which we feel is too vague, or a minimum set of topics that need to be included in the training program, or both.

Commenter	Yes	No	Comment
Response: The SAR has been reworded to clarify to whom the proposed standard will apply, and to clarify what will be required in the standard. The wording now reads: **"**The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators. The proposed standard will require the use of a systematic approach to determining training needs: The proposed standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to: - Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators. - Measure the mis-match between actual and desired performance, and - Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training. The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training. In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefor their knowledge and skills are somewhat different. Training content should be designed based on performance requirements for a person's specific job. To do otherwise does not ensure that: 1. Training needed for performance of real-time reliability tasks are identified 2. Time and money are not wasted on unneeded training 3. Gaps in performance are identified 4. Training is designed and developed to match performance gaps 5. Demonstration of task performance through assessment of learning However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select form for recertification in their Appendix A to their Certification Administrative Manual. The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks.“			
Pepco Holdings, Inc. (1) Richard Kafka Valerie Hildebrand Vic Davis – Delmarva (1)	✓		For each of the proposed standards for real time operating tasks and support tasks, would the standard differentiate between the new hire who may need to be trained to perform all of the tasks identified to a specified minimum level of competency and the more experienced person who might need, on a periodic basis, to demonstrate that they can still perform at the minimum level of

Commenter	Yes	No	Comment
John Miller – Conectiv (5) J. Newton – Pepco Energy (6)			competency and perhaps also perform at a specified higher level of competency?
Response: As envisioned, the standard for system operators will require a training program for new operators and a training program that provides continuing education for existing operators. It will also require periodic drills or training for tasks performed infrequently to maintain competency.			
PJM (2) Albert DiCaprio Bruce Balmat Mark Kuran Joseph Willson ISO/RTO Council Bruce Balmat – PJM (2) Anita Lee – AESO (2) Liza Szot – CAISO (2) Sam Jones – ERCOT (2) Ron Falsetti – IESO (2) Pete Brandien – ISONE (2) Bill Phillips – MISO (2) Mike Calimano – NYISO (2) C. Yeung – SPP (2)	✓		PJM (ISO/RTO Council) agrees with the SAR Drafting Team's approach to limit the scope of the standard to real-time operating tasks that directly impact the reliability of the Bulk Power System. The PJM also agrees with the concept that a mandatory NERC standard not be overly prescriptive. In the case of a Personnel Training Program each Reliability Entity must tailor its Training Programs to the specific tasks its operating personnel are required to perform. PJM also recognizes the conflict facing this Drafting Team: - Reliability entities do not have a common set of jobs tasks for "…the persons performing real-time operating tasks…" and therefore the Team logically wants to allow the Reliability entity to define the tasks that require training and to define the level of competency needed to achieve a desired outcome. However, - Reliability entities that face non-compliance penalties want to be certain about what is expected from them including who (organization / personnel) and what (process / job tasks) are being covered. Equally critical is the issue of how to measure competency in a way that ensures that all operating personnel have the competency to ensure that the reliability of the bulk power system is maintained. Leaving the definition of competency to each Reliability entity does not ensure a base competency level for North America. PJM, (ISO/RTO Council) while agreeing with the approach, believes that the SAR, as written, fails to convey the essence of a NERC standard - to whom does the standard apply, what is the requirement (achieving a NERC specified level of competency, or is the requirement to have a NERC specified process in place?) PJM, (ISO/RTO Council) while understanding of the Drafting Team's above noted conflict, requests that if the Industry consensus is to have a Training Standard, then the Drafting Team must address: (1) WHO (Organizations to have a process, or Operating Persons that must be trained) (2) WHAT (Have a process in place, or Performance measures that define competency)
Response: The SAR has been reworded to clarify to whom the proposed standard will apply, and to clarify what will be required in the

standard. The wording now reads: "The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators. The proposed standard will require the use of a systematic approach to determining training needs: The proposed standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to: - Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators. - Measure the mis-match between actual and desired performance, and - Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training. The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training. The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks." The Drafting Team does not believe that prescribing a competency level for each task performed by each system operator for all Balancing Authorities, Reliability Coordinators, and Transmission Operators across the continent is valid. The performance requirements of a task must be defined with such specificity to be able to design training and learning assessments that will validate competency to perform that task. The same performance description cannot apply to the large number of system operators across the continent that will be covered by the standard. To define the competency level for each task would be to define the performance of each task to be exactly the same for all entities, which is neither practical, nor would it serve to ensure reliability. There may, however, be a subset of tasks for which proficiency should be set on a NERC-wide basis - the SAR has been written with enough flexibility so that this is not precluded.

Joe Knight – MRO (2) 27 additional MRO members not listed above.			

Regarding the applicability identified in the SAR:
For the Standard that will apply to the personnel who perform 'real-time' operating tasks, the SAR Drafting Team is proposing that the 'Operating Tasks Analysis' being conducted by the NERC Personnel Subcommittee serve as the basis for determining which types of organizations will be required to comply with the standard.

2. Do you agree with the SAR Drafting Team's approach to determining which types of organizations will be required to comply with the standard for personnel who perform 'real-time' operating tasks?

Summary Consideration: Most commenters indicated that they did not agree with this approach to determining which types of organizations will be required to comply with the standard. Through these responses and the responses to other questions, stakeholders clearly identified a preference for more specifically limiting the scope and drafting team modified the SAR to state that the training standard would apply to::

"System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators."

Commenter	Yes	No	Comment
FRCC (2) Eric Senkowicz – FRCC Linda Campbell – FRCC Jeff Gooding – FPL (1) Alan Gale – TAL (5) Mark Bennett – Gainesville (5) Dennis Minton – FL Keys (1)		✓	We don't disagree with the concept but asking for endorsement of the "Operating Tasks Analysis" that has not been published or included for review with this SAR seems inappropriate and premature in the development of the standard itself especially if it will be used to "determine which types of organizations will be required to comply with the standard". Need clarification on "type of organization" as this seems to be getting away from the registered entity concept.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators."			
Northeast Power Coordinating Council CP9 Reliability Standards Working Group Guy Zito – NPCC (2) K. Goodman – ISO-NE(2) Ralph Rufrano – NYPA (1)		✓	NPCC Participating members, although believe it is a laudable approach to allow the Operating Tasks Analysis to determine what and who the training program should address, the Standard should be initially directed at those who have direct control or those that have supervisory control to implement actions that may impact reliablity of the system.

Commenter	Yes	No	Comment
David Little – NS Power (1) Peter Lebro – NGrid (1) David Kiguel – Hydro One (1) J. Barnhart – Nstar (1) W. Shemley – ISONE (2) Greg Campoli – NYISO (2) Ron Falsetti – IESO (2) A. Adamson – NYSRC (2) Sashi Parekh – MA Dept. of Tele. And Energy (9) R. Pelligrinni – United Illum. (1)			
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators."			
ATC (1) Jason Shaver		✓	ATC reserves judgement on the SAR Drafting Team's approach until the results are revealed to the industry. In addition, the SAR does not discuss any alternate approaches considered by the SAR Drafting Team .
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. Commenter	Yes	No	Comment
However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select from for recertification in their Appendix A to their Certification Administrative Manual.			
Con Ed of New York (1) Walter Cintron		✓	Where is this information?
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." The results of the job analysis will be available as an attached reference document to the standard.			
Entergy Services, Inc. (1) Ed Davis		✓	We are not sure but it appears the initial standard resulting from this SAR would require a process to be developed and not require training of anyone. Therefore this question is premature, not appropriate at this time, and should be asked when the SAR for personnel training is presented to the industry. However, at this time we will say we do not agree with the drafting team's approach. The standard that will apply to the personnel who perform real-time operating tasks should apply to those personnel performing the tasks, not to the organizations. An organization that takes on responsibility for meeting the requirements of a standard may delegate the tasks to another organization to actually perform the tasks. The training standards should apply to the personnel actually performing the work for the second organization, not the second organization, nor the organization responsible for meeting the requirements of the standards.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." The requirements will be assigned to the Reliability Coordinator, Balancing Authority and Transmission Operator. It is up to these entities to ensure that their real-time system operating personnel are competent to perform assigned reliability –related tasks.			
NYISO (2)		✓	A national "Operating Tasks Analysis" can provide a useful baseline reference on the topics training programs should address in assuring a base competency of operating personnel in North

Commenter	Yes	No	Comment
Michael Calimano			America. However, prior to the completion, review and evaluation of the task analysis project, it is premature to formalize a training standard based on that foundation. At the present time, if a training standard is needed, it should clearly be applied to those functional entities that are under compliance and certification requirements - RC, BA and TOP.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." The requirements will be assigned to the Reliability Coordinator, Balancing Authority and Transmission Operator. It is up to these entities to ensure that their real-time system operating personnel are competent to perform assigned reliability–related tasks.			
Arizona Public Services (1) Michael Scott		✓	The wording here is a little ambiguous. Is it being proposed that the SAR Drafting Team identify and analyze the critical tasks associated with grid operations, and then each participating organization will determine within their unique structure who performs these critical tasks?...Then these identified personnel would fall under the auspices of the new standard?
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators."			
IESO (2) Ron Falsetti		✓	While we agree that the Operating Tasks Analysis can offer assistance in providing a focus on who and the topics that a training program should cover, the analysis itself is not a critical factor in determining which organizations or functional entities should comply with the training standard (assuming a standard on training program development is needed). Without prejudice to the yet to be made available Operating Tasks Analysis results, we feel that, as a first step, the standard should be directed to at least those recognized entities that must make decisions in implementing, approving or directing others to implement actions that have a direct bearing on system reliability. At the onset, the functional entities that are required to have a training program should be the prime candidates to comply with such a standard. At present, the certification standards for RC, BA and TOP are being developed and expected to be posting for balloting. Each of these standards contains a requirement for the respective entity (organization) to have a training program and provide its operating personnel with training (e.g. Standard ORG-022-1). Given this requirement, it makes logical sense that a standard on training program development be also applied to these entities. To require other entities for which an organization certification standard and the corresponding requirement for having a training program do not current exist or expect to be established in the

Commenter	Yes	No	Comment
			near future would likely be challenged by these other entities. Moreover, the scope of the training standard would be too wide for effective development and compliance monitoring.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators."

NERC Standards Evaluation Subcommittee Bill Bojorquez – ERCOT	✓		The SES believes that a Task Analaysis is the correct approach.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." The task list will be made available as a reference to the standard.			
MAAC (2) John Horakh	✓		But also need to determine the type of personnel within those organizations that perform "real-time" operating tasks.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be:			

Commenter	Yes	No	Comment
"System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." With the change in applicability of the standard to only those entities that are ORG certified (TO, BA, RC), there is a clear responsibility for these entities to train their personnel as identified in both this standard and the ORG cert standard for a given organization. It will be the certified organizations responsibility to ensure that personnel performing reliability related tasks in real-time identify and provide required training. If reliability related tasks are performed by other entities on behalf of the certified organization it is still the responsibility of the organization that is certified to meet NERC compliance requirements and ensure appropriate training has been identified and provided to those performing their reliability tasks.

Response: It is not within the scope of this proposed SAR or proposed standard to revise the Functional Model.			
Pepco Holdings, Inc. (1) Richard Kafka Valerie Hildebrand Vic Davis – Delmarva (1) John Miller – Conectiv (5)	✓		Using the task analysis would be a good method for identifying who would be subject to the real time operating tasks standard. The approach suggests that if a person performs any of the tasks identified with "real time operating" that person's organization regardless of its functional model type would be subject to the standard. Would the standard apply to an organization if the person performed only one or two tasks or if an organization's understanding of what a particular task entails differs from the accepted task analysis prepared by the Personnel Subcommittee?

For the Standard that will apply to the personnel who perform 'support tasks', the SAR Drafting Team is proposing that an 'Operations Support Task Analysis' planned for development by the NERC Personnel Subcommittee serve as the basis for determining which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard.

3. Do you agree with the approach proposed above to determine which support tasks directly impact reliability of the BES and for determining which types of organizations will be required to comply with the standard?

Summary Consideration: Most commenters indicated that they did not agree with this approach. Through these responses and the responses to other questions, stakeholders clearly identified a preference for more specifically limiting the scope of this SAR and drafting team modified the SAR to state that the training would be for:

> "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators."

The support tasks performed by support personnel will not be addressed in this standard.

Commenter	Yes	No	Comment
FRCC (2) Eric Senkowicz – FRCC Linda Campbell – FRCC Jeff Gooding – FPL (1) Alan Gale – TAL (5) Mark Bennett – Gainesville (5) Dennis Minton – FL Keys (1)		✓	Need clarification on "type of organization" as this seems to be getting away from the registered entity concept. The FRCC believes that efforts and resources should focus on "real-time" personnel standard at this time and should be closely coordinated and complementary to the developments of the PCGC and the new CEH Certification policy. Real-time personnel have the "primary" impact to the reliability of the BES and as such should be the focus of the standard. The development of any standards should at the very least, complement the Operator Certification process especially in terminology and overlapping of compliance "measures". The PS scope with regard to "support personnel" needs to be limited at this time and not included witthin this SAR Further, we would propose to eliminate "support personnel" training scope completely from this SAR and initiate a "stand-alone" SAR addressing "support personnel" training.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be**:** "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." Commenter	Yes	No	Comment
"System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." Alternate approaches were considered such as requiring a list of topics to train to. Unfortunately not all organizations perform the same tasks. A more simplistic approach that does not employ a systematic process to training is not flexible to training needs and cannot ensure the following: 1. Training needed for performance of real-time reliability tasks are identified 2. Time and money are not wasted on unneeded training 3. Gaps in performance are identified 4. Training is designed and developed to match performance gaps 5. Demonstration of task performance through assessment of learning However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select from for recertification in their Appendix A to their Certification Administrative Manual.			
Con Ed of New York (1) Walter Cintron		✓	The information should be provided in order to make an assessment.
Response: Agreed – however most entities felt that the scope of the SAR should be limited to just system operators. The drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators."			
Arizona Public Services (1) Michael Scott		✓	Once the tasks that "directly impact reliability of the BES" are identified and analyzed, each participating organization would be in the best position to decide which individuals would need to comply with the standard.
Response: Agreed – however most entities felt that the scope of the SAR should be limited to just system operators. The drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." The support tasks performed by support personnel will not be addressed in this standard.			

Commenter	Yes	No	Comment
Entergy Services, Inc. (1) Ed Davis		✓	Our response to Question 2 above also applies here with respect to Operations Support Task Analysis, the personnel performing those tasks, and the applicable organizations.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." The support tasks performed by support personnel will not be addressed in this standard.			
NYISO (2) Michael Calimano	✓	✓	The NYISO does agree that the proposed systematic approach to training will be helpful in developing effective training programs. The need for a North American "Operations Support Task Analysis" to define training which personnel or which organizational entities are required to comply with the training standard not clear. In the mandatory standard environment, each entity responsible to comply with NERC standards, will train operations staff to comply. Extending the standard to cover "support" tasks should be a secondary consideration, if it is necessary at all.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." The support tasks performed by support personnel will not be addressed in this standard.			
IESO (2) Ron Falsetti	✓	✓	We do not hold a position on whether or not the proposed analysis be performed since the priority at this time is to (a) determine the need for having a standard for the entities (or is it the personnel as the question implies?) that perform "direct" tasks, and (b) develop the standard. Extending the standard to cover entities (or personnel) that perform the "support" tasks should be a secondary consideration and, when pursued, can be built upon the structure and success of the initial set. We agree that the systematic approach will help responsible organizations develop a structured and effective training program for operating personnel to attain the required competency to perform their tasks. We further recognize that the training standards should not be prescriptive as different organizations may assign different tasks to its operating personnel, and hence the standards should provide the flexibility for these organizations to develop the training program according to their specific needs, budget and resource considerations, etc.

Commenter	Yes	No	Comment
			However, as mentioned earlier, simply putting this as a standard requirement without (a) some mention of the topics, even just at a high level, to be included in the training program and (b) a sense of how the requirement can be measured may render the standard too vague, which begs a question on the need for this standard.
Response: The question asked by the SAR drafting team is no longer a pertinent question since the drafting team has revised the applicability of the standard to be: "System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators." In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefor their knowledge and skills are somewhat different. Training content should be designed based on performance requirements for a person's specific job. To do otherwise does not ensure that: 1. Training needed for performance of real-time reliability tasks are identified 2. Time and money are not wasted on unneeded training 3. Gaps in performance are identified 4. Training is designed and developed to match performance gaps 5. Demonstration of task performance through assessment of learning However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select form for recertification in their Appendix A to their Certification Administrative Manual. There may, however, be a subset of tasks for which proficiency should be set on a NERC-wide basis - the SAR has been written with enough flexibility so that this is not precluded.			
PJM (2) Albert DiCaprio Bruce Balmat Mark Kuran Joseph Willson ISO/RTO Council	✓	✓	In the mandatory standard environment each entity responsible to comply with a NERC standard, must do whatever is required to comply with that standard. To the extent that support persons need training to ensure that the entity complies, then training will be done (otherwise the entity would in the long or short run be unable to continually comply). PJM (IRC) proposes that the priority of the Drafting Team be: 1 - Determine the need for having a standard 2 - Define WHO the standard applies to (is it reliability entities or is it directed at personnel as

Commenter	Yes	No	Comment
Bruce Balmat – PJM (2) Anita Lee – AESO (2) Liza Szot – CAISO (2) Sam Jones – ERCOT (2) Ron Falsetti – IESO (2) Pete Brandien – ISONE (2) Bill Phillips – MISO (2) Mike Calimano – NYISO (2) C. Yeung – SPP (2)			the question implies) 3. - Develop a standard Extending the standard to include entities (or personnel) that perform "support" tasks is a secondary consideration; one that, if needed, should be pursued subsequent to the development of the primary standard. PJM (IRC)does agree that the proposed Systematic approach would be useful to help organizations develop structured and effective training programs attain a required (by standard or by organization's needs) level of competency. PJM (IRC) agrees that training standards should not be prescriptive and that any Training standard must permit flexibility in HOW each responsible entity complies to the standard. However, as previously mentioned, crafting this SAR into a mandatory standard (a) without some definition of the topics to be included in the Training Programs, and (b) without some indication of how compliance will be measured - renders this SAR too vague, which in turn begs the question of the need for a standard at all.

Response: During the initial posting of the SAR, most commenters indicated there is a reliability-related need for a training standard.

The drafting team has revised the applicability of the standard to clarify WHO must comply with the training standard – it is the Reliability Coordinator, Balancing Authority and Transmission Operator.

"The scope of this training standard is limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators."

The SAR was revised to identify what the standard will require. The standard will require the use of a systematic approach to determining training needs. The standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to:

- Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators.
- Measure the mis-match between actual and desired performance, and
- Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training.

The SAR was revised to identify some of the measures – and these are expected to be further refined during standard development:

- The standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training.
- The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks.

-As envisioned, a very broad list of training topics may be included in the proposed standard to serve as an aid to those developing training

Regarding the Focus of the Proposed SAR
The SAR Drafting Team proposes that the training standards require the use of a 'systematic' approach to developing training. The 'systematic' approach requires the following:

1. **Determining the needs for training** through a task analysis or job and task analysis process, followed by a training needs assessment. This step enables the organization to know what training its operators need.
2. **Designing and adjusting the training program** to make sure it directly correlates performance requirements, learning objectives, and learning evaluation to tasks. The training program must be designed to bring the system operators from their current level of competency to the organization's desired level of competency.
3. **Developing the training program** so that it includes effective learning experiences and delivery methods. The approach to this step, as well as step 2, will drive the requirements for training and operating staffs.
4. **Delivering the training to the personnel**; in other words, ensure that the training actually takes place as designed.
5. **Verifying and documenting the competency** that the personnel achieved through a documented assessment process

4. Do you agree with the SAR Drafting Team that the training standards should require use of the 'systematic' approach to training as opposed to requiring specific topics be taught to all personnel for a specific number of hours?

Summary Consideration: A Systematic Approach to training is a methodical approach as opposed to a disorganized approach. There is not one systematic approach to training, and the SAR is not meant to imply that there is only one methodical approach. There are, however certain questions that must be asked and answered for training to produce the ability to perform tasks as required by the job.

.The revised SAR states more clearly that the standard will require entities to:

- Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators.
- Measure the mis-match between actual and desired performance, and
- Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training.

.

Commenter	Yes	No	Comment
FRCC (2) Eric Senkowicz – FRCC Linda Campbell – FRCC Jeff Gooding – FPL (1) Alan Gale – TAL (5) Mark Bennett – Gainesville (5) Dennis Minton – FL Keys (1)		✓	The FRCC appreciates the tremendous efforts that have been undertaken in researching, addressing and developing training program improvement strategies for the industry with respect to BES system operator training. We also agree in principle that the "systematic" approach to developing training programs is the "best" approach for the industry as we go forward. Having said that, we do have significant concerns with the proposed implementation track via the "training standard". Our concern lies in translation of these subjective training concepts, principles and approaches into "clear" and "measurable" compliance elements, if the standard were to proceed through the development process. The SAR states that "the training standard includes all five of these steps (of the systematic approach), and measures compliance by requiring documentation that these steps were performed". The FRCC contends that the necessary documentation to demonstrate compliance of a valid "systematic approach" leaves too much ambiguity to become effective Reliability Standards, Measures. As we further reviewed this issue, we have come to the conclusion that the Reliability Standard may be the wrong document to use to convey the requirements of a "systematic training program" to the industry. We suggest that the "Training Standard" should proceed but with a slightly diferent approach. The evaluation /verification and accreditation / certification (for lack of a specific terminology) of an entity's "systematic training program" should occur outside the Reliability Standards and Compliance arena. The evaluation should also be performed by appropriate personnel who are qualified and knowledgeable in the training concepts to ensure accurate determination of adequacy of such programs. The "Training Standard" would then prescribe training requirements, by job function (ie. hours in relevant study areas as determined by competency evaluations), and based on JTA impacts on BES reliability. On further reflection, we would also offer that such an approach will lend itself better to improving the overall quality of industry training programs than the proposed track of the standard. An evalation / accreditation process will re-focus the programs away from striving to meet the "minimum" documentation requirements of a "systematic training program" to a cooperative process geared to, not only evaluate the program, but perhaps serve as an opportunity to share industry-wide training "best practices". Finally, in light of limited resources, this approach would provide the industry the greatest flexibility at achieving compliance to the "Training Standard" by allowing entities access to not only "in house" training programs but also access to external training resources (as long as they have been "accredited" as a "systematic approach program") to fulfill their training objectives.
Response: The SAR has been reworded to clarify to whom the proposed standard will apply, and what will be required in the standard. The wording now reads:			

Commenter	Yes	No	Comment
			"The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators. The proposed standard will require the use of a systematic approach to determining training needs: The proposed standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to: - Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators. - Measure the mis-match between actual and desired performance, and - Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training. The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training. The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks." Guidelines are not subject to compliance and accountability. The SAR team feels that not incorporating a training standard in response to the blackout recommendations would be doing a disservice to the industry. A Systematic Approach to training is a methodical approach as opposed to a disorganized approach. There is not one systematic approach to training, and the SAR is not meant to imply that there is only one methodical approach. There are, however certain questions that must be asked and answered for training to produce the ability to perform tasks as required by the job. However one groups those questions and whatever words one uses to describe those groupings, the basic questions must be addressed. In regard to "prescribing training requirements by job function (ie. hours in relevant study areas as determined by competency evaluations)", the drafting team interprets this to equate to a list of topics for a job classification, and that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefor their knowledge and skills are somewhat different. Training content should be designed based on performance requirements for a person's specific job. The Drafting Team does not believe that prescribing a competency level for each task performed by each system operator for all Balancing Authorities, Reliability Coordinator, and Transmission Operator across the continent is valid. The performance requirements of a task must be defined with such specificity to be able to design training and learning assessments that will validate competency to perform that task that the same performance description cannot apply to the large number of system operators across the continent that will be covered by the standard. To define the competency level for each task would be to define the performance of each task to be exactly the same for all entities, which is neither practical, nor would it serve to ensure reliability. There may, however, be a subset of tasks for which proficiency should be set on a NERC-wide

Commenter	Yes	No	Comment
basis - the SAR has been written with enough flexibility so that this is not precluded.			
Con Ed of New York (1) Walter Cintron		✓	Not in the form of the rejected SAR Draft.1.0 323825
Response: The SAR has been reworded to clarify to whom the proposed standard will apply, and what will be required in the standard. The wording now reads: "The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators. The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training. The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks."			
ISO/RTO Council Bruce Balmat – PJM (2) Anita Lee – AESO (2) Liza Szot – CAISO (2) Sam Jones – ERCOT (2) Ron Falsetti – IESO (2) Pete Brandien – ISONE (2) Bill Phillips – MISO (2) Mike Calimano – NYISO (2) C. Yeung – SPP (2) PJM (2)	✓	✓	PJM (ISO/RTO Council) does agree that the proposed Systematic approach would be useful to help organizations develop structured and effective training programs attain a required (by standard or by organization's needs) level of competency. PJM agrees that training standards should not be prescriptive and that any Training standard must permit flexibility in HOW each responsible entity complies to the standard. However, as previously mentioned, crafting this SAR into a mandatory standard (a) without some definition of the topics to be included in the Training Programs, and (b) without some indication of how compliance will be measured - renders this SAR too vague, which in turn begs the question of the need for a standard at all. The term 'competency' is subjective and not a measurable quantity. The proposed Systematic Approach is just that one approach out of many. Generally speaking , just as one training program is as good as another, one Training approach is as good as another. NERC may need to mandate training but it must provide more justification to show that it is mandatory to follow one approach. PJM (ISO/RTO Council) proposes that if the PS believes that this standard is a goal that

Commenter	Yes	No	Comment
Albert DiCaprio Bruce Balmat Mark Kuran Joseph Willson			everyone should "strive" to achieve, then this proposal should be drafted as a Best Practice - but not as a standard.

Response: In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefore their knowledge and skills are somewhat different.

Training content should be designed based on performance requirements for a person's specific job. To do otherwise does not ensure that:

1. Training needed for performance of real-time reliability tasks are identified
2. Time and money are not wasted on unneeded training
3. Gaps in performance are identified
4. Training is designed and developed to match performance gaps
5. Demonstration of task performance through assessment of learning

There may, however, be a subset of tasks for which proficiency should be set on a NERC-wide basis - the SAR has been written with enough flexibility so that this is not precluded.

However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select from for recertification in their Appendix A to their Certification Administrative Manual.

Training should produce the ability to perform. Performance is measurable. If not, then we would never know when a task is complete and done as well as needed. Defining performance means identifying what triggers action, what action is required, and to what specification or criteria. To say it in simpler terms, a performance statement says "when this happens, do this, this well". What is done, when it is done, and how well it is done are all very measurable, as is training based on performance requirements. In addition, each of the stages of a systematic approach to training is very measurable. For example, it is easy to check to see if training objectives are based on performance requirements, and if learning assessments check for achievement of learning objectives.

The term competency is being used in a general manner in the SAR to refer to the ability to perform a task. Training should produce the ability to perform. Performance is measurable. If not, then we never know when a task is complete and done as well as needed. Defining performance means identifying what triggers action, what action is required, and to what specification or criteria. To say it in simpler terms, a performance statement says "when this happens, do this, this well". This is very measurable, and training based on performance requirements is very measurable.

Commenter	Yes	No	Comment
A Systematic Approach to training is a methodical approach as opposed to a disorganized approach. There is not one systematic approach to training, and the SAR is not meant to imply that there is only one methodical approach. There are, however certain questions that must be asked and answered for training to produce the ability to perform tasks as required by the job. However one groups those questions and whatever words one uses to describe those groupings, the basic questions must be addressed. For example, if training is requested to correct a performance problem and the question is not asked "Is the performance problem due to a lack of ability to perform?', then the training may be teaching something already known to someone that already has the ability to perform a task, but for some other reason is not applying his or her ability to perform in the workplace. Not using a systematic or methodical approach to training will not ensure that: 1. Training needed for performance of real-time reliability tasks are identified 2. Time and money are not wasted on unneeded training 3. Gaps in performance are identified 4. Training is designed and developed to match performance gaps 5. Demonstration of task performance through assessment of learning Best Practices are not subject to compliance and accountability. The SAR drafting team feels that not incorporating a training standard in response to the blackout recommendations would be doing a disservice to the industry. Best Practices and guidelines have existed for many, many years, and our industry has chosen to ignore them to a large extent, as was noted in the 2003 blackout reports, as it was in many other blackout reports before that.			
NYISO (2) Michael Calimano	✓	✓	The NYISO agrees that a requirement of a "systematic" approach to training will be a benefit to the industry. However as mentioened before, simply putting this as a standardf requirement without (a) some mention of topics to be included in the training program, and (b) a sense of how the requirement can be measured will render the standard too vague, which bring into question the need for such a standard.
Response: Training should produce the ability to perform. Performance is measurable. If not, then we never know when a task is complete and done as well as needed. Defining performance means identifying what triggers action, what action is required, and to what specification or criteria. To say it in simpler terms, a performance statement says "when this happens, do this, this well". What is done, when it is done, and how well it is done are all very measurable, as is training based on performance requirements. Whether or not the ability to do tasks is applied in the workplace is outside the scope of training. Many factors other than the ability to perform are involved in performance actually occurring. In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefor their knowledge and skills are somewhat different. There may, however, be a subset of tasks for which proficiency should be set on a NERC-wide basis - the SAR has been written with enough flexibility so that this is not precluded. However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select from for recertification in their Appendix A to their Certification Administrative Manual.			

Commenter	Yes	No	Comment
IESO (2) Ron Falsetti	✓	✓	We agree that the systematic approach can help responsible organizations to develop a structured and effective training program to help operating personnel to acquire the needed competency to perform their tasks. However, as mentioned earlier, simply putting this as a standard requirement without (a) some mention of the topics, even just at a high level, to be included in the training program and (b) a sense of how the requirement can be measured may render the standard too vague, which begs a question on the need for this standard.
Response: In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefor their knowledge and skills are somewhat different. Training content should be designed based on performance requirements for a person's specific job. To do otherwise does not ensure that: 1. Training needed for performance of real-time reliability tasks are identified 2. Time and money are not wasted on unneeded training 3. Gaps in performance are identified 4. Training is designed and developed to match performance gaps 5. Demonstration of task performance through assessment of learning However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select form for recertification in their Appendix A to their Certification Administrative Manual. There may be a subset of tasks for which proficiency should be set on a NERC-wide basis - the SAR has been written with enough flexibility so that this is not precluded. Training should produce the ability to perform. Performance is measurable. If not, then we never know when a task is complete and done as well as needed. Defining performance means identifying what triggers action, what action is required, and to what specification or criteria. To say it in simpler terms, a performance statement says "when this happens, do this, this well". What is done, when it is done, and how well it is done is all very measurable, as is training based on performance requirements. In addition, each of the stages of a systematic approach to training is very measurable. For example, it is easy to check to see if training objectives are based on performance requirements, and if learning assessments check for achievement of learning objectives.			
NPCC CP9 Reliability Standards Working Group Guy Zito – NPCC (2) K. Goodman – ISO-NE(2) Ralph Rufrano – NYPA (1) David Little – NS Power (1) Peter Lebro – NGrid (1)	✓		If in fact a standard must develop then the NPCC participating members believe that the systematic approachful would be useful however it must be stressed that the individual organizations that must perform the training and show their affected employees must demonstrate a level of competancy than they must be afforded the latitude to tailor their training programs to accomplish this. How does one apply a metric to competency?

Commenter	Yes	No	Comment
David Kiguel – Hydro One (1) J. Barnhart – Nstar (1) W. Shemley – ISONE (2) Greg Campoli – NYISO (2) Ron Falsetti – IESO (2) A. Adamson – NYSRC (2) Sashi Parekh – MA Dept. of Tele. And Energy (9) R. Pelligrinni – United Illum. (1)			
Response: Requiring a systematic approach to training will provide the flexibility to entities needed to tailor their training programs to fit their needs. That is why the approach of requiring a process has been chosen. In regard to metrics for competency, the term competency is being used in a general manner in the SAR to refer to the ability to perform a task. Training should produce the ability to perform. Performance is measurable. If not, then we never know when a task is complete and done as well as needed. Defining performance means identifying what triggers action, what action is required, and to what specification or criteria. To say it in simpler terms, a performance statement says “when this happens, do this, this well”. This is very measurable, training based on performance requirements is very measurable.			
ATC (1) Jason Shaver	✓		ATC is supportive of the 'systematic' approach to developing customized, personnel training as opposed to a centrally developed, topic specific, standardized approach to personnel training. The former approach allows for more flexibility between companies while providing a common framework for the industry. That being said, ATC recommedns the team give consideration to how NERC will validate and audit this standard as a customized approach will likely result in varying levels of documentation and results among companies. Any standards that come out of this SAR should be complimentary ,or at a minimum parallel, to NERC's CEH accreditation process. This standard should not create a conflicting approach to what is currently being used for the NERC CEH accreditation process.
Response: Points well made. The drafting team will consider documentation requirements. In regard to being complimentary to the CE Program, this approach fits quite well with the requirements of the CE Program.			
Entergy Services, Inc. (1) Ed Davis	✓		We agree that the standard developed from this SAR should expand on this SYSTEMATIC TRAINING PROCESS.
Response: The SAR has been reworded to clarify to whom the proposed standard will apply, and what will be required in the standard. The wording now reads: **”**The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and			

Commenter	Yes	No	Comment
Transmission Operators. The proposed standard will require the use of a systematic approach to determining training needs: The proposed standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to: - Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators. - Measure the mis-match between actual and desired performance, and - Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training. The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training. The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks.“			
MRO (2) Dick Pursley – GRE (2) Al Boesch – NPPD (2) Terry Bilke – MISO (2) Bob Coish – MHEB (2) Dennis Florom – LES (2) Ken Goldsmith – ALT (2) Todd Gosnell – OPPD (2) W. Guttormson – SPC (2) Tom Mielnik – MEC (2) Jim Maenner P. Oreschnick – XEL (2) Dave Rudolph – BEPC (2) Darrick Moe – WAPA (2) Joe Knight – MRO (2) 27 additional MRO members not listed above.	✓		The concern we have with a "systematic" approach is training that is required in areas where Operator exposure in real time is sporadic (e.g. disturbances, restoration, frequency arrest, voltage collapse) may be sacrificed. A "systematic" approach in our view will tend to concentrate more on supporting daily operating functions, and ignore keeping Operators familiar with abnormal operations which is critical to maintaining the BES. Unfortunately a "systematic" approach has challenges in the compliance world whereas a specific number of hours is measurable and can easily fit in the compliance world.
Response: As envisioned, the standard for system operators will require a training program for new operators and a training program that provides continuing education for existing operators. It will also require periodic drills or training for tasks performed infrequently to maintain competency.			
Southern Co. – Transm. (1)	✓		We agree but there are still some very basic training requirements which are needed regardless of the function or region the work is being done. These functions must be done the same way by

Commenter	Yes	No	Comment
Marc M. Butts Jim Viikinsalo – SOCO (1) Jim Busbin – SOCO (1) Jim Griffith – SOCO (1)			all or there will be confusion in the industry.
Response: The Drafting Team does not believe that prescribing a competency level for each task performed by each system operator for all Balancing Authorities, Reliability Coordinator, and Transmission Operator across the continent is valid. The performance requirements of a task must be defined with such specificity to be able to design training and learning assessments that will validate competency to perform that task that the same performance description cannot apply to the large number of system operators across the continent that will be covered by the standard. To define the competency level for each task would be to define the performance of each task to be exactly the same for all entities, which is neither practical, nor would it serve to ensure reliability. There may, however, be a subset of tasks for which proficiency should be set on a NERC-wide basis - the SAR has been written with enough flexibility so that this is not precluded.			
Northeast Utilities (1) Murale Gopinathan	✓		Northeast Utilities endorses the use of SAT process
Response: Thank you for your support.			
Arizona Public Services (1) Michael Scott	✓		We agree with the SAT philosophy for determining training requirements. However, the description provided in Step 1 above prescribes strict adherence to the following model: Job Analysis, Task Analysis, Needs Assessment. At the risk of getting into semantics, the understanding of these terms is pivotal to successful training: (1) Job Analysis, i.e. identifying tasks associated with a job, and determining these task's (DIF) Difficulty/Importance/Frequency (2) Task Analysis, i.e. analysis of each of these tasks to identify the knowledge/skills/abilities involved, (3) "Needs Assessment" (aka Needs Analysis) regarding each task to identify/solve gaps between performance desired and existing performance. We would challenge the Drafting Team to consider the possibility that thorough analysis can be performed correctly in a number of ways. For instance, many reserve the right to go no farther in the analysis process than the DIF determination, which may reveal that the task is so simple (or so prescriptively proceduralized), or that is so unimportant (from a stability or reliability standpoint), or is done so frequently that the likelihood of excellent performance is very strong, that no further analysis is indicated. In addition, flexibility is often provided to analysts to allow the use of Needs Assessment first, which may preclude the need for JTA at all. For example, if a performance deficiency is detected, Needs Assessment may determine that this problem occurred because of a procedure deficiency, human factor shortfall, or other non-training related challenge. The correct intervention could be a job aid, procedure revision, or better lighting. IF there is a knowledge or skill deficit, THEN a JTA may be performed, learning objectives designed, and coursework

			developed. In summary, we believe that the Systematic Approach to Training is an excellent process, but that this standard should not prescribe the absolute sequence or order of its application. Finally, the term "assessment" in item 5 above has a broad range of meaning. Do you mean that the trainee must be assessed (i.e. evaluations or examinations)? Or do you mean that the evaluation process needs to be assessed for effectiveness (or audited) periodically? Or do you mean that the improvement in personnel performance (because of training) needs to be measured or assessed via some pre-determined metrics?
Response: Excellent comments. The drafting team realizes that we have a wide range of background and understanding of the training process in our industry. The points made by the commenter will be clarified in the standard and its attachments and references to a point. A standard cannot contain sufficient verbiage to explain all concepts and principles it addresses.			
NERC Standards Evaluation Subcommittee Bill Bojorquez – ERCOT	✓		The SES notes that this is an excellent approach, but cautions that neither training programs nor personnel certifications nor qualifications are a guarantee of reliability.
Response: Excellent observation! Training can only validate competency. It cannot guarantee performance. It can document the ability to perform, but performance can be deficient for many reasons, only one of which is the ability to perform. The lack of a procedure or insufficient operating systems or data are just some examples of things other than competency deficiency that can prevent an otherwise competent operator from performing as required.			
MAAC (2) John Horakh	✓		But this "systematic" approach pre-supposes that personnel are NOT at the organization's desired level of competency. There really needs to be a "Step 0" that periodically measures whether an individual currently possesses the organization's desired level of competency for the job or tasks they are performing. If not, then they need training.
Response: Agreed – only if there is a mis-match between desired and actual performance, is training needed. If a systematic approach to training is followed competency gaps for existing operators will be identified as compared to the require level of performance. The SAR has been reworded to clarify to whom the proposed standard will apply, and what will be required in the standard. The wording now reads: **"**The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators. The proposed standard will require the use of a systematic approach to determining training needs: The proposed standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to: - Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators. - Measure the mis-match between actual and desired performance, and

- Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training. The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training. The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks.“			
Pepco Holdings, Inc. (1) Richard Kafka Valerie Hildebrand Vic Davis – Delmarva (1) John Miller – Conectiv (5) J. Newton – Pepco Energy (6)	✓		The systematic approach is an excellent approach to developing training versus requiring a specific number of hours of training on specific topics.
Response: Thank you for your support of the use of the systematic approach.			
AEP (1, 5, 6) James H. Sorrels, Jr.	✓		Yes, the NERC Certification Program already includes a list of required continuing education topics. Additional NERC training documents developed to influence and support the known training tasks from the NERC task analysis, would be good to support the standard, but not to measure the standard. These documents would be created separate from the standards and would be added to the existing NERC training documents.
Response: This is what is intended.			
Salt River Project (1) Michael J. Pfeister	✓		
Cinergy (1, 3, 6) Jeffrey T. Baker	✓		
TVA (1) Kathleen Davis	✓		

The SAR Drafting Team proposes that the training standard should not include a list of required training topics, because any list of training topics would not be applicable to all entities. Instead, the SAR Drafting Team proposes that each entity provide training to support competent performance of all reliability-related real-time tasks performed within that entity. The final determination of what tasks are performed within each entity, and therefore what tasks must be addressed in the training program needs to be determined by each entity.

5. Do you agree with the approach to a training standard that requires each entity to determine their specific training needs?

Summary Consideration: Most commenters agreed that the standard should require each entity to determine its own specific training needs. Several entities in response to this question and in response to earlier questions indicated that a minimum list of topics would be helpful. The drafting team will therefore include some high level suggested topics in the standard; the PCGC already has a list of topics to select from for recertification in their Appendix A to their Certification Administrative Manual. There may be, however, a subset of tasks for which proficiency should be set on a NERC-wide basis - the revised SAR has been written with enough flexibility so that this is not precluded.

Commenter	Yes	No	Comment
Cinergy (1, 3, 6) Jeffrey T. Baker		✓	My concern is this approach will result in voids. I believe high level goals should be outlined by the SAR drafting team with the individual enitites providing the necessary traing to meet each goal.
Response: This is a unique comment in the way it is stated. What we believe it says is exactly what the systematic approach to training accomplishes – the goal of the standard is to require the application of a systematic (methodical as opposed to random or disorganized) approach to training as the goal, with the specifics of what constitutes a systematic approach, and the individuals entities retaining the latitude to determine their specific training needs using a systematic approach.			
Entergy Services, Inc. (1) Ed Davis		✓	We are not sure but it appears the initial standard resulting from this SAR would require a process to be developed and not require training of anyone. Therefore this question is premature, not appropriate at this time, and should be asked when the SAR for personnel training is presented to the industry. Also, we are not sure we understand the statement nor the question. An organization should be able to specify the tasks for which it is responsible. That specification of tasks is through being the functional entity responsible to meet the requirements of a standard, or through a delegation agreement. An organization whose employees perform tasks to meet reliability-related real-time tasks should have a process to evaluate the competency of its personnel and to train its personnel to perform those tasks. That process should evaluate the specific training needs of the employees performing those tasks. Competency standards should apply to the personnel performing the tasks, not to the organization.

Commenter	Yes	No	Comment
			A list of training topics may be included in the standard but they would apply to the personnel performing the tasks, not to the organization.

Response: The drafting team has revised the applicability of the standard to be:

"System operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators."

The SAR will require training of anyone (to whom it applies) that has found, using a systematic approach to training, that there is a gap in personnel's performance requirements and their ability to perform.

The drafting team agrees that an organization whose employees perform tasks to meet reliability-related real-time tasks should have a process to evaluate the competency of its personnel and to train its personnel to perform those tasks. That process should evaluate the specific training needs of the employees performing those tasks. That is the result of focusing the standard on a systematic approach to training as opposed to a list of required topics. Using a systematic approach, the organization determines which system operator tasks directly impact reliability and train to those tasks when they identify a competency gap.

In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefor their knowledge and skills are somewhat different. Training content should be designed based on performance requirements for a person's specific job. To do otherwise does not ensure that:

1. Training needed for performance of real-time reliability tasks are identified
2. Time and money are not wasted on unneeded training
3. Gaps in performance are identified
4. Training is designed and developed to match performance gaps
5. Demonstration of task performance through assessment of learning

However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select form for recertification in their Appendix A to their Certification Administrative Manual.

In regard to the proposed standard applying to personnel performing tasks, the drafting team agrees that competency applies to personal performing tasks. The SAR would require the responsible entities to ensure that personnel are provided with training that ensures that competency.

NYISO (2) Michael Calimano	✓	✓	The NYISO agrees that each entity should determine their own specific training needs and the methods to address those needs. If there is to be a benefit of a NERC training standard, such a standard should define a consistent set of topics which need to be addressed across the industry,

Commenter	Yes	No	Comment
			regardless of size, location or organizational structure.
Response: In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefor their knowledge and skills are somewhat different. Commenter	Yes	No	Comment
However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select form for recertification in their Appendix A to their Certification Administrative Manual. There maybe a subset of tasks for which proficiency should be set on a NERC-wide basis - the revised SAR has been written with enough flexibility so that this is not precluded. Training should produce the ability to perform. Performance is measurable. If not, then we would never know when a task is complete and done as well as needed. Defining performance means identifying what triggers action, what action is required, and to what specification or criteria. To say it in simpler terms, a performance statement says “when this happens, do this, this well”. What is done, when it is done, and how well it is done are all very measurable, as is training based on performance requirements. In addition, each of the stages of a systematic approach to training are very measurable. For example, it is easy to check to see if training objectives are based on performance requirements, and if learning assessments check for achievement of learning objectives.			
PJM (2) Albert DiCaprio Bruce Balmat Mark Kuran Joseph Willson ISO/RTO Council Bruce Balmat – PJM (2) Anita Lee – AESO (2) Liza Szot – CAISO (2) Sam Jones – ERCOT (2) Ron Falsetti – IESO (2) Pete Brandien – ISONE (2) Bill Phillips – MISO (2) Mike Calimano – NYISO (2) C. Yeung – SPP (2)	✓	✓	PJM (IRC) does agree that "the final determination of what tasks are performed …be addressed in (a) training program…determined by each entity." PJM also agrees that if this SAR is to be a standard, then the proposal must identify, at least a high-level, the topics that must be used to meet the compliance requirements for a training program. PJM (IRC) suggests that if this SAR is to proceed then the RC, BA and TOP are the entities to which this standard will apply because their operating functions are clearly defined in the functional model. PJM (RIC) believes that there is no reason why some of the topics that reflect the operating functions of the three above noted functional entities should not be included, as minimum requirements, in the standard. This would ensure that there is consistent coverage in the training programs for the same function across the industry, regardless of size, location and organization structure. PJM (IRC) agrees that the Personnel Subcommittee has created an excellent training manual that organizations should consider as a "Best Practice” approach to training, but this material need not be turned into a NERC Standard .
Response: The SAR has been revised to clarify its scope and applicability and the drafting team believes the revised SAR supports your suggestions. The revised SAR is only applicable to the Reliability Coordinator, Balancing Authority and Transmission Operator. While the drafting team believes that each entity should identify its own company-specific list or reliability-related tasks and each entity should identify company-specific training needs, the drafting team also recognizes that there maybe a subset of tasks for which proficiency should be set on a NERC-wide basis - the revised SAR has been written with enough flexibility so that this is not precluded.

FRCC (2) Eric Senkowicz – FRCC Linda Campbell – FRCC Jeff Gooding – FPL (1) Alan Gale – TAL (5) Mark Bennett – Gainesville (5) Dennis Minton – FL Keys (1)	We reiterate our concern with the development of a "support staff" training standard at this time. The NERC PS should focus its efforts on real-time operations of the BES at this time. Trying to get every entity to have a "Cadillac" training system is beyond the charge of establishing MINIMUM standards as stated in the SAR "purpose". Training programs for all the "support staff" in an organization would be a significant cost that may not significantly improve the reliability of the BES. Introduction - Page SAR-5, item number 5. What process is an "amendment of the Training Standard"? The word "amendment" is not used in the Reliability Standards Process Manual, Version 4 of 8/2/05. The SDT/PS should follow the approved process for modification and not attempt to create a new process by saying they are going to "amend" a standard when they can get around to it. Finally, we want to reiterate our appreciation for the significant work of the PS and by no means are we suggesting it should be tempered or abandoned. We feel that the concepts, as described, do "need" to be delivered to the industry, we just don't concur that the "Training Standard" is an appropriate "systematic training program" evaluation and measurement vehicle.
Response: The SAR was revised, and no longer contains any requirements for training 'support staff'. The SAR has been revised and no longer includes the reference 'amendment to the Training Standard.' The revised SAR still requires use of the systematic approach to developing training.	
ATC (1) Jason Shaver	The SAR Team should consider whether this SAR, if applicable to Planning Authority personnel, also has applicability to other Reliability Functions, as indicated in the "Reliability Functions" section, such as Resource Planner, Transmission Planner and Distribution Provider. Any standards that come out of this SAR should be complimentary ,or at a minimum parallel, to NERC's CEH accreditation process. ATC requests that meeting invites for the proctored JTA Workshops be sent out by email in addition to being posted on the NERC Standards Development web page. The industry should know about the workshops as soon as they are agreed to by NERC to allow for adequate scheduling time. ATC looks forward to reviewing this standard in the future.
Response: These comments are very relevant to the broader view of the 2003 Blackout Studies. Based on stakeholder comments, the drafting team reduced the scope of the SAR to focus specifically on the training of real-time system operators who perform reliability-related Bulk Electric System Tasks for Reliability Coordinators, Transmission Operators and Balancing Authorities. The drafting team still believes training is needed for other operating and support personnel, but recognizes that stakeholders want to focus on the more critical training issue first – that of the real time system operators.	

Commenter	Comment
There has been very intentional coordination between the SAR drafting team, the PCGC certificate maintenance process changes, and the proposed training standard to make them complimentary. As envisioned, this standard will complement the Organization Certification Standards, System Operator Certification, and the Continuing Education Hours program. The proctored JTA has been re-thought because of the difficulty an entity would have in sending a system operator to a location with the associated travel expenses to just complete a survey. The intent was to make the completion of the survey more valid by doing it with one-on-one instruction, but technology offers more options and the drafting team has realized that there are more cost responsible options available with the current state of technology. We will take a more cost-effective approach to doing the JTAs.	
Con Ed of New York (1) Walter Cintron	The Draft SAR 1.0 323825 is missing sections R9,10,11,12,13 and 14. I think that this initial SAR should limit itself to those performing operating tasks in a real-time or day-ahead time frame. As is the SAR is too encompassing and requires resources that are not available and may be unrealistic to support if drafted by many entities throughout the country.
Response: The SAR has been reworded to narrow the scope and applicability of the associated standard. The wording now reads: **"**The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators.	
Entergy Services, Inc. (1) Ed Davis	1. We commend the SAR authors for modifying the SAR based on comments submitted. However, we believe the authors have not modified the SAR enough. This SAR continues to be overly broad, ambiguous and confusing. The SAR contains a discussion of many issues but does not specify the requirements of a standard resulting from THIS SAR. 2. We are not sure but THIS SAR seems to be requesting the initial standard would require a process to be developed and not require training of anyone. We agree that the development of the process should be vetted through the industry standards developemnt process to obtain industry-wide comments. However, we think the development of a PROCESS rises to the level of being a STANDARD. We also think that the PROCESS of a training program is not really measurable, except in a very subjective sense, and will cause significant problems with audits and sanctions. 3. Also, after reading the SAR it is not cleasr which entity is being discussed: the corporation that needs to develop a training program, or the employee who may need training. If the SAR is discussing both the corporation and the employee then it is not clear which parts of the SAR apply to the corporation and which apply to the employee.

Commenter	Comment
	4. However, we do not think the industry participants should guess about the intent and/or content of a standard to be developed. Nor should we agree to march forward with a vague request for a standard and associated requirements. 5. The SAR contains a discussion of Job Task Analysis, Operating Task Analysis and Operations Support Task Analysis that will be performed. Then, based on those results something else will be done. We suggest another SAR be written and submitted when those analyses are complete. For instance, Item 3 states the task analysis will supply the industry with the task analysis data that will serve as the foundation for performance requirements required to determine competency gaps. 6. There is a section entitled Concepts of the Training Standard which includes the statement that the proposed NERC training standard includes the requirements for these training standards. We are unable to find the requirements of the training standards in the SAR. They do not seem to be there. 7. The SAR contains 5 steps which appear to be steps in a training program PROCESS. Those steps seem reasonable. The SAR also contains a highlighted section with three paragraphs. The first paragraph contains a reasonable statement that every organization should determine the tasks that its operating personnel perform. The second paragraph contains the seemingly contradictory statement that the organization is not required to perform a Job Task Analysis. The third paragraph contains a statement that the Personnel Subcommittee is conducting three studies. 8. What would be the requirements of a standard that resulted from this SAR? We do not know from the content of this SAR and therefore suggest the authors make the SAR more explicit.
Response: 1, 4, 8 The SAR has been reworded to clarify to whom the proposed standard will apply, and what will be required in the standard. The wording now reads: **"**The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators. The proposed standard will require the use of a systematic approach to determining training needs: The proposed standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to: - Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators.	

Commenter	Comment
	- Measure the mis-match between actual and desired performance, and - Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training. The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training. The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks." 2. Training should produce the ability to perform a task to a specified level of competence. Performance is measurable. If not, then we would never know when a task is complete and done as well as needed. Defining performance means identifying what triggers action, what action is required, and to what specification or criteria. To say it in simpler terms, a performance statement says "when this happens, do this, this well". What is done, when it is done, and how well it is done are all very measurable, as is training based on performance requirements. In addition, each of the stages of a systematic approach to training is very measurable. For example, it is easy to check to see if training objectives are based on performance requirements, and if learning assessments check for achievement of learning objectives. 3. Competency applies to personnel performing tasks. The SAR would require the responsible entities to ensure that personnel are provided with training that ensures that competency. 5. The SAR drafting team, based on stakeholder comments, has decided to limit the scope of the training standard to system operators performing real-time operations. The support tasks performed by support personnel will not be addressed in this standard. Furthermore the proposed standard will be limited to the organizations that will be certified under the pending orrganization certification standards for the Transmission Operator (TO), the Balancing Authority (BA) and the Reliability Coordinator (RC). The results of the NERC job analysis will be included in the standard as an aid to the industry, not the basis for determining to whom the standard applies. This is a change form the last version of the SAR. 6. The specific requirements of the standard have not been completely developed. It is the understanding of the SAR drafting team that this is not part of the SAR drafting and approval process. The SAR has been revised to omit these references. 7. Agree. The revised SAR states that entities will be required to follow a systematic process.
MRO (2) Dick Pursley – GRE (2) Al Boesch – NPPD (2) Terry Bilke – MISO (2) Bob Coish – MHEB (2)	It appears that this SAR is not a new standard as checked under SAR type on SAR-1 but is actually a revision to existing standard PER-002-0. The PER-002-0 standard would appear to be redundant and not needed after this standard has been developed. We are very pleased about the NERC Personnel Subcommittee's interest and efforts to clarify and develop standards concerning training of support personnel. We also applaude the responsiveness of the System Personnel Training SAR Drafting Team to the initial concerns with the first draft of the SAR.

Commenter	Comment
Dennis Florom – LES (2) Ken Goldsmith – ALT (2) Todd Gosnell – OPPD (2) W. Guttormson – SPC (2) Tom Mielnik – MEC (2) Jim Maenner P. Oreschnick – XEL (2) Dave Rudolph – BEPC (2) Darrick Moe – WAPA (2) Joe Knight – MRO (2) 27 additional MRO members not listed above.	
Response: Yes, this standard would replace PER_002.	
NYISO (2) Michael Calimano	The NYISO agrees that the systemaic approach to to training based on local needs and tasks is move that will benefit the reliable operation of the BES. However, the standard needs to be developed with a manageable scope, clearly defined measures of compliance, and it should contain an outline of topics that would insure consistancy in both the method and the content of operations training across the industry.
Response: The SAR has been reworded to clarify to whom the proposed standard will apply, and what will be required in the standard. The wording now reads: **"**The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators. The proposed standard will require the use of a systematic approach to determining training needs: The proposed standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to: - Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators. - Measure the mis-match between actual and desired performance, and - Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training. The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training. The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks.“	

Commenter	Comment
In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefor their knowledge and skills are somewhat different. Training content should be designed based on performance requirements for a person's specific job. To do otherwise does not ensure that: 1. Training needed for performance of real-time reliability tasks are identified 2. Time and money are not wasted on unneeded training 3. Gaps in performance are identified 4. Training is designed and developed to match performance gaps 5. Demonstration of task performance through assessment of learning However, the drafting team will include some high level suggested topics in the standard; the PCGC already has a list of topics to select form for recertification in their Appendix A to their Certification Administrative Manual. There maybe a subset of tasks for which proficiency should be set on a NERC-wide basis - the revised SAR has been written with enough flexibility so that this is not precluded.	
IESO (2) Ron Falsetti	We feel that development of a training standard is a step in the right direction in view of the recommendations of the 2003 blackout report and given the requirements to have certified personnel for some of the functional entities and these entities' responsibility to provide training. However, the standard needs to be developed with manageable scope, tangible requirements that can be measured, and with an aim to achieve consistency in training development not just in terms of the process but also in terms of the topics for the same function across the industry. In this vein, we offer the following suggestions for consideration: a. The SAR to clearly convey to whom (entities) the proposed standard would apply. To limit the scope at the onset, we suggest the standard be developed for compliance by the RC, BA and TOP only. b. The SAR to provide a high level description of the requirements, which should include (i) the use of a systematic approach to develop the training program and (ii) a high level scope of coverage of the training program. The tasks listed in the draft Organization Certification standards for RC, BA and TOP could serve to provide this coverage.
Response: Agreed. The SAR has been reworded to clarify to whom the proposed standard will apply, and what will be required in the standard. The wording now reads: **"**The scope of this proposed training standard will be limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators.	

Commenter	Comment
The proposed standard will require the use of a systematic approach to determining training needs: The proposed standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to: - Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators. - Measure the mis-match between actual and desired performance, and - Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training. The proposed standard will require that entities have evidence that a systematic approach to training was conducted and used as the basis for providing training. The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks.“ In regard to a list of topics, the drafting team believes that requiring all RCs, Bas, and TOs to train on the same topics, or even all BAs to train on the same list of topics, is counter to a valid approach to training. All BAs do not do the same tasks in the same way, therefor their knowledge and skills are somewhat different. Training content should be designed based on performance requirements for a person’s specific job. However, the drafting team will include some high level suggested topics in the standard. There maybe a subset of tasks for which proficiency should be set on a NERC-wide basis - the revised SAR has been written with enough flexibility so that this is not precluded.	
NERC Standards Evaluation Subcommittee Bill Bojorquez – ERCOT	The SES believes that it is appropriate to begin the development of training standards with those most affecting the real-time relaiablity. The SES also believes that it will be very difficult to develop training standards for personnel involved in longer range planning. It is an inherently different process, involving group efforts and cycles of review, that tends to identify strong and poor performers. There are general requirements for educational level and subjects, training in the tools of trade and the general processes used in loger range planning, but it difficult to conceive of a training program that could provide asssurance of "good planning."
Response: The scope of the SAR was reduced to focus, as you and several others suggested, on the real-time system operators who most affect real-time reliability.	
Pepco Holdings, Inc. (1) Richard Kafka Valerie Hildebrand Vic Davis – Delmarva (1) John Miller – Conectiv (5) J. Newton – Pepco Energy (6)	This is a much more labor intensive process. Arriving at an assessment that accurately measures a person’s competency could be difficult to create or achieve, particularly in an organization with limited training resources.
Response: While difficult to achieve, the drafting team believes that this is the right direction. End-users need to know that those charged with responsibility for protecting reliability of the interconnected grid are competent. As envisioned, the reference documents identified in the revised SAR will provide entities with assistance in meeting the standard’s requirements.	

Commenter	Comment
AEP (1, 5, 6) James H. Sorrels, Jr.	The standard should provide a time specification and allowance for implementation of the standard. Putting future continuing education training materials and programs into format will fall into place more readily than the existing initial training program materials already in place by most entities. Re-development of these programs, especially if requiring additional staffing to handle development and delivery methods, would require more time to implement for existing progression programs.
Response: Developing an implementation plan at this point would be premature – the implementation plan will be developed by the standard drafting team after the standard has been drafted.	
PJM (2) Albert DiCaprio Bruce Balmat Mark Kuran Joseph Willson ISO/RTO Council Bruce Balmat – PJM (2) Anita Lee – AESO (2) Liza Szot – CAISO (2) Sam Jones – ERCOT (2) Ron Falsetti – IESO (2) Pete Brandien – ISONE (2) Bill Phillips – MISO (2) Mike Calimano – NYISO (2) C. Yeung – SPP (2)	In its comments to the first draft of this SAR, the Industry overwhelmingly supports the value of Training. PJM (IRC) also strongly endorses the concept of training to ensure reliability, and supports the Systematic Approach process being developed. The Personnel Subcommittee has taken a step in the right direction in view of the recommendations of the 2003 Blackout Report, however, PJM must point out the fact that the SAR is required to complement: 1. Current Certification process 2. Functional Model regarding the entities that are responsible for compliance to NERC standards 3. NERC Standards Process - Manageable scope - Measurable requirements - Consistent application and results
Response: The drafting team believes that the revised SAR does complement the new certification standards, the functional model and the NERC standards process. The revised SAR does provide more clarity to the scope and applicability of the proposed standard.	

NORTH AMERICAN ELECTRIC RELIABILITY COUNCIL

Princeton Forrestal Village, 116-390 Village Boulevard, Princeton, New Jersey 08540-5731

May 16, 2006

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

Announcement:
Drafting Team Nominations; Pre-ballot Reviews; Ballot Pools Open May 15

The Standards Authorization Committee (SAC) announces the following standards actions:

Nominations for Personnel Training Standard Drafting Team Open (May 15–June 1)

The SAC is soliciting drafting team members to draft the personnel training standard. The standard will require that the Reliability Coordinator, Balancing Authority, and Transmission Operator have a training program for real-time system operators. If you are interested in volunteering for this standard drafting team, please submit the nomination form by June 1, 2006.

Nominations for Modifications to IRO-004 for Timely Submission of Data Drafting Team Open (May 15–June 1)

The SAC is soliciting drafting team members to assist the requester in responding to the comments submitted with the SAR and the proposed changes to the associated standard. The proposed change would add timing requirements relative to the submission of operational data used for day-ahead operational analyses. If you are interested in volunteering for this drafting team, please submit the nomination form by June 1, 2006.

Four Phase III & IV Standards Posted for 30-day Pre-Ballot Review (May 15–June 14)

Four of the Phase III & IV standards are being posted for a 30-day pre-ballot review period. Balloting is expected to begin on or about June 15, 2006.

PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements requires regions to establish requirements for installation of disturbance monitoring equipment and reporting of disturbance data to facilitate analyses of events.

PRC-018-1 — Disturbance Monitoring Equipment Installation and Data Reporting requires entities to install Disturbance Monitoring Equipment and report disturbance data to facilitate analyses of events.

VAR-001-1 — Voltage and Reactive Control is a Version 0 standard with the addition of requirements for the transmission operator to provide the generator operator with voltage or reactive power schedules and for the transmission operator to provide the generator owner with step-up transformer tap changes.

VAR-002-1 — Generator Operation for Maintaining Network Voltage Schedules is a new standard that requires generator operators to operate in the automatic voltage control mode, and to notify the transmission operator of certain changes that could affect the voltage or reactive support in the transmission operator's area. The standard also requires the generator owner to provide entities with data on transformer tap settings and to ensure compliance with the transmission operator's step-up transformer tap specifications.

Ballot Pool for Disturbance Monitoring Equipment Standards (PRC-002 and PRC-018) Open (May 15)

A ballot pool has been created to vote on the two Phase III & IV standards that address disturbance monitoring & reporting (PRC-002 and PRC-018). Any member of the registered ballot body that is interested in casting a vote on this set of standards may join the ballot pool up to the time that the ballot window opens. Once the ballot window opens, no changes can be made to the ballot pool.

Ballot Pool for Coordination of Generator Reactive Resources Standards (VAR-001 and VAR-002) Open (May 15)

A ballot pool has been created to vote on the two Phase III & IV Standards that address the coordination of generator reactive resources (VAR-001 and VAR-002). Any member of the registered ballot body that is interested in casting a vote on this set of standards may join the ballot pool up to the time that the ballot window opens. Once the ballot window opens, no changes can be made to the ballot pool.

Standards Development Process

The NERC posting and balloting procedures are described in the *Reliability Standards Process Manual*, which contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Please send questions to Maureen Long at maureen.long@nerc.net, or call 813-468-5998.

Sincerely,

Maureen E. Long

Standard Authorization Request Form

Title of Proposed Standard	System Personnel Training Requirements
Request Date	July 1, 2004
Draft Three	4/12/2006

SAR Requestor Information		**SAR Type** (Put an 'x' in front of one of these selections)	
Name	NERC Personnel Subcommittee	☒	New Standard
Primary Contact	Earl Cass, Chair NERC PS	☐	Revision to existing Standard
Telephone	605-882-7550	☐	Withdrawal of existing Standard
Fax	605-882-7453		
E-mail	cass@wapa.gov	☐	Urgent Action

Purpose/Industry Need

A training standard is needed to ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System are competent to perform those tasks. The competency of system operators is critical to the reliability of the North American Bulk Electric System.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies by double clicking the grey boxes.)*		
☒	Reliability Authority	Ensures the reliability of the bulk transmission system within its Reliability Authority area. This is the highest reliability authority.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules
☐	Planning Authority	Plans the bulk electric system
☐	Resource Planner	Develops a long-term (>1year) plan for the resource adequacy of specific loads within a Planning Authority area.
☐	Transmission Planner	Develops a long-term (>1 year) plan for the reliability of transmission systems within its portion of the Planning Authority area.
☐	Transmission Service Provider	Provides transmission services to qualified market participants under applicable transmission service agreements
☐	Transmission Owner	Owns transmission facilities
☒	Transmission Operator	Operates and maintains the transmission facilities, and executes switching orders
☐	Distribution Provider	Provides and operates the “wires” between the transmission system and the customer
☐	Generator Owner	Owns and maintains generation unit(s)
☐	Generator Operator	Operates generation unit(s) and performs the functions of supplying energy and Interconnected Operations Services
☐	Purchasing-Selling Entity	The function of purchasing or selling energy, capacity and all necessary Interconnected Operations Services as required
☐	Market Operator	Integrates energy, capacity, balancing, and transmission resources to achieve an economic, reliability-constrained dispatch.
☐	Load-Serving Entity	Secures energy and transmission (and related generation services) to serve the end user

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check boxes for all that apply by double clicking the grey boxes.)*	
☐	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.
Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box by double clicking the grey area.)*	
1.	The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2.	An Organization Standard shall not give any market participant an unfair competitive advantage.Yes
3.	An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4.	An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes
5.	An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft, modify, or withdraw a Standard based on this description.)

The scope of this training standard is limited to system operators performing tasks in real-time that directly impact the reliability of the Bulk Electric System (BES), and who perform such tasks for entities registered as Reliability Coordinators, Balancing Authorities, and Transmission Operators.

The standard will require the use of a systematic approach to determining training needs:. The standard will require each Reliability Coordinator, Balancing Authority and Transmission Operator to:

- Identify the desired performance for each real-time, reliability-related task performed by its real-time system operators.
- Measure the mis-match between actual and desired performance, and
- Use the results of the mis-match between desired and actual performance as the basis for determining training needs, developing, delivering and evaluating training.

The standard will require that entities have evidence that this systematic approach to training was conducted and used as the basis for providing training.

The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks.

The following documents will be developed in parallel with this standard to provide support in its implementation:

- Generic, reliability-related tasks assigned to real-time system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators
- How to determine task performance requirements
- How to apply a systematic approach to training

Personnel Training Standard Drafting Team — Nomination Form

Please return this form to sarcomm@nerc.com by June 1, 2006. For questions, please contact Richard Schneider at 609-452-8060 or Richard.Schneider@nerc.net.

Please note this drafting team will likely meet initially the second week of July (Tuesday and Wednesday or Wednesday and Thursday) 2006 to begin drafting the proposed standard. The complete meeting schedule has not been determined yet. It is expected the team will meet several times in 2006 including face-to-face meetings, as well as, meetings facilitated through various remote meeting technologies. **All candidates should be prepared to participate actively at these meetings.**

NORTH AMERICAN ELECTRIC RELIABILITY COUNCIL

Princeton Forrestal Village, 116-390 Village Boulevard, Princeton, New Jersey 08540-5731

May 16, 2006

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

Announcement:
Drafting Team Nominations; Pre-ballot Reviews; Ballot Pools Open May 15

The Standards Authorization Committee (SAC) announces the following standards actions:

Nominations for Personnel Training Standard Drafting Team Open (May 15–June 1)

The SAC is soliciting drafting team members to draft the personnel training standard. The standard will require that the Reliability Coordinator, Balancing Authority, and Transmission Operator have a training program for real-time system operators. If you are interested in volunteering for this standard drafting team, please submit the nomination form by June 1, 2006.

Nominations for Modifications to IRO-004 for Timely Submission of Data Drafting Team Open (May 15–June 1)

The SAC is soliciting drafting team members to assist the requester in responding to the comments submitted with the SAR and the proposed changes to the associated standard. The proposed change would add timing requirements relative to the submission of operational data used for day-ahead operational analyses. If you are interested in volunteering for this drafting team, please submit the nomination form by June 1, 2006.

Four Phase III & IV Standards Posted for 30-day Pre-Ballot Review (May 15–June 14)

Four of the Phase III & IV standards are being posted for a 30-day pre-ballot review period. Balloting is expected to begin on or about June 15, 2006.

PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements requires regions to establish requirements for installation of disturbance monitoring equipment and reporting of disturbance data to facilitate analyses of events.

PRC-018-1 — Disturbance Monitoring Equipment Installation and Data Reporting requires entities to install Disturbance Monitoring Equipment and report disturbance data to facilitate analyses of events.

VAR-001-1 — Voltage and Reactive Control is a Version 0 standard with the addition of requirements for the transmission operator to provide the generator operator with voltage or reactive power schedules and for the transmission operator to provide the generator owner with step-up transformer tap changes.

VAR-002-1 — Generator Operation for Maintaining Network Voltage Schedules is a new standard that requires generator operators to operate in the automatic voltage control mode, and to notify the transmission operator of certain changes that could affect the voltage or reactive support in the transmission operator's area. The standard also requires the generator owner to provide entities with data on transformer tap settings and to ensure compliance with the transmission operator's step-up transformer tap specifications.

Ballot Pool for Disturbance Monitoring Equipment Standards (PRC-002 and PRC-018) Open (May 15)

A ballot pool has been created to vote on the two Phase III & IV standards that address disturbance monitoring & reporting (PRC-002 and PRC-018). Any member of the registered ballot body that is interested in casting a vote on this set of standards may join the ballot pool up to the time that the ballot window opens. Once the ballot window opens, no changes can be made to the ballot pool.

Ballot Pool for Coordination of Generator Reactive Resources Standards (VAR-001 and VAR-002) Open (May 15)

A ballot pool has been created to vote on the two Phase III & IV Standards that address the coordination of generator reactive resources (VAR-001 and VAR-002). Any member of the registered ballot body that is interested in casting a vote on this set of standards may join the ballot pool up to the time that the ballot window opens. Once the ballot window opens, no changes can be made to the ballot pool.

Standards Development Process

The NERC posting and balloting procedures are described in the *Reliability Standards Process Manual*, which contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Please send questions to Maureen Long at maureen.long@nerc.net, or call 813-468-5998.

Sincerely,

Maureen E. Long

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standard drafting team appointed by the Standards Authorization Committee on June 21, 2006.

Proposed Action Plan and Description of Current Draft:

This is the first posting of the proposed standard and its associated implementation plan for a 30-day comment period, from September 27–October 26, 2006.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments and post a revised standard and implementation plan for a second comment period for 45-days.	November 15–December 29, 2006
2. Respond to comments on the second draft of the proposed standard.	January 15, 2007
3. Obtain the Standards Committee's approval to move the standard forward to balloting.	January 15, 2007
4. Post the standard and implementation plan for a 30-day pre-ballot review.	February 1–March 2, 2007
5. Conduct an initial ballot for ten days.	March 5–16, 2007
6. Respond to comments submitted with the initial ballot.	March 23, 2007
7. Conduct a recirculation ballot for ten days.	March –April 4, 2007
8. Post for a 30-day preview for board.	April 1–30, 2007
9. BOT adoption.	May 2, 2007

A. Introduction

1. **Title:** **System Operator Training**

2. **Number:** PER-005-1

3. **Purpose:** To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System are competent to perform those tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Reliability Coordinator.

   4.1.2 Balancing Authority.

   4.1.3 Transmission Operator.

5. **Proposed Effective Date for Regulatory Approvals:** July 1, 2007

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct a System Operator job task analysis (JTA). The analysis must be updated when there is a new or revised task or tool. The JTA results shall include a list of company-specific reliability-related tasks assigned to each System Operator position and the following information for each of those tasks: [Risk Factor: High]

R1.1. The conditions under which the task is performed.

R1.2. The actions to be taken in performing the task, including identification of references and tools used in performing the task.

R1.3. Identification of whether the task is performed alone or as part of a team.

R1.4. The criticality of the task with respect to reliability.

R1.5. The frequency of performing the task.

R1.6. The knowledge, skill, and experience needed to perform the task.

R1.7. The criteria for successful performance of the task.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall assess the training needs (for the tasks identified in Requirement 1 and the criteria for successful performance of the task identified in Requirement 1.7.) of entry-level or newly hired experienced System Operators.[Risk Factor: Medium]

R3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct a training needs assessment of incumbent System Operator to identify mismatches (for the tasks identified in Requirement 1 and the criteria for successful performance of the task identified in Requirement 1.7.) between actual performance and the criteria for successful performance for each position performing reliability-related tasks identified in R1. (including any contract System Operator or System

Operator performing tasks identified in R1. under delegation agreements) at least once every year. [Risk Factor: High]

R4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have an annual training plan developed from the training needs assessments in R2. and R3. that identifies the topics, anticipated duration of the topic, and target schedule for the following types of training: [Risk Factor: Medium]

R4.1. Entry-level System Operator training to bring entry-level System Operator performance to a minimum acceptable level of competency on all assigned reliability-related tasks.

R4.2. Refresher training to reduce performance gaps of incumbent System Operator.

R4.3. Refresher training to provide incumbent System Operator with practice in performing tasks with high criticality and low frequency of occurrence.

R4.4. Continuing training to provide incumbent System Operator with new knowledge and skill to perform new or revised tasks or to use new tools.

R5. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify that persons developing or delivering training have the following qualifications: [Risk Factor: High]

R5.1. Training development:

R5.1.1. Operating knowledge in the subject matter covered by the training activity.

R5.1.2. Competency in developing training using a systematic approach.

R5.2. Training delivery:

R5.2.1. Competency in training delivery.

R6. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall implement its System Operator training program by providing training to all of its System Operator (including any contract System Operator or System Operator performing tasks identified in R1. under delegation agreements) as follows: [Risk Factor: High]

R6.1. Entry-level training to provide System Operator with the knowledge and skill identified in R2. to meet the associated criteria for successful performance identified in R1.7.

R6.2. Continuing training to reinforce knowledge and skills of incumbent System Operators as identified in the JTA (Requirement 1) that were not covered in Requirement 4.2.

R6.3. Refresher training to eliminate performance gaps identified by the training needs assessments in Requirement 2, and Requirement 3.

R6.4. Continuing training to acquire the knowledge and skills necessary for new or modified tasks and tools identified in R2. and R3.

R6.5. Annual refresher training for incumbent System Operator that includes the use of drills and simulations on tasks that have high reliability-related criticality (as identified in R1.4.) and low frequency of occurrence (as identified in R1.5.) to meet the associated criteria for successful performance identified in R1.7. This refresher training shall include:

R6.5.1. At least 32 hours of emergency operations or system restoration training, simulating the system conditions, operating procedures and communication processes.

R6.5.2. At least one exercise each year shall involve other entities on a sub-regional, regional or interconnection-wide basis, involving all real-time operating positions likely to be involved in the actual event, with each person performing their assigned duties. [Risk Factor: Medium]

R7. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall document the following for each training activity used to support its reliability-related System Operator training: [Risk Factor: Lower]

R7.1. Title of the activity.

R7.2. Training provider.

R7.3. Description of the content covered by the activity.

R7.4. Training method or methods.

R7.5. Tools or reference documents needed for the training.

R7.6. Identification of the task or tasks (identified in R1.), or supporting knowledge or skill (identified in R1.6.) covered by the training.

R7.7. Identification of the conditions under which the associated task is performed (as identified in R1.1.).

R7.8. Identification of any prerequisite training.

R7.9. Objectives and assessments that duplicate the criteria for successful performance identified in R1.7. and mastery of the knowledge and skills in R1.6.

R7.10. Practice in following the steps and using the tools and references identified in R1.2., including practice with others if the task is normally performed as part of a team (as identified in R1.3.)

R8. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall track the progress of each of its System Operator (including any contract System Operator or System Operator performing tasks identified in R1. under delegation agreements) in using training to obtain the knowledge, skill and experience needed to meet the performance criteria specified in R1.7. for the tasks identified in R1. by maintaining the following records: [Risk Factor: Medium]

R8.1. For each reliability-related task identified in R1., the date and method used to assess whether the System Operator's performance meets the criteria specified in R1.7.

R8.2. For participation in each training activity identified under R7., the date and duration of participation in training activities designed to develop their ability to meet the performance criteria in R1.7.

R9. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of its System Operator training program to determine if the training does prepare System Operator to meet the criteria for successful performance as identified in R1.7. and use the results to update the program to meet identified deficiencies, giving consideration to the following information sources: [Risk Factor: Medium]

R9.1. Feedback from trainees to identify areas where the training should be clarified or modified.

R9.2. Results of learning assessments.

R9.3. Post-training workplace performance feedback.

R9.4. Audit results.

R10. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall maintain its System Operator training program so that the information provided to trainees accurately reflects the current operating environment. [Risk Factor: Medium]

C. Measures

M1. Each Reliability Authority, Balancing Authority and Transmission Operator shall have available for inspection, the results of its latest JTA with the details specified in R 1.1. through R1.7.

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, the results of its latest training needs analysis that identifies each entry-level or newly hired experienced System Operator's training needs as specified in R2.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, the results of its latest training needs analysis that identifies each incumbent System Operator's mismatches between actual performance and the criteria for successful performance as specified in R3.

M4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, its latest annual training plan as specified in R4.

M5. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection documentation of the qualifications of personnel who developed or delivered System Operator training to show compliance with R5.

M6. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, its training activities for its entry-level System Operator as specified in R6.1.

M7. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, its training records to show that it provided each of its

incumbent System Operators with annual refresher training and continuing training in accordance with R6.2. and 6.4.

M8. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection its training records to show that it provided its incumbent System Operator with training to eliminate performance gaps in accordance with R6.3.

M9. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, training materials used for entry-level training, refresher training, and continuing training that meet the criteria identified in R7.

M10. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, a training record showing the current status of each of its System Operators in meeting the performance identified in R1.7. as specified in R8.

M11. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, the results of its latest annual evaluation of its System Operator training program. (R9.)

M12. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, the latest versions of its System Operator training program to demonstrate that the information in the training materials was updated in accordance with R10.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

1.2. Compliance Monitoring Period and Reset

One or more of the following methods shall be used to verify compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The performance monitoring period for all requirements is one calendar year. The performance reset period for all requirements is one calendar year.

1.3. Data Retention

The Reliability Coordinator, Balancing Authority and Transmission Operator shall each have its current, in-force documents available as evidence of compliance as specified in each of the Measures.

If an entity is found non-compliant the entity shall keep information related to the non-compliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels (To be added with the next draft of the standard)

2.1. Level 1:

2.2. Level 2:

2.3. Level 3:

2.4. Level 4:

E. Regional Differences

None.

Implementation Plan — System Operator Training Standard

Background

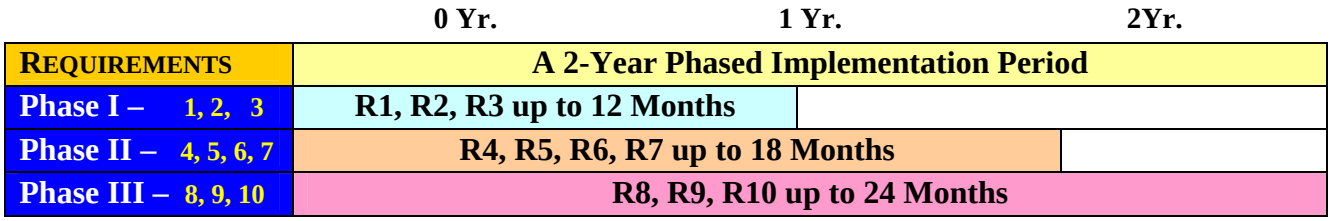
The System Operator Training standard is designed to provide all system operators who work for the Reliability Coordinator, Balancing Authority, and Transmission Operator with training to provide the knowledge and skills needed to perform all assigned reliability-related tasks to a specified level of proficiency. The training provided under this standard includes training for entry-level system operators to bring those system operators to a minimum level of proficiency. Both refresher and continuing training are required for incumbent system operators. Refresher training is aimed at providing practice in performing tasks that are rated as having 'high importance' with respect to reliability, while also having a 'low frequency' of performance. Refresher training is also aimed at closing any gaps between actual and desired performance of individual system operators. Continuing training is aimed at providing incumbent system operators with new knowledge and skill to perform new tasks or use new tools.

The drafting team is developing several reference documents to assist responsible entities in complying with this standard. The reference documents include the following:

- A list of tasks commonly assigned to system operating positions for use in conducting a job task analysis
- Instructions on how to conduct a job task analysis, including guidance on how to establish performance criteria for tasks
- Instructions on how to conduct a training needs analysis suitable for use in determining what knowledge and skills are needed for an entry-level system operator to perform assigned tasks
- Instructions on how to conduct a training needs analysis suitable for use in determining mismatches between desired and actual performance of incumbent system operators
- References that provide guidance on developing training materials

Effective Date

The proposed standard will become effective when adopted by FERC, which is expected to be July 1, 2007. This assumes the standard is approved by its Ballot Pool in April 2007 and is adopted by the NERC Board of Trustees on May 2, 2007. Compliance with the requirements is phased in as follows[1]:



Requirements 1–3	June 30, 2008
Requirements 4–7	December 31, 2008
Requirements 8–10	June 30, 2009

Note: These dates are relative to the final FERC approval date. The standard will go into effect beginning the first quarter after FERC approves the standard.

[1] Note that not all training needs to be implemented by the effective date. If there are no new System Operators, then there is no need to begin using the training designed for entry-level System Operators. However, annual refresher training and remedial training must be provided by the effective date for Requirement 4.

Impact on Existing Standards and Other Standards in Development

When this standard is implemented, the drafting team recommends retiring both PER-002-0 — Operating Personnel Training and PER-004-1 — Reliability Coordination — Staffing.

- PER-002-0 requires the Balancing Authority and Transmission Operator to have a training program, but has no requirements for the Reliability Coordinator to have a training program for its operating personnel. The requirements in PER-002-0 are not written as specifically or as objectively as the requirements in the proposed standard.

PER-004-1 has 5 requirements:

- The drafting team identified Requirement 1 as being duplicated by PER-003-0.
- Requirement 2 requires the Reliability Coordinator's operating personnel to have five days a year of emergency operations training and is duplicated by the proposed standard.
- Requirement 3 requires the Reliability Coordinator's operating personnel to have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas. The job task analysis required as a foundation for the System Operator training program in the proposed standard should identify that this is reliability-related knowledge that a System Operator needs to perform several tasks — and therefore training and an assessment of the System Operator's knowledge in this area will be required under the proposed standard. In addition, one of the purposes of requirement R6.4.2. in this standard is to develop a Reliability Coordinator's knowledge of other entities in the Reliability Coordinator's area.
- Requirement 4 requires the Reliability Coordinator's operating personnel to have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions. The job task analysis required as a foundation for the System Operator training program in the proposed standard should identify that this is reliability-related knowledge that a System Operator needs to perform several tasks — and therefore training and an assessment of the System Operator's knowledge in this area will be required under the proposed standard. In addition, one of the purposes of requirement R6.4.2. in this standard is to develop a Reliability Coordinator's knowledge of other entities in the Reliability Coordinator's area.
- Requirement 5 requires the Reliability Coordinator's operating personnel to pay particular attention on SOLs and IROLs and inter-tie facility limits and requires the Reliability Coordinator to ensure that protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times. There are other standards that require the Reliability Coordinator to operate within SOLs and IROLs and there are other standards that require the Reliability Coordinator to have monitoring capabilities and back up facilities. The Missing Measures and Compliance Elements Drafting Team determined that the language in this requirement was ambiguous and they declined to develop any measures or compliance elements to support the requirement.

Applicability

Every requirement in the proposed standard applies to all Reliability Coordinators, Balancing Authorities and Transmission Operators. The training described in the standard must be provided to all system operators, whether those system operators who work for the responsible entity are entity employees, contract employees or work as system operators for another entity under a delegation agreement. The intent is to ensure that all system operators who perform real-time operating functions for Reliability Coordinators, Balancing Authorities, and Transmission Operators have the knowledge and skills needed to perform all assigned reliability-related tasks to a measurable, acceptable degree of competency.

TASK CHECKLIST: EMERGENCY OPERATIONS

NOTE ON TASKS: This generic list of tasks is intended to be used as a resource to assist with the creation of Job Task Analysis (JTAs). Please note organizations using this list or any other generic resource should customize them to accurately document tasks specific to their worksite.

ITEM#	TYPE OF ACTIVITY	EMERGENCY OPERATIONS TASKS
1	capacity	Request emergency energy upon loss of a resource
2	capacity	Respond to capacity deficiency
3	capacity	Respond to loss of energy resources within allowable regional or pool timeframe
4	capacity	Prepare for a capacity emergency by bringing on all available generation
5	capacity	Prepare for a capacity emergency by postponing equipment maintenance
6	capacity	Prepare for a capacity emergency by scheduling emergency energy purchases
7	capacity	Prepare for a capacity emergency by reducing load
8	capacity	Prepare for a capacity emergency by initiating voltage reductions
9	capacity	Prepare for a capacity emergency by requesting emergency assistance from other systems
10	capacity	Schedule available emergency assistance with as much advance notice as possible given a capacity emergency
11	capacity	Utilize the assistance provided by the Interconnection's frequency bias (*in a capacity emergency*) only for the time period necessary to utilize operating reserves
12	capacity	Utilize the assistance provided by the Interconnection's frequency bias (*in a capacity emergency*) only for the time period necessary to analyze ability to recover using own resources
13	capacity	Utilize the assistance provided by the Interconnection's frequency bias (*in a capacity emergency*) only for the time period necessary to schedule emergency assistance from others
14	freq	Direct corrective actions to correct abnormal frequency
15	load shed	Manually shed load to alleviate system emergency conditions
16	load shed	Following the activation of automatic load shedding schemes, restore system load as appropriate for current system conditions and in coordination with adjacent systems
17	load shed	Following the activation of automatic load shedding schemes, shed additional load manually if there is insufficient generation to support the connected load
18	load shed	Following the activation of automatic load shedding schemes, monitor system voltage levels to ensure high voltage conditions do not develop
19	load shed	Following the activation of automatic load shedding schemes, monitor system frequency to ensure high frequency conditions do not develop
20	load shed	Following the activation of automatic load shedding schemes, monitor the performance of any automatic load restoration relays
21	load shed	Following the activation of automatic load shedding schemes, resynchronize transmission at preplanned locations if possible
22	load shed	Following the activation of automatic load shedding schemes, disable automatic underfrequency relays if system conditions warrant
23	load shed	Direct distribution providers to shed load when required for system reliability
24	load shed	Use manual load shedding to prevent imminent separation from the Interconnection due to transmission overloads or to prevent voltage collapse
25	procedure	Implement emergency procedures.
26	procedure	Notify the Reliability Coordinator of the implementation of its own emergency procedures.
27	procedure	Comply with reliability coordinators' instructions during emergency conditions
28	procedure	Direct implementation of emergency procedures
29	procedure	Maintain knowledge of existing and proposed emergency assistance agreements and contracts
30	procedure	Mandate the sale or purchase of energy to optimize reliability
31	procedure	Respond to system emergencies and frequency deviations to meet local, regional, and NERC DCS requirements
32	procedure	Notify appropriate personnel or departments in event of an emergency

ITEM#	TYPE OF ACTIVITY	EMERGENCY OPERATIONS TASKS
33	procedure	Perform or direct actions such as starting generation, canceling pre-scheduled maintenance, schedule interchange, or shed load to return the system to a secure state
34	procedure	Perform regular testing of emergency procedures to determine preparedness and alertness of shift personnel
35	procedure	Provide emergency services coordination for field personnel
36	procedure	Respond to generation losses, recognizing economic and reliability restrictions to effectively maintain tie-line flows
37	procedure	Respond to requests for emergency assistance from neighboring systems
38	procedure	Declare system emergencies
39	procedure	Develop and/or implement contingency plans when facilities/equipment are forced out of service
40	procedure	Formulate a plan to implement corrective actions when equipment ratings are exceeded or anticipated to be exceeded
41	procedure	Use sub-regional, regional, and NERC hotline to coordinate actions during emergency conditions
42	procedure	Schedule emergency energy when needed and create interchange transaction tags within one hour
43	procedure	Coordinate response to system emergencies
44	procedure	Request emergency assistance from neighboring systems
45	procedure	Assume sole control of designated telecommunication systems for use during an emergency
46	procedure	Implement emergency procedures related to generating resources within a balancing area as directed by the reliability authority
47	restoration	Direct the restoration of the transmission system following a major system outage, load shedding, islanding, or blackout
48	restoration	Ensure adequate protective relaying exists during all phases of the system restoration sequence
49	restoration	Test or simulate system restoration procedures to validate restoration plans
50	restoration	Following a partial or total system shutdown, implement the appropriate provisions and procedures of the system's restoration plan in a coordinated manner with adjacent systems
51	restoration	Following a partial or total system shutdown, arrange for start-up and/or emergency power for generation units as required
52	restoration	Following a partial or total system shutdown, arrange for and utilize emergency (backup) telecommunications facilities as required
53	restoration	Following a partial or total system shutdown, restore the integrity of the Interconnection as soon as possible
54	transmission	Formulate a plan to implement corrective actions when an operating reliability limit violation is anticipated
55	transmission	Determine the cause and extent of transmission system disturbances and interruptions and the impact on other facilities
56	transmission	Apply relief measures as necessary to permit re-synchronizing and reconnecting to the Interconnection when separated from the Interconnection
57	transmission	Use manual load shedding to prevent imminent separation from the Interconnection due to transmission overloads, or to prevent voltage collapse
58	transmission	Implement load shedding as directed by a transmission operator
59	transmission	Identify and take appropriate actions when partial or full system islanding occurs
60	voltage	Implement voltage reductions to alleviate system emergency conditions
61	voltage	Identify and take appropriate actions when a partial or full system voltage collapse occurs

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: While we agree with a Job Task Analysis being performed (Job Description), PER-002 already provides sufficient direction to assure entities develop quality Training Programs and are staffed with "adequately trained personnel".

   Requirement 1.3 is too granular. For instance, certain tasks can be performed as part of a team at times or alone at times.

   Criticality of the task in 1.4 with respect to reliability cannot always be correctly assessed. For example, the consequences of not performing TTC calculations to ensure that TTC capability is accurate may or may not have a critical affect on the system.

   Requirement 1.5 is too specific-Some tasks are performed continuously while other tasks are asking the system operator to perform studies for emergency outages. Another example is the notification to affected parties about a time error correction taking place. The frequency of these tasks sometimes can not be predetermined and do not reoccur on a steady cycle. A final task that can't have a predetermined frequency is notifications of problems or expected problems in system conditions. These simply happen and you respond as quickly as possible.

   Recommend removing Requirements 1.3, 1.4, and 1.5.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: We agree that training needs analysis should be done but NERC should focus on assuring training takes place and not on the process.

   It is unnecessary to differentiate between an "entry-level" and a "newly hired experienced" System Operator. Besides the fact that it is unclear what these terms are intended to represent (one is a job family level term and the other one trying to reflect a degree of experience independent of level), the training considerations (and terms) should focus on initial and refreshing/reinforcing training. If this approach is taken then the experience level or incumbency is irrelevant. For a new operator all training would be initial. For an experienced "incumbent" operator, some would be "refresher/reinforcing" and some might be "initial" for newly assigned tasks.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☐ Yes

   ☒ No

   Comments: Each entity should be left to determine the training needs of its personnel. See comments for question #2.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: Each entity should have training goals, schedules and an overall plan to address how operator training is to be accomplished

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Recommend that NERC leave the levels of competency to the individual Utility to decide what is an acceptable level. Not all electrical systems are the same.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: We could agree, if under 7.10, that Req. 1.3 be removed as recommended in our earlier commments.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The benefit gained from required use of a simulator is difficult to quantify.

   Table-top exercises and drills can be just as effective at a significiantly reduced cost.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: While we agree training records should be maintained, the criteria defined for "each" task identified in the JTA would be overly burdensome. The current Reliability Exam identifies 203 operator tasks. The focus should be on the performance gaps or developmental needs identified in the gap analysis. This is not what the document states. This needs to be clarified. We do not need to track every task of every operator in the JTA.

   Perhaps the training records is best contained in the employee's performance appraisals under accomplishments (tasks mastered) and developmental needs (tasks needing improvement).

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

☐ No

Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: Under Requirement 1, one would not expect an imminent cascading outage to occur due to a job task analysis (JTA) not being performed. Not having a list of company-specific reliability-related tasks for a system operator is a problem, but the system operator could have 30 years experience and it's the experience which prevents cascading outages and not specifically the JTA. Recommend Medium risk factor.

    Under Requirement 3, not having a training needs assessment may not be a wise action on the part of a RC, BA, or TOP, but would not conducting a training needs assessment directly lead to cascading outages if the assessment did not exist? Recommend Medium risk factor.

    Under Requirement 5, if the system operator trainer is very experienced with their duties, how will not having a certain level of competency directly result in cascading outages, i.e, high risk factor rating. What is NERC's acceptable level of competency- NERC certified, Master's Degree, 10 years as an instructor? Recommend Medium risk factor.

    Under Requirement 6, same comments as above. Recommend Medium risk factor.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: Under Measurement 5, it says you must have documentation of the qualifications of the trainer, but Requirement 5 doesn't mention what would be an acceptable level of competency. Recommend allowing each Utility the ability to determine what is the acceptable level of competency.

    Measurement 1: Recommend that R1.3, R1.4, and R1.5 be removed.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☒ No

Comments: Southern does not believe the proposed standard is necessary, especially as written. Therefore, we do not believe an Implementation plan is needed.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☐ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: Southern Company does not believe this Standard is necessary since PER-002 could be revised to include certain components of this proposed standard. However, if the development of this standard continues, we make the following comments:

    Requirement 4 is essentially a duplicate of PER-002, Requirement 2.
    Requirements 4.1-4.4 are essentially duplicates of PER-002, Requirements 3.1-3.4.
    Requirement 5.1 and 5.2 are very close to PER-002, Requirement 3.4.
    If you remove these duplications, the SDT may not be left with enough substance to build a standard around.

    Under Requirement 1, recommend changing the name of System Operator job task analysis to System Operator Job Description.

    Job Performance Appraisals should be an acceptable method for meeting Requirement 8.1.

    Does the 32 hours of emergency operations training specified in Requirement 6.5.1 count toward the 5 days of training required for PER-002, Requirement 4?

    The primary emphasis of this standard seems to rely on the process and not about measuring whether or not operators are properly training.

    R5 - The term "systematic approach" is used but no direction or expectation is provided in the standard on what is acceptable.

    R6.5.2 - The requirement expressed here is too prescriptive and in some cases probably not practical. If this requirement is ultimately considered appropriate, it should be done as part of EOP-005 R6 and not inserted here as part of a general training standard. The same argument could be made for R6.5.1 as well.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: We agree that these are things that are generally considered when doing a task analysis. We're not sure that they all must be done for each task, which is what your question asks. This is good for a template for a training program task analysis. If this is too prescriptive, an unitended side effect would be for entities to shorten their task list so they can meet all the sub-requirements. The primary requirement should be to have a training program. Also, there is no way that doing a task analysis differently puts the Interconnection at risk of cascading, which is what the High Risk assignment implies. As a side note, the industry still needs to resolve and clarify the risk definitions. The draft standard is an example of people confusing importance with risk.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: There would also be some recurring or refresher requirements. However, it may be that some organizations won't have new operators. The training program should have a goal of having skilled operators. There should be one training program, it doesn't have to be overly prescriptive.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: The scope of things mentioned should generally be considered as part of an overall plan. We agree with the question, but this doesn't seem to line up with the requirement.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: We agree with a need for a general annual review of the overall program. While each operator should have a few specific items on which they should include in

their overall training goals, there does not have to be a separate plan for each individual.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☒ No

   Comments: While a trainer needs to understand the material presented, this requirement implies a second layer of administration to keep track of the qualifications of the trainer. This requirement needs to line up with the requirements of the CEH program. This also is rated as a high risk requirement, which is inconsistent with the definition.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The items list in R7 are typically outlined in skills or task-based training and are appropriate as a guideline, but appear to be too prescriptive. There are other valid training activities that wouldn't follow this format. This also needs to line up with the CEH program.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Your question asks about the simulator's use during drills and exercizes. We agree that all certified operators should have some simulation based training (it could be a generic simulator). While nice to use a simulator during excerises, the drill should not be a slave to the tool. For example, very productive restoration excercises can be done without all participants simultaneiously using simulator. There are other very imporant aspects of drills (testing procedures and communications).

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments: We agree with "should", but R8 says "shall" and identifies it as a medium risk requirement. The design of an item in a training program (or lack thereof), does not put the Interconnection at risk of cascading.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☒ No

   Comments: We agree with "should", but R9 says "shall" and identifies it as a medium risk requirement. The design of an item in a training program (or lack thereof), does not put the Interconnection at risk of cascading. Requirements 4 and 9 could be combined and simplified (provide annual review and a summary of changes).

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

☒ Yes

☒ No

Comments: Your question does not mirror R10. Yes, material should be reviewed. R10 appears to be something that can not be measured, with the exception of applying it after the fact when the operator didn't have perfect knowledge. Also, the measure implies that even training that will not be offered in a given year must be annually updated. This is another requirement that should be aligned with the CEH program.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: We agree training is very important. However, we cannot identify any of the items in this standard should be classified above a lower risk. It's the direct actions of the operators that can put the interconnection at risk. Missing an item (or varying) in the design of a training module does not put the Interconnection at risk of cascading.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: The measures are too complex. There are already requirements that say what training needs to be provided. Over-specifiying how the training is delivered and the detailed design of the program seems to go too far. There are probably four core requirements in the standard. The measures and compliance monitoring should be simplified (some overall score for the requirements that are met).

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: This needs to be simplified. We're not sure why there would be spot checks and triggered investigations for training. This standard can be evaluated during the normal audit and self-certification cycle.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☒ Yes

    ☒ No

    Comments: We agree that some of the other training design requirements should be retired if this standard is adopted. This standard should be simplified prior to implmentation. Also the two-year implementation plan might be too short to put all this detail in a training program.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments: Some workshops and templates or examples of what meets the standard would be useful.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: More time will be needed if the standard is too prescriptive. Most entities will have to put material together for hundreds of tasks and training activities.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: The standard should be boiled down to the core training requirements (develop a program, deliver training [including and consistent with CEH], record and assess progress, adjust the program annually). It would be simpler if this standard were measured globally (3 of the 4 requirements with no deficiencies is passing, minor deficieiencies in 2 requirements is level 1, etc.).

    We agree that training is very important, but importance is not the same as the risk. Depending on how this standard is read, there appear to be 40 different things for which non-compliance can be assessed (and almost all of them are rated at medium or high risk). Deviating from a template training design does not put the Interconnections at risk of cascading. The standard as a whole should be evaluated at a lower risk.

    This standard should absorb the 32 hours of emergency training.

    Alternatively, this standard could lay out a way to evaluate "certified training providers".

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: Job task analysis are subjective to whomever is developing these tasks and subject to interpretation of the standard and reference document which is currently not available. This approach results in lack of continutity across the industry which should be a goal specifically in an effort to audit compliance.
   The Natural Gas Transmission Industry has struggled with a a similar standard referred to as the Operator Qualification Rule (49 CFR 192.801) on a larger scale and lessons on implementation can be learned from their experience. The problem of lack of conformity between operating companies showed up in compliance audits specifically in the area of what was a qualifing task and the name of that task. What this industry did after a few years because of the confusion and inefficent program management is develop a list of minimum tasks that applicable parties should address and provide details related to that task as a minimum comparable to those requested in R1.1-R1.7. If one of these tasks did not apply to a applicable party, they simply addressed it in their plan and provided supporting information. Another benefit of conformity, it allows plans to be develop and adoption by applicable operating parties across mutiple systems. Additionally, personnel transferring from one applicable party to an other can provide evidence of their past performance to it as it relates to the tasks and begin work which saves time/money and gets qualified personnel working.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: If a list of reliability related tasks and supporting information is provided, then this processes is manageable. Lack of providing a list of tasks and requirements related will add confusion and unneeded complexity to the process.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: If a list of reliability related tasks and supporting information is provided, then this processes is manageable. Lack of providing a list of tasks and requirements related will add confusion and unneeded complexity to the process.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: Annual training for System Operators is agreeable. To develop an individualizeed training program to any level of detail will be difficult to manage. However, if a standard list of applicable reliability related tasks are provided then individual training becomes mute. All operators will be required to demonstrate core competantancy. It would be left to management and the employee of the steps necessary to prepare an employee to qualify for applicable reliability related tasks.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: It is impractical at times for the trainer to be the subject matter expert or knowledge on the subject matter, but may have individual(s) present to address questions or concerns which should be allowed. It allows the best of both worlds a good trainer and knowledgeable parties.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: What does the word "mastery" in this context mean? Are we saying anything less than a perfect score does not meet this requirement or is "proficient" a better word choice.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It should not be part of the standard to require every company to use company-specific simulation for some drills. It should be left to the company to determine how it is most practical to meet the language "use of drills and simulation."

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments: What does the word "mastery" in this context mean? Are we saying anything less than a perfect score meets this requirement or is "proficient" a better word choice.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments: What constitutes an "evaluation?"

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: Is this not already covered in R5.1.2 implicity? This proposed requirement is fundamental to training and does not need to be required.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: We do not believe the risk factor of "High" for R5 is appropriate due to the fact that quality training can be provided by a trainer on the material and subject mater experts to address questions or concerns. This should be ranked as "Medium."

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: A list of reliability related tasks and performance expectations should be agreed upon then measures can be developed. The definition of "reliability related task" and agreement of the industry of minimum requirements as associated with these task as it applies to R1.1 through R1.7 should be provided. Also the word "mastery" should be revised to "proficient."

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: Twelve months is not enough time unless a standard list of " reliability related task" and agreement by the industry of minimun requirments as associated with these task as it applies to R1.1 through R1.7 can be provided.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☒ No

Comments: A field test should be required to provide critical feedback to the industry which should save both time and money in the implementation phase and improve the compliance and audit process.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Twelve months is not enough time unless a standard list of " reliability related task" and agreement of the industry of minimun requirments as associated with these tasks as it applies to R1.1 through R1.7 can be provided.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: A standard list of reliability related tasks with corresponding minimum requirements should be developed for R1.1 through R1.7 to allow the applicable parties to prevent unnecessary expenditures and poor use of resources and time. This would benefit all parties involved. It also should allow smaller organization to contract with third parties to write plans for them if necessary using a standard approach. It should allow all of us to take the guess work out of what is intended by the requirements.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: Some direction on assessing criticality is warranted here. In R1.4, how does one define the "Criticality of the task with respect to reliability"? What are the criteria? How can there be consistency among individual companies if there aren't any guidelines? It would seem a task is either critical or it is not. Who determines the shades of grey that R1.4 imbues in its present wording? In order to fulfill the purpose of this standard, ensuring that operators are competent, all tasks that are part of the job should be assessed and trained to as needed. Many of these tasks aren't critical to reliablility when looked at individually yet they are required to perform the job. When it comes to sanctions, criticality should be a key consideration.

   Entities should be required to identify only the tasks that are critical to reliability. These tasks can then be documented and training provided based on an operators need to be trained. The listed R1.1 through R1.7 for each of what could be dozens of tasks that may or may not be critical to relaibility isn't necessary and does not justify the resources required to meet this requirement. Our operators perform numerous tasks that are not critical to reliability and should not be subject to this requirement.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: Partially agree. The means propoposed to assess the training needs of an incumbent operator would appear to require simulating each and every task identified in R1 and grading every operator on their performance of each every year. This would seem an extremely time intensive process to just identify what you then plan to train them on. Is that truly the intent of this requirement? Entry Level/newly hired operators should not be required to have a needs analysis. These operators can be assumed to need all of our training curriculum. An analysis should be done periodically for incumbent operators. R1 does state that JTA should be reliability-related but it does not say critical-to-reliability. the way it is stated allows for a reasonably short list.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☐ Yes

   ☒ No

Comments: If the training needs analysis is done properly, continuing training and refresher training needs will be identified and planned for. With this in mind is it truly necessary to keep the current wording of R4.2-R4.3?

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: We partially agree that this is a helpful planning tool and time permitting, everyone should have one. But does requiring this level of detail on a training plan increase reliability? Does not having it decrease reliability or an operator's skill level? With the dynamic nature of the industry, training plans with this much detail are only educated guesses at best. Should we penalize an entity for not having one? No. Do we penalize them if it doesn't turn out to be accurate? Certainly not. From an audit or compliance standpoint, who is to say that the training plan for employee X is satisfactory or not? What sort of consitent guidelines will be applied by an audit team? How does the drafting team view a "training plan". Does a training plan define targets and goals or is it more binding than that? There should be some leeway for contingencies and changing training needs.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments: Who decides what is an acceptable level of knowledge of the subject matter? Who decides who is competent in developing training or in delivering training material? With no established parameters, enforcement of this requirement will be subjective and arbitrary. It is doubtful that an entity would spend the time and resources to train personnel with a trainer that wasn't competent. This situation would not be acceptable to most entities no matter what the NERC requirements are. If this remains a requirement, it will amount to no more than a rubber stamp of trainers qualifications since this is impossible for NERC or a Compliance Review team to determine with no criteria for "competent" or for "qualifications". What works for one company may not work for another. DOE Good Practices place this responsibility with line managment. It is probably OK to let each company establish who is responsible to make the determination. Ultimately the entity (BA, TO, RC) will be held to the requirement. Some quantification of the qualifications in R5 may help apply consistency among companies and provide objective criteria for compliance auditors.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Partially agree. R6.5.1 needs to state "generic" simulator. Since most entities do not have simulators for their own systems, the generic simulator needs to be an option for this emergency training.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: This implies that an annual assessment of job task mastery would be conducted. Then you would be requiring records of training delivered to fill performance gaps from that annual assessment. In theory, these records would have to be exclusive of your training records that keep track of when a class can be retaken for credential maintenance, which is not annually. You would be chasing two separate and unequal targets: performance based training versus time sensitive credential maintenance education. One supports reliability. The other looks good on paper. Doing both simultaneously is an administrative nightmare. This requirement forces entities to administer two separate training programs for each operator. One program for CEH's and maintaining NERC Certification and another independent program to meet the R8 requirement. This is unnecessary. Entities should be self compliant in determining operators performance without subjecting them to the documentation of R8.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

☒ Yes

☐ No

Comments: It is a worthwhile target. I would hope that some provision for edits or correction notes during a class could be allowed. I would hate to see this requirement prevent the delivery of needed training if resources are constrained, which can happen with any size training department.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☒ Yes

    ☐ No

    Comments:

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: Any of the Measures that only include showing documentation or a record without any regard to what that documentation should include (e.g. qualification of training personnel) does not provide an objective and impartial measurement. Any measure that only requires providing of documentation with no further regard to accuracy or effectiveness is simply a requirement to produce, maintain and update paperwork. This is further stress on entities resources and manpower for nothing more than a cursory look by s Compliance Review team. Either make the measurement have more "teeth" or don't include it at all.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: The process of Triggered Investigations needs to be further refined and defined. One entity could cause another entity a great deal of work and cost by submitting multiple complaints or allegations. What if any recourse does the accused party have available to them? There should at least be an appeal process. Who is allowed to call for a Triggered Investigation? This section is too vague and could become onerous.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference: Is this standard the proper place to insert the WECC CEH requirement of 10 CEH of WECC-specific topics every 2 years?

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: The sheer volume of documentation that this Standard will require will take a lot of time. Many entities are already struggling to meet the training hour requirements. This would further tax resources that are already fully subscribed. The implementation plan is much too aggressive and should be extended to give entities

time to prepare for these requirements. At a minimum the implementation plan should consider the burden expected by the new standard for support personnel.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: See comments on # 15.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: This standard will require more Staff to meet requirements thereby increasing the cost of providing power to our customers with little benefit for these customers.

    Requirement 1 - "maintain" may be a better choice that "conduct" a System Operator JTA...

    Requirement 5.1 and 5.2 are truly just headings (not requirements) and should be eliminated. The others in this section (R5.1.1, R5.1.2, and R5.2.1) could be renumbered to R5.1-R5.3.

    It may be beneficial to define some terms associated with this standard. What is meant by "critical task", "training plan", and other intermediate levels of tasks?

    This standard was reviewed by a Transmission Operations Manager, Generation Operations Manager, Training Supervisor, and 2 Training Analysts. While some effort was made to arrive at consensus, some variety was left in tact for the drafting team to consider. It may be more beneficial to obtain a variety of perspectives without too many edits for the sake of maintaining a unified voice from one company. The drafting team needs to see the variety of perceptions as individuals read through this standard.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: We agree that these are things that are generally considered when doing a task analysis. We're not sure that they all must be done for each task, which is what your question asks. This is good for a template for a training program task analysis. If this is too prescriptive, an unintended side effect would be for entities to shorten their task list so they can meet all the sub-requirements. The primary requirement should be to have a training program. Also, there is no way that doing a task analysis differently puts the Interconnection at risk of cascading, which is what the High Risk assignment implies. As a side note, the industry still needs to resolve and clarify the risk definitions. The draft standard is an example of people confusing importance with risk.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: There would also be some recurring or refresher requirements. However, it may be that some organizations won't have new operators. The training program should have a goal of having skilled operators. There should be one training program, it doesn't have to be overly prescriptive.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: The scope of things mentioned should generally be considered as part of an overall plan. We agree with the question, but this doesn't seem to line up with the requirement.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: We agree with a need for a general annual review of the overall program. While each operator should have a few specific items on which they should include in

their overall training goals, there does not have to be a separate plan for each individual.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☒ No

   Comments: While a trainer needs to understand the material presented, this requirement implies a second layer of administration to keep track of the qualifications of the trainer. This requirement needs to line up with the requirements of the CEH program. This also is rated as a high risk requirement, which is inconsistent with the definition.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: The items list in R7 are typically outlined in skills or task-based training and are appropriate as a guideline, but appear to be too prescriptive. There are other valid training activities that wouldn't follow this format. This also needs to line up with the CEH program.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Your question asks about the simulator's use during drills and exercizes. We agree that all certified operators should have some simulation based training (it could be a generic simulator). While nice to use a simulator during excerises, the drill should not be a slave to the tool. For example, very productive restoration excercises can be done without all participants simultaneously using a simulator. There are other very imporant aspects of drills (testing procedures, plans and communications).

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments: We agree with "should", but R8 says "shall" and identifies it as a medium risk requirement. The design of an item in a training program (or lack thereof), does not put the Interconnection at risk of cascading.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☒ No

   Comments: We agree with "should", but R9 says "shall" and identifies it as a medium risk requirement. The design of an item in a training program (or lack thereof), does not put the Interconnection at risk of cascading. Requirements 4 and 9 could be combined and simplified (provide annual review and a summary of changes).

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

☒ Yes

☒ No

Comments: Your question does not mirror R10. Yes, material should be reviewed. R10 appears to be something that can not be measured, with the exception of applying it after the fact when the operator didn't have perfect knowledge. Also, the measure implies that even training that will not be offered in a given year must be annually updated. This is another requirement that should be aligned with the CEH program.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: We agree training is very important. However, we cannot identify any of the items in this standard should be classified above a lower risk. It's the direct actions of the operators that can put the interconnection at risk. Missing an item (or varying) in the design of a training module does not put the Interconnection at risk of cascading.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: The measures are too complex. There are already requirements that say what training needs to be provided. Over-specifiying how the training is delivered and the detailed design of the program seems to go too far. There are probably four core requirements in the standard. The measures and compliance monitoring should be simplified (some overall score for the requirements that are met).

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: This needs to be simplified. We're not sure why there would be spot checks and triggered investigations for training. This standard can be evaluated during the normal audit and self-certification cycle.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☒ Yes

    ☒ No

    Comments: We agree that some of the other training design requirements should be retired if this standard is adopted. This standard should be simplified prior to implmentation. Also the two-year implementation plan might be too short to put all this detail in a training program.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments: Some workshops and templates or examples of what meets the standard would be useful.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☐ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: More time will be needed if the standard is too prescriptive. Most entities will have to put material together for hundreds of tasks and training activities.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: The standard should be boiled down to the core training requirements (develop a program, deliver training [including and consistent with CEH], record and assess progress, adjust the program annually). It would be simpler if this standard were measured globally (3 of the 4 requirements with no deficiencies is passing, minor deficiencies in 2 requirements is level 1, etc.).

    We agree that training is very important, but importance is not the same as the risk. Depending on how this standard is read, there appear to be 40 different things for which non-compliance can be assessed (and almost all of them are rated at medium or high risk). Deviating from a template training design does not put the Interconnections at risk of cascading. The standard as a whole should be evaluated at a lower risk.

    This standard should absorb the 32 hours of emergency training.

    Alternatively, this standard could lay out a way to evaluate "certified training providers".

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: Does R1 require a JTA for all company-specific reliability-related tasks, or only for those tasks judged by a company to warrant a JTA? Does R1 require the JTA to be revised for all new or revised tasks or tools? Is the reference document defining how a JTA is conducted needed to understand the requirements and expectations of this standard and the impact of the associated one year implementation plan for R1-3?.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

Comments: Training requirements for newly-hired operators can be vastly different from one operator to another. For example, one newly-hired operator may have a background in substation work with knowledge and skills that are applicable to operators while another may have no experience at all. Does the requirement permit a company to determine the training needs of a new hire from a standard JTA and customize training requirements for the employee, or does this requirement imply that a JTA would have to be conducted and established for every new hire?

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: However, we do not believe this requirement should be applicable to all new tasks or tools. For example, if tagging is modified such that the action on the part of the operator changes in a minor way, would this require a modification to the JTA and accompanying training plan?

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

Comments: An annual training plan for all operators within the company is fine. However, an annual training plan for each individual operator is not feasible. Once an operator becomes a system operator they should be at a certain level of competency such that individulized training is not needed. Too much individualized training may be an indication of a poor performing operator that is not compatible with the job.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Will the company be permitted to define competency and the appropriate level of operating knowledge referenced in R5, or will the criteria for these be established by an external entity? If the critieria is established by an external entity, would an SME be permitted to provide training under the supervision of an individual "qualified" by the criteria? If the criteria is established by an external entity, should it be included in the standard?

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: If the training is NERC Approved, the ILA for the training activity should be sufficient documentation.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It should not be part of the standard that every company utilize a company-specific simulator. The wording "the use of drills and simulations" is fine.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: Evaluations by supervision and management would identify areas that need improvement. Once an operator becomes a system operator they should be at a certain level of competency such that individulized training is not needed. Too much individualized training may be an indication of a poor performing operator that is not compatible with the job.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

Comments: It is impractical to evaluate the risk factors until we have a clear understanding of the Requirements in this standard.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: It is impractical to evaluate the measurements until we have a clear understanding of the Requirements in this standard.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

Comments: It is impractical to evaluate the Compliance Monitoring section until we have a clear understanding of the Requirements in this standard.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: Twelve months may not be a reasonable length of time for many companies depending on the expectations of a JTA and whether it is applicable to all tasks or tools or changes to all tasks and tools. The Phase II and Phase III implementation dates may be ok if the first implementation date for the JTA is extended significantly.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☒ No

Comments: A field test may provide critical feedback in determining realistic implementation dates, requirements, and measures.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Refer to response on 15.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: The NERC CE Program is a good program for the industry. It is requiring additional training for the system operators in a well structured manner. Interpretations of this standard that do not permit flexibility for companies to apply judgement to the overall implementation of their training programs and associated analyses would result in this standard being overly prescriptive

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: We agree that these are things that should be collected when doing a task analysis, which is what your question asks. This is a good for a template for a training program task analysis. However, the question presumes that a JTA is needed to have an effective training program. A JTA dictates that each task that each job function performs be documented in detail. This is an enormous amount of work. Additionally, in a dynamic operational environment where decision making is constant and conditions are changing, tasks are not prescribed.The primary requirement should be to have a training program. JTAs are a good, but not the only, way to establish a baseline for an effective training program. This is too prescriptive, and may lead to entities developing abbreviated task lists solely to meet all the sub-requirements.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: Requirement 2 relies on the successful completion of R1's JTA requirement, which would be very difficult and ever changing. There should be one training program, with the goal to have skilled operators.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: Requirement 3 is also contingent on the successful completion of R1's JTA requirement. This question does not seem to line up with the requirement. Why not replace the requirement with the rephrasing of this the question as a statement?

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

Comments: The overall program should be reviewed annually. While each operator should have a few specific items on which they should include in their overall training goals, there does not have to be a separate plan for each individual.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments: While a trainer needs to understand the material presented, this requirement implies a second layer of administration to keep track of the qualifications of the trainer. This requirement needs to line up with the requirements of the CEH program. How would you determine or measure competency in development and delivery of training? Who would be your trainers?

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The items listed in Requirement 7 are appropriate as a guideline, but are too prescriptive. There are other valid training activities that do not match this format. This also needs to line up with the CEH program. Individual Learning Activity required by NERC for an approved continuing education hour has the requested information in this requirement.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Yes, the key word being *some*. certified operators should have some simulation based training (generic or specific simulator), but training activities should not rely on any one tool or method exclusively.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments: These requirements are being done as part of the Continuing Education program. Individual Learning Activity required by NERC for an approved continuing education hour has the requested information in this requirement. Why not have a single requirement simply to adhere to the Continuing Education program?

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments: Is an evaluation of the training program to be able to train to a JTA that is changing (i.e. this has the potential of chasing a moving target)? Requirements 4 and 9 could be combined and simplified (provide annual review and a summary of changes).

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

☐ No

Comments: Yes, material should be reviewed. Here again the question does not match the requirement referenced. Requirement 10 appears to be something that cannot be effectively measured, with the exception of applying it after the fact when the operator didn't have perfect knowledge. In addition, the measure implies that even training that will not be offered in a given year must be annually updated. This is another requirement that should be aligned with the CEH program.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: Training is obviously very important. However, none of the requirements in this standard should be classified above a lower risk. Direct actions of operators can put the interconnection at risk. Missing an item (or varying) in the design of a training module does not directly put the Interconnection at risk of cascading. We must differentiate between risk and importance. Deviation from a template training design does not put the Interconnections at risk of cascading. The standard as a whole should be evaluated at a lower risk.

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☐ No

    Comments: Yes, the measures, although complex and interdependent, match the requirements as drafted. However, most, if not all, of the requirements need work which, in turn, will cause the measures to be revised accordingly.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: Not completely, no. Compliance monitoring should be consistent across the regions.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference: If the standard is not too detailed and prescriptive, no regional differences will be needed.

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: In the current draft, the implementation plan is too short. If the requirements are re-written to be less prescriptive and detailed, a two year plan may be workable.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments: Yes, but for a different reason -- the decision on a field test should be made on a more mature draft of the standard. The comments presented here anticipate a significant change in the next draft of this standard.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: In the current draft, the implementation plan is too short. If the requirements are re-written to be less prescriptive and detailed, a two year plan may be workable.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: The purpose of this standard is to ensure system operators are competent; however, the standard fails to ensure or measure competency. NERC certification, continuing education requirements, recommended training topics, and training activities approved by NERC is sufficient direction for an effective training program.

    The standard should be boiled down to the core training requirements (develop a program, deliver training [including and consistent with CEH], record and assess progress, adjust the program annually).

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. 1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: PER-002 already requires a coordinated training program to ensure reliable system operation.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: PER-002 already calls for a training program that addresses the initial and continuing training needs of personnel responsible for system operations.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: I agree that training programs should be categorized into initial and continuing training needs; however PER-002 already requires this.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: The sub requirements of R4 are unecessary.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Determining the compentency of a personnel delivering training appears to be very subjective.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The first six sub-requirements appear to be the items listed on a CEH learning activity application. R7.7, R7.8, R7.9, R7.10 are confusing and seem to be unmeasureable.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The financial burden could be too great for smaller entities by requiring company specific simulators.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☐ No

   Comments: CEH program requires all approved system operator training to be recorded.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: R1 should be Med or Low

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☐ No

    Comments:

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☐ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☐ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☐ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: These training requirments are reminecent of kudzu (a fast growing vine with deep roots planted years ago to help stop soil erosion). Just like the unstoppable vines that have taken over and smothered other plants, climbed trees and taken over crops, these proposed training requirements reflect kudzu in that they keep growing. Rules, regulations and documentation overkill are strangling the efforts to operate a reliable power system.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments:
   In response to the specific question posed: The PJM agrees with the IRC that the information listed should be included in a Job Task Analysis. However, the format of the question focuses on the details of the requirement (i.e. what goes into a JTA) and presupposes the need for the requirement itself.

   In its present form, it appears that each subject entity would be free to select the JTA model of its choice. The standard needs to identify the criteria that would be used to assess the adequacy of the entity's JTA and other required elements in the Training Standard.

   PJM does NOT agree that a Job Task Analysis should be a NERC mandated requirement. The customized subjective nature of job tasks precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.

   Requirement 1, states that the JTA must be updated whenever there is a new or revised task or tool. The measurement for R1 states that you need a current JTA. It is impossible to evaluate this requirement let alone have consistency across ALL system operators in North America.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments:
   The IRC agrees that Training programs must address the needs of the individuals, regardless of the experience level. Further, the IRC agrees that Training Programs must span the entire spectrum from new hires to experienced individuals.

   R2 and R3 however, would mandate individual person by person formal assessments. And R3 would impose unprecedented annual 'needs assessments' of each incumbent operators.

   R2 and R3 go well beyond requiring Corporate Operator Training programs, and go into mandating the practices and procedures for Personalized Training programs. The IRC does not agree that a one-size-fits-all Assessment requirement will meet the unique and varying needs of the responsible functional entities. As noted in the response to

Q1, the customized subjective nature of indiviual's needs precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.

A training needs analysis should to be conducted for all new entry level operator candidates, and newly hired experienced operator to determine their present level of accomplishment. However, to mandate that there be an annual Training Needs Assessment of all incumbent system operators is without basis and "over-the-top". If there was an identified deviation in performance, then a determination by entity management would need to be conducted to determine whether or not the performance deviation is a training issue or something else. Not all problems can be resolved by training.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☒ No

   Comments:
   PJM supports a requirement that all responsible entities must have a System Operator Training Plan for maintaining current competencies, learning new competencies, and practicing needed competencies. The Plan should include training that covers all the experience levels for the specific respective entity (not for some undefined common need).

   All responsible entities must have the option of training entry level system operators either by internal training resources or by contracting with a training entity to provide same.

   All responsible entities must have a plan for entry-level system operator training, IF and ONLY IF entry-level training is required. However, there is no basis to fully-develop and have-ready-for-delivery an entry-level program if no such need exists.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:
   PJM supports ongoing Training Programs, but does not support a standard that requires a program "for each operator". Operator-specific programs may be an admirable objective, but they are not always practical.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments:
   A requirement that each entity verify trainer competency mandates each entity to assume an expertise that is outside the scope of those reliability entities. For this requirement to remain in this standard, the industry would need to define what competence is and what measures are used to assess competency before requiring it of anyone.

   Incompetent trainers will be identified by system operators failing the NERC certification tests. Since uncertified operators are prohibited from real-time operations the integrity of the system is not threatened - however, continuing such test failures would likely result in the trainers being replaced.

   As note in the responses to Q1 and Q2, any standard that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard. To meet the FERC directive the standard must include a definition of competence and the measures used to assess that competence.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments:
   If the question is "Do you agree that the list in R7 is useful in any Training Program?", then PJM agrees that the items in the list are useful.

   If the question is "Do you agree that NERC mandate each item in the R7 list in order to have a valid Training Program?", then PJM would does not agree that there is any basis for mandating those requirements. The proposed set may be a good set but it is not justified as the only set.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   PJM does not support requirements that mandate "How to" carry out a given standard. Although PJM does support the use of near-real time Operating Training simulators, PJM also recognizes a simulator is not a necessary tool for conducting valid excercises.

   A veteran trainer can accomplish higher quality and more relevant training by way of a well designed and executed table top exercise rather than a "generic" simulator or even a system specific OTS which is not kept current with the real time system. An OTS/DTS simulator is a tool for training rather than the training itself.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments:
   PJM agrees that a training results tracking system is a valid Training task, but questions whether or not this task rises to the level of a NERC standard.

   Note:
   Question 8 refers to Requirement 8. However, Question 8 asks a question (relating to documenting operator needs) that is not part of Requirement 8 (relating to training only)

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments:
   An annual evaluation of training programs is a good practice, it is important but it is not required. As with other proposed requirements, this requirement does not provide a quantitative measure related to evaluation. There is no explicit template or document detailing how program evaluation is to be conducted. To qualify as a Standard, there need to be specific measures. This is an example where an accreditation process for real time operating personnel training programs would be a better fit than a Training Standard.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☒ No

    Comments:
    In response to the question, PJM agrees that training materials should be up-to-date.

    In response to the proposed R10, the associated measures have no relationship to evaluating whether or not the materials are up-to-date. The Drafting Team must more accurately define the term "accurately reflects" . Also, there is no specificity identifed as to what constitutes "current operating environment". What is required to determine if an entity is in compliance or out of compliance?

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: See response to question 19

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: See response to question 19

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: See response to question 19

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: See response to question 19

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☐ No

    Comments: The proposed standard requires more public discussion before discussing field testing needs.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: The proposed standard requires more public discussion before discussing implementation plans.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:
    PJM recognizes and supports the need for and the value of developing system operator Training plans, and of maintaining and implementing those plans.

    PJM also recognizes that owing to the diverse system characteristics, varying operating systems and multitude of operating procedures used by the subject responsible entities, that the Training Programs used to effect those Training plans are not and cannot be standardized.

    Violations Risk Factors
    PJM does not agree that the SDT correctly interpreted the definitions of the Violation Risk Factors; and does not agree with the factors proposed.

    Training Program Accreditation
    Rather than attempting to proscribe what must be included in every program, PJM suggests that the SDT consider creating a System Operator Training Accreditation Program.

    PJM suggests the SDT consider revising the Standard to simplifiy the standard to mandate:
    - Responsible entities have a System Operator Training Plan
    - Responsible entities use accredited Training Programs to implement those plans

    PJM further suggests that the that the details proposed in the current standard be drafted into a Technical Reference Guide that could serve as the basis for the Accreditation program.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Ideally simulators should be used by entities that have responsibility for the operation of the bulk power transmission system. They have been proven to be effective for operators learning how to respond to different contingencies on their systems. Restoration plans can also be simulated so that the operators are restore their systems following a blackout.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: R6.5.2 risk factor is medium whereas R6 is labeled high. SubRegional, regional exercises should be a high priority as maintaining reliability throughout the bulk transmission system is not limited to individual systems. The blackout of 2003 in the Northeast and the blackouts in the WSCC are perfect examples of why these exercises should be done.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: The Reguirement R3 and Measure R3 may not be realistic to maintain as "mismatch" between criteria and actual performance needs to be defined in the document.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: No the starting dates are to stringent in order to have a job task analysis completed and in place by June 2007. December 2007 would be more realistic.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: See comment to #15.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: There are no questions regarding R3 which needs some interpretation of what a " mismatch" is. I cannot see how this item can be tracked unless there is a clear violation of a procedure.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: The R1 requirement specifies that the information that must be collected pertains to only reliability related tasks 'identified' by the JTA. Thus the methodology for the JTA should remain under the descretion of the entity. Regarding the list of information related to the reliability tasks identified by the JTA - different training philosophies may not need this much detail in order to adequately train operators to successfully perform the tasks. Employing differing JTA methods and 'required' information neither makes an operator and entity more or less competent and reliable.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: Many entities may employ a 'pipeline' training program for a new operator whereby the trainee receives training whether or not they have previous knowledge, then the knowledge and skill abilities are assessed through testing and a qualification card process.
   Additionally, to attempt to individually assess the training needs of each incumbent operator would be burdensome to employ and document. Again, some entities may operate under the philosphy that once an individual achieves qualification, and they periodically pass testing to maintain qualification then no additional plan is needed. If they fail, only then is an individual remediation plan is developed.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

Comments: An annual plan for training should be developed & implemented. However, it is not needed on an individual basis.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Of course the training developers and presenters should be competent. However, how would one verify the competence? What qualifications would be acceptable (M5)? This is subjective. R5 - R5.2.1 adds ambiguities into the standard.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Again, the requirements for documentation are too are stringent. The way this is written, it appears that any reliability based training must essentially meet NERC CE requirements.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: This is idealistic. Of course the use of a simulator has benefits. The ability for entities to access a simulator may be cost prohibitive. Until the system operator training program matures, hands on simulation should be desired but table top exercises should be acceptable to meet simulation requirements. Some entities may have only a few specific reliability tasks, thus obtaining a simulator just for those few tasks may be impractical.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: Documentation should be required, but as long as the training program covers demonstrating the skill requirement and keeping records of who has completed the task, then maintaining a record of task completion for every individual is excessively burdensome.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments: However, R9 is redundant. Evaluating the training program is inherent in developing an annual plan as identified in R4.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

☐ No

Comments: Obviously the training material should be current. However a particular training module need not be updated until is being prepared for presentation. Additionally, corrections should be allowed to occur during training sessions since things can change quickly and not allow the training materials to be updated (e.g. setpoints, procedure steps, new equipment).

On a similar topic, the NERC Operator exam process should be held to maintaing tests current under this philosophy (or not including/grading questions on information that has changed during the testing cycle). We have had to train operators on old/outdated information just for testing purposes. This is not productive.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: This standard is administrative. Nothing in this standard affects reliability in the first degree. Thus, most if not all items should be rated as "lower".

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: Due to the redundancy in the Requirements, the Measures are equally redundant.
    Additionally, why are there no Measures for R6.5 - 6.5.2?

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: R6.5 on "EOPs" should be implemented immediately since the industry is currently held to this requirement under a memo issued after the 2003 blackout. PER-002 already requires this training. If PER-002 is eliminated by this standard then R6.5 should become effective immediately.

    Also, the implementation plan proposes to retire PER-004 and states that PER-004 R1 is duplicated in PER-003. This is not completely true. PER-004 R1 states that the RC will be staffed 24/7, but PER-003 just states that the operators will be NERC Certified. Later in the Measures it states it will be staffed "at all times". PER-003 should be modified if PER-004 is to be eliminated.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: see comment in question # 15

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: R6 seems to exist only to state that one must 'implement' the plan developed in R4. This unecessarily clutters the standard. It would be more concise to state in R4 that one must 'develop and implement' an annual training plan.

    Thanks for the opportunity to provide input on the development of the standard. In general, we support the principle of developing more structured guidelines for operator training.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: Further information is needed to offer an informed opinion on Requirement 1 and the required information specified in R1.1 through R1.7. The term reliability-related needs clarification and specific examples of what fits and does not fit the definition of reliability related. Clarification and or an example of an acceptable job task analysis is also required to properly comment on this standard.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: The training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator. Properly trained incumbent system operators should not require a training needs assessment on an annual basis. Particularly since other specific NERC standards identify required annual training and the new NERC Certification credential maintenance program requires continuing training hours in specific categories.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

☐ No

Comments: Certainly anyone who develops or delivers training to system operators must be competent to do so. However, the term operating knowledge needs to be further clarified. If a person lacks actual operating experience for a particular task, would they not be considered competent to develop or deliver training to system operators? In R5.1.2 and R5.2.1, what criteria will be used to establish competency? If an individual has actual operating experience of a particular task, but has not been formally trained in delivering training, will they be considered competent?

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: The requirement in R6.5.2 to involve all real-time operating positions involved in the actual event is a good goal, but may not be achievable due to personnel availability.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments: This should apply to entry-level or newly-hired experienced system operator only.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☒ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: Requirement R1 for a Job Task Analysis would certainly be very important in ensuring that a training program has addressed every required subject. However, to say that it is a HIGH risk factor implies that it is critical to system reliability. There are probably many company training programs preparing highly qualified operators that support system reliability that do not have a Job Task Analysis completed to the detail specified. Given this situation, a lower risk factor may be more appropriate.

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☐ No

    Comments: We agree with the Measures to the extent that they agree with our comments to the Requirements.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: Too aggressive for the standard in it's present form. All phases of the Implementation Plan should be extended by 12 months.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

Comments: We agree that field testing is not necessary. However seminars and/or training material to throughly explain this standard and examples of a compliant training program are required before this standard can be implemented.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: See answer to question 15.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: The tasks to be performed by a system operator should be defined by the standard drafting team (SDT). A training program should then be developed by the entity to assure that any and all operators are proficient in those tasks. The standard need not get into the specifics of the training program.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: Before taking an unsupervised shift a system operator needs to have demonstrated proficiency, regardless of past experience.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: Again, the SDT needs to identify the knowledge set for a system operator.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: R4 should only be a restatement of this question (each entity should have a training program that assures the proficency of the system operators) and not include the details as presently stated in R4 of the draft standard.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: How the training is performed should be at the discretion of the entity. The purpose is to produce system operators that meet a defined level of proficency. If the operator can prove a level of proficiency the training was succesful.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments: The entity should have records showing the system operators have either mastered a proficency or have not.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: While it is good practice it does not belong in the standard. See response to Q19

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

☒ Yes

☒ No

Comments: A violation risk factor of High means a violation has the potential to directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or did or could have placed the bulk power system at an unacceptable risk of instability, separation or cascading failure.

R1. No. A lack of a job task analysis is not a high risk factor to the BPS. It should be Medium
R2. Yes.
R3. Yes
R4. No. This should be low. This is purely administrative.
R5. Yes. Lack of competency in developing the trainig program could have unacceptable ramifications on the training.
R6. Yes
R7. Yes
R8. No. It is Lower since it is purely administrative.
R9. No. It is Lower and administrative.
R 10. Yes.

12. Do you agree with the Measures in the proposed standard?

☒ Yes

☒ No

Comments: Agree with 1, 2, 3, 5 and 11. Disagree with 4, 6-10 and 12
4-See comments on Q4
6-9-See comments on Q6
10-See comments on Q8
12-See comments on Q10 and Q19

13. Do you agree with Compliance Monitoring section of the standard?

☒ Yes

☐ No

Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☒ Yes

☐ No

Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

☐ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☐ No known conflicts

    Conflict: Conflicts with sections of PER-002.

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☐ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: This Standard is overly broad and vague. This Standard is focused on the training program and not on the purpose of training. It is not important that an entity has a training program. Rather, it is vital that the entity has an effective training program, and one that is measurable by NERC.

    The Proposed Standard defines actions the entity must take, but it does not define a performance measure that is tied to improving System Operator competency. For instance, if a gap is identified and training is provided, then the entity has met the proposed Standard's requirements. But there is no assessment of successful training or poor training. Whether a gap is closed or remains after training does not matter to this Standard.

    This Standard should be limited to a requirement for the entity to identify and document required skills, a requirement to define an acceptable time period to acquire the skill, a method of documenting the Operator's skill, a method to reassess the Operator's skill if a gap was measured, and removal from Operation if a gap persists.

    The proposed NERC Standard is too keen on documentation of lesson plans, and not sharp enough on defining valuable objectives. Specific comments are:

    1. R1. What is a Job Task Analysis? Needs to be defined. There is a difference between a list of tasks the Operator performs and a step by step instruction of performing the tasks.

    2. R1.1 Needs to be more specific. What is meant by conditions?
    R1.2 This needs to be defined for the level of specificity required.
    R1.4. I think all real-time reliability related tasks are equally critical. The SDT should otherwise define levels of criticality criteria.
    R1.5 What is the SDT looking for in frequency definition? How is it defined?
    R1.6 Knowledge, skill and experience levels are not needed for JTA. All system operators, regardless of experience levels, should be able to perform reliability tasks.

    3. R4 This does not belong in a Standard. The details are the responsibility of the entity.

4. R 6.2 How many hours of continuing training is required.
R6.3 The word “Requirement” should not be spelled out.
R6.4 Is not needed. Seems a repeat of R6.3
R6.5.1 Is the PER-002 R4 requirement going to be deleted?

5. R7. Training, the hours of training, the method of delivery, and objectives do not need to be documented to have a successful training program. Suggest eliminating this requirement.
6. R8. Training should be performed until an Operator is competent in a task.
7. R10- Not needed in a Standard.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: Each company, not NERC, has the right to decide what, if any, job task analysis should be performed when training its employees. Categorizing specific tasks into a listing for job task analysis documentation should never be considered a HIGH risk factor. Only specific tasks that are considered critical to reliability should be considered in an analysis for compliance to a reliability standard.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: No. It is not NERC's responsibility to dictate the training needs of new hires, as OUR company determines what is necessary for training issues to prepare the new hire for performing OUR specific job reqirements. NERC should only be involved with the Certification and OUR company shall train the new hires to meet and/or exceed the certification requirements. The Certification test itself is the measure of competence to do the job and NERC need not set a requirement on new hire/entry level training needs for individual companies on which to be monitored.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: Continuing enducation, refresher courses on current and infrequently performed jobs is important. We all experience in any job that we perform or with any degree/certification that we hold the need to stay current on latest trend and refresh the lesser used functions. As determined in job reviews for salary administration, to assess competency and further training needs our company already performs these functions, NERC need not be involoved in employee development OR our company's administration functions.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

Comments: Yes, I agree that the training plans should be developed by each company to suit its needs but it may not be necessary to develop an individual plan for each operator as this determination would be a result of the employee review process.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Again, this is an administrative function that each company should oversee, to assure it will be able to operate in a reliable manner, consistent with the NERC Standards that apply to RELIABILITY, and NOT what NERC decides is the criteria for measurement of a trainer's competency.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Each company's admisnistrative and training functions are NOT a NERC resposiblity to dictate.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Mandating that a training simulator drill is a REQUIREMENT would force small companies and/or those that have little or no impact on reliability of the Interconnection to incu un-warranted expense and could not pass a cost-benefit analysis by any reasonable person.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: This is truly a salary review/administration function and is NOT something NERC should be involved in.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: I agree that training programs should be reviewed but not necessarily on an annual basis. Again this is part of the company's administration function not NERC's.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: Unless major system changes or major NERC rules change, the company's training plans need not be changed or reviewed that often. Every 3 years would be more than adequate to review training plans.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: See comment 1. High and Medium risk factors assigned to listing of job tasks/documentation/ or review is extreme. High and medium risk factors should be equated with critical or significant impact on the Bulk Power System.
    As in above coments, the administrative functions that should NOT be included in the Standard (such as R1 - JTA) would not then be a violation consideration.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: This is all a duplication of the much simpler and less intrusive PER-002 and PER-003.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: See comments in 12.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: As above, the entire standard is duplicative, intrusive and overstepping in its bounds. It should be eliminated.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Should not be implemented at all

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: But not annually, suggest a 3 year cycle to fit with the overall training needs including Continuing Education for Operator Certification.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: Annual plan is too frequent, not looking a the long term plan. Again, suggest a 3 year cycle to fit with the overall training needs including Continuing Education for Operator Certification.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This requires a huge amount of documentation (which doesn't make better training), Are you trying to sell software with this Standard?. To be specific, R7.6 requires indentifying task from R1, then R7.7, R7.9 and R7.10 all require documentation of information already documented in R1 in association with the task(s) listed for R7.6, one circular reference should be enough.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Although I fully support the use of GOOD simulators, requiring the use of a simulator would force many entities to use the generic simulators which are not necessarily a benefit over a well-designed exercise. Many of the generic simulators are not "realistic" and therefore do not reinforce the training and may actually detract from it.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: I agree with the items in R8 but not with what this question asks.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: This is too frequent, need to evaluate a "program" by results and trends over time, suggest 3 year evaluation. This does not preclude evaluating and improving elements of the "program" more often.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

Comments: It is more important to get the training to the operators than to update materials. This can be covered by explaining any portion of the materials that may be outdated or incorrect, rather than not being able to provide prompt and timely training because of a requirement that all materials have been updated. This requirement might prohibit someone from using a training video that contains excellent information but also includes a reference to an outdated requirement or procedure (90% corect, 10% wrong).

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: Based on the NERC definitions of the Risk Factors, it is hard for me to agree that ANY of this Standard qualifies as HIGH (causing instability, cascading failures, etc) even giving them a risk factor of Medium may be a "stretch". I suggest R1, R3, R5, & R6 be changed from HIGH to MEDIUM, and R8 be changed to LOWER (as is record keeping and seem to match the definition of ".. administrative in nature ..")

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: Can't agree with all measures without agreeing to all requirements, however, they match the requirements well in general.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: Not giving enough time to meet the new requirements (lots of development and creating excessive documentation will have to be done) and should not make ANY requirement effective mid-year. Suggest effective dates of 1/1/2009 for R1 - R7 and 1/1/2010 for R8 - R10 at the earliest.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Not giving enough time to meet the new requirements (lots of development and creating excessive documentation will have to be done) and should not make ANY requirement effective mid-year. Suggest effective dates of 1/1/2009 for R1 - R7 and 1/1/2010 for R8 - R10 at the earliest.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: R6.5 needs to be revised. Why maintain the 32 hour requirement which was arbitrarily "pulled from the air" as a reaction to the blackout, if the training program is developed and evaluated as required, arbitrary specified hours should not be required. R6.5.2 requires coordination and development of exercises that can not be completed by an individual entity (how can they be held to compliance if their neighbor fails to particpate, etc?). To complete this requirement annually for every operator at every entitity you better schedule an exercise every week, much too excessive, try every three years for each operator or maybe this is already covered by Continuing Education for Certification.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: Generally agree with the information that should be collected but, should not be required by NERC in a standard. If & how a job task analysis is done should be left up to the employer not NERC.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: Generally agree that the needs of entry and experienced operators should be identified but, should not be required by NERC in a standard. Again, this should be the left to the employer, not required by NERC in a standard.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

Comments: This should be the left to the employer, not required by NERC in a standard.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: This should be the left to the employer, not required by NERC in a standard.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: This should be the left to the employer, not required by NERC in a standard.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: There is no need for this standard. The NERC System Operator Certification Program with the required continiuing education for re-certification that is allready in place is more than sufficient to ensure an adequate level of training is accomplished at the NERC level. Each individual employer must decide the level of training it requires for operation of it's own system.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☐ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☒ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☐ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: There is no need for this standard. The NERC System Operator Certification Program with the required continiuing education for re-certification that is allready in place is more than sufficient to ensure an adequate level of training is accomplished for System Operators to know and to abide by NERC standards. The Employer of the System Operator is alleady held accountable via the 100 or so present standards, each with multiple requirments, should the System Opertator not be sufficintly trained and cause a violation of these standards.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: BPA agrees with the basic requirement of performing a training needs analysis to determine training needs, as expressed in requirement R2 and R3. BPA disagrees with the annual requirement proposed in R3 for incumbent system operators. While BPA agrees that the training needs analysis should occur with some periodicity, evaluating every system operator against the entire task list "at least once every year" is excessive. A complete and thorough assessment should result in a foundation for more than one years worth of training. Prior to going through the complete reassessment again, sufficient time should be allowed for the system operator to complete training and develop skills and knowledge in the areas identified as lacking. BPA suggests a three year cycle rather than every year.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

☒ No

Comments: BPA agrees that personnel assigned to develop or deliver training should be competent to do so. However, BPA strongly disagrees that the verification of competency should be done by NERC, the RRO, or any other outside entity.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: R7 lists documentation requirements for each "learning activity" used to support reliability related training. BPA does not support the requirements listed. BPA suggests following the documentation principles described in the NERC Continuing Education Program. These items include:

   Learning Objectives
   Training Content and Materials
   Delivery Method and Qualifications of Instructors
   Learning Assessment to assure the learning objectives have been achieved
   Evaluation of the learning activity
   Review and update

   Requirements R7.6 - R7.9 are references to the tasks determined in the JTA that the learning activity is designed to cover. By complying with R7.6, the entity has made the link to the task analysis. The remaining items (R7.7-R7.9) are not beneficial to assuring quality learning activities. BPA recommends that items R7.7-R7.9 be removed.

   It is not clear whether requirement R7.10 is asking for special documentation of a component of a learning activity, or if it is listing additional requirements for learning activity content. This requirement is not beneficial to assuring quality learning activities, and should be removed.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: BPA supports keeping a training record for each system operator, but finds the record-keeping requirements described in R8.1 and R8.2 to be unnecessarily detailed. The performance assessment criteria and duration of learning activity described in 8.1 and 8.2 are already captured in the learning activity documentation and assessment of meeting learning objectives. Separately identifying these items here is unnecessary. BPA suggests that a training record which consists of a historical

record of the annual training plan and the dates that training activities were successfully completed would be an adequate record for tracking progress toward meeting competency requirements of the assigned job.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

☐ Yes

☒ No

Comments: While training has been considered a contributing factor in many system disturbances, it does not follow that the essentially administrative tasks performed in the process of developing, implementing, and record-keeping of training activities should be assigned Violation Risk Factors of Medium or High.

Incomplete training documentation does not mean that training provided by an entity has been ineffective or non-existent. Poor documentation practices do not "directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures", stated in the NERC definition of High Risk.

BPA notes that a Violation Risk Factor of Lower does not imply that it is acceptable to ignore or poorly perform the requirement.

BPA suggests the following Violation Risk Factors for the requirements described in the proposed standard:
R1 - Prepare and update JTA for each position. LOWER
R2 - Perform training needs assessment for each new hire. MEDIUM
R3 - Perform annual training needs assessment for each incumbent. MEDIUM
R4 - Develop annual training plan for each system operator. LOWER
R5 - Training delivery by qualified instructors. MEDIUM
R6 - Training provided meets Knowledge and Skill requirements of position. MEDIUM
R7 - Documentation Guidelines for training materials. LOWER
R8 - Documentation Guidelines for personnel training records. LOWER
R9 - Annual program review to ensure effectiveness. LOWER
R10 - Use of updated instructional materials. LOWER

12. Do you agree with the Measures in the proposed standard?

☐ Yes

☒ No

Comments: BPA agrees the measures are worded appropriately for the Requirements as written. Howver, BPA and others are requesting changes to the Requirements which will require corresponding changes in many of the Measures.

13. Do you agree with Compliance Monitoring section of the standard?

☐ Yes

☒ No

Comments: The RRO is identified as the Compliance Monitor for the Standard. The Compliance Monitoring Period and Reset section lists all the potential methods the RRO may use to monitor compliance. BPA recommends Self-certification, Periodic Audit (required 3-year compliance audit, not the readiness audit), and Triggered Investigations. The Data Retention requirements are more detailed than necessary and

BPA recommends a simple requirement for all training documentation and records to be retained for three-years, similar to the requirement of the NERC CE Program.

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☒ No

Comments: BPA agrees with the concept of a phased implementation. The specific requirements included in each phase will need to reassessed once changes to the requirements requested by BPA and other commenters are included in the next revision of the standard.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☐ Yes

☒ No

Comments: BPA recommends field testing as a standard practice for all NERC Standards. Field testing reveals administrative concerns and sometimes substantive concerns that were not foreseen. All standards should be subject to at least a brief field testing period.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: The implementation plan will need to be assessed once changes to the requirements requested by BPA and other commenters are included in the next revision of the standard.

    BPA agrees with the concept of phased implementation. That said, to implement the training program described by this standard, in a manner that reflects the quality and effectiveness expected by industry participants, will require longer than two years.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: Requirements R4 and R6 address comparable training areas with the primary difference being that R4 is the "annual training plan" and R6 is the "implementation" of the annual training plan. BPA suggests the drafting team combine R4 and R6 into a single requirement addressing the separate issues of an annual training plan and its associated implementation. Separate Measures could be written to address these two areas even though they are contained within a single Requirement.

    BPA agrees with the requirement for annual refresher training on high reliability tasks (R6.5), and the inclusion of the 32 hour emergency operations requirement (R6.5.1) in this standard. While acknowledging the benefit of participation in regional exercises, BPA believes the requirement that all system operators participate in a regional exercise "involving all real-time operating positions likely to be involved in the actual event, with each person performing their assigned duties." (R6.5.2) is excessive and does not provide benefit commensurate with the development cost on an annual basis. BPA suggests removing requirement R6.5.2.

    BPA supports a Standard requiring development, delivery, and evaluation of system operator training using a "systematic approach". However, a mandatory reliability standard with economic sanctions should address the essental elements needed to comply with the Standard and not become too prescriptive in the implementation of the requirements. BPA applauds the restraint the drafting team has shown by making the effort to include only the essential elements of a systematic training program.

    Finally, BPA thanks the drafting team for your dedicated concern and efforts to improve our industry by helping entities develop valuable and effective training programs for system operators.

Comment Form — System Operator Training Standard — 1st Draft

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments:
   In response to the specific question posed: The IRC agrees that the information listed should be included in a Job Task Analysis. However, the format of the question focuses on the details of the requirement (i.e. what goes into a JTA) and presupposes the need for the requirement itself.

   The IRC does NOT agree that a Job Task Analysis should be a NERC mandated requirement. The customized subjective nature of job tasks precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments:
   The IRC agrees that Training programs must address the needs of the individuals, regardless of the experience level. Further, the IRC agrees that Training Programs must span the entire spectrum from new hires to experienced individuals.

   R2 and R3 however, would mandate individual person by person formal assessments. And R3 would impose unprecedented annual 'needs assessments' of each incumbent operators.

   R2 and R3 go well beyond requiring Corporate Operator Training programs, and go into mandating the practices and procedures for Personalized Training programs. The IRC does not agree that a one-size-fits-all Assessment requirement will meet the unique and varying needs of the responsible functional entities. As noted in the response to Q1, the customized subjective nature of indiviual's needs precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☒ No

   Comments:
   The IRC supports a requirement that all responsible entities must have a System Operator Training Plan for maintaining current competencies, learning new competencies, and practicing needed competencies. The Plan should include training that covers all the experience levels for the specific respective entity (not for some undefined common need).

   All responsible entities must have a plan for entry-level system operator training, IF and ONLY IF entry-level training is required. However, there is no basis to fully-develop and have-ready-for-delivery an entry-level program if no such need exists.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:
   The IRC supports ongoing Training Programs, but does not support a standard that requires a program "for each operator". Operator-specific programs may be an admirable objective, but they are not always practical.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments:
   A requirement that each entity verify trainer competency mandates each entity to assume an expertise that is outside the scope of those reliability entities.

   The IRC supports ongoing Training Programs that employ systematic approaches to training. Such programs, including NERC's current Continuing Education program, include a feedback component from the participants in the areas of content and instructor competency. Although participant verification of the competency of the instructors is an inherent component of such systematic approaches, a standard on verification is unnecessary.

As note in the responses to Q1 and Q2, any standard that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard. To meet the FERC directive the standard must include a definition of competence and the measures used to assess that competence.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments:
   If the question is "Do you agree that the list in R7 is useful in any Training Program?", then the IRC agrees that the items in the list are useful.

   If the question is "Do you agree that NERC mandate each item in the R7 list in order to have a valid Training Program?", then the IRC would not agree that there is any basis for mandating those requirements. The proposed set may be a good set but it is not justified as the only set.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   The IRC agrees that simulators can be valuable training tools

   The IRC does not support requirements that mandate "How to" carry out a given standard. Although the IRC supports the use of near-real time Operating Training simulators, the IRC recognizes a simulator is not a necessary tool for conducting valid exercises.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments:
   The IRC agrees that a training results tracking system is a valid Training task, but questions whether or not this task rises to the level of a NERC standard.

   Note:
   Question 8 refers to Requirement 8. However, Question 8 asks a question (relating to documenting operator needs) that is not part of Requirement 8 (relating to training only)

9. Do you agree that entities should evaluate their training programs every year? (R9.)

☐ Yes

☒ No

Comments:
An annual evaluation of training programs is a good practice, it is important but it is not required. As with other proposed requirements, this requirement does not provide a quantitative measure related to evaluation.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

☒ Yes

☒ No

Comments:
In response to the question, the IRC agrees that training materials should be up-to-date.

In response to the proposed R10, the associated measures have no relationship to evaluating whether or not the materials are up-to-date. The Drafting Team must more accurately define the term "accurately reflects" .

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: See response to question 19

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: See response to question 19

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: See response to question 19

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: See response to question 19

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☐ No

    Comments: The proposed standard requires more public discussion before discussing field testing needs.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: The proposed standard requires more public discussion before discussing implementation plans.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:
    The IRC recognizes and supports the need for and the value of developing system operator Training plans, and of maintaining and implementing those plans.

    The IRC also recognizes that owing to the diverse system characteristics, varying operating systems and multitude of operating procedures used by the subject responsible entities, that the Training Programs used to effect those Training plans are not and cannot be standardized.

    Violations Risk Factors
    The IRC does not agree that the SDT correctly interpreted the definitions of the Violation Risk Factors; and does not agree with the factors proposed.

    Training Program Accreditation
    Rather than attempting to proscribe what must be included in every program, the IRC suggests that the SDT consider creating a System Operator Training Accreditation Program.

    The IRC suggests the SDT consider revising the Standard to simplifiy the standard to mandate:
    - Responsible entities have a System Operator Training Plan
    - Responsible entities use accredited Training Programs to implement those plans

    The IRC further suggests that the details proposed in the current standard be drafted into a Technical Reference Guide that could serve as the basis for the Accreditation program.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: The phrase "company-specific reliability-related tasks" is too vague and subjective, which impacts the effect of R.1.1-R1.7 negatively. In addition, R1.1 task information realted to "the conditions under which the task is performed" should reference some reasonable aggregation of conditions, such as normal operating conditions, etc.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: CECD provided a negative response because CECD does not feel that, unless applicable, resources should be dedicated to developing new-hire training programs. CECD does feel it is appropriate to assess the training needs of operators in general, however it is unclear what evidence an entity must produce to show an assessment was performed. Is the annual training plan evidence that an assessment was performed? As written currently, are entities to assume that entry-level assessments are to be revised as tasks are added versus the annual gap assessments for incumbents?

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☐ Yes

   ☒ No

   Comments: CECD provides a negative response because CECD does not feel that, unless applicable, resources should be dedicated to developing new-hire training programs. CECD does feel training programs should include continuing training on new tasks or tools and refresher training as described above.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

Comments: However, there must be flexibility for variations from the plan, because of the nature of real time operating environements.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments: CECD does not think this should be included in this standard. CECD does not think a company is not going to waste limited time and resources on training provided by unqualified individuals. This may be appropriate for CEU type training where credit is provided but it is not a requirement that should be applied here.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The training documentation does not need to be this extensive. As stated above, this type of documentation might be appropriate for a CEU program but should not be a requirement in this standard. Training records should be adequate to show the Type of Training, the Trainer, Date, and the Length of Time of the activitiy.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Individual trainings programs should be able to allocate resources as they deem necessary and beneficial to their specific organization.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: Documentation should be by exception, reflecting only performance improvement needs, considering that there are already going to be records in place indicating the training that has been completed per R.7.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: CECD does feel it is appropriate to evaluate the program but disagrees with the information sources reflected in the current draft.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments: This answer is applicable to a general operator training program, not necessarily any potential training matierial such as for new-hires.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: The Risk Factors associated with documentation, i.e. JTA, Annual Training Plan, Qualification Verification, should be assigned a Low state. The Risk Factor associated with actual training activity should be assigned a Medium Risk Factor. The items CECD suggests are Low Risk Factors should be assigned that specific priority due to the fact that the items described above, are administrative, and do not directly cause or contribute to instability, separation or cascading events (emphasis on "directly").

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: The Annual Training plan and training records should be the only items required for inspection based on the answers provided on this comment form.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: The current draft should be revised and a new implementation plan drafted to fit the amended draft.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: The requirements in R1.1 through R1.7 are good guidelines but are too complicated for some relatively simple tasks. R1. should stand alone with the detailed guidance on how to structure a JTA left to the reference documents which are being prepared by the drafting team.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: A requirement to perform an annual training needs analysis for every incumbent system operator is an unnecessary administrative burden. Proposed language would mandate such an analysis whenever there was a substantive change in the system operators JTA.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☐ Yes

   ☒ No

   Comments: Propose changing the word annual to continuing to allow some flexibility in when refresher training is provided.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: R4.1 through R4.4 are unnecessary repitition and should be deleted.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: R7.9 and R7.10 are difficult to understand. Propose deleting both of these sub-requirements.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Although we use a simulator and feel that it is a useful tool, use of a simulator would be an unnecessary and/or unreasonable requirement for some entities. If the generic EPRI OTS or similar simulator was less problematic to install and use, it would be easier to agree with such a requirement.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: Annual evaluation would be an unnecessary administrative burden. Propose requring this every three years or whenever there is a substantive change in the system operator JTA, whichever occurs first.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☐ No

    Comments:

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☐ No

    Comments:

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: The Implementation Plan states that several reference documents will be issued to assist in compliance with the Standard but fails to establish a timeline for their release. These documents should be available as soon as possible and workshops should be scheduled to assist entities with compliance.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Depending upon the level of detailed requirements in the final Standard, more than 24 months may be required to implement all components.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: Generally agree with the information that should be collected but, should not be required by NERC in a standard. If & how a job task analysis is done should be left up to the employer not NERC.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: Generally agree that the needs of entry and experienced operators should be identified but, should not be required by NERC in a standard. Again, this should be the left to the employer, not required by NERC in a standard.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

Comments: This should be the left to the employer, not required by NERC in a standard.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: This should be the left to the employer, not required by NERC in a standard.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: This should be the left to the employer, not required by NERC in a standard.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: This should be the left to the employer, not required by NERC in a standard.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: There is no need for this standard. The NERC System Operator Certification Program with the required continiuing education for re-certification that is allready in place is more than sufficient to ensure an adequate level of training is accomplished at the NERC level. Each individual employer must decide the level of training it requires for operation of it's own system.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☐ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☒ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☐ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: There is no need for this standard. The NERC System Operator Certification Program with the required continiuing education for re-certification that is allready in place is more than sufficient to ensure an adequate level of training is accomplished for System Operators to know and to abide by NERC standards. The Employer of the System Operator is alleady held accountable via the 100 or so present standards, each with multiple requirments, should the System Opertator not be sufficintly trained and cause a violation of these standards.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: As posted, creating a JTA for operating positions can be an onerous undertaking as the list could be quite extensive. From the compliance viewpoint, the task may become onerous, depending on the level of detail and documentation that will be required. For example, switching operations could be broken down into many sub-tasks such as, routine, planned, contingency, restoration, emergency, low voltage, high voltage, system, auxiliary, SPS, manual, directed, independent etc. To facilite the requirement, NERC could provide a list of tasks for System Operators that entities can use and modify as required to represent their own uniqueness.
   In addition, there are other ways to determine training needs besides the use of a JTA. For example,
   - Lessons learned from Operating Experience
   - Corporate/Divisional Mandated Training
   - Remedial Training requirements
   - Government Legislated
   - Safety Training
   - New or changed tools, processes, procedures, instructions
   - New or modified equipment
   - AdHoc training requirements
   - Response to feedback or requests for training

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: Yes, the analysis should allow to compare a new worker's experience and knowledge (or lack of) versus that of an experienced system operator to facilitate identification of what they need to know and train accordingly.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: A training program must adapt to the level of experience and knowledge of staff. The training curricula should be tailored to include new operators and experienced ones with refreshers and more advanced levels for the latter.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: A plan and schedule should be developed and implemented. However, some flexibility should exist in the plan to allow for Ad-hoc or unplanned/unforseen training requirements.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Clarification must be provided on what is meant by “verification.” Attendance to a course on training facilitation doesn't guarantee competency in delivery. Sometimes it is difficult to expect a subject matter expert (SME) to be also a good instructor. In these cases, assistance in facilitation may be required. As for "competency in development using a systematic approach"...some SMEs may not be competent in this development. Therefore, assistance and staging the development may be required to ensure an adaquate end product.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: In general, these should be documented but there may be some training activities where not all of the items in R7.1 through R7.10 are applicable. Also, the associated training should include "Learning Objectives."

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The use of a company-specific simulator for training is an asset. However, time spent using "generic" simulators may be better spent specifically reviewing one's own system restoration requirements via table top exercises, group activities, drills, discussion, facilitated restoration plan sessions, etc.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments: Training records for each individual operator should be kept. Measures of competency utilized should include simulations, testing, completed checklists, and job performance appraisals.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☒ No

   Comments: Training program evaluation and improvement should be an ongoing process. If the standard specifies a time period, a one-year cycle may be too long. Any specified time should add the words “as a minimum.” The response to feedback and lessons learned should be used to improve training on a continuous basis. Adjustments should be made to the curricula, design, development, and implementation of training as required and practical.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

☒ No

Comments: Although desirable, using updated materials may not always be required. In some cases it is a necessity while in others it is not. Entities should make an evaluation as to the suitability of their materials, facilitator, etc. before using it.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: The Requirements assigned High Risk Factor should be Medium. According to the definitions of Risk Factors, Training itself (or lack of it) will not directly contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures. The high fisk factor is in the requirements on credentials of operators which is dealt with in another standard.

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☒ No

    Comments: Although agreeing with the need of Measures in general, there are some that may pose unnecessary documentation burden to entities.

    For example, M3 can be satisfied by use of an annual employee performance review without the need of creating an additional document to demonstrate compliance.

    Also, in M11, providing results of the annual review does not prove that an entity is modifying training as per their findings.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: Preparation for compliance with this Standard represents considerable work. The Implementation Plan should give more time to become auditable compliant.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☐ Yes

☒ No

Comments: There must be a field test to assess any impacts and adjust the standard accordingly.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: The phase in period should be conmensurate with the entity size. Larger entities may take longer to comply with this standard. Please see our response to question 15.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: In general, it is a good idea to be more prescriptive in training requirements but this standard is too prescriptive.
    -Greater understanding of the required detail pertaining to the JTA requirement in R1 is needed. Normally there are 3 requirement associated with learning objectives; action, conditions, and standard… not the 7 items listed R1.1 through R1.7.
    -R6.5.2 may be impossible to implement for every operator annually.
    -A clearer understanding of "reliability-related" and R1.4 "Criticality of the task with respect to reliability" is needed as this is open to subjective interpretation.
    -The activities listed in R7 may not all be applicable for each activity used to support reliability-related training.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: What deems high criticality and how will a designation be made?

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☐ No

   Comments: Not sure

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments: How would we designate mastering a skill versus just attending a class and getting a 70%

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☒ Yes

    ☐ No

    Comments:

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☐ No

    Comments:

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☒ Yes

    ☐ No

    Comments: How do they confirm that any implementation has taken place

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☐ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: This requirement is overly prescriptive as to the development, content, and maintenance of a Job Task Analysis. This requirement will force every organization to out source, at a significant expense, the initial development of an overly prescriptive complex Job Task Analysis Database and to purchase a complex Learning Management System to manage the JTA data to support this requirement. Given the small training staffs of most training organizations, their time and energy would be better spent performing a less prescriptive informal job task analysis. When the Institute of Nuclear Power Operations (INPO) required commercial nuclear power plants to develop training programs using a Systematic Approach to Training, they not only provided a generic Job Analysis/Task List, they also provided a generic Job Task Analysis for all of the generic tasks that could be used by each of the training organizations. It appears that NERC will only provide a generic task list. A Job Task Analysis (JTA) is much more manpower intensive than a Job Analysis. If NERC will require a company specific task list with all of the requirements specified in requirements 1.1 through 1.7, then they should provide a generic task list and a generic JTA that satisfies requirement 1.1 thru 1.7.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: This requirement would place a significant administrative burden on a very small training staff to perform a training needs analysis for each operator on over 300 tasks. For small training organizations, it should be sufficient to have hiring practices that require minimum entry level education and experience and provide a training program based on the entry level requirements of the position description that addresses all of the tasks for the position. For incumbent operators, it should be sufficient to provide an operator training program that provides continuing training that covers infrequently performed complex tasks that are important to system reliability. The continuing training program should also address training weaknesses/deficiencies that have been identified through management observations of operator performance. It would be an overwhelming task for a small training organization to perform individual training needs analysis for each incumbent operator on over 300 tasks. While we understand the benefit of performing an individual training needs analysis for each newly hired system operator and for the incumbent system operators, we do not feel that the value added by this activity would justify the additional administrative burden. We would be better served by concentrating on the following:
   - Develop well defined entry level requirements

- Develop and maintain an Initial Training Program which provides training on all tasks selected for training.
- Develop and maintain a continuing training program that addresses 1) generic deficiencies for all operators, 2) training on core critical tasks

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This requirement is overly prescriptive for the documentation of each training activity. While most of these requirements should be covered, they may not necessarily be covered in the same document/location.
   R.7.1 - Title of the activity (Yes) Lesson Plan Cover Page/Attendance Form
   R.7.2 - Training Provider (Yes) CONVEX on Cover Page/Attendance Form
   R.7.3 - Description of the Content Covered by Activity - (Yes) Lesson Plan Outline
   R.7.4 - Classroom Lesson Plan, DTS Exercise (Yes)
   R.7.5 - Tool or References (Yes) References listed in Lesson Plan
   R.7.6 - Identification of Task or tasks covered (Yes) Task to Training Matrix not in Lesson Plan
   R.7.7 - Conditions under which tasks are performed are typically implied or part of the terminal objective. (Yes)
   R.7.8 - Identification of Prerequisite training; typically Not Applicable or defined as part of the training sequence for the Initial Training Program but not formally listed in any document except the Initial Training Qualification Guide. (Yes)
   R.7.9. - Objectives and assessments Objectives are part of every lesson plan (Yes)
   R.7.10 - Practice in following the steps and using the tools. (No) May be applicable for skill training during OJT or DTS but not for knowledge requirements covered in a classroom training activity. Overly prescriptive to specify practice in following steps and using the tools and references.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Since the skills and knowledge of several of the operator's critical tasks can not be adequately covered in a table top exercise, classroom discussion, or OJT, a company specific-simulator should be used for operator training. Unfortunately the vendors that provide system operator simulators are not well designed and require excessive support for scenario development and maintenance. The EPRI OTS Simulator may be the most cost efficient option for small training organizations. It can be made company specific to meet an organization's needs but will not provide the same user interface as a site specific training simulator.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

Comments: With a typical task list of over 300 tasks this would be an administrative burden that will require organizations to purchase a complex Learning Management System. Typically Learning Management System reporting will provide reports for completion of Training Activities not tasks. A Learning Management Systems will track Training Activities (Classroom Lesson Plans, OJT Guides, Table Top Exercises, Simulator Scenarios, etc) and those training activities should be tied to the tasks covered by the learning activity.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☒ Yes

    ☐ No

    Comments: I agree with the High Risk Factor for Requirement 1 but not the level of detail specified for the JTA. It is important to have a company specific task list and a task to training matrix that identifies the following:
    Training Frequency = Initial Training, Continuing Training or Both
    Training Environment = Classroom, Simulator, OJT, etc.
    Training Activity Id which identifies the training activity with the objectives/content that addresses the knowledge/skills associated with the task.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: Measurement M1 is focusing on the content of a JTA not the training material and program that addresses the company specific task list. Emphasis should be placed on the following not the overly prescriptive items of 1.1 thru 1.7
    It is important to have a company specific task list and a task to training matrix that identifies the following:
    Training Frequency = Initial Training, Continuing Training or Both
    Training Environment = Classroom, Simulator, OJT, etc.
    Training Activity Id which identifies the training activity with the objectives/content that addresses the knowledge/skills associated with the task.

    Measurement M2 if a position description with well defined hiring requirements for new operators and for M3/M7/M8 a generic incumbent system operator assessment of training needs is not adequate to meet these requirements then these requirements would be an overly burdensome administrative requirement on organizations training staffs.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☒ No

Comments: If NERC only provides a generic task list, organizations will not be able to complete a company specific task list and support a company specific job task analysis that meets the requirements of R.1.1 thru R.1.7 in one year with available resources. Organizations can not support the requirements of their existing Initial and Continuing Training Programs and complete a manpower intensive Job Analysis/Task Analysis at the same time. Most organizations do not have a training staff with the experience necessary to perform a Job Task Analysis. This will require organizations to seek contractor support to complete the requirement in that amount of time. If all utilities seek contractor support to complete their JTAs within the one year there will be a huge vacuum created by the lack of contractors to support this effort. A company specific job task analysis will also require the involvement of subject matter experts which means additional demands on your system operator's time. Organizations will be challenged to free up operators to serve as subject matter experts (SME) in support of a company specific JTA.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☐ Yes

☒ No

Comments: The drafting team should commit to not only provide a generic task list but also a generic JTA for the generic task list. A field test may help them recognize the unreasonable demand that this standard will place on the organziations.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Organizations will not have the inhouse resources to comply with this standard and will result in a considerable expense to complete a company specific JTA using a vendor.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: This standard will require a huge investment for creating a formal Job Task Analysis Database/Document to meet requirement R1.1 - R1.7 and there will still be the cost of developing the training materials. To manage such a JTA Database will require purchasing a costly Learning Management System. Most organizations are not currently staffed to manage such an undertaking and there is not a large source of system operators with the training experience to complete all aspects of this standard. From my own personal experience in the nuclear industry, I was part of a 3 person training staff prior to implementing the Systematic Approach to Training at a commercial nuclear power plant in 1984. There was a steep learning curve and a significant increase in staffing to support the administrative requirements. INPO provided a generic task list and job task analysis. We were required to perform a company specific Job Analysis/Job Task Analysis and develop training material using the results of the Job Task Analysis. This effort took close to a year using a 20 person contractor staff and we ultimately hired an additional 11 full time instructors to support the operator training program. We stopped all formal training programs during the performance of the JA/JTA and placed a significant demand on operator's time to serve as subject matter experts to support the JA/JTA and provide technical reviews for training material.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments:

   We believe R1 should consist of requiring the responsible entity to conduct a System Operator job task analysis, update that JTA when there is a new or revised task or tool, and specify the criteria for being QUALIFIED TO PERFORM each task. We agree that the responsible entity should keep a list of company-specific reliability-related tasks assigned to each System Operator position.

   We believe the draft R1 is overly prescriptive and suggest the last phrase of R1 - and the following information for each of those tasks: - be deleted. We also suggest R1.1 through R1.6 be deleted.

   If R1.3 is not deleted as part of the above suggestion, then R1.3 should be deleted because it is not significant if a task is performed alone or as part of a team.

   If R1.6 is not deleted as part of the above suggestion, then R1.6 should be modified to delete the term - experience - from the requirement. JTAs are performed to determine the skills and knowledge needed, not the experience needed, to perform a task.

   We also believe that R1.7 of the draft standard should require the specification of the - criteria for being QUALIFIED to perform each task. The requirement should not be to specify the criteria for - successful PERFORMANCE of the task.

   This draft standard should address the criteria for individuals to be QUALIFIED to perform a task, and should address the continuing training for personnel that are QUALIFIED. The standard should not require the employers to specify the CRITERIA for SUCCESSFUL PERFORMANCE.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments:

   Overall we agree with R2 with the exception that the training needs should be to meet the - criteria for being QUALIFIED to perform each task - and not - the criteria for successful PERFORMANCE of the task.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☐ Yes

   ☒ No

   Comments:

   We agree with the question as presented here but we do not agree with the way the subject is being implemented in the draft standard.

   Please see our suggested changes contained our response to Question 19 in this document, including our concerns regarding Sytsem Operators under contract or System Operators performing tasks identified in R1 under delegation agreement.

   Please also see our suggested changes to R6 contained in our response to Question 19 concerning the annual refresher training, practice of tasks that have high criticality and are infrequently performed.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments:

   We believe responsible entities should have annual plans that identifies the training planned for each system operator. However, we think that it is not necessary to specify that in a reliability standard for the BES and should be deleted from this standard.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments:

   Again, we agree with the question as presented here but we do not agree with the way the implied subject is being implemented in the draft standard.

Our concern here may be expectations, or terminology or semantics. The draft standard states the responsible entities shall VERIFY that persons developing or delivering training have the following qualifications:. VERIFY is a very nebulous term. Are audit teams going to accept a responsible entity's verification procedure and results? Are there industry-wide certification organizations that might be included in this standard whose stamp of approval would be acceptable to auditors so that responsible entities will only have to see that stamp of approval to know they are meeting this requirement? Is the responsible entity expected to give a test to the employees of a potential vendor to - verify - the employee of the potential vendor is qualified?

Entergy employees who are subject matter experts in developing training programs using the systematic approach provide training to other Entergy employees. Is Entergy (or other reponsible entities) expected to have their subject matter experts certified to satisfy the "competency" requirement R5.1.2? CERTIFIED by whom? Who establishes the VERIFICATION criteria - the responsible entities or the NERC auditors?

Entergy employees who are subject matter experts also provide training for other Entergy employees. Is Entergy (or other reponsible entities) expected to have their subject matter experts certified to satisfy the "competency" requirement in R5.2.1? CERTIFIED by whom? Who establishes the VERIFICATION criteria - the responsible entities or the NERC auditors?

We suggest this requirement be changed to specify that the responsible entities establish the verification criteria, as follows -

Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify - to the satisfaction of that Reliability Coordinator, Balancing Authority or Transmission Provider - that persons developing or delivering training have the following qualifications:.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:

   We suggest R7 be deleted since it is overly prescriptive and should apply to the entity giving the training course, not the Responsible Entity of this standard. Responsible entities should keep records of the training of System Operators but should not be required to document the details of every course, especially if that course is developed by another entity and certified by some certification organization.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:

   The use of a simulator is helpful and a great tool for training but not necessary, especially for small responsible entities, and should be deleted.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments:

   We believe responsible entities should keep records concerning the development of each system operator. However, we think that it is not necessary to specify that in a reliability standard for the BES.

   Please see our suggested changes contained our response to Question 19 in this document, including our conerns regarding Sytsem Operators under contract or System Operators performing tasks identified in R1 under delegation agreement.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments:

   We believe responsible entities should continually evaluate their training programs. However, we think that it is not necessary to specify that in a reliability standard for the BES and R9 should be deleted from this standard.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments:

    We believe responsible entities should update their training materials. However, we think that it is not necessary to specify that in a reliability standard for the BES and R10 should be deleted from this standard.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments:

    All of the Requirements in this draft standard should have a Violation Risk Factor of LOW. No Requirement in any training standard should have a Violation Risk Factor above LOW.

    A VRF of HIGH applies to requirements that - could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures. Violation of a training requirement does not meet this criteria for HIGH.

    A VRF of MEDIUM applies to requirements that - could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. Violation of a training requirement does not meet this criteria for MEDUIM.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments:

    Please revise the Measures to make them compatible with the revised requirements.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☒ No

Comments:

The Implementation Plan references standard PER-004-1. If there is an approved PER-004-1 it is not on the NERC standards website. There is an approved standard PER-004-0.

We suggest the Phased Implementation Period be over 3 years rather than the 2 years indicated.

The following statement is contained in the discussion of PER-004-1 R3 and R4 - In addition, one of the purposes of requirement R6.4.2. in this standard is to develop a Reliability Coordinator's knowledge of other entities in the Reliability Coordinator's area. Should the reference to R6.4.2 actually be R6.5.2?

The Applicability section contains a statement about System Operators under contract or delegation agreement. Please see our suggested changes contained our response to Question 19 in this document, including our concerns regarding Sytsem Operators under contract or System Operators performing tasks identified in R1 under delegation agreement.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments:

    We suggest the Phased Implementation Period be over 3 years rather than the 2 years indicated.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:

    Entergy Transmission agrees with the SAR requirements for developing this standard. The SAR requires a systematic approach be used to identify training needs and to conduct the training. The SAR also requires responsible entities have evidence that each of its real-time system operators is competent to perform each assigned task.

    Entergy's suggested changes contained herein are intended to make this draft standard better conform to the SAR requirements.

    We believe this draft standard is overly prescriptive in its detailed requirements for how the responsible entities implement a systematic approach to training. We also believe this draft standard is overly prescriptive in the detailed process, information and documentation entities must follow to meet the requriements of this draft standard.

    We also request that, in all locations in the standard, the criteria for being QUALIFIED TO PERFORM A TASK should be specified in the draft standard, replacing - criteria for SUCCESSFUL PERFORMANCE.

    The authors of this questionairre did not ask any questions, nor did they provide a place to comment on R6 which requires the implementation of the training program. We suggest R6.1 though R6.4 are overly proscriptive and should be deleted. Also, R6.5.2 requiring at least one exercise each year involving all real-time operating positions should be deleted as being too high a risk factor for the continued real-time reliability of the BES and would involve significant time and effort for the expected gain in operational experience.

We are concerned about the broadbrush requirements placed on the responsible entities concerning the training of System Operators under contract or under delegation agreement. This draft standard implies that the responsible entities are responsible for conducting a training needs assessment (R3), implementing its training program (R6), and tracking the progress of each of the operators (R8) for each of the operators under contract or under delegation agreement. We suggest the responsibility for training be assigned to either the contractor or the responsible entity, depending on the content of the training required (training about general power systems, or training concerning the responsible entity's specific system) and which entity is performing a specific task. First, the contractor under delegation agreement (not the responsible entity) should be responsible for training its employees about general power systems and tasks associated with the the specific system knowledge for the responsible entity; the responsible entity should not be measured nor held in compliance for delegated tasks. Second, the contractor employing system operators (not the responsible entity) should be responsible for training the contractor employees about general power systems, while the responsible entity should be responsible for training the contract system operator about the specific system knowledge for the responsible entity. We suggest the draft standard be revised to reflect these training responsibility concepts. We will agree with the Applicability statement in the Implementation Plan concerning contract employees and delegation agreement employees given the changes are satisfactorily made in the standard.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☒ No

   Comments: Operating tasks that do not affect the reliability of the BES should not be subject to the same auditability as those that do. The language as written does not indicate that reliability-related tasks should be associated with the reliability of the Bulk Electric System. We feel it is important for these training standards to have appropriate flexibility to accommodate training requirements on an entity basis.

   Recommendation: Change the language to reflect Bulk Electric System reliability-related tasks.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: The proposed standard requires the development of individual training plans for each system operator within a company's training program. For many entities that do not have extensive training programs and resources, this is particularly burdensome and unnecessary from a practical standpoint. From a reliability perspective, the "training needs analysis" should focus on the training needs of a company, to achieve reliable operation of its facilities. The program should then make sure that all relevant personnel are adequately "trained" within the bounds of the defined program (as defined within the JTA) which will ensure the most reliable operation of that entity's facilities and subsequently ensure the overall reliable operation of the Bulk System.

   We feel that any "training needs analysis" must be based on the needs of the entity as a whole (as defined within the JTA) and not the individual operators. Further, this approach will ensure that all operators within a particular operating company receive equal training to maintain and develop operating skills and knowledge.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☒ No

   Comments: We agree but would prefer to have defined terms and intervals if necessary. We are uncomfortable with the term "incumbent" and "refresher". Right

now, these terms are unbounded (without definitions) and could be subject to various interpretations and misrepresentations.

Entry-level could be defined as the interval necessary or training components required for a NERC "certified" individual to become knowledgeable or functional at relevant tasks of the JTA for a particular entitiy's facility and operations (could be referred to as a qualification process). Once an operator becomes "qualified" then he/she enters the training program as a System Operator subject to a company's continuing training requirements.

The term refresher training is also too vague and should either be bounded by EOPS requirements (as already exists), or referred to as continuing training or defined in the standards glossary.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

☐ Yes

☒ No

Comments: The plan should address the training needs of the organization and how those needs will be met by providing the appropriate training to the required personnel (see answer to #2).

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

☒ Yes

☐ No

Comments: Not a "High" risk factor .

Language should provide for the use of subject matter experts (SMEs) in the development and delivery of training with the direction and assistance from an individual that has competency using a systematic approach to training.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This requirement is overly prescriptive and is inappropriate for this Reliability standard. The format is a good tool for development. We support its use as it also provides consistency with the NERC CE process, but again, it does not belong in a requirement.

   All of requirement R7 should be deleted.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Simulators can be a critical and effective training tool. The problem with mandating their use is that some systems are not complex enough to warrant (technically or economically) the use of simulators for training their respective operators and the current applicability criteria of the standards process do not allow for flexibility of appropriate exemptions.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: All the risk factors associated with the training standards should be "Lower" risk factors. These training activities will be occuring outside of the "real-time" operating arena and therefore violations of these requirements cannot in and of themselves cause impacts as defined by "High" and "Medium" risk factors. An entity would be required to violate several core operating requirements prior to the violation of a training requirement having any material impact on a system. At that, the linkage of an event to a training activity would be extremely subjective.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: Measures should be modified in accordance with our comments on the Requirements.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: We appreciate the significant effort that went into the current draft of PER-005-1. As stated previously, for future flexibility of the "training" standards, we would encourage the drafting team to re-evaluate its creation of the "new" standard. We would suggest rolling in the appropriate requirements (JTA concept and the other requirements into the existing training standards (PER-002 applicable to BAs and TOPs and PER-004 applicable to RCs)).

    Simply, this would allow flexibility for the industry to evaluate future training requirements that could enhance Interconnection reliability and apply them with a higher degree of precision and appropriateness.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☒ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: The standard needs additional drafting prior to evaluating the implementation plan.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: Requirement R6.5.2 needs to be deleted. Joint training exercises can be beneficial, but to mandate these at this time is not justifiable. The requirement is inappropriate since it would put an entity's compliance with the requirement, subject to cooperation by another entity.

    Language requiring a training needs assessment of System Operators performing task identified in R1 under delegations agreements is extremely burdensome. As an example, a neighboring company may be performing the regulating function of an entity, since some form of regulation will be identified in the JTA - the entity will be forced to perform a training needs assessment on that company performing regulation service to determine if their operators can successfully perform the tasks identified in the JTA - even if those operators are being trained by there own company.

    We therfore, disagree with the use of the parenthetical expression (including any contract System Operator or System Operator performing tasks identified in R1. under delegation agreements). The use of this caveat throughout the standard creates confusion and ambiguity in that it makes the requirements dificult to read and dilutes clarity.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**.     Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Longer time will be required to comply with this standard. Many organizations are currently not properly staffed to accommodate this increased workload.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: R6.5.2 requires all real-time operating positions to participate in at least one multi-entity exercise per year. BGE is a member of PJM. PJM currently conducts 2 Restoration drills per year. BGE includes as many operating personnel as possible in these drills, however, it is not feasible to include all operating positions.

    BGE recommends revising this requirement to read: "involving as many real-time operting positions as possible…….and, ensure that all operating positions participate in these drills at least once every 5 years".

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☒ No

   Comments: The language as written does not indicate that reliability-related tasks should be associated with the reliability of the Bulk Electric System. As we will detail later, we feel it is important for these training standards to have appropriate flexibility to accommodate training requirements on an entity basis. For example, for an entity that primarily operates a distribution system, it is much easier for them to define their auditable training program if the standard is clear on requirements applying to BES related tasks. LSE and DP operating tasks that do not affect the BES should not be subject to the auditability of those that do. ie. these tasks do not affect the reliability of the Bulk Electric System and as such should not be auditable by NERC.

   Recommendation: Change the language to reflect Bulk Electric System reliability-related tasks.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: As written, the proposed standard requirement, requires the development of individual training plans for each system operator that is part of the training program. For many entities that do not have extensive training programs and resources, this is particularly burdensome and unnecessary from a practical standpoint. From a reliability perspective, the "training needs analysis" should focus on the training needs of a company, to achieve reliable operation of its facilities. The program should then make sure that all relevant personnel are adequately "trained" within the bounds of the defined program (as defined within the JTA) which will ensure the most reliable operation of that entity's facilities and subsequently ensure the overall reliable operation of the Bulk System.

   Individual training needs assessment may be a "next" step in the training evolution, but at this time we feel that any "training needs analysis" must be based on the needs of the entity as a whole (as defined within the JTA) and not the individual operators.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☒ No

Comments: We agree with the concepts. We would prefer to have defined terms and intervals if necessary. We are uncomfortable with the term "incumbent" and "refresher". Right now, these terms are unbounded (without definitions) and could be subject to various interpretations and misrepresentations. Therefore any terms referenced in the requirements, if not defined within the requirements, should be bounded by the addition of a definition within the standards glossary.

ie. Entry-level could be defined as the interval necessary or training components required for a NERC "certified" individual to become knowledgeable or functional at relevant tasks of the JTA for a particular entitiy's facility and operations (could be referred to as a qualification process). Once an operator becomes "qualified" then he/she enters the training program as a System Operator subject to a company's continuing training requirements.

The term refresher training is also too vague and should either be bounded by EOPS requirements (as already exists), or referred to as continuing training or defined in the standards glossary.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☒ No

   Comments: The plan should address the training needs of the organization and how those needs will be met by providing the appropriate training to the required personnel (see answer to #2).

   It is also imperative that the requirement include a reference to allow organizations to deviate from the "anticipated" training plan. This is based on the continuously evolving nature of real-time operations along with identification of operational issues and training needs that are developed as a result of system disturbance analysis.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Not a "High" risk factor .

   Language should provide for the use of subject matter experts (SMEs) in the development and delivery of training with the direction and assistance from an individual that has competency using a systematic approach to training.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This requirement is overly prescriptive and is inappropriate for this Reliability standard. The format is a good tool for development. We support its use as it also provides consistency with the NERC CE process, but again, it does not belong in a requirement. It sends the wrong signal to the industry, one where compliance should focus on the specific details of individual training activities and away from overall quality of an organizations training initiatives.

   All of requirement R7 should be deleted.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Simulators can be a critical and effective training tool. The problem with mandating their use is that some systems are not complex enough to warrant (technically or economically) the use of simulators for training their respective operators and the current applicability criteria of the standards process do not allow for flexibility of appropriate exemptions.

   We would also suggest that PER-002 and PER-004 remain in-place to provide the industry the flexibility and granularity that is appropriate to differentiate requirements for Reliability Coordinators (very complex) and BAs and TOPs, which in some cases may not be very complex systems (see overall comment below on question #15). We would suggest that the enhancements provided by the current draft of PER-005 be "rolled" into the content of PER-002 and PER-004.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

☒ Yes

☐ No

Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: All the risk factors associated with the training standards should be "Lower" risk factors. These training activities will be occuring outside of the "real-time" operating arena and therefore violations of these requirements cannot in and of themselves cause impacts as defined by "High" and "Medium" risk factors. An entity would be required to violate several core operating requirements prior to the violation of a training requirement having any material impact on a system. At that, the linkage of an event to a training activity would be extremely subjective.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: Measures should be modified in accordance with our comments on the Requirements.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: We appreciate the significant effort that went into the current draft of PER-005-1. As stated previously, for future flexibility of the "training" standards, we would encourage the drafting team to re-evaluate its creation of the "new" standard. We would suggest rolling in the appropriate requirements (JTA concept and the other requirements into the existing training standards (PER-002 applicable to BAs and TOPs and PER-004 applicable to RCs)).

    The requirements may be duplicated as necessary in both standards, but preservation of the individual standards would allow the flexibility to create appropriate requirements and improvements to the standards without having to address ALL

stakeholders affected by the standard. It is difficult to justify that the same training requirements should be applied to a 100 MW (peak load) Balancing Authority as to a Reliability Coordinator that evaluates the wide area view of a 45,000 MW system.

Simply, this would allow flexibility for the industry to evaluate future training requirements that could enhance Interconnection reliability and apply them with a higher degree of precision and appropriateness.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☐ Yes

☒ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: The standard needs additional drafting prior to evaluating the implementation plan.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: Requirement R6.5.2 needs to be deleted. Joint training exercises can be beneficial, but to mandate these at this time is not justifiable. The requirement is inappropriate since it would put an entity's compliance with the requirement, subject to cooperation by another entity.

    Language requiring a training needs assessment of System Operators performing task identified in R1 under delegations agreements is extremely burdensome. As an example, a neighboring company may be performing the regulating function of an entity, since some form of regulation will be identified in the JTA - the entity will be forced to perform a training needs assessment on that company performing regulation service to determine if their operators can successfully perform the tasks identified in the JTA - even if those operators are being trained by there own company.

    We therfore, disagree with the use of the parenthetical expression (including any contract System Operator or System Operator performing tasks identified in R1. under delegation agreements). The use of this caveat throughout the standard creates confusion and ambiguity in that it makes the requirements dificult to read and dilutes clarity. If the DT has a concern they should address it explicitely through a proposed definition or adding a caveat to the applicability section. Conceptually does the caveat imply that an entity will be responsible for tracking the training activities of another entity that it may have delegated a tasks to? If this is the intention, it will lead to significant confusion from a compliance measurement standpoint as far as an entity demonstrating compliance to the requirement by having to audit another entity's training records / program and demonstrate compliance on behalf of multiple entities.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: Limit standard to exactly what is required, no need to over extend bounds if intent

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: See 1

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Can competent be defined as NERC Certified?

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: R.7.1. ,R.7.2., R.7.3., R.7.6., R.7.9., R.7.10., ARE ADEQUATE

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Not every RC, BA, or TO, needs or can afford a simulator. The current requirements include simiulator hours so to maintain certification operators seek training facilities that provide them.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: It is not really necessary, CEH record keeping is adequate.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: What is definition of Risk Factor

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: only M1, M4, M6, M7, M11, M12 are needed

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: Review need only entail list of operators, credentials, and outline of program and progress in program

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: I do not believe this extensive standard is necessary with the current CEH program that requires operating personnel to become and remain certified and CEH's must be maintained.Currently training and training requirements and registration of CEH's seems to detail that all Certified operators are being adequately reained in all areas. Is that not the intent os EOPS, simulator and class room training? Each Entity designs their training program to train oparators based on tasks they percieve as critical to its system. This Standard for compliance seems too aggressive for all companies to comply, most don't have budget or personnel to maintain this extensive standard.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☒ No

   Comments: We agree that the majority of the information listed in R1.1 throguh R1.7 need to be collected to describe a tasks to be performed by the personnel to whom the training program is intended. However, we do not feel that a NERC standard should mandate an operating entity to perform a job task analysis to develop this list and the corresponding training program.

   An industry-wide standard shold stipulate that these operating entities (RC, BA and TOP) each develop and deliver a training program that will bring their operators to the competency level required to perform those tasks that the entity is responsible for as specified in the Functional Model. We view the listed items in R1 to be part of the task and work environment description, which can be combined with those listed in R7 and included in the training program document. A way to capture this would be to put the key attributes that must be included in a training program in a template to facilitate compliance audit.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☒ No

   Comments: The training need analysis should identify the training needs and the full spectrum of competency level that must be achieved/demonstrated to perform the tasks covering all levels of the system operator being trained. An entry level operator may need to start at a lower training level than their more experienced counterparts. Experienced operators, including those who have been certified, may refresh their training at an intermediate level depending on the gaps identified. Analyzing the training needs for a specific group of operators and develop a program specifically for that level may render the program too specific and hence ineffective.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☒ No

   Comments: Please see our response to Q2.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: The will ensure that the training need is reviewed at least annually and a business plan with resource commitment provided.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments: The desired results of this standard are operator competency and the responsible entities developing and providing the training. An industry-wide standard should not have to require each entity to provide competent instructors. Incompetent instructors will soon be replaced by competent ones as soon as the entities fail to secure a sufficient number of certified operators to meet other NERC requirements. Also, by having such a requirement, what follows would likely be "instructor certification" to assess instructors' competency. This is not necessary.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: This is a good list for inclusion in the traning manual. However, many of them are a repeat of R1's and as such, can be combined with those listed in R1.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☒ No

   Comments: This will help the entity in its annual review of its training plan, but is part of the annual training plan itself (4, above).

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☒ No

    Comments: Yes, but it's too fine a requirement and appears micro-managing. It is also covered by the annual training plan activities. We suggest that this requirement be combined with other annual review requirements or be removed.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: A well-structured training program is an important component to ensure that the concerned operating entities bring their system operation personnel to the competency needed to meet the entities' certification requirements and to assure operating reliability. However, actions taken by the operators in accordance with NERC standards have a direct impact on system reliability, not the training program itself. There are a number of requirements in this standard that are rated High and Medium, which we feel should at best be rated Medium and Lower, respectively, as they have a much more remote, secondary impact than actual operation. For comparison, for example, mitigating limit violation is assigned a High level; maintaining generation-load-interchange balance is assigned a Medium level. These requirements have a more direct impact on ensuring system reliability and controlling system conditions than developing and delivering the training program.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: We do not agree with the requirements at this time so we are unable to agree with the measures, at least not until the requirements are revised and the measures adjusted accordingly. Please also see comments/suggestions in Q19.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: Same as above.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: Please see comments in Q19.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: We cannot assess this until after the implementation plan is revised according to the changes made to the standard.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:

    The IESO appreciates the opportunity to comment, and commends the drafting team for its breath of consideration in coming up with this draft standard. However, we feel that the standard can better focus on the key requirements for training.

    (1) We feel that the standard should focus on the following 4 key requirements to hold each of the three operating entities (RC, BA and TOP) responsible for:

    a. Developing a training program which lists the tasks (specifically for the RC, BA and TOP as listed in the Functional Model) to be performed and the competency level required to perform the tasks;
    b. Delivering the training program;
    c. Recording, tracking and assessing progress of the persons receiving training;
    d. Planning, providing resource, reviewing and adjusting (as necessary) the training program annually.

    (2) Individual organizations may require the operators to perform other tasks but such tasks and the corresponding training requirements are outside of the scope of an industry-wide NERC standard from the viewpoint of the tasks assigned to the three functional entities. The training requirements to perform these other tasks should not be included in this standard.

    (3) Some of the items listed in R1.1 to R1.7 support the job/task description. They can be put as attachment template requirements that the training program shall include, and to aid assessment of compliance. Similarly. some of the items listed in R7 can be put into a template as requirements to prove delivery of the trainiing program.

    4. Based on the above philosophy, we recommend the SDT to consider revising the draft standard as follows:

    (i) Keep R1 (for Key Requirement 1a above) and revise it as appropriate to require each of the 3 entities to develop a training program for their operating staff to perform

the task associated with the entity's registered function; put some of R1.1 to R1.7 to a template attachment;
(ii) Combine R2, R3, R4, R9 and R10 (for Key Requirement 1d above) to become a requirement for an annual planning, review, and maintenance exercise for the training program.
(iii) Keep R6 (for Key Requirement 1b above), and put some of the items in R7 in a template attachment for proof of training delivery.
(iv) Keep R8 (for Key Requirement 1c above), and revise it as appropriate.
(v) Remove R5

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: A job task analysis should be performed to identify the tasks assigned to each operating desk but the "analysis" does not need to be updated when there is a new or revised task or tool. Shouldn't this section say the task list must be updated when there is a change?

   R1.1 Reliability-related tasks can be performed under many different conditions. How would we identify all the conditions these tasks could be performed under and what purpose does this provide? We believe this should be removed and is not required in the Standard.

   R1.2 We support including "The actions to be taken in performing the task, including identification of references and tools used in performing the task." in the Standard.

   R1.3 "Identification of whether the task is performed alone or as part of a team." BCTC does not support including this in the Standard. Many tasks need to be performed either "alone or as part of a team". We believe this should be removed and is not required in the Standard.

   R1.4 "The criticality of the task with respect to reliability." BCTC does not support including this in the Standard. Seprating out tasks as being "critical" to reliability implies other tasks are less important. There is no benefit to separating "critical" tasks from others. We don't see how this could be measured properly and all tasks that are reliability related should be considered important.

   R1.5 "The frequency of performing the task." BCTC supports including this in the Standard. It can be helpful in developing the yearly training plan and including infrequency of tasks in the refresher or continuing training program.

   R1.6. "The knowledge, skill, and experience needed to perform the task." BCTC supports including this in the Standard.

   R1.7 "The criteria for successful performance of the task." BCTC does not support including this in the Standard. Separately identifying the criteria for "successful performance" of each individual task is not necessary. BCTC fully supports a learning assessment at the end of each learning activity to determine if the learning objectives were met for the activity. We believe this will be a burden in developing a job task analysis for System Operators and does not provide and benefit to add performance critiera to "every task" performed.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

☒ Yes

☐ No

Comments: These should simply be referred to as a training assesment for "initial" training of a System Operator and a training assessment for "continuing" training. It is not necessary to say they are "entry level or newly hired experienced". A proper gap analysis measuring each System Operator against all the tasks required to be performed will determine how much training is required. However, R3 requires a training needs assessment of each operator to identify performance gaps (we prefer competency gaps or a gap analysis) at least once "every year." This indicates every operator must be assessed against the entire task list at least once a year. BCTC believes this type of assessment of system operators should occur with some regularity but every year is unnecessary and will lead to work that will not produce any real results, different than a simple gap analysis would. BCTC suggests a simple gap anlysis every 2 to 3 years, or when job duties change significantly, will get the results needed.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

☒ Yes

☐ No

Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

☒ Yes

☐ No

Comments: It is not clear what "anticipated duration of the topic" is meant to define in the annual training plan. It is expected that "anticipated duration" for a topic to be trained on would be different for entry level SO's vs refresher training for incumbant SO's. BCTC believes that "anticipated duration" for training topics should not be a requirement as it is different in each context listed in subsections under R4.

R4.2 suggests that training should solve all gaps in performance. BCTC would suggest that the standard should say that when an assessment determines training is the solution to a gap in performance it shall be done. Only after an assessment after a performance issue should the decision to train be required.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

☒ Yes

☐ No

Comments: The key phrase in this question is "entitites" verify the competence of those that develop and deliver training. BCTC believes the wording in the standard means that our entity will determine competency to train our system operators. BCTC

does not support outside entities such as NERC or the Regional Reliability Organizations determining if training personnel are competent.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: BCTC generally supports the list in R7 as a good record of training. We note that the list is similar to the data required for learning activities to be approved by the NERC Continuing Education Program. The "NO" response is due to the following we believe are not necessary or beneficial:

   R7.7 "Identification of the conditions under which the associated task is performed (as identified in R1.1.)." As mentioned in Question #1, BCTC does not support identification of the conditions when a task is performed. Most tasks need to be performed under many conditions.

   R7.9 "Objectives and assessments that duplicate the criteria for successful performance identified in R1.7. and mastery of the knowledge and skills in R1.6." As mentioned in Question #1, separately identifying the criteria for successful performance of the task is not necessary. Successful "performance criteria" is usually executing the skills and knowledge necessary to do the task resulting in the desired outcome, essentially doing the task without mistakes. Additionally, many topics in operator training don't support the concept that an operator can demonstrate performance of the task at the end of the learning activity. The task likely can't be performed until an operating condition on the system calls for the task to be performed, which may be days or weeks after the training took place. A "performance criteria" can be a general operating philosophy such as safe and error free operating of the system. We don't believe it is required to add performance critiera to "every task" performed.

   R7.10 As mentioned in Question #1, BCTC does not support including this in the Standard. Many tasks need to be performed either "alone or as part of a team" depending on normal operating or emergency conditions at the time. Whether a task is generally performed individually or as a team is a fundamental part of identifying the task and does need a separate reference in the standard.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: BCTC has simulator that models our system but we also recognize the benefits associated with other computer-based simulators whether generic or company specific. We have also used table to exercises and simulated events, not using the company simulator that have been as effective in training. BCTC does not support including this as a requirement in the Standard. Effective "simulation" of either normal operation or an emergency event is the goal and can be accomplished through many different methods of simulation.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments: The question asks if a record of each operators training that shows the tasks mastered and the tasks where performance needs improvement. This is somewhat different than the requirements listed in R8 which seem to deal with meeting performance criteria. We caution that the administrative work already involved with Certifcation, Continuing Education along with external and internal training has grown by 10 fold in the past 3 - 4 years. BCTC supports keeping a training record for each operator but does not support the following:

   1. A separate record listing all the tasks identified in the job task analysis and whether the operator has "mastered" that individual task or still "needs improvement" is more detailed recording keeping than is needed. The training program and annual training plan for each operator is designed to fill identified gaps in an operator's skill and knowledge needed to accomplish the tasks, thus the concept is addressed in designing the training plan rather than requiring a separate list of the operator's standing with the tasks.

   2. Section R8 seems to focus on documenting how the "performance critiera" is met. It indicates appliable entities must track their operator's progress in using training to obtain the knowledge, skill and experience needed to "meet the performance criteria specified in R1.7. for the tasks identified in R1." BCTC supports a learning assessment at the end of each learning activity to determine if the training objectives were met for the class. Separately identifying the criteria for successful "performance" of the task is unnecessary. Successful "performance criteria" is usually executing the skills and knowledge necessary to do the task resulting in the desired outcome, essentially doing the task without mistakes. Additionally, many topics in operator training don't support the concept that an operator can perform the task at the end of the learning activity. The task likely can't be performed until an operating condition on the system calls for the task to be performed, which may be days or weeks after the training took place. A "performance criteria" can be an operating philosophy such as safe and error free operation of the system but it will be unbenficially burdensome to add performance critiera to "every task" performed.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments: BCTC supports a requirement for yearly evaluation of the training program "to meet the criteria for successful performance as identified in R1.7." provided the performance criteria is not task specific as mentioned above in Questions #1 and 8. We would support a simple gap analysis be performed to determine what worked and what didn't work.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments: This requirement does not specifically say the words "training materials" and it should say this. The measure says "training materials".

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

☐ Yes

☒ No

Comments: BCTC notes NERC documents on violation risk factors state, "These reliability-related risks are proposed for use when determining a penalty or sanction for a violation of that requirement." Thus the purpose of the risk factors is for use when determining a penalty or sanction. Also from NERC documents, the risk factors are intended to represent the following in the operating timeframe:

High = A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;

Medium = A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;

Lower = A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;

With the understanding that violation risk factors are not to rank the importance of a requirement to the industry but rather as an aggragating factor in determining penalties and sanctions, BCTC offers the following comments on the violation risk factors in the draft Standard:

R1 is listed as HIGH and while it is clearly important to reliable operations, R1 does not fit the definition of HIGH and should be changed to MEDIUM or LOWER.

R2 is listed as MEDIUM and BCTC agreesor reduce it to LOWER.

R3 is listed as HIGH and while it is important to developing a training program, R3 does not fit the definition of HIGH and should be changed to MEDIUM or LOWER.

R4 is listed as MEDIUM and BCTC agrees or reduce it to LOWER.

R5 is listed as HIGH and while it is important to developing a training program, R5 does not fit the definition of HIGH and should be changed to MEDIUM or LOWER.

R6 is listed as HIGH and while it is important to developing a training program, R6 does not fit the definition of HIGH and should be changed to MEDIUM or LOWER.

R6.5.2 is listed as MEDIUM and BCTC agrees but does not understand why this sub-requirement receives an independent violation risk factor. Is it possible this is meant to apply to R6.5 and both of its sub-requirements R6.5.1 and R6.5.2? If so, since BCTC

recommends R6 (all of it) be changed to a MEDIUM or reduce it to LOWER it would make this sub-requirement designation unnecessary.

R7 is listed as LOWER and BCTC agrees.

R8 is listed as MEDIUM and BCTC agrees or reduce it to LOWER.

R9 is listed as MEDIUM and BCTC agrees or reduce it to LOWER.

R10 is listed as MEDIUM and BCTC agrees or reduce it to LOWER.

12. Do you agree with the Measures in the proposed standard?

☒ Yes

☒ No

Comments: BCTC agrees the measures are worded appropriately for the Requirements as written. BCTC and others will be requesting changes to the Requirements which will require corresponding changes in some wording of the Measures. We would expect the measures would change with any changes to the requirements that come from industry suggestions.

13. Do you agree with Compliance Monitoring section of the standard?

☒ Yes

☒ No

Comments: The RRO is identified as the Compliance Monitor for the Standard. The Compliance Monitoring Period and Reset section lists all the potential methods the RRO may use to monitor compliance. BCTC recommends Self-certification, Period Audit (required 3-year compliance audit, not the readiness audit), and Triggered Investigations. The Data Retention requirements are more detailed than necessary and BCTC recommends a simple requirement for all training documentation and records to be retained for three-years, similar to the requirement of the NERC CE Program.

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☒ Yes

☐ No

Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

☐ Yes

☒ No

Comments: BCTC recommends field testing should be the practice for all NERC Standards. Field testing reveals administrative concerns and sometimes larger concerns that were not foreseen. All standards should be subject to at least a brief field testing period.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☐ No

    Comments: The plan says in part that PER-004-1 will be replaced with this Standard. The existing Standard is PER-004-0. Did the document mean to say PER-004-0 or is there a new PER-004-1 in progress that BCTC is not aware of or was this a typo?

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: There was no question directly associated with R6 to allow comments. Requirements R4 and R6 address similar training areas with the primary difference being R4 is for the "annual training plan" and R6 is the "implementation" of the training plan. It is difficult to write NERC standards but some of the Standards repeat the same words just in a different context. Can the drafting team look at combining R4 and R6 into a single requirement addressing the separate issues of an annual training plan and the associated implementation of the plan? Separate Measures could be written to address these two areas even though they are contained within a single Requirement.

    BCTC supports a requirement for development, delivery, and evaluation of system operator training using a "systematic approach to training" as required in this Standard. Even though a specific principle of a systematic approach to training makes it more effective, that doesn't mean that principle should be part of a mandatory reliability standard. A reference document describing many of the "how" to do a quality job of using the systematic approach would be helpful. Some of our comments to remove parts of the Standard may fit well within a reference document that is not used to judge compliance.

    This standard may be the single most expensive standard to come from NERC for the electrical industry. It is important to ensure the words are clear and we know what is expected and not open to interpretation. We believe it also important to test this standard in industry to ensure it will work for its intended purpose. BCTC would request NERC to take the time to ensure the administrative requirements are gradually introduced and they do not take away time from training efforts already ongoing. The industry has been working through Certification and Continuing Education requirements that have been refined over the past 3 years and these requirements have been good to ensure training efforts and requirements get better within our industry. We hope that you will come back with a standard that is simple to understand not burdonsome on us to follow on top of the training requirements for CE and all the other efforts ongoing.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments:
   In response to the specific question posed: The NYISO agrees that the information listed should be included in a Job Task Analysis. However, the format of the question focuses on the details of the requirement (i.e. what goes into a JTA) and presupposes the need for the requirement itself.

   The NYISO does NOT agree that a Job Task Analysis should be a NERC mandated requirement. The customized subjective nature of job tasks precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: There should not be a training needs assessment. There is a competency adequacy assessment. If the individual is competent no action is required. If the individual is not competent, action must be taken to attain competency. Entry level, new hire or incumbent status has no place in a standardized approach to training, unless you are intending to assume competency based on incumbency. If an individual does the task every day, the competency assessment is based on real time job performances. There is no need training needs analysis outside of the standard competency evaluation for the tasks.

   No different actions are taken in assessing competency based on employment history. The competency test is based on the task, not the work history of the individual

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☐ Yes

   ☒ No

   Comments:

The NYISO supports a requirement that all responsible entities must have a System Operator Training Plan for maintaining current competencies, learning new competencies, and practicing needed competencies. The Plan should include training that covers all the experience levels for the specific respective entity (not for some undefined common need).

There is absolutely no basis in the standardized approach to training based on years of service or the 'newness' of the task addressed. Requiring a formal structure of "entry level", "continuing" and "refresher" training is a useless administrative overhead mandate. ADDIE has no references to years of service. ADDIE is competency and performance based requirement. The competency test is based on the task, not the work history of the individual

R2 and R3 can be replaced by a single, ongoing competency evaluation requirement

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: If each and every training need for each individual can be defined a priori, a year in advance, individual annual plans may have meaning. Since, tasks and individual performance frequently change over time - take NERC standards as an example - there is no value added in requiring an individual plan at any level of detail beyond a general overview. Only a broad brush overview of training activities is a useful expenditure of effort on an annual basis.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments: A requirement that each entity verify trainer competency mandates each entity to assume an expertise that is outside the scope of those reliability entities.

   The NYISO supports ongoing Training Programs that employ systematic approaches to training. Such programs, including NERC's current Continuing Education program, include a feedback component from the participants in the areas of content and instructor competency. Although participant verification of the competency of the instructors is an inherent component of such systematic approaches, a standard on verification is unnecessary

   As note in the responses to Q1 and Q2, any standard that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard. To meet the FERC directive the standard must include a definition of competence and the measures used to assess that competence.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: R7.7 is unnecessary, and should be deleted. Once you identify the task - the task should incorporate the triggers for its implementation in its definition. Referencing the task is sufficient for record keeping.

   7.9 are unnecessary, and should be deleted. Including a statement that the requirements "duplicate" a previously defined requirement should be a dead give away that the requirement is unnecessary. Successfully mastery measures of the task should be included in the task documentation.

   7.10 is unnecessary and should be deleted. "Practice", alone or in teams, is an excessively vague and pointless requirement. Once the individual has demonstrated competency (a.k.a., practicing once), how many times should the individual re-demonstrate (a.k.a. practice more)? Five times? Ten times? One hundred times? Practice is not a requirement.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The NYISO does not support requirements that mandate "How to" carry out a given standard. Although the NYISO supports the use of near-real time Operating Training simulators, the NYISO recognizes a simulator is not a necessary tool for conducting valid excercises.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: The NYISO agrees that a training results tracking system is a valid Training task, but questions whether or not this task rises to the level of a NERC standard.

   Note:
   Question 8 refers to Requirement 8. However, Question 8 asks a question (relating to documenting operator needs) that is not part of Requirement 8 (relating to training only)

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: No. They should continually evaluate the compentency of their people. If the personnel competency is maintained, studying the training program in total is unnecessary.

   An annual evaluation of training programs is a good practice, it is important but it is not required. As with other proposed requirements, this requirement does not provide a quantitative measure related to evaluation.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: No. Making a criteria statement on the topic of "updates" has the effect of requiring administrative burden independent of a systematic approach to training. If training is developed and delivered based on clearly defined tasks, required actions, and clearly stated measures of competency, "updating" training is moot. R10 is redundant and should be removed. There is no way that a entity could comply with R1 and R4 and simultaneously violate R10. Remove R10.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

☐ Yes

☒ No

Comments: Vilolation risk factors have meaning when applied to specific tasks within a systematic approach to training. Violation risk factors associated with standards requirements have no function outside of the justification for specific measures and compliance portions of the standard. That tidbit of measures and compliance development should not be retained in the standard text.

12. Do you agree with the Measures in the proposed standard?

☐ Yes

☒ No

Comments: M2 and M3 can be combined. M3 would do the job by removing the word "incumbent". The measure would then apply to entry level, incumbent, and progression qualifications.

Same thing applies to M6, M7 and M8. It is all the same requirement. One person's entry level training is another person's refresher training. Continuing training is entry level training applied to people who are already employed.

See final comments

13. Do you agree with Compliance Monitoring section of the standard?

☐ Yes

☒ No

Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☒ No

Comments: Since I do not endorse the standard as written, it is too early to say that the implementation schedule is appropriate.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☐ Yes

☒ No

Comments: Do to the massive change in the industry, a field test would seem prudent.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Since I do not endorse the standard as written, it is too early to say that the implementation schedule is appropriate.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:
    In addition to the comments supplied here, the NYISO supports the comments provided by NPCC and the IRC.

    R6.5.1 - the 32 hour of emergency training - has no place in a standard that lays out requirements for a systematic approach to training, and should be removed. The 32 hours is a number that was pulled out of the air and has no relation to operator competency at reliability related tasks. It is completely indefensible from a compliance point of view.

    This standard could be boiled down to the essential elements by requiring a standardized approach to training without detailing detailed requirements for entry-level, new operator and incumbents, nor program structure requirements.

    R1 is the requirement to conduct a task analysis. No problem

    R2 and R3 are poorly worded requirements to evaluate competency in performing reliability related tasks. Adding artificial categories based of levels of work experience has no bearing on the content, format, or frequency competency evaluations. How about:

    R 2/3 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct a competency performance assessment of System Operators to identify mismatches between actual performance and the criteria for successful performance for each position performing reliability related tasks.

    R4 and R6 address the need develop and implement a plan. There is absolutely no value to having a plan, if it is not implemented. The reliability entity should get no credit at all for developing a plan that is not implemented. There is no value added in specifying a specific training structure. How about:

R 4/6 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall develop and implement an ongoing training plan developed from the training needs assessments. The plans shall identify the topics, anticipated duration of the topic, and target schedule for delivery.

R5 is the requirement for qualified trainers. I question the need to use two subsections instead of just listing the three requirements.

R7, R8 and R9 are the requirements to maintain training records, assessments records and training content records. How about:

R7/8/9. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall maintain competency evaluation and training records:

Individual competency evaluation records
R7/8/9.1. For each system Operator, reliability-related task identified, the date and method used to assess whether the System Operator's performance meets the criteria specified.

Individual training completion records
R7/8/9.2. For each system operator, activity the date, the duration of the activity, and completion status for training activities.

Individual Training Activity Content records
R7/8/9.3 For each training activities - the addressed task, the duration of the activity, overall success rate of participants, feedback comments of participants

Training Plan records
R7/8/9.3 For all training activities - the addressed task, overall success rate of participants, feedback comments of participants

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: The tasks to be performed by a system operator should be defined by the standard drafting team (SDT). A training program should then be developed by the entity to assure that any and all operators are proficient in those tasks. The standard need not get into the specifics of the training program.

   NPCC participating members also believe that an operating entity should not be mandated to perform a formalized job task analysis to identify a list of tasks and the corresponding training program.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: Before taking an unsupervised shift a system operator needs to have demonstrated proficiency, regardless of past experience. The training provided must meet the need of the individual regardless of the level of experience to ensure no gaps are in the training or any assumption of knowledge where there may be not be sufficient background.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: Again, the SDT needs to identify the knowledge set for a system operator.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: NPCC participating members believe R4 should only be a restatement of this question (each entity should have a training program that assures the proficency of

the system operators) and not include the details as presently stated in R4 of the draft standard.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☒ No

   Comments: NPCC participating members believe that although it is important for the trainer to have basic understanding and competency of the subject matter, it is not a measurable metric for compliance. Many believe that incompetent trainers will result in system operators failing the "test" and that they will ultimatly be identified for more simplistic performance based processes than need to be stated in this standard.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: NPCC participating members believe that it is unnecessary to be overly perscriptive in how the training is performed. This should be left to the discretion of the entity. The purpose is to produce system operators that meet a defined level of proficency. If the operator can prove a level of proficiency, the training was succesful.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Although NPCC participating members believe that a simulator holds great value in conducting operator training, it is not an absolute necessity. Many smaller entities have expressed concern that the cost of a simulator is excessive and depending on the size of their area may have the appropriate cost-benefit ratio. Valid training exercises may be conducted effectively without it.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments: The entity should have records showing the system operators have either mastered a proficency or have not but does this rise to the level of importance that it needs to be stated in a NERC-ERO Reliability Standard? This type of information will be maintained in a normal "course of business" and doesn't need to be specified here.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments: NPCC participating members believe that a yearly review is laudable and good practice, but should not be a requirement.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

☒ No

Comments: NPCC Participating members expressed concern on how the phrase "accurately reflects" can be quantified and measured and requests clarification. If this is not practical then it should be removed as a Requirement.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☒ Yes

    ☒ No

    Comments: A violation risk factor of High means a violation has the potential to directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or did or could have placed the bulk power system at an unacceptable risk of instability, separation or cascading failure.

    R1. No. A lack of conducting a formal job task analysis is not a high risk factor to the BPS. It should be Medium

    R4. No. This should be "low." This is purely administrative.

    R8. No. It should be Lower and mainly administrative.

    R9. No. It is Lower and administrative.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: NPCC Participating members have expressed some disagreement with the Requirements as written so the measures are in question as well.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments: NPCC Participating members have expressed some disagreement with the Requirements as written so the measures are in question as well.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☒ Yes

    ☐ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

☐ No known conflicts

Conflict: Conflicts with sections of PER-002.

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

☐ Yes

☒ No

Comments: NPCC Participating members cannot comment or agree to the implementation plan until a final draft of the standard is available.

19. Please provide any other comments you have on this standard that you haven't already provided above.

Comments: NPCC Participating members believe this Standard is focused on the training program and not on the purpose of training. It is not important that an entity has a training program, rather it is vital that the entity has an effective training program, and one that is measurable by NERC.

The Proposed Standard defines actions the entity must take but it does not define a performance measure that is tied to improving System Operator competency. For instance, if a gap is identified and training is provided, then the entity has met the proposed Standard's requirements. But there is no assessment of successful training or poor training. Whether a gap is closed or remains after training does not matter to this Standard.

This Standard should be limited to a requirement for the entity to identify and document required skills, a requirement to define an acceptable time period to acquire the skill, a method of documenting the Operator's skill, a method to reassess the Operator's skill if a gap was measured, and removal from Operation if a gap persists.

The proposed NERC Standard is too keen on documentation of lesson plans, and not sharp enough on defining valuable objectives. Specific comments are:

1. R1. What is a Job Task Analysis? Needs to be defined. There is a difference between a list of tasks the Operator performs and a step by step instruction of performing the tasks.

2. R1.1 Needs to be more specific. What is meant by conditions?
R1.2 This needs to be defined for the level of specificity required.
R1.4. I think all real-time reliability related tasks are equally critical. The SDT should otherwise define levels of criticality criteria.
R1.5 What is the SDT looking for in frequency definition? How is it defined?
R1.6 Knowledge, skill and experience levels are not needed for JTA. All system operators, regardless of experience levels, should be able to perform reliability tasks.

3. R4 This does not belong in a Standard. The details are the responsibility of the entity.

4. R 6.2 How many hours of continuing training is required.
R6.3 The word “Requirement” should not be spelled out.
R6.4 Is not needed. Seems a repeat of R6.3
R6.5.1 Is the PER-002 R4 requirement going to be deleted?

5. R7. Training , the hours of training, the method of delivery, and objectives do not need to be documented to have a successful training program. Suggest eliminating this requirement.
6. R8. Training should be performed until an Operator is competent in a task.
7. R10- Not needed in a Standard.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: An important question resulting from the language used in the Requirement is: What is meant by "company-specific reliability-related tasks"? One interpretation could be "only those reliability-related tasks that are specific to a given company's operation" (as opposed to generic operator tasks). A second interpretation could be "that subset of all of the tasks derived from the JTA that are designated as reliability-related". Throughout the draft Standard there are repeated references to "tasks identified" and "reliability-related tasks identified". A clearer understanding will substantially aid in determining how onerous this Standard will be.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

Comments: The Trainer competencies cited in 5.1.2 (systematic approach) and 5.2.1 (delivery) are subjectively determined at best and may force many entities into the untenable, and undesirable, position of having to completely outsource their training needs.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: While desirable, such a simulator tool may be prohibitively expensive to procure and maintain and update. "Lessons Learned", tabletop drills and functional exercises are acceptible alternatives that accomplish the same goals.
   Re 6.5.2: It is extremely difficult to schedule enough such inter-entity drills to be able to capture each Operator's participation on an annual basis given shift requirements, etc. A three-year per-Operator participation requirement, equivalent to an Audit span, is more readily accomplishable.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: In my opinion, only R6, the implementaton of a System Operator training program, merits a "High" VRF as a Requirement that, if violated, could… place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures". The remaining Requirements with a proposed "High" VFR are contributory in nature and are more appropriate as "Medium".

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☐ No

    Comments:

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: The proposed Standard is an admittedly "complex standard with many requirements" and the Responsible Entities will require time and resources to examine their current practices, complete the requisite analyses and implement the programs to meet the Requirements of these Standards. An Implementation Schedule akin to that required for CIP-002 through CIP-009, i.e., varying degrees of parallel (as opposed to serial) compliance with specific milestones (Begin Work, Substantially Compliant, Compliant, Auditably Compliant applied to all Requirements at the same time as opposed to strict Auditable Compliance for each grouping within the serial stages) over four years rather than two. Many budgets for 2007 are already locked-in and the first serial stage in particular (R1, R2, R3) will be costly.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: The proposed Standard is complex in nature and contains many Requirements and will be potentially costly to many Entities. The Responsible Entities will require time and resources to perform the depth and breadth of work mandated. An Implementation Schedule over four years rather than two better complements the five-phases of the systematic approach to training and will significantly increase the probability that this effort be accomplished in a complete and thorough manner with the costs spread over a realistic time frame.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: The phraseology "including any contract System Operator or System Operator performing tasks identified in R1 under delegation agreements" (R3, R6, R8) has in some instances been interpreted as applying to System Operators in a Local Control Center and in other instances to field personnel who perform SCADA-controlled or manual switching functions. The NERC Functional Model, as best as I know, contains no such reference. If the Drafting team is proposing that these Requirements extend beyond the what is in the Functional Model, e.g., RC and TOP, it should succinctly state such in a manner that will cause no confusion when the balloting commences.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments: A company can do this for its internal training. For training from a NERC CE provider, whether instructor led, on-line, or video, this verification should be done by NERC and entities should not need to re-verify what NERC should have already done.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: A company can do this for internal training. For training from a NERC CE provider, whether instructor led, on-line, or video, R7.1 through R7.5 and R7.8 should be satisfied by supplying the NERC CE number for the class. Entities will still need to perform R7.6, R 7.7, R7.9, and R7.10.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: As long as this can also be satisfied by using a generic simulator such as the EPRI OTS.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments: I agree with the wording of question #10. Wording in R10 is different than this question though. It requires that the training program reflect the "current" operating environment. R10 should not be worded to preclude training on known changes/improvements before they are implemented.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: All requirements except R6 (and its sub requirements) are administrative. None of the requirements put the BES one event away from a cascading failure.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: M9: R7.1 through R7.5 and R7.8 should be satisfied by supplying the NERC CE number for the class.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☒ Yes

    ☐ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☐ No

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: ATC believe that Requirement R1.1 and R1.7 go too far in prescribing what has to be included in a job task analysis.

   ATC does support the requirement that a job task analysis be performed but does not agree that with the need to prescribe the sub-bullets.

   ATC recommends that the SDT delete Requirements R1.1 – R1.7.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: ATC does not believe that a separate training program needs be created for entry-level, newly-hired, and incumbent system operators. It is our position that a single training program can be developed to serve as the umbrella. Under the training program umbrella, individuals' training needs can be matched to those course offerings most appropriate to their level of expereince and area of need. Requiring the documentation of multiple training programs for the same tasks at varying levels does not enhance system reliability or lead to more educated system operators. Rather, it adds to the administrative burden placed on the trainers, thereby reducing the amount of time available to develop and deliver quality training.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: Although ATC agrees with the question as posed above, this is not consistent with the way the proposed standard is written.

   In addition, we believe that this standard should be written in a way that offers entities the flexibility to meet some or all of their training program requirements via external NERC certified course offerings under the recently approved NERC Continuing Education (CE) Program.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: ATC believes that a training needs assessment should be completed on an annual basis and that, this needs assessment would be one of the items taken into consideration in creating the training program; however, to create a separate training plan for each individual operator is overly prescriptive. ATC asks for the following changes:

   Changes to Requirement 4

   Each RC, BA and TO shall have an annual training plan developed from the training needs assessment that identifies the topics, anticipated durations of the topic, and target schedules.

   In conjunction with this change, ATC requests the deletion of Requirements 2 and 3.

   ATC also recommends that the SDT delete Requirements 4.1 – 4.4. These requirements are overly prescriptive. They increase the administrative burden on a company and do not enhance system reliability or lead to more educated system operators.

   ATC recommends that NERC rewrite this standard in light of NERC's Continuing Education (CE) Program, as there will likely be a large amount of overlap in acquiring CE hours in order to maintain an individual's certification and in fulfilling organizational training requirements. Many companies will be looking to the CE Providers to help them meet their NERC CE hour certification requirements and their internal training program needs at the same time. The organizational training requirements are already tied to an individual's need to maintain certification via PER-003 which requires organizations to staff positions having the primary responsibility for real-time operation of the Bulk Electric System with certifed NERC personnel.

   If this standard fails to recognize the Continuing Education Program, which has already been approved by the NERC BOT, this standard, as written, will largely serve to increase administrative costs in the industry with minimal additional reliability benefits.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments: ATC believes that Requirement 5 is both unnecessary and overly burdensome. We recommend that this requirement including its sub-requirements be deleted from the standard.

   Again, ATC believes that this standard should be written in a way that offers entities the flexibility to meet some or all of their training program requirements via external

NERC certified course offerings under the recently approved NERC Continuing Education Program. Therefore, the burden for providing qualified instructors lies with the CE Provider and NERC in approving Individual Learning Activity (ILA) applications.

As written, this standard creates duplicative requirements on the entity to track CE Provider credentials and substantiate the credentials of training provided by external instructors. This is the job of NERC under the CE Program. Failure for this standard to acknowledge an existing, NERC approved Continuing Education Program, merely because it has been developed by a separate arm of NERC is insufficient justification to place this additional administrative burden and cost upon the industry. The standard, as written, requires each industry member to create its own set of training records which in large part will be duplicative of the data that NERC has already captured under its CE program.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: ATC does not agree with the requirements in R7 nor its sub-requirements. (R7.1 – 7.10) Again the SDT has ignored the reality of NERC CE Program requirements in writing this standard.

   ATC recommends that Requirement 7 be deleted along with its sub-requirements. At a minimum, an exception for collecting and reporting this data should be made for those programs that have been previously approved by NERC as part of their CE Program.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: ATC does not believe that this is the correct place to insert any drill exercises requirements. Any additional training requirement that NERC wants to place on certified operators should be made under the certification arm of NERC not through the standards process.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: Although ATC agrees with the question as posed above, this is not consistent with the way the proposed standard is written; "should" versus "shall."

   In addition, if an entity is required to document this information, the entity should be allowed to view the completed CE course information in regard to their employees in the NERC database once implemented. Currently, NERC has restricted access of this information to the individual alone. Apart from having this flexibility, this requirement is duplicative and increases the administrative burden on the industry without enhancing system reliability or leading to more educated system operators. Why make an employer report the same information that NERC already has available to a large extent via its CE Program?

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

Comments: Although ATC agrees with the question as posed above, this is not consistent with the way proposed Requirement 9 is written. ATC is supportive of conducting an annual review of training programs; however, Requirement 9 is overly prescriptive. ATC proposes that the following change be made:

Each RC, BA and TO shall evaluate its System Operator training program to determine if the training is meeting their system operators' needs and, if not, use the results to update the program to correct identified deficiencies.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

☒ Yes

☐ No

Comments: Although ATC agrees with the question as posed above, this is not consistent with the way proposed Requirement 10 is written. ATC proposes that the SDT rewrite this requirement to better align it with the question. Any training program should be reviewed prior to conducting the actual training; however, NERC should not require an annual review of all training programs if a program is not scheduled for delivery in that year. Requiring an annual review of all classes, regardless of anticipated delivery schedule is unduly burdensome and of no value to the industry. Lastly, this requirement fails to take into account the NERC CE Program requirements. Existing classes previously approved and delivered under the NERC CE Program must be reviewed and updated prior to delivery. The process for ensuring that this happens is auditable under the NERC CE Program and should not be duplicated here.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: ATC believes that only Requirement 6.5.1 should be given a High Violation Risk Factor. All other requirements should be either medium or lower.

    R1 lower
    ATC suggests that R2 and R3 be deleted.
    R4 lower
    ATC suggest that R5 be deleted
    R6 medium
    R6.5.1 High
    R6.5.2 should be deleted
    R7 should be deleted
    R8 lower
    R9 lower
    R10 medium

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: ATC disagrees with those measures that are tied to requirements that we believe should be deleted.

    Measure 12 requires updates to training programs even if that program is not scheduled for delivery in that training year. This measure should be rewritten to require that training programs only need to be reviewed prior to delivery and that the delivered program reflect current industry standards and topology.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

☒ No

Comments: ATC does not agree with the implementation schedule with the proposed standard as written. ATC strongly recommends that the implementation schedule be extended for an additional one to two years based upon the way the standard is currently written.

Phase 1 should be 18-24 months
Phase 2 should be 24-36 months
Phase 3 should be 36-48 months

ATC may agree with the implementation schedule as is if the SDT modifies the requirements in accordance with ATC's recommendations.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☐ No known conflicts

    Conflict: ATC believes that this proposed standard as written is duplicative and in conflict with the requirements of NERC's CE Program. The SDT should align this standard with the NERC CE Program.

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: See refer to ATC's response to question 15.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: In general, the requirements of this standard are overly prescriptive and unduly burdensome on the industry as they ignore the existing continuing education requirements already in place under the NERC CE Program.

    In addition, this standard needs to be flexible enough such that it allows entities to meet either a portion or all of its organizational training requirements via external NERC approved CE training vendors, under the existing CE Program, without requiring the entity to re-document and justify training courses previously approved by NERC.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: The standards should require a JTA, but the information collected and specified in R1 through R7 should be separate and used as a guide (e.g., and appendix). This would allow each entity to come up with it's own. Actions as a result of a task can be difficult to measure and document. How many categories of criticality are there? Is this a standard or a recommendation? If this is a requirement, what is the minimum requirement for each? Is this a requirement for the industry or for each individual operator?

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: This item requires clarification. Is the standard requiring each person within each company to provide a black start/restoration drill at least once per year? If this is the case, the possibility of meeting this standard is unlikely. Regional and subregional training must be available for entities to participate at the level required by R6.5.2

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: A three-year plan would be better than an annual plan. A plan for a group of operators (e.g., entry-level system operators, newly-hired experienced operators, qualified/certified operators) would make better use of training. This would also offer refresher training to other operators on the same task.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Prefer that the standard use the term "qualified" instead of "competent".

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This is a great list of activity components for the perfect program, but is not necessary for all activities and topics of training. These should be a part of a "Guide" provided as an attachment to the standard not a part of the standard as measured requirements.
   When some needs are discovered due to poor performance or lack of knowledge, the training may be done informally on the job by another qualified operator via assignment by a supervisor. Having this documentation for every training activity is not practical, but it is a good guide to strive for in formal training.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This is good practice, but it may not be practical for every company to have a simulator that reflects the company's actual system. Simlulated practice can be sufficient for many entities.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: This question does not match R8. The standards should require training records, but not rating records.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

Comments: Yes, this is good in theory, but it should be a "guide" not the standard. This would be very difficult to put into practice. You can still deliver the training and point out updates rather than delaying necessary training.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: None of the violation risk factors should not be rated as "high". R1, R3, R5, & R6 are all marked as "high". They should be dropped to a violation risk of "medium". R8 is "medium" but should be dropped to "low" because it is just record keeping. R9 should drop from "medium" to "low".

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: Since there are areas within the standard that we disagree with, it is impossible to agree with the Measures in the proposed standard.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: If the standard is implemented as is, it would require additional training staff and the purchase of an LMS, which would make the implementation unrealistic. All of these requirements should begin on January 1 so that compliance is consistent for the year. We would prefer to see some examples of quality JTAs. We believe it's necessary to have some benchmark standards that can be used across the industry.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Realistically implementation may take more than two years. Refer to question #15.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: We would prefer to see some examples of quality JTAs. We believe it's necessary to have some benchmark standards that can be used across the industry. This standard would require an unrealistic amount of record keeping, considering current staffing. Few entities have the resources, staff, and time to meet the demands of this standard.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: In addition, I believe the JTA should include a list of industry-standard, reliability-related tasks in addition to the company-specific tasks. This would set a standard level of best practice across the industry.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: In addition, I believe the analysis should include not only the mismatch between the criteria for successful performance and actual performance, but it should also include:
   a gap analysis between knowledge criteria and actual knowledge, and
   a gap analysis between knowledge (what you know) and action (what you're able to do)
   Therefore there are three gap analyses:
   1. Performance Gaps
   2. Knowledge Gaps
   3. Knowledge/Action Gaps

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: I would add to the categories of competency: competency in assessment methods to ensure valid and reliable assessment tools which measure both knowledge and performance.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: I would like to see Training Provider Qualifications added to the list.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments: I'll reiterate the importance of having an assessment tool or tools that can clearly assess "mastery". This should be a rubric or assessment with levels of competency. The more granular, the better. If we rely on a simple checklist, we'll look back to discover an overabundance of Master Operators, which could reflect a false sense of competency across the industry.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments: At least once per year. These evaluations should include recommendations for improvement and implementation timelines for making such improvements. Participant feedback should be a component of these evaluations.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments: This seems to be more of a recommendation than a rule. I would be interested in seeing a plan to enforce this requirement. If it's not enforceable, the level of accountability diminishes.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☒ Yes

    ☐ No

    Comments:

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☐ No

    Comments:

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☐ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☐ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☐ No known conflicts

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: AEP supports that the standard should require a Job Task Analysis, but the information, collected and specified in R1.1-R1.7, should be identified separately from the standard, as a "Guide", such as an attachment or appendix to the standard.

   R1.1 should specify the condition categories (e.g., Emergency, Normal, Contingency, etc.).

   R1.2. should not require actions to be taken in performing the task unless the action is another task or sub-task. Actions may require a matrix or flow chart based on an individual's understanding of basic concepts. This could be very challenging in some cases, especially where there are a number of different actions/responses that are practical, and correct, that would yield similar results. As a result, we have documented operating procedures and plans (e.g., EOP and Black Start plans). R1.2 should simply read: Identification of references and tools, including actions if appropriate, used in performing the task.

   R1.4 is vague as it needs to specify the different categories of criticality (e.g., Low, Med, High).

   R1.6 should have the word experience removed or replaced with a different word or phrase within the requirement. Is experience intended to mean operator/trainee assessment by the trainer rather than experience over a time period of doing the task? If an individual has the knowledge and skill to perform the task, experience over time may not be relevent, such as for new tasks involving new tools. Experience comes with performing the tasks. Experience in doing a task may not be practical or possible (except as a lab type demonstration exercise during a training activity) until the tool/task has been proven and utilized in real-time operation. R1.6 should read: The knowledge and skill needed to perform the task; or, The criteria for demonstration of the knowledge and skill to perform the task.

   R1.7 - The criteria for successful performance is difficult to measure/document for many tasks. R1.7 seems redundant to R1.6, which is duplicative if a demonstration of knowledge and skills has been specified.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

Comments: Yes. However, the wording of requirements R2 and R3 should be changed to clarify that the intent is for the needs analysis to be performed for each System Operator job classification not for each individual System Operator.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

☐ Yes

☒ No

Comments: No. AEP agrees with the concept, but not with the details of the requirement. It should be clear that each applicable entity needs to have an annual training plan for each job classification, not plans for each individual operator. In R4.4, the use of the term "continuing training" is not consistent with the use of the term "continuing education" and "continuing training" in the NERC Continuing Education Program Administrative Manual. In the Manual, the term continuing education/training (per the Manual, the terms training and education are used interchangeably) is used to describe any training that extends the basic knowledge and skills required to do a job. Whereas, R4.4 uses the term in the context that continuing training is just one type of training used to extend the basic knowledge and skills to do a job. The use of terminology in the proposed standard should be consistent with existing NERC usage and definitions.

R4, R4.2, R4.3: It is not practical to formally train on all reliability tasks on an annual basis. Training is provided for job classification as a result of a training needs analysis and prioritized to address the greatest needs first. Conducting continuing/refresher training to the whole group assures that all get refreshed. Whereas, refresher training on critical tasks already being performed correctly by the group in a job classification, would not need training. If an operator is not performing a task correctly, immediate training or intervention by a mentor or supervisor may be required instead of scheduling a formal structured training session, that is documented in the training program.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

☐ Yes

☒ No

Comments: No. However, AEP does believe that each entity should have an annual plan for each job classification of system operator. AEP supports training identification at the job classification level, not at the individual level. The training needs assessment performed for R2 should apply for all entry level employees for a job classification, similarly the assessment for R3 should apply to all non-entry level job classifications.

New/entry level employees should not be performing reliability-related tasks (R4.1) on an unsupervised basis as they would not be qualified or NERC certified. The initial training plan should be a part of the annual training plan, but may best be referenced as an attachment or appendix to the annual training plan. It should be a stand alone program separate from that of the continuing education program for incumbent

operators. Initial training program time frames for entry-level employees, with little to no experience, generally may extend longer than a year. Annual refresher training, as in R6.5, is the part of the training plan that should give focus on identifying and scheduling training activities for qualified/certified operators. The training plan could require new entry level operators to receive the same annual refresher training given to qualified/certified operators, in addition to the training they receive in their initial training program, so as to reinforce the concepts of their initial training program.

R 4.2 and R4.3 should be combined. If the refresher training of R4.3 is completed, it will address gap refresher training of R4.2, if it exists. The term performance gaps is a somewhat ambiguous term that is open to interpretation.

R6 only needs to say "shall implement its System Operator training program as identified and specified in R4". It doesn't need the redundancy of R6.1 - R6.4

R6.5 should then be moved to be included as R4.5 as a type of training identified and targeted by the annual training plan.

R6.5.2 is too broad and vague. Need to clarify that "involving all real-time operating positions" only means involving real-time positions within a control center, not field personnel. Also, the wording needs to be clear that not all operators have to participate in the joint exercise required in R6.5.2.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

☐ Yes

☒ No

Comments: No. Competency in this area would not be easily measured. Being competent reflects such attributes as being qualified, capable, fit, and adequate. AEP does not disagree that entities should use competent and qualified trainers. The issue is how to measure that. Additionally, we do not believe there exists a "qualification certificate" that would be pertinent to the trainers in our industry. Therefore, R5 should be a guideline not a requirement.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: While this is a very good list of activity components, AEP believes that these components should be a part of a "Guide," provided as an attachment to the standard, and not be a part of the standard as measured requirements.

   When developmental needs are discovered due to poor performance or lack of knowledge, the training may be done informally on the job by another qualified operator via assignment by a supervisor. Retaining this documentation for every training activity is not practical, but it is a good goal to strive for in formal training.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: A simulator that reflects the operator's actual system is the best and is preferred over generic simulators. However, the use of generic simulators have benefits and should not be excluded. The use of simulators should not be exclusive of table top exercises as they too can prove to be very helpful.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: AEP believes that there should not be a record specific to tasks needing performance improvement, but rather should be evaluated at the group level. Training issues are best identified by group and training provided to the group.

   To the extent that individual performance issues occur, this becomes an individual job performance concern that is addressed through various human resource management approaches.

   Documentation for each task as specified by R8 would require extensive data entry into an LMS, in addition to the documentation needed to provide before entering data into an LMS. Another factor to consider is enabling the LMS to accept/accommodate such documentation for view by administrators and operators. The implementation schedule

would need to be reconsidered if these types of changes are necessary in the LMS system.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: No. We agree with the concept, just not the wording of R10. As presently worded, it should be a guideline not a requirement. Keep in mind that NERC itself has a history of using old reference material and training documents. NERC certification exams do not test the user on the most recent and current Reliability Standards, rather for practical purposes, the exam has a cut-off date for which Standard Revisions will be included in the exam. This typically results in an examinee being tested on some Standards that are not the current version at the time of their exam. Again we agree in concept that all entities need to keep their training materials current and applicable. But, for this to be a requirement, it needs different and more measurable criteria then presently in R10.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

☐ Yes

☒ No

Comments: No.
R1 should be rated as Lower Risk. It is not the lack of documenting job task analysis that would place the system at risk, it is the quality of the performance of those tasks. While, a job task analysis may be important to developing a good training plan, it does not meet the requirements of the High Risk definition for NERC Violation Risk Factors.

R2 should be rated Lower Risk. Newly hired and entry level operators should not be operating the system unsupervised until they are qualified. Nonperformance of R2 will not directly impact the reliability of the system, but rather would be an indirect cause over time. R2 does not meet the VRF definition of High Risk.

We concur with R3 being rated High Risk, as R3 relates to assessing successful or unsuccessful performance of reliability tasks which directly effects reliability of the system.

R4 should be rated Lower Risk as having a documented annual training plan is administrative in nature and lack of the documentation (the Plan) does not in itself mean the required and proper training has not and does not occur.

R5 in its present state should only be a guideline thus does not need a VRF. Conceptually, the qualification of the trainer would be Lower Risk as it is not the trainer that performs the actual reliability tasks. That is not to say having qualified trainers is not important.

R6 should be rated Medium Risk. While proper implementation of the Training Plan is important, it does not directly lead to unreliable operation of the system, but rather is an indirect cause. Thus, it does not meet the NERC VRF definition of High Risk.

We concur with R7 being rated a Lower Risk as it pertains to documentation which is administrative in nature.

R8 should be rated Lower Risk, as this is an administrative function. Nonperformance to R8 does not directly affect reliability, but could be an indirect cause.

R9 should be rated Lower Risk. While this an important administrative task, it by itself would not be a direct cause of unreliable operation.

R10 in its present form should not be a requirement, thus should not have a rated risk factor. How does R10 mesh with the concept of using a "generic" simulator for some drills and exercises as asked in question #7, when R10 states the training program must "reflect the current operating environment"? A generic simulator may be on a pseudo system which does not reflect any entity's current operating environment. This is just an example of why the present wording of R10 is inadequate.

12. Do you agree with the Measures in the proposed standard?

☐ Yes

☒ No

Comments: No.
As AEP does not agree with all the requirements in the proposed standard, we can't agree with all the measures in the proposed standard.

M1 - Conceptually we agree, just need to make changes to R1.1 - R1.7 as previously commented.

M2 - Shall have available for inspection the results of its latest training needs analysis for each entry-level System Operator job classification.

M3 - Shall have available for inspection the results of its latest training needs analysis for each System Operator job classification.

M4 - Agree.

M5 - Disagree. M5 is not a measure and R5 in its present state is not measurable. By what criteria is each Region and each auditor going to use to determine if an entity's documentation of qualifications is satisfactory?

M6 - Disagree. What is meant by training activities? Do you mean have available an entity's entry-level training plan? Or do you mean have available an entity's entry-level training material? Or do you mean something else?

M7 - Conceptually agree. However, we desire to see the standard use terminology in a manner consistent with the NERC Continuing Education Program Administrative Manual, which uses the term refresher training as a subset of continuing training.

M8 - Consider combining M7 and M8. In essence, the measure is to provide training records.

M9 - This measure would not be needed if R7 becomes a guide rather than a requirement of the standard as we suggest in our previous comments.

M10 - Remove M10. R8 is not appropriate nor is M10 which is the measure for R8. This is getting too close to making public record an individual's job performance appraisal(s), which heretofore have been treated as confidential between an employer and the employee.

M11 - Agree.

M12 - Just because an entity provides it latest versions of its training program, that will not necessarily demonstrate that the information within the program accurately reflects the current operating environment as required in R10. As stated previously, R10 needs work.

13. Do you agree with Compliance Monitoring section of the standard?

☒ Yes

☐ No

Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☒ No

Comments: No. AEP does not agree with the proposed implementation plan.

AEP recommends a phased implementation approach over a 3-year period. Compliance to Requirements 1-3 should start 18 months after FERC approval, compliance to Requirements 4-7 should begin after 30 months, and compliance to Requirements 8-10 should begin after 36 months.

Additionally, AEP disagrees with the retiring of PER-004-1 Requirements 3 and 4 upon implementation of this proposed standard. The drafting team incorrectly assumes the job task analysis for a Reliability Coordinator's System Operators would obviously include these requirements as tasks to be performed by a Reliability Coordinator. But if the NERC Standards do not have a requirement such as PER-004-1 R3 and R4, then why would they include this in their job task analysis? It would be a step backward for reliability to assume that every entity has the same interpretation of what an entity is to do and not to do. If we could make this assumption, then we wouldn't need Mandatory Standards. AEP can only support the retiring all of PER-004-1 if the drafting team can show where else in the NERC Standards an RC is required to perform what is contained in PER-004-1 R3 and R4.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: This appears to be a repeat of question 15 above. AEP would like to see this changed to phase-in time period of 3 years.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: The Standard Drafting Team needs to be careful to not include verbiage in the Requirements and Measures that could lead to entities having to provide an individual's job performance evaluation as part of the documentation for training. These are private and confidential personnel records that should not become part of public record.

    This proposed standard needs additional work. AEP continues to agree conceptually with the purpose of the proposed standard and the need for such a standard. We would suggest that the drafting team take another hard look at what should be considered requirements and what are just good guidelines. The standard needs to focus on requirements. Presently, we believe it contains a significant amount of detail that should be considered guidelines, not requirements.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: These need additional information for clarification. The process for the JTA should be more of a guide instead of a standard.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: Certification for new operators is already in Standard PER-002. After certification, exposuer to training for each operator should be the same program.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: Once certified, entry-level system operators should be encluded with experienced training in order for them to be exposed to all available materails.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: Each enity should have a training plan for the trainig process of the job. This would not leave out anyone (entry-level system operators) during the training process.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: However, who determines the qualifications for this. The word competent leaves room for several loop holes.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This list is too repetitive and complicated. Again, this whould be a guide and not a standard.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Affordable, effective, and reliable simulation technology does not yet exist. This could be a financial burden on small entities. Table top drills at this time are more effective.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: This could be complicated and time comsuming. Delete R8.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: Evaluation should occurs after each training session, but evaluation of the entire training program should not be required each year.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments: Once again, this should be a guide and not a standard.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: The risk for a violation should be no more than medium to low. The levels may need to be reconsidered.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments:

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: The self-certification would be more in line for every 3 years or when standards change.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: The implementation as is would be a considerable expense for everyone. Examples and explainations should be give first.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments: Any new training standard should be field tested before implementation without penalty.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☐ No

    Comments: After some serious adjustments, this could be inplementated in two years. No as it is now however.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: Examples, explainations and studies should be conducted first. Most of this standard would put a burden on all entities.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: The goal of this standard is to ensure that operators are trained to maintain the BES. If a company has a process in place that already performs this task why must there be a standard that mandates a direction as how one will determine if someone in trained. For example: The NERC PER-002 states that a company will have a process in place to have operators trained to maintain the bulk electric system (BES)

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: We believe that traing needs to be provided for new hire and entry level, however, not necessarily using R1.1 - R1.7

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: However, not necessarily by R1.1-R1.7 criteria

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: A company should have as a minimum a training program that provide contiuing training at least annually.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Partly I do not agree with section concerning R1.1 to R.1.7

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: However, NERC needs to allow a company to be able to work with vendors or other sources for simulator time in the entity does not have a company - specific simulator.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments: We think there should be system operator training records. However, not necessarily in the way stated

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: If materials are being used on a dailey, weekly and monthly basis then updates before using should not be required. There should be an annual review.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: Don't agree with R1

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☐ No

    Comments:

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: I don't agree with requirement 1

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments: However, I don't think this standard is necessary.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☐ No

    Comments: If the requirements in R1 can be generic to allow the companies to prepare a traing program.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: This procedure is to restrictive. If a company can show that there are procedures in place that show how operators are trained to maintain the BES than we shouldn't have to prepare a Job Task Analysis and maintain it. There is more than one way to ensure operators are trained. I was not a Nuclear operator, however, I don't recall that job task analysis's are prepared. The operators are trained on a simulator over a 6 month period and then follow procedures when in the field. I do not believe there are JTAs. I think preparing what this standard states would overburden a company that has a process in place to ensure an operator is properly trained to maintain the BES under all conditions.

    A second comment is that PER-002 request that the RRO and NERC define a set of training program ojectives. Is SERC also going to have a set of stanards the entities must follow. Again this stanard is very restrictive.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: In R1.1, the MRO recommends the addition of some examples for the definition of conditions i.e. emergency, normal, etc…; also in R1.4, add some examples of the levels of criticality.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: Some entities have procedure documents for activities such as switching where an individual will go out and perform the task under the direct supervision of a SO, does this standard apply to those individuals that are under the direction of the SO?

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☐ No

Comments: The region is being requested to define competency as it is seen from the perspective of the regional members, as this definition may vary from member to member. The competency of the trainer will be reflected in how each entities' system operators meet the myriad of requirements in this standard. If the entities' system operators training meets the requirements in this standard, the assumption can be made that the trainer is competent. This requirement is not needed. This is a business decision and should not be a requirement in this standard.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: The industry should have a standard template to assist industry trainers to meet all the requirements listed in R7.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: The MRO believes that user friendly simulators should be made available to the applicable entities, it does not believe that these entities should be required to have these simulators on site.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments: It appears that based in the requirements listed under R9. that this is an ongoing exercise and is accomplished annually if the requirements are met. Further, please clarify the intent of R9.3.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: The MRO recommends that the SDT review the VRF associated with the following requirements: R1, R3, R5, R6, R8, and R9; with respect to the fact that each of the requirements is calling for an administrative action to be taken which does not directly meet the definition of High Risk.

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☐ No

    Comments: The MRO recommends that the SDT review M5 in the event R5 changes, in order for M5 to remain consistent with any changes made to R5.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☒ Yes

    ☐ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: The MRO recommends that compliance measurement and enforcement wait until after the two-year phase-in period. There is concern that measuring compliance on only a portion of the standard will lead to a disjointed standard where compliance is not measured uniformly.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: The MRO believes that as long as this standard is not in conflict with other standards that require hours of emergency training (i.e. PER-003), then it is fine; however care needs to be taken to prevent these conflicts from arising in the future.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☐ No

   Comments:

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☐ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: Overall, Progress Energy agrees that the Initial and continuing training plans should be tailored to the System Operator job function as identified from the job task analysis. However, it appears the inidividual GAP analysis requirements of the proposed standard are beyond the INPO training model for nuclear reactor operators. Progress Energy recommends that during initial and continuing training, gaps in performance versus the system operator job function expectations can be identified, especially in simulator exercises. From this identificaiton of gaps in performance expectations identified in continuing training, remedial training (refresher training) can take place immediately in the training session to ensure learning takes place, individual performace meets the job funtion requirments, and most importantly the gap is addressed immediately. To be consistant with the INPO training model, there is no need for a formal individual gap analysis to be conducted annually outside of the continuing training process. Also, if a gap is identified in this proposed standard's required annual assessment, the standard does not require the operating entity which has identified the gap to provide any immediate remedial action and thus the operating entity is creating a litigation issue.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: We do not agree with the use of the word "experience" in R1.3. It is very subjective and difficult to quantify effectively or consistently. We suggest clarification of the meaning or just strike it all together.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: Does the term "each system operator" refer to individual operators or individual functions? (refer to reply #12)

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: We do agree that the use of a simulator is the best way to practice drills and exercises, but we also believe that utilities should have the flexiblity to use other means (e.g. tabletop) to train and practice skills…..especially very small utilities that may not be able to afford a simulator.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: We agree with the first part of the sentence that states that there should be a record of the operator's qualifications, but do not agree that there be a continuous process of evaluation for the purpose of new training plan development.
   If there is a developmental problem, it will be handled within the organization's Performance Management Process. Overall performance improvement is addressed at the function level in the Continued Training process.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: Was the term "Violation Risk Factor" defined ? What criteria and methods were used to determine Violation Risk Factor levels?
    A "High" on any of the requirements seems a bit extreme. If High is used a justification should be providedl.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: The use of the word "each" in M2 , M3 and M6 made us wonder if it pertained to a person or funtion. We feel that it would be too administratively cumbersome to be at the individual operator level.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☒ Yes

    ☐ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☐ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments:
   In response to the specific question posed: ISO New England agrees that the information listed should be included in a Job Task Analysis (JTA). However, the format of the question focuses on the details of the requirement (i.e. what goes into a JTA) and presupposes the need for the requirement itself.

   We do NOT agree that a Job Task Analysis should be a NERC mandated requirement. The customized subjective nature of job tasks precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments:
   ISO New England agrees that Training programs must address the needs of the individuals, regardless of the experience level. Further, we agrees that Training Programs must span the entire spectrum from new hires to experienced individuals.

   R2 and R3 however, would mandate individual person by person formal assessments. And R3 would impose unprecedented annual 'needs assessments' of each incumbent operator.

   R2 and R3 go well beyond requiring Corporate Operator Training programs, and go into mandating the practices and procedures for Personalized Training programs. ISO New England does not agree that a one-size-fits-all Assessment requirement will meet the unique and varying needs of the responsible functional entities. As noted in the response to Q1, the customized subjective nature of indiviual's needs precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to

improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

☒ Yes

☒ No

Comments:
ISO New England supports a requirement that all responsible entities must have a System Operator Training Plan for maintaining current competencies, learning new competencies, and practicing needed competencies. The Plan should include training that covers all the experience levels for the specific respective entity (not for some undefined common need).

All responsible entities must have a plan for entry-level system operator training, IF and ONLY IF entry-level training is required. However, there is no basis to fully-develop and have-ready-for-delivery an entry-level program if no such need exists.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

☒ Yes

☐ No

Comments:
ISO New England supports ongoing Training Programs, but does not support a standard that requires a program "for each operator." Operator-specific programs may be an admirable objective, but they are not always practical.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

☐ Yes

☒ No

Comments:
A requirement that each entity verify trainer competency mandates each entity to assume an expertise that is outside the scope of those reliability entities.

ISO New England supports ongoing Training Programs that employ systematic approaches to training. Such programs, including NERC's current Continuing Education program, include a feedback component from the participants in the areas of content and instructor competency. Although participant verification of the competency of the instructors is an inherent component of such systematic approaches, a standard on verification is unnecessary.

As note in the responses to Q1 and Q2, any standard that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard. To meet the FERC directive the standard must include a definition of competence and the measures used to assess that competence.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments:
   If the question is "Do you agree that the list in R7 is useful in any Training Program?" then ISO New England agrees that the items in the list are useful.

   If the question is "Do you agree that NERC mandate each item in the R7 list in order to have a valid Training Program?" ISO New England does not agree that there is any basis for mandating those requirements. The proposed set may be a good set but it is not justified as the only set.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   ISO New England does not support requirements that mandate "How to" carry out a given standard. Although ISO New England supports the use of near-real time Operating Training simulators and in fact has a fully functioning simulator, we recognize a simulator is not a necessary tool for conducting valid excercises.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments:
   ISO New England agrees that a training results tracking system is valid, but questions whether or not this task rises to the level of a NERC standard.

   Note:
   Question 8 refers to Requirement 8. However, Question 8 asks a question (relating to documenting operator needs) that is not part of Requirement 8 (relating to training only).

9. Do you agree that entities should evaluate their training programs every year? (R9.)

☐ Yes

☒ No

Comments:
An annual evaluation of training programs is a good practice, it is important but it is not required. As with other proposed requirements, this requirement does not provide a quantitative measure related to evaluation.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

☒ Yes

☒ No

Comments:
In response to the question, ISO New England agrees that training materials should be up-to-date.

In response to the proposed R10, the associated measures have no relationship to evaluating whether or not the materials are up-to-date. The Drafting Team must more accurately define the term "accurately reflects."

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: See response to question 19

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: See response to question 19

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: See response to question 19

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: See response to question 19

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☐ No

    Comments: The proposed standard requires more public discussion before discussing field testing needs.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: The proposed standard requires more public discussion before discussing implementation plans.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:
    ISO New England recognizes and supports the need for and the value of developing system operator Training plans, and of maintaining and implementing those plans.

    ISO New England also recognizes that owing to the diverse system characteristics, varying operating systems and the multitude of operating procedures used by the subject responsible entities, that the Training Programs used to effect those Training plans are not and cannot be standardized.

    Violations Risk Factors
    ISO New England does not agree that the SDT correctly interpreted the definitions of the Violation Risk Factors; and does not agree with the factors proposed.

    Training Program Accreditation
    Rather than attempting to proscribe what must be included in every program, we suggest that the SDT consider creating a System Operator Training Accreditation Program.

    ISO New England suggests the SDT consider revising the Standard to simplifiy the standard to mandate:
    - Responsible entities have a System Operator Training Plan
    - Responsible entities use accredited Training Programs to implement those plans

    ISO New England further suggests that the details proposed in the current standard be drafted into a Technical Reference Guide that could serve as the basis for the Accreditation program.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: Yes, But I believe this is going to end up being a major compliance issue in the future if this SAR goes through as written, What is wrong with PER002-0 dated

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: refer to 1

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☐ Yes

   ☒ No

   Comments: Not necessarily, Some Systems that perform these functions that are radial feeds and BA's don't need to practice blackstart every year unless a new employee is hired.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: I believe this needs to be completely eliminated the way it is written.What is needed is th student name, the "task' completion date.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Again depending on the size of the system and how the loss of said system could affect the bulk electric system I am not sure that simulstion is needed. I agree that there are certain benefits derived from observing an individual systems configuration and flows during different contingencies.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: Either they are competent or not. If they don't they need to do it again.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: Let the entities train as they see fit within the structure of PER-002

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: Again, depending on the size and configuration of the entities generation/transmission system depend on whether the risk factors are assigned at all.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: I believe that if a review of a training program takes place, the only thing needed is student name/ credentials/ outline of program, where they are in the program.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: I believe that entities need a training program, and must have one for compliance. I don't believe that all the requirements and measurements are necessary to have a comptent operator. This is mostly back office work for tracking purposes. Again PER 002 should suffice.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments: Not only does it not need to be field tested It need to be forgotten about. It is already covered.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments:

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: My opinion is this standard is not necessary at this time. What seems to be taking place is somewhat backwards. In the past all entities wer required to develop[a training plan to ensure that there was competent personnel manning Control Centers. Each entity developed their individual programs based on the tasks that they percieved as " high risk, or important". This got accomplished. Now I see a SAR dictating exactly how a training program should look and what sort of back up documentation is required. What kind of measurements and possible fines for not having a program as narrated in the SAR. The schedule for Compliance is too aggressive for some companies that don't have " dedicated, qualified trainers.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: The JTA should be based on each company's needs, the time, money and man hours to do a JTA is considerable. if you were to use a vender to do the JTA cost will increase. So after you have the JTA done, now you build the training program around it. This is time, money and man hours. Now deliver the training to the troops, Money, time and man hours. Do you have or can you get the personnel to deliver the training? Most companies do not or cannot, so we go to the outside and have a vender do it for us. From what I hear most companies are in the same boat doing more with less and not able to find qualified folks to get all the training done that is now required by the standards. This standard as it stands now would be very hard to comply with, you say phase it in over 2 years, more time is needed, 4 to 5 years would be more realistic for the industry to accomplish this.

   I disagree with R1.1 clarify conditions?, the task could be performed under normal/emergency conditions. Are you asking for that much detail on each task? It should be performing the task successfully

   R1.5 every utility is different, the operator may perform the task once or 50 times a shift what does it matter as long as they do it correctly?

   R1.7 - What is the criteria for successful performance of a task? It should be what I set it at. anything missed will be addressed.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☒ No

   Comments: We interview experianced outside Operators in Transmission and Generation to come into the Transmission (GCC) department. We do verbal/scenario type of questions and look at their resume, if they qualify in this regard, then we proceed with training them in all aspects of Transmission. It does not matter what they say they know, we cover it all (They have to learn our system & procedures) and then test them. This happens until they are qualified to assume a shift by themselves.

   I disagree with R2 and R3 this is too much and going to far. Assessments on individual's needs can be captured in their exam results thru out normal training (Refresher/Continual) as it is delivered. And follow up would be done if needed.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☒ No

   Comments: Each entity should have a documented training program for refresher and continuing training. Each entity should have a training plan for outside operators as well as inside operators coming from Distribution to Transmission. But it all depends on how the entity is set up and what functions they perform. It should not be mandatory to have a entry level or apprentice type of trainning program if the entity does not need it.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: But due to manpower in operator ranks and in training sections it is very hard to comply with such a schedule. First you will spend a lot of time putting it together and then a lot of time changing it due to shift/personnel issues.

   A basic plan (Based on your system) will work for all system operators. Make a list of all the training that is needed for Refresher/Continual (Continual will change due to additions of new equipment or operating practices) training that needs to be done for all the operators trying to make it an indiviual plan is not worth the effort. If you get some tracking software you can run reports on who needs or has not done what training.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments: Personnel who develop and/or deliver the training should be experianced in those areas of their expertise, if not then bring in the SME's (Subject matter Experts) to round it out. If the students are learning (Exam Results), knowledge transfer is being done.

   Other than that who ever is the trainer (Mostly those that were Operators) should have a record of being competent in their previous position(s). Attending Train the Trainer courses is desireable but not mandatory.

   What do you mean when you say Verify? Just looking at their work history or what? How would we measure this? By surveys?

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Is this going to be a required form from NERC stating as you have it in R7? (The JTA is driving the training program, everything has been identified) Could you explain why this would be needed for each activity/task and how it would help me?

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Generic works for the concepts, system specific does the same but also gives the real flavor. This should not be made to be mandatory, table top drills do work and provide the concepts.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments: We always want to track an Operator's progress. Take Operators off shift and test them in reliability related tasks to see if there performance meets the criteria. If the training plan is based on the JTA this is already being done in initial training, refresher training. This is more of a question not R8. The tracking of a Operator training should include how well they did on exams, how frequently this training has been repeated, any follow up done and what other training he is due for, etc.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: We evaluate our training before we deliver it each time to see if it applies, there are so many changes on the system and in operating procedures we make modifications to the training. To say to do it every year is not practical (You are to late). This part of the Standard should just say "Evaluate your training program as needed". Doing it this way eliminates your suggested annual evaluation of the entire training program. I think that R9.1, R9.2 & R9.3 (Post feed back) is good for anything you missed prior to delivering the training and make it better for next delivery.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☒ No

    Comments: Okay you have done a JTA and built your training program and made adjustments to the JTA (Kept it up to date) you will be training your folks in the current operating environment. If not, go and sit out on the floor in real time and observe to see if the training is up to date with what the Operators are doing. Does this requirement really need to be stated?

    Define "accurately reflects"

    Question does not reflect standard as it is stated

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: I do not see how this applies, need more Info on how you came up with this Violation Risk Factor?

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: What if a company did not do a JTA? (M1). M2 & M3 are asking for to much, we can show you results of exams. I am not sure of what you mean mismatches on Actual performance and criteria for successful performance? Is this all done in training or real time?

    M5 - we should only have to show work history and training records of the trainer and maybe the pass/fail rate of those he trained. That might be hard to do if those he trained moved onto other jobs or companies.

    M6 - Only if that company brings folks in like that. Entry level is lika a apprenticeship program to me. Clarify if my interpation is wrong.

    M9 - is telling me that I have to have this documentation in a certain form style as in R7. this seems to be over kill. It should be enough to show that training is being done successfully on what topics and dates it has been delivered.

    M10 - See question 1 and clarify.

    M11 - See Question 9

    M12 - See question 10 this would be very burdensome to do. The training materials are adjusted before and after delivery until they are going to be delivered again which maybe months to years. This is about taking time to update a course which may not be delivered until months to year or so and changes will have taken place which will cause more time to be used to update the material. In a perfect world this would be very desirable but in the real world it is not going to happen. Manpower, time and system priorites will override this function.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

Comments: When you notify an entity that they will be audited will you also at that time tell them what they will be audited on or will it be a full blown compliance audit?

If someone notifys you that we are in noncompliance did you get proof from that entity before proceeding with investigation?

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☒ No

Comments: I believe more time 4 to 5 years is needed for all entities to get it done right. So a phasing in period would be the best approach. But more dialog is needed, we do not need to rush into this half cocked.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☐ Yes

☐ No

Comments: To soon to proceed, the standard needs more ironing out.l

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☐ No

    Comments: It needs to be extended, unless you are saying the standard goes into effect and then in 2 years later we start with compliance?

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: A lot of these requirements need adjustment so that they are not burdensome. You can come up with all the requirements you think fit and will work but the bottom line is can it physicallly be done in the short amount of time you have allotted not to mention money but mostly personnel to carry it out. There are a lot of trainers that are overworked, overloaded and burning out and it is very hard to find qualified folks to be trainers, the industry is in short supply. The only viable option is to have a vender do it, this also takes time. We are 2 years in the running in building our training program with a vender. Why is it taking so long, manangement has to buy into it, chossing a vender, working with the vender to get what you want, vender time to complete based on their other clients, completeing JTA for all positions, production, add your companies materials (Procedures, referances, etc) revise, review, deliver, revise. All this takes time not to mention that existing training is still going on with everything else. Real time issues take presendance over anything else. We still in the process with the vender to complete our training program.

    These are my thoughts raw, uncut and last minute.

    Thanks, Matthew Santos.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: Some of the tasks that have a high cricicality and that are infrequently perfromed such as System Restoration and Loss of Control Center Functionality are already addressed in the EOP Standard. If you are going to address those things in the Training Standard then take them out of the EOP one.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: It is hard enough just trying to make sure that every Operator gets in his 32 hours of EOP, System Restoration Training and Backup Facility training, as well as making sure that they are getting the proper allotment of CE hours for re-newing their certificate. Now you are going to expect us to also create an individual training plan for each Operator to also track and correct their deficiencies on a yearly basis. Who is going to do all this work?

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

☐ No

Comments: Who are the entities mentioned that are going to certify that each person developing and doing the training is capable? Is there going to be a certification program to do this?

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The JTA and Needs Assesment should be used to develop the Training Activity. Other than the Title, Objectives, prerequisites, and a method for assessing the accomplishment of the objectives, the rest can be eliminated.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: I think table top paper type drills are pretty much a waste of time. However requiring everyone to have a company specific simulator is unrealistic. It pretty much takes one full time person to maintain a simulator, updating databases and making new scenarios and testing them. Also company specific simulators are expensive. I think that some very good concepts can be taught on a generic simulator, such as restoration concepts, voltage collapse, Ferantti rise, operating islands, synchronizing, etc;.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: In the heirarchy of training, tasks are at the very bottom. It would be almost impossible to try and track each task for each Operator.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: Training programs should be evaluated and updated as things change. A complete evalution could be done every three years.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

Comments: Why would any Trainer not do this anyway. Why do we need a Standard for it?

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: Don't even need R10.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: M5 - What determines who is qualified? And what is the documentation that says that they are?

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: The plan is to aggressive especially if some of the training is not thoroughly developed at the current time. A lot of companies will be required to hire another Trainer just to do development work and record keeping.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: Should be longer.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: During Job Analysis a task list for a position is created, and that determination of whether these tasks are selected for training is also created, typically by a difficulty, importance, and frequency review. This is alluded to in R1.4 and R1.5. This task list should be auditable.

   During Task Analysis the selected tasks mentioned above are analyzed to identify the conditions, behaviors, and standards to which a task must be performed. The knowledge, skills, and abilities of the selected tasks must be identified. These points are mentioned in R1.1, R1.2, R1.6, and R1.7. The analysis of these selected tasks should be auditable.

   To measure an individual's mastery of a task, evaluation in a team setting is problematic, if not impossible. We therefore disagree with R1.3.

   To make the R1 section more usable, we respectfully suggest the following wording:

   R1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct a System Operator job task analysis (JTA). The analysis must be updated when there is substantive change to the operator's job (e.g. new or revised task or tool).

   The JTA results shall include:

   R1.1 A task list containing company-specific reliability-related tasks for each System Operator position, including analysis data used to determine whether the task is selected for training (e.g. infrequent, critical, difficult, etc.)

   R1.2 Analysis of each task selected for training, including conditions, actions, and standards for performance, and the knowledge, skills, and abilities required by the trainee.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: We agree that the new-hire must have an assessment of their training needs, leading to an individualized training plan.

We strongly disagree with the recommendation to conduct an ANNUAL assessment of incumbent operator training needs. The Systematic Approach to Training, if properly applied, will lead to a initial training program design that develops qualified personnel for the job position. An entity would doubtless have to conduct a one-time assessment of incumbent operators' training needs, against the newly designed program, filling any gaps with the needed training. Once the incumbents have received the initial training for the job position they have held, there is no further need for annual training needs assessments. New tasks, industry events, enhanced skills training, performance improvement, etc. would be provided, via the Systematic Approach to Training, as continuing education.

For the sake of simplicity, we would suggest the following wording for R2 and R3:

R2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall assess the training needs of new System Operators, creating individualized training plans for them as needed. The plan will include the topics and the schedule for the training.

R3. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct a one-time assessment of the training needs of incumbent System Operators, creating individualized training plans for them as needed. The plan will include the topics and the schedule for the training.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: We agree with the idea, but again the verbiage used is needlessly wordy. Suggestion:

   R4. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have an annual training plan that includes:

   R4.1 Training for new System Operators, as identified in B.R2.

   R4.2 Training for incumbent System Operators, as identified in B.R3.

   R4.3 Continuing education for incumbent System Operators, that includes training:
   - to correct identified performance gaps
   - based on analysis decisions
   - on new or revised tasks

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

☒ Yes

☐ No

Comments: See item 3 above.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

☒ Yes

☐ No

Comments: The answer to the question above is Yes. But we disagree with what the standard says. According to the proposed standard, if you develop training you must know the material and know the training process, but if you implement training (aka: teach) you must only know the training process. We disagree. We suggest the following:

R5. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify that persons developing or delivering training have the following qualifications:

R5.1 Operating knowledge in the subject matter covered by the training activity

R5.2 Competency in developing training using a systematic approach

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This R.7 section appears to be focused on the "I" of the ADDIE process, so I suggest combining sections R.6 and R.7 for simplicity. Rather than take each of the 10 items individually, here's a suggestion:

   R6. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct training that includes:

   R6.1 Training for new System Operators, as identified in B.R2.

   R6.2 Training for incumbent System Operators, as identified in B.R3.

   R6.3 Continuing education for incumbent System Operators, that includes training:
   - to correct identified performance gaps
   - based on analysis decisions
   - on new or revised tasks

   R6.4 Drills and/or simulations on tasks that have high reliability-related criticality and low frequency of occurrence shall be conducted. This training shall include:

   R6.4.1 At least 32 hours of emergency operations or system restoration training, simulating the system conditions, operating procedures, and communication processes.

   R6.4.2 At least one exercise each year involving other entities, including all real-time operating positions likely to be involved in the actual event.

   R6.5 Retention of course completion documentation, including the course title, provider, attendee name, completion date, and grade.

   R6.5.1 If the training is NERC Approved, a copy of the course certificate will be retained in the operator's training file (If the training has been approved by NERC, the learning objectives, course materials, evaluations, etc. are already archived.).

   R6.5.2 If the training provided is not NERC Approved, a copy of the course materials shall be retained, including learning objectives, lesson plan if applicable, and evaluation.

   R6.5.3 Training records shall be retained for three years.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

☐ Yes

☒ No

Comments: Owning and maintaining a "simulator" may financially unfeasible for some entities. All entities can participate in "simulations", though, including tabletop drills, etc.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

☐ Yes

☒ No

Comments: As mentioned earlier on question 2, a one-time assessment of an incumbent operator's training needs, in relation to a newly designed training program is appropriate. After the operator meets these needs, the SAT process includes feedback measures that identify opportunities for performance improvement.

Continuously evaluating each and every qualified operator against a catalog of tasks in order to repeatedly design a unique, customized annual training plan adds an additional layer of administrative burden that would be cumbersome, expensive, and ineffective.

We recommend dropping R8 in its entirety.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

☐ Yes

☒ No

Comments: An eighteen-month self-assessment (strategically located between the triennial audits) would be effective and cost-efficient.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

☒ Yes

☐ No

Comments: Latitude for making approved pen-and-ink revisions to curriculum should be allowed, enabling "the show to go on", without a slow word processing and approval cycle. Let's stay nimble.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

☐ Yes

☒ No

Comments: I don't understand how the value of these Factors is calculated, so I can't agree.

12. Do you agree with the Measures in the proposed standard?

☐ Yes

☒ No

Comments: Based on the simplifications recommended in my review of this standard, I suggest the following Measures:

M1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the results of its latest JTA as specified in R1.

M2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the assessment of new System Operator training needs and any resulting individualized training plans as specified in R2.

M3. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the assessment of incumbent System Operator training needs and any resulting individualized training plans as specified in R3.

M4. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the annual training plan for System Operators as specified in R4.

M5. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, documentation of personnel qualifications who developed or delivered System Operator training as specified in R5.

M6. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, training records that document training activities as specified in R6.

M7. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the results of its latest program evaluation as specified in R7.

13. Do you agree with Compliance Monitoring section of the standard?

☐ Yes

☒ No

Comments: The annual self-certification is too frequent. Conducting a thorough self-assessment 18 months following the triennial audit would be effective. This would provide a "halfway point" snapshot of program progress between the audits.

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☒ Yes

☐ No

Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☐ No

Background Information:

The System Operator Training Standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities and Transmission Operators are provided with training to promote the reliability and adequacy of the North American Interconnections and their bulk electrical systems.

Just prior to the 2003 blackout in the northeastern U.S and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December, 2004 the SAR for a system operations training program was first posted for industry comment. The SAR Drafting Team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk electric system operations.

The System Operator Training Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1 through R1.7)?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: It is important to determine the training requirements for training new Operators, however, on-going training for incumbent Operators should be in the form of training plans that accomplish those things that are important to the job specific needs of a company and to maintain NERC operator certifications.

   R3 is for unacceptable levels of performance for incumbent Operators to be assessed annually. For those reliability tasks that are done routinely, any performance problems should be addressed as they are known and not wait for an annual assessment. For those reliability tasks that are not done frequently (peak load operating conditions, emergency plans, etc.), those should be part of an annual training program. I would recommend the following language modifications to the proposed standard:

   R3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct a training needs assessment of incumbent System Operator to identify reliability-related training activities that are not routine ~~mismatches (~~for the tasks identified in Requirement 1, periodic training required for each non-routine reliability-related task, and a training plan to support maintaining NERC operator certifications and to maintain Operator skill levels~~ and the criteria for successful performance of the task identified in Requirement 1.7) between actual performance and the criteria for successful performance for each position performing reliability-related tasks identified in R1 (including any contract System Operator or System Operator performing tasks identified in R1 under delegation agreements)~~ at least once every three years or as additional reliability tasks are added or modified.

   R4 seems to capture the essence of what I am referring to here, except for a training plan to support maintaining NERC operator certification.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to

improve performance and annual refresher training to practice tasks that have high criticality and are infrequently performed?

☐ Yes

☒ No

Comments: R4.2 does not fit with this standard. Any lapses in performance should be dealt with immediately. Each company should have policies in place to allow a company to take any actions necessary to remedy operator performance issues.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4)

☒ Yes

☐ No

Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5)

☒ Yes

☐ No

Comments: What does "systematic approach" mean? It seems the proposed standard has dictated a good way of determining the training needs by a job task analysis, training needs assessments and a determination of acceptable performance criteria. If someone follows this standard is that an acceptable "systematic approach"?

6. Do you agree with the list of training activity components provided in R7? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:

7. Do you think that every Reliability Coordinator, Balancing Authority and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

☐ Yes

☒ No

Comments: A simulated activity does not have to be dependent on a training simulator. There are table-top exercises and drills sufficient to meet training needs. In fact, many parts of an emergency exercise do not require the use of a simulator (e.g. field personnel at various locations to perform specific field tasks).

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8)

   ☒ Yes

   ☐ No

   Comments: I think the reference in R8.2 should be for training identified under R4. R7 seems to be the information needed for tracking and R8 is the requirement for tracking.

9. Do you agree that entities should evaluate their training programs every year? (R9)

   ☒ Yes

   ☐ No

   Comments: Annually seems a bit over the top, however, once a program is implemented, it should not take very much to evaluate a training program each year including the sources for feedback as they are available.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments:

	Standard	**Comments**
R1: JTA	High	Medium
R2: New hire requirements	Medium	High
R3: Incumbent training needs	High	High
R4: Training plans	Medium	Medium
R5: Trainer competency	High	Medium
R6: Training implementation	High	High
R7: Training documentation	Low	Low
R8: Training tracking	Medium	Low
R9: Training program evaluation	Medium	Low
R10: Training program maintenance	Medium	Medium

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

Comments: Since commented on the R3 requirement, the proposed M3 no longer fits. I would propose the following language changes:

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, the results of its latest training needs analysis that identifies each incumbent System Operator's training plan~~mismatches between actual performance and the criteria for successful performance~~ as specified in R3.

13. Do you agree with Compliance Monitoring section of the standard?

☐ Yes

☒ No

Comments: The performance reset period seems a bit harsh. Are there any standards that have a flexible reset period?

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☒ Yes

☐ No

Comments: I agree with the plan components, however, I think the implementation time frame is bit aggressive for most entities.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here.

☒ No known conflicts

Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

☐ Yes

☒ No

Comments: I think two years is too aggressive for companies that do not have and cannot afford to have a dedicated training staff and do not need a dedicated training staff. Although, the standard espouses appropriate training elements, I think companies that do not have a dedicated staff will need three years to meet this standard.

19. Please provide any other comments you have on this standard that you haven't already provided above.

Comments: Do not agree with all the requirements in R6 as stated below:

R6. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall implement its System Operator training program by providing training to all of its System Operator (including any contract System Operator or System Operator performing tasks identified in R1 under delegation agreements) as follows: [Risk Factor: High]

R6.1. Entry-level training to provide System Operator with the knowledge and skill identified in R2 to meet the associated criteria for successful performance identified in R1.7.

R6.2. Continuing training to reinforce knowledge and skills of incumbent System Operators as identified in the JTA (Requirement 1) that meet requirements R4.2 to R4.4~~were not covered in Requirement 4.2~~. (Everything the incumbent Operator needs is identified by R3 and specified in R4. There should not be anything that is not covered by this standard.)

R6.3. Refresher training to eliminate performance gaps identified by the training needs assessments in by the JTA (Requirement 1) and ~~Requirement 2, and~~ Requirement 4.2~~3~~.

R6.4. Continuing training to acquire the knowledge and skills necessary for new or modified tasks and tools identified in R1 and R2~~ and R3~~.

R6.5. Annual refresher training for incumbent System Operator that includes the use of drills and simulations on tasks that have high reliability-related criticality (as identified in R1.4) and low frequency of occurrence (as identified in R1.5) to meet the associated criteria for successful performance identified in R1.7. This refresher training shall include:

~~**R6.5.1.** At least 32 hours of emergency operations or system restoration training, simulating the system conditions, operating procedures and communication processes.~~ (This requirement is already in Reliability Standard PER-002, R4 and is not necessary to be repeated in this proposed standard.)

R6.5.2. If sub regional, regional or interconnection-wide system exercises are available, at~~At~~ least one exercise each year shall involve other entities on a sub-regional, regional or

interconnection-wide basis, involving the appropriate~~all~~ real-time operating positions likely to be involved in the actual event, with each person performing their assigned duties. (It is inappropriate to require an organization to do something that is entirely out of their control. What if no there are no sub regional or regional activities available? It should be left up to the companies involved to determine the extent of an exercise.)

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: The standard should require a Job Task Analysis, but, the information collected and specified in R1.1-R1.7 should be separate from the standard as a "Guide" such as an attachment or appendix to the standard.
   R1.1 should specify the condition categories (e.g., Emergency, Normal, Contingency, etc.
   R1.2. should not require: actions to be taken in performing the task unless the action is another task or sub-task. Actions may require a matrix or flow chart based on an individuals understanding of basic concepts. This could be very challenging in some cases especially where there are a number of different actions/responses that are practical, and correct, that would yeald simular results. This is why we have documented operating procedures and plans (e.g., EOP and Black Start plans). R1.2 should simply read: Identification of references and tools, including actions if appropriate, used in performing the task.
   R1.4 is vague as it needs to specify the different categories of: criticality (e.g., Low, Med, High).
   R1.6 should have the word experience removed or replaced with a different word or phrase within the requirement. Is experience intended to mean operator/trainee assessment by the trainer rather than experience over a time period of doing the task? If an individual has the knowledge and skill to perform the task, experience over time may not be relevent, such as for new tasks involving new tools. Experience comes with performing the tasks. Experience in doing a task may not be practical or possible (except as a lab type demonstration exercise during a training activity) until the tool/task has been proven and utilized in real-time operation. R1.6 should read: The knowledge and skill needed to perform the task; or, The criteria for demonstration of the knowledge and skill to perform the task.
   R1.7 - Criteria for successful performance, is difficult to measure/document for many tasks. R.7 seems redundant to R1.6, which already covers this if a demonstration of knowledge and skills has been specified.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: The Initial training program for new entry level employees generally trains by precluding the training needed for new entry level employees. Training assessment to perform the job is done in preparing the initial training program. Training needs analysis for entry-level employees is actually an analysis to update the Initial Training Program before entry-level employees arrive. In other words, the initial training plan reflects entry level operator needs analysis, whereas qualified/certified operator needs

analysis would involve separate documented results. I answer yes with some reservation as to how to keep track of all the individual assessments once they are made, and the individual progress within those assessments.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: Yes, with some modification/clarification. Don't change the industry terminology and meaning of continuing training; Refresher training and new knowledge training is all categories of Continuing Training. We have a continuing education program and certification program which has already established terminology in using Continuing Education and Continuing Training.
   R4.2-R4.3 Where do you draw the line on training critical tasks affecting reliability? How do you gage criticality? You can't re-train all reliability tasks every year. Training is done for the imcumbant group as a result of training needs analysis for the group and prioritized to give the greatest needs presidence. When performance is obviously low for one or two related to a task or subject, others are not likely up to par either. Therefore, giving continuing/refresher training to the whole group assures all operators get refreshed. Whereas, refresher training on critical tasks performed correctly by the group, which does not show a deficiency, would not need training. If an operator is not performing a task correctly, immediate training by a mentor could be suffice without scheduling a formal structured training session documented in a training program.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☒ No

   Comments: Yes and No. Not necessarily each system operator individually by name, but each system operator by job title and/or as entry level/new operators verses qualified/certified operators. The Initial training program for new entry level employees generally trains by precluding the training needed for these employees. Training assessment to perform the job should be done in preparing the initial training program for entry level employees and would apply to all entry level operators.
   New/entry level employees should not be performing reliability-related tasks (R4.1) unsupervised as they would not be qualified or certified. The initial training plan should be a part of the training plan but may best be referenced as an attachment or appendix to the annual training plan as it is a separate stand alone plan from that of the continuingplan. Initial training plan timeframes for entry-level employees with little to no Transmission Operating experience gennerally may extend longer than a year such as a 2-5 year plan.
   R 4.2 and R4.3 should be combined. If the refresher training of R4.3 is done, it will take care of gap refresher training of R4.2, if it exists. Performance gaps is a somewhat ambiguous terminology open to interpretation.
   The annual training is a part of the training plan that should give focus on identifying and scheduling continuing and refresher training for qualified/certified operators. The

plan could require new entry level operators to receive the same annual training given to qualified/certified operators in addition to their initial training so as to re-inforce their initial training program.
R6 only needs to say "shall implement its System Operator training program as identified and specified in R4". It doesn't need the redundancy of R6.1 - R6.4
R6.5 should then be moved to be included as R4.5 as a type of training idendified and targeted by the annual training plan.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: Yes, but competency is not very measurable. Being competent reflects such terms as being qualified, capable, fit, and adequate. Maybe the word qualified would be better than the word competent. Qualifications are somewhat measurable and would be less subjective to the auditing process. Such qualifications to train are reflected by experience, time, and performance in the field (e.g., experience in Operations).

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This is a great list of activity components for the perfect program, but is not necessary for all activities and topics of training. These should be a part of a "Guide" provided as an attachment to the standard not a part of the standard as measured requirements.
   When some needs are discovered due to poor performance or lack of knowledge, the training may be done informally on the job by another qualified operator via assignment by a supervisor. Having this documentation for every training activity is not practical, but it is a good guide to strive for in formal training.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: A Simulator that reflects the operator's actual system is the best and is highly preferred by operators who have experienced both generic and specific simulators. Use of generic simulators has limited benefits. They are OK for show & tell of operating concepts or if it can't be done with a company-specific simulator for some reason. Use of a generic simulator is better than no simulator only to a point.
   This is a best practice item. The standard should require simulation excersises, but not require entities to use a simulator. Table top drills and excersises are sometimes better than actual simulators. Not every entity should be required to have a simulator. For small entities, purchase of a simulator or purchase of generic simulator training may not be economically feasable.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: Not a record specific to tasks needing performance improvement, but rather documentation that each operator has had, and completed, the training required to perform/master the required tasks.
   Task performance improvement record documentation could require all tasks to be demonstrated under supervision, on some routine schedule, to verify performance. Documentation for each task as specified by R8 would require extensive data entry into an Learning Management System (LMS) in addition to the paper trail needed to document before entering data into an LMS. Another factor is getting the LMS to accept/accommodate such documentation for view by administrators and operators. Perfect record keeping and documentation can only be achieved by giving time for each

entity to develop their LMS to accommodate the guidelines, if they even have an LMS. The NERC LMS is proof that development of an LMS, even if just for the high level tracking takes extensive time and money, let alone an LMS that handles the detail of JTA and JTA actions, course criteria, etc.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments: The only item in R9 causes concern is that of R9.4.
   Because of the vast differences between audit teams, (background, experience, regional differences) I believe audit results cannot be used as a requirement for evaluating a specific training program. Can they be a guide? Yes, but not a requirement.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments: Yes, but as a guide, not as a standard requirement. Even NERC doesn't do this. NERC has a history of using old reference and training documents that have not been updated for years. NERC certification exams use 6 month to year old training references. Sometimes using old material with disclaimers is required to get the training done.
    It is a challenge to keep procedures and protocols up-to-date, let alone every detail within a training document before use. A review date on training material doesn't always mean it is totally up to date.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

☐ Yes

☒ No

Comments: R1 requires a JTA rated High Risk. Whether I do or don't do a JTA isn't what puts the reliability at high risk. It is certain tasks not performed or tasks performed improperly that reflect high risk. Not performing a JTA is Lower Risk.
R2 is rated Medium. Newly hired and entry level operators would not be operating the system unsupervised until they are qualified. Therefore R2 does not directly effect the reliability of the system. R2 should be rated Lower Risk.
R3 is rated High, which is proper because it relates to successful or unsuccessful performance of reliability tasks which directly effects reliability of the system.
R4 is rated Medium Risk in having an annual training plan, which is within reason.
R5 is rated High Risk, which is within reason related to qualified developers/trainers.
R6 is rated High Risk. This should probably be Medium Risk as R6.5.2 is rated Medium.
R7 is appropriately rated Lower Risk, as most of this requirement is busy work documentation.
R8 is rated Medium Risk. Tracking of training or not tracking training with records does not directly affect reliability. R8 should be rated Lower Risk.
R9 is rated Medium Risk. This should probably be Lower Risk, as from experience, evaluations done on an as needed bases has worked fine with no direct affect on reliability
R10 is appropriately reated Medium Risk considering it is important, whether related to training or operating procedures/protocol, that information gets updated for operation of the real-time system.

12. Do you agree with the Measures in the proposed standard?

☐ Yes

☒ No

Comments: As I don't agree with all the parts of the standard, I can't agree with the measures. Also as a statement to be considered, a detailed standard with these type of requirements and measurements would have less impact on a small entity with only one RTO and a few System Operators as compared to a large entity.
Many different individual training plans with many different training needs analysis and further customizing plans to satisfy each individual is much more complex, including record keeping, than that for an entity with only 5 operators in one RTO footprint.
M1 - OK if clarifications are made as needed for R1.1 - R1.7
M2 should require an initial training program plan that reflects the Training Needs Analysis (TNA) for entry level/new operators, not necessarily for each individual operator but rather for all entry level operators.
M3 should require results of TNA per job title of incumbent operators, not necessarily for each individual operator.
M4 - Training Plan - OK
M5 - Training Personnel Qualifications - OK
M6 - Entry Level Operator Training - OK
M7 - Incumbent Operator refresher training - OK, but should be stated as continuing training as refresher training is a category of continuing training. Use the industry standard terminology

M8 - Incumbent Operator gap refresher training - Not needed if M7 records are provided. To accomplish M8, you must also have identified a gap. Gaps may not exist. Identifying gaps that might exist should be part of a guide, not the standard.
M9 - Documentation of Training material detail for all levels - This measure would not be needed if R7 becomes a guide rather than a requirement of the standard.
M10 - Remove - M10, If M10 is necessary, it should only require record of training to perform tasks.
M11 - Training program annual evaluation - OK
M12 - Training program annual update if required - OK

13. Do you agree with Compliance Monitoring section of the standard?

☒ Yes

☐ No

Comments: Yes, as long as requirement documentation that is needed to satisfy the audit or self-certification is specified before-hand.

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☒ No

Comments: Not if this plan were implemented, as is, without modification.
Re-vamping all training materials to meet this standard including the list of components in R7 along with the JTA elements of R1 would require budgeting, staff increase, and time. Time to do it, even after attaining the staff, would be a big consideration. Budgeting and staff increase is a huge undertaking within itself. This training standard only allows a 2 year time-frame to allow entities to achieve staffing and attain compliance to the standard. A year could be gone before budgets and staffing is achieved. Revamping all existing training to meet this standard while implementing and maintaining the required CE and Certification program requirements will be a huge and time consuming undertaking, to say the least. I believe that in light of these concerns, a 3 year time frame for implementation is more practical (e.g., R1, R2, R3 up to 18 months; R4, R5, R6, & R7 up to 30 months; R8, R9, R10 up to 36 months).
Also in reference to retirement of PER 004, R3 & R4 are dependant upon a JTA. The JTA may or may not address these. Therefore, R3 & R4 of PER 004 should not be retired.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☒ Yes

☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: This appears to be a repeat of question 15 above. We would like to see this changed to phase-in time period of 3 years.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: This training standard should be practical in its requirements and measurements. It does't have to address all the detail of the training activities and guidelines, as part of the requirements, to be effective.
    This standard calls for perfection in-line and beyond that of some college or university programs.
    Few entities will have the resourses, staff and time to meet these demands, so therfore we may be setting up many entities to fail.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: OTS agrees a job task analysis should be performed to identify the tasks assigned to each operating desk. OTS does not believe the "analysis" needs to be updated when there is a new or revised task or tool. We believe R1 should say the task list must be updated. The level of detail for the analysis should be sufficient to identify the task and guide what type of training may be appropriate. Too much detail does not make for a better analysis and this requirement places work on operating entities that is not beneficial. The list in R1.1 through R1.7 is more detailed than is warranted. OTS lists the R1.1 through R1.7 and offers comments on each item:

   R1.1 "The conditions under which the task is performed." OTS does not support identification of the conditions when a task is performed. Most tasks need to be performed under many conditions. If a task is a critical emergency task the condition is a fundamental part of identifying the task and does not need a separate reference.

   R1.2 "The actions to be taken in performing the task, including identification of references and tools used in performing the task." OTS supports including this in the Standard.

   R1.3 "Identification of whether the task is performed alone or as part of a team." OTS does not support including this in the Standard. Many tasks need to be performed either "alone or as part of a team" depending on normal operating or emergency conditions at the time. Whether a task is generally performed individually or as a team is a fundamental part of identifying the task and does need a separate reference in the standard.

   R1.4 "The criticality of the task with respect to reliability." OTS does not support including this in the Standard. Singling out tasks as being "critical" to reliability implies other reliability related tasks are not critical to reliability. All tasks identified as being reliability related should be considered important or "critical." If a task is inherently critical it will be known as a fundamental part of identifying the task and does need a separate reference. Criticality can be a relataive issue and cannot be measured accurately.

   R1.5 "The frequency of performing the task." OTS supports including this in the Standard. It can be helpful in developing the annual training plan and considering the frequency of tasks in the refresher or continuing training program.

   R1.6. "The knowledge, skill, and experience needed to perform the task." OTS supports including this in the Standard.

   R1.7 "The criteria for successful performance of the task." OTS does not support including this in the Standard. Separately identifying the criteria for "successful performance" of each individual task is not necessary and provides limited benefits.

OTS fully supports a learning assessment at the end of each learning activity to determine if the learning objectives were met for the activity. Successful "performance criteria" is usually executing the skills and knowledge necessary to do the task correctly and in the right timeframe resulting in the desired outcome, essentially doing the task without mistakes. Many topics in operator training do not support the concept that an operator can demonstrate "performance" of the task at the end of the learning activity. Many tasks cannot be performed until an operating condition on the system calls for the task to be performed, which may be days or weeks after the training took place. A "performance criteria" can be a general operating philosophy such as safe and error free operating of the system, but it will be a burden and does not provide and benefit to add performance critiera to "every task" performed.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☒ No

   Comments: These should simply be referred to as a training assesment for "initial" training of a System Operator and a training assessment for "continuing" training. It is not necessary to say they are "entry level or newly hired experienced". A proper gap analysis measuring each System Operator against all the tasks required to be performed will determine how much training is required. However, R3 requires a training needs assessment of each operator to identify performance gaps (we prefer competency gaps or a gap analysis) at least once "every year." This indicates every operator must be assessed against the entire task list at least once a year. OTS agrees this type of assessment of incumbant operators should occur with some periodicity but every year is unnecessary and will lead to unbeneficial concerns of the operators. OTS suggests a two or three year cycle rather than every year.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments: It is not clear what "anticipated duration of the topic" is meant to define in the annual training plan. It is expected that "anticipated duration" for a topic to be trained on would be different for entry level System Operator vs. refresher training for incumbant System Operators. OTS believes that "anticipated duration" for training

topics should not be a requirement as it is different in each context listed in subsections under R4.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments: The key phrase in this question is "entitites" verify the competence of those that develop and deliver training. OTS does not support outside entities such as NERC or the Regional Reliability Organizations determining if personnel are competent.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: R7 lists documentation required for each "learning activity" used to support its reliability related training. The OTS does not support the requirements listed in R7 and instead suggests following the principles contained with the NERC Continuing Education Program for developing a valid learning activity. These items include:

   Learning objectives
   Training content or materials
   Identify delivery method and qualifications of instructors
   Learning assessment to assure the learning objectives have been achieved
   Evaluation of the learning activity
   Review and update

   The list in R7 includes several additional documentation requirements that are not beneficial to assuring quality learning activities. While OTS recognizes the NERC CE Program is independent of a Reliability Standard, the documentation requirements for non-NERC CE-approved learning activity should not exceed the well defined items listed for the CE Program.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: As a group of trainers, OTS recognizes the benefits associated with a computer-based simulator whether generic or company specific. However, OTS does not support including this as a requirement in the Standard. Effective "simulation" of either normal operation or an emergency event is the goal and can be accomplished through other methods of simulation.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☒ No

   Comments: The question asks if a record of each operators training that shows the tasks mastered and the tasks where performance needs improvement. This is somewhat different than the requirements listed in R8 which seem to deal with meeting performance criteria. OTS supports keeping a training record for each operator but does not support the following:

1. A separate record listing all the tasks identified in the job task analysis and whether the operator has "mastered" that individual task or still "needs improvement" is more detailed recording keeping than is needed. The training program and annual training plan for each operator is designed to fill identified gaps in an operator's skill and knowledge needed to accomplish the tasks, thus the concept is addressed in designing the training plan rather than requiring a separate list of the operator's standing with the tasks.

2. Section R8 seems to focus on documenting how the "performance critiera" is met. It indicates appliable entities must track their operator's progress in using training to obtain the knowledge, skill and experience needed to "meet the performance criteria specified in R1.7. for the tasks identified in R1." As OTS has previously mentioned, we fully support a learning assessment at the end of each learning activity to determine if the learning objectives were met for the activity. Successful "performance criteria" is usually executing the skills and knowledge necessary to do the task correctly and in the right timeframe resulting in the desired outcome, essentially doing the task without mistakes. Many topics in operator training do not support the concept that an operator can demonstrate "performance" of the task at the end of the learning activity. Many tasks cannot be performed until an operating condition on the system calls for the task to be performed, which may be days or weeks after the training took place. A "performance criteria" can be a general operating philosophy such as safe and error free operating of the system, but it will be a burden and does not provide and benefit to add performance critiera to "every task" performed.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

☒ Yes

☐ No

Comments: OTS supports a requirement for yearly evaluation of the training program "to meet the criteria for successful performance as identified in R1.7." provided the performance criteria is not task specific as mentioned above in Questions #1 and 8.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

☒ Yes

☐ No

Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: OTS notes NERC documents on violation risk factors state, "These reliability-related risks are proposed for use when determining a penalty or sanction for a violation of that requirement." Thus the purpose of the risk factors is for use when determining a penalty or sanction. Also from NERC documents, the risk factors are intended to represent the following in the operating timeframe:

    High = A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;

    Medium = A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;

    Lower = A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;

    With the understanding that violation risk factors are not to rank the importance of a requirement to the industry but rather as an aggravating factor in determining penalties and sanctions, OTS does not support the violation risk factors as listed in the draft Standard. A review of the Measures in the Standard indicate all Requirements are essentially administrative in terms of providing documentation the Requirment has been met. A lack of documentation does not necessarily mean the training or other requirement did not occur. OTS recommends all violation risk factors in this Standard be set at "Lower."

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☒ No

    Comments: OTS agrees the measures are worded appropriately for the Requirements as written. Of course OTS and others are requesting changes to the Requirements which will require corresponding changes in some wording of the Measures.

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☒ No

Comments: The RRO is identified as the Compliance Monitor for the Standard. The Compliance Monitoring Period and Reset section lists all the potential methods the RRO may use to monitor compliance. OTS recommends Self-certification, Period Audit (required 3-year compliance audit, not the readiness audit), and Triggered Investigations. The Data Retention requirements are more detailed than necessary and OTS recommends a simple requirement for all training documentation and records to be retained for three-years, similar to the requirement of the NERC CE Program.

14. Please identify any Regional Differences that you feel should be included in this standard.

☒ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☐ No

Comments: The implementation plan was not posted with the Standard but was posted afterwards. While OTS has not had time to evaluate and make recommendations on the implementation plan, we do recommend all specific dates be removed. The plan notes the dates slide with the approval date of the Standard but OTS believes the approximate dates will do more to confusion the issue than to help.

16. Do you agree with the drafting team that this standard does not need to be field tested?

☐ Yes

☒ No

Comments: OTS recommends field testing should be a standard practice for all NERC Standards. Field testing reveals administrative concerns and sometimes substantive concerns that were not foreseen. All standards should be subject to at least a brief field testing period.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☐ No

    Comments: The implementation plan was not posted with the Standard but was posted afterwards. While OTS has not had time to evaluate and make recommendations on the implementation plan, we do recommend all specific dates be removed. The plan notes the dates slide with the approval date of the Standard but OTS believes the approximate dates will do more to confusion the issue than to help.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: There was no question directly associated with R6 to allow comments. Requirements R4 and R6 address comparable training areas with the primary difference being R4 is for the "annual training plan" and R6 is the "implementation" of the annual training plan. Too many NERC and regional standards seem to say the same thing over and over with the only material difference being context. OTS suggests the drafting team combine R4 and R6 into a single requirment addressing the separate issues of an annual training plan and the associated implementation of the plan. Separate Measures could be written to address these two areas even though they are contained within a single Requirement.

    The OTS is the principle group in the Western Interconnection to support the WECC training program and providing support to the trainers in the West. OTS believes that quality training can and should result in quality System Operators and improved system reliability. Quality training doesn't just happen, it requires analysis and process. OTS supports a requirement for development, delivery, and evaluation of system operator training using a "systematic approach to training" as required in this Standard and as endorsed by the FERC.

    However, a mandatory reliability standard with economic sanctions should address the essental elements and not become too prescriptive in its requirements. The drafting team has shown restraint since early versions of the SAR and removed many requirements. Even though a specific principle of a systematic approach to training makes it more effective, that doesn't mean that principle should be part of a mandatory reliability standard. A reference document describing many of the "how" to do a quality job of using the systematic approach would be helpful. Some of the OTS comments to remove parts of the Standard would fit well within a reference document that is not used to judge compliance.

    OTS requests the drafting team provide detailed responses to the comments expressed in this form and in accordance with the spirit of the standard drafting process.

Finally, OTS thanks the drafting team for your dedicated concern and efforts to improve our industry by helping entities develop valuable and effective training programs for system operators.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: I think Per-002 is adequate in insure reliable trained operators
   Also if NERC is going to inpose a job task analysis on us,NERC should set the minimum standards so it is fair and equitible for everyone.I don't think most companies have enough staff to comply with this standard.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☐ Yes

   ☐ No

   Comments: This is already covered by PER-002

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☐ Yes

   ☒ No

   Comments: Who is going to determine what is competent?NERC should already have a list of people and training companies whom are competent to deliver training.Several companies don't have resourses enough to have full time trainers on staff and must relay on outside entities for most training.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This is unnessary and covered by the CEH application.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This would be great,but in the real world simulators are just to expensive except for the larger utilities and not available for everyone.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments: This is already covered by requiring operatore to have CEH's.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☐ Yes

    ☒ No

    Comments: Not requiring but allowing upgrades as needed.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: I didn't see where the factors are explained.So must disagree.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: I don't think this standard is needed at all. Its just overkill. PER-002 covers training.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☐ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☐ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☒ No

    Comments: I don't think anybody out there has enough staff on board to implement this standard. If we have a field testing period most would find that it just won't work as written.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☐ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: I don't feel that it should be implemented at all.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: This standard will require additional staff and many man hours to implement. Most utilities don't have the man power to inplement this. Where are these people coming from.This is not needed at this time.As we have PER-002.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: The requirement is appropriate for entry-level and newly-hired system operators and perhaps as a baseline for incumbent system operations as a starting point for the basis of this Standard. But once a training needs assessment has been completed and presumably any training needed to fill gaps has been remedied, yearly training needs assessments are not required. R3 seems to be suggesting that an annual performance assessment should be conducted to determine possible deficiencies in an incumbent system operator's performance based on a reliability task's criteria. Since performance problems can be caused by a variety of things and remedied by things other than training—it is not appropriate to call this a training needs assessment nor to require one for each incumbent on an annual basis. These performance weaknesses need to be assessed and if training is the appropriate intervention—it should be included in the training plan as identified in our comments to Q4 below.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

   Comments: There is some language difference between this question and the wording in R4 and M4 that should be clarified. This question implies a plan is required for each system operator but R4 and the associated M4 state that one plan is required by the entity. This one plan would identify the set of training activities planned for the entity's

cadre of System Operators for any given year. One plan rather than a plan for each is appropriate and if, as is stated in our comment on Q2 above, the annual performance assessment identifies training as a solution to a performance weakness, that training would be stated generically in this plan.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: A simulator is not necessary and goes farther than that required for either annual training emergency or otherwise or for exercises within other types of training. There are other ways of including simulations in operator training.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☐ Yes

   ☒ No

   Comments: Periodic evaluation is important, but it is not necessary to evaluate on an annual basis. Rather, the evaluation should be based on known changes to the system, training methods or tasks and should be conducted before the next use of the materials.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

☐ Yes

☒ No

Comments: The Risk Factors are not consistent with the definitions of the Violation Risk Factors in the Reliability Standards Development Procedure adopted August 2, 2006. We need to be careful not to confuse importance with risk. Nothing in a training standard could rise to the level of a High Risk Factor, that quote -is, one that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. -unquote. Some of the training requirements may meet the definition for Medium Risk Factor, while most would result in a Lower Risk Factor.

12. Do you agree with the Measures in the proposed standard?

☐ Yes

☒ No

Comments: The Measures should be changed to conform to the previous comments. Specifically M 3, M 4, M 8, M10, and M 11

13. Do you agree with Compliance Monitoring section of the standard?

☒ Yes

☐ No

Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

☐ No known Regional Differences

Regional Difference:

15. Do you agree with the proposed Implementation Plan?

☐ Yes

☒ No

Comments: Phase I is permitted and could take up to one year to complete. Phase II will most likely be dependant on completion of Phase I. Extend Phase II and Phase III each by six months, extending the entire schedule to December 31, 2009.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: See comments to Question 15

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments:

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☐ Yes

   ☒ No

   Comments: R1.1 PNM does not support identification of the conditions when a task is performed, since most tasks need to be performed under many conditions.

   R1.3 PNM does not support this granularity of identifying if a task is performed individually or alone. PNM does not see a benefit in a reference

   R1.4 PNM does not support including this in the standard. The task will identify the inhererently criticality of the task and does not need a reference.

   R1.7 PNM agrees a job task analysis should be performed to identify the tasks assigned to each operating desk, however PNM does not believe the "analysis" needs to be updated when there is a new or revised task or tool.Too much detail does not make for a better analysis and this requirement places work on operating entities that is not beneficial.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments: A proper gap analysis measuring each System Operator against all the tasks required to be performed will determine how much individual training is required. If done properly, this will identify the yearly training needs. PNM feels that annual assessment of every operator against the entire task force is of value, however suggest a 2 or 3 year interval for this assessment.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

☐ No

Comments: PNM agrees that the annual plan should identify the training it has planned, however since system operators are at different knowledge levels the "anticipated duration" for training topics should not be a requirement as it is different in each context listed in subsections under R4.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

☒ Yes

☐ No

Comments: If by "entities" the standard refer to the electric utility and not the NERC Region or NERC.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: R7 lists documentation required for each "learning activity" used to support its reliability related training. PNM does not support the requirements listed in R7 and instead suggests following the principles contained with the NERC Continuing Education Program for developing a valid learning activity

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with “hands-on” experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: PNM recognizes the benefits associated with a computer-based simulator and uses both generic and company specific. However, PNM does not support including this as a requirement in the Standard. Effective "simulation" of either normal operation or an emergency event is the goal and can be and is accomplished through other methods of simulation at PNM.

8. Do you agree that there should be a record of each system operator’s training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: PNM supports keeping a training record for each operator but does not support a separate record listing all the tasks identified in the job task analysis and whether the operator has "mastered" that individual task or still "needs improvement" because it is a more detailed record keeping than is needed. PNM does not agree that there is benefit to add performance critiera to "every task" performed.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments: Provided the performance criteria is not task specific.

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

☐ No

Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: With the understanding that violation risk factors are not to rank the importance of a requirement to the industry but rather as an aggravating factor in determining penalties and sanctions, PNM does not support the violation risk factors as listed in the draft Standard. A review of the Measures in the Standard indicate all Requirements are essentially administrative in terms of providing documentation the Requirment has been met. A lack of documentation does not necessarily mean the training or other requirement did not occur. PNM recommends all violation risk factors in this Standard be set at "Lower."

12. Do you agree with the Measures in the proposed standard?

    ☒ Yes

    ☐ No

    Comments: PNM notes that changes to requirements will create appropriate changes to measures.

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: The Data Retention requirements are more detailed than necessary and PNM recommends a simple requirement for all training documentation and records to be retained for three-years, similar to the requirement of the NERC CE Program.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☒ Yes

    ☒ No

    Comments: See response to #18

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

☒ No

Comments: PNM recommends field testing should be a standard practice for all NERC Standards. Field testing reveals administrative concerns and sometimes substantive concerns that were not foreseen. All standards should be subject to at least a brief field testing period.

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☐ No

    Comments: PNM recommend all specific dates be removed. The plan notes the dates slide with the approval date of the Standard but PNM believes the approximate dates will do more to confusion the issue than to help.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: The drafting team should provide detailed responses to the comments expressed in this form and in accordance with the spirit of the standard drafting process.

    Finally, PNM thanks the drafting team for your dedicated concern and efforts to improve our industry by helping entities develop valuable and effective training programs for system operators.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Please: Enter text only, with no formatting or styles added.
Use punctuation and capitalization as needed (except quotations).
Use more than one form if responses do not fit in the spaces provided.
Submit any formatted text or markups in a separate WORD file.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☒ No

   Comments: W agree that these are things that are generally considered when doing a task analysis. We're not sure that they all must be done for each task, which is what your question asks. This is good for a template for a training program task analysis. If this is too prescriptive, an unitended side effect would be for entities to shorten their task list so they can meet all the sub-requirements. The primary requirement should be to have a training program. Also, there is no way that doing a task analysis differently puts the Interconnection at risk of cascading, which is what the High Risk assignment implies. As a side note, the industry still needs to resolve and clarify the risk definitions. The draft standard is an example of people confusing importance with risk.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments: The scope of things mentioned should generally be considered as part of an overall plan. We agree with the question, but this doesn't seem to line up with the requirement.

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

☒ Yes

☐ No

Comments: While a trainer needs to understand the material presented, this requirement implies a second layer of administration to keep track of the qualifications of the trainer. This requirement needs to line up with the requirements of the CEH program. This also is rated as a high risk requirement, which is inconsistent with the definition.

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: The items list in R7 are typically outlined in skills or task-based training and are appropriate as a guideline, but appear to be too prescriptive. There are other valid training activities that wouldn't follow this format. This also needs to line up with the CEH program.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☒ No

   Comments: We agree with "should", but R9 says "shall" and identifies it as a medium risk requirement. The design of an item in a training program (or lack thereof), does not put the Interconnection at risk of cascading. Requirements 4 and 9 could be combined and simplified (provide annual review and a summary of changes).

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments: Your question does not mirror R10. Yes, material should be reviewed. R10 appears to be something that can not be measured, with the exception of applying it after the fact when the operator didn't have perfect knowledge. Also, the measure

implies that even training that will not be offered in a given year must be annually updated. This is another requirement that should be aligned with the CEH program.

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: We agree training is very important. However, we cannot identify any of the items in this standard should be classified above a lower risk. It's the direct actions of the operators that can put the interconnection at risk. Missing an item (or varying) in the design of a training module does not put the Interconnection at risk of cascading.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments: The measures are too complex. There are already requirements that say what training needs to be provided. Over-specifiying how the training is delivered and the detailed design of the program seems to go too far. There are probably four core requirements in the standard. The measures and compliance monitoring should be simplified (some overall score for the requirements that are met).

13. Do you agree with Compliance Monitoring section of the standard?

    ☐ Yes

    ☒ No

    Comments: This needs to be simplified. We're not sure why there would be spot checks and triggered investigations for training. This standard can be evaluated during the normal audit and self-certification cycle.

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☐ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☒ Yes

    ☐ No

    Comments:

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☒ Yes

    ☐ No

Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☐ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☒ Yes

    ☒ No

    Comments: However, more will be needed if the standard is too prescriptive. Most entities will have to put material together for hundreds of tasks and training activities.

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: The System Personnel Training Standard lays out guidelines for a well thought out training program. However, there are other ways to have an effective training program and each organization's needs are not the same. The primary issues relate to the administrative complexity and the compliance elements in the standard. There are a significant number of items for which non-compliance can be assessed. The team proposes that many of these are high and medium risk requirements. High risk requirements are events/items that can directly lead to cascading. Varying the design of a training program cannot directly lead to cascading outages. Also, the team has not proposed what tasks are considered reliability related tasks, leaving it to each company to determine. By not defining a minimum suite of reliability related tasks for Reliability Coordinator, Balancing Authority and Transmission Operator, who will determine if the company identified reliability tasks cover even a reasonable subset of tasks performed by the system operator. If no minimum set of reliability tasks are identified, the standard will not ensure that all companies are doing the right thing and the training of system operators will not be improved.

    The standard should be boiled down to the core training requirements (develop a program, deliver training [including and consistent with CEH], record and assess progress, adjust the program annually). It would be simpler if this standard were measured globally (3 of the 4 requirements with no deficiencies is passing, minor deficieiencies in 2 requirements is level 1, etc.).

    This standard should absorb the 32 hours of emergency training.

Please use this form to submit comments on the proposed System Operator Training standard. Comments must be submitted by **October 26, 2006**. You may submit the completed form by e-mail to sarcomm@nerc.com with the words "SO Training Standard" in the subject line. If you have questions please contact Craig Lawrence at craig.lawrence@nerc.net or by telephone at 609-452-8060.

Background Information:

The System Operator Training standard is deigned to help insure that system operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their bulk power systems.

Just prior to the 2003 blackout in the northeastern U.S. and Canada, the Personnel Subcommittee developed a strategic plan for improving industry training programs. In December 2004, the SAR for a system operations training program was first posted for industry comment. The SAR drafting team responded to comments and revised the SAR three times in response to industry comments. Many comments were received with suggestions that varied along the spectrum from indicating that the standard should not be prescriptive to suggesting that the standard should specify that a certain number of hours of training should be provided on a restricted list of topics. Throughout the SAR refinement process, the proposed approach was to require the use of a systematic approach to training. That approach remains central to the draft standard and was supported by FERC in the FERC Staff Preliminary Assessment of NERC Reliability Standards.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Operator Training Standard Drafting Team would like to receive stakeholder comments on this standard. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.com with the subject "SO Training Standard" by **October 26, 2006**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas. If your answer is no, please submit your suggested changes or improvement.

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

   ☒ Yes

   ☐ No

   Comments: The information is typical of classical Job Task Analysis information. However , criticallity of the task(R1.4) needs to be defined or removed. Tasks are critical to reliability or not critical.

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator and the training needs of the incumbent system operator?

   ☐ Yes

   ☒ No

   Comments: An Initial Training Program (as identified in PER-002) should identify the set of knowledge and skill levels that must initially be learned and demonstrated. All operators must successfully complete the initial training regardless of previous training or experience. It is not necessary to perform an initial training needs analysis. A formal training needs analysis could be conducted for a period of time (once a year for 3 years) after completing the initial training plan.

   Incumbent, experienced operators are continually assessed by supervisors and remedial training identified. Formal, yearly needs assessments of all experienced incumbents will make little difference to reliability and take time away from necessary ongoing training.

3. Do you agree with that each entity's training program should include training for entry-level system operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

   ☒ Yes

   ☐ No

   Comments:

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each system operator? (R4.)

   ☐ Yes

   ☒ No

Comments: The annual training plan should identify the training that all operators will complete to maintain knowledge and skills necessary for reliable operation. Individual performance issues will be addressed on an exception basis.

5. Do you agree that entities should verify that the personnel who develop or deliver training to system operators are competent to do so? (R5.)

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the list of training activity components provided in R7.? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The NERC CEH Format should be acceptable for documenting reliability related trainiing. An additional standard is not necessary.

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Simulation that makes a situation "real" to the operator and burdens the operator to make choices and perform tasks under duress is the best method of raising awarness and providing confidence.

8. Do you agree that there should be a record of each system operator's training that shows the tasks that system operator has already mastered and the tasks where performance needs improvement? (R8.)

   ☐ Yes

   ☒ No

   Comments: There should be a record of each system operator's training that shows the tasks that system operator has mastered. The other necessary records are those that document ongoing training and the performance of each system operator in that ongoing training.

9. Do you agree that entities should evaluate their training programs every year? (R9.)

   ☒ Yes

   ☐ No

   Comments:

10. Do you agree that requiring entities to update their training materials as needed before the materials are used is necessary? (R10.)

    ☒ Yes

    ☐ No

    Comments:

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

    ☐ Yes

    ☒ No

    Comments: Based on the definition of Risk Factors in the NERC Reliability Standards Development Procedure, TXU Electric Delivery would use the Lower definition for the standard. Not performing a JTA does not cause a reliability issue.

12. Do you agree with the Measures in the proposed standard?

    ☐ Yes

    ☒ No

    Comments:

13. Do you agree with Compliance Monitoring section of the standard?

    ☒ Yes

    ☐ No

    Comments:

14. Please identify any Regional Differences that you feel should be included in this standard.

    ☒ No known Regional Differences

    Regional Difference:

15. Do you agree with the proposed Implementation Plan?

    ☐ Yes

    ☒ No

    Comments: TXU Electric Delivery believes that it would take 4 years for a phased implementation.

16. Do you agree with the drafting team that this standard does not need to be field tested?

    ☐ Yes

    ☒ No

    Comments:

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

    ☒ No known conflicts

    Conflict:

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

    ☐ Yes

    ☒ No

    Comments: see 15

19. Please provide any other comments you have on this standard that you haven't already provided above.

    Comments: In general , the standard, as written, will significantly increase training and administrative costs and not provide a significant amount of increased reliability. Per-002 and Per-003 provide general guidance to ensure training is conducted and performed appropriately.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Background

The System Personnel Training Standard Drafting Team (SPT SDT) thanks all those who submitted comments with the first posting of the System Personnel Training Standard.

The initial draft of this standard was posted for a public comment period from September 27 through October 26, 2006. The SPT SDT asked industry participants to provide feedback on the standards through a special Comment Form. There were 58 sets of comments, including comments from 174 people representing 91 different entities from all NERC Regions and six of the nine Industry Segments as shown in the table on the following pages. *(Note that although NERC has ten Industry Segments in its Registered Ballot Body, there were only nine Industry Segments when the proposed standard was first posted for comment.)*

In this document, the SPT SDT's consideration of comments is provided in blue text immediately following each comment submitted for each question. A summary response to each question is highlighted in yellow following each question. The following conforming changes were made to the requirements in the standard – changes were made to the associated measures and compliance elements:

- Eliminated the individual requirements for each of the phases of the SAT process (R1, R4, R6, and R9) and replaced these with a revised R1 that necessitates using the SAT process to develop the required training.
- Consolidated R2 and R3 that addressed assessing training needs for entry-level or newly hired experienced System Operators and incumbent System Operators into one requirement, the revised R2 that is applicable to positions, not individuals, as well eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.
- Eliminated the requirement for verification of qualifications for persons developing or delivering training (R5).
- Eliminated the requirement for providing details of training activities (R7).
- Eliminated the requirement addressing the maintenance of the System Operator training program (R10).

Several commenters have identified reasons why compliance with a new training standard may be challenging and while the drafting team is sympathetic to these commenters, the drafting team would also remind those stakeholders that the 2003 blackout occurred when there was voluntary compliance to an Operating Policy that asked entities to provide operator training – and the investigation concluded that not every system operator who was on duty on that day was prepared to recognize and respond to the conditions present on the bulk electric system. From an 'outsider's perspective' a system operator holds a position that is critical to infrastructure. System operator training needs to be viewed in the same light as a pilot's training – you wouldn't want to be a passenger in a plane with a pilot whose skills had not been verified. While the existing certification standard does require that system operators acquire a NERC credential, the content of the exam for that NERC credential is not company-specific and does not cover all the procedures, processes and tools that are available to an individual system operator at a specific work location. The intent of this standard is to ensure that system operators are as prepared as the pilot who has been trained to fly the plane he is in – and is prepared to address not only normal but a variety of abnormal conditions. Nothing less will meet the needs of the entities that rely on electricity for their safety, comfort and livelihoods. Almost every infrastructure critical to our national security relies upon electricity. While providing training does take resources, it is necessary. The drafting team has modified the standard to retain its critical components while eliminating the elements of the standard that explained 'how' to achieve the desired results.

Several stakeholders have commented that the NERC Continuing Education (CE) program should be a substitute for the new training standard. The drafting team disagrees with this position. The CE program does not provide assurance that the system operator sitting at the console has the capability to perform

all of the reliability-related tasks associated with the system operator position. Who would want to be a passenger on a plane that had a pilot who had been trained to take off and land but had never been through training to maneuver through thunderstorms? We need to reach a point where we have assurance that system operators are capable of performing **all** the reliability-related tasks assigned to their position.

The following web page includes the stakeholder comments in their original format; a clean version of the standard, supporting references, and a revised Implementation Plan:

http://www.nerc.com/~filez/standards/System-Personnel-Training.html

Note that a red-line version of the standard and Implementation Plan have not been posted due to the significant changes that were made to these documents since the initial posting.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Process Manual: http://www.nerc.com/standards/newstandardsprocess.html.

Index to Questions, Comments and Responses:

1. Do you agree with the information that must be collected when doing a job task analysis (R1.1. through R1.7.)?

Summary Consideration:

The majority of the stakeholders that provided comments did not did not support the performance of a job task analysis as a requirement that should be included in this standard. They also did not agree that the requirement should prescribe the information that must be collected when conducting the job task analysis. In addition, several commenters requested that the requirement be revised to include only an analysis of the reliability related tasks, not all tasks.

The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training, not the outcomes or details of each phase.

Question 1		
Commenter		**Comment**
Tim Hattaway; Alabama Electric Coop (5)	no	PER-002 already requires a coordinated training program to ensure reliable system operation.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Improvements in industry training are warranted based on findings from the '03 Blackout Report and FERC Order 693. In FERC Order 693 "the Commission (FERC) directs that NERC submit a modification to PER-002-0 that: (1) identifies the expectations of the training for each job function; (2) develops training programs tailored to each job function with consideration of the individual training needs of the personnel; (3) expands the Applicability to include reliability coordinators, generator operators, and operations planning and operations support staff with a direct impact on the reliable operation of the Bulk-Power System; (4) uses the SAT methodology in its development of new training programs; and (5) includes the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation."		
John Bussman:AECI (1,5,6)	no	The goal of this standard is to ensure that operators are trained to maintain the BES. If a company has a process in place that already performs this task why must there be a standard that mandates a direction as how one will determine if someone in trained. For example: The NERC PER-002 states that a company will have a process in place to have operators trained to maintain the bulk electric system (BES)
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. In FERC Order 693 "the Commission (FERC) directs that NERC submit a modification to PER-002-0 that: (1) identifies the expectations of the training for each job function; (2) develops training programs tailored to each job function with consideration of the individual training needs of the personnel; (3) expands the Applicability to include reliability coordinators, generator operators, and operations planning and operations support staff with a direct impact on the reliable operation of the Bulk-Power System; (4) uses the SAT methodology in its development of new training programs; and (5) includes the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation."		
Richard Appel; Sunflower Electric Power Co (1,3,5)	no	I think Per-002 is adequate in insure reliable trained operators Also if NERC is going to impose a job task analysis on us, NERC should set the minimum standards so it is fair and equitable for everyone. I don't think most companies have

Question 1		
Commenter		**Comment**
		enough staff to comply with this standard.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Marion Lucas; Alcoa Power Generating, Inc (1)	no	Each company, not NERC, has the right to decide what, if any, job task analysis should be performed when training its employees. Categorizing specific tasks into a listing for job task analysis documentation should never be considered a High risk factor. Only specific tasks that are considered critical to reliability should be considered in an analysis for compliance to a reliability standard.
Response: The SPT SDT agrees with the comment that the methodology used to perform and the information collected during the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of a systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. The SPT SDT agrees with the comment that only specific tasks that are considered critical to reliability should be considered and has revised the requirement to include only reliability-related tasks by System Operator positions.		
Will Franklin; Entergy (6)	no	The R1 requirement specifies that the information that must be collected pertains to only reliability related tasks 'identified' by the JTA. Thus the methodology for the JTA should remain under the discretion of the entity. Regarding the list of information related to the reliability tasks identified by the JTA - different training philosophies may not need this much detail in order to adequately train operators to successfully perform the tasks. Employing differing JTA methods and 'required' information neither makes an operator and entity more or less competent and reliable.
Response: The SPT SDT agrees with the comment that the methodology used to perform and the information collected during the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirements such that the methodology used to perform the analysis phase of a systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
SRP (1)	no	Some direction on assessing criticality is warranted here. In R1.4, how does one define the "Criticality of the task with respect to reliability"? What are the criteria? How can there be consistency among individual companies if there aren't any guidelines? It would seem a task is either critical or it is not. Who determines the shades of grey that R1.4 imbues

Question 1		
Commenter		**Comment**
		in its present wording? In order to fulfill the purpose of this standard, ensuring that operators are competent, all tasks that are part of the job should be assessed and trained to as needed. Many of these tasks aren't critical to reliability when looked at individually yet they are required to perform the job. When it comes to sanctions, criticality should be a key consideration. Entities should be required to identify only the tasks that are critical to reliability. These tasks can then be documented and training provided based on an operators need to be trained. The listed R1.1 through R1.7 for each of what could be dozens of tasks that may or may not be critical to reliability isn't necessary and does not justify the resources required to meet this requirement. Our operators perform numerous tasks that are not critical to reliability and should not be subject to this requirement.
Response: The SPT SDT agrees with your comment on criticality and has removed the references to criticality from the requirement. The SPT SDT agrees with the comment that only specific tasks that are considered critical to reliability should be considered and has revised the requirements to include only reliability-related tasks by System Operator positions.		
WECC RCCWG (1,2)	no	Entities should be required to identify only the tasks that are critical to reliability. These tasks can then be documented and training provided based on an operators need to be trained. The listed R1.1 through R1.7 for each of what could be dozens of tasks that may or may not be critical to relaibility isn't necessary and does not justify the resources required to meet this requirement. Our operators perform numerous tasks that are not critical to reliability and should not be subject to this requirement. R1.1 states that the conditions under which the task is performed are to be specified. It is not clear what the intent of requirement 1.1 is. A full set of conditions for each task performed is not necessary for development of training. It seems that other 1.x requirements adequately frame conditional information required for training purposes and Requirement 1.1 should be eliminated.
Response: The SPT SDT agrees with your comment on criticality and conditions and has removed the references to criticality and conditions from the requirement. The SPT SDT revised the requirements such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
John Kerr; GRDA	no	These need additional information for clarification. The process for the JTA should be more of a guide instead of a standard.
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must		

Question 1		
Commenter		**Comment**
be included in the development of the training.		
Dale Wadding; Dairyland Power Cooperative (5)	no	The requirements in R1.1 through R1.7 are good guidelines but are too complicated for some relatively simple tasks. R1. should stand alone with the detailed guidance on how to structure a JTA left to the reference documents which are being prepared by the drafting team.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Jason Shaver; ATC (1)	no	ATC believe that Requirement R1.1 and R1.7 go too far in prescribing what has to be included in a job task analysis. ATC does support the requirement that a job task analysis be performed but does not agree that with the need to prescribe the sub-bullets. ATC recommends that the SDT delete Requirements R1.1 – R1.7.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirements such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
William J. Smith; Allegheny Power (1)	no	Further information is needed to offer an informed opinion on Requirement 1 and the required information specified in R1.1 through R1.7. The term reliability-related needs clarification and specific examples of what fits and does not fit the definition of reliability related. Clarification and or an example of an acceptable job task analysis is also required to properly comment on this standard.
Response: The SPT SDT agrees with your comment on the need to clarify the reliability-related needs and has added a clarifying statement in the applicability section of the standard. In response to your request for examples of reliability-related tasks, the SPT SDT has included a Generic System Operator Task List as part of the revised standard. The SPT SDT revised the requirements such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Santee Cooper (G2)	no	Does R1 require a JTA for all company-specific reliability-related tasks, or only for those tasks judged by a company to warrant a JTA? Does R1 require the JTA to be revised for all new or revised tasks or tools? Is the reference document defining how a JTA is conducted needed to understand the requirements and expectations of this standard and the impact of the associated one year implementation plan for R1-3?

Question 1		
Commenter		**Comment**
Response: The SPT SDT agrees with your comment on the need to clarify the reliability-related needs and has added a clarifying statement in the applicability section of the standard. In response to your request for examples of reliability-related tasks, the SPT SDT has included a Generic System Operator Task List as part of the revised standard. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
SPP OTWG (1,2)	no	The standards should require a JTA, but the information collected and specified in R1 through R7 should be separate and used as a guide (e.g., and appendix). This would allow each entity to come up with it's own. Actions as a result of a task can be difficult to measure and document. How many categories of criticality are there? Is this a standard or a recommendation? If this is a requirement, what is the minimum requirement for each? Is this a requirement for the industry or for each individual operator?
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT has provided links to references on the systematic approach to training (SAT) that can provide further clarification and examples. The SPT SDT agrees with your comment on criticality and has removed the references to criticality from the requirement. The SPT SDT agrees with your comment that the requirement is not for individual operators but is applicable to job positions and has modified the requirement accordingly.		
WECC OTS (1,2)	no	OTS agrees a job task analysis should be performed to identify the tasks assigned to each operating desk. OTS does not believe the "analysis" needs to be updated when there is a new or revised task or tool. We believe R1 should say the task list must be updated. The level of detail for the analysis should be sufficient to identify the task and guide what type of training may be appropriate. Too much detail does not make for a better analysis and this requirement places work on operating entities that is not beneficial. The list in R1.1 through R1.7 is more detailed than is warranted. OTS lists the R1.1 through R1.7 and offers comments on each item: R1.1 "The conditions under which the task is performed." OTS does not support identification of the conditions when a task is performed. Most tasks need to be performed under many conditions. If a task is a critical emergency task the condition is a fundamental part of identifying the task and does not need a separate reference. R1.2 "The actions to be taken in performing the task, including identification of references and tools used in performing the task." OTS supports including this in the

Question 1		
Commenter		**Comment**
		Standard. R1.3 "Identification of whether the task is performed alone or as part of a team." OTS does not support including this in the Standard. Many tasks need to be performed either "alone or as part of a team" depending on normal operating or emergency conditions at the time. Whether a task is generally performed individually or as a team is a fundamental part of identifying the task and does need a separate reference in the standard. R1.4 "The criticality of the task with respect to reliability." OTS does not support including this in the Standard. Singling out tasks as being "critical" to reliability implies other reliability related tasks are not critical to reliability. All tasks identified as being reliability related should be considered important or "critical." If a task is inherently critical it will be known as a fundamental part of identifying the task and does need a separate reference. Criticality can be a relative issue and cannot be measured accurately. R1.5 "The frequency of performing the task." OTS supports including this in the Standard. It can be helpful in developing the annual training plan and considering the frequency of tasks in the refresher or continuing training program. R1.6. "The knowledge, skill, and experience needed to perform the task." OTS supports including this in the Standard. R1.7 "The criteria for successful performance of the task." OTS does not support including this in the Standard. Separately identifying the criteria for "successful performance" of each individual task is not necessary and provides limited benefits. OTS fully supports a learning assessment at the end of each learning activity to determine if the learning objectives were met for the activity. Successful "performance criteria" is usually executing the skills and knowledge necessary to do the task correctly and in the right timeframe resulting in the desired outcome, essentially doing the task without mistakes. Many topics in operator training do not support the concept that an operator can demonstrate "performance" of the task at the end of the learning activity. Many tasks cannot be performed until an operating condition on the system calls for the task to be performed, which may be days or weeks after the training took place. A "performance criteria" can be a general operating philosophy such as safe and error free operating of the system, but it will be a burden and does not provide and benefit to add performance criteria to "every task" performed.

Question 1		
Commenter		**Comment**
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT agrees with your comment on criticality and conditions and has removed the references to criticality from the requirement. The SPT SDT has revised the requirement to focus on positions, as opposed to individual or team performance. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard that includes the desired performance.		
Gordon Rawlings; BCTC (1)	no	A job task analysis should be performed to identify the tasks assigned to each operating desk but the "analysis" does not need to be updated when there is a new or revised task or tool. Shouldn't this section say the task list must be updated when there is a change? R1.1 Reliability-related tasks can be performed under many different conditions. How would we identify all the conditions these tasks could be performed under and what purpose does this provide? We believe this should be removed and is not required in the Standard. R1.2 We support including "The actions to be taken in performing the task, including identification of references and tools used in performing the task." in the Standard. R1.3 "Identification of whether the task is performed alone or as part of a team." BCTC does not support including this in the Standard. Many tasks need to be performed either "alone or as part of a team". We believe this should be removed and is not required in the Standard. R1.4 "The criticality of the task with respect to reliability." BCTC does not support including this in the Standard. Seprating out tasks as being "critical" to reliability implies other tasks are less important. There is no benefit to separating "critical" tasks from others. We don't see how this could be measured properly and all tasks that are reliability related should be considered important. R1.5 "The frequency of performing the task." BCTC supports including this in the Standard. It can be helpful in developing the yearly training plan and including infrequency of tasks in the refresher or continuing training program. R1.6. "The knowledge, skill, and experience needed to perform the task." BCTC supports including this in the Standard. R1.7 "The criteria for successful performance of the task." BCTC does not support including this in the Standard. Separately identifying the criteria for "successful performance" of each individual task is not necessary. BCTC fully supports a learning assessment at the end of each learning activity to determine if the learning objectives

Question 1		
Commenter		**Comment**
		were met for the activity. We believe this will be a burden in developing a job task analysis for System Operators and does not provide and benefit to add performance critiera to "every task" performed.
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT agrees with your comment on criticality and has removed the references to criticality from the requirement. The SPT SDT has revised the requirement to focus on positions, as opposed to individual or team performance. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard that includes the desired performance.		
Michael Scott; APS (1,5)	no	During Job Analysis a task list for a position is created, and that determination of whether these tasks are selected for training is also created, typically by a difficulty, importance, and frequency review. This is alluded to in R1.4 and R1.5. This task list should be auditable. During Task Analysis the selected tasks mentioned above are analyzed to identify the conditions, behaviors, and standards to which a task must be performed. The knowledge, skills, and abilities of the selected tasks must be identified. These points are mentioned in R1.1, R1.2, R1.6, and R1.7. The analysis of these selected tasks should be auditable. To measure an individual's mastery of a task, evaluation in a team setting is problematic, if not impossible. We therefore disagree with R1.3. To make the R1 section more usable, we respectfully suggest the following wording: R1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct a System Operator job task analysis (JTA). The analysis must be updated when there is substantive change to the operator's job (e.g. new or revised task or tool). The JTA results shall include: R1.1 A task list containing company-specific reliability-related tasks for each System Operator position, including analysis data used to determine whether the task is selected for training (e.g. infrequent, critical, difficult, etc.) R1.2 Analysis of each task selected for training, including conditions, actions, and standards for performance, and the knowledge, skills, and abilities

Question 1		
Commenter		**Comment**
		required by the trainee.
Response: The SPT SDT agrees with your statements that the task list should be auditable and agrees with the comment on Requirement 1.3. The SPT SDT has revised the requirement to focus on positions, as opposed to individual or team performance. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
CJ Ingersoll; CECD (3)	no	The phrase "company-specific reliability-related tasks" is too vague and subjective, which impacts the effect of R.1.1-R1.7 negatively. In addition, R1.1 task information realted to "the conditions under which the task is performed" should reference some reasonable aggregation of conditions, such as normal operating conditions, etc.
Response: THE SPT SDT has included a Generic System Operator Task List as part of the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore each entity must complete a company-specific analysis to determine the required training. The SPT SDT revised the requirements such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Richard Krajewski; Public Service Co of NM (1)	no	R1.1 PNM does not support identification of the conditions when a task is performed, since most tasks need to be performed under many conditions. R1.3 PNM does not support this granularity of identifying if a task is performed individually or alone. PNM does not see a benefit in a reference R1.4 PNM does not support including this in the standard. The task will identify the inhererently criticality of the task and does not need a reference. R1.7 PNM agrees a job task analysis should be performed to identify the tasks assigned to each operating desk, however PNM does not believe the "analysis" needs to be updated when there is a new or revised task or tool. Too much detail does not make for a better analysis and this requirement places work on operating entities that is not beneficial.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard that includes the desired performance. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT has revised the requirement to focus on positions, as opposed to individual or team performance. The SPT SDT agrees with your comment on criticality (R1.4) and has removed the references to criticality from the requirement.		

Question 1		
Commenter		**Comment**
Jim Sorrels; AEP (1)	no	AEP supports that the standard should require a Job Task Analysis, but the information, collected and specified in R1.1-R1.7, should be identified separately from the standard, as a "Guide", such as an attachment or appendix to the standard. R1.1 should specify the condition categories (e.g., Emergency, Normal, Contingency, etc.). R1.2. should not require actions to be taken in performing the task unless the action is another task or sub-task. Actions may require a matrix or flow chart based on an individual's understanding of basic concepts. This could be very challenging in some cases, especially where there are a number of different actions/responses that are practical, and correct, that would yield similar results. As a result, we have documented operating procedures and plans (e.g., EOP and Black Start plans). R1.2 should simply read: Identification of references and tools, including actions if appropriate, used in performing the task. R1.4 is vague as it needs to specify the different categories of criticality (e.g., Low, Med, High). R1.6 should have the word experience removed or replaced with a different word or phrase within the requirement. Is experience intended to mean operator/trainee assessment by the trainer rather than experience over a time period of doing the task? If an individual has the knowledge and skill to perform the task, experience over time may not be relevent, such as for new tasks involving new tools. Experience comes with performing the tasks. Experience in doing a task may not be practical or possible (except as a lab type demonstration exercise during a training activity) until the tool/task has been proven and utilized in real-time operation. R1.6 should read: The knowledge and skill needed to perform the task; or, The criteria for demonstration of the knowledge and skill to perform the task. R1.7 - The criteria for successful performance is difficult to measure/document for many tasks. R1.7 seems redundant to R1.6, which is duplicative if a demonstration of knowledge and skills has been specified.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard that includes the desired performance. The SPT SDT revised the requirements such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT agrees with your comment on criticality and has removed the references to criticality from the requirement.		
Southern Co (1,3,5,6)	no	While we agree with a Job Task Analysis being performed (Job Description), PER-002 already provides sufficient direction to assure entities develop quality Training Programs and are staffed with "adequately trained personnel".

Question 1		
Commenter		**Comment**
		Requirement 1.3 is too granular. For instance, certain tasks can be performed as part of a team at times or alone at times. Criticality of the task in 1.4 with respect to reliability cannot always be correctly assessed. For example, the consequences of not performing TTC calculations to ensure that TTC capability is accurate may or may not have a critical affect on the system. Requirement 1.5 is too specific-Some tasks are performed continuously while other tasks are asking the system operator to perform studies for emergency outages. Another example is the notification to affected parties about a time error correction taking place. The frequency of these tasks sometimes can not be predetermined and do not reoccur on a steady cycle. A final task that can't have a predetermined frequency is notifications of problems or expected problems in system conditions. These simply happen and you respond as quickly as possible. Recommend removing Requirements 1.3, 1.4, and 1.5.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT has revised the requirement to focus on positions, as opposed to individual or team performance. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard that includes the desired performance. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Matthew Santos; SDE&G	no	The JTA should be based on each company's needs, the time, money and man hours to do a JTA is considerable. if you were to use a vender to do the JTA cost will increase. So after you have the JTA done, now you build the training program around it. This is time, money and man hours. Now deliver the training to the troops, Money, time and man hours. Do you have or can you get the personnel to deliver the training? Most companies do not or cannot, so we go to the outside and have a vender do it for us. From what I hear most companies are in the same boat doing more with less and not able to find qualified folks to get all the training done that is now required by the standards. This standard as it stands now would be very hard to comply with, you say phase it in over 2 years, more time is needed, 4 to 5 years would be more realistic for the industry to accomplish this. I disagree with R1.1 clarify conditions?, the task could be performed under normal/emergency conditions. Are you asking for that much detail on each task? It should be performing the task successfully R1.5 every utility is different, the operator may perform the

Question 1		
Commenter		**Comment**
		task once or 50 times a shift what does it matter as long as they do it correctly? R1.7 - What is the criteria for successful performance of a task? It should be what I set it at. anything missed will be addressed.
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT reviewed the comment that the implementation timeline should be extended and has revised the implementation plan to reflect an implementation timeline of 2 to 3 years.		
Roger McBeth; Northeast Utilities (1)	no	This requirement is overly prescriptive as to the development, content, and maintenance of a Job Task Analysis. This requirement will force every organization to out source, at a significant expense, the initial development of an overly prescriptive complex Job Task Analysis Database and to purchase a complex Learning Management System to manage the JTA data to support this requirement. Given the small training staffs of most training organizations, their time and energy would be better spent performing a less prescriptive informal job task analysis. When the Institute of Nuclear Power Operations (INPO) required commercial nuclear power plants to develop training programs using a Systematic Approach to Training, they not only provided a generic Job Analysis/Task List, they also provided a generic Job Task Analysis for all of the generic tasks that could be used by each of the training organizations. It appears that NERC will only provide a generic task list. A Job Task Analysis (JTA) is much more manpower intensive than a Job Analysis. If NERC will require a company specific task list with all of the requirements specified in requirements 1.1 through 1.7, then they should provide a generic task list and a generic JTA that satisfies requirement 1.1 thru 1.7.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of a systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. In response to your request for examples of reliability-related tasks, the SPT SDT has included a Generic System Operator Task List as part of the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore each entity must complete a company-specific analysis to determine the required training.		
Ed Davis; Entergy Services (1)	no	We believe R1 should consist of requiring the responsible entity to conduct a System Operator job task analysis, update that JTA when there is a new or revised task or tool, and specify the criteria for being QUALIFIED TO PERFORM each task. We agree that the responsible entity should keep a list of company-specific reliability-related

Question 1		
Commenter		**Comment**
		tasks assigned to each System Operator position. We believe the draft R1 is overly prescriptive and suggest the last phrase of R1 - and the following information for each of those tasks: - be deleted. We also suggest R1.1 performed alone or as part of a team. If R1.6 is not deleted as part of the above suggestion, then R1.6 should through R1.6 be deleted. If R1.3 is not deleted as part of the above suggestion, then R1.3 should be deleted because it is not significant if a task is be modified to delete the term - experience - from the requirement. JTAs are performed to determine the skills and knowledge needed, not the experience needed, to perform a task. We also believe that R1.7 of the draft standard should require the specification of the - criteria for being QUALIFIED to perform each task. The requirement should not be to specify the criteria for - successful PERFORMANCE of the task. This draft standard should address the criteria for individuals to be QUALIFIED to perform a task, and should address the continuing training for personnel that are QUALIFIED. The standard should not require the employers to specify the CRITERIA for SUCCESSFUL PERFORMANCE.
Response: The SPT SDT revised the requirements such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Duke Energy (G1) (1)	no	We agree that these are things that should be collected when doing a task analysis, which is what your question asks. This is a good for a template for a training program task analysis. However, the question presumes that a JTA is needed to have an effective training program. A JTA dictates that each task that each job function performs be documented in detail. This is an enormous amount of work. Additionally, in a dynamic operational environment where decision making is constant and conditions are changing, tasks are not prescribed. The primary requirement should be to have a training program. JTAs are a good, but not the only, way to establish a baseline for an effective training program. This is too prescriptive, and may lead to entities developing abbreviated task lists solely to meet all the sub-requirements.
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in		

Question 1		
Commenter		**Comment**
the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Ron Gunderson; NPPD (1) Robert Coish; MEHB (1, 3, 5, 6)	no	We agree that these are things that are generally considered when doing a task analysis. We're not sure that they all must be done for each task, which is what your question asks. This is good for a template for a training program task analysis. If this is too prescriptive, an unintended side effect would be for entities to shorten their task list so they can meet all the sub-requirements. The primary requirement should be to have a training program. Also, there is no way that doing a task analysis differently puts the Interconnection at risk of cascading, which is what the High Risk assignment implies. As a side note, the industry still needs to resolve and clarify the risk definitions. The draft standard is an example of people confusing importance with risk.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium.		
MISO (1,6)	no	We agree that these are things that are generally considered when doing a task analysis. We're not sure that they all must be done for each task, which is what your question asks. This is good for a template for a training program task analysis. If this is too prescriptive, an unintended side effect would be for entities to shorten their task list so they can meet all the sub-requirements. The primary requirement should be to have a training program. Also, there is no way that doing a task analysis differently puts the Interconnection at risk of cascading, which is what the High Risk assignment implies. As a side note, the industry still needs to resolve and clarify the risk definitions. The draft standard is an example of people confusing importance with risk.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium.		
Hydro One Networks (1)	no	As posted, creating a JTA for operating positions can be an onerous undertaking as the list could be quite extensive. From the compliance viewpoint, the task may become onerous, depending on the level of detail and documentation that will be required. For example,

Question 1		
Commenter		**Comment**
		switching operations could be broken down into many sub-tasks such as, routine, planned, contingency, restoration, emergency, low voltage, high voltage, system, auxiliary, SPS, manual, directed, independent etc. To facilite the requirement, NERC could provide a list of tasks for System Operators that entities can use and modify as required to represent their own uniqueness. In addition, there are other ways to determine training needs besides the use of a JTA. For example, - Lessons learned from Operating Experience - Corporate/Divisional Mandated Training - Remedial Training requirements - Government Legislated - Safety Training - New or changed tools, processes, procedures, instructions - New or modified equipment - AdHoc training requirements - Response to feedback or requests for training
Response: In response to your request for examples of reliability-related tasks, the SPT SDT has included a Generic System Operator Task List as part of the revised standard. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Kathleen Goodman; ISO-NE (2) ISO/RTO Council (2)	no	In response to the specific question posed: ISO New England (IRC) agrees that the information listed should be included in a Job Task Analysis (JTA). However, the format of the question focuses on the details of the requirement (i.e. what goes into a JTA) and presupposes the need for the requirement itself. We do NOT agree that a Job Task Analysis should be a NERC mandated requirement. The customized subjective nature of job tasks precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
PJM (2)	no	In response to the specific question posed: The PJM agrees with the IRC that the information listed should be included in a Job Task Analysis. However, the format of the

Question 1		
Commenter		**Comment**
		question focuses on the details of the requirement (i.e. what goes into a JTA) and presupposes the need for the requirement itself. In its present form, it appears that each subject entity would be free to select the JTA model of its choice. The standard needs to identify the criteria that would be used to assess the adequacy of the entity's JTA and other required elements in the Training Standard. PJM does NOT agree that a Job Task Analysis should be a NERC mandated requirement. The customized subjective nature of job tasks precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard. Requirement 1, states that the JTA must be updated whenever there is a new or revised task or tool. The measurement for R1 states that you need a current JTA. It is impossible to evaluate this requirement let alone have consistency across ALL System Operators in North America.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
NPCC CP9 (1, 2)	no	The tasks to be performed by a system operator should be defined by the standard drafting team (SDT). A training program should then be developed by the entity to assure that any and all operators are proficient in those tasks. The standard need not get into the specifics of the training program. NPCC participating members also believe that an operating entity should not be mandated to perform a formalized job task analysis to identify a list of tasks and the corresponding training program.
Response: The SPT SDT has included a Generic System Operator Task List as part of the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore, each entity must complete a company-specific analysis to determine the required training. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Alan Adamson; NYSRC (2)	no	The tasks to be performed by a system operator should be defined by the standard drafting team (SDT). A training program should then be developed by the entity to assure that any and all operators are proficient in those tasks. The

Question 1		
Commenter		**Comment**
		standard need not get into the specifics of the training program.
Response: The SPT SDT has included a Generic System Operator Task List as part of the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore each entity must complete a company-specific analysis to determine the required training. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
SCE&G ERO WG (1, 3, 5)	yes	Job task analysis are subjective to whomever is developing these tasks and subject to interpretation of the standard and reference document which is currently not available. This approach results in lack of continuity across the industry which should be a goal specifically in an effort to audit compliance. The Natural Gas Transmission Industry has struggled with a a similar standard referred to as the Operator Qualification Rule (49 CFR 192.801) on a larger scale and lessons on implementation can be learned from their experience. The problem of lack of conformity between operating companies showed up in compliance audits specifically in the area of what was a qualifying task and the name of that task. What this industry did after a few years because of the confusion and inefficient program management is develop a list of minimum tasks that applicable parties should address and provide details related to that task as a minimum comparable to those requested in R1.1-R1.7. If one of these tasks did not apply to a applicable party, they simply addressed it in their plan and provided supporting information. Another benefit of conformity, it allows plans to be develop and adoption by applicable operating parties across multiple systems. Additionally, personnel transferring from one applicable party to an other can provide evidence of their past performance to it as it relates to the tasks and begin work which saves time/money and gets qualified personnel working.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT has included a Generic System Operator Task List as part of the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore each entity must complete a company-specific analysis to determine the required training.		
Ron Falsetti; IESO (2)	Yes/no	We agree that the majority of the information listed in R1.1

Question 1		
Commenter		**Comment**
		through R1.7 need to be collected to describe tasks to be performed by the personnel to whom the training program is intended. However, we do not feel that a NERC standard should mandate an operating entity to perform a job task analysis to develop this list and the corresponding training program. An industry-wide standard should stipulate that these operating entities (RC, BA and TOP) each develop and deliver a training program that will bring their operators to the competency level required to perform those tasks that the entity is responsible for as specified in the Functional Model. We view the listed items in R1 to be part of the task and work environment description, which can be combined with those listed in R7 and included in the training program document. A way to capture this would be to put the key attributes that must be included in a training program in a template to facilitate compliance audit.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. Based on industry feedback, R7 has been removed from the revised standard.		
Mark Bennett; Gainesville Regional Utilities (5)	yes	Yes, But I believe this is going to end up being a major compliance issue in the future if this SAR goes through as written, What is wrong with PER002-0 dated
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Certification is outside the scope of this standard.		
MRO (1,2)	yes	In R1.1, the MRO recommends the addition of some examples for the definition of conditions i.e. emergency, normal, etc…; also in R1.4, add some examples of the levels of criticality.
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT has removed the references to criticality, R1.4, from the requirement.		
Jim Gunnell; SPP (2)	yes	In addition, I believe the JTA should include a list of industry-standard, reliability-related tasks in addition to the company-specific tasks. This would set a standard level of best practice across the industry.
Response: The SPT SDT has included a Generic System Operator Task List as part of the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore each entity must complete a company-specific analysis to determine the required training.		
Gerald LaRose; NYPA (1)	yes	An important question resulting from the language used in the Requirement is: What is meant by "company-specific

Question 1		
Commenter		**Comment**
		reliability-related tasks"? One interpretation could be "only those reliability-related tasks that are specific to a given company's operation" (as opposed to generic operator tasks). A second interpretation could be "that subset of all of the tasks derived from the JTA that are designated as reliability-related". Throughout the draft Standard there are repeated references to "tasks identified" and "reliability-related tasks identified". A clearer understanding will substantially aid in determining how onerous this Standard will be.
Response: The SPT SDT agrees with the comment that only specific tasks that are considered critical to reliability should be considered and has revised the requirement to include analysis that considers only reliability-related tasks by System Operator positions. The SPT SDT has revised the requirement to include company-specific reliability-related tasks only and removed all references to “tasks-identified” and "reliability-related tasks identified" from this requirement. The SPT SDT has revised section 4.2 (under Applicability) to address the industry’s concern with the applicability. The intent of this paragraph is to provide in what is meant by reliability-related tasks.		
FRCC SO Subcommittee (1,2,5)	Yes/no	The language as written does not indicate that reliability-related tasks should be associated with the reliability of the Bulk Electric System. As we will detail later, we feel it is important for these training standards to have appropriate flexibility to accommodate training requirements on an entity basis. For example, for an entity that primarily operates a distribution system, it is much easier for them to define their auditable training program if the standard is clear on requirements applying to BES related tasks. LSE and DP operating tasks that do not affect the BES should not be subject to the auditability of those that do. ie. these tasks do not affect the reliability of the Bulk Electric System and as such should not be auditable by NERC. Recommendation: Change the language to reflect Bulk Electric System reliability-related tasks.
Response: The SPT SDT agrees with the comment that only specific tasks that are considered critical to reliability should be considered and has revised the requirement to include analysis that considers only reliability-related tasks by System Operator positions. The SPT SDT agrees with your suggested change to the language to reflect Bulk Electric System reliability-related tasks and has changed the references.		
FPL (1,3,5)	Yes/no	Operating tasks that do not affect the reliability of the BES should not be subject to the same auditability as those that do. The language as written does not indicate that reliability-related tasks should be associated with the reliability of the Bulk Electric System. We feel it is important for these training standards to have appropriate flexibility to accommodate training requirements on an entity basis. Recommendation: Change the language to reflect Bulk Electric System reliability-related tasks.
Response: The SPT SDT agrees with the comment that only specific tasks that are considered critical to

Commenter		**Comment**
reliability should be considered and has revised the requirement to include analysis that considers only reliability-related tasks by System Operator positions. The SPT SDT agrees with your suggested change to the language to reflect Bulk Electric System reliability-related tasks and has changed the references.		
Allan George; Sunflower (1)	yes	Limit standard to exactly what is required, no need to over extend bounds if intent
Response: Yes, the SPT SDT agrees that standard should reflect minimum acceptable level of performance.		
Dan Kay; South Mississippi EPA (4)	yes	Generally agree with the information that should be collected but, should not be required by NERC in a standard. If & how a job task analysis is done should be left up to the employer not NERC.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Brian Thumm; ITC (1)	yes	Job task analyses can be very detailed. There are also many different scenarios to be considered when developing JTAs. While the list of JTA elements in the standard is sufficient, there could be clearer guidance as to the level of detail that an entity is expected to include in their JTAs, and the extent to which all possible permutations are documented.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
TVA (1)	yes	We do not agree with the use of the word "experience" in R1.3. It is very subjective and difficult to quantify effectively or consistently. We suggest clarification of the meaning or just strike it all together.
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Michael Gammon; KCP&L (1)	yes

2. Do you agree that the training needs analysis should identify the training needs of the entry-level or newly-hired experienced System Operator and the training needs of the incumbent System Operator?

Summary Consideration:

Most commenters did not agree with the requirement that the training needs analysis differentiate between the training needs of the entry-level, newly-hired experienced, and the incumbent System Operators. The majority of the commenters also expressed concern with the requirement to have an annual training plan developed from the training needs assessments. Several commenters expressed concern with the requirement for individual System Operator assessments, rather than position assessments.

The SPT SDT consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.

Because the approved SAR did include the following language, the SDTSDT did not eliminate the need to assess the performance of individual System Operators:

> The proposed standard will require that each responsible entity have evidence that each of its real-time system operators is competent to perform each assigned task that is on its Company-specific List of Reliability-related Tasks.

To meet the language in the approved SAR, the drafting team did include the following requirement in the revised standard:

> R4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall assess the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks. [Risk Factor: Medium]

Question 2		
Commenter		**Comment**
Marion Lucas; Alcoa Power Generating, Inc (1)	no	No. It is not NERC's responsibility to dictate the training needs of new hires, as OUR company determines what is necessary for training issues to prepare the new hire for performing OUR specific job requirements. NERC should only be involved with the Certification and OUR company shall train the new hires to meet and/or exceed the certification requirements. The Certification test itself is the measure of competence to do the job and NERC need not set a requirement on new hire/entry-level training needs for individual companies on which to be monitored.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not an individual. Certification is outside the scope of this standard.		
Tim Hattaway; Alabama Electric Coop (5)	no	PER-002 already calls for a training program that addresses the initial and continuing training needs of personnel responsible for system operations.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
John Kerr; GRDA	no	Certification for new operators is already in Standard PER-002. After certification, exposure to training for each operator should be the same program.

Question 2		
Commenter		**Comment**
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Note that PER-002-0 does not include certification requirements for new operators.		
Will Franklin; Entergy (6)	no	Many entities may employ a 'pipeline' training program for a new operator whereby the trainee receives training whether or not they have previous knowledge, then the knowledge and skill abilities are assessed through testing and a qualification card process. Additionally, to attempt to individually assess the training needs of each incumbent operator would be burdensome to employ and document. Again, some entities may operate under the philosphy that once an individual achieves qualification, and they periodically pass testing to maintain qualification then no additional plan is needed. If they fail, only then is an individual remediation plan is developed.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
Dale Wadding; Dairyland Power Cooperative (5)	no	A requirement to perform an annual training needs analysis for every incumbent system operator is an unnecessary administrative burden. Proposed language would mandate such an analysis whenever there was a substantive change in the system operators JTA.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT revised the standard to clarify that the annual assessment is based on position, not an individual.		
SRP (1)	no	Partially agree. The means proposed to assess the training needs of an incumbent operator would appear to require simulating each and every task identified in R1 and grading every operator on their performance of each every year. This would seem an extremely time intensive process to just identify what you then plan to train them on. Is that truly the intent of this requirement? Entry-level/newly hired operators should not be required to have a needs analysis. These operators can be assumed to need all of our training curriculum. An analysis should be done periodically for incumbent operators. R1 does state that JTA should be reliability-related but it does not say critical-to-reliability. the way it is stated allows for a reasonably short list.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
Brian Tuck; BPA (1)	no	BPA agrees with the basic requirement of performing a training needs analysis to determine training needs, as expressed in requirement R2 and R3. BPA disagrees with

Question 2		
Commenter		**Comment**
		the annual requirement proposed in R3 for incumbent system operators. While BPA agrees that the training needs analysis should occur with some periodicity, evaluating every system operator against the entire task list "at least once every year" is excessive. A complete and thorough assessment should result in a foundation for more than one years worth of training. Prior to going through the complete reassessment again, sufficient time should be allowed for the system operator to complete training and develop skills and knowledge in the areas identified as lacking. BPA suggests a three year cycle rather than every year.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is position-related rather than individual specific. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
John Bussman:AECI (1,5,6)	no	We believe that training needs to be provided for new hire and entry-level, however, not necessarily using R1.1 - R1.7
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, as well eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. R1.1 – R1.7 has been removed from the R1.		
William J. Smith; Allegheny Power (1)	no	The training needs analysis should identify the training needs of the entry-level or newly-hired experienced system operator. Properly trained incumbent system operators should not require a training needs assessment on an annual basis. Particularly since other specific NERC standards identify required annual training and the new NERC Certification credential maintenance program requires continuing training hours in specific categories.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. NERC Certification is a separate program; training provided under this standard's requirements can serve to meet the continuing education requirement for certification.		
Pepco Holdings (1)	no	The requirement is appropriate for entry-level and newly-hired system operators and perhaps as a baseline for incumbent system operations as a starting point for the basis of this Standard. But once a training needs assessment has been completed and presumably any training needed to fill gaps has been remedied, yearly training needs assessments are not required. R3 seems to be suggesting that an annual performance assessment should be conducted to determine possible deficiencies in an incumbent system operator's performance based on a reliability task's criteria. Since performance problems can be caused by a variety of things and remedied by things

Question 2		
Commenter		**Comment**
		other than training—it is not appropriate to call this a training needs assessment nor to require one for each incumbent on an annual basis. These performance weaknesses need to be assessed and if training is the appropriate intervention—it should be included in the training plan as identified in our comments to Q4 below.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Southern Co (1,3,5,6)	no	We agree that training needs analysis should be done but NERC should focus on assuring training takes place and not on the process. It is unnecessary to differentiate between an "entry-level" and a "newly hired experienced" System Operator. Besides the fact that it is unclear what these terms are intended to represent (one is a job family level term and the other one trying to reflect a degree of experience independent of level), the training considerations (and terms) should focus on initial and refreshing/reinforcing training. If this approach is taken then the experience level or incumbency is irrelevant. For a new operator all training would be initial. For an experienced "incumbent" operator, some would be "refresher/reinforcing" and some might be "initial" for newly assigned tasks.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
Duke Energy (G1) (1)	no	Requirement 2 relies on the successful completion of R1's JTA requirement, which would be very difficult and ever changing. There should be one training program, with the goal to have skilled operators.
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised R1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
WECC RCCWG (1,2)	no	Partially agree. Entry-level/newly hired operators should not be required to have a needs analysis. These operators can be assumed to need all available training. An analysis should be done periodically for incumbent operators.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		

Question 2		
Commenter		**Comment**
Jason Shaver; ATC (1)	no	ATC does not believe that a separate training program needs be created for entry-level, newly-hired, and incumbent system operators. It is our position that a single training program can be developed to serve as the umbrella. Under the training program umbrella, individuals' training needs can be matched to those course offerings most appropriate to their level of experience and area of need. Requiring the documentation of multiple training programs for the same tasks at varying levels does not enhance system reliability or lead to more educated system operators. Rather, it adds to the administrative burden placed on the trainers, thereby reducing the amount of time available to develop and deliver quality training.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Michael Scott; APS (1,5)	no	We agree that the new-hire must have an assessment of their training needs, leading to an individualized training plan. We strongly disagree with the recommendation to conduct an ANNUAL assessment of incumbent operator training needs. The Systematic Approach to Training, if properly applied, will lead to a initial training program design that develops qualified personnel for the job position. An entity would doubtless have to conduct a one-time assessment of incumbent operators' training needs, against the newly designed program, filling any gaps with the needed training. Once the incumbents have received the initial training for the job position they have held, there is no further need for annual training needs assessments. New tasks, industry events, enhanced skills training, performance improvement, etc. would be provided, via the Systematic Approach to Training, as continuing education. For the sake of simplicity, we would suggest the following wording for R2 and R3: R2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall assess the training needs of new System Operators, creating individualized training plans for them as needed. The plan will include the topics and the schedule for the training. R3. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct a one-time assessment of the training needs of incumbent System Operators, creating individualized training plans for them as needed. The plan will include the topics and the schedule for the training.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into		

Question 2		
Commenter		**Comment**
one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Jim Sorrels; AEP (1)	no	Yes. However, the wording of requirements R2 and R3 should be changed to clarify that the intent is for the needs analysis to be performed for each System Operator job classification not for each individual System Operator.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
FRCC SO Subcommittee (1,2,5)	no	As written, the proposed standard requirement requires the development of individual training plans for each system operator that is part of the training program. For many entities that do not have extensive training programs and resources, this is particularly burdensome and unnecessary from a practical standpoint. From a reliability perspective, the "training needs analysis" should focus on the training needs of a company, to achieve reliable operation of its facilities. The program should then make sure that all relevant personnel are adequately "trained" within the bounds of the defined program (as defined within the JTA) which will ensure the most reliable operation of that entity's facilities and subsequently ensure the overall reliable operation of the Bulk System. Individual training needs assessment may be a "next" step in the training evolution, but at this time we feel that any "training needs analysis" must be based on the needs of the entity as a whole (as defined within the JTA) and not the individual operators.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
FPL (1,3,5)	no	The proposed standard requires the development of individual training plans for each system operator within a company's training program. For many entities that do not have extensive training programs and resources, this is particularly burdensome and unnecessary from a practical standpoint. From a reliability perspective, the "training needs analysis" should focus on the training needs of a company, to achieve reliable operation of its facilities. The program should then make sure that all relevant personnel are adequately "trained" within the bounds of the defined program (as defined within the JTA) which will ensure the

Question 2		
Commenter		**Comment**
		most reliable operation of that entity's facilities and subsequently ensure the overall reliable operation of the Bulk System. We feel that any "training needs analysis" must be based on the needs of the entity as a whole (as defined within the JTA) and not the individual operators. Further, this approach will ensure that all operators within a particular operating company receive equal training to maintain and develop operating skills and knowledge.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Kathleen Goodman; ISO-NE (2)	no	ISO New England agrees that Training programs must address the needs of the individuals, regardless of the experience level. Further, we agree that Training Programs must span the entire spectrum from new hires to experienced individuals. R2 and R3 however, would mandate individual person by person formal assessments. And R3 would impose unprecedented annual 'needs assessments' of each incumbent operator. R2 and R3 go well beyond requiring Corporate Operator Training programs, and go into mandating the practices and procedures for Personalized Training programs. ISO New England does not agree that a one-size-fits-all Assessment requirement will meet the unique and varying needs of the responsible functional entities. As noted in the response to Q1, the customized subjective nature of individual's needs precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
ISO/RTO Council (2)	no	The IRC agrees that Training programs must address the needs of the individuals, regardless of the experience level. Further, the IRC agrees that Training Programs must span the entire spectrum from new hires to experienced individuals. R2 and R3 however, would mandate individual person by person formal assessments. And R3 would impose unprecedented annual 'needs assessments' of each

Question 2		
Commenter		**Comment**
		incumbent operators. R2 and R3 go well beyond requiring Corporate Operator Training programs, and go into mandating the practices and procedures for Personalized Training programs. The IRC does not agree that a one-size-fits-all Assessment requirement will meet the unique and varying needs of the responsible functional entities. As noted in the response to Q1, the customized subjective nature of indiviual's needs precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
PJM (2)	No	The IRC agrees that Training programs must address the needs of the individuals, regardless of the experience level. Further, the IRC agrees that Training Programs must span the entire spectrum from new hires to experienced individuals. R2 and R3 however, would mandate individual person by person formal assessments. And R3 would impose unprecedented annual 'needs assessments' of each incumbent operators. R2 and R3 go well beyond requiring Corporate Operator Training programs, and go into mandating the practices and procedures for Personalized Training programs. The IRC does not agree that a one-size-fits-all Assessment requirement will meet the unique and varying needs of the responsible functional entities. As noted in the response to Q1, the customized subjective nature of indiviual's needs precludes a 'standardized' requirement. Any approach that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard. A training needs analysis should to be conducted for all new entry-level operator candidates, and newly hired experienced operator to determine their present level of accomplishment. However, to mandate that there be an annual Training Needs Assessment of all incumbent system operators is without basis and "over-the-top". If there was an identified deviation in performance, then a determination by entity management would need to be conducted to determine whether or not the performance deviation is a training issue or something else. Not all problems can be resolved by training.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into		

Question 2		
Commenter		**Comment**
one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Ed Davis; Entergy Services (1)	no	Overall we agree with R2 with the exception that the training needs should be to meet the - criteria for being QUALIFIED to perform each task - and not - the criteria for successful PERFORMANCE of the task.
Response: The SPT SDT has revised the requirement to '"mismatch between the desired and actual performance", consistent with the approved standard's SAR.		
CJ Ingersoll; CECD (3)	no	CECD provided a negative response because CECD does not feel that, unless applicable, resources should be dedicated to developing new-hire training programs. CECD does feel it is appropriate to assess the training needs of operators in general, however it is unclear what evidence an entity must produce to show an assessment was performed. Is the annual training plan evidence that an assessment was performed? As written currently, are entities to assume that entry-level assessments are to be revised as tasks are added versus the annual gap assessments for incumbents?
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the measures for the combined requirement such that evidence of the latest assessment for each position must be provided.		
Roger McBeth; Northeast Utilities (1)	no	This requirement would place a significant administrative burden on a very small training staff to perform a training needs analysis for each operator on over 300 tasks. For small training organizations, it should be sufficient to have hiring practices that require minimum entry-level education and experience and provide a training program based on the entry-level requirements of the position description that addresses all of the tasks for the position. For incumbent operators, it should be sufficient to provide an operator training program that provides continuing training that covers infrequently performed complex tasks that are important to system reliability. The continuing training program should also address training weaknesses/deficiencies that have been identified through management observations of operator performance. It would be an overwhelming task for a small training organization to perform individual training needs analysis for each incumbent operator on over 300 tasks. While we understand the benefit of performing an individual training needs analysis for each newly hired system operator and for the incumbent system operators, we do not feel that the value added by this activity would justify the additional

Question 2		
Commenter		**Comment**
		administrative burden. We would be better served by concentrating on the following: - Develop well defined entry-level requirements - Develop and maintain an Initial Training Program which provides training on all tasks selected for training. - - Develop and maintain a continuing training program that addresses 1) generic deficiencies for all operators, 2) training on core critical tasks
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has considered your suggestions on areas of concentration and based on other stakeholder feedback, believes the suggestions would be considered by stakeholders to be too prescriptive to be included in this standard.		
WECC OTS (1,2)	Yes/no	These should simply be referred to as a training assessment for "initial" training of a System Operator and a training assessment for "continuing" training. It is not necessary to say they are "entry-level or newly hired experienced". A proper gap analysis measuring each System Operator against all the tasks required to be performed will determine how much training is required. However, R3 requires a training needs assessment of each operator to identify performance gaps (we prefer competency gaps or a gap analysis) at least once "every year." This indicates every operator must be assessed against the entire task list at least once a year. OTS agrees this type of assessment of incumbent operators should occur with some periodicity but every year is unnecessary and will lead to unbeneficial concerns of the operators. OTS suggests a two or three year cycle rather than every year.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Matthew Santos; SDE&G	Yes/no	We interview experienced outside Operators in Transmission and Generation to come into the Transmission (GCC) department. We do verbal/scenario type of questions and look at their resume, if they qualify in this regard, then we proceed with training them in all aspects of Transmission. It does not matter what they say they know, we cover it all (They have to learn our system & procedures) and then test them. This happens until they

Question 2		
Commenter		**Comment**
		are qualified to assume a shift by themselves. I disagree with R2 and R3 this is too much and going to far. Assessments on individual's needs can be captured in their exam results thru out normal training (Refresher/Continual) as it is delivered. And follow up would be done if needed.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
Ron Falsetti; IESO (2)	Yes/no	The training need analysis should identify the training needs and the full spectrum of competency level that must be achieved / demonstrated to perform the tasks covering all levels of the system operator being trained. An entry-level operator may need to start at a lower training level than their more experienced counterparts. Experienced operators, including those who have been certified, may refresh their training at an intermediate level depending on the gaps identified. Analyzing the training needs for a specific group of operators and develop a program specifically for that level may render the program too specific and hence ineffective.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
Michael Gammon; KCP&L (1)	yes	It is important to determine the training requirements for training new Operators, however, on-going training for incumbent Operators should be in the form of training plans that accomplish those things that are important to the job specific needs of a company and to maintain NERC operator certifications. R3 is for unacceptable levels of performance for incumbent Operators to be assessed annually. For those reliability tasks that are done routinely, any performance problems should be addressed as they are known and not wait for an annual assessment. For those reliability tasks that are not done frequently (peak load operating conditions, emergency plans, etc.), those should be part of an annual training program. I would recommend the following language modifications to the proposed standard: **R3.** Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct a training needs assessment of incumbent System Operator to identify reliability-related training activities that are not routine for the tasks identified in Requirement 1, periodic training required for each non-routine reliability-related task, and a training plan to support maintaining NERC operator certifications and to maintain Operator skill levels at least once every three

Question 2		
Commenter		**Comment**
		years or as additional reliability tasks are added or modified. R4 seems to capture the essence of what I am referring to here, except for a training plan to support maintaining NERC operator certification.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
MISO (1,6) Ron Gunderson; NPPD (1)	yes	There would also be some recurring or refresher requirements. However, it may be that some organizations won't have new operators. The training program should have a goal of having skilled operators. There should be one training program; it doesn't have to be overly prescriptive.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Jim Gunnell; SPP (2)	yes	In addition, I believe the analysis should include not only the mismatch between the criteria for successful performance and actual performance, but it should also include: a gap analysis between knowledge criteria and actual knowledge, and a gap analysis between knowledge (what you know) and action (what you're able to do) Therefore there are three gap analyses: 1. Performance Gaps 2. Knowledge Gaps 3. Knowledge/Action Gaps
Response: Based on stakeholder feedback, the SPT SDT believes the suggestion would be considered by the stakeholders to be too prescriptive. The requirement has been revised to require the entity conduct an analysis to determine the mismatch between actual and desired performance.		
Gordon Rawlings; BCTC (1)	yes	These should simply be referred to as a training assessment for "initial" training of a System Operator and a training assessment for "continuing" training. It is not necessary to say they are "entry-level or newly hired experienced". A proper gap analysis measuring each System Operator against all the tasks required to be performed will determine how much training is required. However, R3 requires a training needs assessment of each operator to identify performance gaps (we prefer

Question 2		
Commenter		**Comment**
		competency gaps or a gap analysis) at least once "every year." This indicates every operator must be assessed against the entire task list at least once a year. BCTC believes this type of assessment of system operators should occur with some regularity but every year is unnecessary and will lead to work that will not produce any real results, different than a simple gap analysis would. BCTC suggests a simple gap anlysis every 2 to 3 years, or when job duties change significantly, will get the results needed.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Hydro One Networks (1)	yes	Yes, the analysis should allow to compare a new worker's experience and knowledge (or lack of) versus that of an experienced system operator to facilitate identification of what they need to know and train accordingly.
Response: The SPT SDT agrees with your comment.		
Dan Kay; South Mississippi EPA (4)	yes	Generally agree that the needs of entry and experienced operators should be identified but, should not be required by NERC in a standard. Again, this should be the left to the employer, not required by NERC in a standard
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
Alan Adamson; NYSRC (2)	yes	Before taking an unsupervised shift a system operator needs to have demonstrated proficiency, regardless of past experience.
Response: The SPT SDT agrees with your comment.		
NPCC CP9 (1, 2)	yes	Before taking an unsupervised shift a system operator needs to have demonstrated proficiency, regardless of past experience. The training provided must meet the need of the individual regardless of the level of experience to ensure no gaps are in the training or any assumption of knowledge where there may be not be sufficient background.
Response: The SPT SDT agrees with your comment.		
Richard Krajewski; Public Service Co of NM (1)	yes	A proper gap analysis measuring each System Operator against all the tasks required to be performed will determine how much individual training is required. If done

Question 2		
Commenter		**Comment**
		properly, this will identify the yearly training needs. PNM feels that annual assessment of every operator against the entire task force is of value, however suggest a 2 or 3 year interval for this assessment.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Santee Cooper (G2)	yes	Training requirements for newly-hired operators can be vastly different from one operator to another. For example, one newly-hired operator may have a background in substation work with knowledge and skills that are applicable to operators while another may have no experience at all. Does the requirement permit a company to determine the training needs of a new hire from a standard JTA and customize training requirements for the employee, or does this requirement imply that a JTA would have to be conducted and established for every new hire?
Response: The SPT SDT has reviewed your comments and have consolidated Requirements 2 and 3 into one requirement that is position-related rather than individual specific and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
SCE&G ERO WG (1, 3, 5)	yes	If a list of reliability related tasks and supporting information is provided, then this processes is manageable. Lack of providing a list of tasks and requirements related will add confusion and unneeded complexity to the process.
Response: The SPT SDT has provided a Generic Task List in the revised standard. A generic job analysis will not address all the reliability related tasks performed by each position at a specific organization. Therefore each entity is required to perform analysis to determine the scope of training.		
Allen Klassen; Westar (1)	yes	But not annually, suggest a 3 year cycle to fit with the overall training needs including Continuing Education for Operator Certification.
Response: The SPT SDT has revised the requirement to clarify that the annual assessment is applicable to positions, not an individual.		
Allan George; Sunflower (1)	yes	See 1
Response: The SPT SDT agrees that standard should reflect minimum acceptable level of performance.		
Mark Bennett; Gainesville Regional Utilities (5)	yes	Refer to 1

Question 2		
Commenter		**Comment**
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Certification is outside the scope of this standard.

Gerald LaRose; NYPA (1)	yes	
FirstEnergy (1,3,5,6)	yes	

3. Do you agree with that each entity's training program should include training for entry-level System Operators, continuing training on new tasks or tools, refresher training to improve performance, and annual refresher training to practice tasks that have high criticality and are infrequently performed?

Summary Consideration:

Most commenters agreed that a training program should include training for entry System Operators, continuing training on new tasks or tools, refresher training to improve performance and annual training to practice tasks that have high criticality and are infrequently performed. However, several commenters did not agree with the details that were included in the requirement. The SPT SDT consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.

Question 3		
Commenter		**Comment**
Richard Appel; Sunflower Electric Power Co (1,3,5)		This is already covered by PER-002
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Southern Co (1,3,5,6)	no	Each entity should be left to determine the training needs of its personnel. See comments for question #2.
Response: The proposed standard does not prevent the inclusion or the exclusion of any training that meets the needs of an organization's training program. The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
CJ Ingersoll; CECD (3)	no	CECD provides a negative response because CECD does not feel that, unless applicable, resources should be dedicated to developing new-hire training programs. CECD does feel training programs should include continuing training on new tasks or tools and refresher training as described above.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
Michael Gammon; KCP&L (1)	no	R4.2 does not fit with this standard. Any lapses in performance should be dealt with immediately. Each company should have policies in place to allow a company to take any actions necessary to remedy operator performance issues.
Response: The SPT SDT has remove R4 from the revised standard.		
Dale Wadding; Dairyland Power Cooperative (5)	no	Propose changing the word annual to continuing to allow some flexibility in when refresher training is provided.
Response: The SPT SDT has removed R4 from the revised standard.		
Jim Sorrels; AEP (1)	no	No. AEP agrees with the concept, but not with the details of the requirement. It should be clear that each applicable entity needs to have an annual training plan for each job

Question 3		
Commenter		**Comment**
		classification, not plans for each individual operator. In R4.4, the use of the term "continuing training" is not consistent with the use of the term "continuing education" and "continuing training" in the NERC Continuing Education Program Administrative Manual. In the Manual, the term continuing education/training (per the Manual, the terms training and education are used interchangeably) is used to describe any training that extends the basic knowledge and skills required to do a job. Whereas, R4.4 uses the term in the context that continuing training is just one type of training used to extend the basic knowledge and skills to do a job. The use of terminology in the proposed standard should be consistent with existing NERC usage and definitions. R4, R4.2, R4.3: It is not practical to formally train on all reliability tasks on an annual basis. Training is provided for job classification as a result of a training needs analysis and prioritized to address the greatest needs first. Conducting continuing/refresher training to the whole group assures that all get refreshed. Whereas, refresher training on critical tasks already being performed correctly by the group in a job classification, would not need training. If an operator is not performing a task correctly, immediate training or intervention by a mentor or supervisor may be required instead of scheduling a formal structured training session, that is documented in the training program.
Response: The SPT SDT has removed R4 from the revised standard.		
SRP (1)	no	If the training needs analysis is done properly, continuing training and refresher training needs will be identified and planned for. With this in mind is it truly necessary to keep the current wording of R4.2-R4.3?
Response: The SPT SDT has removed R4 from the revised standard.		
Mark Bennett; Gainesville Regional Utilities (5)	no	Not necessarily, Some Systems that perform these functions that are radial feeds and BA's don't need to practice blackstart every year unless a new employee is hired.
Response: This standard does not dictate specific training areas that should be in training programs, but does require that each operating organization perform a needs analysis to determine the training areas that should be included in their specific training program.		
WECC RCCWG (1,2)	no	Partially agree. The annual requirement for refresher training to practice tasks that have high criticality and are infrequently performed should be on an as-needed basis, based on the assessment in R3.
Response: The SPT SDT has removed R4 from the revised standard.		
Ed Davis; Entergy Services (1)	no	We agree with the question as presented here but we do not agree with the way the subject is being implemented in

Question 3		
Commenter		**Comment**
		the draft standard. Please see our suggested changes contained our response to Question 19 in this document, including our concerns regarding Sytsem Operators under contract or System Operators performing tasks identified in R1 under delegation agreement. Please also see our suggested changes to R6 contained in our response to Question 19 concerning the annual refresher training, practice of tasks that have high criticality and are infrequently performed.
Response: The SPT SDT has significantly revised the standard based on industry feedback. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. Based on stakeholder feedback the standard has been reworded such that the successful performance is determined using the systematic approach to training by the entity.		
Ron Falsetti; IESO (2)	Yes/no	Please see our response to Q2.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost.		
FPL (1,3,5)	Yes/no	We agree but would prefer to have defined terms and intervals if necessary. We are uncomfortable with the term "incumbent" and "refresher". Right now, these terms are unbounded (without definitions) and could be subject to various interpretations and misrepresentations. Entry-level could be defined as the interval necessary or training components required for a NERC "certified" individual to become knowledgeable or functional at relevant tasks of the JTA for a particular entity's facility and operations (could be referred to as a qualification process). Once an operator becomes "qualified" then he/she enters the training program as a System Operator subject to a company's continuing training requirements. The term refresher training is also too vague and should either be bounded by EOPS requirements (as already exists), or referred to as continuing training or defined in the standards glossary.

Question 3		
Commenter		**Comment**
Response: The SPT SDT has removed R4 from the revised standard. The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
FRCC SO Subcommittee (1,2,5)	Yes/no	We agree with the concepts. We would prefer to have defined terms and intervals if necessary. We are uncomfortable with the term "incumbent" and "refresher". Right now, these terms are unbounded (without definitions) and could be subject to various interpretations and misrepresentations. Therefore any terms referenced in the requirements, if not defined within the requirements, should be bounded by the addition of a definition within the standards glossary. ie. Entry-level could be defined as the interval necessary or training components required for a NERC "certified" individual to become knowledgeable or functional at relevant tasks of the JTA for a particular entitiy's facility and operations (could be referred to as a qualification process). Once an operator becomes "qualified" then he/she enters the training program as a System Operator subject to a company's continuing training requirements. The term refresher training is also too vague and should either be bounded by EOPS requirements (as already exists), or referred to as continuing training or defined in the standards glossary.
Response: The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has removed R4 from the revised standard.		
Matthew Santos; SDE&G	Yes/no	Each entity should have a documented training program for refresher and continuing training. Each entity should have a training plan for outside operators as well as inside operators coming from Distribution to Transmission. But it all depends on how the entity is set up and what functions they perform. It should not be mandatory to have a entry-level or apprentice type of trainning program if the entity does not need it.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has removed R4 from the revised standard.		
ISO/RTO Council (2) Kathleen Goodman; ISO-NE (2)	Yes/no	The IRC supports a requirement that all responsible entities must have a System Operator Training Plan for maintaining current competencies, learning new competencies, and practicing needed competencies. The Plan should include training that covers all the experience levels for the specific respective entity (not for some undefined common need). All responsible entities must have a plan for entry-level

Question 3		
Commenter		**Comment**
		system operator training, IF and ONLY IF entry-level training is required. However, there is no basis to fully-develop and have-ready-for-delivery an entry-level program if no such need exists.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
PJM (2)	Yes/no	PJM supports a requirement that all responsible entities must have a System Operator Training Plan for maintaining current competencies, learning new competencies, and practicing needed competencies. The Plan should include training that covers all the experience levels for the specific respective entity (not for some undefined common need). All responsible entities must have the option of training entry-level system operators either by internal training resources or by contracting with a training entity to provide same. All responsible entities must have a plan for entry-level system operator training, IF and ONLY IF entry-level training is required. However, there is no basis to fully-develop and have-ready-for-delivery an entry-level program if no such need exists.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has removed R4 from the revised standard.		
Michael Scott; APS (1,5)	yes	We agree with the idea, but again the verbiage used is needlessly wordy. Suggestion: R4. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have an annual training plan that includes: R4.1 Training for new System Operators, as identified in B.R2. R4.2 Training for incumbent System Operators, as identified in B.R3. R4.3 Continuing education for incumbent System Operators, that includes training: • to correct identified performance gaps • based on analysis decisions • on new or revised tasks
Response: Based on feedback from stakeholders, the majority of the stakeholders do not support this level of specificity included in the requirement for the training plan. The SPT SDT has removed R4 from the revised standard.		
Jason Shaver; ATC (1)	yes	Although ATC agrees with the question as posed above, this is not consistent with the way the proposed standard is

Question 3		
Commenter		**Comment**
		written. In addition, we believe that this standard should be written in a way that offers entities the flexibility to meet some or all of their training program requirements via external NERC certified course offerings under the recently approved NERC Continuing Education (CE) Program.
Response: The NERC CE program and the required hours to maintain System Operator certification are independent of the proposed standard PER-005. The proposed Standard PER-005 does not prevent the inclusion or the exclusion of any training that meets the needs of an organization's training program under the proposed standard PER-005 and meets the CEH hour requirements to maintain System Operator certification.		
Duke Energy (G1) (1)	yes	Requirement 3 is also contingent on the successful completion of R1's JTA requirement. This question does not seem to line up with the requirement. Why not replace the requirement with the rephrasing of this the question as a statement?
Response: The SPT SDT agrees that there may be a misalignment between the question and the requirement and will strive to align the requirements and the questions moving forward.		
Robert Coish; MEHB (1, 3, 5, 6)	yes	The scope of things mentioned should generally be considered as part of an overall plan. We agree with the question, but this doesn't seem to line up with the requirement.
Response: The SPT SDT agrees that there may be a misalignment between the question and the requirement and will strive to align the requirements and the questions moving forward.		
Michael Clime; Ameren	yes	Some of the tasks that have a high cricicality and that are infrequently perfromed such as System Restoration and Loss of Control Center Functionality are already addressed in the EOP Standard. If you are going to address those things in the Training Standard then take them out of the EOP one.
Response: The suggested comment to revise the EOP standard is beyond the scope of the approved SAR for this standard.		
SPP OTWG (1,2)	yes	This item requires clarification. Is the standard requiring each person within each company to provide a black start/restoration drill at least once per year? If this is the case, the possibility of meeting this standard is unlikely. Regional and subregional training must be available for entities to participate at the level required by R6.5.2
Response: The SPT SDT has modified the requirement for the Reliability Coordinator to conduct a restoration plan exercise annually in coordination with other entities.		
SCE&G ERO WG (1, 3, 5)	yes	If a list of reliability related tasks and supporting information is provided, then this processes is manageable. Lack of providing a list of tasks and requirements related will add confusion and unneeded complexity to the process.

Question 3		
Commenter		**Comment**
Response: In response to your request for examples of reliability-related tasks, the SPT SDT has provided a Generic Task List in the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore you must complete a company-specific analysis to determine the required training.		
Tim Hattaway; Alabama Electric Coop (5)	yes	I agree that training programs should be categorized into initial and continuing training needs; however PER-002 already requires this.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Marion Lucas; Alcoa Power Generating, Inc (1)	yes	Continuing endducation, refresher courses on current and infrequently performed jobs is important. We all experience in any job that we perform or with any degree/certification that we hold the need to stay current on latest trend and refresh the lesser used functions. As determined in job reviews for salary administration, to assess competency and further training needs our company already performs these functions, NERC need not be involoved in employee development OR our company's administration functions.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Santee Cooper (G2)	yes	However, we do not believe this requirement should be applicable to all new tasks or tools. For example, if tagging is modified such that the action on the part of the operator changes in a minor way, would this require a modification to the JTA and accompanying training plan?
Response: The SPT SDT has removed R4 from the revised standard.		
Dan Kay; South Mississippi EPA (4)	yes	This should be the left to the employer, not required by NERC in a standard.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost.		
Ron Gunderson; NPPD (1) MISO (1,6)	yes	The scope of things mentioned should generally be considered as part of an overall plan. We agree with the question, but this doesn't seem to line up with the requirement.
Response: The SPT SDT agrees that there may be a misalignment between the question and the requirement and will strive to align the requirements and the questions moving forward.		
John Bussman:AECI (1,5,6)	yes	However, not necessarily by R1.1-R1.7 criteria
Response: The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must		

Question 3		
Commenter		**Comment**
be included in the development of the training.		
John Kerr; GRDA	yes	Once certified, entry-level system operators should be encluded with experienced training in order for them to be exposed to all available materails.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
NPCC CP9 (1, 2) Alan Adamson; NYSRC (2)	yes	Again, the SDT needs to identify the knowledge set for a system operator.
Response: The SPT SDT believes the suggestion to include a knowledge set in the standard to be outside the scope of SAR and would be too prescriptive.		
Hydro One Networks (1)	yes	A training program must adapt to the level of experience and knowledge of staff. The training curricula should be tailored to include new operators and experienced ones with refreshers and more advanced levels for the latter.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
Edward J. Carmen; Baltimore Gas & Electric (1)	yes	
William J. Smith; Allegheny Power (1)	yes	
TVA (1)	yes	
MRO (1,2)	yes	
WECC OTS (1,2)	yes	
Richard Krajewski; Public Service Co of NM (1)	yes	
Pepco Holdings (1)	yes	
Will Franklin; Entergy (6)	yes	
Roger McBeth; Northeast Utilities (1)	yes	
Allan George; Sunflower (1)	yes	
Jim Gunnell; SPP (2)	yes	
Howard Rulf; WeEnergies (3,4,5)	yes	
Gerald LaRose; NYPA (1)	yes	

Question 3		
Commenter		**Comment**
Gordon Rawlings; BCTC (1)	yes	
James Hinson; ERCOT (2)	yes	
FirstEnergy (1,3,5,6)	yes	
Allen Klassen; Westar (1)	yes	
Brian Thumm; ITC (1)	yes	
Brian Tuck; BPA (1)	yes	

4. Do you think that each entity should have an annual plan that identifies the training it has planned for each System Operator? (R4.)

Summary Consideration:

Several commenters did not agree that the there should be a requirement to have an annual training plan that identifies the training each entity has planned for each System Operator. The SPT SDT removed the requirement and revised Requirement 1 such that it now identifies the phases of the SAT process that must be included in the development of the training, including analysis, design, development, implementation, and evaluation.

Question 4		
Commenter		**Comment**
James Hinson; ERCOT (2)		Not sure
Response: The SPT SDT has removed R4 from the revised standard.		
Will Franklin; Entergy (6) **R-4**	no	An annual plan for training should be developed & implemented. However, it is not needed on an individual basis.
Response: The SPT SDT has removed R4 from the revised standard.		
TVA (1) **R-4**	no	Does the term "each system operator" refer to individual operators or individual functions? (refer to reply #12)
Response: The SPT SDT has removed R4 from the revised standard.		
FPL (1,3,5) **R-4**	no	The plan should address the training needs of the organization and how those needs will be met by providing the appropriate training to the required personnel (see answer to #2).
Response: The SPT SDT has removed R4 from the revised standard.		
MISO (1,6) **R-4**	no	We agree with a need for a general annual review of the overall program. While each operator should have a few specific items on which they should include in their overall training goals, there does not have to be a separate plan for each individual.
Response: The SPT SDT has removed R4 from the revised standard.		
Duke Energy (G1) (1) **R-4**	no	The overall program should be reviewed annually. While each operator should have a few specific items on which they should include in their overall training goals, there does not have to be a separate plan for each individual.
Response: The SPT SDT has removed R4 from the revised standard.		
Santee Cooper (G2) **R-4**	no	An annual training plan for all operators within the company is fine. However, an annual training plan for each individual operator is not feasible. Once an operator becomes a system operator they should be at a certain level of competency such that individulized training is not needed. Too much individualized training may be an indication of a poor performing operator that is not compatible with the job.
Response: The SPT SDT has removed R4 from the revised standard.		
Ed Davis; Entergy Services (1)	no	We believe responsible entities should have annual plans that identifies the training planned for each system

Question 4		
Commenter		**Comment**
R-4.1		operator. However, we think that it is not necessary to specify that in a reliability standard for the BES and should be deleted from this standard.
Response: The SPT SDT has removed R4 from the revised standard.		
SRP (1) **R-4**	no	We partially agree that this is a helpful planning tool and time permitting, everyone should have one. But does requiring this level of detail on a training plan increase reliability? Does not having it decrease reliability or an operator's skill level? With the dynamic nature of the industry, training plans with this much detail are only educated guesses at best. Should we penalize an entity for not having one? No. Do we penalize them if it doesn't turn out to be accurate? Certainly not. From an audit or compliance standpoint, who is to say that the training plan for employee X is satisfactory or not? What sort of consitent guidelines will be applied by an audit team? How does the drafting team view a "training plan". Does a training plan define targets and goals or is it more binding than that? There should be some leeway for contingencies and changing training needs.
Response: The SPT SDT has removed R4 from the revised standard.		
Pepco Holdings (1) **R-4**	no	There is some language difference between this question and the wording in R4 and M4 that should be clarified. This question implies a plan is required for each system operator but R4 and the associated M4 state that one plan is required by the entity. This one plan would identify the set of training activities planned for the entity's cadre of System Operators for any given year. One plan rather than a plan for each is appropriate and if, as is stated in our comment on Q2 above, the annual performance assessment identifies training as a solution to a performance weakness, that training would be stated generically in this plan.
Response: The SPT SDT has removed R4 from the revised standard.		
Michael Clime; Ameren **R-4**	no	It is hard enough just trying to make sure that every Operator gets in his 32 hours of EOP, System Restoration Training and Backup Facility training, as well as making sure that they are getting the proper allotment of CE hours for re-newing their certificate. Now you are going to expect us to also create an individual training plan for each Operator to also track and correct their deficiencies on a yearly basis. Who is going to do all this work?
Response: The SPT SDT has removed R4 from the revised standard.		
Ron Gunderson; NPPD (1) **R-4**	no	We agree with a need for a general annual review of the overall program. While each operator should have a few specific items on which they should include in their overall training goals, there does not have to be a separate plan for each individual.

Question 4		
Commenter		**Comment**
Response: The SPT SDT has removed R4 from the revised standard.		
John Kerr; GRDA **R-4**	no	Each enity should have a training plan for the trainig process of the job. This would not leave out anyone (entry-level system operators) during the training process.
Response: The SPT SDT has removed R4 from the revised standard.		
Jason Shaver; ATC (1) R-4	no	ATC believes that a training needs assessment should be completed on an annual basis and that, this needs assessment would be one of the items taken into consideration in creating the training program; however, to create a separate training plan for each individual operator is overly prescriptive. ATC asks for the following changes: Changes to Requirement 4 Each RC, BA and TO shall have an annual training plan developed from the training needs assessment that identifies the topics, anticipated durations of the topic, and target schedules. In conjunction with this change, ATC requests the deletion of Requirements 2 and 3. ATC also recommends that the SDT delete Requirements 4.1 – 4.4. These requirements are overly prescriptive. They increase the administrative burden on a company and do not enhance system reliability or lead to more educated system operators. ATC recommends that NERC rewrite this standard in light of NERC's Continuing Education (CE) Program, as there will likely be a large amount of overlap in acquiring CE hours in order to maintain an individual's certification and in fulfilling organizational training requirements. Many companies will be looking to the CE Providers to help them meet their NERC CE hour certification requirements and their internal training program needs at the same time. The organizational training requirements are already tied to an individual's need to maintain certification via PER-003 which requires organizations to staff positions having the primary responsibility for real-time operation of the Bulk Electric System with certifed NERC personnel. If this standard fails to recognize the Continuing Education Program, which has already been approved by the NERC BOT, this standard, as written, will largely serve to increase administrative costs in the industry with minimal additional reliability benefits.
Response: The SPT SDT has removed R4 from the revised standard. The SPT SDT has reviewed your comments and consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals. The SPT SDT has revised the standard to clarify that the annual assessment is based on position versus individual.		

Question 4		
Commenter		**Comment**
The SPT SDT agrees with your comments about R4.1 and R4.2 and has removed R4. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes there is nothing in this standard that conflicts with the CE Program requirements.		
AEP	no	No. However, AEP does believe that each entity should have an annual plan for each job classification of system operator. AEP supports training identification at the job classification level, not at the individual level. The training needs assessment performed for R2 should apply for all entry-level employees for a job classification, similarly the assessment for R3 should apply to all non-entry-level job classifications. New/entry-level employees should not be performing reliability-related tasks (R4.1) on an unsupervised basis as they would not be qualified or NERC certified. The initial training plan should be a part of the annual training plan, but may best be referenced as an attachment or appendix to the annual training plan. It should be a stand alone program separate from that of the continuing education program for incumbent operators. Initial training program time frames for entry-level employees, with little to no experience, generally may extend longer than a year. Annual refresher training, as in R6.5, is the part of the training plan that should give focus on identifying and scheduling training activities for qualified/certified operators. The training plan could require new entry-level operators to receive the same annual refresher training given to qualified/certified operators, in addition to the training they receive in their initial training program, so as to reinforce the concepts of their initial training program. R 4.2 and R4.3 should be combined. If the refresher training of R4.3 is completed, it will address gap refresher training of R4.2, if it exists. The term performance gaps is a somewhat ambiguous term that is open to interpretation. R6 only needs to say "shall implement its System Operator training program as identified and specified in R4". It doesn't need the redundancy of R6.1 - R6.4 R6.5 should then be moved to be included as R4.5 as a type of training identified and targeted by the annual training plan. R6.5.2 is too broad and vague. Need to clarify that ""involving all real-time operating positions" only means involving real-time positions within a control center, not field personnel. Also, the wording needs to be clear that not all operators have to participate in the joint exercise required in R6.5.2.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		

Question 4		
Commenter		**Comment**
The SPT SDT has revised the standard to clarify that the annual assessment is based on position, not individual assessments. The SPT SDT agrees with your comments about R4.1 and R4.2 and has removed R4. The SPT SDT has reviewed your comments on R6, which captured the SAT implementation phase, and therefore removed R6 and created a global requirement for use of an SAT process to develop the required training, the revised R1. The SPT SDT has incorporated R6.5.1 into a revised stand-alone requirement, R3, and R6.5.2 has been removed.		
Alan Adamson; NYSRC (2) R-4	no	R4 should only be a restatement of this question (each entity should have a training program that assures the proficency of the system operators) and not include the details as presently stated in R4 of the draft standard.
Response: The SPT SDT has removed R4 from the revised standard.		
Allen Klassen; Westar (1) R-4	no	Annual plan is too frequent, not looking a the long term plan. Again, suggest a 3 year cycle to fit with the overall training needs including Continuing Education for Operator Certification.
Response: The SPT SDT has removed R4 from the revised standard.		
Brian Thumm; ITC (1) **R-4**	no	The annual training plan should be a comprehensive plan identifying the overall needs of a training program, and not focused in the individual needs of any particular system operator.
Response: The SPT SDT has removed R4 from the revised standard.		
NPCC CP9 (1, 2)	no	NPCC participating members believe R4 should only be a restatement of this question (each entity should have a training program that assures the proficency of the system operators) and not include the details as presently stated in R4 of the draft standard.
Response: The SPT SDT has removed R4 from the revised standard.		
SPP OTWG (1,2)	yes	A three-year plan would be better than an annual plan. A plan for a group of operators (e.g., entry-level system operators, newly-hired experienced operators, qualified/certified operators) would make better use of training. This would also offer refresher training to other operators on the same task.
Response: The SPT SDT has removed R4 from the revised standard.		
Tim Hattaway; Alabama Electric Coop (5)	yes	The sub requirements of R4 are unecessary.
Response: The SPT SDT has removed R4 from the revised standard.		
John Bussman:AECI (1,5,6)	yes	A company should have as a minimum a training program that provide contiuing training at least annually.

Question 4		
Commenter		**Comment**
Response: The SPT SDT agrees with your comment.		
Ron Falsetti; IESO (2)	yes	The will ensure that the training need is reviewed at least annually and a business plan with resource commitment provided.
Response: The SPT SDT agrees with your comment.		
Southern Co (1,3,5,6)	yes	Each entity should have training goals, schedules and an overall plan to address how operator training is to be accomplished
Response: The SPT SDT agrees with your comment.		
Gordon Rawlings; BCTC (1)	yes	It is not clear what "anticipated duration of the topic" is meant to define in the annual training plan. It is expected that "anticipated duration" for a topic to be trained on would be different for entry-level SO's vs refresher training for incumbant SO's. BCTC believes that "anticipated duration" for training topics should not be a requirement as it is different in each context listed in subsections under R4. R4.2 suggests that training should solve all gaps in performance. BCTC would suggest that the standard should say that when an assessment determines training is the solution to a gap in performance it shall be done. Only after an assessment after a performance issue should the decision to train be required.
Response: The SPT SDT has removed R4 from the revised standard.		
WECC OTS (1,2)	yes	It is not clear what "anticipated duration of the topic" is meant to define in the annual training plan. It is expected that "anticipated duration" for a topic to be trained on would be different for entry-level System Operator vs. refresher training for incumbant System Operators. OTS believes that "anticipated duration"for training topics should not be a requirement as it is different in each context listed in subsections under R4.
Response: The SPT SDT has removed R4 from the revised standard.		
Richard Krajewski; Public Service Co of NM (1)	yes	PNM agrees that the annual plan should identify the training it has planned, however since system operators are at different knowledge levels the "anticipated duration" for training topics should not be a requirement as it is different in each context listed in subsections under R4.
Response: The SPT SDT has removed R4 from the revised standard.		
FRCC SO Subcommittee (1,2,5) **R-4**	Yes/no	The plan should address the training needs of the organization and how those needs will be met by providing the appropriate training to the required personnel (see answer to #2). It is also imperative that the requirement include a reference to allow organizations to deviate from the

Question 4		
Commenter		**Comment**
		"anticipated" training plan. This is based on the continuously evolving nature of real-time operations along with identification of operational issues and training needs that are developed as a result of system disturbance analysis.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has removed R4 from the revised standard.		
Matthew Santos; SDE&G	yes	But due to manpower in operator ranks and in training sections it is very hard to comply with such a schedule. First you will spend a lot of time putting it together and then a lot of time changing it due to shift/personnel issues. A basic plan (Based on your system) will work for all system operators. Make a list of all the training that is needed for Refresher/Continual (Continual will change due to additions of new equipment or operating practices) training that needs to be done for all the operators trying to make it an indiviual plan is not worth the effort. If you get some tracking software you can run reports on who needs or has not done what training.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT agrees with the comment that an entity needs to be allowed to adjust the training plans to meet changing needs.		
Hydro One Networks (1)	**yes**	A plan and schedule should be developed and implemented. However, some flexibility should exist in the plan to allow for Ad-hoc or unplanned/unforseen training requirements.
Response: The SPT SDT agrees with the comment that an entity needs to be allowed to adjust the training plans to meet changing needs.		
CJ Ingersoll; CECD (3)	**yes**	However, there must be flexibility for variations from the plan, because of the nature of real time operating environements.
Response: The SPT SDT agrees with your comment.		
Dale Wadding; Dairyland Power Cooperative (5)	**yes**	R4.1 through R4.4 are unnecessary repitition and should be deleted.
Response: The SPT SDT has removed R4 from the revised standard.		
SCE&G ERO WG (1, 3, 5)	**yes**	Annual training for System Operators is agreeable. To develop an individualizeed training program to any level of detail will be difficult to manage. However, if a standard list of applicable reliability related tasks are provided then individual training becomes mute. All operators will be

Question 4		
Commenter		**Comment**
		required to demonstrate core competantancy. It would be left to management and the employee of the steps necessary to prepare an employee to qualify for applicable reliability related tasks.
Response: The SPT SDT has removed R4 from the revised standard. In response to your request for examples of reliability-related tasks, the SPT SDT has provided a Generic Task List in the revised standard.		
Marion Lucas; Alcoa Power Generating, Inc (1)	yes	Yes, I agree that the training plans should be developed by each company to suit its needs but it may not be necessary to develop an individual plan for each operator as this determination would be a result of the employee review process.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
PJM (2) Kathleen Goodman; ISO-NE (2) ISO/RTO Council (2)	yes	PJM (ISO-NE) (IRC) supports ongoing Training Programs, but does not support a standard that requires a program "for each operator". Operator-specific programs may be an admirable objective, but they are not always practical.
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		
WECC RCCWG (1,2)	no	Partially agree. An annual plan is a good idea but the operating environment is so dynamic that compliance measurements are impossible to determine. Who is to say that the training plan for employee X is satisfactory or not?
Response: The SPT SDT has reviewed your comments and has consolidated Requirements 2 and 3 into one requirement that is applicable to positions, not individuals, and eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators. The SPT SDT has revised the standard to clarify that the annual assessment is based on positions, not an individual.		
MRO (1,2)	yes	Some entities have procedure documents for activities such as switching where an individual will go out and perform the task under the direct supervision of a SO, does this standard apply to those individuals that are under the direction of the SO?
Response: The applicability section of the standard has been expanded to clarify the System Operators that are included in this standard.		
Dan Kay; South Mississippi EPA (4)	**yes**	This should be the left to the employer, not required by NERC in a standard.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Michael Scott; APS (1,5)	yes	See item 3 above.

Question 4		
Commenter		**Comment**
Response: The majority of the stakeholders do not support this level of specificity be required in the training plan. Therefore, the SPT SDT has not included these details in the requirement		
Edward J. Carmen; Baltimore Gas & Electric (1)	yes	
Robert Coish; MEHB (1, 3, 5, 6)	yes	
William J. Smith; Allegheny Power (1)	yes	
Mark Bennett; Gainesville Regional Utilities (5)	yes	
Richard Appel; Sunflower Electric Power Co (1,3,5)	yes	
Jim Gunnell; SPP (2)	yes	
Howard Rulf; WeEnergies (3,4,5)	yes	
Gerald LaRose; NYPA (1)	yes	
Roger McBeth; Northeast Utilities (1)	yes	
Allan George; Sunflower (1)	yes	
FirstEnergy (1,3,5,6)	yes	
Brian Tuck; BPA (1)	yes	

5. Do you agree that entities should verify that the personnel who develop or deliver training to System Operators are competent to do so? (R5.)

Summary Consideration:

The majority of the commenters did not agree that a requirement should be included in the standard that necessitates entities to verify that the personnel who develop or deliver training to System Operators are competent. Since this requirement was outside the scope of the approved SAR, the SPT SDT removed this requirement from the revised standard.

Question 5		
Commenter		**Comment**
MRO (1,2)		The region is being requested to define competency as it is seen from the perspective of the regional members, as this definition may vary from member to member. The competency of the trainer will be reflected in how each entities' system operators meet the myriad of requirements in this standard. If the entities' system operators training meets the requirements in this standard, the assumption can be made that the trainer is competent. This requirement is not needed. This is a business decision and should not be a requirement in this standard.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
CJ Ingersoll; CECD (3)	no	CECD does not think this should be included in this standard. CECD does not think a company is not going to waste limited time and resources on training provided by unqualified individuals. This may be appropriate for CEU type training where credit is provided but it is not a requirement that should be applied here.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Jason Shaver; ATC (1)	no	ATC believes that Requirement 5 is both unnecessary and overly burdensome. We recommend that this requirement including its sub-requirements be deleted from the standard. Again, ATC believes that this standard should be written in a way that offers entities the flexibility to meet some or all of their training program requirements via external NERC certified course offerings under the recently approved NERC Continuing Education Program. Therefore, the burden for providing qualified instructors lies with the CE Provider and NERC in approving Individual Learning Activity (ILA) applications. As written, this standard creates duplicative requirements on the entity to track CE Provider credentials and substantiate the credentials of training provided by external instructors. This is the job of NERC under the CE Program. Failure for this standard to acknowledge an existing, NERC approved Continuing Education Program, merely because it has been developed by a separate arm of NERC is insufficient justification to place this additional administrative burden and cost upon the industry. The standard, as written, requires each industry member to create its own set of training records which in large part will be duplicative of the data that NERC has already

Question 5		
Commenter		**Comment**
		captured under its CE program.
Response: Based on stakeholder comments, the SPT SDT has removed R5. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes there is nothing in this standard that conflicts with the CE Program requirements.		
Ron Falsetti; IESO (2)	no	The desired results of this standard are operator competency and the responsible entities developing and providing the training. An industry-wide standard should not have to require each entity to provide competent instructors. Incompetent instructors will soon be replaced by competent ones as soon as the entities fail to secure a sufficient number of certified operators to meet other NERC requirements. Also, by having such a requirement, what follows would likely be "instructor certification" to assess instructors' competency. This is not necessary.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Brian Tuck; BPA (1)	no	PA agrees that personnel assigned to develop or deliver training should be competent to do so. However, BPA strongly disagrees that the verification of competency should be done by NERC, the RRO, or any other outside entity.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
SRP (1)	no	Who decides what is an acceptable level of knowledge of the subject matter? Who decides who is competent in developing training or in delivering training material? With no established parameters, enforcement of this requirement will be subjective and arbitrary. It is doubtful that an entity would spend the time and resources to train personnel with a trainer that wasn't competent. This situation would not be acceptable to most entities no matter what the NERC requirements are. If this remains a requirement, it will amount to no more than a rubber stamp of trainers qualifications since this is impossible for NERC or a Compliance Review team to determine with no criteria for "competent" or for "qualifications". What works for one company may not work for another. DOE Good Practices place this responsibility with line managment. It is probably OK to let each company establish who is responsible to make the determination. Ultimately the entity (BA, TO, RC) will be held to the requirement. Some quantification of the qualifications in R5 may help apply consistency among companies and provide objective criteria for compliance auditors.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Howard Rulf; WeEnergies (3,4,5)	no	A company can do this for its internal training. For training from a NERC CE provider, whether instructor led, on-line, or video, this verification should be done by NERC and entities should not need to re-verify what NERC should

Question 5		
Commenter		**Comment**
		have already done.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Jim Sorrels; AEP (1)	no	No. Competency in this area would not be easily measured. Being competent reflects such attributes as being qualified, capable, fit, and adequate. AEP does not disagree that entities should use competent and qualified trainers. The issue is how to measure that. Additionally, we do not believe there exists a "qualification certificate" that would be pertinent to the trainers in our industry. Therefore, R5 should be a guideline not a requirement.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Matthew Santos; SDE&G	no	Personnel who develop and/or deliver the training should be experianced in those areas of their expertise, if not then bring in the SME's (Subject matter Experts) to round it out. If the students are learning (Exam Results), knowledge transfer is being done. Other than that who ever is the trainer (Mostly those that were Operators) should have a record of being competent in their previous position(s). Attending Train the Trainer courses is desireable but not mandatory. What do you mean when you say Verify? Just looking at their work history or what? How would we measure this? By surveys?
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
WECC RCCWG (1,2)	no	The qualifications requirement is vague. How much operating knowledge is enough? When training is administered, audits of the training should be used to determine adequacy. The current requirement and measure would, in effect, amount to no more than a rubber stamp of trainers qualifications since this is impossible for NERC or a Compliance Review team to determine.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
ISO/RTO Council (2) Kathleen Goodman; ISO-NE (2)	no	A requirement that each entity verify trainer competency mandates each entity to assume an expertise that is outside the scope of those reliability entities. The IRC (ISO-NE) supports ongoing Training Programs that employ systematic approaches to training. Such programs, including NERC's current Continuing Education program, include a feedback component from the participants in the areas of content and instructor competency. Although participant verification of the competency of the instructors is an inherent component of such systematic approaches, a standard on verification is unnecessary.

Question 5		
Commenter		**Comment**
		As note in the responses to Q1 and Q2, any standard that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard. To meet the FERC directive the standard must include a definition of competence and the measures used to assess that competence.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
PJM (2)	no	A requirement that each entity verify trainer competency mandates each entity to assume an expertise that is outside the scope of those reliability entities. For this requirement to remain in this standard, the industry would need to define what competence is and what measures are used to assess competency before requiring it of anyone. Incompetent trainers will be identified by system operators failing the NERC certification tests. Since uncertified operators are prohibited from real-time operations the integrity of the system is not threatened - however, continuing such test failures would likely result in the trainers being replaced. As note in the responses to Q1 and Q2, any standard that requires the responsible entity to define the terms and conditions of a requirement becomes what FERC calls (and objects to) a 'fill-in-the-blank' standard. To meet the FERC directive the standard must include a definition of competence and the measures used to assess that competence.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Gerald LaRose; NYPA (1)	no	The Trainer competencies cited in 5.1.2 (systematic approach) and 5.2.1 (delivery) are subjectively determined at best and may force many entities into the untenable, and undesirable, position of having to completely outsource their training needs.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Richard Appel; Sunflower Electric Power Co (1,3,5)	no	Who is going to determine what is competent?NERC should already have a list of people and training companies whom are competent to deliver training.Several companies don't have resourses enough to have full time trainers on staff and must relay on outside entities for most training.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Ed Davis; Entergy Services (1)	no	Again, we agree with the question as presented here but we do not agree with the way the implied subject is being implemented in the draft standard.

Question 5		
Commenter		**Comment**
		Our concern here may be expectations, or terminology or semantics. The draft standard states the responsible entities shall VERIFY that persons developing or delivering training have the following qualifications:. VERIFY is a very nebulous term. Are audit teams going to accept a responsible entity's verification procedure and results? Are there industry-wide certification organizations that might be included in this standard whose stamp of approval would be acceptable to auditors so that responsible entities will only have to see that stamp of approval to know they are meeting this requirement? Is the responsible entity expected to give a test to the employees of a potential vendor to - verify - the employee of the potential vendor is qualified? Entergy employees who are subject matter experts in developing training programs using the systematic approach provide training to other Entergy employees. Is Entergy (or other reponsible entities) expected to have their subject matter experts certified to satisfy the "competency" requirement R5.1.2? CERTIFIED by whom? Who establishes the VERIFICATION criteria - the responsible entities or the NERC auditors? Entergy employees who are subject matter experts also provide training for other Entergy employees. Is Entergy (or other reponsible entities) expected to have their subject matter experts certified to satisfy the "competency" requirement in R5.2.1? CERTIFIED by whom? Who establishes the VERIFICATION criteria - the responsible entities or the NERC auditors? We suggest this requirement be changed to specify that the responsible entities establish the verification criteria, as follows - Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify - to the satisfaction of that Reliability Coordinator, Balancing Authority or Transmission Provider - that persons developing or delivering training have the following qualifications:.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Duke Energy (G1) (1)	no	While a trainer needs to understand the material presented, this requirement implies a second layer of administration to keep track of the qualifications of the trainer. This requirement needs to line up with the requirements of the CEH program. How would you determine or measure competency in development and delivery of training? Who would be your trainers?
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Ron Gunderson; NPPD (1)	Yes/no	While a trainer needs to understand the material presented, this requirement implies a second layer of

Question 5		
Commenter		**Comment**
		administration to keep track of the qualifications of the trainer. This requirement needs to line up with the requirements of the CEH program. This also is rated as a high risk requirement, which is inconsistent with the definition.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
NPCC CP9 (1, 2)	Yes/no	NPCC participating members believe that although it is important for the trainer to have basic understanding and competency of the subject matter, it is not a measurable metric for compliance. Many believe that incompetent trainers will result in system operators failing the "test" and that they will ultimatly be identified for more simplistic performance based processes than need to be stated in this standard.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Santee Cooper (G2)	yes	Will the company be permitted to define competency and the appropriate level of operating knowledge referenced in R5, or will the criteria for these be established by an external entity? If the critieria is established by an external entity, would an SME be permitted to provide training under the supervision of an individual "qualified" by the criteria? If the criteria is established by an external entity, should it be included in the standard?
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
FRCC SO Subcommittee (1,2,5)	yes	Not a "High" risk factor . Language should provide for the use of subject matter experts (SMEs) in the development and delivery of training with the direction and assistance from an individual that has competency using a systematic approach to training.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
SCE&G ERO WG (1, 3, 5)	yes	It is impractical at times for the trainer to be the subject matter expert or knowledge on the subject matter, but may have individual(s) present to address questions or concerns which should be allowed. It allows the best of both worlds a good trainer and knowledgeable parties.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Robert Coish; MEHB (1, 3, 5, 6) MISO (1,6)	yes	While a trainer needs to understand the material presented, this requirement implies a second layer of administration to keep track of the qualifications of the trainer. This requirement needs to line up with the requirements of the CEH program. This also is rated as a high risk requirement, which is inconsistent with the definition.

Question 5		
Commenter		**Comment**
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
William J. Smith; Allegheny Power (1)	yes	Certainly anyone who develops or delivers training to system operators must be competent to do so. However, the term operating knowledge needs to be further clarified. If a person lacks actual operating experience for a particular task, would they not be considered competent to develop or deliver training to system operators? In R5.1.2 and R5.2.1, what criteria will be used to establish competency? If an individual has actual operating experience of a particular task, but has not been formally trained in delivering training, will they be considered competent?
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Marion Lucas; Alcoa Power Generating, Inc (1)	yes	Again, this is an administrative function that each company should oversee, to assure it will be able to operate in a reliable manner, consistent with the NERC Standards that apply to RELIABILITY, and NOT what NERC decides is the criteria for measurement of a trainer's competency.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Will Franklin; Entergy (6)	yes	Of course the training developers and presenters should be competent. However, how would one verify the competence? What qualifications would be acceptable (M5)? This is subjective. R5 - R5.2.1 adds ambiguities into the standard.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Tim Hattaway; Alabama Electric Coop (5)	**yes**	Determining the compentency of a personnel delivering training appears to be very subjective.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
John Kerr; GRDA	**yes**	However, who determines the qualifications for this. The word competent leaves room for several loop holes.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Brian Thumm; ITC (1)	**yes**	Competency of a trainer is subjective. Guidance should be provided on how to assess and verify the competency of both developing and delivering operator training. Competency should be more than having attended a training class (e.g., Train-the-Trainer). Competency can be measured using various metrics to assess the actual effectiveness of the trainer of the training program as a whole. NERC should consider definitive standards for assessing and verifying competency of training personnel if such competency is to be included as such a key element of this particular standard.

Question 5		
Commenter		**Comment**
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Hydro One Networks (1)	yes	Clarification must be provided on what is meant by "verification." Attendance to a course on training facilitation doesn't guarantee competency in delivery. Sometimes it is difficult to expect a subject matter expert (SME) to be also a good instructor. In these cases, assistance in facilitation may be required. As for "competency in development using a systematic approach"…some SMEs may not be competent in this development. Therefore, assistance and staging the development may be required to ensure an adaquate end product.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Jim Gunnell; SPP (2)	yes	I would add to the categories of competency: competency in assessment methods to ensure valid and reliable assessment tools which measure both knowledge and performance.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Allan George; Sunflower (1)	yes	Can competent be defined as NERC Certified?
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Southern Co (1,3,5,6)	**yes**	Recommend that NERC leave the levels of competency to the individual Utility to decide what is an acceptable level. Not all electrical systems are the same.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Michael Scott; APS (1,5)	Yes	The answer to the question above is Yes. But we disagree with what the standard says. According to the proposed standard, if you develop training you must know the material and know the training process, but if you implement training (aka: teach) you must only know the training process. We disagree. We suggest the following: R5. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify that persons developing or delivering training have the following qualifications: R5.1 Operating knowledge in the subject matter covered by the training activity R5.2 Competency in developing training using a systematic approach
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
WECC OTS (1,2)	Yes	The key phrase in this question is "entitites" verify the competence of those that develop and deliver training. OTS does not support outside entities such as NERC or

Question 5		
Commenter		**Comment**
		the Regional Reliability Organizations determining if personnel are competent.
Response: Based on stakeholder comments, the SPT SDT has removed this requirement.		
Michael Clime; Ameren	Yes	Who are the entities mentioned that are going to certify that each person developing and doing the training is capable? Is there going to be a certification program to do this?
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Richard Krajewski; Public Service Co of NM (1)	Yes	If by "entities" the standard refer to the electric utility and not the NERC Region or NERC.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
FPL (1,3,5)	Yes	Not a "High" risk factor . Language should provide for the use of subject matter experts (SMEs) in the development and delivery of training with the direction and assistance from an individual that has competency using a systematic approach to training.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Gordon Rawlings; BCTC (1)	Yes	The key phrase in this question is "entitites" verify the competence of those that develop and deliver training. BCTC believes the wording in the standard means that our entity will determine competency to train our system operators. BCTC does not support outside entities such as NERC or the Regional Reliability Organizations determining if training personnel are competent.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Dan Kay; South Mississippi EPA (4)	**Yes**	This should be the left to the employer, not required by NERC in a standard.
Response: Based on stakeholder comments, the SPT SDT has removed R5.		
Dale Wadding; Dairyland Power Cooperative (5)	Yes	
Edward J. Carmen; Baltimore Gas & Electric (1)	Yes	
TVA (1)	yes	
Michael Gammon; KCP&L (1)	yes	
SPP OTWG (1,2)	yes	
Mark Bennett; Gainesville Regional Utilities (5)	yes	

Question 5		
Commenter		**Comment**
Pepco Holdings (1)	yes	
John Bussman: AECI (1,5,6)	yes	
Roger McBeth; Northeast Utilities (1)	yes	
James Hinson; ERCOT (2)	yes	
FirstEnergy (1,3,5,6)	yes	
Alan Adamson; NYSRC (2)	yes	
Allen Klassen; Westar (1)	yes	

6. Do you agree with the list of training activity components provided in R7? If not, please explain in the comment area.

Summary Consideration:

The majority of the commenters did not agree with the list of training activity components presented in R7. Based on commenter feedback, the SPT SDT removed this requirement from the standard.

Several commenters expressed concern with the overlap between the standard's requirements and the NERC CEH program. The SPT SDT explained that the CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.

Question 6		
Commenter		**Comment**
Marion Lucas; Alcoa Power Generating, Inc (1)	no	Each company's admisnistrative and training functions are NOT a NERC resposiblity to dictate.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Ed Davis; Entergy Services (1)	no	We suggest R7 be deleted since it is overly prescriptive and should apply to the entity giving the training course, not the Responsible Entity of this standard. Responsible entities should keep records of the training of System Operators but should not be required to document the details of every course, especially if that course is developed by another entity and certified by some certification organization.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Dale Wadding; Dairyland Power Cooperative (5)	no	R7.9 and R7.10 are difficult to understand. Propose deleting both of these sub-requirements.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Southern Co (1,3,5,6)	no	We could agree, if under 7.10, that Req. 1.3 be removed as recommended in our earlier commments.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Santee Cooper (G2)	no	If the training is NERC Approved, the ILA for the training activity should be sufficient documentation.
Response: The SPT SDT has removed this requirement. The audit process requires entities to produce their evidence of compliance to any standard.		
CJ Ingersoll; CECD (3)	no	The training documentation does not need to be this extensive. As stated above, this type of documentation might be appropriate for a CEU program but should not be a requirement in this standard. Training records should be adequate to show the Type of Training, the Trainer, Date, and the Length of Time of the activitiy.

Question 6		
Commenter		**Comment**
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Tim Hattaway; Alabama Electric Coop (5)	no	The first six sub-requirements appear to be the items listed on a CEH learning activity application. R7.7, R7.8, R7.9, R7.10 are confusing and seem to be unmeasureable.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Richard Appel; Sunflower Electric Power Co (1,3,5)	no	This is unnessary and covered by the CEH application.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Ron Gunderson; NPPD (1)	no	The items list in R7 are typically outlined in skills or task-based training and are appropriate as a guideline, but appear to be too prescriptive. There are other valid training activities that wouldn't follow this format. This also needs to line up with the CEH program.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Duke Energy (G1) (1)	no	The items listed in Requirement 7 are appropriate as a guideline, but are too prescriptive. There are other valid training activities that do not match this format. This also needs to line up with the CEH program. Individual Learning Activity required by NERC for an approved continuing education hour has the requested information in this requirement.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		

Question 6		
Commenter		**Comment**
John Kerr; GRDA	no	This list is too repetitive and complicated. Again, this whould be a guide and not a standard.
Response: The SPT SDT has removed this requirement. The audit process already requires entities to produce their evidence of compliance to any standard.		
SPP OTWG (1,2)	no	This is a great list of activity components for the perfect program, but is not necessary for all activities and topics of training. These should be a part of a "Guide" provided as an attachment to the standard not a part of the standard as measured requirements. When some needs are discovered due to poor performance or lack of knowledge, the training may be done informally on the job by another qualified operator via assignment by a supervisor. Having this documentation for every training activity is not practical, but it is a good guide to strive for in formal training.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The activity you describe in your comment as informal training, the SPT SDT considers coaching or communicating. Documentation for coaching and communicating is not required for this standard.		
Jim Sorrels; AEP (1)	no	While this is a very good list of activity components, AEP believes that these components should be a part of a "Guide," provided as an attachment to the standard, and not be a part of the standard as measured requirements. When developmental needs are discovered due to poor performance or lack of knowledge, the training may be done informally on the job by another qualified operator via assignment by a supervisor. Retaining this documentation for every training activity is not practical, but it is a good goal to strive for in formal training.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The activity you describe in your comment as informal training, the SPT SDT considers coaching or communicating. Documentation for coaching and communicating is not required for this standard.		
Jim Gunnell; SPP (2)	no	I would like to see Training Provider Qualifications added to the list.
Response: The SPT SDT has removed R7.		
NPCC CP9 (1, 2)	no	NPCC participating members believe that it is unnecessary to be overly prescriptive in how the training is performed. This should be left to the discretion of the entity. The purpose is to produce system operators that meet a defined level of proficiency. If the operator can prove a level of proficiency, the training was successful.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their		

Question 6		
Commenter		**Comment**
evidence of compliance to any standard.		
Howard Rulf; WeEnergies (3,4,5)	no	A company can do this for internal training. For training from a NERC CE provider, whether instructor led, on-line, or video, R7.1 through R7.5 and R7.8 should be satisfied by supplying the NERC CE number for the class. Entities will still need to perform R7.6, R 7.7, R7.9, and R7.10.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Roger McBeth; Northeast Utilities (1)	no	This requirement is overly prescriptive for the documentation of each training activity. While most of these requirements should be covered, they may not necessarily be covered in the same document/location. R.7.1 - Title of the activity (Yes) Lesson Plan Cover Page/Attendance Form R.7.2 - Training Provider (Yes) CONVEX on Cover Page/Attendance Form R.7.3 - Description of the Content Covered by Activity - (Yes) Lesson Plan Outline R.7.4 - Classroom Lesson Plan, DTS Exercise (Yes) R.7.5 - Tool or References (Yes) References listed in Lesson Plan R.7.6 - Identification of Task or tasks covered (Yes) Task to Training Matrix not in Lesson Plan R.7.7 - Conditions under which tasks are performed are typically implied or part of the terminal objective. (Yes) R.7.8 - Identification of Prerequisite training; typically Not Applicable or defined as part of the training sequence for the Initial Training Program but not formally listed in any document except the Initial Training Qualification Guide. (Yes) R.7.9. - Objectives and assessments Objectives are part of every lesson plan (Yes) R.7.10 - Practice in following the steps and using the tools. (No) May be applicable for skill training during OJT or DTS but not for knowledge requirements covered in a classroom training activity. Overly prescriptive to specify practice in following steps and using the tools and references.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. Note that on-the-job training method of delivery in this standard is not distinguished from any other method of delivery. All reliability-related training covered by this standard is subject to the requirements of this standard, regardless of the delivery method.		
Michael Scott; APS (1,5)	no	This R.7 section appears to be focused on the "I" of the ADDIE process, so I suggest combining sections R.6 and

Question 6		
Commenter		**Comment**
		R.7 for simplicity. Rather than take each of the 10 items individually, here's a suggestion: R6. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct training that includes: R6.1 Training for new System Operators, as identified in B.R2. R6.2 Training for incumbent System Operators, as identified in B.R3. R6.3 Continuing education for incumbent System Operators, that includes training: • to correct identified performance gaps • based on analysis decisions • on new or revised tasks R6.4 Drills and/or simulations on tasks that have high reliability-related criticality and low frequency of occurrence shall be conducted. This training shall include: R6.4.1 At least 32 hours of emergency operations or system restoration training, simulating the system conditions, operating procedures, and communication processes. R6.4.2 At least one exercise each year involving other entities, including all real-time operating positions likely to be involved in the actual event. R6.5 Retention of course completion documentation, including the course title, provider, attendee name, completion date, and grade. R6.5.1 If the training is NERC Approved, a copy of the course certificate will be retained in the operator's training file (If the training has been approved by NERC, the learning objectives, course materials, evaluations, etc. are already archived.). R6.5.2 If the training provided is not NERC Approved, a copy of the course materials shall be retained, including learning objectives, lesson plan if applicable, and evaluation. R6.5.3 Training records shall be retained for three years.
Response: The SPT SDT has removed R7, as well as modified several other requirements. The audit process requires entities to produce their evidence of compliance to any standard.		
Jason Shaver; ATC (1)	no	ATC does not agree with the requirements in R7 nor its sub-requirements. (R7.1 – 7.10) Again the SDT has ignored the reality of NERC CE Program requirements in writing this standard. ATC recommends that Requirement 7 be deleted along

Question 6		
Commenter		**Comment**
		with its sub-requirements. At a minimum, an exception for collecting and reporting this data should be made for those programs that have been previously approved by NERC as part of their CE Program.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
FPL (1,3,5)	no	This requirement is overly prescriptive and is inappropriate for this Reliability standard. The format is a good tool for development. We support its use as it also provides consistency with the NERC CE process, but again, it does not belong in a requirement. All of requirement R7 should be deleted.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
FRCC SO Subcommittee (1,2,5)	no	This requirement is overly prescriptive and is inappropriate for this Reliability standard. The format is a good tool for development. We support its use as it also provides consistency with the NERC CE process, but again, it does not belong in a requirement. It sends the wrong signal to the industry, one where compliance should focus on the specific details of individual training activities and away from overall quality of an organizations training initiatives. All of requirement R7 should be deleted.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
WECC OTS (1,2)	no	R7 lists documentation required for each "learning activity" used to support its reliability related training. The OTS does not support the requirements listed in R7 and instead suggests following the principles contained with the NERC Continuing Education Program for developing a valid learning activity. These items include: Learning objectives Training content or materials Identify delivery method and qualifications of instructors Learning assessment to assure the learning objectives have been achieved Evaluation of the learning activity Review and update The list in R7 includes several additional documentation requirements that are not beneficial to assuring quality

Question 6		
Commenter		**Comment**
		learning activities. While OTS recognizes the NERC CE Program is independent of a Reliability Standard, the documentation requirements for non-NERC CE-approved learning activity should not exceed the well defined items listed for the CE Program.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Allan George; Sunflower (1)	no	R.7.1. ,R.7.2., R.7.3., R.7.6., R.7.9., R.7.10., ARE ADEQUATE
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Richard Krajewski; Public Service Co of NM (1)	no	R7 lists documentation required for each "learning activity" used to support its reliability related training. PNM does not support the requirements listed in R7 and instead suggests following the principles contained with the NERC Continuing Education Program for developing a valid learning activity
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Brian Tuck; BPA (1)	no	R7 lists documentation requirements for each "learning activity" used to support reliability related training. BPA does not support the requirements listed. BPA suggests following the documentation principles described in the NERC Continuing Education Program. These items include: Learning Objectives Training Content and Materials Delivery Method and Qualifications of Instructors Learning Assessment to assure the learning objectives have been achieved Evaluation of the learning activity Review and update Requirements R7.6 - R7.9 are references to the tasks determined in the JTA that the learning activity is designed to cover. By complying with R7.6, the entity has made the link to the task analysis. The remaining items (R7.7-R7.9) are not beneficial to assuring quality learning activities. BPA recommends that items R7.7-R7.9 be removed. It is not clear whether requirement R7.10 is asking for special documentation of a component of a learning activity, or if it is listing additional requirements for learning activity content. This requirement is not beneficial to assuring quality learning activities, and should be removed.

Question 6		
Commenter		**Comment**
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Gordon Rawlings; BCTC (1)	no	BCTC generally supports the list in R7 as a good record of training. We note that the list is similar to the data required for learning activities to be approved by the NERC Continuing Education Program. The "NO" response is due to the following we believe are not necessary or beneficial: R7.7 "Identification of the conditions under which the associated task is performed (as identified in R1.1.)." As mentioned in Question #1, BCTC does not support identification of the conditions when a task is performed. Most tasks need to be performed under many conditions. R7.9 "Objectives and assessments that duplicate the criteria for successful performance identified in R1.7. and mastery of the knowledge and skills in R1.6." As mentioned in Question #1, separately identifying the criteria for successful performance of the task is not necessary. Successful "performance criteria" is usually executing the skills and knowledge necessary to do the task resulting in the desired outcome, essentially doing the task without mistakes. Additionally, many topics in operator training don't support the concept that an operator can demonstrate performance of the task at the end of the learning activity. The task likely can't be performed until an operating condition on the system calls for the task to be performed, which may be days or weeks after the training took place. A "performance criteria" can be a general operating philosophy such as safe and error free operating of the system. We don't believe it is required to add performance critiera to "every task" performed. R7.10 As mentioned in Question #1, BCTC does not support including this in the Standard. Many tasks need to be performed either "alone or as part of a team" depending on normal operating or emergency conditions at the time. Whether a task is generally performed individually or as a team is a fundamental part of identifying the task and does need a separate reference in the standard.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Michael Clime; Ameren	no	The JTA and Needs Assesment should be used to develop the Training Activity. Other than the Title, Objectives, prerequisites, and a method for assessing the accomplishment of the objectives, the rest can be

Question 6		
Commenter		**Comment**
		eliminated.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Dan Kay; South Mississippi EPA (4)	no	This should be the left to the employer, not required by NERC in a standard.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Alan Adamson; NYSRC (2)	no	How the training is performed should be at the discretion of the entity. The purpose is to produce system operators that meet a defined level of proficency. If the operator can prove a level of proficiency the training was successful.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Allen Klassen; Westar (1)	no	This requires a huge amount of documentation (which doesn't make better training), Are you trying to sell software with this Standard?. To be specific, R7.6 requires identifying task from R1, then R7.7, R7.9 and R7.10 all require documentation of information already documented in R1 in association with the task(s) listed for R7.6, one circular reference should be enough.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
John Bussman:AECI (1,5,6)	Yes/no	Partly I do not agree with section concerning R1.1 to R.1.7
Response: The SPT SDT revised the Requirement 1 such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Ron Falsetti; IESO (2)	Yes/no	This is a good list for inclusion in the training manual. However, many of them are a repeat of R1's and as such, can be combined with those listed in R1.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Robert Coish; MEHB (1, 3, 5, 6) MISO (1,6)	yes/no	The items list in R7 are typically outlined in skills or task-based training and are appropriate as a guideline, but appear to be too prescriptive. There are other valid training activities that wouldn't follow this format. This also needs to line up with the CEH program.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not		

Question 6		
Commenter		**Comment**
just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Matthew Santos; SDE&G	Yes/no	Is this going to be a required form from NERC stating as you have it in R7? (The JTA is driving the training program, everything has been identified) Could you explain why this would be needed for each activity/task and how it would help me?
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Kathleen Goodman; ISO-NE (2) PJM (2) ISO/RTO Council (2)	Yes/no	If the question is "Do you agree that the list in R7 is useful in any Training Program?" then ISO New England (PJM) agrees that the items in the list are useful. If the question is "Do you agree that NERC mandate each item in the R7 list in order to have a valid Training Program?" ISO New England (PJM) does not agree that there is any basis for mandating those requirements. The proposed set may be a good set but it is not justified as the only set.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
SCE&G ERO WG (1, 3, 5)	yes	What does the word "mastery" in this context mean? Are we saying anything less than a perfect score does not meet this requirement or is "proficient" a better word choice.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. Mastery is a common training industry term used to indicate satisfactory performance of a task.		
Brian Thumm; ITC (1)	yes	There may be times when not all of the items are applicable to a particular activity. NERC should ensure that "Not Applicable" is an appropriate response when documenting training activity components. Otherwise, the list of training activity components should be a guideline for what to include in the analysis, and not a prescriptive list of components as currently written in the standard.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Will Franklin; Entergy (6)	yes	Again, the requirements for documentation are too are stringent. The way this is written, it appears that any reliability based training must essentially meet NERC CE requirements.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not		

Question 6		
Commenter		**Comment**
just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. This standard does not require that reliability-related training be approved by the CE Program.		
Hydro One Networks (1)	yes	In general, these should be documented but there may be some training activities where not all of the items in R7.1 through R7.10 are applicable. Also, the associated training should include "Learning Objectives."
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
MRO (1,2)	yes	The industry should have a standard template to assist industry trainers to meet all the requirements listed in R7.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
Mark Bennett; Gainesville Regional Utilities (5)	yes	I believe this needs to be completely eliminated the way it is written.What is needed is th student name, the "task' completion date.
Response: The SPT SDT has removed R7. The audit process requires entities to produce their evidence of compliance to any standard.		
TVA (1)	yes	
Michael Gammon; KCP&L (1)	yes	
WECC RCCWG (1,2)	yes	
Pepco Holdings (1)	yes	
SRP (1)	yes	
Gerald LaRose; NYPA (1)	yes	
James Hinson; ERCOT (2)	yes	
FirstEnergy (1,3,5,6)	yes	
William J. Smith; Allegheny Power (1)	yes	

7. Do you think that every Reliability Coordinator, Balancing Authority, and Transmission Operator should use either a generic or a company-specific simulator for some drills and exercises? (Note that one of the Blackout Recommendations was that a full-scale simulator should be made available to provide operator training personnel with "hands-on" experience in dealing with possible emergency or other system conditions.) If not, please explain in the comment area.

Summary Consideration:
Most commenters stated the use of a simulator enhanced or improved the simulation experience of the operator. However, some felt that these tools were too time consuming and difficult to operate and maintain to make them valuable at this time as a training tool. Overall the majority of commenters felt that the requirement to provide a generic or company-specific simulator was too prescriptive. The next largest number of commenters felt that the requirement of a simulator was too expensive. Several expressed concerns about the value of requiring a simulator for non-complex systems. One suggested rolling the whole standard into PER-002 and PER-004. One commentator expressed concern about the ability to schedule enough regional drills in a year to cover all operating personnel and suggested a three year window to accomplish this requirement. One commenter expressed concern that generic simulators are not "realistic" and therefore do not reinforce the training and may actually detract from it. Two commenters stated that generic simulators were okay. One commenter stated that a company should be allowed to work with vendors or other sources for simulator time.

The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).

Question 7		
Commenter		**Comment**
FRCC SO Subcommittee (1,2,5)	no	Simulators can be a critical and effective training tool. The problem with mandating their use is that some systems are not complex enough to warrant (technically or economically) the use of simulators for training their respective operators and the current applicability criteria of the standards process do not allow for flexibility of appropriate exemptions. We would also suggest that PER-002 and PER-004 remain in-place to provide the industry the flexibility and granularity that is appropriate to differentiate requirements for Reliability Coordinators (very complex) and BAs and TOPs, which in some cases may not be very complex systems (see overall comment below on question #15). We would suggest that the enhancements provided by the current draft of PER-005 be "rolled" into the content of PER-002 and PER-004.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
FPL (1,3,5)	no	Simulators can be a critical and effective training tool. The problem with mandating their use is that some systems are not complex enough to warrant (technically or economically) the use of simulators for training their respective operators and the current applicability criteria of the standards process do not allow for flexibility of appropriate exemptions.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain		

Question 7		
Commenter		**Comment**
entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Ed Davis; Entergy Services (1)	no	The use of a simulator is helpful and a great tool for training but not necessary, especially for small responsible entities, and should be deleted.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Santee Cooper (G2)	no	It should not be part of the standard that every company utilize a company-specific simulator. The wording "the use of drills and simulations" is fine.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
John Kerr; GRDA	no	Affordable, effective, and reliable simulation technology does not yet exist. This could be a financial burden on small entities. Table top drills at this time are more effective.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Allan George; Sunflower (1)	no	Not every RC, BA, or TO, needs or can afford a simulator. The current requirements include simiulator hours so to maintain certification operators seek training facilities that provide them.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).The current certification requirements include simulation hours not simulator hours.		
Gerald LaRose; NYPA (1)	no	While desirable, such a simulator tool may be prohibitively expensive to procure and maintain and update. "Lessons Learned", tabletop drills and functional exercises are acceptible alternatives that accomplish the same goals. Re 6.5.2: It is extremely difficult to schedule enough such inter-entity drills to be able to capture each Operator's participation on an annual basis given shift requirements, etc. A three-year per-Operator participation requirement, equivalent to an Audit span, is more readily accomplishable.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).The SPT SDT has removed R6.		
Dan Kay; South Mississippi EPA (4)	no	This should be the left to the employer, not required by NERC in a standard.

Question 7		
Commenter		**Comment**
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Allen Klassen; Westar (1)	no	Although I fully support the use of GOOD simulators, requiring the use of a simulator would force many entities to use the generic simulators which are not necessarily a benefit over a well-designed exercise. Many of the generic simulators are not "realistic" and therefore do not reinforce the training and may actually detract from it.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Brian Thumm; ITC (1)	no	The training standard should ensure that operator training is effective in producing knowledgeable system operators, and should not be prescriptive in the manner that the training is delivered. Simulations are more than just computer-based training sessions, or those performed in a dedicated control-room environment for the purpose of simulation training. Simulation can be non-computerized training sessions, and can be comprised of table-top drills, discussions, etc.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Tim Hattaway; Alabama Electric Coop (5)	no	The financial burden could be too great for smaller entities by requiring company specific simulators.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
CJ Ingersoll; CECD (3)	no	Individual trainings programs should be able to allocate resources as they deem necessary and beneficial to their specific organization.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Marion Lucas; Alcoa Power Generating, Inc (1)	no	Mandating that a training simulator drill is a REQUIREMENT would force small companies and/or those that have little or no impact on reliability of the Interconnection to incu un-warranted expense and could not pass a cost-benefit analysis by any reasonable person.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		

Question 7		
Commenter		**Comment**
Gordon Rawlings; BCTC (1)	no	BCTC has simulator that models our system but we also recognize the benefits associated with other computer-based simulators whether generic or company specific. We have also used table to exercises and simulated events, not using the company simulator that have been as effective in training. BCTC does not support including this as a requirement in the Standard. Effective "simulation" of either normal operation or an emergency event is the goal and can be accomplished through many different methods of simulation.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Dale Wadding; Dairyland Power Cooperative (5)	no	Although we use a simulator and feel that it is a useful tool, use of a simulator would be an unnecessary and/or unreasonable requirement for some entities. If the generic EPRI OTS or similar simulator was less problematic to install and use, it would be easier to agree with such a requirement.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Hydro One Networks (1)	no	The use of a company-specific simulator for training is an asset. However, time spent using "generic" simulators may be better spent specifically reviewing one's own system restoration requirements via table top exercises, group activities, drills, discussion, facilitated restoration plan sessions, etc.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Southern Co (1,3,5,6)	no	The benefit gained from required use of a simulator is difficult to quantify. Table-top exercises and drills can be just as effective at a significiantly reduced cost.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Pepco Holdings (1)	no	A simulator is not necessary and goes farther than that required for either annual training emergency or otherwise or for exercises within other types of training. There are other ways of including simulations in operator training.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		

Question 7		
Commenter		**Comment**
Richard Appel; Sunflower Electric Power Co (1,3,5)	no	This would be great,but in the real world simulators are just to expensive except for the larger utilities and not available for everyone.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Michael Scott; APS (1,5)	no	Owning and maintaining a "simulator" may financially unfeasible for some entities. All entities can participate in "simulations", though, including tabletop drills, etc.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
WECC OTS (1,2)	no	As a group of trainers, OTS recognizes the benefits associated with a computer-based simulator whether generic or company specific. However, OTS does not support including this as a requirement in the Standard. Effective "simulation" of either normal operation or an emergency event is the goal and can be accomplished through other methods of simulation.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Mark Bennett; Gainesville Regional Utilities (5)	no	Again depending on the size of the system and how the loss of said system could affect the bulk electric system I am not sure that simulstion is needed. I agree that there are certain benefits derived from observing an individual systems configuration and flows during different contingencies.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Richard Krajewski; Public Service Co of NM (1)	no	PNM recognizes the benefits associated with a computer-based simulator and uses both generic and company specific. However, PNM does not support including this as a requirement in the Standard. Effective "simulation" of either normal operation or an emergency event is the goal and can be and is accomplished through other methods of simulation at PNM.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
SPP OTWG (1,2)	no	This is good practice, but it may not be practical for every company to have a simulator that reflects the company's actual system. Simlulated practice can be sufficient for

Question 7		
Commenter		**Comment**
		many entities.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Jason Shaver; ATC (1)	no	ATC does not believe that this is the correct place to insert any drill exercises requirements. Any additional training requirement that NERC wants to place on certified operators should be made under the certification arm of NERC not through the standards process.
Response: This training standard is independent of the NERC certification requirements.		
TVA (1)	no	We do agree that the use of a simulator is the best way to practice drills and exercises, but we also believe that utilities should have the flexiblity to use other means (e.g. tabletop) to train and practice skills….especially very small utilities that may not be able to afford a simulator.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities. At this time, the drafting team is not clear about the meaning of "control over a significant portion of load and generation" (§1393).		
Michael Gammon; KCP&L (1)	no	A simulated activity does not have to be dependent on a training simulator. There are table-top exercises and drills sufficient to meet training needs. In fact, many parts of an emergency exercise do not require the use of a simulator (e.g. field personnel at various locations to perform specific field tasks).
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
SCE&G ERO WG (1, 3, 5)	no	It should not be part of the standard to require every company to use company-specific simulation for some drills. It should be left to the company to determine how it is most practical to meet the language "use of drills and simulation."
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
ISO/RTO Council (2)	no	The IRC agrees that simulators can be valuable training tools The IRC does not support requirements that mandate "How to" carry out a given standard. Although the IRC supports the use of near-real time Operating Training simulators, the IRC recognizes a simulator is not a necessary tool for conducting valid exercises.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and		

Question 7		
Commenter		**Comment**
generation" (§ 1393).		
PJM (2)	no	PJM does not support requirements that mandate "How to" carry out a given standard. Although PJM does support the use of near-real time Operating Training simulators, PJM also recognizes a simulator is not a necessary tool for conducting valid excercises. A veteran trainer can accomplish higher quality and more relevant training by way of a well designed and executed table top exercise rather than a "generic" simulator or even a system specific OTS which is not kept current with the real time system. An OTS/DTS simulator is a tool for training rather than the training itself.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Kathleen Goodman; ISO-NE (2)	no	ISO New England does not support requirements that mandate "How to" carry out a given standard. Although ISO New England supports the use of near-real time Operating Training simulators and in fact has a fully functioning simulator, we recognize a simulator is not a necessary tool for conducting valid excercises.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
SRP (1) WECC RCCWG (1,2)	no	Partially agree. R6.5.1 needs to state "generic" simulator. Since most entities do not have simulators for their own systems, the generic simulator needs to be an option for this emergency training.
Response: The requirement does not require the use of simulators. It requires the use of "realistic drills and/or simulation".		
Ron Gunderson; NPPD (1)	Yes/no	Your question asks about the simulator's use during drills and exercizes. We agree that all certified operators should have some simulation based training (it could be a generic simulator). While nice to use a simulator during excerises, the drill should not be a slave to the tool. For example, very productive restoration excercises can be done without all participants simultaneiously using simulator. There are other very imporant aspects of drills (testing procedures and communications).
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Matthew Santos; SDE&G	Yes/no	Generic works for the concepts, system specific does the same but also gives the real flavor. This should not be made to be mandatory, table top drills do work and provide

Question 7		
Commenter		**Comment**
		the concepts.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Michael Clime; Ameren	yes	I think table top paper type drills are pretty much a waste of time. However requiring everyone to have a company specific simulator is unrealistic. It pretty much takes one full time person to maintain a simulator, updating databases and making new scenarios and testing them. Also company specific simulators are expensive. I think that some very good concepts can be taught on a generic simulator, such as restoration concepts, voltage collapse, Ferantti rise, operating islands, synchronizing, etc;.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
MRO (1,2)	yes	The MRO believes that user friendly simulators should be made available to the applicable entities, it does not believe that these entities should be required to have these simulators on site.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Will Franklin; Entergy (6)	yes	This is idealistic. Of course the use of a simulator has benefits. The ability for entities to access a simulator may be cost prohibitive. Until the system operator training program matures, hands on simulation should be desired but table top exercises should be acceptable to meet simulation requirements. Some entities may have only a few specific reliability tasks, thus obtaining a simulator just for those few tasks may be impractical.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
John Bussman:AECI (1,5,6)	yes	However, NERC needs to allow a company to be able to work with vendors or other sources for simulator time in the entity does not have a company - specific simulator.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
MISO (1,6)	Yes/no	Your question asks about the simulator's use during drills and exercizes. We agree that all certified operators should have some simulation based training (it could be a generic simulator). While nice to use a simulator during excerises, the drill should not be a slave to the tool. For example,

Question 7		
Commenter		**Comment**
		very productive restoration excercises can be done without all participants simultaneously using a simulator. There are other very imporant aspects of drills (testing procedures, plans and communications).
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
NPCC CP9 (1, 2)	Yes/no	Although NPCC participating members believe that a simulator holds great value in conducting operator training, it is not an absolute necessity. Many smaller entities have expressed concern that the cost of a simulator is excessive and depending on the size of their area may have the appropriate cost-benefit ratio. Valid training exercises may be conducted effectively without it.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Jim Sorrels; AEP (1)	yes	A simulator that reflects the operator's actual system is the best and is preferred over generic simulators. However, the use of generic simulators have benefits and should not be excluded. The use of simulators should not be exclusive of table top exercises as they too can prove to be very helpful.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Howard Rulf; WeEnergies (3,4,5)	yes	As long as this can also be satisfied by using a generic simulator such as the EPRI OTS.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
Roger McBeth; Northeast Utilities (1)	yes	Since the skills and knowledge of several of the operator's critical tasks can not be adequately covered in a table top exercise, classroom discussion, or OJT, a company specific-simulator should be used for operator training. Unfortunately the vendors that provide system operator simulators are not well designed and require excessive support for scenario development and maintenance. The EPRI OTS Simulator may be the most cost efficient option for small training organizations. It can be made company specific to meet an organization's needs but will not provide the same user interface as a site specific training simulator.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		

Question 7		
Commenter		**Comment**
Duke Energy (G1) (1)	yes	Yes, the key word being *some*. certified operators should have some simulation based training (generic or specific simulator), but training activities should not rely on any one tool or method exclusively.
Response: The SPT SDT has considered FERC Order 693, requiring the use of simulators for certain entities and is seeking clarification on the meaning of "control over a significant portion of load and generation" (§ 1393).		
William J. Smith; Allegheny Power (1)	Yes	
Jim Gunnell; SPP (2)	Yes	
Ron Falsetti; IESO (2)	Yes	
James Hinson; ERCOT (2)	Yes	
FirstEnergy (1,3,5,6)	Yes	
Alan Adamson; NYSRC (2)	Yes	
Brian Tuck; BPA (1)	Yes	
Robert Coish; MEHB (1, 3, 5, 6)	Yes	
Edward J. Carmen; Baltimore Gas & Electric (1)	Yes	

8. Do you agree that there should be a record of each System Operator's training that shows the tasks that System Operator has already mastered and the tasks where performance needs improvement? (R8.)

Summary Consideration:

Overall the commenters felt that R8 was too burdensome or prescriptive. In general, the commenters that had concerns about the recommended training records agreed that records be generated, but not rating records. Some cited the shear number of tasks involved as justification for concern about this requirement being burdensome. One suggested records be kept by exception rather than requiring including all tasks mastered. Many pointed to the CEH program as justification for eliminating this requirement from the standard. Some pointed to the supervisory evaluation process as the appropriate place for managing performance issues. In response to commenters concerns, the drafting team has removed this requirement.

Based on stakeholder comments, the SPT SDT removed this requirement.

Question 8		
Commenter		**Comment**
Tim Hattaway; Alabama Electric Coop (5)		CEH program requires all approved system operator training to be recorded.
Response: The SPT SDT does not have enough detail to respond to the comment.		
SPP OTWG (1,2)	No	This question does not match R8. The standards should require training records, but not rating records.
Response: The SPT SDT agrees that there may be a misalignment between the question and the requirement and will strive to align the requirements and the questions moving forward. The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Allan George; Sunflower (1)	No	It is not really necessary, CEH record keeping is adequate.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
WECC RCCWG (1,2)	no	This requirement forces entities to maintain two separate training programs for each operator. One program for CEH's and maintaining the NERC Certification and another independent program to meet the R8 requirement. This is unnecessary. Entities should be self compliant in determining operators performance without subjecting them to the documentation of R8.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. Evidence of compliance to a NERC standard is a requirement of a NERC standard and compliance		

Question 8		
Commenter		**Comment**
processes.		
Jason Shaver; ATC (1)	no	Although ATC agrees with the question as posed above, this is not consistent with the way the proposed standard is written; "should" versus "shall." In addition, if an entity is required to document this information, the entity should be allowed to view the completed CE course information in regard to their employees in the NERC database once implemented. Currently, NERC has restricted access of this information to the individual alone. Apart from having this flexibility, this requirement is duplicative and increases the administrative burden on the industry without enhancing system reliability or leading to more educated system operators. Why make an employer report the same information that NERC already has available to a large extent via its CE Program?
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Dan Kay; South Mississippi EPA (4)	no	This should be the left to the employer, not required by NERC in a standard.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
TVA (1)	no	We agree with the first part of the sentence that states that there should be a record of the operator's qualifications, but do not agree that there be a continuous process of evaluation for the purpose of new training plan development. If there is a developmental problem, it will be handled within the organization's Performance Management Process. Overall performance improvement is addressed at the function level in the Continued Training process.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Santee Cooper (G2)	no	Evaluations by supervision and management would identify areas that need improvement. Once an operator becomes a system operator they should be at a certain level of competency such that individualized training is not needed. Too much individualized training may be an indication of a poor performing operator that is not compatible with the job.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is		

Question 8		
Commenter		**Comment**
included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Ed Davis; Entergy Services (1)	No	We believe responsible entities should keep records concerning the development of each system operator. However, we think that it is not necessary to specify that in a reliability standard for the BES. Please see our suggested changes contained our response to Question 19 in this document, including our conerns regarding Sytsem Operators under contract or System Operators performing tasks identified in R1 under delegation agreement.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The SPT SDT has significantly revised the standard based on industry feedback. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. Based on stakeholder feedback the standard has been reworded such that the successful performance is determined using the systematic approach to training by the entity.		
Marion Lucas; Alcoa Power Generating, Inc (1)	No	This is truly a salary review/administration function and is NOT something NERC should be involved in.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
CJ Ingersoll; CECD (3)	No	Documentation should be by exception, reflecting only performance improvement needs, considering that there are already going to be records in place indicating the training that has been completed per R.7.
Response: The SPT SDT has removed R7 from the revised standard and has revised this requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Mark Bennett; Gainesville Regional Utilities (5)	no	Either they are competent or not. If they don't they need to do it again.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Richard Krajewski; Public Service Co of NM (1)	no	PNM supports keeping a training record for each operator but does not support a separate record listing all the tasks identified in the job task analysis and whether the operator has "mastered" that individual task or still "needs improvement" because it is a more detailed record keeping

Question 8		
Commenter		**Comment**
		than is needed. PNM does not agree that there is benefit to add performance critiera to "every task" performed.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The revised standard does not include a requirement to perform a job task analysis.		
Roger McBeth; Northeast Utilities (1)	no	With a typical task list of over 300 tasks this would be an administrative burden that will require organizations to purchase a complex Learning Management System. Typically Learning Management System reporting will provide reports for completion of Training Activities not tasks. A Learning Management Systems will track Training Activities (Classroom Lesson Plans, OJT Guides, Table Top Exercises, Simulator Scenarios, etc) and those training activities should be tied to the tasks covered by the learning activity.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Southern Co (1,3,5,6)	no	While we agree training records should be maintained, the criteria defined for "each" task identified in the JTA would be overly burdensome. The current Reliability Exam identifies 203 operator tasks. The focus should be on the performance gaps or developmental needs identified in the gap analysis. This is not what the document states. This needs to be clarified. We do not need to track every task of every operator in the JTA. Perhaps the training records is best contained in the employee's performance appraisals under accomplishments (tasks mastered) and developmental needs (tasks needing improvement).
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The revised standard does not include a requirement to perform a job task analysis.		
Michael Scott; APS (1,5)	no	As mentioned earlier on question 2, a one-time assessment of an incumbent operator's training needs, in relation to a newly designed training program is appropriate. After the operator meets these needs, the SAT process includes feedback measures that identify opportunities for performance improvement. Continuously evaluating each and every qualified operator against a catalog of tasks in order to repeatedly design a unique, customized annual training plan adds an additional layer of administrative burden that would be cumbersome, expensive, and ineffective. We recommend dropping R8 in its entirety.

Question 8		
Commenter		**Comment**
Response: The SPT SDT agrees with your statement that the SAT process includes feedback measures that identify opportunities for performance improvement. The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. R4, the requirement for maintaining an annual training plan, has been removed from the revised standard.		
Will Franklin; Entergy (6)	no	Documentation should be required, but as long as the training program covers demonstrating the skill requirement and keeping records of who has completed the task, then maintaining a record of task completion for every individual is excessively burdensome.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Michael Clime; Ameren	no	In the heirarchy of training, tasks are at the very bottom. It would be almost impossible to try and track each task for each Operator.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task		
SRP (1)	no	This implies that an annual assessment of job task mastery would be conducted. Then you would be requiring records of training delivered to fill performance gaps from that annual assessment. In theory, these records would have to be exclusive of your training records that keep track of when a class can be retaken for credential maintenance, which is not annually. You would be chasing two separate and unequal targets: performance based training versus time sensitive credential maintenance education. One supports reliability. The other looks good on paper. Doing both simultaneously is an administrative nightmare. This requirement forces entities to administer two separate training programs for each operator. One program for CEH's and maintaining NERC Certification and another independent program to meet the R8 requirement. This is unnecessary. Entities should be self compliant in determining operators performance without subjecting them to the documentation of R8.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Jim Sorrels; AEP (1)	no	AEP believes that there should not be a record specific to tasks needing performance improvement, but rather should be evaluated at the group level. Training issues are best

Question 8		
Commenter		**Comment**
		identified by group and training provided to the group. To the extent that individual performance issues occur, this becomes an individual job performance concern that is addressed through various human resource management approaches. Documentation for each task as specified by R8 would require extensive data entry into an LMS, in addition to the documentation needed to provide before entering data into an LMS. Another factor to consider is enabling the LMS to accept/accommodate such documentation for view by administrators and operators. The implementation schedule would need to be reconsidered if these types of changes are necessary in the LMS system.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
John Kerr; GRDA	no	This could be complicated and time comsuming. Delete R8.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Allen Klassen; Westar (1)	no	I agree with the items in R8 but not with what this question asks.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Brian Tuck; BPA (1)	no	BPA supports keeping a training record for each system operator, but finds the record-keeping requirements described in R8.1 and R8.2 to be unnecessarily detailed. The performance assessment criteria and duration of learning activity described in 8.1 and 8.2 are captured in the learning activity documentation and assessment of meeting learning objectives. Separately identifying these items here is unnecessary. BPA suggests that a training record which consists of a historical record of the annual training plan and the dates that training activities were successfully completed would be an adequate record for tracking progress toward meeting competency requirements of the assigned job.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Matthew Santos; SDE&G	Yes/no	We always want to track an Operator's progress. Take Operators off shift and test them in reliability related tasks to see if there performance meets the criteria. If the training plan is based on the JTA this is already being done in initial

Question 8		
Commenter		**Comment**
		training, refresher training. This is more of a question not R8. The tracking of a Operator training should include how well they did on exams, how frequently this training has been repeated, any follow up done and what other training he is due for, etc.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The requirement to perform a job task analysis has been removed from the revised standard. The SPT SDT agrees with your proposed list of tracking methods, however, believes they are too prescriptive to be included in the standard.		
WECC OTS (1,2)	Yes/no	The question asks if a record of each operators training that shows the tasks mastered and the tasks where performance needs improvement. This is somewhat different than the requirements listed in R8 which seem to deal with meeting performance criteria. OTS supports keeping a training record for each operator but does not support the following: 1. A separate record listing all the tasks identified in the job task analysis and whether the operator has "mastered" that individual task or still "needs improvement" is more detailed recording keeping than is needed. The training program and annual training plan for each operator is designed to fill identified gaps in an operator's skill and knowledge needed to accomplish the tasks, thus the concept is addressed in designing the training plan rather than requiring a separate list of the operator's standing with the tasks. 2. Section R8 seems to focus on documenting how the "performance critiera" is met. It indicates appliable entities must track their operator's progress in using training to obtain the knowledge, skill and experience needed to "meet the performance criteria specified in R1.7. for the tasks identified in R1." As OTS has previously mentioned, we fully support a learning assessment at the end of each learning activity to determine if the learning objectives were met for the activity. Successful "performance criteria" is usually executing the skills and knowledge necessary to do the task correctly and in the right timeframe resulting in the desired outcome, essentially doing the task without mistakes. Many topics in operator training do not support the concept that an operator can demonstrate "performance" of the task at the end of the learning activity. Many tasks cannot be performed until an operating condition on the system calls for the task to be performed, which may be days or weeks after the training took place. A "performance criteria" can be a general operating philosophy such as safe and error free operating of the system, but it will be a burden and does not provide and benefit to add performance critiera to "every task" performed.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is		

Question 8		
Commenter		**Comment**
included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The requirement to perform a job task analysis has been removed from the revised standard, including R1.7.		
ISO/RTO Council (2) PJM (2) Kathleen Goodman; ISO-NE (2)	Yes/no	The IRC (PJM) (ISO-NE) agrees that a training results tracking system is a valid Training task, but questions whether or not this task rises to the level of a NERC standard. Note: Question 8 refers to Requirement 8. However, Question 8 asks a question (relating to documenting operator needs) that is not part of Requirement 8 (relating to training only)
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The SPT SDT agrees that there may be a misalignment between the question and the requirement and will strive to align the requirements and the questions moving forward.		
MISO (1,6) Ron Gunderson; NPPD (1)	Yes/no	We agree with "should", but R8 says "shall" and identifies it as a medium risk requirement. The design of an item in a training program (or lack thereof), does not put the Interconnection at risk of cascading.
Response: The SPT SDT agrees that there may be a misalignment between the question and the requirement and will strive to align the requirements and the questions moving forward. The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Michael Gammon; KCP&L (1)	yes	I think the reference in R8.2 should be for training identified under R4. R7 seems to be the information needed for tracking and R8 is the requirement for tracking.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. R7 has been removed from the revised standard.		
Alan Adamson; NYSRC (2)	Yes/no	The entity should have records showing the system operators have either mastered a proficency or have not.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
NPCC CP9 (1, 2)	Yes/no	The entity should have records showing the system operators have either mastered a proficency or have not but does this rise to the level of importance that it needs to be stated in a NERC-ERO Reliability Standard? This type of information will be maintained in a normal "course of business" and doesn't need to be specified here.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is		

Question 8		
Commenter		**Comment**
included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Gordon Rawlings; BCTC (1)	Yes/no	The question asks if a record of each operators training that shows the tasks mastered and the tasks where performance needs improvement. This is somewhat different than the requirements listed in R8 which seem to deal with meeting performance criteria. We caution that the administrative work already involved with Certifcation, Continuing Education along with external and internal training has grown by 10 fold in the past 3 - 4 years. BCTC supports keeping a training record for each operator but does not support the following: 1. A separate record listing all the tasks identified in the job task analysis and whether the operator has "mastered" that individual task or still "needs improvement" is more detailed recording keeping than is needed. The training program and annual training plan for each operator is designed to fill identified gaps in an operator's skill and knowledge needed to accomplish the tasks, thus the concept is addressed in designing the training plan rather than requiring a separate list of the operator's standing with the tasks. 2. Section R8 seems to focus on documenting how the "performance critiera" is met. It indicates appliable entities must track their operator's progress in using training to obtain the knowledge, skill and experience needed to "meet the performance criteria specified in R1.7. for the tasks identified in R1." BCTC supports a learning assessment at the end of each learning activity to determine if the training objectives were met for the class. Separately identifying the criteria for successful "performance" of the task is unnecessary. Successful "performance criteria" is usually executing the skills and knowledge necessary to do the task resulting in the desired outcome, essentially doing the task without mistakes. Additionally, many topics in operator training don't support the concept that an operator can perform the task at the end of the learning activity. The task likely can't be performed until an operating condition on the system calls for the task to be performed, which may be days or weeks after the training took place. A "performance criteria" can be an operating philosophy such as safe and error free operation of the system but it will be unbenficially burdensome to add performance critiera to "every task" performed.
Response: The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task. The requirement to perform a job task analysis,		

Question 8		
Commenter		**Comment**
including R1.7 addressing performance criteria, has been removed from the revised standard.		
Duke Energy (G1) (1)	yes	These requirements are being done as part of the Continuing Education program. Individual Learning Activity required by NERC for an approved continuing education hour has the requested information in this requirement. Why not have a single requirement simply to adhere to the Continuing Education program?
Response: The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Richard Appel; Sunflower Electric Power Co (1,3,5)	yes	This is already covered by requiring operatore to have CEH's.
Response: The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
SCE&G ERO WG (1, 3, 5)	yes	What does the word "mastery" in this context mean? Are we saying anything less than a perfect score meets this requirement or is "proficient" a better word choice.
Response: The SPT SDT has removed the word "mastery" from the revised standard.		
John Bussman:AECI (1,5,6)	yes	We think there should be system operator training records. However, not necessarily in the way stated
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
William J. Smith; Allegheny Power (1)	yes	This should apply to entry-level or newly-hired experienced system operator only.
Response: The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Jim Gunnell; SPP (2)	yes	I'll reiterate the importance of having an assessment tool or tools that can clearly assess "mastery". This should be a rubric or assessment with levels of competency. The more granular, the better. If we rely on a simple checklist, we'll look back to discover an overabundance of Master Operators, which could reflect a false sense of competency across the industry.
Response: The word "mastery" has been removed from the revised standard. The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
James Hinson; ERCOT (2)	yes	How would we designate mastering a skill versus just attending a class and getting a 70%

Question 8		
Commenter		**Comment**
Response: The word "mastery" has been removed from the revised standard. The SPT SDT has revised the requirement such that it now reflects the language that is included in the approved SAR, necessitating the standard to include a requirement to assess each real-time system operator's competence to perform each assigned task.		
Hydro One Networks (1)	yes	Training records for each individual operator should be kept. Measures of competency utilized should include simulations, testing, completed checklists, and job performance appraisals.
Response: While these are good industry practices, the revised standard does not require this level of granularity.		
Dale Wadding; Dairyland Power Cooperative (5)	yes	
Edward J. Carmen; Baltimore Gas & Electric (1)	yes	
Robert Coish; MEHB (1, 3, 5, 6)	yes	
FRCC SO Subcommittee (1,2,5)	yes	
FPL (1,3,5)	yes	
MRO (1,2)	yes	
Pepco Holdings (1)	yes	
Brian Thumm; ITC (1)	yes	
FirstEnergy (1,3,5,6)	yes	
Howard Rulf; WeEnergies (3,4,5)	yes	
Gerald LaRose; NYPA (1)	yes	
Ron Falsetti; IESO (2)	yes	

9. Do you agree that entities should evaluate their training programs every year? (R9.)

Summary Consideration:

The majority of the commenters agreed that entities should evaluate their training programs every year. The majority of the stakeholders also support an annual review and recognize that more frequent evaluations as part of the learning activity can contribute to meeting the annual review requirement.

In the second draft version of the standard, the SPT SDT revised Requirement 1 such that it now identifies the phases of the SAT process that must be included in the development of the training, including analysis, design, development, implementation, and evaluation. R9 in the first draft version of standard addressed the evaluation phase of the SAT process. Therefore with the revised R1, R9, which described the requirements for the evaluation phase of the SAT process, was removed in the revised standard.

Question 9		
Commenter		**Comment**
John Kerr; GRDA	no	Evaluation should occurs after each training session, but evaluation of the entire training program should not be required each year.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Matthew Santos; SDE&G	no	We evaluate our training before we deliver it each time to see if it applies, there are so many changes on the system and in operating procedures we make modifications to the training. To say to do it every year is not practical (You are to late). This part of the Standard should just say "Evaluate your training program as needed". Doing it this way eliminates your suggested annual evaluation of the entire training program. I think that R9.1, R9.2 & R9.3 (Post feed back) is good for anything you missed prior to delivering the training and make it better for next delivery.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Kathleen Goodman; ISO-NE (2) ISO/RTO Council (2)	no	An annual evaluation of training programs is a good practice, it is important but it is not required. As with other proposed requirements, this requirement does not provide a quantitative measure related to evaluation.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This standard is not prescribing any one method, allowing flexibility.		
PJM (2)	no	An annual evaluation of training programs is a good practice, it is important but it is not required. As with other proposed requirements, this requirement does not provide a quantitative measure related to evaluation. There is no explicit template or document detailing how program evaluation is to be conducted. To qualify as a Standard, there need to be specific measures. This is an example where an accreditation process for real time operating personnel training programs would be a better fit than a

Question 9		
Commenter		**Comment**
		Training Standard.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Dale Wadding; Dairyland Power Cooperative (5)	no	Annual evaluation would be an unnecessary administrative burden. Propose requring this every three years or whenever there is a substantive change in the system operator JTA, whichever occurs first.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Ed Davis; Entergy Services (1)	no	We believe responsible entities should continually evaluate their training programs. However, we think that it is not necessary to specify that in a reliability standard for the BES and R9 should be deleted from this standard.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Marion Lucas; Alcoa Power Generating, Inc (1)	no	I agree that training programs should be reviewed but not necessarily on an annual basis. Again this is part of the company's administration function not NERC's.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
CJ Ingersoll; CECD (3)	no	CECD does feel it is appropriate to evaluate the program but disagrees with the information sources reflected in the current draft.
Response: The SPT SDT has insufficient information to respond to this comment.		
Pepco Holdings (1)	no	Periodic evaluation is important, but it is not necessary to evaluate on an annual basis. Rather, the evaluation should be based on known changes to the system, training methods or tasks and should be conducted before the next use of the materials.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Allen Klassen; Westar (1)	no	This is too frequent, need to evaluate a "program" by results and trends over time, suggest 3 year evaluation. This does not preclude evaluating and improving elements of the "program" more often.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		

Question 9		
Commenter		**Comment**
Michael Clime; Ameren	no	Training programs should be evaluated and updated as things change. A complete evalution could be done every three years.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Michael Scott; APS (1,5)	no	An eighteen-month self-assessment (strategically located between the triennial audits) would be effective and cost-efficient.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Brian Thumm; ITC (1)	no	Periodic review of operator training programs should be required, but annual reviews may be excessive. Biannual evaluations would be more appropriate. The standard should also describe by whome the evaluation should be performed. An independent audit of the training program would likely produce different results than if the training manager were to assess the incumbent program.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Dan Kay; South Mississippi EPA (4)	no	This should be the left to the employer, not required by NERC in a standard.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Hydro One Networks (1)	Yes/no	Training program evaluation and improvement should be an ongoing process. If the standard specifies a time period, a one-year cycle may be too long. Any specified time should add the words “as a minimum.” The response to feedback and lessons learned should be used to improve training on a continuous basis. Adjustments should be made to the curricula, design, development, and implementation of training as required and practical.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Ron Falsetti; IESO (2)	Yes/no	This will help the entity in its annual review of its training plan, but is part of the annual training plan itself (4, above).
Response: The SPT SDT agrees with your comment.		
Ron Gunderson; NPPD (1)	Yes/no	We agree with "should", but R9 says "shall" and identifies it as a medium risk requirement. The design of an item in a

Question 9		
Commenter		**Comment**
Robert Coish; MEHB (1, 3, 5, 6) MISO (1,6)		training program (or lack thereof), does not put the Interconnection at risk of cascading. Requirements 4 and 9 could be combined and simplified (provide annual review and a summary of changes).
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Jason Shaver; ATC (1)	yes	Although ATC agrees with the question as posed above, this is not consistent with the way proposed Requirement 9 is written. ATC is supportive of conducting an annual review of training programs; however, Requirement 9 is overly prescriptive. ATC proposes that the following change be made: Each RC, BA and TO shall evaluate its System Operator training program to determine if the training is meeting their system operators' needs and, if not, use the results to update the program to correct identified deficiencies.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
SCE&G ERO WG (1, 3, 5)	yes	What constitutes an "evaluation?"
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Duke Energy (G1) (1)	yes	Is an evaluation of the training program to be able to train to a JTA that is changing (i.e. this has the potential of chasing a moving target)? Requirements 4 and 9 could be combined and simplified (provide annual review and a summary of changes).
Response:. The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Michael Gammon; KCP&L (1)	yes	Annually seems a bit over the top, however, once a program is implemented, it should not take very much to evaluate a training program each year including the sources for feedback as they are available.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Jim Gunnell; SPP (2)	yes	At least once per year. These evaluations should include recommendations for improvement and implementation timelines for making such improvements. Participant feedback should be a component of these evaluations.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the		

Question 9		
Commenter		**Comment**
revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
NPCC CP9 (1, 2)	yes	NPCC participating members believe that a yearly review is laudable and good practice, but should not be a requirement.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
WECC OTS (1,2)	yes	OTS supports a requirement for yearly evaluation of the training program "to meet the criteria for successful performance as identified in R1.7." provided the performance criteria is not task specific as mentioned above in Questions #1 and 8.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Gordon Rawlings; BCTC (1)	yes	BCTC supports a requirement for yearly evaluation of the training program "to meet the criteria for successful performance as identified in R1.7." provided the performance criteria is not task specific as mentioned above in Questions #1 and 8. We would support a simple gap analysis be performed to determine what worked and what didn't work.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
MRO (1,2)	yes	It appears that based in the requirements listed under R9. that this is an ongoing exercise and is accomplished annually if the requirements are met. Further, please clarify the intent of R9.3.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Will Franklin; Entergy (6)	yes	However, R9 is redundant. Evaluating the training program is inherent in developing an annual plan as identified in R4.
Response: The SPT SDT has removed R9 and rolled the requirement to conduct evaluations into the revised R1, as part of the SAT methodology. The SAT methodology supports a variety of approaches to evaluate training. This requirement is not prescribing any one method, allowing flexibility.		
Richard Krajewski; Public Service Co of NM (1)	yes	Provided the performance criteria is not task specific.
Response: The SPT SDT has insufficient information to respond.		
William J. Smith; Allegheny	Yes/no

10. Do you agree that requiring entities to update their training materials as needed before the materials are used as necessary?

Summary:

The comments express overall agreement with the concept of keeping training material up to date. There are concerns with the methods that can be used to do this and the viability of this as a measurable requirement for the proposed standard. Based on stakeholder feedback, the SPT SDT removed this requirement and updated the measures.

Question 10		
Commenter		**Comment**
Richard Appel; Sunflower Electric Power Co (1,3,5)	no	Not requiring but allowing upgrades as needed.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Mark Bennett; Gainesville Regional Utilities (5)	no	Let the entities train as they see fit within the structure of PER-002
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Michael Clime; Ameren	no	Why would any Trainer not do this anyway. Why do we need a Standard for it?
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
SCE&G ERO WG (1, 3, 5)	no	Is this not already covered in R5.1.2 implicity? This proposed requirement is fundamental to training and does not need to be required.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Marion Lucas; Alcoa Power Generating, Inc (1)	no	Unless major system changes or major NERC rules change, the company's training plans need not be changed or reviewed that often. Every 3 years would be more than adequate to review training plans.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Ed Davis; Entergy Services (1)	no	We believe responsible entities should update their training materials. However, we think that it is not necessary to specify that in a reliability standard for the BES and R10 should be deleted from this standard.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Jim Sorrels; AEP (1)	no	No. We agree with the concept, just not the wording of R10. As presently worded, it should be a guideline not a requirement. Keep in mind that NERC itself has a history of using old reference material and training documents. NERC certification exams do not test the user on the most

Question 10		
Commenter		**Comment**
		recent and current Reliability Standards, rather for practical purposes, the exam has a cut-off date for which Standard Revisions will be included in the exam. This typically results in an examinee being tested on some Standards that are not the current version at the time of their exam. Again we agree in concept that all entities need to keep their training materials current and applicable. But, for this to be a requirement, it needs different and more measurable criteria then presently in R10.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
John Bussman:AECI (1,5,6)	no	If materials are being used on a dailey, weekly and monthly basis then updates before using should not be required. There should be an annual review.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Hydro One Networks (1)	no	Although desirable, using updated materials may not always be required. In some cases it is a necessity while in others it is not. Entities should make an evaluation as to the suitability of their materials, facilitator, etc. before using it.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Dan Kay; South Mississippi EPA (4)	no	This should be the left to the employer, not required by NERC in a standard.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Allen Klassen; Westar (1)	no	It is more important to get the training to the operators than to update materials. This can be covered by explaining any portion of the materials that may be outdated or incorrect, rather than not being able to provide prompt and timely training because of a requirement that all materials have been updated. This requirement might prohibit someone from using a training video that contains excellent information but also includes a reference to an outdated requirement or procedure (90% corect, 10% wrong).
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Alan Adamson; NYSRC (2)	no	
ISO/RTO Council (2) Kathleen Goodman; ISO-NE (2)	Yes/no	In response to the question, the IRC (ISO-NE) agrees that training materials should be up-to-date. In response to the proposed R10, the associated measures have no relationship to evaluating whether or not the materials are up-to-date. The Drafting Team must more

Question 10		
Commenter		**Comment**
		accurately define the term "accurately reflects" .
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Ron Gunderson; NPPD (1) Robert Coish; MEHB (1, 3, 5, 6) MISO (1,6)	Yes/no yes	Your question does not mirror R10. Yes, material should be reviewed. R10 appears to be something that can not be measured, with the exception of applying it after the fact when the operator didn't have perfect knowledge. Also, the measure implies that even training that will not be offered in a given year must be annually updated. This is another requirement that should be aligned with the CEH program.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
PJM (2)	Yes/no	In response to the question, PJM agrees that training materials should be up-to-date. In response to the proposed R10, the associated measures have no relationship to evaluating whether or not the materials are up-to-date. The Drafting Team must more accurately define the term "accurately reflects" . Also, there is no specificity identifed as to what constitutes "current operating environment". What is required to determine if an entity is in compliance or out of compliance?
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Matthew Santos; SDE&G	Yes/no	Okay you have done a JTA and built your training program and made adjustments to the JTA (Kept it up to date) you will be training your folks in the current operating environment. If not, go and sit out on the floor in real time and observe to see if the training is up to date with what the Operators are doing. Does this requirement really need to be stated? Define "accurately reflects" Question does not reflect standard as it is stated
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Duke Energy (G1) (1)	yes	Yes, material should be reviewed. Here again the question does not match the requirement referenced. Requirement 10 appears to be something that cannot be effectively measured, with the exception of applying it after the fact when the operator didn't have perfect knowledge. In addition, the measure implies that even training that will not be offered in a given year must be annually updated. This is another requirement that should be aligned with the CEH program.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the		

Question 10		
Commenter		**Comment**
standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Howard Rulf; WeEnergies (3,4,5)	yes	I agree with the wording of question #10. Wording in R10 is different than this question though. It requires that the training program reflect the "current" operating environment. R10 should not be worded to preclude training on known changes/improvements before they are implemented.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Jason Shaver; ATC (1)	yes	Although ATC agrees with the question as posed above, this is not consistent with the way proposed Requirement 10 is written. ATC proposes that the SDT rewrite this requirement to better align it with the question. Any training program should be reviewed prior to conducting the actual training; however, NERC should not require an annual review of all training programs if a program is not scheduled for delivery in that year. Requiring an annual review of all classes, regardless of anticipated delivery schedule is unduly burdensome and of no value to the industry. Lastly, this requirement fails to take into account the NERC CE Program requirements. Existing classes previously approved and delivered under the NERC CE Program must be reviewed and updated prior to delivery. The process for ensuring that this happens is auditable under the NERC CE Program and should not be duplicated here.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.		
Will Franklin; Entergy (6)	yes	Obviously the training material should be current. However a particular training module need not be updated until is being prepared for presentation. Additionally, corrections should be allowed to occur during training sessions since things can change quickly and not allow the training materials to be updated (e.g. setpoints, procedure steps, new equipment). On a similar topic, the NERC Operator exam process should be held to maintaing tests current under this philosophy (or not including/grading questions on information that has changed during the testing cycle). We have had to train operators on old/outdated information just for testing purposes. This is not productive.

Question 10		
Commenter		**Comment**
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
SRP (1)	yes	It is a worthwhile target. I would hope that some provision for edits or correction notes during a class could be allowed. I would hate to see this requirement prevent the delivery of needed training if resources are constrained, which can happen with any size training department.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Michael Scott; APS (1,5)	yes	Latitude for making approved pen-and-ink revisions to curriculum should be allowed, enabling "the show to go on", without a slow word processing and approval cycle. Let's stay nimble.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
SPP OTWG (1,2)	yes	Yes, this is good in theory, but it should be a "guide" not the standard. This would be very difficult to put into practice. You can still deliver the training and point out updates rather than delaying necessary training.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
John Kerr; GRDA	yes	Once again, this should be a guide and not a standard.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Jim Gunnell; SPP (2)	yes	This seems to be more of a recommendation than a rule. I would be interested in seeing a plan to enforce this requirement. If it's not enforceable, the level of accountability diminishes.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
CJ Ingersoll; CECD (3)	yes	This answer is applicable to a general operator training program, not necessarily any potential training matierial such as for new-hires.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
NPCC CP9 (1, 2)	Yes/no	NPCC Participating members expressed concern on how the phrase "accurately reflects" can be quantified and measured and requests clarification. If this is not practical then it should be removed as a Requirement.

Question 10		
Commenter		**Comment**
Response: Based on stakeholder feedback, this requirement has been removed from the standard.		
Ron Falsetti; IESO (2)	Yes/no	Yes, but it's too fine a requirement and appears micro-managing. It is also covered by the annual training plan activities. We suggest that this requirement be combined with other annual review requirements or be removed.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Gordon Rawlings; BCTC (1)	yes	This requirement does not specifically say the words "training materials" and it should say this. The measure says "training materials".
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Brian Thumm; ITC (1)	yes	Information provided to trainees should accurately reflect the current operating environment, so if that requires updating the training materials, then yes, updating training materials as needed is necessary. That's not how the standard is written, though.
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Brian Tuck; BPA (1)	yes	While it is good practice it does not belong in the standard. See response to Q19
Response: Based on stakeholder feedback, this requirement, R10, has been removed from the standard.		
Dale Wadding; Dairyland Power Cooperative (5)	yes	
Edward J. Carmen; Baltimore Gas & Electric (1)	yes	
Santee Cooper (G2)	yes	
FRCC SO Subcommittee (1,2,5)	yes	
William J. Smith; Allegheny Power (1)	yes	
TVA (1)	yes	
Michael Gammon; KCP&L (1)	yes	
FPL (1,3,5)	yes	
MRO (1,2)	yes	
WECC RCCWG (1,2)	yes	

Question 10

Roger McBeth; Northeast Utilities (1)	yes	
Allan George; Sunflower (1)	yes	
FirstEnergy (1,3,5,6)	yes	

11. Do you agree with the Violation Risk Factors assigned to each requirement in the proposed standard? If no, please identify which requirement you feel should have a different risk factor, and identify why.

Summary Consideration:
The comments range from identifying a lack of understanding of what a Violation Risk Factor (VRF) is to giving recommendations on the factors for each requirement. Several commenters disagreed that any of requirements should have a High risk factor. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). In the revised standard, none of the requirements are assigned a High VRF.

Question 11		
Commenter		**Comment**
Michael Clime; Ameren	no	Don't even need R10.
Response: The SPT SDT has removed R10.		
Richard Appel; Sunflower Electric Power Co (1,3,5)	no	I didn't see where the factors are explained.So must disagree.
Response: All standards are required to have Violation Risk Factors as part of the Standards process. The Reliability Standards Development Procedure manual explains the definitions of these values.		
Michael Scott; APS (1,5)	no	I don't understand how the value of these Factors is calculated, so I can't agree.
Response: All standards are required to have Violation Risk Factors as part of the Standards process. The Reliability Standards Development Procedure manual explains the definitions of these values.		
Matthew Santos; SDE&G	no	I do not see how this applies, need more Info on how you came up with this Violation Risk Factor?
Response: All standards are required to have Violation Risk Factors as part of the Standards process. Reliability Standards Development Procedure manual explains the definitions of these values. The SPT SDT evaluated all requirements relative to the risk factor guides. Based on stakeholder feedback, the SPT SDT revised the risk factors accordingly.		
TVA (1)	no	Was the term "Violation Risk Factor" defined ? What criteria and methods were used to determine Violation Risk Factor levels? A "High" on any of the requirements seems a bit extreme. If High is used a justification should be providedl.
Response: All standards are required to have Violation Risk Factors as part of the Standards process. The Reliability Standards Development Procedure manual explains the definitions of the risk factors.		
Mark Bennett; Gainesville Regional Utilities (5)	no	Again, depending on the size and configuration of the entities generation/transmission system depend on whether the risk factors are assigned at all.
Response: Per the NERC Standards Development process, all standards are required to have Violation Risk Factors.		
ISO/RTO Council (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium.		

Question 11		
Commenter		**Comment**
Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for system operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback.		
PJM (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback.		
Kathleen Goodman; ISO-NE (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback.		
Santee Cooper (G2)	no	It is impractical to evaluate the risk factors until we have a clear understanding of the Requirements in this standard.
Response: The SPT SDT realizes that VRFs may change if any requirements are modified. The SPT SDT has reviewed all assigned VRFs for the draft two of this standard.		
Pepco Holdings (1)	no	The Risk Factors are not consistent with the definitions of the Violation Risk Factors in the Reliability Standards Development Procedure adopted August 2, 2006. We need to be careful not to confuse importance with risk. Nothing in a training standard could rise to the level of a High Risk Factor, that quote -is, one that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. -unquote. Some of the training requirements may meet the definition for Medium Risk Factor, while most would result in a Lower Risk Factor.
Response: Based on stakeholder comments the SPT SDT has changed all high risk factors to medium or low risk. Training has been cited as a major contributing factor to many large scale events and		

Question 11		
Commenter		**Comment**
blackouts and hence the levels of violation risk factor were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
WECC OTS (1,2)	no	OTS notes NERC documents on Violation Risk Factors state, "These reliability-related risks are proposed for use when determining a penalty or sanction for a violation of that requirement." Thus the purpose of the risk factors is for use when determining a penalty or sanction. Also from NERC documents, the risk factors are intended to represent the following in the operating timeframe: High = A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; Medium = A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; Lower = A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature; With the understanding that Violation Risk Factors are not to rank the importance of a requirement to the industry but rather as an aggravating factor in determining penalties and sanctions, OTS does not support the Violation Risk Factors as listed in the draft Standard. A review of the Measures in the Standard indicate all Requirements are essentially administrative in terms of providing documentation the Requirment has been met. A lack of documentation does not necessarily mean the training or other requirement did not occur. OTS recommends all Violation Risk Factors in this Standard be set at "Lower."
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium. Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of violation risk factor were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Richard Krajewski; Public Service Co of NM (1)	no	With the understanding that Violation Risk Factors are not to rank the importance of a requirement to the industry but rather as an aggravating factor in determining penalties and sanctions, PNM does not support the Violation Risk Factors as listed in the draft Standard. A review of the Measures in the Standard indicate all Requirements are essentially administrative in terms of providing documentation the Requirment has been met. A lack of documentation does not necessarily mean the training or

Question 11		
Commenter		**Comment**
		other requirement did not occur. PNM recommends all Violation Risk Factors in this Standard be set at "Lower."
Response: Based on stakeholder comments the SPT SDT has changed all high risk factors to medium. Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of violation risk factor were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
SPP OTWG (1,2)	no	None of the Violation Risk Factors should not be rated as "high". R1, R3, R5, & R6 are all marked as "high". They should be dropped to a violation risk of "medium". R8 is "medium" but should be dropped to "low" because it is just record keeping. R9 should drop from "medium" to "low".
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
MRO (1,2)	no	The MRO recommends that the SDT review the VRF associated with the following requirements: R1, R3, R5, R6, R8, and R9; with respect to the fact that each of the requirements is calling for an administrative action to be taken which does not directly meet the definition of High Risk.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
MISO (1,6)	no	We agree training is very important. However, we cannot identify any of the items in this standard should be classified above a lower risk. It's the direct actions of the operators that can put the interconnection at risk. Missing an item (or varying) in the design of a training module does not put the Interconnection at risk of cascading.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium risk factors. Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of violation risk factor were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced where appropriate.		
FPL (1,3,5)	no	All the risk factors associated with the training standards should be "Lower" risk factors. These training activities will be occuring outside of the "real-time" operating arena and therefore violations of these requirements cannot in and of themselves cause impacts as defined by "High" and "Medium" risk factors. An entity would be required to violate several core operating requirements prior to the violation of a training requirement having any material

Question 11		
Commenter		**Comment**
		impact on a system. At that, the linkage of an event to a training activity would be extremely subjective.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium risk factors. Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Hydro One Networks (1)	no	The Requirements assigned High Risk Factor should be Medium. According to the definitions of Risk Factors, Training itself (or lack of it) will not directly contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures. The high fisk factor is in the requirements on credentials of operators which is dealt with in another standard.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium risk factor. Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
William J. Smith; Allegheny Power (1)	no	Requirement R1 for a Job Task Analysis would certainly be very important in ensuring that a training program has addressed every required subject. However, to say that it is a High risk factor implies that it is critical to system reliability. There are probably many company training programs preparing highly qualified operators that support system reliability that do not have a Job Task Analysis completed to the detail specified. Given this situation, a lower risk factor may be more appropriate.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium risk factor. The SPT SDT has either removed the requirement (R3 and R5) or changed the risk factor from High to Medium (R1 and R6). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Howard Rulf; WeEnergies (3,4,5)	no	All requirements except R6 (and its sub requirements) are administrative. None of the requirements put the BES one event away from a cascading failure.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Gerald LaRose; NYPA (1)	no	In my opinion, only R6, the implementaton of a System Operator training program, merits a "High" VRF as a Requirement that, if violated, could… place the bulk electric system at an unacceptable risk of instability, separation, or

Question 11		
Commenter		**Comment**
		cascading failures". The remaining Requirements with a proposed "High" VFR are contributory in nature and are more appropriate as "Medium".
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Ron Falsetti; IESO (2)	no	A well-structured training program is an important component to ensure that the concerned operating entities bring their system operation personnel to the competency needed to meet the entities' certification requirements and to assure operating reliability. However, actions taken by the operators in accordance with NERC standards have a direct impact on system reliability, not the training program itself. There are a number of requirements in this standard that are rated High and Medium, which we feel should at best be rated Medium and Lower, respectively, as they have a much more remote, secondary impact than actual operation. For comparison, for example, mitigating limit violation is assigned a High level; maintaining generation-load-interchange balance is assigned a Medium level. These requirements have a more direct impact on ensuring system reliability and controlling system conditions than developing and delivering the training program.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Will Franklin; Entergy (6)	no	This standard is administrative. Nothing in this standard affects reliability in the first degree. Thus, most if not all items should be rated as "lower".
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
John Kerr; GRDA	no	The risk for a violation should be no more than medium to low. The levels may need to be reconsidered.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the

Commenter		**Comment**
standard and reduced, where appropriate.		
Ron Gunderson; NPPD (1)	no	We agree training is very important. However, we cannot identify any of the items in this standard should be classified above a lower risk. It's the direct actions of the operators that can put the interconnection at risk. Missing an item (or varying) in the design of a training module does not put the Interconnection at risk of cascading.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Tim Hattaway; Alabama Electric Coop (5)	no	R1 should be Med or Low
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
FRCC SO Subcommittee (1,2,5)	no	All the risk factors associated with the training standards should be "Lower" risk factors. These training activities will be occuring outside of the "real-time" operating arena and therefore violations of these requirements cannot in and of themselves cause impacts as defined by "High" and "Medium" risk factors. An entity would be required to violate several core operating requirements prior to the violation of a training requirement having any material impact on a system. At that, the linkage of an event to a training activity would be extremely subjective.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Robert Coish; MEHB (1, 3, 5, 6)	no	We agree training is very important. However, we cannot identify any of the items in this standard should be classified above a lower risk. It's the direct actions of the operators that can put the interconnection at risk. Missing an item (or varying) in the design of a training module does not put the Interconnection at risk of cascading.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. Question 11		
Commenter		**Comment**
applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Duke Energy (G1) (1)	no	Training is obviously very important. However, none of the requirements in this standard should be classified above a lower risk. Direct actions of operators can put the interconnection at risk. Missing an item (or varying) in the design of a training module does not directly put the Interconnection at risk of cascading. We must differentiate between risk and importance. Deviation from a template training design does not put the Interconnections at risk of cascading. The standard as a whole should be evaluated at a lower risk.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Marion Lucas; Alcoa Power Generating, Inc (1)	no	See comment 1. High and Medium risk factors assigned to listing of job tasks/documentation/ or review is extreme. High and medium risk factors should be equated with critical or significant impact on the Bulk Power System. As in above coments, the administrative functions that should NOT be included in the Standard (such as R1 - JTA) would not then be a violation consideration.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
CJ Ingersoll; CECD (3)	no	The Risk Factors associated with documentation, i.e. JTA, Annual Training Plan, Qualification Verification, should be assigned a Low state. The Risk Factor associated with actual training activity should be assigned a Medium Risk Factor. The items CECD suggests are Low Risk Factors should be assigned that specific priority due to the fact that the items described above, are administrative, and do not directly cause or contribute to instability, separation or cascading events (emphasis on "directly").
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Ed Davis; Entergy Services (1)	no	All of the Requirements in this draft standard should have a

Question 11		
Commenter		**Comment**
		Violation Risk Factor of Low. No Requirement in any training standard should have a Violation Risk Factor above Low. A VRF of High applies to requirements that - could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures. Violation of a training requirement does not meet this criteria for High. A VRF of Medium applies to requirements that - could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. Violation of a training requirement does not meet this criteria for MEDUIM.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
John Bussman: AECI (1,5,6)	no	Don't agree with R1
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
SCE&G ERO WG (1, 3, 5)	no	We do not believe the risk factor of "High" for R5 is appropriate due to the fact that quality training can be provided by a trainer on the material and subject mater experts to address questions or concerns. This should be ranked as "Medium."
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Jason Shaver; ATC (1)	no	ATC believes that only Requirement 6.5.1 should be given a High Violation Risk Factor. All other requirements should be either medium or lower. R1 lower ATC suggests that R2 and R3 be deleted.

Question 11		
Commenter		**Comment**
		R4 lower ATC suggest that R5 be deleted R6 medium R6.5.1 High R6.5.2 should be deleted R7 should be deleted R8 lower R9 lower R10 medium
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Michael Gammon; KCP&L (1)	no	**Standard** / **Comments** R1: JTA — High — Medium R2: New hire requirements — Medium — High R3: Incumbent training needs — High — High R4: Training plans — Medium — Medium R5: Trainer competency — High — Medium R6: Training implementation — High — High R7: Training documentation — Low — Low R8: Training tracking — Medium — Low R9: Training program evaluation — Medium — Low R10: Training program maintenance — Medium — Medium
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Jim Sorrels; AEP (1)	no	No. R1 should be rated as Lower Risk. It is not the lack of documenting job task analysis that would place the system at risk, it is the quality of the performance of those tasks. While, a job task analysis may be important to developing a good training plan, it does not meet the requirements of the

Question 11		
Commenter		**Comment**
		High Risk definition for NERC Violation Risk Factors. R2 should be rated Lower Risk. Newly hired and entry-level operators should not be operating the system unsupervised until they are qualified. Nonperformance of R2 will not directly impact the reliability of the system, but rather would be an indirect cause over time. R2 does not meet the VRF definition of High Risk. We concur with R3 being rated High Risk, as R3 relates to assessing successful or unsuccessful performance of reliability tasks which directly effects reliability of the system. R4 should be rated Lower Risk as having a documented annual training plan is administrative in nature and lack of the documentation (the Plan) does not in itself mean the required and proper training has not and does not occur. R5 in its present state should only be a guideline thus does not need a VRF. Conceptually, the qualification of the trainer would be Lower Risk as it is not the trainer that performs the actual reliability tasks. That is not to say having qualified trainers is not important. R6 should be rated Medium Risk. While proper implementation of the Training Plan is important, it does not directly lead to unreliable operation of the system, but rather is an indirect cause. Thus, it does not meet the NERC VRF definition of High Risk. We concur with R7 being rated a Lower Risk as it pertains to documentation which is administrative in nature. R8 should be rated Lower Risk, as this is an administrative function. Nonperformance to R8 does not directly affect reliability, but could be an indirect cause. R9 should be rated Lower Risk. While this an important administrative task, it by itself would not be a direct cause of unreliable operation. R10 in its present form should not be a requirement, thus should not have a rated risk factor. How does R10 mesh with the concept of using a "generic" simulator for some drills and exercises as asked in question #7, when R10 states the training program must "reflect the current operating environment"? A generic simulator may be on a pseudo system which does not reflect any entity's current operating environment. This is just an example of why the present wording of R10 is inadequate.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		

Question 11		
Commenter		**Comment**
Southern Co (1,3,5,6)	no	Under Requirement 1, one would not expect an imminent cascading outage to occur due to a job task analysis (JTA) not being performed. Not having a list of company-specific reliability-related tasks for a system operator is a problem, but the system operator could have 30 years experience and it's the experience which prevents cascading outages and not specifically the JTA. Recommend Medium risk factor. Under Requirement 3, not having a training needs assessment may not be a wise action on the part of a RC, BA, or TOP, but would not conducting a training needs assessment directly lead to cascading outages if the assessment did not exist? Recommend Medium risk factor. Under Requirement 5, if the system operator trainer is very experienced with their duties, how will not having a certain level of competency directly result in cascading outages, i.e, high risk factor rating. What is NERC's acceptable level of competency-NERC certified, Master's Degree, 10 years as an instructor? Recommend Medium risk factor. Under Requirement 6, same comments as above. Recommend Medium risk factor.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
NPCC CP9 (1, 2)	Yes/no	A violation risk factor of High means a violation has the potential to directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or did or could have placed the bulk power system at an unacceptable risk of instability, separation or cascading failure. R1. No. A lack of conducting a formal job task analysis is not a high risk factor to the BPS. It should be Medium R4. No. This should be "low." This is purely administrative. R8. No. It should be Lower and mainly administrative. R9. No. It is Lower and administrative.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Gordon Rawlings; BCTC (1)	no	BCTC notes NERC documents on Violation Risk Factors state, "These reliability-related risks are proposed for use

Question 11		
Commenter		**Comment**
		when determining a penalty or sanction for a violation of that requirement." Thus the purpose of the risk factors is for use when determining a penalty or sanction. Also from NERC documents, the risk factors are intended to represent the following in the operating timeframe: High = A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; Medium = A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; Lower = A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature; With the understanding that Violation Risk Factors are not to rank the importance of a requirement to the industry but rather as an aggragating factor in determining penalties and sanctions, BCTC offers the following comments on the Violation Risk Factors in the draft Standard: R1 is listed as High and while it is clearly important to reliable operations, R1 does not fit the definition of High and should be changed to Medium or LowER. R2 is listed as Medium and BCTC agrees or reduce it to LowER. R3 is listed as High and while it is important to developing a training program, R3 does not fit the definition of High and should be changed to Medium or LowER. R4 is listed as Medium and BCTC agrees or reduce it to LowER. R5 is listed as High and while it is important to developing a training program, R5 does not fit the definition of High and should be changed to Medium or LowER. R6 is listed as High and while it is important to developing a training program, R6 does not fit the definition of High and should be changed to Medium or LowER. R6.5.2 is listed as Medium and BCTC agrees but does not understand why this sub-requirement receives an independent violation risk factor. Is it possible this is meant to apply to R6.5 and both of its sub-requirements R6.5.1 and R6.5.2? If so, since BCTC recommends R6 (all of it) be changed to a Medium or reduce it to LowER it would make this sub-requirement designation unnecessary.

Question 11		
Commenter		**Comment**
		R7 is listed as LowER and BCTC agrees. R8 is listed as Medium and BCTC agrees or reduce it to LowER. R9 is listed as Medium and BCTC agrees or reduce it to LowER. R10 is listed as Medium and BCTC agrees or reduce it to LowER.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Allan George; Sunflower (1)	no	What is definition of Risk Factor
Response: Please see the Reliability Standards Development Procedure manual pages 7-8 for definitions. http://www.nerc.com/standards/newstandardsprocess.html		
Dan Kay; South Mississippi EPA (4)	no	This should be the left to the employer, not required by NERC in a standard.
Response: All standards are required to have Violation Risk Factors as part of the Standards process. Reliability Standards Development Procedure manual explains the definitions of the risk factors. Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium.		
Alan Adamson; NYSRC (2)	Yes/no	A violation risk factor of High means a violation has the potential to directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or did or could have placed the bulk power system at an unacceptable risk of instability, separation or cascading failure. R1. No. A lack of a job task analysis is not a high risk factor to the BPS. It should be Medium R2. Yes. R3. Yes R4. No. This should be low. This is purely administrative. R5. Yes. Lack of competency in developing the trainig program could have unacceptable ramifications on the training. R6. Yes R7. Yes R8. No. It is Lower since it is purely administrative. R9. No. It is Lower and administrative. R 10. Yes.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium		

Question 11		
Commenter		**Comment**
or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Allen Klassen; Westar (1)	no	Based on the NERC definitions of the Risk Factors, it is hard for me to agree that ANY of this Standard qualifies as High (causing instability, cascading failures, etc) even giving them a risk factor of Medium may be a "stretch". I suggest R1, R3, R5, & R6 be changed from High to Medium, and R8 be changed to LowER (as is record keeping and seem to match the definition of ". administrative in nature .")
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Brian Thumm; ITC (1)	no	Although training is a very important component of a reliable transmission network, the performance of job task analyses, conductance of training needs assessments, and verification of trainer qualifications does not rise to the level of "high" risk. All of these high-risk activities are more appropriately classified as medium-risk.
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Brian Tuck; BPA (1)	no	While training has been considered a contributing factor in many system disturbances, it does not follow that the essentially administrative tasks performed in the process of developing, implementing, and record-keeping of training activities should be assigned Violation Risk Factors of Medium or High. Incomplete training documentation does not mean that training provided by an entity has been ineffective or non-existent. Poor documentation practices do not "directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures", stated in the NERC definition of High Risk. BPA notes that a Violation Risk Factor of Lower does not imply that it is acceptable to ignore or poorly perform the requirement. BPA suggests the following Violation Risk Factors for the requirements described in the proposed standard:

Question 11		
Commenter		**Comment**
		R1 - Prepare and update JTA for each position. LowER R2 - Perform training needs assessment for each new hire. Medium R3 - Perform annual training needs assessment for each incumbent. Medium R4 - Develop annual training plan for each system operator. LowER R5 - Training delivery by qualified instructors. Medium R6 - Training provided meets Knowledge and Skill requirements of position. Medium R7 - Documentation Guidelines for training materials. LowER R8 - Documentation Guidelines for personnel training records. LowER R9 - Annual program review to ensure effectiveness. LowER R10 - Use of updated instructional materials. LowER
Response: Based on stakeholder comments the SPT SDT has changed all High risk factors to Medium or Low risk. The SPT SDT agrees and has either removed the requirement (R3, R4, R5, R6, R7, R8, R9, and R10) or changed the risk factor from High to Medium (R1 and R2). Training has been cited as a major contributing factor to many large scale events and blackouts and hence the levels of VRF were applied with this in mind. The SPT SDT has re-evaluated all assigned VRFs for this draft posting of the standard and reduced, where appropriate.		
Roger McBeth; Northeast Utilities (1)	yes	I agree with the High Risk Factor for Requirement 1 but not the level of detail specified for the JTA. It is important to have a company specific task list and a task to training matrix that identifies the following: Training Frequency = Initial Training, Continuing Training or Both Training Environment = Classroom, Simulator, OJT, etc. Training Activity Id which identifies the training activity with the objectives/content that addresses the knowledge/skills associated with the task.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Jim Gunnell; SPP (2)	yes	
SRP (1)	yes	
James Hinson; ERCOT (2)	yes	
WECC RCCWG (1,2)	yes	

Question 11		
Commenter		**Comment**
FirstEnergy (1,3,5,6)	yes	

12. Do you agree with the Measures in the proposed standard?

Summary:

Most commenters did not agree with the Measures in the proposed standard. Based on industry feedback on the SPT SDT has significantly revised the measures, as follows:

- M1 has been modified to reflect the revised R1 focusing on the outcomes of the SAT process.
- M2 and M3 have been combined into one measure that requires evidence of the latest assessment for each position, not for each System Operator.
- M4 and the associated requirement, R4, have been removed from the revised standard.
- M5 and the associated requirement, R5, have been removed from the revised standard.
- M6 and M7 and the associated requirement, R6, have been removed from the revised standard.
- M8 and the associated requirement, R6, have been removed from the revised standard.
- M9 and the associated requirement, R7, have been removed from the revised standard.
- M10 and the associated requirement, R8, have been removed in the revised standard.
- M11 and the associated requirement R9, have been removed from the revised standard.
- M12 and the associated requirement, R10, have been removed in the revised standard.

Question 12		
Commenter		**Comment**
Richard Appel; Sunflower Electric Power Co (1,3,5)	no	I don't think this standard is needed at all. Its just overkill. PER-002 covers training.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Marion Lucas; Alcoa Power Generating, Inc (1)	no	This is all a duplication of the much simpler and less intrusive PER-002 and PER-003.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Dan Kay; South Mississippi EPA (4)	no	There is no need for this standard. The NERC System Operator Certification Program with the required continiuing education for re-certification that is allready in place is more than sufficient to ensure an adequate level of training is accomplished at the NERC level. Each individual employer must decide the level of training it requires for operation of it's own system.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The certification program is outside the scope of this standard.		
Kathleen Goodman; ISO-NE (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost.		

Question 12		
Commenter		**Comment**
The SPT SDT has significantly revised the standard based on industry feedback.		
PJM (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback.		
ISO/RTO Council (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback.		
Ed Davis; Entergy Services (1)	no	Please revise the Measures to make them compatible with the revised requirements.
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements.		
Santee Cooper (G2)	no	It is impractical to evaluate the measurements until we have a clear understanding of the Requirements in this standard.
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements.		
SPP OTWG (1,2)	no	Since there are areas within the standard that we disagree with, it is impossible to agree with the Measures in the proposed standard.
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements		
FPL (1,3,5) FRCC SO Subcommittee (1,2,5)	no	Measures should be modified in accordance with our comments on the Requirements.
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements.		
Pepco Holdings (1)	no	The Measures should be changed to conform to the previous comments. Specifically M 3, M 4, M 8, M10, and M 11
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements. Specifically the following changes were made:		

Question 12		
Commenter		**Comment**
M1 has been modified to reflect the revised R1 focusing on the outcomes of the SAT process. M2 and M3 have been combined into one measure that requires evidence of the latest assessment for each position, not for each System Operator. M4 and the associated requirement, R4, have been removed from the revised standard. M5 and the associated requirement, R5, have been removed from the revised standard. M6 and M7 and the associated requirement, R6, have been removed from the revised standard. M8 and the associated requirement, R6, have been removed from the revised standard. M9 and the associated requirement, R7, have been removed from the revised standard. M10 and the associated requirement, R8, have been removed in the revised standard. M11 and the associated requirement, R9, have been removed from the revised standard. M12 and the associated requirement, R10, have been removed in the revised standard.		
Richard Krajewski; Public Service Co of NM (1)	yes	PNM notes that changes to requirements will create appropriate changes to measures.
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements		
Allen Klassen; Westar (1)	no	Can't agree with all measures without agreeing to all requirements, however, they match the requirements well in general.
Response: The Measures have been re-evaluated and changed to be consistent with the revised requirements.		
Brian Tuck; BPA (1)	no	BPA agrees the measures are worded appropriately for the Requirements as written. However, BPA and others are requesting changes to the Requirements which will require corresponding changes in many of the Measures.
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements.		
Ron Falsetti; IESO (2)	no	We do not agree with the requirements at this time so we are unable to agree with the measures, at least not until the requirements are revised and the measures adjusted accordingly. Please also see comments/suggestions in Q19.
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements. The SPT SDT agrees that the element identified is important and are encompassed in the revised standard. The SPT SDT has significantly revised the standard based on industry feedback. The standards addresses the core SAT phases. The SPT SDT agrees with the comment that only specific tasks that are considered critical to reliability should be considered and has revised the requirement to include analysis that considers only reliability-related tasks by System Operator positions. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed		

Question 12		
Commenter		**Comment**
in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT has combined R2 and R3 and removed R4, R5, R6, R7, R8, R9, and R10 from the revised standard.		
NPCC CP9 (1, 2)	no	NPCC Participating members have expressed some disagreement with the Requirements as written so the measures are in question as well.
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements.		
MISO (1,6) Ron Gunderson; NPPD (1) Robert Coish; MEHB (1, 3, 5, 6)	no	The measures are too complex. There are already requirements that say what training needs to be provided. Over-specifiying how the training is delivered and the detailed design of the program seems to go too far. There are probably four core requirements in the standard. The measures and compliance monitoring should be simplified (some overall score for the requirements that are met).
Response: Based on industry feedback, the Requirements and the Measures have been simplified. The Requirements have been changed such that how the training is designed, developed, and delivered is not prescribed. The standards now addresses the core SAT phases.		
CJ Ingersoll; CECD (3)	no	The Annual Training plan and training records should be the only items required for inspection based on the answers provided on this comment form.
Response: The NERC standards development process requires Measures for all Requirements that are included in a standard.		
SCE&G ERO WG (1, 3, 5)	no	A list of reliability related tasks and performance expectations should be agreed upon then measures can be developed. The definition of "reliability related task" and agreement of the industry of minimum requirements as associated with these task as it applies to R1.1 through R1.7 should be provided. Also the word "mastery" should be revised to "proficient."
Response: The Measures have been re-evaluated and changed to be consistent with the revised Requirements. In response to your request for examples of reliability-related tasks, the SPT SDT has included a Generic Task List in the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore, each entity must complete a company-specific analysis to determine the required training. The SPT SDT has removed the word mastery from the requirement and replaced with acceptable.		
TVA (1)	no	The use of the word "each" in M2 , M3 and M6 made us wonder if it pertained to a person or function. We feel that it would be too administratively cumbersome to be at the individual operator level.

Question 12		
Commenter		**Comment**
Response: The SPT SDT has reviewed the requirements and modified them such that the requirements apply to a position, not individual System Operators. M2 and M3 have been combined into one measure that requires evidence of the latest assessment for each position, not for each System Operator. M6 and M7 and the associated requirement, R6, have been removed from the revised standard.		
Mark Bennett; Gainesville Regional Utilities (5)	no	I believe that if a review of a training program takes place, the only thing needed is student name/ credentials/ outline of program, where they are in the program.
Response: The NERC standards development process requires measures for all Requirements in a standard.		
WECC RCCWG (1,2)	no	Any measure that only requires providing of documentation with no further regard to accuracy or effectiveness is simply a requirement to produce, maintain and update paperwork. This is further stress on entities resources and manpower for nothing more than a cursory look by a Compliance Review team. Either make the measurement have more "teeth" or don't include it at all.
Response: Evidence of compliance for each Requirement is a NERC requirement. The SPT SDT is sensitive to the burden this places on the industry as a result of the approval of this standard however there is an urgent priority placed on the industry to develop effective training programs that are consistent in measurability for audit purposes, as required by the ERO and FERC.		
SRP (1)	no	Any of the Measures that only include showing documentation or a record without any regard to what that documentation should include (e.g. qualification of training personnel) does not provide an objective and impartial measurement. Any measure that only requires providing of documentation with no further regard to accuracy or effectiveness is simply a requirement to produce, maintain and update paperwork. This is further stress on entities resources and manpower for nothing more than a cursory look by s Compliance Review team. Either make the measurement have more "teeth" or don't include it at all.
Response: Evidence of compliance for each requirement is a NERC requirement. The SPT SDT is sensitive to the burden this places on the industry as a result of the approval of this standard however there is an urgent priority placed on the industry to develop effective training programs that are consistent in measurability for audit purposes, as required by the ERO and FERC.		
Roger McBeth; Northeast Utilities (1)	no	Measurement M1 is focusing on the content of a JTA not the training material and program that addresses the company specific task list. Emphasis should be placed on the following not the overly prescriptive items of 1.1 thru 1.7 It is important to have a company specific task list and a task to training matrix that identifies the following:

Question 12		
Commenter		**Comment**
		Training Frequency = Initial Training, Continuing Training or Both Training Environment = Classroom, Simulator, OJT, etc. Training Activity Id which identifies the training activity with the objectives/content that addresses the knowledge/skills associated with the task. Measurement M2 if a position description with well defined hiring requirements for new operators and for M3/M7/M8 a generic incumbent system operator assessment of training needs is not adequate to meet these requirements then these requirements would be an overly burdensome administrative requirement on organizations training staffs.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. M1 has been modified to reflect the revised R1 focusing on the outcomes of the SAT process. In response to your suggestion on the inclusion of the training matrix, based on stakeholder feedback this level of specificity and prescriptiveness would not be endorsed by the industry. The Measures have been re-evaluated and changed to be consistent with the revised Requirements. The SPT SDT does not understand the intent of the last comment.		
Michael Gammon; KCP&L (1)	no	Since commented on the R3 requirement, the proposed M3 no longer fits. I would propose the following language changes: **M3.** Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection, the results of its latest training needs analysis that identifies each incumbent System Operator's training plan as specified in R3.
Response: M2 and M3 have been combined into one measure that requires evidence of the latest assessment for each position, not for each System Operator.		
Michael Clime; Ameren	no	M5 - What determines who is qualified? And what is the documentation that says that they are?
Response: M5 and the associated requirement, R5, have been removed from the revised standard.		
Southern Co (1,3,5,6)	no	Under Measurement 5, it says you must have documentation of the qualifications of the trainer, but Requirement 5 doesn't mention what would be an acceptable level of competency. Recommend allowing each Utility the ability to determine what is the acceptable level of competency. Measurement 1: Recommend that R1.3, R1.4, and R1.5 be removed.
Response: M5 and the associated requirement, R5, have been removed from the revised standard.		

Question 12		
Commenter		**Comment**
M1 has been modified to reflect the revised R1 focusing on the outcomes of the SAT process.		
Brian Thumm; ITC (1)	no	Some of the measures do not accurately capture of the compliance elements of the requirements. For example, M5 requires that the RC/BA/TOp have available for inspection certain documentation of personnel qualifications, but the corresponding R5 does not require the RC/BA/TOp to assemble and retain such documentation. R5 merely requires that the employer verify qualifications of its employees, and such verification would not necessarily require the employer to copy and retain evidence of the qualifications. Much like an NERC audit, the RC/BA/TOp could require the employee to "have available for inspection" any necessary items to demonstrate their qualifications. Disconnects such as this between the Measures and Requirements should be corrected. Proposed wording for R5 is as follows: R5. Each RC, BA, and TOp shall maintain documentation which demonstrates that persons developing or delivering training have the following qualifications …
Response: Requirement 5 addressing trainer qualification has been removed from the revised standard. Based on stakeholder feedback the requirements and the associated measures are not as prescriptive in the revised standard.		
Howard Rulf; WeEnergies (3,4,5)	no	M9: R7.1 through R7.5 and R7.8 should be satisfied by supplying the NERC CE number for the class.
Response: The SPT SDT agrees that some elements of the CE program can be used to comply with this standard. Note that M9 and the associated requirement, R7, have been moved from the revised standard.		
Jason Shaver; ATC (1)	no	ATC disagrees with those measures that are tied to requirements that we believe should be deleted. Measure 12 requires updates to training programs even if that program is not scheduled for delivery in that training year. This measure should be rewritten to require that training programs only need to be reviewed prior to delivery and that the delivered program reflect current industry standards and topology.
Response: The Requirements and Measures have been re-evaluated and changed for this posting of the standard. M12 and the associated requirement, R12, have been removed from the revised standard.		
Allan George; Sunflower (1)	no	only M1, M4, M6, M7, M11, M12 are needed
Response: M1 has been modified to reflect the revised R1 focusing on the outcomes of the SAT process.		

Question 12		
Commenter		**Comment**
M2 and M3 have been combined into one measure that requires evidence of the latest assessment for each position, not for each System Operator. M4 and the associated requirement, R4, have been removed from the revised standard. M5 and the associated requirement, R5, have been removed from the revised standard. M6 and M7 and the associated requirement, R6, have been removed from the revised standard. M8 and the associated requirement, R6, have been removed from the revised standard. M9 and the associated requirement, R7, have been removed from the revised standard. M10 and the associated requirement, R8, have been removed in the revised standard. M11 and the associated requirement, R9, have been removed from the revised standard. M12 and the associated requirement, R10, have been removed in the revised standard. The Requirements and Measures have been re-evaluated and changed for this posting of the standard.		
Michael Scott; APS (1,5)	no	Based on the simplifications recommended in my review of this standard, I suggest the following Measures: M1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the results of its latest JTA as specified in R1. M2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the assessment of new System Operator training needs and any resulting individualized training plans as specified in R2. M3. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the assessment of incumbent System Operator training needs and any resulting individualized training plans as specified in R3. M4. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the annual training plan for System Operators as specified in R4. M5. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, documentation of personnel qualifications who developed or delivered System Operator training as specified in R5. M6. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, training records that document training activities as specified in R6. M7. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection, the results of its latest program evaluation as specified in R7.
Response: M1 has been modified to reflect the revised R1 focusing on the outcomes of the SAT process.		

Question 12		
Commenter		**Comment**
M2 and M3 have been combined into one measure that requires evidence of the latest assessment for each position, not for each System Operator. M4 and the associated requirement, R4, have been removed from the revised standard. M5 and the associated requirement, R5, have been removed from the revised standard. M6 and M7 and the associated requirement, R6, have been removed from the revised standard.		
Jim Sorrels; AEP (1)	no	No. As AEP does not agree with all the requirements in the proposed standard, we can't agree with all the measures in the proposed standard. M1 - Conceptually we agree, just need to make changes to R1.1 - R1.7 as previously commented. M2 - Shall have available for inspection the results of its latest training needs analysis for each entry-level System Operator job classification. M3 - Shall have available for inspection the results of its latest training needs analysis for each System Operator job classification. M4 - Agree. M5 - Disagree. M5 is not a measure and R5 in its present state is not measurable. By what criteria is each Region and each auditor going to use to determine if an entity's documentation of qualifications is satisfactory? M6 - Disagree. What is meant by training activities? Do you mean have available an entity's entry-level training plan? Or do you mean have available an entity's entry-level training material? Or do you mean something else? M7 - Conceptually agree. However, we desire to see the standard use terminology in a manner consistent with the NERC Continuing Education Program Administrative Manual, which uses the term refresher training as a subset of continuing training. M8 - Consider combining M7 and M8. In essence, the measure is to provide training records. M9 - This measure would not be needed if R7 becomes a guide rather than a requirement of the standard as we suggest in our previous comments. M10 - Remove M10. R8 is not appropriate nor is M10 which is the measure for R8. This is getting too close to making public record an individual's job performance appraisal(s), which heretofore have been treated as confidential between an employer and the employee. M11 - Agree. M12 - Just because an entity provides it latest versions of its training program, that will not necessarily demonstrate that the information within the program accurately reflects the current operating environment as required in

Question 12		
Commenter		**Comment**
		R10. As stated previously, R10 needs work.
Response: M1 has been modified to reflect the revised R1 focusing on the outcomes of the SAT process. M2 and M3 have been combined into one measure that requires evidence of the latest assessment for each position, not for each System Operator. M4 and the associated requirement, R4, have been removed from the revised standard. M5 and the associated requirement, R5, have been removed from the revised standard. M6 and M7 and the associated requirement, R6, have been removed from the revised standard. M8 and the associated requirement, R6, have been removed from the revised standard. M9 and the associated requirement, R7, have been removed from the revised standard. M10 and the associated requirement, R8, have been removed in the revised standard. M11 and the associated requirement, R9, have been removed from the revised standard. M12 and the associated requirement, R10, have been removed in the revised standard.		
Matthew Santos; SDE&G	no	What if a company did not do a JTA? (M1). M2 & M3 are asking for to much, we can show you results of exams. I am not sure of what you mean mismatches on Actual performance and criteria for successful performance? Is this all done in training or real time? M5 - we should only have to show work history and training records of the trainer and maybe the pass/fail rate of those he trained. That might be hard to do if those he trained moved onto other jobs or companies. M6 - Only if that company brings folks in like that. Entry-level is lika a apprenticeship program to me. Clarify if my interpation is wrong. M9 - is telling me that I have to have this documentation in a certain form style as in R7. this seems to be over kill. It should be enough to show that training is being done successfully on what topics and dates it has been delivered. M10 - See question 1 and clarify. M11 - See Question 9 M12 - See question 10 this would be very burdensome to do. The training materials are adjusted before and after delivery until they are going to be delivered again which maybe months to years. This is about taking time to update a course which may not be delivered until months to year or so and changes will have taken place which will cause more time to be used to update the material. In a perfect world this would be very desirable but in the real world it is not going to happen. Manpower, time and system priorites will override this function.
Response: M1 has been modified to reflect the revised R1 focusing on the outcomes of the SAT process.		

Question 12		
Commenter		**Comment**
M2 and M3 have been combined into one measure that requires evidence of the latest assessment for each position, not for each System Operator. M4 and the associated requirement, R4, have been removed from the revised standard. M5 and the associated requirement, R5, have been removed from the revised standard. M6 and M7 and the associated requirement, R6, have been removed from the revised standard. M8 and the associated requirement, R6, have been removed from the revised standard. M9 and the associated requirement, R7, have been removed from the revised standard. M10 and the associated requirement, R8, have been removed in the revised standard. M11 and the associated requirement, R9, have been removed from the revised standard. M12 and the associated requirement, R10, have been removed in the revised standard.		
John Kerr; GRDA	no	
Gordon Rawlings; BCTC (1)	Yes/no	BCTC agrees the measures are worded appropriately for the Requirements as written. BCTC and others will be requesting changes to the Requirements which will require corresponding changes in some wording of the Measures. We would expect the measures would change with any changes to the requirements that come from industry suggestions.
Response: The SPT SDT agrees and have re-evaluated/modified the Requirements and Measures.		
MRO (1,2)	yes	The MRO recommends that the SDT review M5 in the event R5 changes, in order for M5 to remain consistent with any changes made to R5.
Response: M5 and the associated requirement, R5, have been removed from the revised standard.		
Hydro One Networks (1)	Yes/no	Although agreeing with the need of Measures in general, there are some that may pose unnecessary documentation burden to entities. For example, M3 can be satisfied by use of an annual employee performance review without the need of creating an additional document to demonstrate compliance. Also, in M11, providing results of the annual review does not prove that an entity is modifying training as per their findings.
Response: M3 has been modified to reflect a needs analysis by position not individual. M11 and the associated requirement, R9, have been removed from the revised requirement.		
Alan Adamson; NYSRC (2)	Yes/no	Agree with 1, 2, 3, 5 and 11. Disagree with 4, 6-10 and 12 4-See comments on Q4 6-9-See comments on Q6 10-See comments on Q8

Question 12		
Commenter		**Comment**
		12-See comments on Q10 and Q19
Response: M1 has been modified to reflect the revised R1 focusing on the outcomes of the SAT process. M2 and M3 have been combined into one measure that requires evidence of the latest assessment for each position, not for each System Operator. M4 and the associated requirement, R4, have been removed from the revised standard. M5 and the associated requirement, R5, have been removed from the revised standard. M6 and M7 and the associated requirement, R6, have been removed from the revised standard. M8 and the associated requirement, R6, have been removed from the revised standard. M9 and the associated requirement, R7, have been removed from the revised standard. M10 and the associated requirement, R8, have been removed in the revised standard. M11 and the associated requirement, R9, have been removed from the revised standard. M12 and the associated requirement, R10, have been removed in the revised standard.		
WECC OTS (1,2)	Yes/no	OTS agrees the measures are worded appropriately for the Requirements as written. Of course OTS and others are requesting changes to the Requirements which will require corresponding changes in some wording of the Measures.
Response: The Requirements and Measures have been re-evaluated and changed for this posting of the standard.		
Duke Energy (G1) (1)	yes	Yes, the measures, although complex and interdependent, match the requirements as drafted. However, most, if not all, of the requirements need work which, in turn, will cause the measures to be revised accordingly.
Response: The SPT SDT agrees. The Requirements and Measures have been re-evaluated and changed for this posting of the standard.		
William J. Smith; Allegheny Power (1)	yes	We agree with the Measures to the extent that they agree with our comments to the Requirements.
Response: The SPT SDT agrees. The Requirements and Measures have been re-evaluated and changed for this posting of the standard.		
Dale Wadding; Dairyland Power Cooperative (5)	yes	
Will Franklin; Entergy (6)	yes	
John Bussman:AECI (1,5,6)	yes	
Jim Gunnell; SPP (2)	yes	
Gerald LaRose; NYPA (1)	yes	
James Hinson; ERCOT (2)	yes	

Question 12		
Commenter		**Comment**
FirstEnergy (1,3,5,6)	yes	

13. Do you agree with Compliance Monitoring section of the standard?

Summary Consideration:

Some commenters expressed concern with the use of spot check audits and triggered evaluations, as well as the frequency of self certification. The majority of the responses agreed with the Compliance Monitoring section of the standard. The SPT SDT has removed the self-certification, spot check, periodic audit and the triggered investigations statements in the Compliance Monitoring and Reset section and included these methods in Section 1.4, Additional Compliance Information. The NERC Compliance Monitoring and Enforcement Program, approved by FERC, addresses each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Inclusion of these methods provides the registered entity information on various methods used to determine compliance with this standard.

Question 13		
Commenter		**Comment**
Marion Lucas; Alcoa Power Generating, Inc (1)	no	See comments in 12.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Kathleen Goodman; ISO-NE (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for system operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback.		
PJM (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for system operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback.		
ISO/RTO Council (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback.		
Mark Bennett; Gainesville Regional Utilities (5)	no	I believe that entities need a training program, and must have one for compliance. I don't believe that all the requirements and measurements are necessary to have a comptent operator. This is mostly back office work for tracking purposes. Again PER 002 should suffice.

Question 13		
Commenter		**Comment**
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Brian Tuck; BPA (1)	no	The RRO is identified as the Compliance Monitor for the Standard. The Compliance Monitoring Period and Reset section lists all the potential methods the RRO may use to monitor compliance. BPA recommends Self-certification, Periodic Audit (required 3-year compliance audit, not the readiness audit), and Triggered Investigations. The Data Retention requirements are more detailed than necessary and BPA recommends a simple requirement for all training documentation and records to be retained for three-years, similar to the requirement of the NERC CE Program.
Response: The SPT SDT has removed the self-certification, spot check, periodic audit, and the triggered investigations statements in the Compliance Monitoring and Reset section and added these methods to Section 1.4, Additional Compliance Information. The NERC Compliance Monitoring and Enforcement Program (CMEP), approved by FERC, addresses each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Details on these compliance monitoring methods can be found on the NERC website, Compliance and Section 3.0 of the CMEP document. "The Compliance Enforcement Authority will monitor, assess, and enforce compliance with Reliability Standards using eight (8) monitoring processes to collect information in order to make assessments of compliance: (1) Compliance Audits, (2) Self-Certifications, (3) Spot Checking, (4) Compliance Violation Investigations, (5) Self-Reporting, (6) Periodic Data Submittals, (7) Exception Reporting, and (8) Complaints." Inclusion of these methods provides the registered entity information on various methods used to determine compliance with this standard. Only the compliance monitoring methods applicable to this standard have been included in the revised standard. The term "triggered investigations has been removed and replaced with the term "investigations" to more closely match the language used in the CMEP. Section 1.3 Data Retention has been changed to reflect data retention specifications for all requirements of four years or since its most recent on-site compliance audit, whichever is greater. This data retention will allow an entity to provide evidence of compliance for all years in-between formal compliance audits.		
WECC RCCWG (1,2)	no	I do not agree with the Triggered Investigations. There is no recourse provided for entities that are accused of non compliance. There is no appeal process. Who is allowed to call for a Triggered Investigation? This section is too vague and onerous.
Response The NERC Compliance Monitoring and Enforcement Program (CMEP), approved by FERC, addresses each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Details on these compliance monitoring methods can be found on the NERC website, Compliance and Section 3.0 of the CMEP document. "The Compliance Enforcement Authority will monitor, assess, and enforce compliance with Reliability Standards using eight (8) monitoring processes to collect information in order to make assessments of compliance: (1) Compliance Audits, (2) Self-Certifications, (3) Spot Checking, (4) Compliance Violation Investigations, (5) Self-Reporting, (6) Periodic Data Submittals, (7) Exception Reporting, and (8) Complaints." Inclusion of these methods provides the registered entity information on various methods used to determine compliance with this standard. Only the compliance monitoring methods applicable to this standard have been included in the revised standard. The term "triggered investigations has been removed and replaced with the term "investigations" to more		

Question 13		
Commenter		**Comment**
closely match the language used in the CMEP. An investigation may be initiated in response to a system disturbance, Complaint, or possible violation of a Reliability Standard identified by any other means. Per the CMEP, all entities have the right for due process, regardless of the type of compliance monitoring method used.		
SRP (1)	no	The process of Triggered Investigations needs to be further refined and defined. One entity could cause another entity a great deal of work and cost by submitting multiple complaints or allegations. What if any recourse does the accused party have available to them? There should at least be an appeal process. Who is allowed to call for a Triggered Investigation? This section is too vague and could become onerous.
Response: The NERC Compliance Monitoring and Enforcement Program (CMEP), approved by FERC, addresses each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Details on these compliance monitoring methods can be found on the NERC website, Compliance and Section 3.0 of the CMEP document. "The Compliance Enforcement Authority will monitor, assess, and enforce compliance with Reliability Standards using eight (8) monitoring processes to collect information in order to make assessments of compliance: (1) Compliance Audits, (2) Self-Certifications, (3) Spot Checking, (4) Compliance Violation Investigations, (5) Self-Reporting, (6) Periodic Data Submittals, (7) Exception Reporting, and (8) Complaints." Inclusion of these methods provides the registered entity information on various methods used to determine compliance with this standard. Only the compliance monitoring methods applicable to this standard have been included in the revised standard. The term "triggered investigations has been removed and replaced with the term "investigations" to more closely match the language used in the CMEP. An investigation may be initiated in response to a system disturbance, Complaint, or possible violation of a Reliability Standard identified by any other means. Per the CMEP, all entities have the right for due process, regardless of the type of compliance monitoring method used.		
Ron Gunderson; NPPD (1) MISO (1,6) Robert Coish; MEHB (1, 3, 5, 6)	no	This needs to be simplified. We're not sure why there would be spot checks and triggered investigations for training. This standard can be evaluated during the normal audit and self-certification cycle.
Response: The NERC Compliance Monitoring and Enforcement Program(CMEP), approved by FERC, addresses each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Details on these compliance monitoring methods can be found on the NERC website, Compliance and Section 3.0 of the CMEP document. "The Compliance Enforcement Authority will monitor, assess, and enforce compliance with Reliability Standards using eight (8) monitoring processes to collect information in order to make assessments of compliance: (1) Compliance Audits, (2) Self-Certifications, (3) Spot Checking, (4) Compliance Violation Investigations, (5) Self-Reporting, (6) Periodic Data Submittals, (7) Exception Reporting, and (8) Complaints." Inclusion of these methods provides the registered entity information on various methods used to determine compliance with this standard. Only the compliance monitoring methods applicable to this standard have been included in the revised standard. Spot checks may be used to confirm self-certification, may be random or may be initiated in response to events, or by operating problems, or system events. The term "triggered investigations has been removed and replaced with the term "investigations" to more closely match the language used in the CMEP..		

Question 13		
Commenter		**Comment**
John Bussman:AECI (1,5,6)	no	don't agree with requirement 1
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirements such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
Michael Scott; APS (1,5)	no	The annual self-certification is too frequent. Conducting a thorough self-assessment 18 months following the triennial audit would be effective. This would provide a "halfway point" snapshot of program progress between the audits.
Response The NERC Compliance Monitoring and Enforcement Program(CMEP), approved by FERC, addresses each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Details on these compliance monitoring methods can be found on the NERC website, Compliance and Section 3.0 of the CMEP document. For all requirements that do not require more frequent self-certification, a yearly self-certification will be used.		
John Kerr; GRDA	no	The self-certification would be more in line for every 3 years or when standards change.
Response: The NERC Compliance Monitoring and Enforcement Program (CMEP), approved by FERC, addresses each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Details on these compliance monitoring methods can be found on the NERC website, Compliance and Section 3.0 of the CMEP document. For all requirements that do not require more frequent self-certification, a yearly self-certification will be used.		
Michael Gammon; KCP&L (1)	no	The performance reset period seems a bit harsh. Are there any standards that have a flexible reset period?
Response: The reset period of one month was under the direction of FERC and the SPT SDT cannot change this component of compliance.		
Matthew Santos; SDE&G	no	When you notify an entity that they will be audited will you also at that time tell them what they will be audited on or will it be a full blown compliance audit? If someone notifys you that we are in noncompliance did you get proof from that entity before proceeding with investigation?
Response: Each entity will be notified by its regional entity at a minimum of 60 days in advance to an on-site audit. Included in this notification, is the scope of the audit, i.e., which NERC and regional standards will be reviewed. Annually, the regional entities and NERC compliance staff determine which standards will be included in the actively monitored standards. These are the standards, which at a minimum will be part of the onsite audit for all regions. The regional entity will notify the entity of any investigations at which time the will be asked to provide evidence. Per the Compliance Monitoring and Enforcement Program (CMEP), approved by FERC, all entities have the right for due process, regardless of the type of compliance monitoring method used. Details on these compliance monitoring methods as well as all other aspects concerning Compliance Monitoring and Enforcement program can be found on the NERC website, Compliance and Section 3.0		

Question 13		
Commenter		**Comment**
of the CMEP document. This document has been approved by FERC.		
Duke Energy (G1) (1)	no	Not completely, no. Compliance monitoring should be consistent across the regions.
Response: This is beyond the scope of this standard. However, the purpose of industry standards development is to achieve consistency. The application of the compliance monitoring is consistent across the regions. Per the regional delegation agreements approved by FERC, each region must implement the compliance process as outlined in the NERC Compliance Monitoring and Enforcement Program (CMEP), also approved by FERC. Details on these compliance monitoring methods as well as all other aspects concerning the CMEP can be found on the NERC website, Compliance, CMEP document, Section 3.0. The compliance elements increase consistent application of the standards.		
Allan George; Sunflower (1)	no	Review need only entail list of operators, credentials, and outline of program and progress in program
Response: The comment does not provide enough information to accurately address. An operator's certification credential and its maintenance are outside the scope of this standard. Each Compliance Enforcement Authority will judge compliance to the requirements in the standard to perform compliance audits. The entity must retain evidence of compliance to each requirement of this standard.		
Richard Krajewski; Public Service Co of NM (1)	no	The Data Retention requirements are more detailed than necessary and PNM recommends a simple requirement for all training documentation and records to be retained for three-years, similar to the requirement of the NERC CE Program.
Response: Section 1.3 Data Retention has been changed to reflect data retention specifications for all requirements of 4 years or since its most recent on-site compliance audit, whichever is greater. This data retention will allow an entity to provide evidence of compliance for all years between formal compliance audits.		
Ron Falsetti; IESO (2)	no	Same as above.
Response: There is insufficient information for the Training Standard Drafting Team to respond to this comment. Future comments should provide a specific reason(s) for the objection such that the Training Standard Drafting Team has an opportunity to respond.		
Santee Cooper (G2)	no	It is impractical to evaluate the Compliance Monitoring section until we have a clear understanding of the Requirements in this standard.
Response: The requirements, as well as the Compliance Monitoring section have been revised based on stakeholder comments. Specifically the following changes have been made to the requirements: Eliminated the individual requirements for each of the phases of the SAT process (R1, R4, R6, and R9) and replaced these with a revised R1 that necessitates using the SAT process to develop the required training. Consolidated R2 and R3 that addressed assessing training needs for entry-level or newly hired experienced System Operators and incumbent system operators into one requirement, revised R2, which is applicable to positions, not individuals, as well eliminated the distinction between entry-level, incumbent, and newly hired experienced System Operators.		

Question 13		
Commenter		**Comment**
Eliminated the requirement for verification of qualifications for persons developing or delivering training (R5). Eliminated the requirement for providing details of training activities (R7) Eliminated the requirement addressing the maintenance of the System Operator training program (R10).		
Dan Kay; South Mississippi EPA (4)	no	
WECC OTS (1,2) Gordon Rawlings; BCTC (1)	Yes/no	The RRO is identified as the Compliance Monitor for the Standard. The Compliance Monitoring Period and Reset section lists all the potential methods the RRO may use to monitor compliance. OTS recommends Self-certification, Period Audit (required 3-year compliance audit, not the readiness audit), and Triggered Investigations. The Data Retention requirements are more detailed than necessary and OTS (BCTC) recommends a simple requirement for all training documentation and records to be retained for three-years, similar to the requirement of the NERC CE Program.
Response: The SPT SDT has moved the self-certification, spot check, periodic audit and the triggered investigations statements in the Compliance monitoring and Reset section to Section 1.4, Additional Compliance Information. The NERC Compliance Monitoring and Enforcement Program (CMEP), approved by FERC, address each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Details on these compliance monitoring methods can be found on the NERC website, Compliance and Section 3.0 of the CMEP document. "The Compliance Enforcement Authority will monitor, assess, and enforce compliance with Reliability Standards using eight (8) monitoring processes to collect information in order to make assessments of compliance: (1) Compliance Audits, (2) Self-Certifications, (3) Spot Checking, (4) Compliance Violation Investigations, (5) Self-Reporting, (6) Periodic Data Submittals, (7) Exception Reporting, and (8) Complaints." Inclusion of these methods provides the registered entity information on various methods used to determine compliance with this standard. Only the compliance monitoring methods applicable to this standard have been included in the revised standard. The term "triggered investigations has been removed and replaced with the term "investigations" to more closely match the language used in the CMEP. Section 1.3 Data Retention has been changed to reflect data retention specifications for all requirements of 4 years or since its most recent on-site compliance audit, whichever is greater. This data retention will allow an entity to provide evidence of compliance for all years between formal compliance audits.		
NPCC CP9 (1, 2)	yes	NPCC Participating members have expressed some disagreement with the Requirements as written so the measures are in question as well.
Response: The Requirements and Measures have been re-evaluated and changed for this posting of the standard.

14. Please identify any Regional Differences that you feel should be included in this standard.

Summary Consideration:

The Standard Drafting Team agrees that there are no regional differences (now called Regional Variances) with the drafted standard PER-005. Training specific to any Region that is needed by a Functional Entity should be included in the training programs developed for that Functional Entity.

Question 14	
Commenter	**Comment**
SRP (1)	No known Regional Differences Is this standard the proper place to insert the WECC CEH requirement of 10 CEH of WECC-specific topics every 2 years?
Response: This standard is not the appropriate place to include specific requirements such as the WECC specific training topics. Any specific items WECC desires to impose on its members should be included in the training plans developed by the WECC and its members.	
Duke Energy (G1) (1)	No known Regional Differences. If the standard is not too detailed and prescriptive, no regional differences will be needed.
Response: The SPT SDT agrees.	
Will Franklin; Entergy (6)	No known Regional Differences
Tim Hattaway; Alabama Electric Coop (5)	No known Regional Differences
Ron Gunderson; NPPD (1)	No known Regional Differences
John Bussman:AECI (1,5,6)	No known Regional Differences

15. Do you agree with the proposed Implementation Plan?

Summary Consideration:

Most commenters did not agree with the proposed Implementation Plan, expressing concern with the proposed implementation time. Based on stakeholder feedback, the implementation plan has been lengthened to three years and the specific dates were removed.

Question 15		
Commenter		**Comment**
WECC OTS (1,2)		The implementation plan was not posted with the Standard but was posted afterwards. While OTS has not had time to evaluate and make recommendations on the implementation plan, we do recommend all specific dates be removed. The plan notes the dates slide with the approval date of the Standard but OTS believes the approximate dates will do more to confusion the issue than to help.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Dale Wadding; Dairyland Power Cooperative (5)	no	The Implementation Plan states that several reference documents will be issued to assist in compliance with the Standard but fails to establish a timeline for their release. These documents should be available as soon as possible and workshops should be scheduled to assist entities with compliance.
Response: The SPT SDT has provided a Generic Task List, as well as a reference document with the revised standard The SPT SDT will consider conducting a workshop.		
Southern Co (1,3,5,6)	no	Southern does not believe the proposed standard is necessary, especially as written. Therefore, we do not believe an Implementation plan is needed.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost.		
Marion Lucas; Alcoa Power Generating, Inc (1)	no	As above, the entire standard is duplicative, intrusive and overstepping in its bounds. It should be eliminated.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost.		
CJ Ingersoll; CECD (3)	no	The current draft should be revised and a new implementation plan drafted to fit the amended draft.
Response: The SPT SDT recognizes modifications to the proposed standard may have an impact on the implementation plan and has posted a new implementation plan with the revised draft of the		

Question 15		
Commenter		**Comment**
standard.		
Ron Falsetti; IESO (2)	no	Please see comments in Q19.
Response: The SPT SDT agrees that the element identified is important and are encompassed in the revised standard. The SPT SDT has significantly revised the standard based on industry feedback. The standards addresses the core SAT phases. The SPT SDT agrees with the comment that only specific tasks that are considered critical to reliability should be considered and has revised the requirement to include analysis that considers only reliability-related tasks by System Operator positions. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT has combined R2 and R3 and removed R4, R5, R6, R7, R8, R9, and R10 from the revised standard.		
Kathleen Goodman; ISO-NE (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback.		
PJM (2)	no	See response to question 19
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Question 15		
Commenter		**Comment**
Gerald LaRose; NYPA (1)	no	The proposed Standard is an admittedly "complex standard with many requirements" and the Responsible Entities will require time and resources to examine their current practices, complete the requisite analyses and implement the programs to meet the Requirements of these Standards. An Implementation Schedule akin to that required for CIP-002 through CIP-009, i.e., varying degrees of parallel (as opposed to serial) compliance with specific milestones (Begin Work, Substantially Compliant, Compliant, Auditably Compliant applied to all Requirements at the same time as opposed to strict Auditable Compliance for each grouping within the serial stages) over four years rather than two. Many budgets for 2007 are already locked-in and the first serial stage in particular (R1, R2, R3) will be costly.
Response: The SPT SDT understands the cost implications as a result of the approval of this standard, however, there is an urgent priority placed on the industry by the Electric Reliability Organization and FERC to develop training programs that provide the basis to ensure quality and effective training and that are audit consistent.		
FRCC SO Subcommittee (1,2,5)	no	We appreciate the significant effort that went into the current draft of PER-005-1. As stated previously, for future flexibility of the "training" standards, we would encourage the drafting team to re-evaluate its creation of the "new" standard. We would suggest rolling in the appropriate requirements (JTA concept and the other requirements into the existing training standards (PER-002 applicable to BAs and TOPs and PER-004 applicable to RCs)). The requirements may be duplicated as necessary in both standards, but preservation of the individual standards would allow the flexibility to create appropriate requirements and improvements to the standards without having to address ALL stakeholders affected by the standard. It is difficult to justify that the same training requirements should be applied to a 100 MW (peak load) Balancing Authority as to a Reliability Coordinator that evaluates the wide area view of a 45,000 MW system. Simply, this would allow flexibility for the industry to evaluate future training requirements that could enhance Interconnection reliability and apply them with a higher degree of precision and appropriateness.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The drafting team made significant changes to the requirements in the standard, and believes the revised requirements are equally applicable to the Reliability Coordinator, Transmission Operator and Balancing Authority so the requirements have been retained in a single standard.		
FPL (1,3,5)	no	We appreciate the significant effort that went into the current draft of PER-005-1. As stated previously, for future flexibility of the "training" standards, we would encourage the drafting team to re-evaluate its creation of the "new" standard. We would suggest rolling in the appropriate requirements (JTA concept and the other requirements into

		the existing training standards (PER-002 applicable to BAs and TOPs and PER-004 applicable to RCs)). Simply, this would allow flexibility for the industry to evaluate future training requirements that could enhance Interconnection reliability and apply them with a higher degree of precision and appropriateness.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The drafting team made significant changes to the requirements in the standard, and believes the revised requirements are equally applicable to the Reliability Coordinator, Transmission Operator and Balancing Authority so the requirements have been retained in a single standard.		
Matthew Santos; SDE&G	no	I believe more time 4 to 5 years is needed for all entities to get it done right. So a phasing in period would be the best approach. But more dialog is needed, we do not need to rush into this half cocked.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Jason Shaver; ATC (1)	no	ATC does not agree with the implementation schedule with the proposed standard as written. ATC strongly recommends that the implementation schedule be extended for an additional one to two years based upon the way the standard is currently written. Phase 1 should be 18-24 months Phase 2 should be 24-36 months Phase 3 should be 36-48 months ATC may agree with the implementation schedule as is if the SDT modifies the requirements in accordance with ATC's recommendations.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Pepco Holdings (1)	no	Phase I is permitted and could take up to one year to complete. Phase II will most likely be dependant on completion of Phase I. Extend Phase II and Phase III each by six months, extending the entire schedule to December 31, 2009.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. The time lines and phases have been adjusted.		
Ed Davis; Entergy Services (1)	no	The Implementation Plan references standard PER-004-1. If there is an approved PER-004-1 it is not on the NERC standards website. There is an approved standard PER-004-0. We suggest the Phased Implementation Period be over 3 years rather than the 2 years indicated. The following statement is contained in the discussion of PER-004-1 R3 and R4 - In addition, one of the purposes of

Question 15		
Commenter		**Comment**
		requirement R6.4.2. in this standard is to develop a Reliability Coordinator's knowledge of other entities in the Reliability Coordinator's area. Should the reference to R6.4.2 actually be R6.5.2? The Applicability section contains a statement about System Operators under contract or delegation agreement. Please see our suggested changes contained our response to Question 19 in this document, including our concerns regarding Sytsem Operators under contract or System Operators performing tasks identified in R1 under delegation agreement.
Response: The drafting team posted a proposed revision to PER-004 showing suggested retirement of most of the requirements. The new version of PER-004 will be PER-004-1. Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Jim Sorrels; AEP (1)	no	No. AEP does not agree with the proposed implementation plan. AEP recommends a phased implementation approach over a 3-year period. Compliance to Requirements 1-3 should start 18 months after FERC approval, compliance to Requirements 4-7 should begin after 30 months, and compliance to Requirements 8-10 should begin after 36 months. Additionally, AEP disagrees with the retiring of PER-004-1 Requirements 3 and 4 upon implementation of this proposed standard. The drafting team incorrectly assumes the job task analysis for a Reliability Coordinator's System Operators would obviously include these requirements as tasks to be performed by a Reliability Coordinator. But if the NERC Standards do not have a requirement such as PER-004-1 R3 and R4, then why would they include this in their job task analysis? It would be a step backward for reliability to assume that every entity has the same interpretation of what an entity is to do and not to do. If we could make this assumption, then we wouldn't need Mandatory Standards. AEP can only support the retiring all of PER-004-1 if the drafting team can show where else in the NERC Standards an RC is required to perform what is contained in PER-004-1 R3 and R4.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. Please see the revised implementation plan which includes a table showing the disposition of each requirement recommended for retirement in PER-004-1. The implementation plan proposes retiring PER-004 R3 and R4 when PER-005-1 Requirements 1 and 4 become effective. The drafting team believes that a training program that is developed following the SAT process that addresses all reliability-related tasks assigned to a reliability coordinator will address the topics covered in PER-004 R3 and R4.		
William J. Smith; Allegheny Power (1)	no	Too aggressive for the standard in it's present form. All phases of the Implementation Plan should be extended by 12 months.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three		

Question 15		
Commenter		**Comment**
years and the dates were removed.		
Duke Energy (G1) (1)	no	In the current draft, the implementation plan is too short. If the requirements are re-written to be less prescriptive and detailed, a two year plan may be workable.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
WECC RCCWG (1,2)	no	Much too aggressive. Entities are still struggling with Emergency and CEH training requirements. The implementation should be extended to give eitities time to prepare for these requirements.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
SPP OTWG (1,2)	no	If the standard is implemented as is, it would require additional training staff and the purchase of an LMS, which would make the implementation unrealistic. All of these requirements should begin on January 1 so that compliance is consistent for the year. We would prefer to see some examples of quality JTAs. We believe it's necessary to have some benchmark standards that can be used across the industry.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. Any proposed standard is dependent upon jurisdictional regulatory approval and it is unlikely that all regulatory approvals will be achieved in the same time frame.		
Michael Clime; Ameren	no	The plan is to aggressive especially if some of the training is not thoroughly developed at the current time. A lot of companies will be required to hire another Trainer just to do development work and record keeping.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
SCE&G ERO WG (1, 3, 5)	no	Twelve months is not enough time unless a standard list of " reliability related task" and agreement by the industry of minimun requirments as associated with these task as it applies to R1.1 through R1.7 can be provided.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. The SPT SDT has included a Generic Task List in the revised standard.		
Santee Cooper (G2)	no	Twelve months may not be a reasonable length of time for many companies depending on the expectations of a JTA and whether it is applicable to all tasks or tools or changes to all tasks and tools. The Phase II and Phase III implementation dates may be ok if the first implementation date for the JTA is extended significantly.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		

Question 15		
Commenter		**Comment**
Will Franklin; Entergy (6)	no	R6.5 on "EOPs" should be implemented immediately since the industry is currently held to this requirement under a memo issued after the 2003 blackout. PER-002 already requires this training. If PER-002 is eliminated by this standard then R6.5 should become effective immediately. Also, the implementation plan proposes to retire PER-004 and states that PER-004 R1 is duplicated in PER-003. This is not completely true. PER-004 R1 states that the RC will be staffed 24/7, but PER-003 just states that the operators will be NERC Certified. Later in the Measures it states it will be staffed "at all times". PER-003 should be modified if PER-004 is to be eliminated.
Response: The SPT SDT Team has revised the implementation timeline with the revised draft of the standard that addresses the immediate implementation of EOP hour requirements and PER-004. Your comments on the inconsistency between PER-004 R1 and PER-003 are correct and the Implementation Plan has been revised accordingly. Your comment on PER-004 R1 needing to remain in PER-004 is also correct and this is reflected in the Implementation Plan.		
SRP (1)	no	The sheer volume of documentation that this Standard will require will take a lot of time. Many entities are already struggling to meet the training hour requirements. This would further tax resources that are already fully subscribed. The implementation plan is much too aggressive and should be extended to give entities time to prepare for these requirements. At a minimum the implementation plan should consider the burden expected by the new standard for support personnel.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
John Bussman: AECI (1,5,6)	no	We agree that some of the other training design requirements should be retired if this standard is adopted. This standard should be simplified prior to implmentation. Also the two-year implementation plan might be too short to put all this detail in a training program.
Response: The SPT SDT has revised the standard based on stakeholder feedback. The implementation plan has been lengthened to three years and the dates were removed.		
John Kerr; GRDA	no	The implementation as is would be a considerable expense for everyone. Examples and explanations should be give first.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. Additional information on your request for examples and explanations is needed to respond to this comment.		

Question 15		
Commenter		**Comment**
Roger McBeth; Northeast Utilities (1)	no	If NERC only provides a generic task list, organizations will not be able to complete a company specific task list and support a company specific job task analysis that meets the requirements of R.1.1 thru R.1.7 in one year with available resources. Organizations can not support the requirements of their existing Initial and Continuing Training Programs and complete a manpower intensive Job Analysis/Task Analysis at the same time. Most organizations do not have a training staff with the experience necessary to perform a Job Task Analysis. This will require organizations to seek contractor support to complete the requirement in that amount of time. If all utilities seek contractor support to complete their JTAs within the one year there will be a huge vacuum created by the lack of contractors to support this effort. A company specific job task analysis will also require the involvement of subject matter experts which means additional demands on your system operator's time. Organizations will be challenged to free up operators to serve as subject matter experts (SME) in support of a company specific JTA.
Response: Based on stakeholder feedback, the Implementation Plan has been lengthened to three years and the dates were removed. The drafting team is posting a list of references that may provide assistance so that entities can conduct their own analysis.		
Hydro One Networks (1)	no	Preparation for compliance with this Standard represents considerable work. The Implementation Plan should give more time to become auditable compliant.
Response: Based on stakeholder feedback, the Implementation Plan has been lengthened to three years and the dates were removed.		
Allen Klassen; Westar (1)	no	Not giving enough time to meet the new requirements (lots of development and creating excessive documentation will have to be done) and should not make ANY requirement effective mid-year. Suggest effective dates of 1/1/2009 for R1 - R7 and 1/1/2010 for R8 - R10 at the earliest.
Response: Based on stakeholder feedback, the Implementation Plan has been lengthened to three years and the dates were removed. Any proposed standard's effective date is dependent upon jurisdictional regulatory approval.		
Brian Thumm; ITC (1)	no	The two-year implementation plan is too short to develop the comprehensive documentation required by the proposed standard. Requirement R7 will be the most demanding, and at a minimum, it should be moved into Phase 3 in order to allow for a few extra months to complete it.
Response: Based on stakeholder feedback, the Implementation Plan has been lengthened to three years and the dates were removed.		
Allan George; Sunflower (1)	no	
Dan Kay; South Mississippi EPA (4)	no	

Question 15		
Commenter		**Comment**
Mark Bennett; Gainesville Regional Utilities (5)	no	
Ron Gunderson; NPPD (1)	Yes/no	
Richard Krajewski; Public Service Co of NM (1)	Yes/no	See response to #18
Response: The SPT SDT has reviewed the comment that the implementation timeline should be extended and has revised the Implementation Plan to reflect an implementation timeline of 2 to 3 years and removed all specific dates. The SPT SDT has revised the implementation timeline with the revised draft of the standard.		
MISO (1,6)	Yes/no	We agree that some of the other training design requirements should be retired if this standard is adopted. This standard should be simplified prior to implmentation. Also the two-year implementation plan might be too short to put all this detail in a training program.
Response: The SPT SDT has modified the standard based on stakeholder feedback. Based on stakeholder feedback, the Implementation Plan has been lengthened to three years and the dates were removed.		
Michael Gammon; KCP&L (1)	yes	I agree with the plan components, however, I think the implementation time frame is bit aggressive for most entities.
Response: Based on stakeholder feedback, the Implementation Plan has been lengthened to three years and the dates were removed.		
James Hinson; ERCOT (2)	yes	How do they confirm that any implementation has taken place
Response: The confirmation is achieved through the NERC Standard Compliance process.		
Howard Rulf; WeEnergies (3,4,5)	yes	
NPCC CP9 (1, 2)	yes	
Gordon Rawlings; BCTC (1)	yes	
Robert Coish; MEHB (1, 3, 5, 6)	yes	
FirstEnergy (1,3,5,6)	yes	
TVA (1)	yes	
MRO (1,2)	yes	
Michael Scott; APS (1,5)	yes	
Alan Adamson; NYSRC (2)	yes	

16. Do you agree with the drafting team that this standard does not need to be field tested?

Summary Consideration:

Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.

Question 16		
Commenter		**Comment**
Matthew Santos; SDE&G		To soon to proceed, the standard needs more ironing out.
Response: There is insufficient information for the SPT SDT to respond to this comment.		
Kathleen Goodman; ISO-NE (2) PJM (2) ISO/RTO Council (2)		The proposed standard requires more public discussion before discussing field testing needs.
Response: Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
Richard Krajewski; Public Service Co of NM (1)	no	PNM recommends field testing should be a standard practice for all NERC Standards. Field testing reveals administrative concerns and sometimes substantive concerns that were not foreseen. All standards should be subject to at least a brief field testing period.
Response: Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
Roger McBeth; Northeast Utilities (1)	no	The drafting team should commit to not only provide a generic task list but also a generic JTA for the generic task list. A field test may help them recognize the unreasonable demand that this standard will place on the organziations.
Response: In response to your request for examples of reliability-related tasks, the SPT SDT has included a Generic Task List in the revised standard. Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
Gordon Rawlings; BCTC (1)	no	BCTC recommends field testing should be the practice for all NERC Standards. Field testing reveals administrative concerns and sometimes larger concerns that were not foreseen. All standards should be subject to at least a brief field testing period.
Response: Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
Hydro One Networks (1)	no	There must be a field test to assess any impacts and adjust the standard accordingly.
Response: Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
Brian Tuck; BPA (1)	no	BPA recommends field testing as a standard practice for all NERC Standards. Field testing reveals administrative concerns and sometimes substantive concerns that were

Question 16		
Commenter		**Comment**
		not foreseen. All standards should be subject to at least a brief field testing period.
Response: Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
Richard Appel; Sunflower Electric Power Co (1,3,5)	no	I don't think anybody out there has enough staff on board to implement this standard. If we have a field testing period most would find that it just won't work as written.
Response: The SPT SDT has significantly revised the standard based on industry feedback. Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
WECC OTS (1,2)	no	OTS recommends field testing should be a standard practice for all NERC Standards. Field testing reveals administrative concerns and sometimes substantive concerns that were not foreseen. All standards should be subject to at least a brief field testing period.
Response: Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
SCE&G ERO WG (1, 3, 5)	no	A field test should be required to provide critical feedback to the industry which should save both time and money in the implementation phase and improve the compliance and audit process.
Response: Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
Santee Cooper (G2)	no	A field test may provide critical feedback in determining realistic implementation dates, requirements, and measures.
Response: Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
Dan Kay; South Mississippi EPA (4)	no	
FRCC SO Subcommittee (1,2,5)	no
